TABLE OF CONTENTS

I. TECHNICAL DATA

1-1. VT-400

TV SIGNAL	NTSC Standard (or PAL Standard)
RECORDING SYSTEM	Twin rotating head, Helical scanning frequency modulation system
RECORDING TIME	About 30 minutes (with VK-30)
TAPE SPEED	69.1 mm per second (PAL 67.9 mm/sec)
TAPE WIDTH	12.5 mm (1/2 inch)
HORIZONTAL RESOLUTION	More than 240 lines
VIDEO SIGNAL TO NOISE RATIO	Better than 40 dB
VIDEO INPUT	1Vp-p, 75 ohms
VIDEO OUTPUT	1Vp-p, 75 ohms
AUDIO INPUT	0.1V RMS
AUDIO OUTPUT	1.0V RMS
AUDIO FREQUENCY BAND WIDTH	100 Hz to 10,000 Hz
AUDIO SIGNAL TO NOISE RATIO	Better than 43 dB
TAPE USED	VK-30
BATTERIES	Two rechargeable 6V batteries
BATTERY USING TIME	More than 40 minutes continuous (in color with VC-400)
DIMENSIONS	263(W) x 124(H) x 365(D) mm, (10.4 x 4.9 x 14.4")
WEIGHT	6.9 kg (15.2 lbs) not including batteries

*** For improvement purposes, specifications and design are subject to change without notice.**

1-2. VC-400

COLOR SYSTEM	NTSC (PAL) two tube frequency Multiplex System
VIDICON TUBE	Luminance channel: 2/3" electrostatic focusing electromagnetic deflection type vidicon (20EP20C) Chrominance channel: 2/3" electrostatic focusing, electromagnetic deflection type vidicon (H9303)
VIEWFINDER	1.5" type built-in electronic mono-chrome viewfinder
RECORDING INDICATOR LAMP	Built-in luminous diode inside viewfinder
LENS	6x (12.5 to 75 mm) zoom lens, F2 to closed
APERTURE	Automatic and manual aperture systems
SCANNING SYSTEM	525 (PAL 625) lines, 2:1 interlace system
SYNCHRONIZATION SYSTEM	External synchronization system (utilizes VT-400)
HORIZONTAL FREQUENCY	15.750 (PAL 15.625) kHz
VERTICAL FREQUENCY	60 (50) Hz
HORIZONTAL RESOLUTION	More than 350 lines (center)
SIGNAL-TO-NOISE RATIO	Better than 40 dB
WHITE BALANCE	White Balance Switch (Automatic Digital Memory System)
IDEAL SUBJECT LIGHTING DENSITY	1,000 Lux
MINIMUM SUBJECT LIGHTING DENSITY	300 Lux (F2)
AUTOMATIC SENSITIVITY CONTROL RANGE	300 (F2) to 20,000 Lux (ND-4 standard accessory: 1,200 to 80,000 Lux ND-8 optional accessory: 2,400 to 160,000 Lux)
MICROPHONE	600 ohms non-directional electret condenser microphone
VIDEO OUTPUT	1.0Vp-1, 75 ohms
FILTER SIZE	49 mmϕ
OPERATING TEMPERATURE TOLERANCE RANGE	0° to 40°C (32° to 104°F)
POWER CONSUMPTION	DC9V, 900 mA
BATTERY WAMING	Flashing picture at recording
POWER REQUIREMENTS	DC9V (supplied form VT-400)
DIMENSIONS	88(W) x 234(H) x 335(D) mm, (3.5 x 9.3 x 13.2") including lens hood and hand grip
WEIGHT	2.62 kg (5.76 lbs)

*** For improvement purposes, specifications and design are subject to change without notice.**

1-3. VA-400

POWER SUPPLY	100V, 50/60 Hz for JPN 120V/60 Hz for Canada and U.S.A. 220V/50 Hz for Europe except U.K. 240V/50 Hz for U.K. and Australia 100/110/120/220/240V, 50/60 Hz for other countries
DIMENSIONS	150(W) x 114(H) x 255(D) mm, (5.9 x 4.5 x 10.0")
WEIGHT	4.8 kg (10.6 lbs)

*** For improvement purposes, specifications and design are subject to change without notice.**

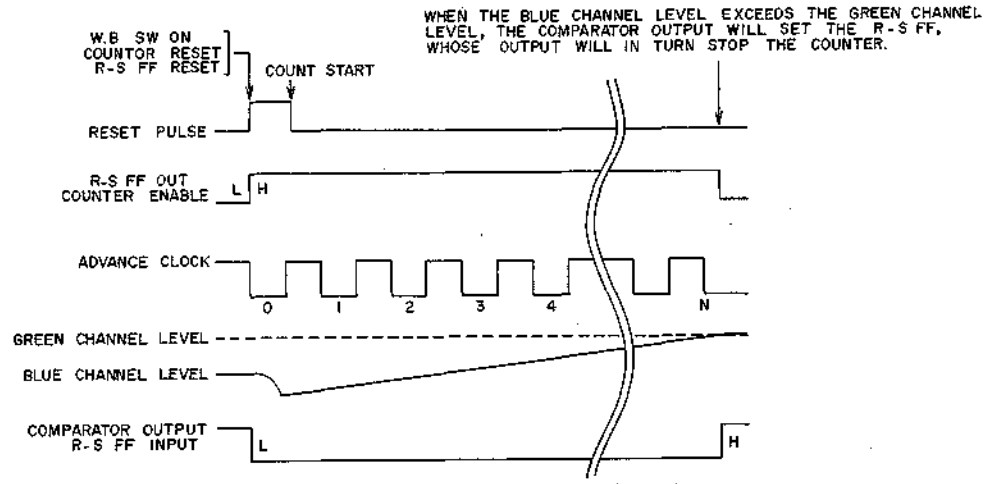

Fig. 3-2

3-1-1. SSG P.C BOARD

(1) Outline of Red, Green and Blue Signal Systems by Channel

The red and blue signals sent from the camera head are supplied to terminal ②.

- In the blue channel, the signal amplified in TR1 passes through the HPF (L1, 2, 3, C2, 4 and 5) and the emitter follower of TR2. Then, the signal level is adjusted on a blue channel level by VR1 and the signal is taken out of the collector in TR3, passing through the demodulation circuit which comprises T1 (differentiation transformer) → D1 and D2 (both wave rectifiers) → LPF. After that, the signal passes through TR6, 7 and 8 so that the blue channel output is delivered from terminal ③ and supplied to the process P.C Board.
  This signal enters the white balance circuit and the white balance is held when the comparated green channel output is fed back and applied to the emitter in TR7 and the blue channel level exceeds the green channel level with the AC gain changed.
- In the red channel, the signal enters the base on TR9 and passes through LPF (L8, 9, 10, C25 and 26), the emitter follower in TR10, the delay line (DL-1) and TR11, 12 and 13, so that the red channel output is delivered from terminal ①.
  Meanwhile, the -B/2 passes through VR2 and is applied to the red channel.
- The difference amplifier in TR16 and 17 is a Chroma suppressor circuit. The Chroma suppressor will function with TR16 and 18 positioned at ON when the red channel level is twice the blue channel level (red channel level exceeds blue channel level) with the red and blue channel signals applied to the bases of TR16 and 17 respectively.

Fig. 3-4

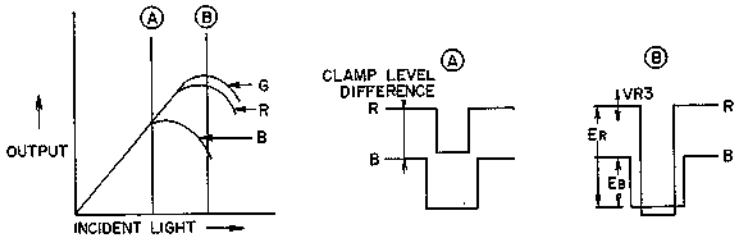

Fig. 3-5

(2) Digital white balance circuit

Press the WHITE BALANCE Switch and NOR ① and ② in IC8 will go "L" while NOR ③ will go "H". The latter "H" signal enters as a reset pulse into ⑦ in IC7 and resets the binary counter. The "H" signal enters terminal ① in R-S FF comprising NOR ①, ②, ③, ④, ⑤ and ⑥ in IC2. On the other hand, the green channel signal enters ② of the comparator in IC3 and the blue channel signal which has dropped to the low level at the same time as resetting enters in comparator ③ in IC3. As long as the green channel level is higher than the blue channel level, therefore, output ① is at the low level, entering ⑥ of R-S FF, while output ④ is at the high level, entering NOR ⑥ in IC8. Input ⑤ is for the red channel and output ④ will be at the low level with either red or blue channel signal at the high level. This output will then enter ⑬ in the clock oscillator which comprises NOR ⑪, ⑫, ⑬, ⑧, ⑨ and ⑩. With ⑬ at the low level, oscillation will start. The clock oscillator output comes out of ⑩ and enters clock input terminal ① in IC7. Besides, the high level output of R-S FF enters ENABLE input terminal ⑩. While the hight level is being held by the ENABLE signal, the clock oscillator output causes the binary counter to go on counting.

Outputs Q_0 thru Q_3 put the IC1 (analogue switch) in operation in accordance with the truth table given in Fig. 3-3. The analogue output is finally connected to the emitter in TR7, changing the AC gain. When the blue channel level exceeds the green channel level, the comparator output will charge its level from L (low) to H (high). The R-S FF will have an "L" output also. In addition, the ENABLE input level will becomes low too. Thus, counting will be ceased.

Even when NOR ⑥ (blue channel) in IC8 is at the low level, the clock oscillator will continue to oscillate as long as NOR ⑤ (red channel) remains at "H" (red channel level is not in excess of the green channel level). With both NOR inputs at the low level, the binary counter will stop counting.

Should it become impossible for the blue channel level to exceed the green channel level, the present counter which is capable of counting 16 at the maximum will be reset when the NAND circuit in IC6 operates under the condition mentioned above.

(3) Chroma suppressor circuit

In case where the incident light is large in VC-150, blue appears yellow due to the beam clogging of chroma signal.

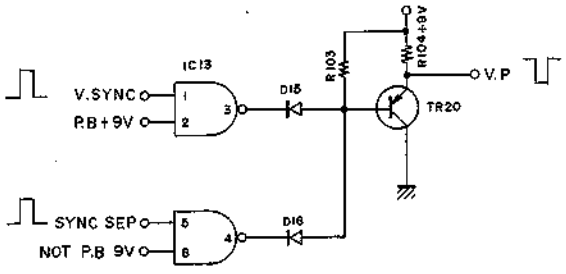

Fig. 3-6

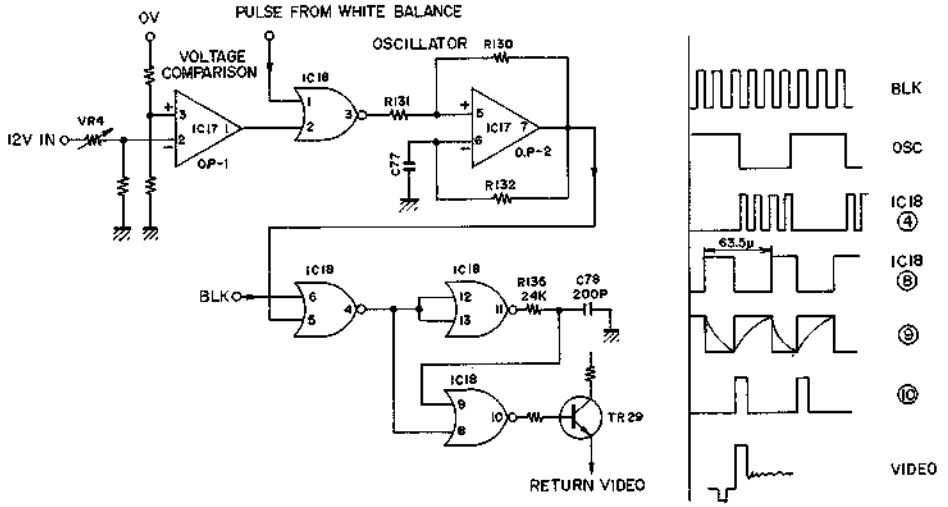

Fig. 3-7

Therefore, the red channel level is compared with the blue channel level and the chroma signal will be cut off, with the Y signal only available, when the red channel level exceeds the blue channel signal ($E_R = 2E_B$). In reality, the red channel clamp level is kept higher than that in the blue channel. When the clamp level of red channel exceeds the blue channel level over the difference in DC level, the chroma suppressor circuit will function.

(4) V pulse (for servo) selector circuit

In recording, the SYNC SEP. input enters and comes out at NAND ④, being inverted. Upon playback, the V SYNC input enters and comes out at NAND ③ being inverted. Then the signal passes through TR20, being supplied as V pulse to the servo circuit.

(5) Battery alarm circuit

With 12V lowered to 10.7V, the OP-1 (IC17) voltage comparator will have an "H" level output while NOR ③ in the IC18 will be "L". With OP-2 (IC17) input ⑤ at the "L" level too, the oscillator will begin functioning. The oscillator output enters NOR ⑤ in IC18 while the BLK enters ⑥ in IC18. The outputs shown in Fig. 3-7 are taken out at output IC18 ④; one is inverted in NOR ⑪, ⑫ and ⑬ and integrated in R135 and C78, thus entering NOR input ⑨ in IC18, while the other enters ⑧ in IC18 as it is. The output is taken out at ⑩ in IC18 and supplied to the return video and flashing the View Finder through the emitter follower in TR29. In the meantime, the white balance flashing signal also enters NOR input ① in IC18.

(6) Pulse generator circuit

This circuit generates such pulses as C. SYNC, C. BLK, BF, CP and HV. Explanations about the circuit are omitted herein.

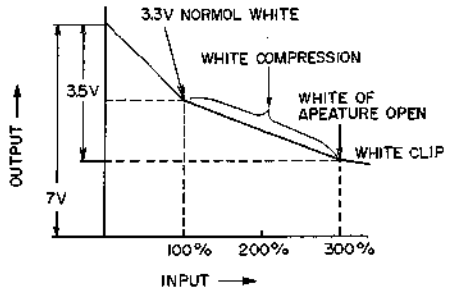

Fig. 3-8

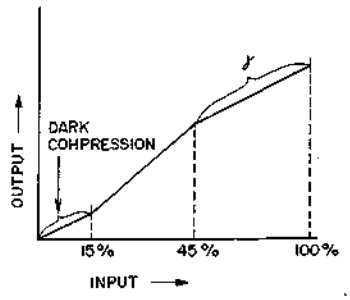

Fig. 3-9

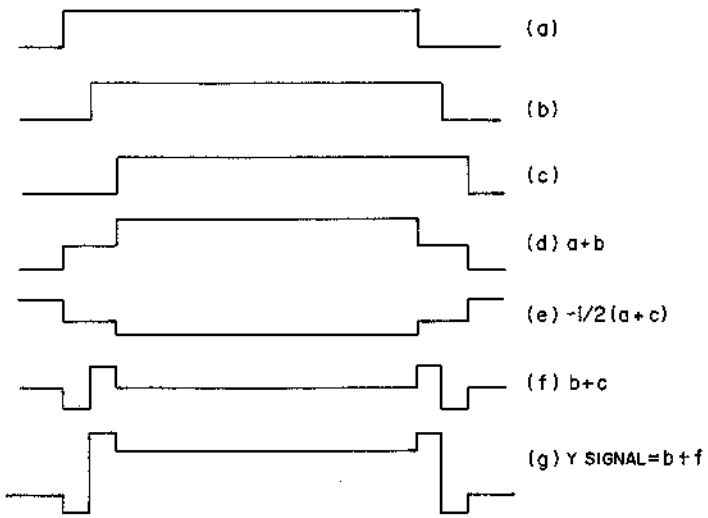

Fig. 3-10

3-1-2. PROCESSOR AND ENCODER P.C BOARD

Each of the R (red), G (green) and B (blue) signals sent from the SSG P.C Board is supplied to the processor circuit.

Since the circuit is commonly applicable to each channel, the explanations given herein pertain to the G channel. The G channel signal is supplied to terminal ⑥ and adjusted in terms of gain by VR1, then passed through the emitter follower in TR1. After that, the signal is clamped in TR2 and amplified in TR3 and TR4. The collector (TP-2) output in TR4 is white-compressed in TR7 and white-clipped in TR6, passing through the emitter follower in TR5. After that, the signal is clamped (setup level is zeroed by VR3) in TR21 and passes through TR9 and TR10. In TR12, the signal is dark-compressed and γ corrected in terms of in TR13 so that the G channel signal output is delivered through the emitter follower in TR14. In TR11, meanwhile, HD enters into the base and the noise during that period is grounded on an AC basis through TR11.

One of the G channel output signals is applied through DL201 to the DL-type aperture compensating circuit. The TR201 output is branched into two; one passes through TR202 and 203, being connected to the emitter in TR207, and the other passes through DL202 (0.2 μs), then comes out from the emitter in TR204, where the signal is also branched into three. The first goes to the Y matrix, the second to the emitter in TR207 through VR11 and the third is amplified in TR205 and passes through DL203 (0.2 μs), being connected from the emitter follower in TR206 to the emitter in TR207. Finally, (f) in Fig. 3-10 is taken out at the collector in TR207 and passes through VR10 (aperture compensation stroke) and the emitter follower in TR209. With the noise so reduced, the signal is supplied to the Y matrix.

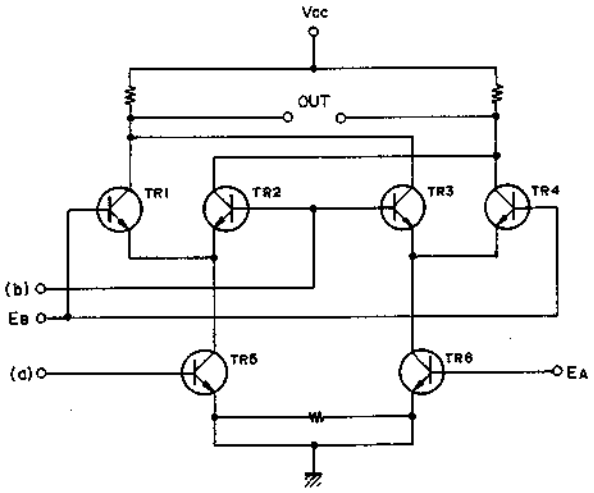

Fig. 3-11

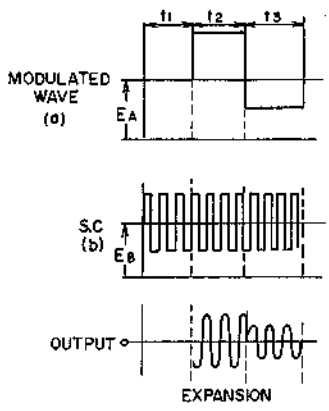

Fig. 3-12

Each of the R, G and B signals has its resistance divided and is outputted at the collector in TR20 at a ratio of $E_Y = 0.59E_G + 0.30E_R + 0.11E_B$. VR12 is used to adjust the Y level.

The signal is clamped in TR212 and passes through TR213 and 214. With BLK mixed from TR215 (VR13 setup level), the SYNC signal is mixed from TR216 (VR14 SYNC level). The signal passes through inverter amplifiers TR217, TR218 and TR219 and through the LPF (R259, C225, 226 and L205). One of the TR221 emitter output signals returns to the camera as the return video signal after passing through the emitter follower in TR222, while the other is overlapped in TR223 with the CHROMA signals from the DMB (Double Balanced Modulator) and outputted as the CAMERA OUT signal. In the -Y matrix circuit, each of the R, G and B signals is applied to the base in TR226, while the G channel signal is applied as GL through the LPF (L202, 203, C212, R230, 500 kHz).

Through inverter amplifier TR226, TR227 and TR228, one is made into B-Y in TR229 and sent to the DBM through the emitter follower in TR230, while the other is made into R-Y in TR231 and sent to the DBM through the emitter follower in TR232. The IC201 is a 2.5V regulator.

We shall now refer to the CHROMA modulation circuit. In the VT-150, the circuit is a ring modulation type, while the VT-400 employs the double balance difference amplifier which is a combination of two difference amplifiers with identical characteristics.

The SC (Sub Carrier) sent from the SSG enters into terminal ⑭. One of the TR244 emitter output signals passes through the emitter follower in TR246 and goes to the R-Y modulator (IC205), while the other enters the B-Y modulator (IC204) through the 90°PS (Phase shift) in L212, C268, TC201 and C269. VR18 and VR19 are used for carrier output zero point adjustment while the VR20 is used to adjust the R-Y amplitude. The CHROMA signal which is a mixture of R-Y and B-Y passes through the emitter follower in TR240 and enters the base of TR241.

When the CHROMA suppressor enters, the D208, 209 210 and 211 will be reversely biased so that no chroma signal will be available.

The signal passes through the LPF (L211, C260 and 261) and through the emitter follower in TR242, being overlapped with the Y signal already referred to.

Double Balance Difference Amplifier

- During period t_1, no signal is available and neither TR5 nor TR6 operate, with output nil.
- During period t_2, a positive signal is available and TR5 is positioned at ON. When TR1 and TR2 become dominant, the signal will be outputted.
- During period t_3, a negative signal is available and TR6 is positioned at ON. When TR3 and TR4 become dominant, the signal will be inverted by 180° and outputted.

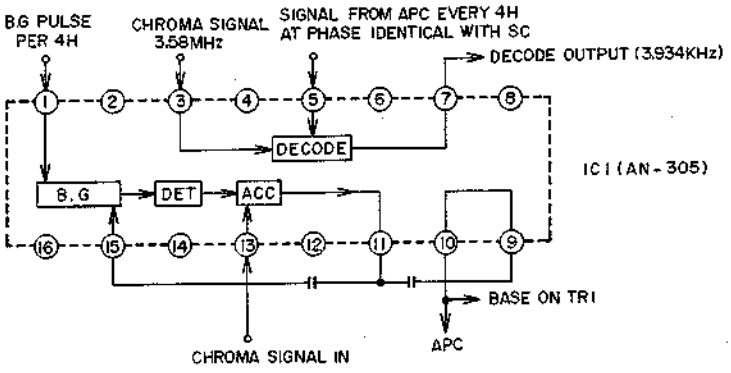

Fig. 3-13

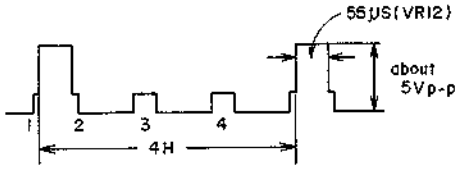

Fig. 3-14

3-1-3. CHROMA P.C BOARD

(1) Recording System

The video signal is supplied to terminal ④ and passes through the BPF (L1,2,3, C1,2 and 3). Then, the CHROMA signal alone enters ⑬ in IC1 (AN-305).

The CHROMA signal is ACCed and its outputs are delivered from ⑩. One of them enters the base on the TR6 and is sent to the APC. The other passes through the emitter follower in TR1 and the Y signal alone is made negative by the 1H DL comb type filter. This signal passes through TR16 and the LPF (L16, C78 and 80) and is taken out of the emitter follower in TR17. One enters as the E-E signal into the emitter in TR20 through VR9 (CHROMA level). In this emitter, the signal is mixed with the E-E Y signal and delivered as VIDEO OUT from the emitter follower in TR22. On the other hand, the TR17 emitter output enters ③ in the IC1 again. In ⑤, fsc' = 3.583479 MHz whose phase is identical with that of the burst signal enters every 4H and is decoded, being outputted from ⑦. After that, the signal passes through the LPF (L5, C17 and 18) and is carrier-set by VR2, with the frequency modulated in the TR4 and TR5 non-stable multi (900k ±300 kHz). Then, the signal passes through the LPF (L7, 8, C25, 26, 27 and 28) and is adjusted on a CHROMA recording level basis by VR3. The signal is mixed with the Y signal in the signal p.c board, going to the video head.

In the APC system, first of all, the E-E Y signal enters input terminal ⑮ in the IC5 (μPC570C) and is Sync-separated, with AFC carried out. Thus, the H sync is taken out at output ②, while 1/4 pulse (one pulse per 4 H) is taken out at TR27 and TR28 stable multi.

Thus, one of the TR29 collector outputs passes through the R167 and enters terminal ① in the IC1 and into the ACC burst gate.

The other TR29 collector output passes through TR30 and a BG pulse enters the TR6 burst gate circuit every 4 H. On the collector side, a burst signal is extracted every 4 H and compared in phase with 3.583479 MHz oscillated by the X-tal in the APC. Thus, from the TR9 emitter output, fsc' = 3.583479 MHz identical in phase with the burst signal enters ⑤ in the IC1, being decoded.

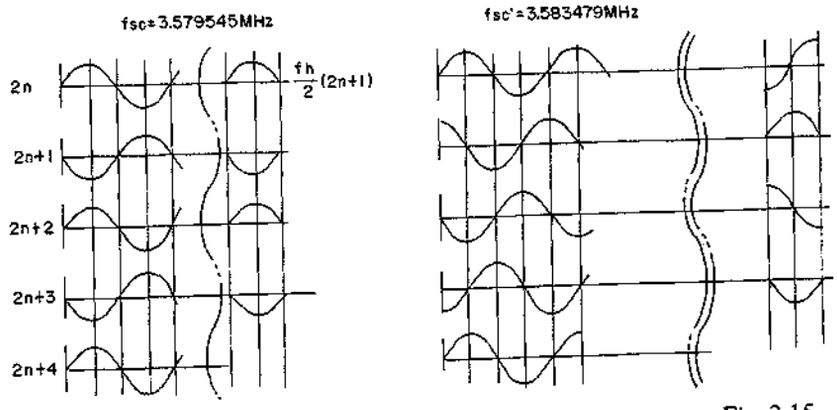

Fig. 3-15

	1H	2H	3H	4H	5H	6H	7H	---
(1) DETECTION AXIS	(B-Y)	(R-Y)	-(B-Y)	-(R-Y)	(B-Y)	(R-Y)	-(B-Y)

(6) (4)+(5)		B+jR	B+jR	B+jR	B+jR	B+jR	B+jR	

Fig. 3-16

- Since fsc' has a continuous 90° deviation every 1H, the phases will coincide between 2n and 2n+4. Therefore, the phases are compared every 4H in the APC.
- The modulation carrier in ③ is locked at 0° every four cycles with H Sync.
- From the above, it is apparent that the VT-400 has the following more advantageous features than those of the VT-150:
  1) ID pulse is not required.
  2) Carrier switch circuit (line switch) is not required.
  3) DC restoration is not required.

(2) Playback System

The PB FM IN signal enters terminal ⑧ and passes through the LPF (L9, 10, C49, 50 and 51). After that, the signal is limited in the IC3 (TA-7061AP), thus entering the demodulation circuit. Through differentiation transformer → D4 and D5 (both wave rectifier) → LPF (L12, 13, 14, C61, 62 and 63) and emitter follower in TR14, the signal enters ⑩ in IC4 (TA71589). The APC output whose phase has been compared with SC in X1 (3.583479 MHz) appears in ⑪. The signal is Double Balance Modulated in IC4 and the output is delivered from ②. One passes through the 1H DL Comb type filter while the other through C76 and R98, both being mixed again. After that, the signal is supplied to the TR20 emitter from the emitter follower in TR17 through the VR9 (CHROMA level).

On the other hand, the PB Y IN signal is supplied from terminal ⑥ and mixed with the CHROMA signal through the D7 and D8 noise reduction delay line (DL-2). After passing through the emitter follower in TR22, the PB Y IN signal is taken out as VIDEO OUT.

3-2. VC-400

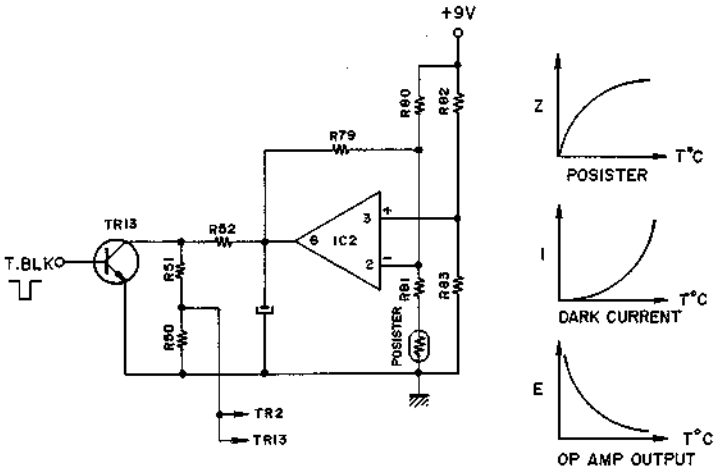

Fig. 3-17

3-2-1. MIC AMP P.C BOARD

The Mic Amp P.C Board is built in the camera head, with a gain of 40 ±3 dB in the IC1 (TA7120P), so as to heighten the signal to noise ratio.

3-2-2. POWER SUPPLY P.C BOARD

This P.C Board is composed of OP AMP IC1 (MC1741CP) and IC2 (μPC305C). The power transistor, which is liable to generate heat, is built in the video tape recorder body.

3-2-3. DEFLECTION 1 P.C BOARD

(1) G channel and RB channel signal systems

The G channel signal sent from the preamplifier is supplied to terminal ⑦ and enters the difference amplifier in TR1 and TR2. A voltage proportional to the OP amplifier output in the dark current compensator circuit is applied to the base in TR2 only during the BLK period, thus determining the gain of TR2. Consequently, TR2 has a constant video output.

Subsequently, the signal enters the difference amplifier in TR3 and TR4 and has the gain adjusted in VR1 (2 kB), with the setup level zeroed in VR2 (10k). After that, the G channel signal passes through the emitter follower in TR5 and is sent as G OUT to the SSG.

At the same time, the G channel signal serves as the input signal of the automatic aperture circuit. The RB channel has the same circuit composition as mentioned above.

Dark Current Compensator Circuit

TR13 is positioned at OFF during the BLK period only.

A voltage proportional to the OP AMP output appears at the center (E_V) between R51 and R50 so as to determine the gain of TR2 and TR12 during the BLK period. Since E_V is therefore as shown in Fig. 3-17, TR2 and the TR12 have a constant VIDEO OUT.

(2) HD/VD Separator and C BLK Circuit

The HD and VD signals, which are supplied from the SSG as mixed, must be separated.

The HD signal appears at TP-1 through TR21 and TR22, while the VD appears at TP2 through TR23. Since the width of these pulses is narrow, however, they may be determined to the BLK width by the Mono Multi of the IC3 (NOR 11-12-13, 8-9-10).

Subsequently, the HD and V BLK enter into ⑤ and ⑥ in IC3 (NOR 4-5-6), respectively, and are mixed, so that the COMP BLK enters TP-3.

The COMP BLK is also supplied to the cathodes in G and C tubes through TR17 and 18.

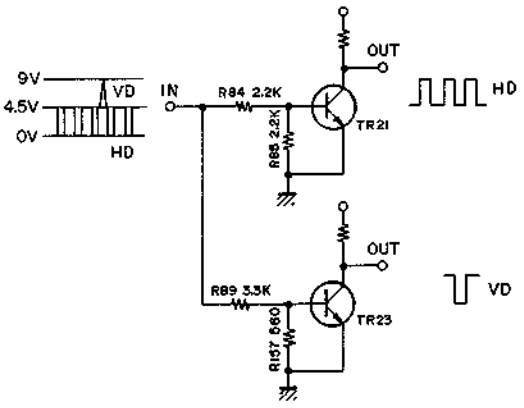

Fig. 3-18

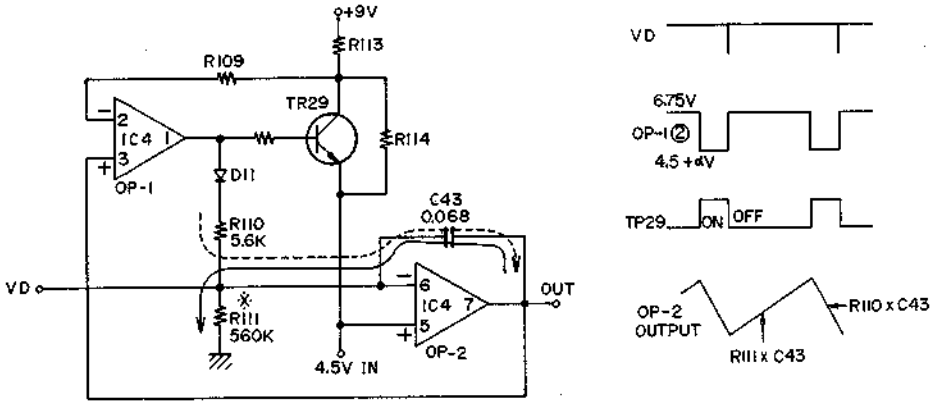

Fig. 3-19

HD/VD Separator Circuit

When no signal is in the circuit (4.5V), TR21 and the TR23 are kept at the ON and OFF positions, respectively. Only when the HD pulse enters, the inverted HD pulse can be taken out at the output terminal of TR21. Only when the VD pulse enters, likewise, can the VD pulse be taken out at the output terminal of TR23.

(3) Vertical Deflection Circuit

This is a Miller integrated circuit of the OP AMP IC4, producing a saw tooth wave of high linearity. This wave is supplied to terminal ⑫ (G channel) in output circuit OP AMP IC4 and to ⑩ (RB channel) in the IC4, thus flowing to their respective vertical yokes. The OP AMP IC5 (5-6-7) is a 4.5V regulator.

On the other hand, the saw tooth wave output passes through the OP AMP IC6 (1-2-3) inverter circuit and is also supplied to the vertical shading compensator circuit (VR12 and 13).

The VR11 is a skew compensating control, supplying the saw tooth wave signal to the Def 2 through the output circuit of the OP AMP IC5 (1-2-3).

Vertical Oscillator and Saw Tooth Wave Generator Circuit

If input ⑤ in OP-2 is higher than ⑥, output ⑦ will be at the H level, thus charging C43. With output ⑦ connected to input ③, input ② has a voltage of 6.75V with TR29 positioned at OFF. When this level is exceeded the input ③, output ① in OP-1 will be at the H level.

TR29 will be positioned at ON, lowering input ② in OP-1 and holding it at 4.5V +αV. Through D11 and R110, input ⑥ in OP-2 will be at the H level while output ⑦ will be at the L level.

C43 will discharge and when output ⑦ in OP-2 becomes lower than the OP-1 input ② of 4.5V + αV., output ① in OP-1 will be at the L level. With TR29 and D11 positioned at OFF, input ⑥ in OP-2 will be at the L level and will start charging C43 at output ⑦. The trigger, meanwhile, enters input ⑥ in OP-2.

(4) Automatic Aperture Circuit

- The G channel signal is clamped in TR6 and detected in D1 to remove the presser effect. At the same time, the signal is smoothed in R25 and C12 so as to avoid a peak detection (mean detection) and is made to enter input 6 in the OP AMP IC1.
- The motor is connected between output ⑦ in the OP AMP IC1 and output ①, that is, inverted and amplified output ⑦.
- The sensitivity is changed over by heightening and lowering the DC level of ⑤ (non-inverted input) in the OP AMP IC1 by use of an external change-over switch.
- Now, assume that there is only a small amount of incident light. Then, input ⑥ in the OP AMP IC1 is at L while output ⑦ is at H, thus positioning TR7 at ON. With input ② in the OP AMP IC1 at H, output ① will be at L, thus positioning TR10 at ON. In the motor, the electric current flows in the order of +B → TR7 → Ⓜ → TR10. When the aperture is opened, the IRIS switch will be positioned at ON. With D4 at ON, the OP AMP IC1 (1-2-3) will have no gain, thus stopping the motor. An increase in incident light under the above-mentioned conditions will position D4 at OFF. If the switch is positioned at ON, the OP AMP IC1 (1-2-3) will have gain, thus causing the motor to start running.

(5) VC-400 Block Diagram (DEF 1)

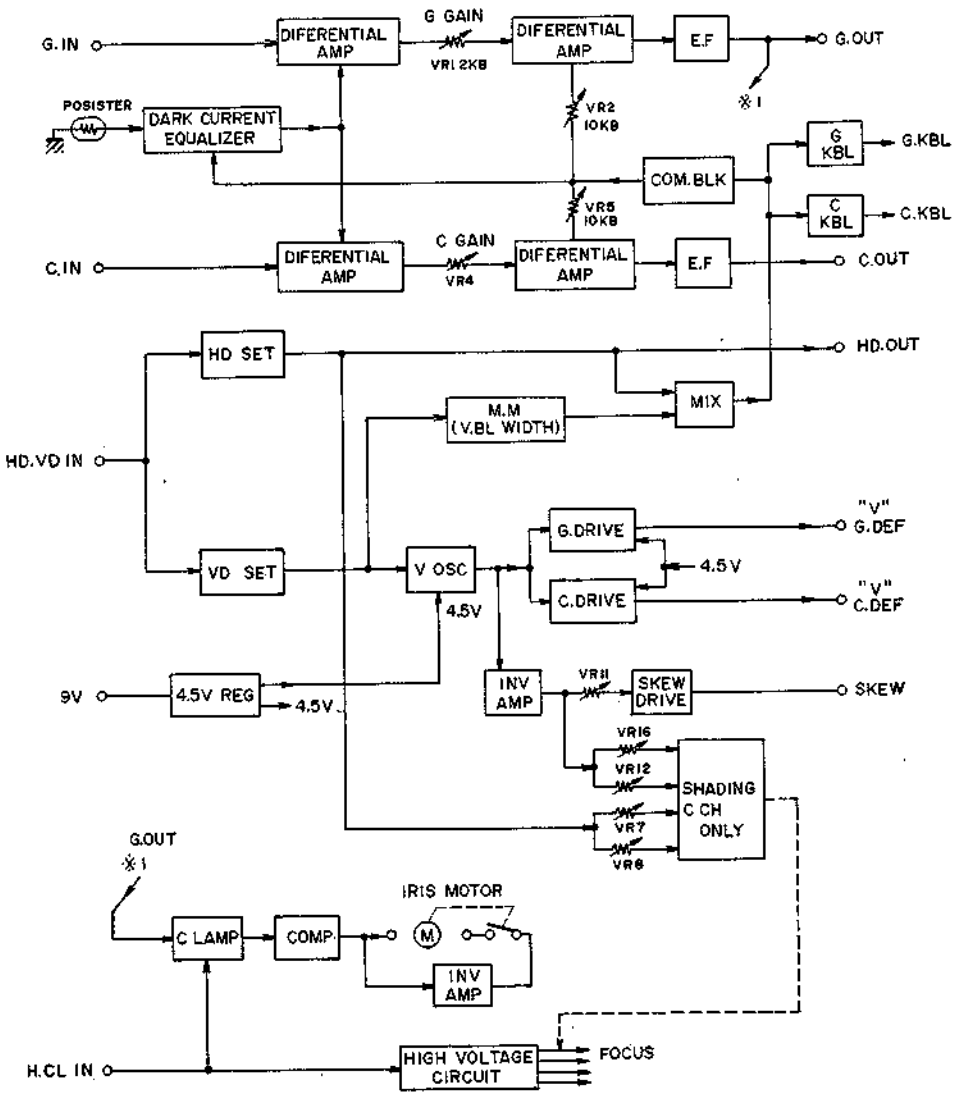

Fig. 3-20

IV. ADJUSTMENT

4-1. VT-400

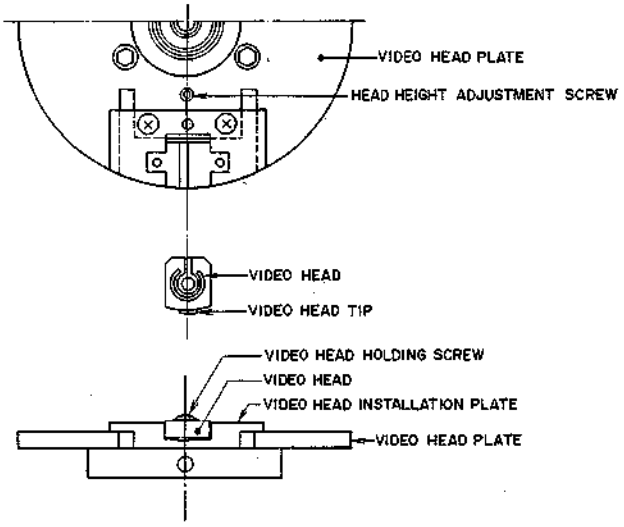

Fig. 4-1

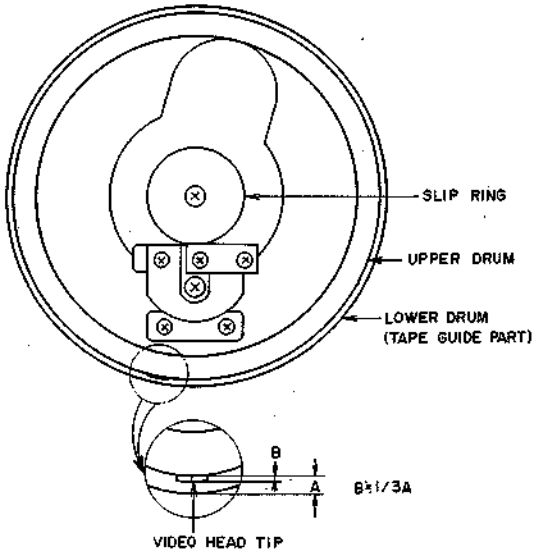

Fig. 4-2 Top View of Video Head Block

4-1-1. VIDEO HEAD ASSEMBLY ADJUSTMENT

(1) Video Head Replacement (Refer to Fig. 4-1)

Replace the video head following the procedure described below.

1) Remove the head metal shield.
2) Disconnect the two lead wires from the video head.
3) Remove the video head holding screw.
4) Remove the video head by lifting it with tweezers and then pulling it towards the center of the drum.
5) Hold the new video head being installed with tweezers and insert it into the video head installation plate while taking care to prevent the video tip from touching the drum.
6) Temporarily fix the video head with the holding screw.

(2) Head Tip Protrusion Adjustment

To accurately perform the video head tip protrusion adjustment, it is necessary to use a video head adjustment microscope. If this microscope is not available, the adjustment can be carried out as follows. Using a magnifying glass (for example, the VF-300 lens), view the video head block from above as shown in Fig. 4-2 and adjust the video head tip protrusion until B ≒ 1/3 A.

For adjustment, loosen the video head retaining screws and adjust by shifting the video head gradually.

NOTE: The tape guide (i.e. A in Fig. 4-2) should be approx 200μ and the video head tip protrusion approx. 60 to 70μ above the upper edge of the lower drum.

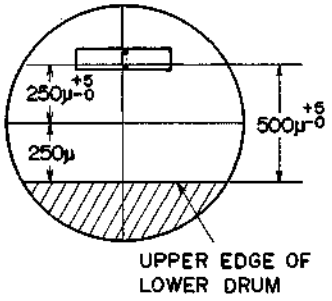

Fig. 4-3

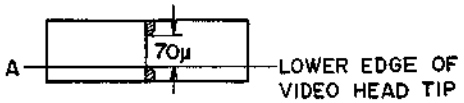

Fig. 4-4

(3) Video Head Height Adjustment

1) View the video head through the microscope and align the transverse axis of the microscope scale with the upper edge of the lower drum.
2) Adjust the microscope until the upper edge of the lower drum is 250μ below the center of the microscope scale as shown in Fig. 4-3.
3) Adjust the head height adjustment screw until the height of the R channel video head (to which red leads are connected) is 250μ as shown in Fig. 4-3. The video head is shown in Fig. 4-4. Be sure to align A with the 250μ level.
4) Turn the video head and adjust the height of the Y channel head (with yellow leads) as in step 3-4).

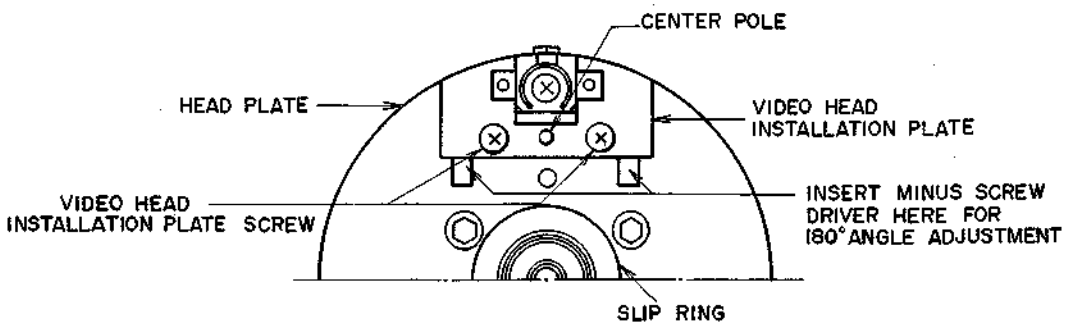

Fig. 4-5

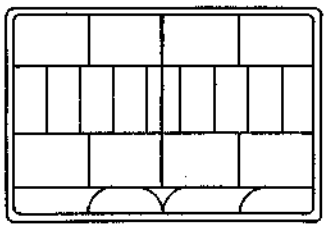

Fig. 4-6

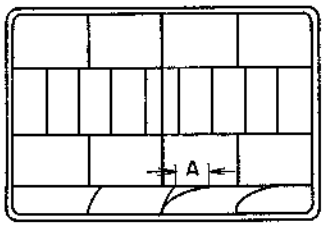

Fig. 4-7

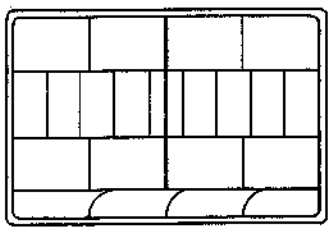

Fig. 4-8

(4) **180° Angle Adjustment**

If vertical lines at switching points are as shown in Fig. 4-6 and 4-7 when playing back a reference tape, the 180° angle adjustment of the video head is incorrect and readjustment is necessary. Adjust as follows:

1) Loosen the two video head installation plate screws on the Y channel head and tighten them temporarily to 1 kg using a torque screwdriver.
2) Insert a ⊖ screwdriver into the gap under the video head installation plate or the head plate and turn the screwdriver slightly.
3) If the video head angle is modified, playback the reference tape and ascertain that only one vertical line appears at a switching point as shown in Fig. 4-8. If the line is still as shown in Fig. 4-6 or Fig. 4-7, readjust the angle. If portion A in Fig. 4-7 is 1.5 cm on a 1.9 inch monitor TV, no readjustment is required.
4) When the vertical line at a switching point is composed of a single line as in Fig. 4-8 or portion A in Fig. 4-7 is within 1.5 cm, the 180° angle adjustment is displaced incorrectly by 1H if the upper part of the picture sways or the BLK line is 1H too much or too little at the beginning or end of the V BLK on the monitor TV. If this is the case, readjust until the phenomenon is eliminated. After adjustment, tighten the screws to 1.5 kg using a torque screwdriver.

NOTE: On the AKAI cassette VTR reference tape, one frame each is recorded for the right half and the left half of the picture. Therefore, if the 180° angle adjustment is incorrect (Fig. 4-6 and 4-7), there are two vertical lines in the center of the picture but one line each on the right and left.
(The right and left halves of the picture are recorded through the Y-channel video heads respectively.)

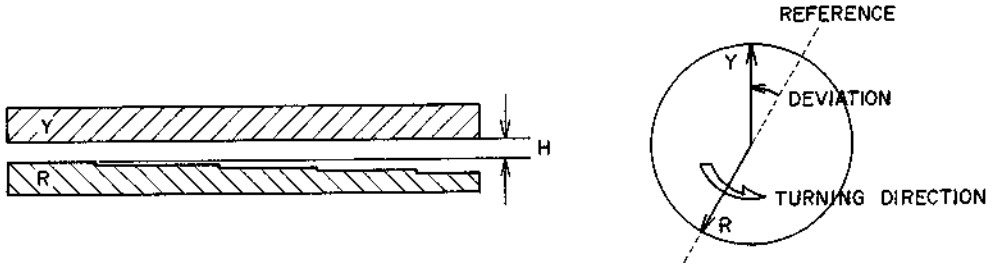

Fig. 4-9

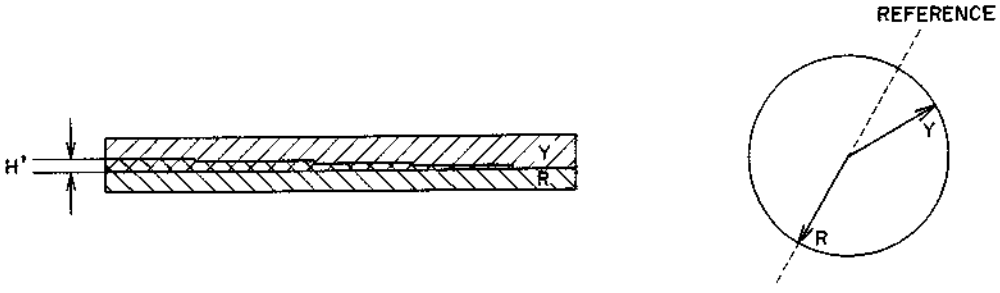

Fig. 4-10

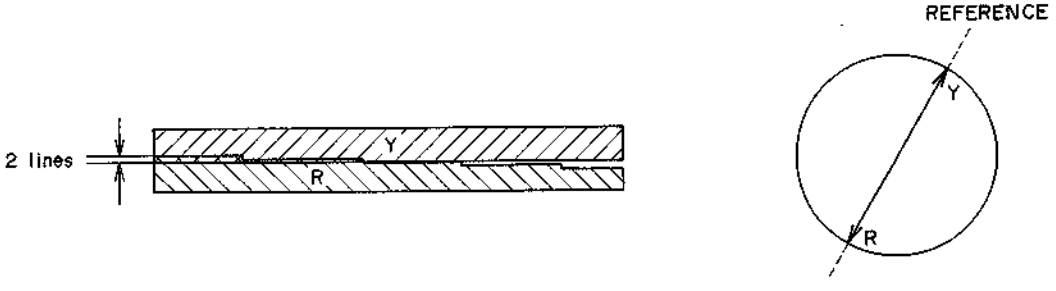

Fig. 4-11

For Reference:
The H alignment signal is recorded on the reference tape provided with the VT-400. It can be conveniently used for the 180° angle adjustment of the video head.

(1) On the VT-400, alignment is made by using the R head as the reference as in the case with conventional VTRs. That is, the Y head must be moved to achieve alignment.

(2) If the Y head has gone beyond the reference, H lines of the white signal appear on the monitor TV as the H alignment signal as shown in the figure below.

(3) If the Y head is behind the reference, BLK of H lines appear on the monitor TV as the H alignment signal.

(4) If the Y head is just on the reference, 2 lines of the H alignment signal at the R portion is overlapped on the Y portion.

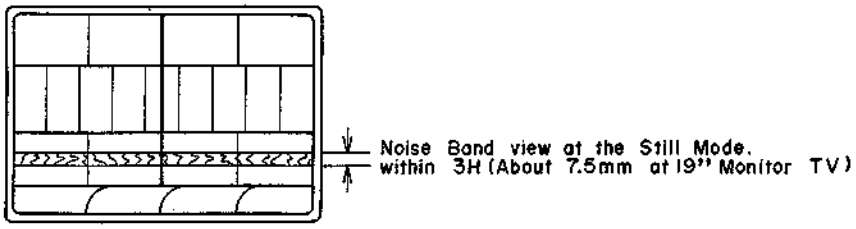

Fig. 4-12

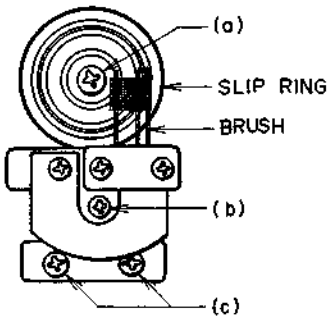

Fig. 4-13

(5) Video Head Height Confirmation

When head height and 180° angle adjustments are complete, confirm the head height as follows.

1) Playback the reference tape in the Still mode and confirm that the noise bandwidth shown in Fig. 4-12 is within 3H (approx 7.5 mm).
2) When the noise bandwidth is over 3H (approx. 7.5 mm), the R-channel and Y-channel video head heights are incorrect. If so, fine-adjust the height of the Y-channel video head, while viewing the screen, until the noise bandwidth is within 3H. However, the noise bandwidth varies slightly according to the tape position. First, find the tape position which permits the widest noise band, and then ascertain that the bandwidth is within 3H.
3) Connect an oscilloscope to TP-5 on the PZ Signal P.C Board (PY-5400) and playback the reference tape so that an RF envelope wave can be seen.
4) Turn on the tracking VR control and turn it gradually to ascertain that the RF envelope wave becomes larger and smaller symmetrically. If the waveform is not symmetrical, the heights of the two video heads are incorrect. If so, readjust the video head height.

(6) Slip Ring and Brush Adjustment

1) Mount the slip ring using screw (a) in Fig. 4-13 in a position which ensures correct and smooth rotation of the ring.
2) Secure the brush using screw (c) in Fig. 4-13 in such a way that the end of the brush is aligned with the groove in the slip ring.
3) When the end of the brush comes into contact with the slip ring, turn screw (b) by one fourth of a turn.
   This positions the brush correctly.
   However, if brush noise appears on the monitor TV, fine-adjust screw (b).

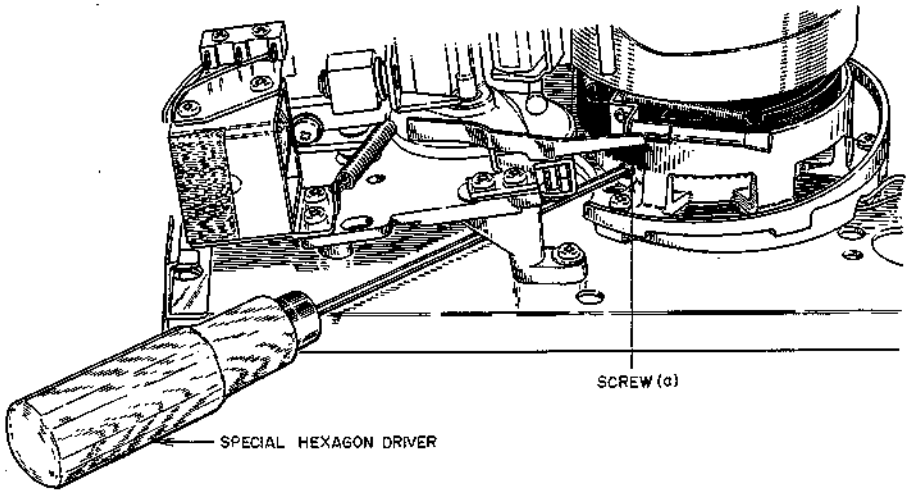

Fig. 4-14

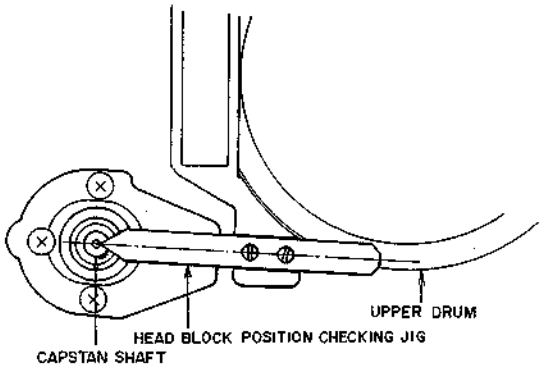

Fig. 4-15

(7) Video Head Block Positioning Adjustment

If the drum holder is removed from the video head block, positioning adjustment will be necessary. Adjust as follows.

1) Remove the Chroma P.C Board and Process and Encoder P.C Board with the metal holder for p.c board and a shield plate from VT-400.
2) Remove the video head block from the VT-400.
3) Remove the gear motor from the drum holder.
4) Remove two of the three 2 mm hexagon screws retaining the drum holder and tighten screw (a) in Fig. 4-14 provisionally.
5) Install the video head block.
6) Shift the head block by hand until the end of the head block position checking jig is aligned with the center of the capstan shaft as shown in Fig. 4-15.
7) After they are correctly positioned, tighten screw (a) only tighten by hand using the special hexagon screwdriver shown in Fig. 4-11.
8) Remove the head block again and tighten the three 2 mm hexagon screws on the drum holder using an ordinary hexagonal wrench.
9) Install the head block and ascertain that positioning is correct as shown in Fig. 4-15.

CAUTION: Avoid using the special hexagon screwdriver to remove 2 mm hexagonal screws fixing the drum holder. The special hexagon screwdriver has limited strength. Use it exclusively for tightening screws by hand in step 7).

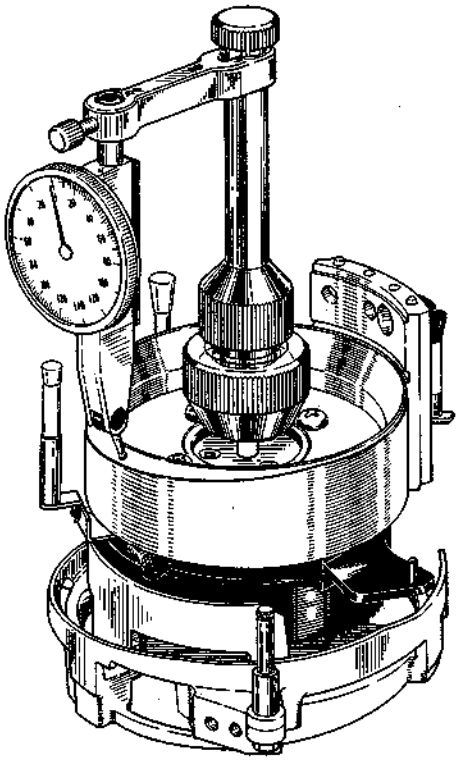

Fig. 4-16

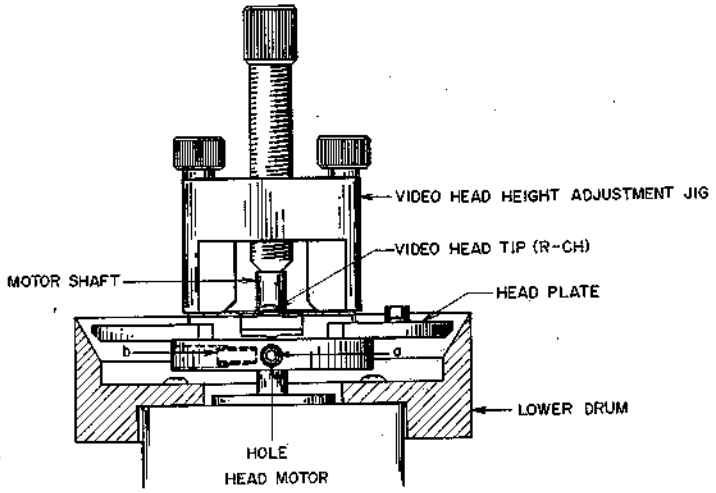

Fig. 4-18

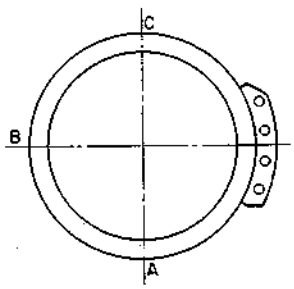

Fig. 4-17

(8) Drum and Head Plate Adjustment

1) Lower Drum Adjustment

a) Mount the lower drum on the drum support with its base fitting completely. Check by fitting a razor blade, etc. onto the bottom of the drum support and lower drum. The three screw holes for fixing the drum support have a small play to the right and left. Tighten the screws in the center of each hole.

b) Mount the lower drum on the drum motor and tighten the four screws provisionally.

c) Use a dial gauge, adjust until point B is within $+5\mu/-0$ from points A and C, then secure the lower drum by tightening the four screws inserted in step b).

2) Head Plate Height Adjustment

a) Fit the video head height adjustment jig to the head plate.

b) Mount the head plate on the motor shaft as shown in Fig. 4-18.

c) Using a microscope and the video head height adjustment jig, adjust until the head plate is 500μ above the upper edge of the lower drum.

d) Bring the R-channel video head to the hole in the lower drum.

e) Tighten the 1.5 mm hexagon screw (a) in Fig. 4-18.

f) Tighten another screw (b) (1.5 mm hexagon screw) located on the opposite side of the R-channel head, 90° counterclockwise from the head plate.

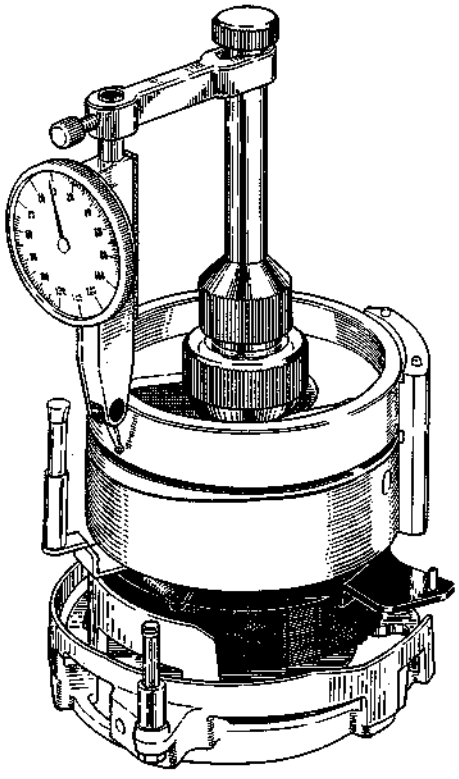

Fig. 4-19

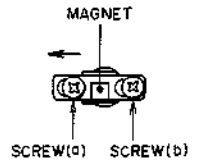

Fig. 4-21

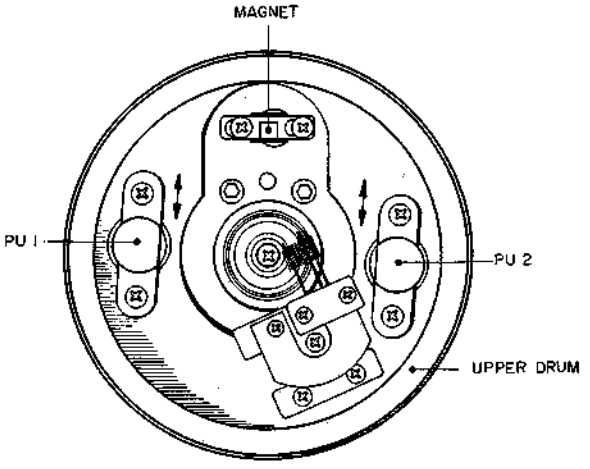

Fig. 4-22

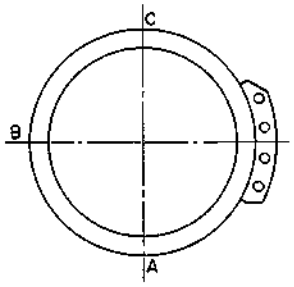

Fig. 4-20

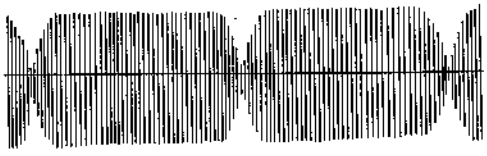

Fig. 4-23

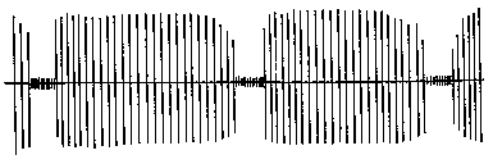

Fig. 4-24

3) Upper Drum Adjustment
   a) Mount the upper drum on the drum support. Take great care not to touch the video head. Ascertain that the upper drum runs level with the upper side of the drum support.
   b) Ascertain that points A and C are within -15μ $\pm 5\mu$ from point B in Fig. 4-20 and errors at points A and C are within 3μ.
   c) If not, adjust the play of the three screws on the upper side of the drum support. If this still fails to obtain the correct relationship between points A, B and C, adjust by inserting a piece of audio tape in the gap between the drum support and the upper drum.

   NOTE: The tape width varies according to the type of the tape. Choose a suitable one.

(9) Magnet and PU Head Adjustment
1) Turn the magnet fully counterclockwise and secure it by tightening screws (a) and (b) as shown in Fig. 4-21 and Fig. 4-22.
2) Connect an oscilloscope to the test point TP-5 on the PZ Signal P.C Board and view the waveform while playing back a reference tape.
3) If the waveform at TP-5 has no signal elements as in Fig. 4-24, adjust the positions of the two PU heads until signal elements are included as in Fig. 4-23.

4-1-2. P.C BOARD LOCATION

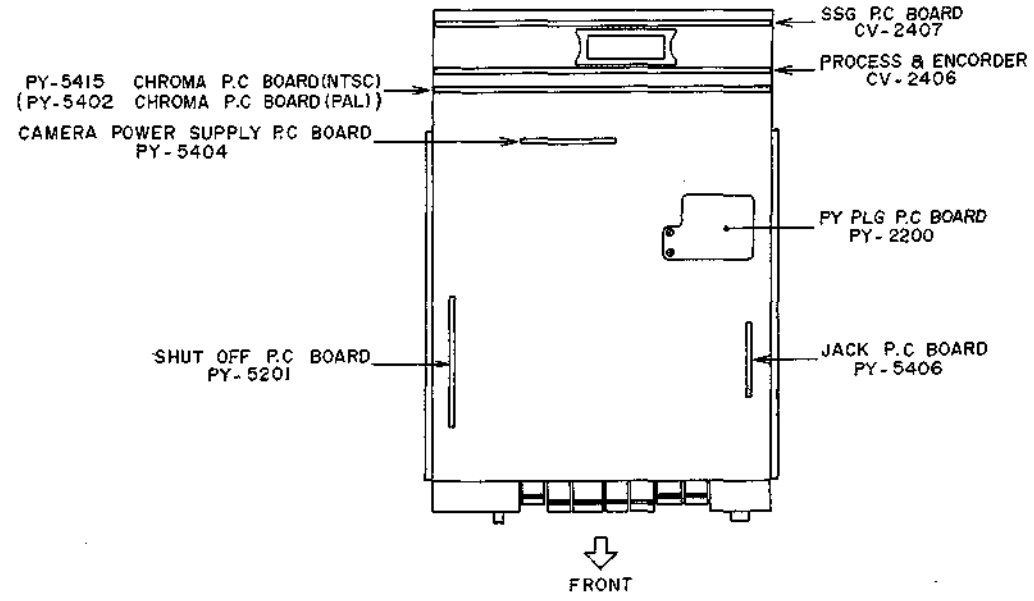

Fig. 4-25 Top View

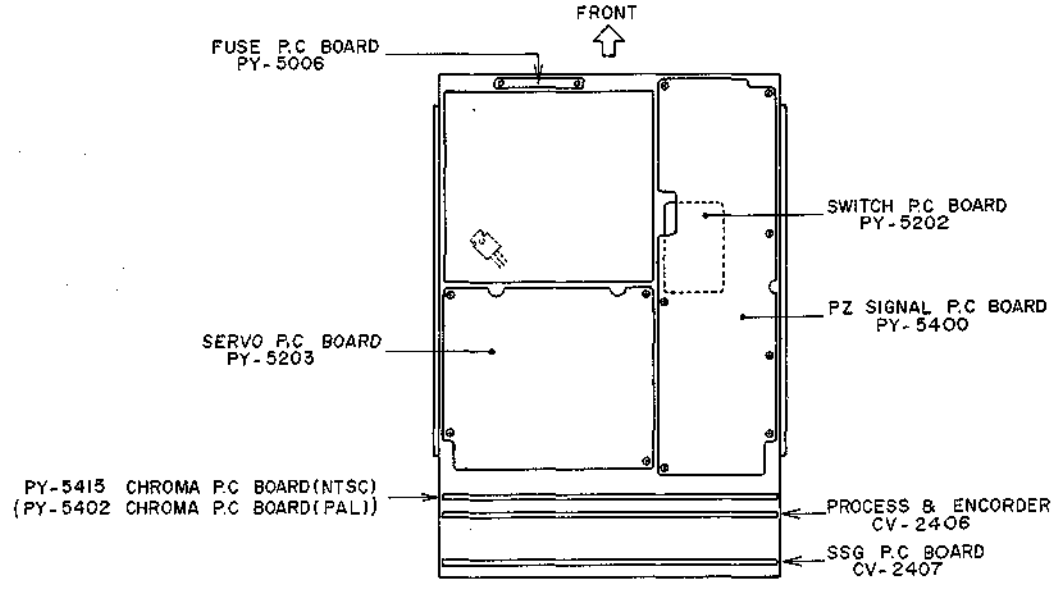

Fig. 4-26 Bottom View

4-1-3. SERVO P.C BOARD (PY-5203)

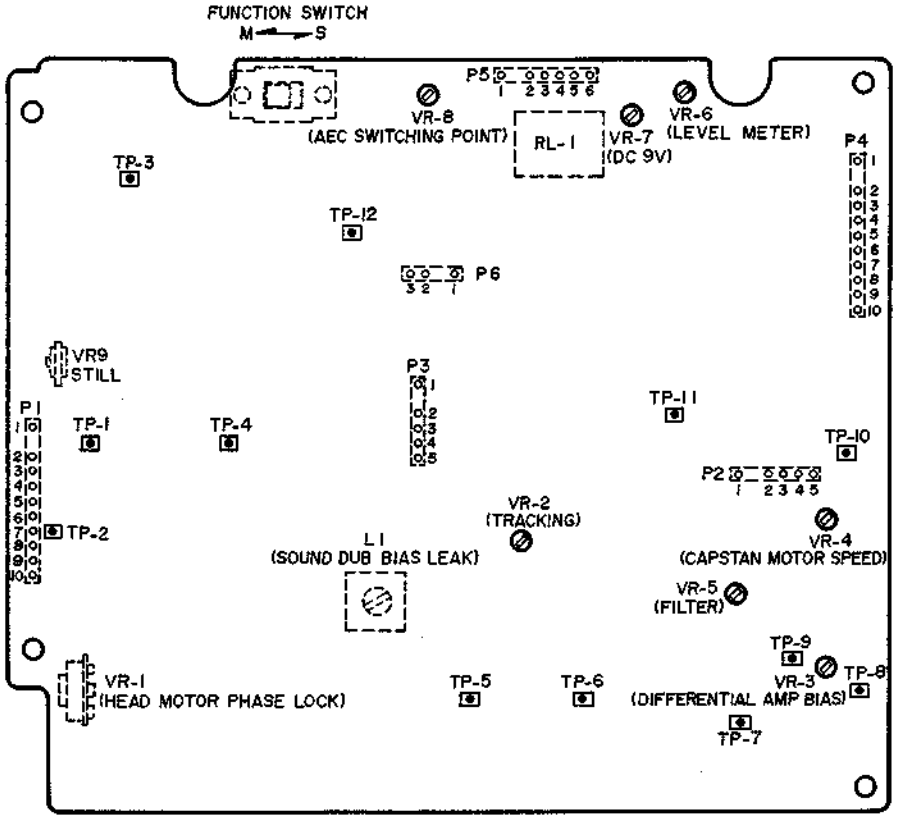

Fig. 4-27 Servo P.C Board (PY-5203) (Pattern side view)

* Set to Function Switch to "S" position.

Step	Adjustment Item	Test Point	Adjustment Parts	Mode	Result
1	DC12V	P4 ⑥	VR1 (300B) of VA-300	E-E	DC12V ±0.02V
2	Battery Checker	TP-12	VR7 500B	E-E	DC10V ±0.1V
		Level Meter	VR6 500B		Meter needle Points to a Position between red and white zone.
3	DC9V	TP-12	VR7 500B		DC9V ±0.1V
4	PU Head Output	TP-1 TP-2	Confirmation	E-E	5	Head Motor Phase Lock	TP-3 TP-4	VR1 2 kB	E-E	 (NOTE 1)

Step	Adjustment Item	Test Point	Adjustment Parts	Mode	Result
6	Differential Amp Bias	TP-8 TP-9	VR3 200B	PB (Reference Tape)	 Adjust the DC voltage of TP-9 to the center of TP-8 wave.
7	Filter	TP-11	VR5 10 kB	PB (Reference Tape)	Make the flat waveform as near to DC as possible and obtain the minimum voltage possible.
8	Capstan Motor Speed	TP-10	VR4 20 kB	E-E	Connect Frequency Counter to TP-10. US: about 866 Hz CCIR: about 848 Hz (NOTE 2)
9	Tracking	TP-3 TP-6	VR2 50 kB	PB (Reference Tape)	10	Sound Dub Bias Leak	TP-5	L1 22 mH	Sound Dub	Adjust Bias leak to minimum.
11	AEC Switching Point	IC1.⑥ (PY-5203) TP-4 (PY-5022)	VR8	E-E Rec	 T: 15.5 ms ±0.5 ms (US) T: 19.0 ms ±0.5 ms (CCIR) (NOTE 3)
12	Still	Monitor TV	VR9	Still (Reference Tape)	 Adjust to minimum blur between color and color on monitor TV.

NOTES:
1. For the last stage of this adjustment, adjust VR-1 (2 kB) until the switching point is 7.5H from the V sync.
2. This is an electrical speed adjustment.
   Finally, set the Function Switch to "M", playback a US 1,000 Hz standard tape and adjust VR4 (20 kB) until the output is within 993 to 1,003 Hz (US) and 977 to 986 Hz (CCIR).
3. The recording current increases only once after the recording power is turned on. If the increase is to be checked again, turn off the power, then turn it on again. The increase waveform can be seen only once on the oscilloscope at the moment when the recording starts in the E-E mode.

4-1-4. SSG P.C BOARD (CV-2407)

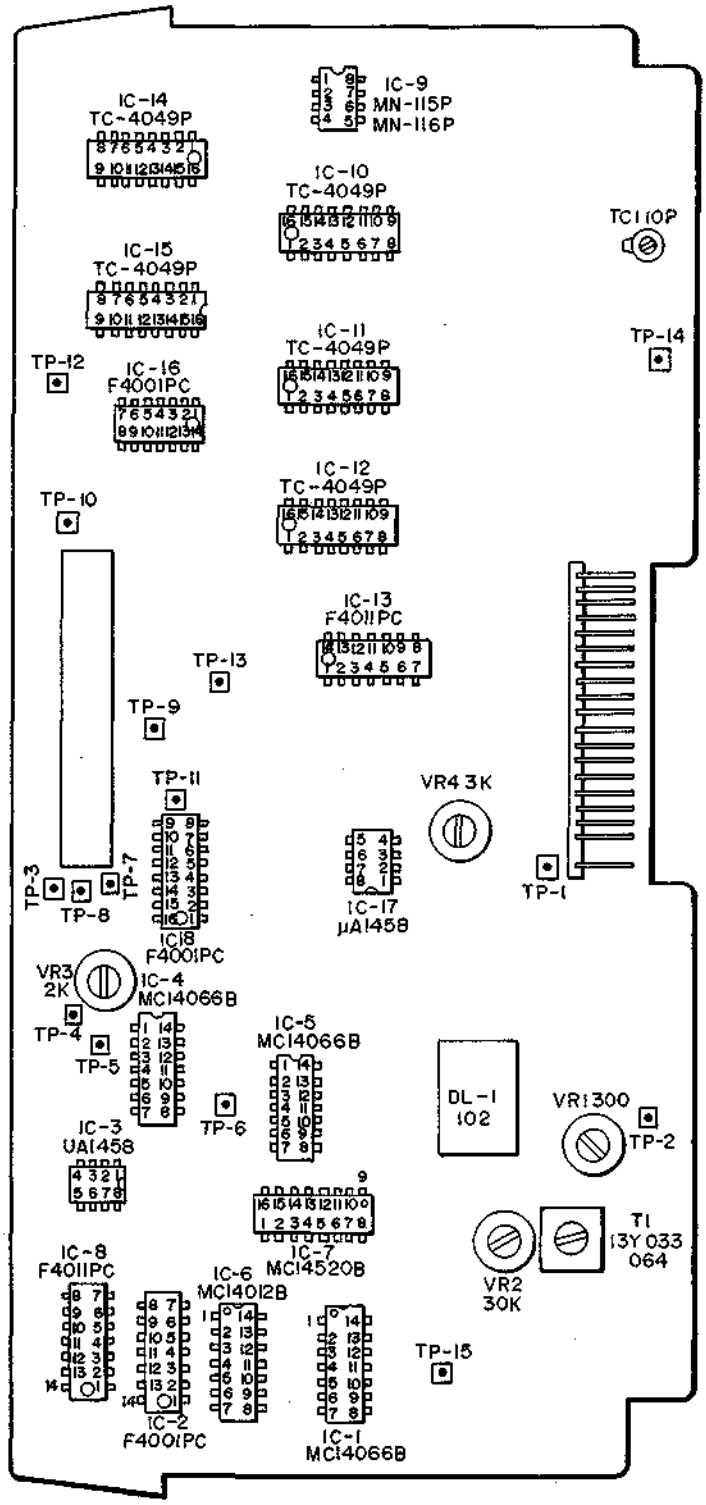

Fig. 4-28

NOTE: If the camera head does not function properly, adjust the camera head and then perform the SSG adjustment.

Step	Adjustment Item	Test Point	Adjustment Parts	Mode	Description	Result
1	PB input checking	TP-1		E-E	○ 300°K, 2000 Lux and grey scale. ○ Adjust the level with the VR on the camera head DEF 1. ○ Initial set-up should be "zero". (Adjust the camera head if necessary)	2	G input checking	TP-8		E-E	Same as step 1.	
3	Blue level	TP-2	VR1	E-E	① Picture the grey scale. ② Set the aperture ring according to step 1. ③ Adjust the level of TP-2 to 3Vp-p.	
4	Checking of blue demodulation output	TP-15			After adjusting VR1 by carrying out step 3, make sure that the output of TP-15 is 0.55p-p. (use the grey scale.)	5	-B/2 adjustment	TP-16	VR2	E-E	① Picture the color bar pattern. ② By moving VR2, change the waveform shown in the figure below into that shown in the "Results" column. ③ The pattern as shown below should be pictured on the monitor TV.  TP-16 BEFORE ADJUSTMENT TP-16 before adjustment	Make adjustment so that the levels of cyanogen, green and blue come as near to the zero level as possible. In particular, the blue level should be brought nearest to the level.  TP-16 AFTER ADJUSTMENT TP-16 after adjustment

Step	Adjustment Item	Test Point	Adjustment Parts	Mode	Description	Result
6	Chroma-Suppress	TR16 Base (Red) TR17 Base (Blue)	VR3	E-E	① Set the zoom to the widest position. ② Picture a fluorescent lamp on the monitor TV. ③ When the aperture is gradually opened by manual, the level of TR17 falls due to suppression of beam after reaching the peak. ④ Fix the aperture when the level of TR17 has reached about half of the peak level. ⑤ Using VR3, set the DC level of TR16 to the point at which the peak level of TR16 exceeds the blue peak level a little. NOTE: Use the oscilloscope in the DC mode.	7	Checking of white balance reset signal	IC8 ③		E-E	Depress and then release the white balance switch and ascertain that the result pulse as shown in the figure is transmitted.	8	Checking of clock pulse	IC8 ⑩		E-E	While depressing the white balance switch, make sure that the clock pulse as shown in the figure is sent out.	9	Checking of normal level estimation	IC3 ⑦ (Red) IC3 ① (Blue)		E-E	When the automatic white balance adjustment is over, the levels of IC3 7 and IC3 1 are changed over from 2.0V to 8.2V.	8.2VDC

4-1-5. PROCESS AND ENCODER P.C BOARD (CV-2406)

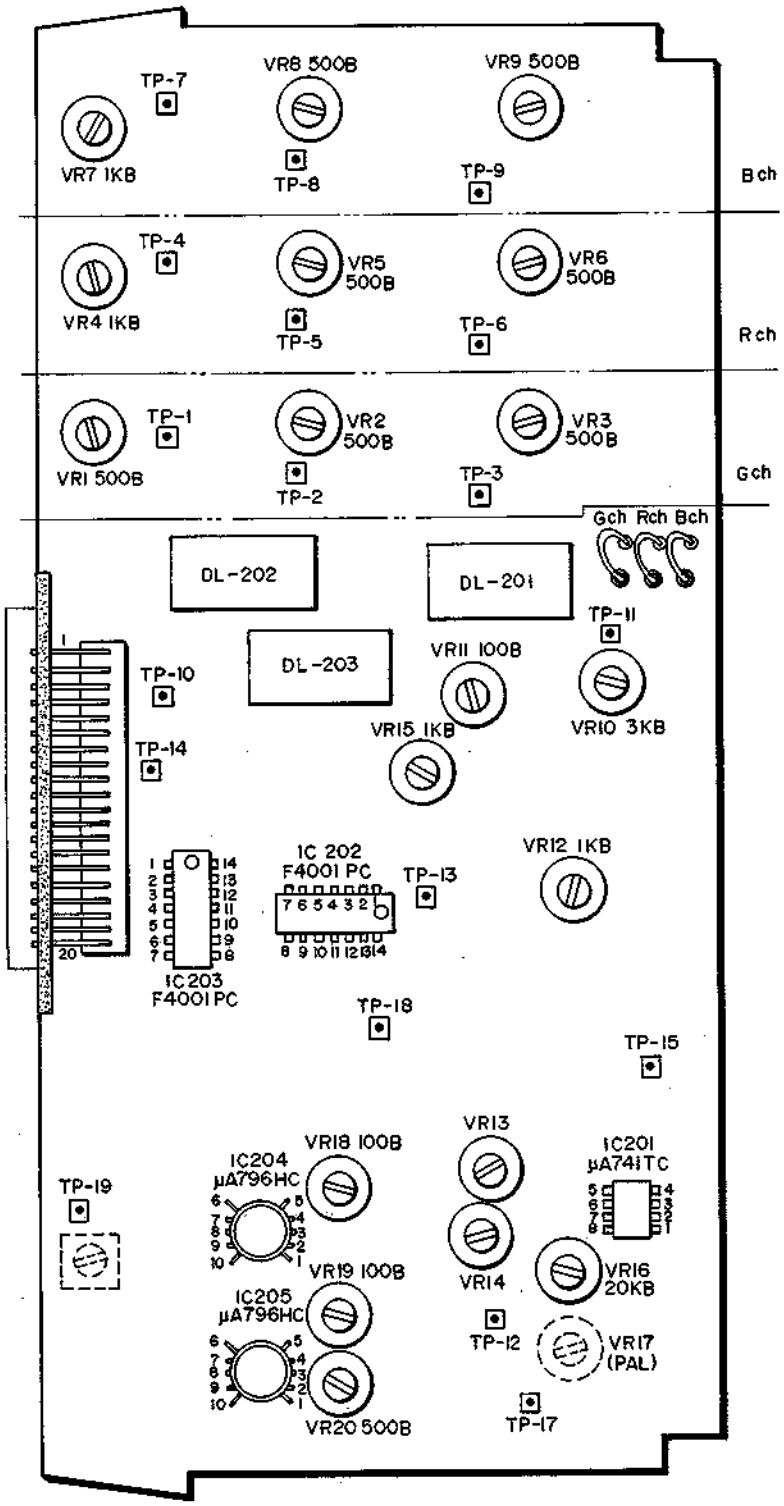

Fig. 4-29

(1) Process Section

Step	Adjustment Item	Test Point	Adjustment Parts	Mode	Description	Result
1	Input level	TP-1(G) TP-4(R) TP-7(B)	VR1 VR4 VR7	E-E	① Use the 2,000 Lux grey scale. ② Adjust the aperture ring, so that the level of G channel on SSG becomes 500 mVp-p. ③ Adjust the each volume, so that the output of each test point become 450 mVp-p.	2	White compression and white clip	TP-2(G) TP-5(R) TP-8(B)	VR2 VR5 VR8	E-E	① The conditions are same as step 1. ② Set the DC level to 7V with VR2, 5 and 8. ③ Ascertain that the grey scale "white" is set to 3Vp-p. Carry out readjustment by performing step 1 if necessary.	3	Checking of operations of white compression and white clip	TP-2(G) TP-5(R) TP-8(B)		E-E	① Use the 2,000 Lux grey scale. ② Open the aperture on the camera to set the levels of TP1, 4 and 7 to 1Vp-p. ③ In this condition, make sure that the waveform conforms to the figure given. Level(A): Starting point of white compression. Level(B): Starting point of white clip.	4	Set-up	TP-3(G) TP-6(R) TP-9(B)	VR3 VR6 VR9		① Same as step 1 above. ② Using each VR, set the set-up level to zero.	
Step	Adjustment Item	Test Point	Adjustment Parts	Mode	Description	Result
5	Fine adjustment of white balance	Video out	VR1 to VR9		① Same as step 1 above. ② Perform fine adjustment with VR of each channel by using the G-channel as standard so that the sub-carrier of the video output signal comes. ③ Make sure that the sub-carrier is set to "0" even when the aperture is opened.	
(2) Encoder Section

1) Adjustment with color bar signal

Step	Adjustment Item	Test Point	Adjustment Parts	Mode	Description	Result
1	Checking of −Y signal	TP-15		E-E	① Disconnect the jumper wires from the encoder input (R, G and B) terminal. ② Sent R, G, B (2Vp-p) to the terminal and from ACB-1. (ACB-1 is a special color bar generator of AKAI made) ③ Ascertain that the waveform confirms to the figure given in the "Results" column.	2	Burst level	TP-16 TP-17	VR16 VR17 (PAL)		① Set the burst level to 0.2V with VR16. ② Make sure that all the other waveforms are similar to that shown in the figure. ③ Ascertain that the off set corresponding to the white portion is below 15mV. (Take care because the offset of the white portion becomes great when there is a difference in the test signal levels.)	 3	Sub-carrier level	TP-19	T-202	E-E	Make adjustment so that the amplitude of the sub-carrier becomes maximum.	
Step	Adjustment Item	Test Point	Adjustment Parts	Mode	Description	Result
4	Carrier balance	TP-18	VR18 VR19		Make adjustment so that the carriers at the white and BLK portions become zero.	
5	Amplitude of R-Y modulated wave		VR20	E-E	① Perform adjustment with each VR/TC so that each bright point lies within " ⊞ " on the vectorscope. ② By moving T-202, make adjustment so that the transient characteristic from each dot to dot become linear. (The vectorscope must be set to the 100% range.)	6	Phase of B-Y modulated wave		TC-201	E-E		
7	Chroma level		VR15	E-E		
8	Video-out	TP-14	VR12 VR14 VR13	E-E	ⓐ Adjust the Y level with VR12. ⓑ Adjust the sync level with VR14. ⓒ Adjust the set-up level with VR13. ⓓ Check the DC level.	9	Aperture correction	TP-10	Checking	E-E	Make sure that the level of the color bar test signal for G channel is 1/4 of that of the input signal. G_H = 0.5V	
		TP-11	VR11	E-E	Using VR11, adjust so that the low frequency components become zero.	

2) Adjustment with camera

Adjustments other than those mentioned in steps 2, 3, 8 and 9 are impossible unless a color bar generator is available. Do not move VRs unless it is absolutely necessary to do so.

Step	Adjustment Item	Test Point	Adjustment Parts	Mode	Description	Result
1	Aperture correction	G.R and B jumper terminal	Checking (Adjustment of aperture)	E-E	① 2,000 Lux and grey scale. ② Adjust the camera aperture so that the levels of input terminals G, R and B (jumper terminals) become 2Vp-p.			TP-11	VR11	E-E	Using VR11, make adjustment so that the "0" level becomes straight as seen in the figure.	
2	Video Out	TP-14	VR12 VR14 VR13		ⓐ Adjust the Y level to 0.7V with VR12. ⓑ Adjust the sync level to 0.3V with VR14. ⓒ Adjust the set-up level to 60 mV with VR13.	 ⓐ Y level ⓑ Sync level ⓒ Set-up level

4-1-6. CHROMA P.C BOARD (NTSC) (PY-5415)

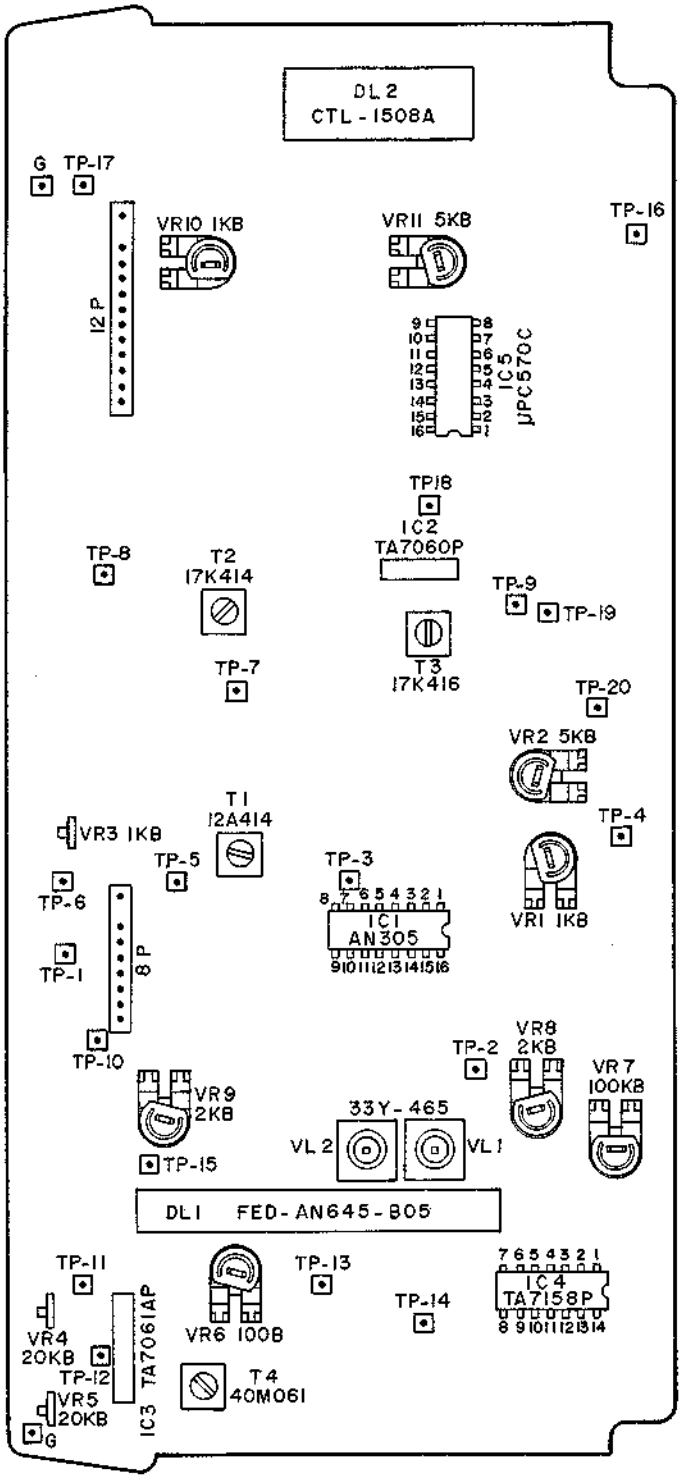

Fig. 4-30

(1) Chroma P.C Board (NTSC)

1) E-E/Rec Mode

Step	Adjustment Item	Test Point	Adjustment Parts	Mode	Description	Result
0	Measuring instrument set			E-E (Camera)	① Disconnect the camera from the VTR unit. ② Remove the process encoder P.C Board from the VTR unit. ③ Apply 1Vp-p 75% color bar signal to TP-1. (Adjustment of E-E system by the steps below should be performed with the above-mentioned set-up unless otherwise specified in "NOTE".)	 (Monitor picture)
1	A.F.C.	TP-18	VR11	E-E (Camera)	Using VR11, make adjustment so that the waveform present the phase relations as shown in the figure. (If no input signal is present or if A.F.C. is not applied, it is impossible to check the waveform of H sync.)	2	1/4 counter	TP-19	VR12	E-E (Camera)	① By turning VR12, set the pulse width to 55μS. ② Ascertain that the pulse width is 4H.	3	Chroma A.G.C.	TP-2	Checking	E-E (Camera)	Make sure that level is 0.75 to 0.95Vp-p.	4	Burst gate	TP-7	Checking	E-E (Camera)	Ascertain that the burst signal emerges at an interval of 4H.	
Step	Adjustment Item	Test Point	Adjustment Parts	Mode	Description	Result
5	A.P.C.	TP-8	T-3		① Measure the DC level of TP-8 when the input signal is off. This level is represented by Ev (=4 to 6.5V). ② Apply the input signal and make adjustment with T-3 so that the DC voltage of TP-8 becomes (E-0.7)v (3.3 to 5.8)v. ③ Perform the steps ① and ② several times. ④ Apply the input signal and make sure that no ripple is caused when the voltage of TP-8 is DC4 to 6.5V.	Ripple (1 to 5 mS, 0.2Vp-p) is caused if locking is cleared.
6	A.P.C. oscillation	TP-9	Checking	E-E	① Make sure that sine wave (2Vp-p) is on. ② Frequency: 3.583479 MHz	7	FM Deviation (900kHz ± 300kHz)	TP-5 TP-3	VR2 VR1		① Move VR1 fully counter clockwise. ② Make adjustment with VR2 so that the cycle of the waveform of TP-5 is 1.1μS. (900 kHz) ③ Using VR1, set the highest frequency to 0.83μS (1.2 MHz). ④ Make sure that the waveform of TP-3 has the 4H cycle. (2 to 2.5Vp-p) ⑤ Because the level changes upon adjustment of the comb-shaped filter, it is necessary to perform step 3 again after adjustment of the reproduction system.	  8	Rec level (chroma)	TP-6	VR3		Set it to 0.3Vp-p.	
9	Output level (Y signal)	TP-17	VR10		Set it to 1.0Vp-p (100% white).	

Step	Adjustment Item	Test Point	Adjustment Parts	Mode	Description	Result
10	Output level (chroma)	TP-17	VR9		Make adjustment so that the burst level becomes 0.3Vp-p. (Adjustment must be performed again after adjustment of the reproduction system because the level changes upon adjustment of the comb-shaped filter.	

2) PB Mode

Step	Adjustment Item	Test Point	Adjustment Parts	Mode	Description	Result
0					Adjustment of the PB system should be made by playback the REF-tape (or by recording and playback the color bar signal.)	
1	A.P.C.	TP-8 TP-9	checking	PB	① Make sure that the DC level of TP-8 is the same as that in the E-E mode. ② Ascertain that the frequency of TP-9 is 3.583479 MHz.	
2	PB Chroma correction	TP-11	VR4	PB	① Disconnect the PB FM signal input circuit R1. ② Make adjustment with VR4 so that the waveform becomes 900 kHz.	(Read the frequency for two cycles.) 3	Carrier balance	TP-13	VR5 VR6	PB	① Disconnect the PB FM signal input circuit R1. ② Adjust with VR so that the waveform becomes even.	 There should be no deviation.

Step	Adjustment Item	Test Point	Adjustment Parts	Mode	Description	Result
4	Comb-shaped filter	TP-15	VR7 VR8 VL1 VL2	PB	① Make adjustment with VR7 so that the level of the white portion of the color bar becomes minimum. ② Make adjustment with VR8, VL1 and VL2 so that the difference between the chroma signal subjected to 1H Delay and the direct chroma signal is minimum. (in case of the vector-scope, make the zero point vector minimum and put it within the " ⊞ " frame. ±5°, ±10%)	Make the level of the white portion minimum.  Make the deviation minimum. (NOTE: Use the color bar signal on the REF tape at 100%).
5	E-E system level	TP-5 TP-17	VR1 VR9	E-E	Carry out readjustment by performing step 7- ③ and 10 described in "Adjustment of E-E System".	
6	PB level (Y level)	TP-17	T-202	PB	Adjust T-202 on the signal P.C Board to set the output level to 1.0Vp-p.	
7	PB level (chroma)	TP-17	T-4	PB	Set the upper limit of the chroma signal for the yellow of the 75% color bar to 1Vp-p 100% white level.	

(2) Chroma P.C Board (PAL)

Step	Adjustment Item	Test Point	Adjustment Parts	Mode	Description	Result
0	Measuring instrument			E-E (Camera)	① Desconnect the camera from the VTR unit. ② Remove the process/ encoder P.C Board on the VTR unit. ③ Apply 1Vp-p 75% color bar signal to TP-1. ④ Set the VT/camera switch to the "camera" position.	
1	Burst gate pulse	TP-20	Checking	E-E	Make sure that the pulse width is 4.0μS ± 0.5μS.	
2	Clamp pulse	TP-21	Checking	E-E	Ascertain that the pulse width is 2μS.	

Step	Adjustment Item	Test Point	Adjustment Parts	Mode	Description	Result
3	A.C.C.	TP-2	VR4	E-E	① Make adjustment with VR4 so that the level of the burst portion of TP-2 becomes about 0.5Vp-p.	
		TP-2	T3	E-E	② Make adjustment with T3 so that the size of the waveform of TP-2 becomes minimum.	
		TP-2	VR4	E-E	③ Again adjust with VR4 so that the level of the burst portion becomes 0.5Vp-p.	
4	A.P.C.	TP-8	T4	E-E	① Remove the input video and measure the DC voltage of TP-8 with the DC range of the oscilloscope. ② Connect the color bar signal to the input terminal. Make adjustment with T4 so that the voltage becomes equal to the value measured in step 3-①. 3 Repeat 1 and 2 so that the voltages coincide with each other. (NOTE: Then, the voltage of TP-8 should be 4 to 6.5V.)	
5	Adjustment of decoder phase	TP-6	T2	E-E	Make adjustment with T2 so that the ratio of the output waveform of TP-6 conforms to the figure.	6	FM modulation				① Temporarily set the VR3 fully counterclockwise.	
		TP-3	VR1	E-E	② Make adjustment with VR1 so that the waveform of TP-3 becomes 1.1μS (900 kHz).	
		TP-3	VR3	E-E	③ Make adjustment with VR3 so that the cycle of the highest frequency becomes 0.83μS (1.3 MHz). NOTE: The cycle of the lowest frequency should be 1.63μS (600 kHz).	

Step	Adjustment Item	Test Point	Adjustment Parts	Mode	Description	Result
7	Rec level	TP-4	VR2	E-E	Again set VR2 so that the level of TP-4 becomes 0.2Vp-p.	
8	FM limiter demodulator	TP-14	T5	E-E	① Make adjustment with T5 so that the level of TP-14 becomes 2.0Vp-p.			TP-13	VR5 VR7	E-E	② Remove the VIDEO IN and make adjustment with VR5 and VR7 so that the balance of the waveform conforms to the figure ⓒ in result column.	
		TP-11	VR6	PB	③ No using the cassette tape, put the PB mode, then make adjust the VR6 so that the waveform at TP-11 becomes 1.1μS (900 kHz).	
9	Encoder	TP-16	VR9 VR8	E-E	① Temporarily set VR9 by turning it fully counter-clockwise. Make adjustment with VR8 so that the sub-carrier of the blanking portion of the TP-16 waveform becomes minimum. ② By using VR9, make the levels at each 1H even.	
10	Vector Adjustment		VR9 T8 T9	E-E	① Connect the vectorscope to the VIDEO OUT terminal on the VTR. ② Move VR9, T8 and T9 by turns so that the bright points of colors become focused on a point and come within " ⊞ ". Allowable error is ±4° and ±7%. NOTE: The " ⊞ " mark shows the phase deviation of ±3° and amplitude deviation of ±5%.			TP-8 (Video Amp)			③ When adjustment in step 2 above is completed, observe the waveform at the VIDEO OUT on the video amp P.C Board and make sure that it conforms to the figure.	
Step	Adjustment Item	Test Point	Adjustment Parts	Mode	Description	Result
11	Chroma output level	TP-16	VR10	E-E	Make adjustment with VR10 so that the level of yellow coincides with the level of 100% white of the Y signal.	
12	REC level		VR2	REC/ PB (B/W)	Record the color bar and playback it on B/W. Make adjustment with VR2 so that no outstand-chroma signal (oblique streak) appears on the screen).	

4-1-7. PZ SIGNAL P.C BOARD (PY-5400)

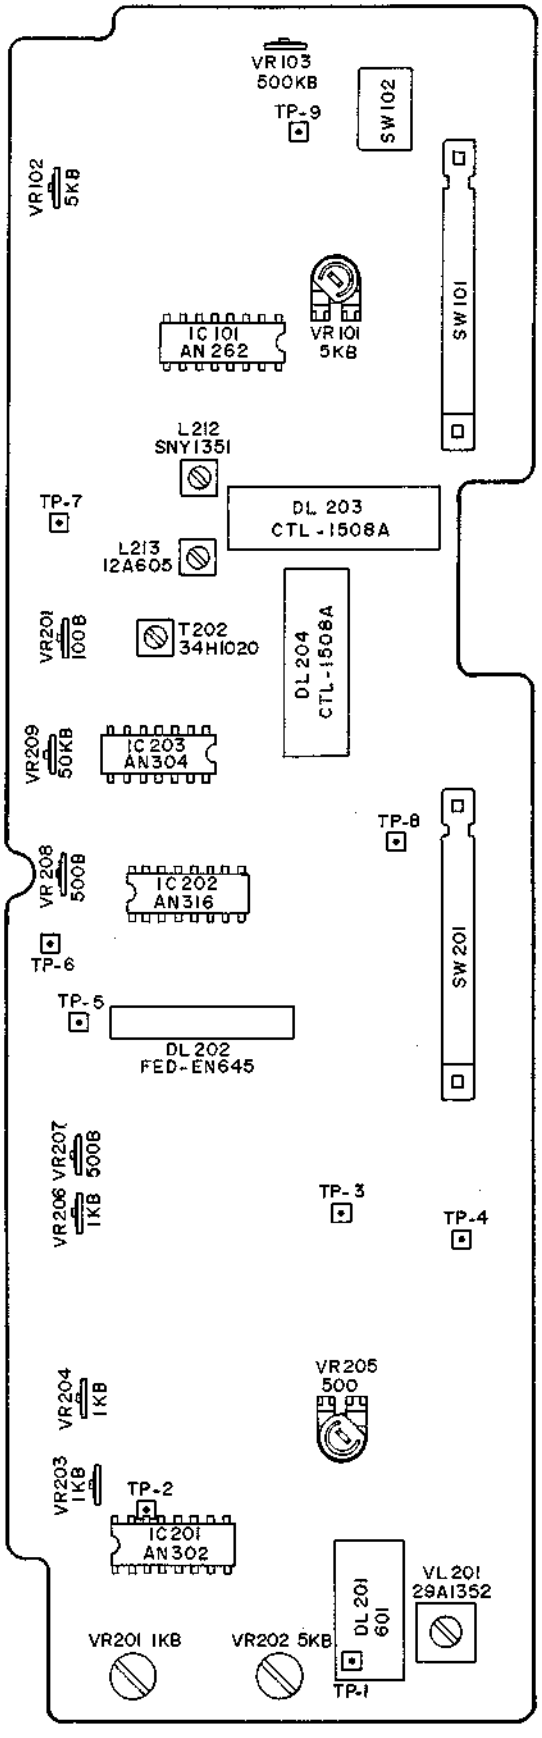

Fig. 4-31

Video Circuit (Signal P.C Board)

Step	Adjustment Item	Test Point	Adjustment Parts	Mode	Description	Result
0					① Apply the color bar signal to the VIDEO IN. ② Set the mode to TV and B/W.	
1	FM carrier set	TP-3	VR201 VR203	E-E	① Turn VR202 fully counterclockwise. (White clip off) ② 0.20μS at VR201. ③ 0.28μS at VR203. ④ Make sure that the output level is about 2Vp-p.	2	Carrier balance	TP-3	VR204 VR209 VR210	E-E	① Remove the video input. ② Adjust the duty ratio to 50%. ③ By moving VR209 and VR210, balance the waveform.	3	Video output level	TP-8	T-5	E-E	Adjust the output to 1Vp-p with T5.	
4	White clip	TP-2	VR202	E-E	① Make adjustment so that B=1/3A in the figure. ② Make sure that A≒1.3V.	5	Chroma trap	TP-4	T202	E-E	Make adjustment to that the chroma becomes minimum.	6	Recording current	TP-5	VR205	REC PB	Adjust VR205 so that the playback output becomes maximum.	7	Head output balance	TP-5	VR206	PB	Make adjustment so that the playback outputs of CH1 head and CH2 head become equal to one another.	

Step	Adjustment Item	Test Point	Adjustment Parts	Mode	Description	Result
8	D.O.C. level	TP-6	VR208	PB	① Remove the solder on the P.C Board for D.O.C. operation checking. ② Record the color bar signal and adjust the output level to about 1Vp-p. ③ Connect the D.O.C. check pattern and check the normal D.O.C. operation with the monitor TV.	

4-2. VC-400

4-2-1. DEFLECTION 1 P.C BOARD

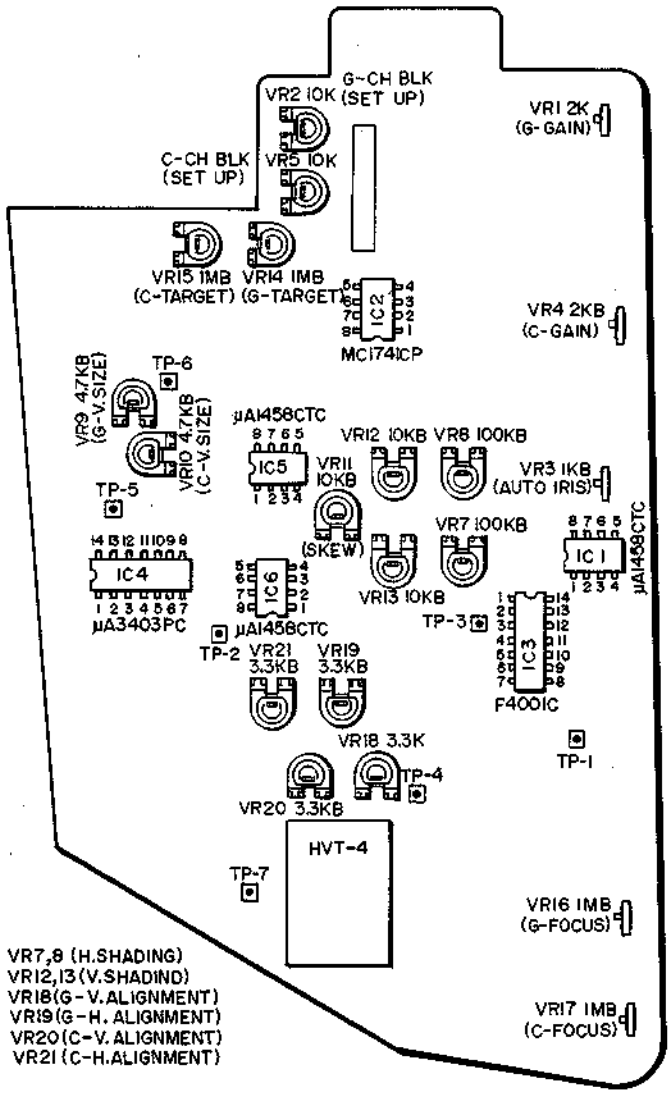

Fig. 4-32

Step	Adjustment Item	Test Point	Adjustment Parts	Mode	Description	Result
1	9V output (power supply P.C Board)	IC1 7	VR1	E-E	Adjust the 9V output to 9V ±30 mV.	+9V DC
2	Checking of H.D. pulse (DEF-1)	TP-1		E-E	Make sure that HD is separated and that the level is about 8Vp-p.	3	Checking of V pulse (DEF-1)	TP-2		E-E	Make sure that the V pulse is separated and that the level is about 7Vp-p.	4	Checking of BLK pulse (DEF-1)	TP-3		E-E	Make sure that the size of the BLK is 7Vp-p and that the V.BL is about 1mS.	5	Checking of K.BLK (DEF-1)	TR17 collector TR18 collector		E-E	Make sure that the size of K.BLK is 20Vp-p.	6	H.DEF deflecting waveform (DEF-1)	TP-5 (G-ch) TP-6 (C-ch)	VR9 VR10	E-E	While observing the screen, adjust VR9 (G-ch) and VR10 (C-ch) so that the levels of G-ch and C-ch become equal. NOTE: on VC-400, no adjustment of linearity is made.	7	DC-DC converter input waveform (DEF-1)	TP-7			The level should be 20Vp-p and the DC level as measured from the ground should be less than 0.3V.	8	DC-DC converter output voltage	R151 R153 D20 VR16,17 VR14,15 D21 D22		E-E	High input resistor above 100Mohms. D20 anode voltage VR16,17 middle point VR14,15 D21 cathode voltage D22 anode voltage	500V±10V 300V±5V −95V±5V more than 60 to 85V. more than 0 to 43V. 23 to 25V −9V±0.5V
9	Amount of beam	G-ch pre-out C-ch pre-out	VR2 VR1	E-E	① 2,000 Lux, white pattern ② Lens aperture open. ③ Set VR2 and VR1 to such a point at which the pre-out waveform in G-ch and C-ch does deviate.	
Step	Adjustment Item	Test Point	Adjustment Parts	Mode	Description	Result
10	Dark current	G-ch pre-out C-ch pre-out	VR14 VR15	E-E	① Lens aperture closed. ② Cause the waveform of pre-out to be 40mV (mean value). ③ Measure in the V range.	11	Camera head output	TR15 Emitter TR16 Emitter	VR1 VR2	E-E	① 2,000 Lux, grey scale. ② Lens aperture F4. ③ Adjust the zoom so that the outside frame of the pattern just fits on the Monitor TV screen. ④ Adjust so that the size at the right is 0.5V.	12	Set-up	TR15 Emitter TR16 Emitter	VR5 VR2	E-E	① Same as step 13 above. ② Make adjustment so that the level of the black portion is just the same as that of the BLK portion. ③ If the level is below 0.5V, readjust the set-up by moving VR1 and 4.	13	Automatic aperture	TR16 Emitter	VR3	E-E	① 2,000 Lux, resolution chart. ② Lens aperture should be set to the "automatic" position (level "2") ③ Move VR3 so that the level of C-ch out becomes 0.5Vp-p. ④ Change over the response switch (from the level 1 to level 3 and vice versa) and ascertain that the aperture changes by about 0.5 to 1.0 F.	

Step	Adjustment Item	Test Point	Adjustment Parts	Mode	Description	Result
14	G-ch focus	Monitor TV	VR16 VR18 VR19	E-E	① 2,000 Lux, resolution chart. ② Lens aperture: Auto "2". ③ Using VR16 (G-ch focus), VR18 (G-ch H alignment) and VR19 (G-ch V alignment), optimize the focus at the center and its vicinity.	
15	Resistration	Monitor TV	VR9 VR10 VR11 Rear VR x2	E-E	① 2,000 Lux, resolution chart. ② Lens aperture: Auto "2". ③ Optimize the registration by adjusting VR9 (G-ch size), VR10 (C-ch size), VR11 (skew) and two rear VRs.	
16	Shading	SSG P.C Board TP-2 or Monitor TV	VR7 VR8 VR12 VR13 VR17 VR20 VR21	E-E	① 2,000 Lux, white pattern. ② Lens focus: Auto "2". ③ To obtain the best shading, adjust: VR7, 8, 12 and 13 (VRs for shading adjustment) VR17 (C-ch focus) VR20 and 21 (C-ch alignment).	TP-2 OUTPUT WAVEFORM 

V. CLASSIFICATION OF VARIOUS P.C BOARDS

5-1. P.C BOARD TITLES AND IDENTIFICATION NUMBER

(1) VT-400

P.C Board Title	P.C Board Number
Process & Encoder P.C Board	CV-2406
SSG P.C Board	CV-2407
PY PLG P.C Board	PY-2200
Fuse P.C Board	PY-5006
Shut-off P.C Board	PY-5201
Switch P.C Board	PY-5202

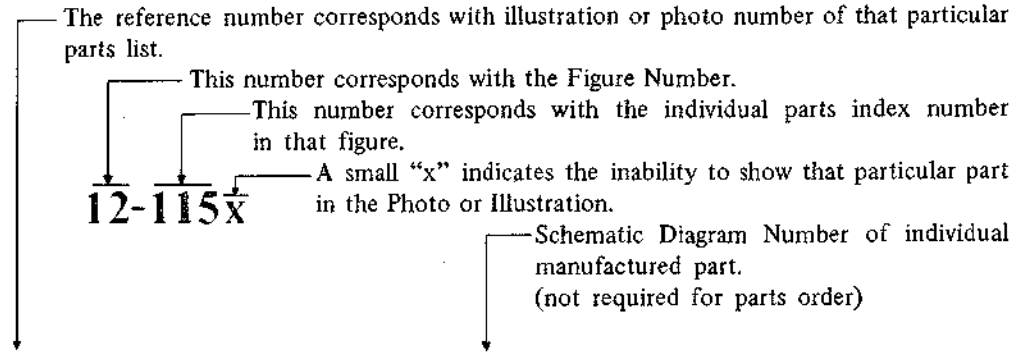
SECTION 2

PARTS LIST

TABLE OF CONTENTS

HOW TO USE THIS PARTS LIST

1. This parts list is compiled by various individual blocks based on assembly process.
2. When ordering parts, please describe parts number, serial number, and model number in detail.
3. How to read List



Ref. No.	Parts No.	Description	Schematic No.
		FLYWHEEL BLOCK #13	
12-115x	800425	Flywheel Block Assy. Comp.	RDG #13
12-116	244506	Flywheel Only	RD-233
12-117x	244754	Felt, Flywheel	RD-275
12-118	251324	Main Metal Case	RD-236
12-119	253080	Main Metal	RD-237

4. The symbol numbers shown on the P.C. Board list can be matched with the Composite Views of Components of the Schematic Diagram or Service Manual.
5. Please utilize separate "Common List for Service Parts" for Resistor Parts orders.
6. The shape of the parts and parts name, etc. can be confirmed by comparing them with the parts shown on the Electrical Parts Table of P.C. Board.
7. Both the kind of part and installation position can be determined by the Parts Number. To determine where a parts number is listed, utilize Parts Index at end of Parts List.
   It is necessary first of all to find the Parts Number. This can be accomplished by using the Reference Number listed at right of parts number in the Parts Index. (meaning of ref. no. outlined in Item 3 above).
8. Utilize separate "Price List for Parts" to determine unit price. The most simple method of finding parts Price is to utilize the reference number.

CAUTION:
1. When placing an order for parts, be sure to list the parts no. model no., and description. There are instances in which if any of this information is omitted, parts cannot be shipped or the wrong parts will be delivered.
2. Please be careful not to make a mistake in the parts no. If the parts no. is in error, a part different from the one ordered may be delivered.
3. Because parts number and parts unit supply in the Preliminary Service Manual (Basic Parts List) may be partially changed, please use this parts list for all future reference.

WARNING: ⚠ INDICATES SAFETY CRITICAL COMPONENTS. FOR CONTINUED SAFETY, REPLACE SAFETY CRITICAL COMPONENTS ONLY WITH MANUFACTURER'S RECOMMENDED PARTS.

AVERTISSEMENT: ⚠ IL INDIQU LES COMPOSANTS CRITIQUES DE SURETE. POUR MAINTENIR LE DEGRE DE SECURITE DE L'APPAREIL NE REMPLACER LES COMPOSANTS DONT LE FONCTIONNEMENT EST CRITIQUE POUR LA SECURITE QUE PAR DES PIECES RECOMMANDEES PAR LE FABRICANT.

AC INLET SYSTEM

This model is equipped with an AC INLET SYSTEM. Please refer to the AC INLET SYSTEM CHART below for the specific type. By the AC INLET SYSTEM, AC (mains) cord can be connected to and disconnected from the model because the model is provided with socket exclusively for AC (mains) cord on its main body.
Please note, however, that certain models are not equipped with this system and has a built-in AC (mains) cord as before.

AC INLET SYSTEM CHART

CLASS I

CLASS II

▣ This mark indicating double insulation will be attached to machine's rear panel
