IMPORTANT WARNING
When the back panel is removed, high voltage parts are exposed, so any adjustment must be carried out by specialized personnel only. Before performing any of the following adjustments, switch on the set for about ten minutes, on average brightness and without the aerial attached («snow effect» only).

- Power Supply
Switch power supply to 220 V.
With contrast and brightness at the minimum, adjust PP1 to 148 V ± 0,5 V at CP22 terminals.

- Adjustment of picture
Horizontal adjustment
Use PC1 for correct adjustment of picture's horizontal position.
Picture width
Use PG3 to adjust picture width
Crosswise Correction
Use PG2 and PG1 for picture's best geometry.
Picture Height
Use PF1 to adjust.

- Focusing
Adjust picture focus with the contrast near to maximum.

- Adjusting picture tube tension
Set contrast and brightness to the minimum. Measure direct current voltage at the three picture-tube cathodes and adjust the G2 screen grid so that the cathode voltage at its higest value is 175 V. Send a «white page» signal to the aerial. Set brightness and contrast to maximum and adjust PV1 and PV2 so that all colour shades disappear.

WICHTIGER HINWEIS
Nach der Entfernung des Rückendeckels des Gerätes werden Teile zugänglich, die auch Hochspannungen besitzen. Infolgesdessen darf jede Reparatur ausschliesslich durch Fachpersonal durchgeführt werden.
Vor der Durchführung der nachstehend beschriebenen Einstellungen soll das Gerät ca. 10 Minuten lang eingeschaltet werden, z.zw. mit mässiger Bildschirmbeleuchtung und ohne Antennesignal (lediglich «Schnee-effekt»).

- Netzteil
Die Netzspannung auf 220 V einstellen.
Danach in Betriebszustand - mit Kontrast und Helligkeit auf Mindestwert - PP1 auf 148 V ± 0,5 V an den Enden von CP22 einstellen.

- Einstellung der Bildgeometrie
Horizontallage
PC1 für die korrekte Horizontallage des Bildes einstellen.
Horizontalamplitude
Die Einstellung mit PG3 für die einwandfreie Horizontalamplitude vornehmen.
Ost-West-Korrektur
Die Einstellung mit PG2 (Kissen) und PG1 (Trapez) für eine bessere Bildgeometrie durchführen.
Vertikalamplitude
Die Einstellung mit PF1 durchführen.

- Fokussierung
Bei auf nahezu Maximalwert eingestellten Kontrast die Einstellung für die bestmögliche Bildfokussierung durchführen.

Einstellung des Arbeitspunktes der Bildröhre
Kontrast und Helligkeit auf Mindestwert einstellen. Die Gleichspannung der drei Kathoden der Bildröhre messen und den Schirmgitterregler G2 so eistellen, dass die beim Maximalwert festgestellte Spannung 175 V beträgt.
In die Antenne ein «weisse Seite-Signal» einschalten. Helligkeit und Kontrast nahezu auf Maximalwert einstellen und PV1 sowie PV2 so einstellen, dass jede Farbabtönung verschwindet.

AVVERTENZA IMPORTANTE
La rimozione dello schienale rende accessibili parti sottoposte a tensioni anche elevate, ogni intervento dovrà perciò essere effettuato esclusivamente da personale specializzato. Prima dell'esecuzione delle regolazioni di seguito descritte l'apparecchio deve essere acceso per una decina di minuti con schermo mediamente illuminato senza segnale in antenna (solo «effetto neve»).

- Alimentatore
Regolare la tensione di rete su 220 V. Regolare quindi, in condizioni di funzionamento, con contrasto e luminosità al minimo, PP1 per 148 V ± 0,5 V ai capi di CP22.

- Regolazione della geometria dell'immagine
Posizione orizzontale
Regolare PC1 per una corretta posizione orizzontale dell'immagine.
Ampiezza orizzontale
Regolare con PG3 per la corretta ampiezza orizzontale.

- Correzione Est-Ovest
Regolare con PG2 (cuscino) e PG1 (trapezio) per la migliore geometria dell'immagine.
Ampiezza verticale
Regolare con PF1

- Focalizzazione
Con il contrasto prossimo al massimo regolare per la migliore focalizzazione dell'immagine.

- Regolazione punto di lavoro del cinescopio
Regolare contrasto e luminosità al minimo. Misurare la tensione continua dei tre catodi del cinescopio e regolare il potenziometro di griglia schermo G2 in modo che la tensione del catodo riscontrato a valore più elevato sia di 175 V
Inserire in antenna un segnale a «pagina bianca». Portare luminosità e contrasto prossimi al massimo e regolare PV1 e PV2 in modo che scompaia ogni sfumatura di colore.

RECOMANDATIONS IMPORTANTES
Ne jamais enlever le panneau arrière de proteclion avant d'avoir débranché la fiche du secteur.
Cet appareil est conforme aux normes internationales de protection contre les radiations et les parasites radioélectriques.

- Alimentation
Régler la tension secteur sur 220 V.
En condition de fonctionnement avec contraste et luminosité au minimum, régler PP1 sur une tension de 148 V ± 0,5 V aux bornes de CP22.

- Réglage de la géométrie de l'image
Position horizontale
PC1 permet de régler correctement la position horizontale de l'image.
Largeur d'image
PG3 permet de régler correctement la largeur d'image.
Correction diagonale
PG2 et PG1 permettent le réglage de la géométrie de l'image.
Hauteur d'image
Régler avec PF1.

- Focalisation
Effectuer la mise au point avec le contraste presque au maximum.

- Réglage de la tension du tube
Régler le contraste et la luminosité au minimum. Mesurer la tension continue des trois cathodes du tube et régler la grille de l'écran G2 jusqu'à ce que l la tension de la cathode plus hant se stabilise sur 175 V. Envoyer à l'antenne un signal à «page blanche». Porter la luminosité et le contraste presque au maximum puis régler PV1 et PV2 de façon à éliminer toutes les nuances de couleur.

ADVERTENCIA IMPORTANTE
Al quitar la tapa posterior de protección deja accesibles partes con tensiones elevadas y peligrosas, por lo tanto solo debe ser llevado a cabo por personas especializadas. Antes de efectuar los ajustes y regulaciónes descritas a continuación debe permanecer el aparato en marcha unos diez minutos con lapantalla sin señal en antena (efecto nieve) y con el control de brillo en su posición media.

- Alimentación
Ajustar la tensión de red a 220 V.
Ajustar PP1 (situando los controles de contraste y brillo al mínimo) hasta obtener 148 V ± 0,5 V en los terminales de CP22.

- Regulación de la geometria de la imagen
Centrado horizontal
Regular PC1 hasta obtener un correcto centrado de la imagen.
- Amplitud horizontal
Regular PG3 hasta obtener una correcta amplitud de la imagen.
Correccion est-oeste
Regular mediante PG2 (cojin) y PG1 (trapecio) hasta obtener una imagen correcta.
Altura de la imagen
Regularla mediante PF1 hasta obtener una altura correcta.

- Foco
Con el contraste casi al maximo ajustar el potenciometro de foco hasta la maxima focalización de la imagen.

- Ajuste del punto de trabajo del tubo de imagen
Regular el contraste y el brillo al mínimo. Medir la tensión continua de los tres catodos del lubo de imagen y ajustar el potenciometro de G2 de manera que la tensión del cátodo mas elevada sea de 175 V.
Conectar a la toma de antena una señal generador modulado, para obtener una «Pantalla blanca».
Regular el brillo y el contraste, casi al máximo y ajustar PV1 y PV2 hasta que desaparezca todo matiz de color.
