

Service Manual

35" CONSOLE COLOR TV
CHASSIS Family WA-C

1258

MODEL

CK-3526R

CK-3527R

CAUTION

Before servicing this chassis, it is important that the serviceman reads the " SAFETY PRECAUTIONS" and " PRODUCT SAFETY NOTICE" in this service manual.

SPECIFICATIONS

| | |
|--------------------------|--|
| · Power Input | AC 120V ; 60Hz |
| · Power Consumption | 240W |
| · Reception Frequency | VHF 54~168MHz, 174~468MHz |
| · Intermediate Frequency | UHF 470~890MHz |
| · Speaker | Video IF Carrier 45.75MHz |
| | Sound IF Carrier 41.25MHz |
| | Color Sub-carrier 42.17MHz |
| | 4" Round 2pcs 8Ω |
| Picture tube | M89KRP11X 35" V 110° Deflection |
| · Cabinet Dimensions | 44.3" (H) × 34.8" (W) × 24.0" (D) (CK-3526R) |
| | 43.0" (H) × 36.5" (W) × 24.3" (D) (CK-3527R) |
| · Weight (Net) | 260.0lbs [CK-3526R] |
| | 262.5lbs [CK-3527R] |

Special Features

- * New " WA" chassis 100% solid state.
- * 10 key Frequency Synthesizer tuning system. (FS-A91)
- * Multichannel sound reception.
- * High quality audio.
- * 43 Function Infra-red Remote control.
- * Mid, Super, Hyper & Ultra band Cable-ready. (181ch).
- * CRT display.
- * Full-square Black Matrix D-II picture tube.
- * S-Video IN terminal.(Ext-1)
- * Video IN (Ext-1/Ext-2) /OUT terminal.
- * Audio IN (Ext-1/Ext-2),(L/R) /OUT terminal (L/R).
- * Noise Reduction.
- * Peak ACL.
- * Scanning Velocity Modulation.
- * Color Temperature control.
- * Black level correction.
- * Dynamic γ Correction.

SAFETY PRECAUTIONS

NOTICE : Observe all cautions and safety related notes located inside the receiver cabinet and on the receiver chassis.

WARNING

1. Operation of this receiver outside the cabinet or with the cover removed presents a shock hazard from the receiver power supplies. Work on the receiver should not be attempted by anyone who is not thoroughly familiar with the precautions necessary when working on high-voltage equipment.
2. Do not install, remove or handle the picture tube in any manner unless shatter-proof goggles are worn. People not so equipped should be kept away while the picture tube is being handled. Keep the picture tube away from the body while handling.

X-RADIATION WARNING

The surface of the picture tube may generate X-Radiation. Precaution during service and, if possible, the use of a lead apron is recommended for shielding while handling.

When replacing the picture tube, use only the designated replacement part since it is a critical component with regard to X-Radiation as noted above. (No high-voltage adjustments are provided.) The high-voltage specification is described on cover page.

LEAKAGE CURRENT CHECK

Before returning the receiver to the customer, it is recommended that leakage current be measured according to the following methods.

1. Cold Check

With the AC plug removed from the 120V AC source, place a jumper across the two AC plug prongs. Turn the receiver AC switch on. Using an ohm-meter, connect one lead to the AC plug and touch the other lead to each exposed metal part (antennas, handle bracket, metal cabinet, screwheads, metal overlays, control shafts, etc.), particularly any exposed metal part having a return path to the chassis. Exposed metal parts having a return path to the chassis should have a minimum resistance reading of 1 meg ohm. Any resistance below this value indicates an abnormality which requires corrective action. Exposed metal parts not having a return path to the chassis will indicate an open circuit.

2. Hot Check

Use the circuit in Fig. 1 to perform this test.

- (1) With switch S1 open, connect the receiver to the measuring circuit. Immediately after connection, measure the leakage current using both positions of switch S2, and with the switching devices in the receiver in all of their operating positions.
- (2) Switch S1 is then closed, energizing the receiver. Immediately after closing the switch, measure the leakage current using both positions of switch S2, and with the switching devices in the receiver in all of their operating positions. Current measurements of items (1) and (2) are to be repeated after the receiver has reached thermal stabilization. The leakage current shall not be more than 0.5 milliamperes.

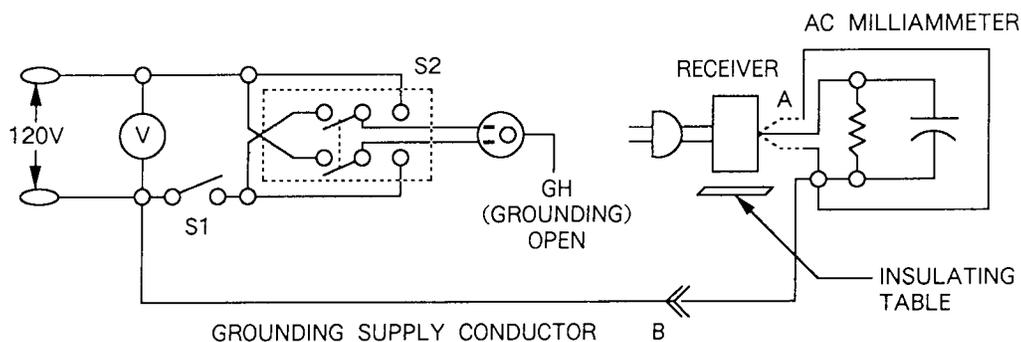

Fig. 1

PRODUCT SAFETY NOTICE

Many electrical and mechanical parts in the television receivers have special safety related characteristics. These characteristics are often not evident from visual inspection nor can the protection afforded by them necessarily be obtained by using replacement components rated for higher voltage, wattage, etc. Replacement parts which have these special safety characteristics are identified in this service manual. Electrical components having such features are identified by shading on the schematic diagram and the parts list of this service manual and by marking of the supplementary sheet for this chassis to be issued subsequently. Therefore replacements for any safety parts should be identical in value and characteristics.

DISASSEMBLY PROCEDURE

- REMOVAL OF PCB**
- PCB-DEFL
 - PCB-SIGNAL
 - PCB-Y/C
 - PCB-CONTROL
 - PCB-PIP
 - PCB-CRT
 - PCB-SPWR/DBF

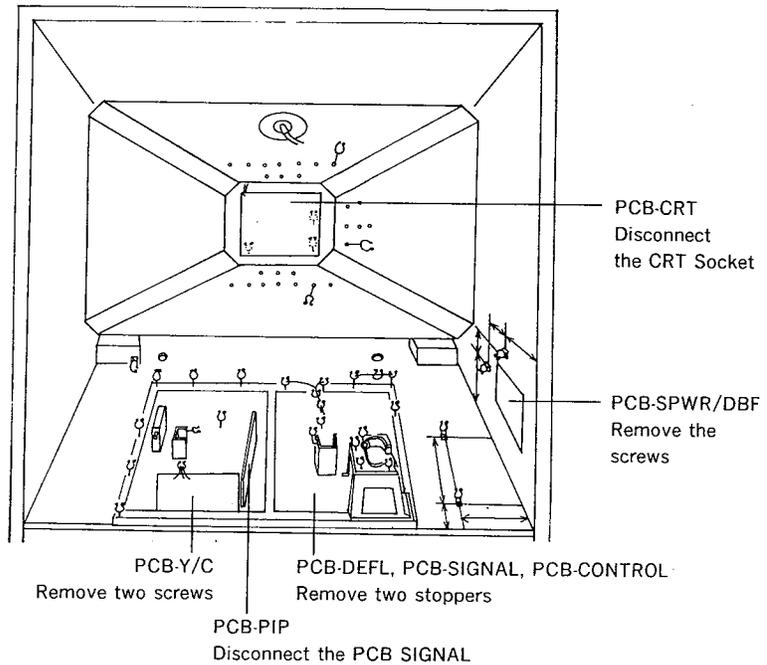

Fig. 1-1

※When servicing PCB-Y/C and PCB-PIP use the service JIG (Parts No. 859C431020) for easier service.

CAUTION

When the connector-lead **PV** is used pin4-pin4, insert the connector following.

- ① Insert connector-lead to connector **PV** on PCB-DEFL as shown.

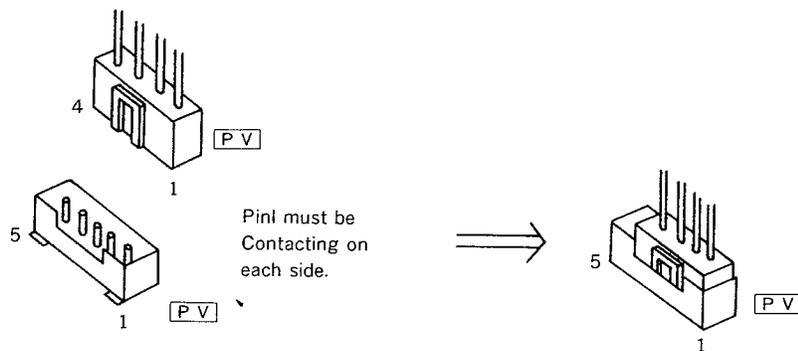

Fig. 1-2

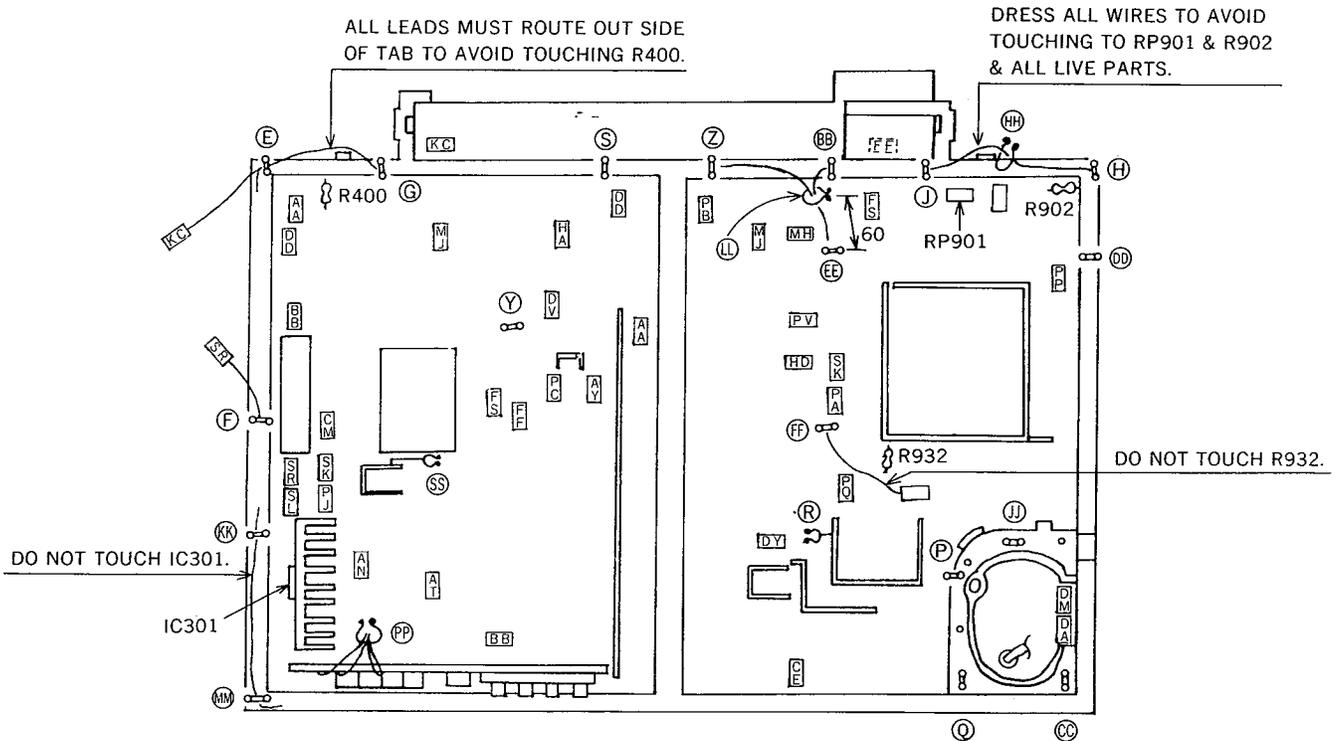

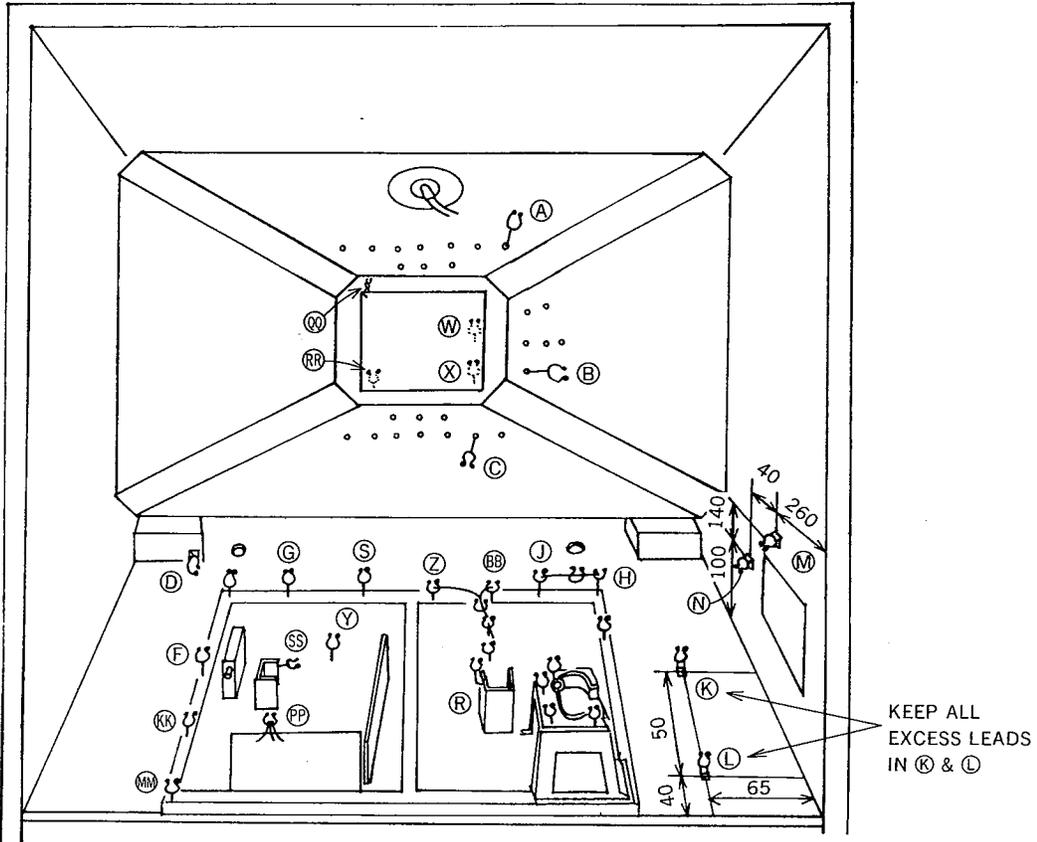

LEAD DRESSING

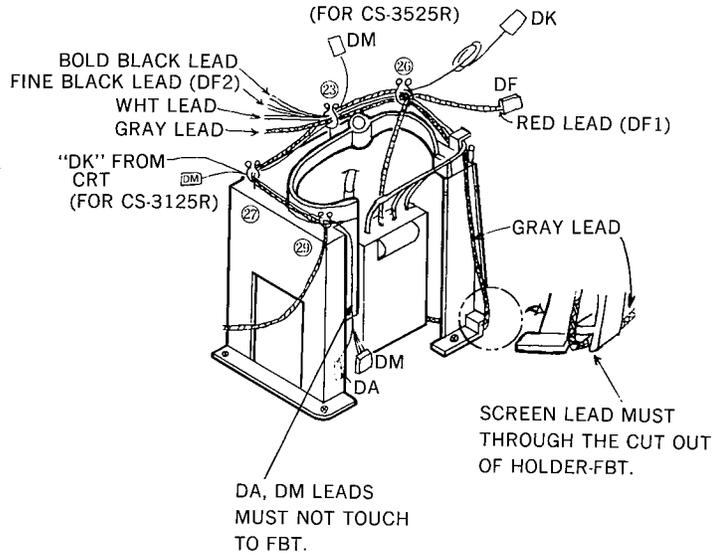

Wiring

The lead wires to be clamped are listed in the table below.

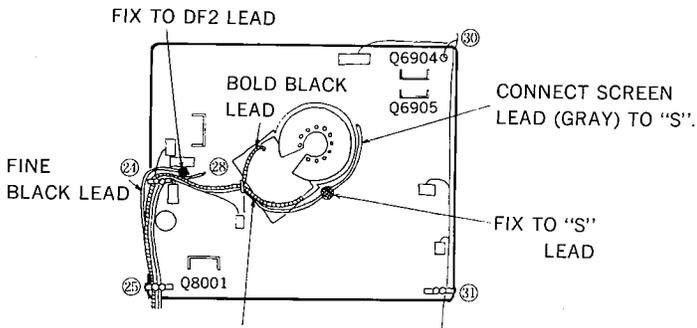

Note: *The inner wires are routed or clamped so that they do not come close to the heat generating or high-tension parts. After servicing route all wires in their original position.

The anode lead wires are routed so no tensile strength is applied to the anode cap. If the mounting angle of the anode cap and the route of the anode lead wires are changed, return them to the initial angle and route.

<FOR CS-3525R>

MAKE A MECHANICAL JOINT AND SOLDER TO SOCKET-CRT FOR FOCUS LEADS (F1&F2).

REPLACING THE PICTURE TUBE

Note : Replacement of the CRT requires the use of 3 persons. Follow the procedure as outlined below.

1. Remove the 15 screws retaining the BACK BOARD, as shown in Fig. 2-1.
2. Remove the lead clammer and connector anode cap.
3. Remove the PCB-DEFL, PCB-SIGNAL, PCB-SPWR/DBF and PCB-CRT.
4. Remove 4 screws retaining the shield cover, as shown in Fig. 2-2.

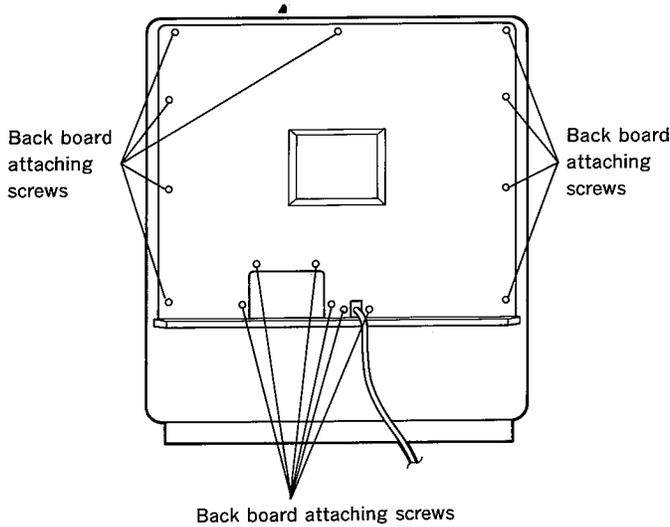

Fig. 2-1

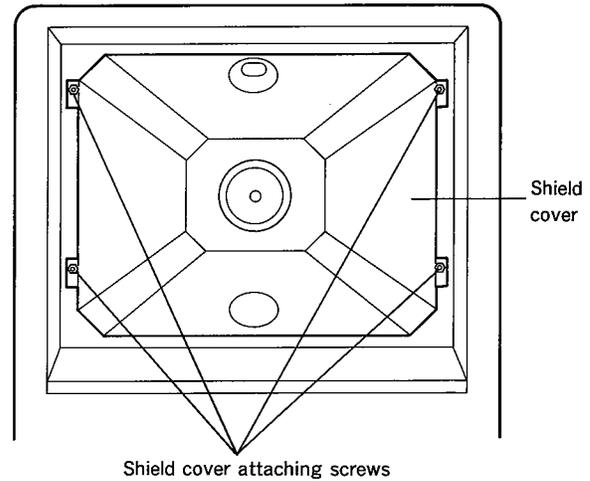

Fig. 2-2

5. Mount the set on the base so that center of picture tube is aligned with the center of the base, as shown in Fig. 2-3.

Note : Support both sides of the set so that the CRT does NOT carry the weight of the CABINET.

6. Remove the 4 CRT lock nuts, using the T driver (JIG No. 859C 358020).
7. Lower the cabinet slowly.
8. Replace the CRT with new one. For installation of the picture tube, reverse the above procedure, as shown in Fig. 2-4.

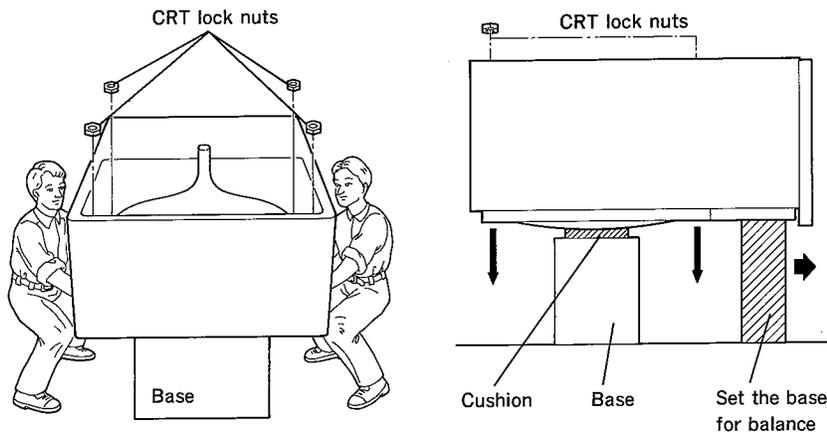

Fig. 2-3

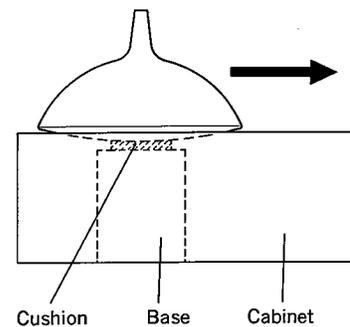

Fig. 2-4

ITC adjustment

PURITY AND CONVERGENCE

Before adjusting the INTEGRATED TUBE COMPONENT, run the CRT for more than an hour with a monochrome signal applied to give normal beam current flow. Degauss not only the front and rear of the CRT but also the external magnetic shield, CRT holder, etc. (Insufficient degaussing causes magnetization, giving an unfavorable effect on color purity adjustment.)

Purity and Convergence adjustment should be performed in the following sequence when replacing either the Picture Tube, Deflection Yoke or Purity & Convergence Magnetic Assembly.

Note 1 : The picture tube provided for service is supplied in the form of an assembly with Picture Tube, Deflection Yoke and Purity Convergence magnetic assembly.

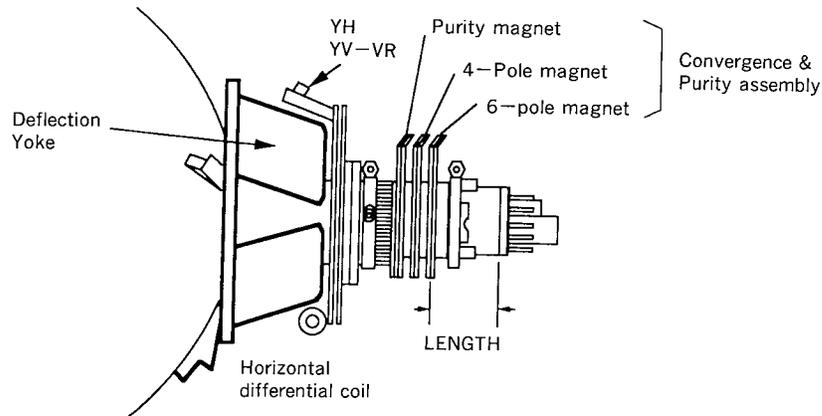

As a rule, Purity & Convergence adjustment have already been preset at the factory, so that the regular adjustment only is required.

Note 2 : When replacing either the Deflection Yoke or Purity & Convergence Magnetic Assembly, follow procedures (1) through (5).

Note 3 : If purity adjustment only is required, with no components replaced, follow "REGULAR ADJUSTMENT".

Procedure

- (1) Remove the deflection yoke and rubber wedges from the picture tube cone with care not to strike or scratch the cone surface.
- (2) Clean the remaining cement off the deflection yoke and the surface of the picture tube cone.
- (3) Put the deflection yoke on the neck of the picture tube, fully forward against cone.
- (4) Put the Purity & Convergence assembly on the neck of the picture tube so that the distance between the 6-pole magnet and the base of the tube is 1.77 ± 0.04 inches (45 ± 1.0 mm) as shown in Fig. 5-1, and tighten screw by hand.
- (5) Demagnetize the front and sides of the picture tube with a degaussing coil.

| CRT | LENGTH |
|-----------|--|
| M89KRP11X | 1.77 ± 0.04 inches (45 ± 1.0 mm) |

Fig. 5-1

Preliminary Adjustment

1. Purity

- (1) Tune receiver to a monochrome signal.
- (2) Set the B-CUT-OFF switch S6902 to up side position (switch "ON") on PCB CRT to produce a yellow raster.
- (3) With the deflection yoke positioned fully forward, adjust the purity magnet so that the yellow bar is at the center of the screen with normal vertical centering.
- (4) Slide the deflection yoke slowly backwards to produce a uniform yellow raster.
- (5) Produce the primary color rasters: red, green and blue, and make sure no contamination is observed for each color.
To produce a red raster, set the B-CUT-OFF switch S6902 and the G-CUT-OFF switch S6901 to up side position (switch "ON") on PCB CRT.
To produce green and blue primary color, short-circuit the base and emitter of Q6904 (R-OUT) or set the B-CUT-OFF switch S6902 and the G-CUT-OFF switch S6901 to up side position (switch "ON") on PCB CRT.
Temporarily fasten the deflection yoke.
- (6) Re-set S6902 and S6901 to center position (switch "OFF") on PCB CRT.

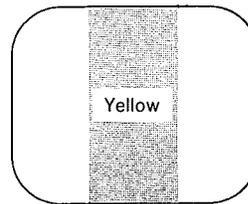

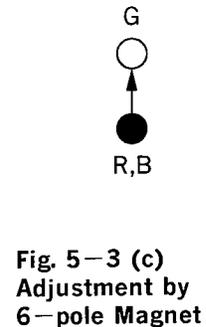

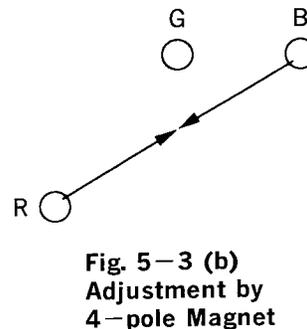

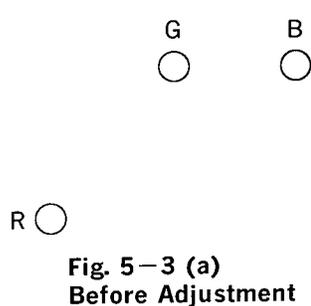

Fig. 5-2

2. Static Convergence Adjustment

- (1) Tune the receiver to a crosshatch signal.
- (2) Set the BRIGHTNESS control to center position and CONTRAST control to maximum position.
- (3) Adjust the degree of one angle of the 4-pole magnet and the angular position of them to converge the "B" beam and "R" of the screen.
[Refer to Fig. 5-3 (b)]
- (4) Adjust the degree of the angle between the tabs of the 6-pole magnet and the angular position of them to converge the "B" beam and "R" to the center beam "G" at the center of the screen. [Refer to Fig. 5-3 (c)]
- (5) If necessary, repeat the above steps.

Note :

- * The 4-pole magnet moves "B" and "R" beams in opposite direction the same distance.
- * The 6-pole magnet moves "B" and "R" beams in the same direction the same distance.
- * The center beam "G" is not movable by the 4-pole and 6-pole magnet.

3. Focus Adjustment

- (1) Supply a gray scale signal with window.
- (2) Observing around the vertical line, adjust FOCUS-2 control for best overall focus.
- (3) Observing around the horizontal line, adjust FOCUS-1 control for best overall focus.
- (4) Repeat step 2 and 3 three times or more until no further improvement is noted.

Regular Adjustment

1. Purity

Tune receiver to a monochrome signal.

- (1) Set the B-CUT-OFF switch S6902 to up side position (switch "ON") on PCB CRT to produce a yellow raster.
- (2) Loosen the deflection yoke screw and move it forward. Make certain that the yellow bar is at the horizontal center. If necessary, adjust purity magnets to center it.
- (3) Slide the yoke backwards to produce a uniform yellow raster.
- (4) Using the same procedure as for Preliminary adjustment, produce red, blue and green primary color raster and make sure no contamination is observed for each color.
- (5) If necessary, repeat above steps.
- (6) Tighten the yoke in position.
- (7) Re-set S6902 and S6901 to center position (switch "OFF") on PCB CRT.

Note: When adjusting the deflection yoke position, never touch any portion of the yoke other than the screw. Do not touch the purity ring magnet unless absolutely necessary, in which case carry out the preliminary purity adjustment procedures again.

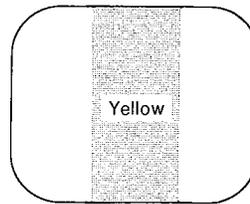

Fig. 5-4

Screen corner landing compensation

* The steps described below are for correcting outward color beam divergence at screen corners. Take reversal placement of the magnetic pieces for correcting inward divergence.

- (1) Degauss the unit.
- * Do not use any degaussing coil other than the built-in degaussing coil since the external coil may fail degaussing and worse, will magnetize the TV set.
- (2) Receive the red, green or blue signal.
- (3) Make sure that the color other than the received color does not appear at a corner of the screen. If appears, attach magnetic pieces (up to 3 pieces at a position) on the funnel of the CRT so that the color disappears.
(Magnetic piece part number : 461D033020)

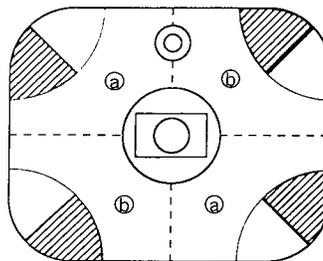

Fig. 5-5

When an undesirable color appears at the area ② in the figure above, attach the magnetic pieces on the opposite surface of the funnel with the magnetic pieces on the opposite surface facing outside.

When an undesirable color appears at the area ① in the figure above, attach the magnetic pieces on the opposite surface of the funnel with the surface facing inside.

(CAUTION)

The magnetic piece will distort raster and disturb convergence system. Do not place a magnetic piece at a distance less than 1.97 inches (50mm) away from the bobbin of the deflection yoke.

If an undesirable color appear at area shown , move the magnetic piece leftward (counterclockwise) until the color disappears.

If an undesirable color appear at area shown , move the magnetic piece rightward (clockwise) until the color disappears.

After correction, degauss the set and then check the screen corners for discoloration. If exists, fine adjust the magnetic pieces for that corner.

Repeat degaussing and checking.

2. Focus Adjustment

- (1) Supply a gray scale signal with window.
- (2) Observing around the vertical line, adjust FOCUS-2 control for best overall focus.
- (3) Observing around the horizontal line, adjust FOCUS-1 control for best overall focus.
- (4) Repeat step 2 and 3 three times or more until no further improvement is noted.

3. Static Convergence Adjustment

- (1) Tune the receiver to a crosshatch signal.
- (2) Set the BRIGHTNESS control and CONTRAST control in the standard positions.
- (3) Adjust the degree of the angle of the 4-pole magnet and the angular position of them to converge the "B" beam and "R" of the screen.
[Refer to Fig. 5-3 (b)]
- (4) Adjust the degree of the angle between the tubs of the 6-pole magnet and the angular position of them to converge the "B" beam and "R" to the center beam "G" at the center of the screen. [Refer to Fig. 5-3 (c)]
- (5) If necessary, repeat above steps.

Note 1 :

- * The 4-pole magnet moves "B" and "R" beams in opposite direction the same distance.
- * The 6-pole magnet moves "B" and "R" beams in the same direction the same distance.
- * The center beam "G" is not movable by the 4-pole and the 6-pole magnet.

Note 2 :

Never perform focus adjustment after convergence adjustments. If focus is adjusted after convergence adjustment, check convergence.

YH adjustment

4. Dynamic convergence

When color beams do not converge as they deflected upper and lower portions of the Y axis as shown at the left side of the figure below, turn the adjusting potentiometer, YH (T), on upper of the deflection yoke counterclockwise and then turn the potentiometer YH (B) clockwise until the beams come at the correct aperture mask.

* Note that the potentiometer YH (T) affects the beams at upper portion of the screen while the YH (B) at lower portion.
[Displacement amount : +1.8mm to -1.2mm]

* Read the counterclockwise and clockwise as clockwise and counterclockwise when the beam diverging directions are opposite to the example shown in the figure below.

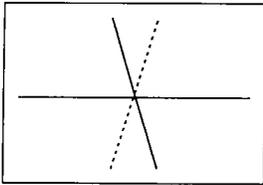

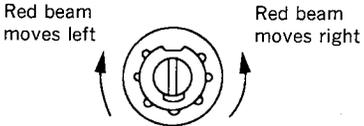

| | Direction of divergence | Adjusting potentiometers, YH (T) and YH (B) |
|----|---|--|
| YH |  |  |

Fig. 5-6 (a)

* At their full travel end, the YH potentiometers can move the beams to approx 4.0mm. Do not turn them more than 1.5 graduations.

Fig. 5-6 (b)

YV adjustment

When beam lines do not converge at upper and lower portion of the screen, turn the adjusting potentiometer, YV, at upper of the deflection yoke clockwise.

[Displacement amount : ±1.0mm]

Read the clockwise as counterclockwise when the beam diverging directions are opposite to the example shown in the figure below.

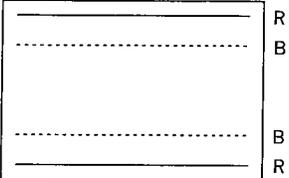

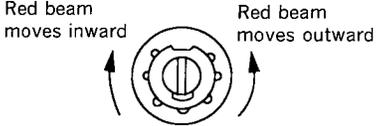

| | Direction of divergence | Adjusting potentiometers |
|----|---|--|
| YV |  |  |

Fig. 5-6(c)

XV adjustment

Adjust vertical cross (XV) with the horizontal differential coil as illustrated below.

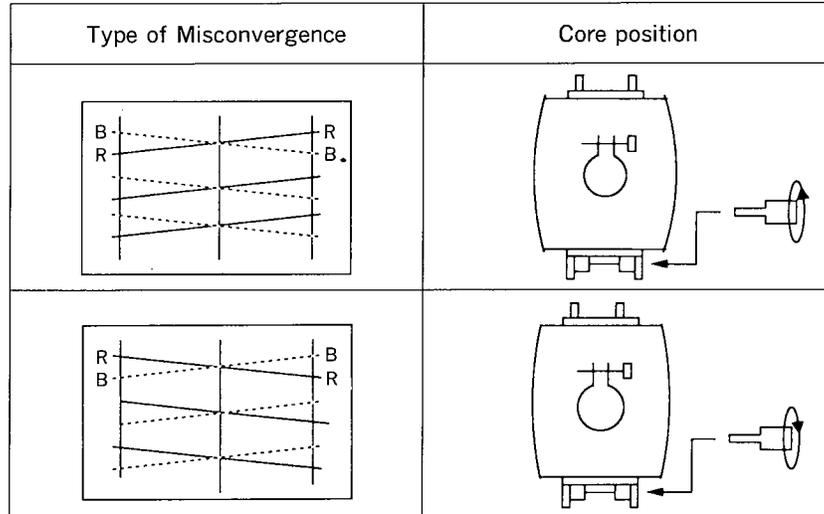

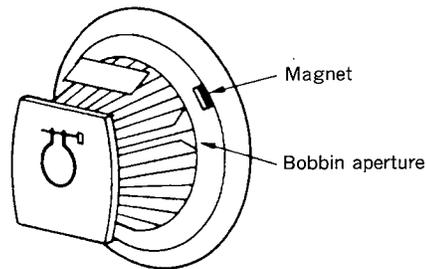

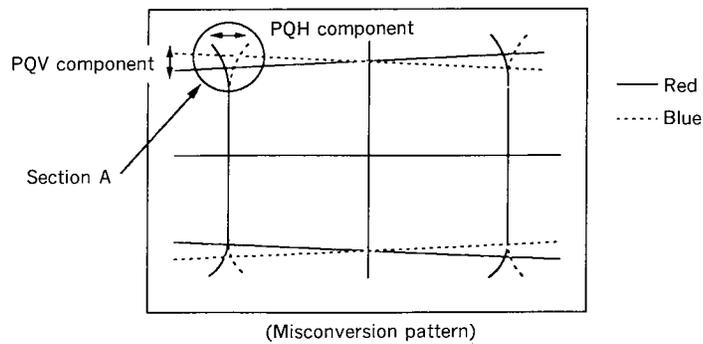

Fig. 5-7

If convergence is poor at corners, place the magnet at the aperture of the deflection yoke bobbin as shown in Fig. 5-8 so that PQH (Pin cushion quality H) and PQV (Pin cushion quality V) components shall be minimized.

To correct the A section of the screen in Fig. 5-8, stick a magnet to the position shown in Fig. 5-8 below.

(Part No. of the magnet : 461D017010)

Magnet mounting position
(Rear view of deflection yoke).

Fig. 5-8

5. After the position of the wedges have been decided, gently turn up the end of the wedge and strip the tape from the rear of the end to expose the adhesive material, then adhere to the picture tube cone.
Apply, silicone grease TSE392-C (Parts No. 859D106020) between wedges and the picture tube cone. (Fig. 5-10)
