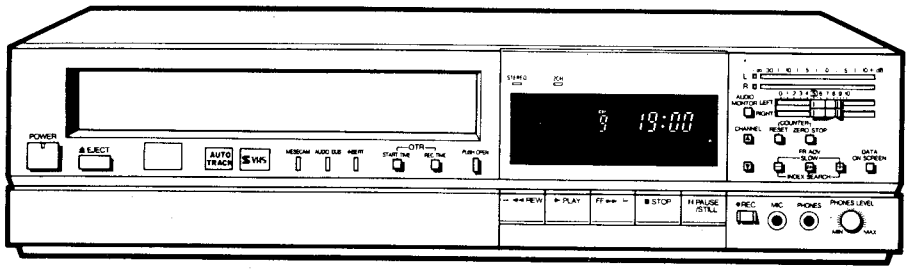
AKAI SERVICE MANUAL



S-VHS VHS PAL 625

VIDEO CASSETTE RECORDER

MODEL VS-S99EO/EOG/EK

SPECIFICATIONS

Format	EO/EOG . . .	S-VHS/VHS standard (PAL, MESECAM)
	EK	S-VHS/VHS standard
Video recording system	. .	Rotary, slant azimuth two-head helical scan system
Rotary heads	. . . . .	Four video heads, two audio heads & one erase head
RF input	EO	System B, G (PAL, MESECAM) with monaural or multiplexed 2 channel audio VHF ch 2–12, A–H_2 UHF ch 21–69 CATV S_1'–S_3', S_1–S_{20} (M_1–M_{10}, U_1–U_{10})
	EOG	System B, G (PAL, MESECAM) with monaural or multiplexed 2 channel audio VHF ch 2–12, UHF ch 21–69 CATV S_1'–S_3', M_1–M_{10}, U_1–U_{31}
	EK	System I with monaural or multiplexed 2 channel audio (NICAM) UHF ch 21–69
RF output	EO/EOG . . .	System G type modulation UHF ch 32–40 adjustable (preset ch 36)
	EK	System I type modulation UHF ch 32–40 adjustable (preset ch 38)
Recording (line input)		
	EO/EOG . . .	PAL, SECAM (MESECAM TAPE)
	EK	PAL
Playback (line output)		
	EO/EOG . . .	PAL, SECAM (MESECAM TAPE)
	EK	PAL
Video		
Line input	. . . . .	0.75–1.5 Vp-p/75 ohms, unbalanced RCA type jack 21 pin scart socket and S-socket (Y-signal) 0.15–0.6 Vp-p/75 ohms, unbalanced S-socket (C-signal)
Line output	. . . . .	1.0 Vp-p/75 ohms, unbalanced RCA type jack 21 pin scart socket and S-socket (Y-signal) Burst 0.3 Vp-p/75 ohms, unbalanced S-socket (C-signal)

Audio	(VHS Hi-Fi: 2 ch, Linear: 1 ch)
Line input level	−8 dBs/50 K ohms unbalanced RCA type jack −6 dBs/50 K ohms unbalanced 21 pin scart socket
Line output level	−8 dBs/1 K ohms unbalanced RCA type jack −6 dBs/1 K ohms unbalanced 21 pin scart socket
Mic input	−67 dBs/50 K ohms unbalanced mini jack
Dynamic range	More than 90 dB (VHS Hi-Fi)
Frequency response . . .	20–20,000 Hz (VHS Hi-Fi)
Wow & Flutter	Less than 0.005% WRMS (VHS Hi-Fi)
Recording/playback time .	240 min. with E-240 cassette in SP mode 480 min. with E-240 cassette in LP mode
Tape speed	
SP mode	23.39 mm/sec
LP mode	11.70 mm/sec
FF, REW time	Approx. 3 min. with E-180 cassette
Timer	
Program	8 programs/1 month and OTR (one touch timer recording)
Clock reference	Quartz crystal
Power requirement	
EO/EOG . . .	220 V AC, 50 Hz
EK	240 V AC, 50 Hz
Power consumption	48 W
Operating temperature . . .	5–40°C
Dimensions	424 (W) × 112 (H) × 410 (D)
Weight	9.2 Kg

Standard accessories

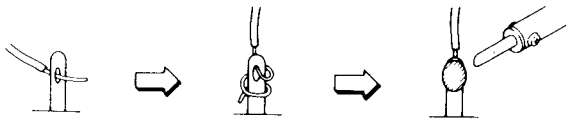
Remote control unit	1
Batteries for remote control	4
Coaxial cable (75 ohm)	1
Audio cable	1
S-VIDEO cable	1
Operator's manual	1

* For improvement purposes, specifications and design are subject to change without notice.

★SAFETY INSTRUCTIONS

PRECAUTIONS DURING SERVICING

1. Parts identified by the ⚠ (*) symbol parts are critical for safety. Replace only with parts number specified.
2. In addition to safety, other parts and assemblies are specified for conformance with such regulations as those applying to spurious radiation.
   These must also be replaced only with specified replacements.
   Examples: RF converters, tuner units, antenna selector switches, RF cables, noise blocking capacitors, noise blocking filters, etc.
3. Use specified internal wiring. Note especially:
   1) Wires covered with PVC tubing
   2) Double insulated wires
   3) High voltage leads
4. Use specified insulating materials for hazardous live parts. Note especially:
   1) Insulation Tape
   2) PVC tubing
   3) Spacers (Insulating Barriers)
   4) Insulation sheets for transistors
   5) Plastic screws for fixing microswitch (especially in turntable)
5. When replacing AC primary side components (transformers, power cords, noise blocking capacitors, etc.), wrap ends of wires securely about the terminals before soldering.



6. Observe that wires do not contact heat producing parts (heatsinks, oxide metal film resistors, fusible resistors, etc.).
7. Check that replaced wires do not contact sharp edged or pointed parts.
8. Also check areas surrounding repaired locations.
9. Use care that foreign objects (screws, solder droplets, etc.) do not remain inside the set.

SAFETY CHECK AFTER SERVICING

After servicing, make measurements of leakage-current or resistance in order to determine that exposed parts are acceptably insulated from the supply circuit.
The leakage-current measurement should be done between accessible metal parts (such as chassis, ground terminal, microphone jacks, signal-input/output connectors, etc.) and the earth ground through a resister of 1500 ohms paralleled with a 0.15 μF capacitor, under the unit's normal working conditions. The leakage-current should be less than 0.5 mA rms AC.
The resistance measurement should be done between accessible exposed metal parts and power cord plug prongs with the power switch (if included) "ON". The resistance should be more than 2.2 Mohms.

★INFORMATION

SYMBOLS OF MODEL NAME FOR PRIMARY DESTINATION

Symbol indicates the destination of the units as listed below.

Symbol	Classification	Principal Destination	System	
			Color	Broadcast
EA	S	Australia	PAL	B, G
ED	E	China	PAL	D
EDG	E	East Europe	PAL	D, K
EDI	E	China, Hong Kong	PAL	D, K, I
EG	E	Spain, Northern Europe, Other	PAL	B, G
	Y7	Saudi Arabia		
EK	B	U.K.	PAL	I
	Y1	Hong Kong

U	A	U.S.A.	NTSC	M
	C	Canada		
UM	U	Latin America	NTSC	M
J	J	Japan	NTSC	M

S-VHS SYSTEM

1. An S-VHS (Super-VHS) Overview

1-1 To meet the demand for higher picture quality imaging capabilities, the S-VHS offers a new high resolution VTR system (400 lines min. in horizontal resolution) by performing in an S-VHS mode that is divorced from any of the conventional standard VHS modes.

1-2 The S-VHS performance has been made possible by the S-VHS sub-emphasis circuit operated with new signal processing techniques and a new high performance S-VHS cassette tape.

1-3 The S-VHS VTR shall be made capable of both the following operations:

1) S-VHS mode record/playback (REC/PB) with an S-VHS cassette
2) Any standard VHS mode REC/PB with a standard VHS cassette

The VTR will therefore have to be equipped with a record (REC) mode selector switch.
Incidentally, no cassette recorded in an S-VHS mode may be played back on any conventional VHS VTR (i.e. no compatibility).

1-4 The S-VHS cassette can also serve as a standard VHS cassette.
The reverse, however, does not hold true, that is to say, no standard VHS cassette may serve as an S-VHS cassette.

2. S-VHS Engineering Specifications

2-1 S-VHS VIDEO CASSETTE

VIDEO CASSETTE
Conforms to the VHS specifications, similarly to any standard VHS or VHS-C cassette.
Only, an ID hole will have to be provided on the cassette for identification of its S-VHS format.

ID hole
Provided on all S-VHS cassettes, serves to have a VTR identify their S-VHS format. The S-VHS video tape recorder equipped with an auto-ID unit for telling regular VHS cassettes apart automatically prevents any S-VHS REC mode from being phased in when loaded with a regular VHS cassette.

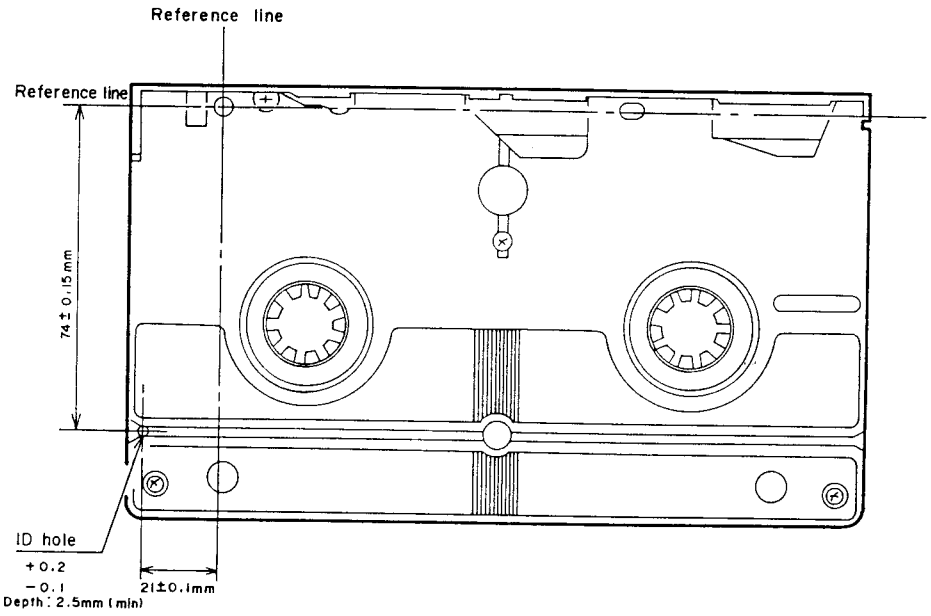

Fig. 1 S-VHS standard cassette ID hole

MAGNETIC TAPE
A high performance tape that meets the freshly set S-VHS standard. Its higher performance has substantially contributed to the high picture quality of S-VHS imagings. To maintain compatibility with the regular VHS, however, the use of any special tape has been avoided, and the usual hematite tape been employed instead, successfully achieving the high performance capabilities.

2-2 S-VHS Specifications

Both the NTSC and PAL versions conform to the VHS specifications, except that the S-VHS REC modes of the NTSC version cover only the SP (standard) and EP (6 hours) formats, and no LP (4 hours) format.

2-3 S-VHS video signal REC format (PAL/NTSC)

The S-VHS recorded frequency band surpasses that of the regular VHS REC frequency band mainly through the following improvements.

1) In/Output Video Signals

Either PAL (NTSC) signals or the separate Y/C signals that conform with the PAL (NTSC) signal format.

① Y/C separator for which comb filters have been employed, to fully utilize In/Output Signals:

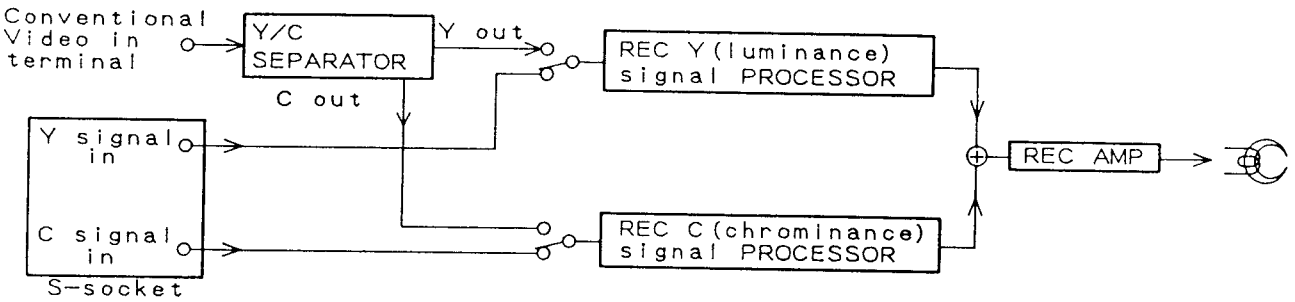
The S-VHS picture quality is enhanced by utilizing the 3 MHz and higher band luminance signal left unused by the conventional VHS in which a chrominance signal has been interleaved. For this reason, high precision comb filters have been employed for the Y/C separation of this band. (This arrangement is mandatory for the NTSC version.)

② Separate Y/C signal input/output terminals (S-Socket)

The S-VHS type VCR is equipped with video input/output terminals for conventional composite video signals as well as an S-socket for separate luminance (Y) and chrominance (C) signals (Figs. 2 and 3).

Accordingly, by operating the S-VHS combined with an S socket-equipped TV set, all Y/C interferences may be eliminated and crosstalk and dot interferences suppressed as well, contributing to an overall enhancement of the picture quality.

Recording



Playback

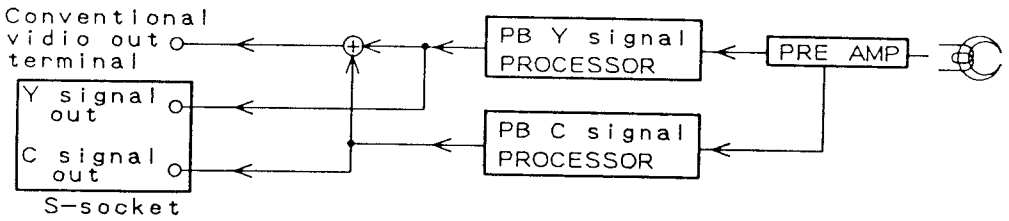


Fig. 2 Separated Y/C signal input-output socket system

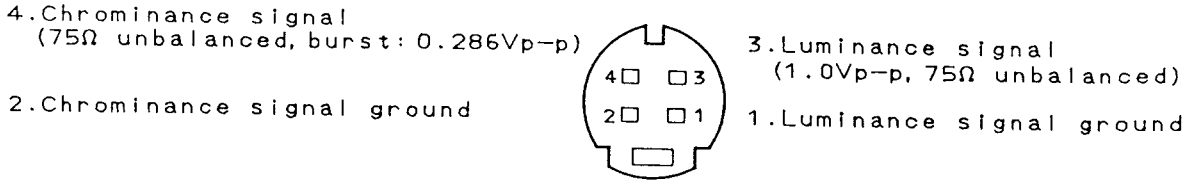

Fig. 3 S-socket

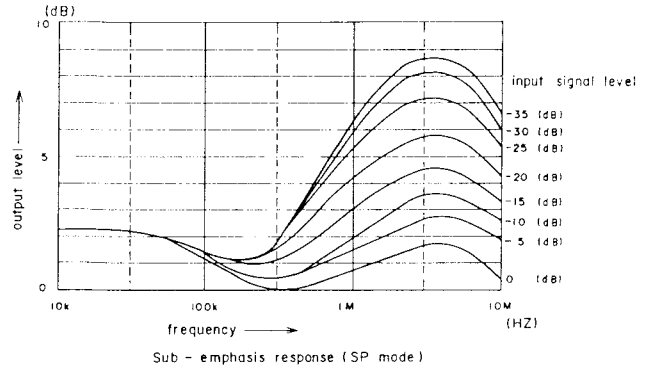
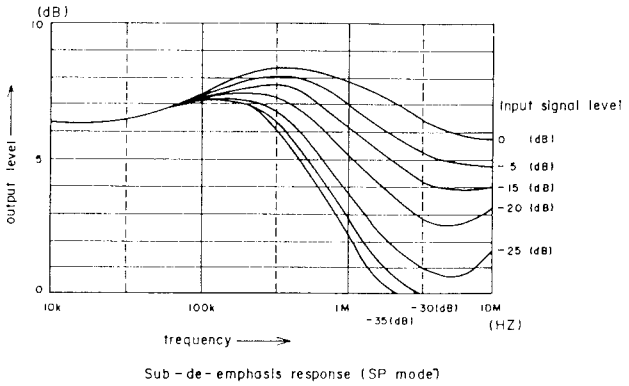
2) Add-on Sub-Emphasis

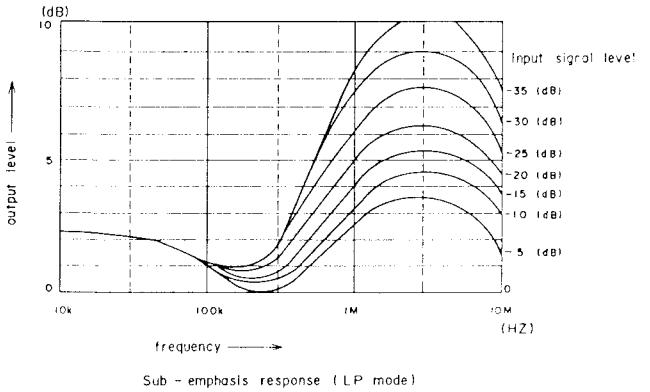
The S-VHS sub-emphasis is a non-linear emphasis circuit that corresponds to the non-linear emphasis, detail enhancer, or equivalent of the conventional VHS or HQ, but has been configured focusing on the further extended high frequency range of S-VHS.

Figs. 4 and 5 show the SP as well as LP mode output response curves of the sub-emphasis and sub-de-emphasis circuits respectively, when a sweep signal has been added to the emphasis circuit.

Unlike the conventional non-linear emphasis circuit (Fig. 6) or the detail enhancer (Fig. 7), these sub-emphasis/sub-de-emphasis circuits exhibit a unique contour of their response curves at mid-range frequencies between the low and high regions, first dipping downward and then climbing up again along with a rise in frequencies. Their response to a pulse input is shown in Fig. 8 in contrast with that of the conventional VHS.







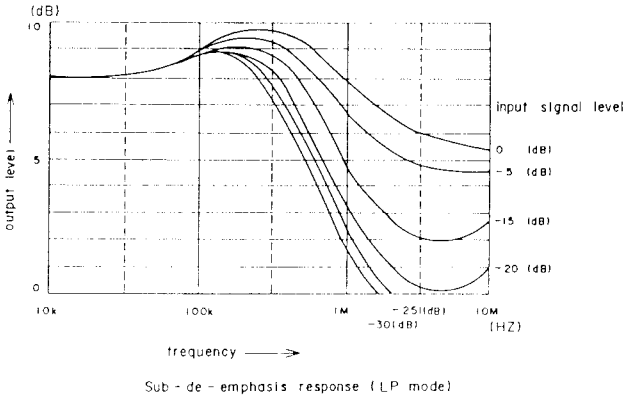


Fig. 4 Sub-emphasis response

Fig. 5 Sub-de-emphasis response

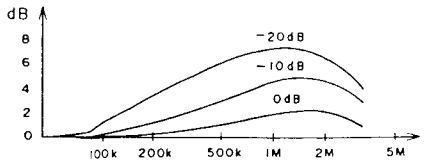

Fig. 6 VHS conventional non-linear emphasis response

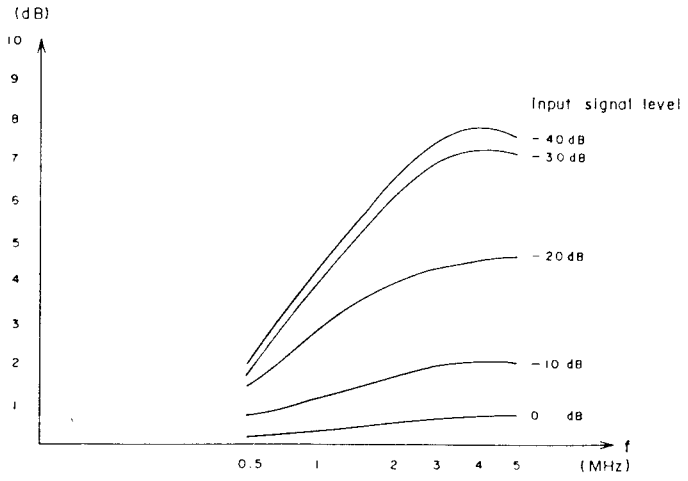

Fig. 7 Detail enhancer response

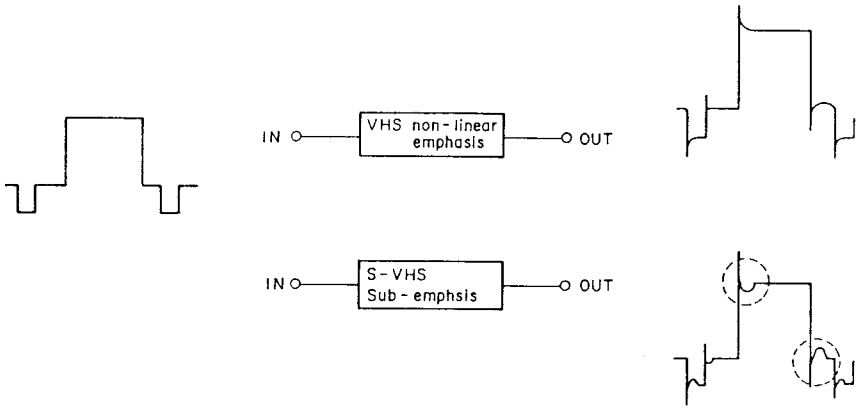

Fig. 8 Comparison of emphasis response

3) Luminance signal REC carrier frequency shift

To improve the video signal's high range frequency response during recording/playback, Y signal REC carrier frequency is increased (PAL: 3.8–4.8 MHz, NTSC: 3.4–4.4 MHz to 5.4 MHz–7 MHz). The deviation band is also expanded from 1 MHz to 1.6 MHz. The new S-VHS tape makes this frequency increase possible.

Luminance signal REC format: frequency modulated recording

White peak : 7.0 MHz ± 100 kHz
Sync tip : 5.4 MHz ± 100 kHz
Deviation : 1.6 MHz ± 100 kHz

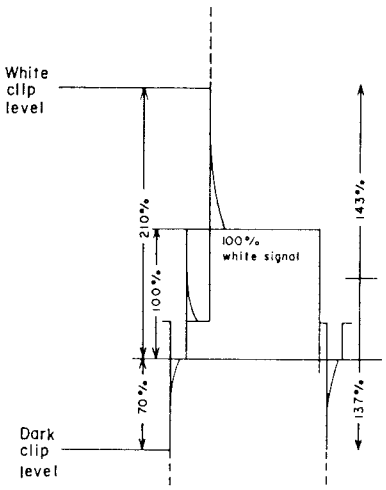

Fig. 9 White & dark clip

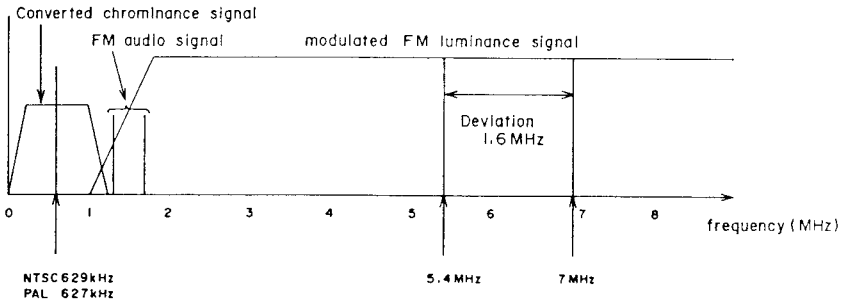

Fig. 10 Modulated luminance and chrominance signal spectrums

4) Others

① FM luminance signal recording current

The current setting shall be made to provide an optimum recording current level for the S-VHS tape.

② Pilot burst signal (with PAL System only)

By adding the pilot burst signal onto the recording chrominance signal, the luminance signal playback circuit shall be made switchable by detecting the pilot burst signal phase in a PB mode.

The purpose of this arrangement is to switch the Y PB circuit in accordance with whether any or no high frequency components of the luminance signal have been included in the chrominance signal at recording, by detecting an index signal added on for the switching purpose to the chrominance signal in advance, to preclude any interference between the C and Y circuits brought about by the invasion of the chrominance frequency band at playback by such high frequency components of the luminance signal. Unlike the NTSC, the PAL system leaves the use of comb filters optional for the Y/C separation of a composite input, which is the reason for the add-on pilot burst signal. The pilot burst injecting location on the circuit is the stage preceding the main converter.

I. CONTROLS

II. DISASSEMBLY

2-1. REMOVAL OF TOP COVER

1) As shown in Fig. 2-1, remove the four screws (ⓐ, ⓑ, ⓒ and ⓓ, two on each side retaining the top cover.
2) Gently expand the bottom edges of the top cover, pivot cover forward, then slide toward rear, in the direction of the arrows.

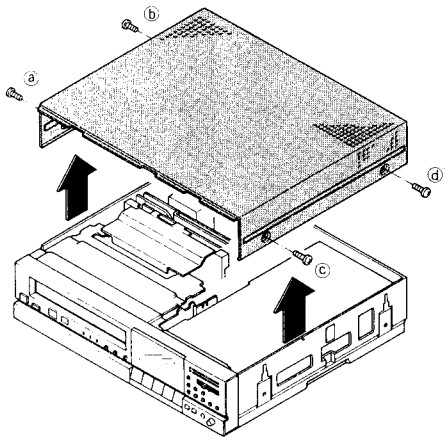

Fig. 2-1

2-2. REMOVAL OF BOTTOM COVER

1) Remove the ten screws (ⓐ, ⓑ, ⓒ, ⓓ, ⓔ, ⓕ, ⓖ, ⓗ, ⓘ and ⓙ) retaining the bottom cover as shown in Fig. 2-2.
2) Remove the bottom cover by sliding toward the rear and pulling outward in the direction of the arrow.

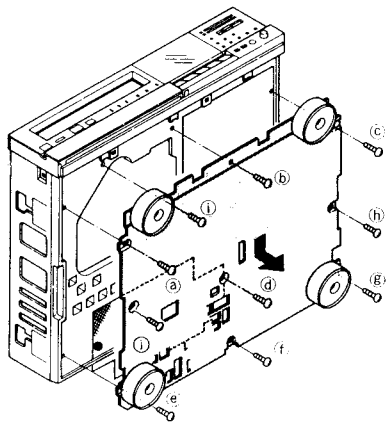

Fig. 2-2

2-3. REMOVAL OF FRONT PANEL

1) Remove the top cover.
2) Pull out the PHONES LEVEL knob on the front panel.
3) Remove the screw ⓘ on the top side of the front panel.
4) Release the hooks ⓐ, ⓑ, ⓒ, ⓓ, ⓔ, ⓕ, ⓖ and remove the front panel in the direction of the arrows as shown in Fig. 2-3.

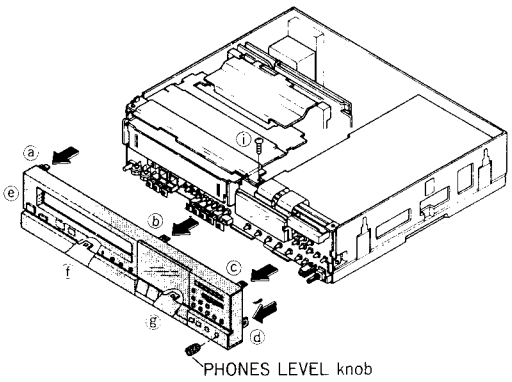

Fig. 2-3

2-4. HOW TO EXECUTE CIRCUIT BOARD SERVICE

CAUTION: Before attempting to remove or repair any PCB unplug the power cord from the A.C. source.

Location of printed circuit boards (Refer to Fig. 2-4)

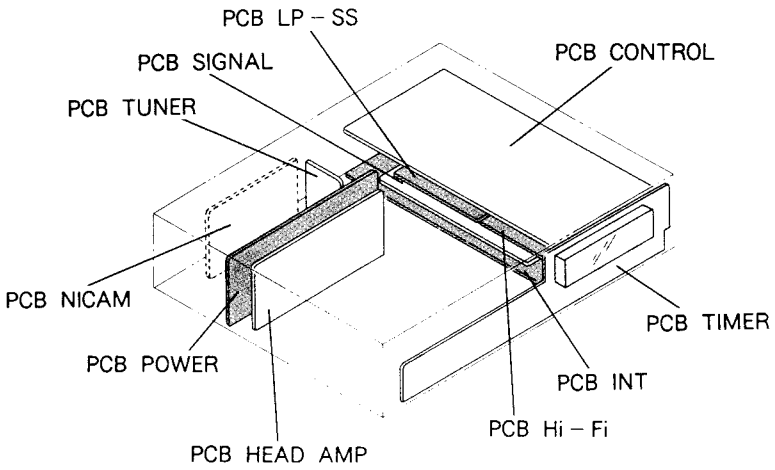

Fig. 2-4

2-4-1. PCB CONTROL

1) Remove the top cover.
2) Remove the four screws ⓐ, ⓑ, ⓒ and ⓓ retaining the PCB CONTROL as shown in Fig. 2-5.
3) Release the hook ⓔ and pivot the PCB CONTROL in the direction of the arrow.

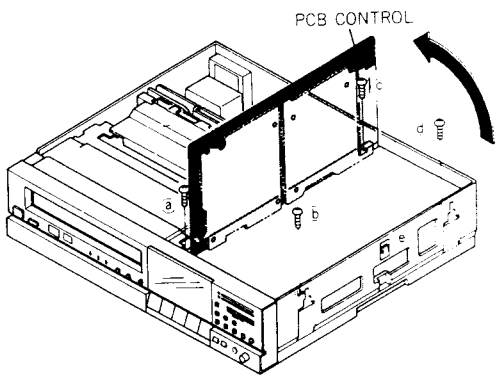

Fig. 2-5

2-4-2. PCB Hi-Fi

1) Pivot the PCB CONTROL.
2) Unlock the four PCB supports (ⓐ, ⓑ, ⓒ and ⓓ) retaining the PCB Hi-Fi as shown in Fig. 2-6.

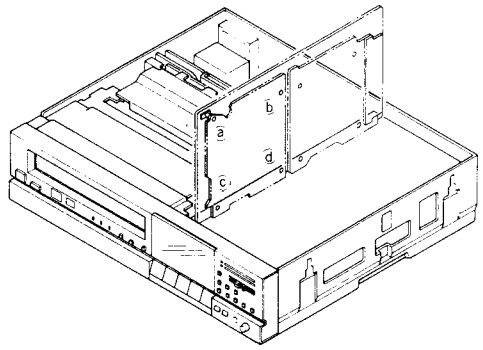

Fig. 2-6

2-4-3. PCB LP-SS

1) Pivot the PCB CONTROL.
2. Unlock the four PCB supports (ⓐ, ⓑ, ⓒ and ⓓ) retaining the PCB LP-SS as shown in Fig. 2-7.

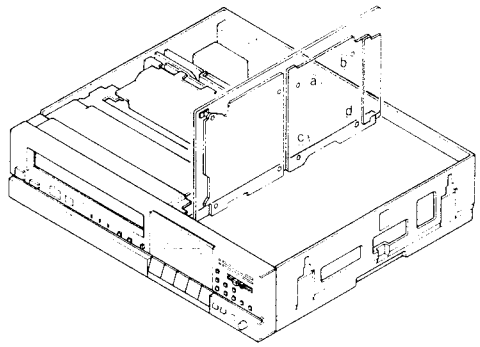

Fig. 2-7

2-4-4. PCB Y-SIGNAL

1) Pivot the PCB CONTROL.
2) Disconnect connector YR on the PCB Y-SIGNAL.
3) Unlock the two PCB supports (ⓐ and ⓑ) retaining the PCB Y-SIGNAL and pivot the PCB Y-SIGNAL in the direction of the arrow as shown in Fig. 2-8.

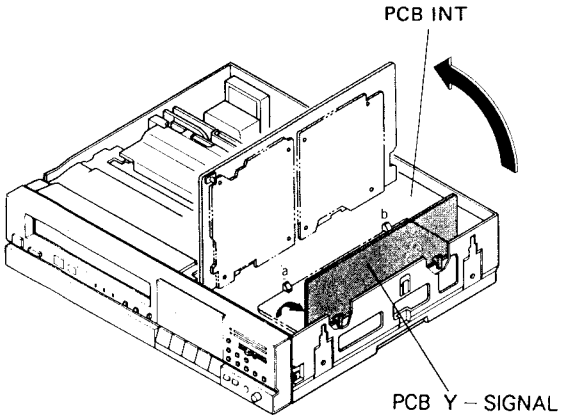

Fig. 2-8

2-4-5. PCB INT

1) Remove the bottom cover.
2) Pivot the PCB Y-SIGNAL.

2-4-6. PCB TIMER

1) Remove the front panel.
2) Remove the four screws (ⓐ, ⓑ, ⓒ and ⓓ) retaining the PCB TIMER and then remove the PCB TIMER as shown in Fig. 2-9.

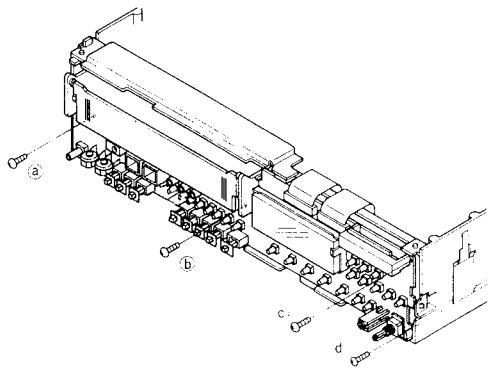

Fig. 2-9

2-4-7. PCB HEAD AMP

[Removal]

1) Remove the two screws (ⓐ and ⓑ) retaining the drum shield plate and then remove the drum shield plate.
2. Remove the two screws (ⓒ and ⓓ) retaining the PCB HEAD AMP and remove the PCB HEAD AMP by lifting in an upward direction as shown in Fig. 2-10.

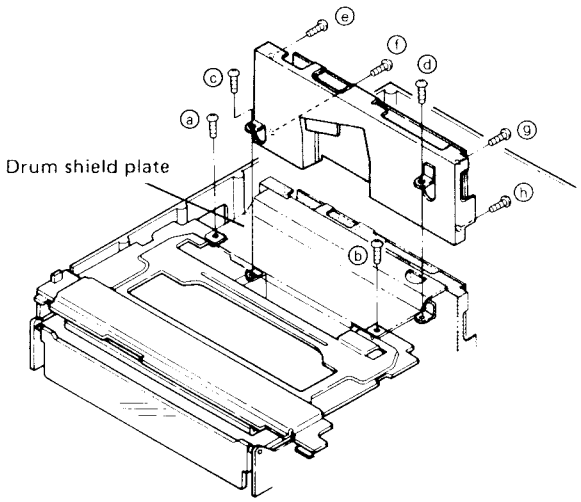

Fig. 2-10

[Installation]

1) Install the PCB HEAD AMP onto the drum assembly by connecting the connector [GB] on the PCB HEAD AMP.
2) With PCB HEAD AMP installed as in the above step 1), make sure the holes of the set screws (ⓒ and ⓓ) are aligned.
   If not, change the mounting position of the shield case and PCB so that the holes of the set screws (ⓒ and ⓓ) are properly aligned.
   If PCB is fastened without aligning the holes of the screws, the FM waveform may be disturbed.

2-4-8. PCB TUNER

1) Remove the three screws (ⓐ, ⓑ and ⓒ) retaining the PCB TUNER as shown in Fig. 2-11.
2) Remove the two screws (ⓓ and ⓔ) retaining the Radiator holder.
3) Remove the PCB TUNER by lifting in an upward direction.

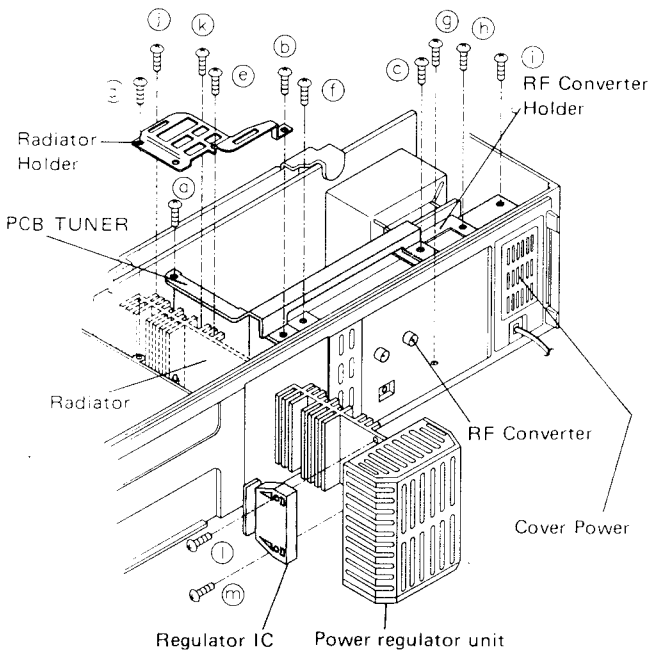

Fig. 2-11

2-4-9. PCB POWER TRANS

1) Remove the PCB TUNER.
2) Remove the three screws (ⓕ, ⓖ and ⓗ) retaining the RF converter as shown in Fig. 2-11.
3) Remove the RF converter and the RF converter holder by lifting in an upward direction.
4) Remove the screw (ⓘ) retaining the cover power and remove the cover power.
5) Remove the screw (ⓐ) retaining the PCB HEAD AMP and the ground lead wire as shown in Fig. 2-12.
6) Remove the four screws (ⓑ, ⓒ, ⓓ and ⓔ) retaining the PCB POWER TRANS.
7) Unlock the hook and remove the PCB POWER TRANS by pulling upward as shown in Fig. 2-12.
8) Remove the four screws (ⓕ, ⓖ, ⓗ and ⓘ) retaining the bracket and remove the bracket from the PCB POWER TRANS.

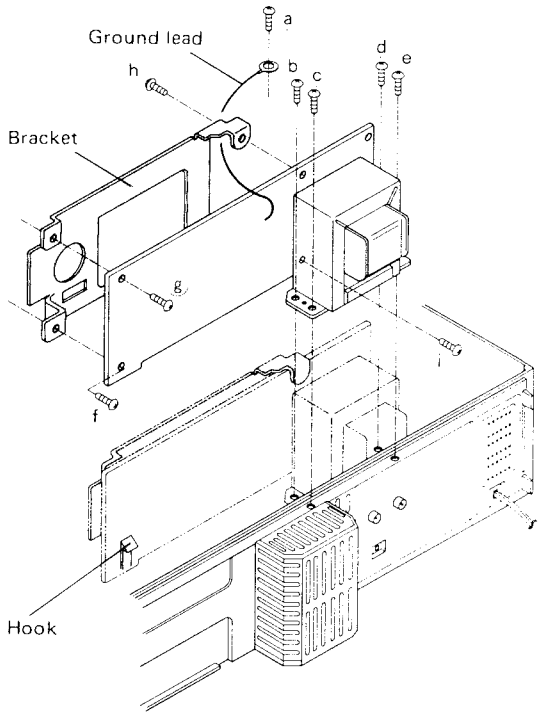

Fig. 2-12

2-4-10. POWER REGULATOR UNIT (IC970)

1) Remove the two screws (ⓓ and ⓔ) retaining the Radiator holder as shown in Fig. 2-11.
2) Remove the two screws (ⓙ and ⓚ) retaining the power regulator unit and sliding toward the rear side as shown in Fig. 2-11.
3) Remove the two screws (ⓛ and ⓜ) retaining the regulator IC and remove the regulator IC from the Radiator as shown in Fig. 2-11.

III. MAJOR COMPONENT REMOVAL AND INSTALLATION

3-1. REPLACEMENT OF CASSETTE HOUSING

[Removal]

1) Remove the top cover and front panel.
2) Remove the two screws (ⓐ and ⓑ) retaining the video head shield cover and remove the two screws (ⓒ and ⓓ) retaining the stay front as shown in Fig. 3-1.
3) Remove the video head shield cover and stay front.
4) Remove the cassette housing loading belt as shown in Fig. 3-2.
5) Disconnect connector DF , as shown in Fig. 3-3.
6) Unclamp lead wire on the cassette housing as shown in Fig. 3-1.
7) Remove the two screws (ⓐ and ⓑ) retaining the cassette housing as shown in Fig. 3-3.
8) Remove the cassette housing by sliding back in the direction of the arrow.

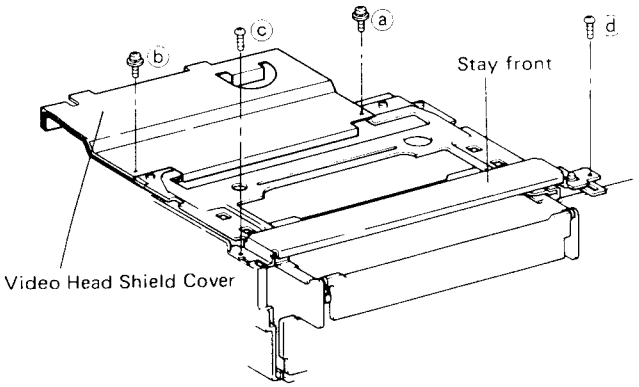

Fig. 3-1

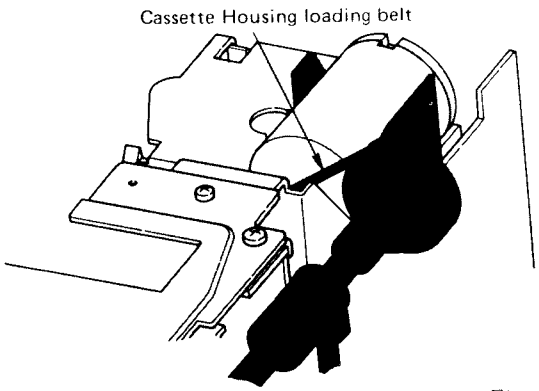

Fig. 3-2

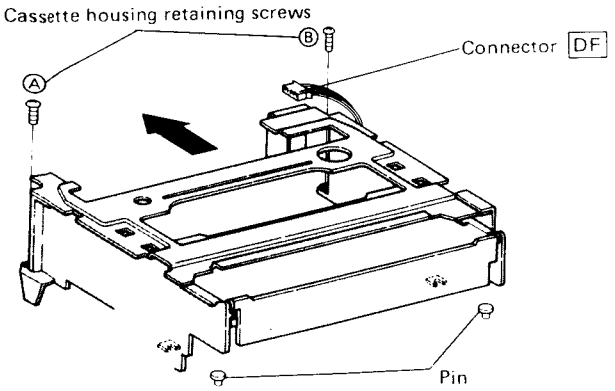

Fig. 3-3

[Replacement]

To reassemble the cassette housing into the VCR adhere to the following steps. If these steps are not carried out properly, abnormal noise may be produced in the FF and REW modes or the tape may be damaged in play-back.

1) Set the positioning U-holes at the right and left front of the cassette housing side onto the pins at the front side of the main transport plate, refer to Fig. 3-3, then slide the cassette housing inside to the point where the holes for the housing screws are matched to the screw holes on the main plate.
2) Install the two cassette housing screws.
3) Clamp the lead wire on the cassette housing.
4) Reconnect connectors DF .
5) Attach the cassette housing loading belt shown in Fig. 3-2.
6) Attach the stay front and the video head shield cover as shown in Fig. 3-1.
7) Check that the cassette is loaded and unloaded smoothly without abnormal noise.
8) Check that, in the unloaded position, the loading prevention latch attached to the bottom of the cassette housing is fastened to the housing side strip. (See Fig. 3-4)
9) If an irregularity is detected in steps 7) and 8) the cassette housing may be incorrectly assembled. Loosen the fastening screws, unfasten the cassette housing and readjust, as required.

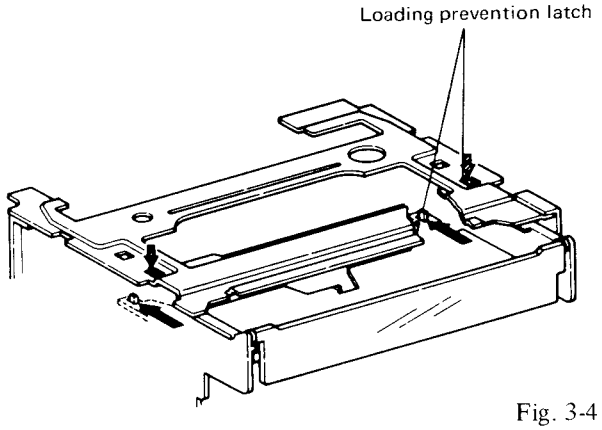

Fig. 3-4

3-2. REPLACEMENT OF DRUM MOTOR/ VIDEO HEAD ASSEMBLY

[Removal of Drum Motor/Video Head Assembly]

1) Remove the video head shield cover.
2) Remove the PCB HEAD AMP.
3) Remove the Regulator Transistor fastening screw as shown in Fig. 3-5 and remove the Regulator Transistor.
4) Disconnect connector DY from Drum assembly.
5) Remove the three drum retaining screws as shown in Fig. 3-6.

6) Holding the upper drum assembly, remove the complete Drum Motor/Video head assembly by gently pulling in an upward direction.
7) Disconnect connector DA from Drum assembly.
8) Remove the brush retaining screw and brush as shown in Fig. 3-6.

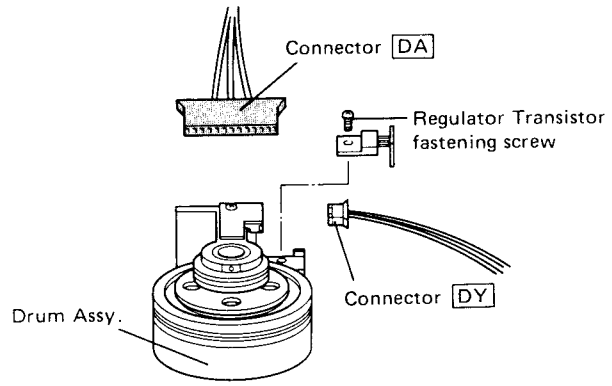

Fig. 3-5

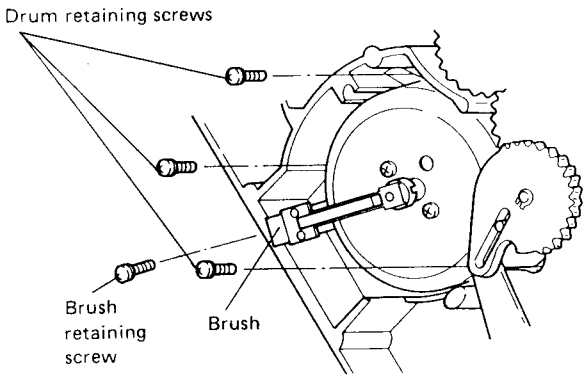

Fig. 3-6

[Installation of Drum Motor/Video Head Assembly]

During installation, avoid holding the Upper drum with bare hands. If this cannot be avoided, a cleaning procedure must be performed.

1) Fasten the brush with the brush retaining screw to the new Drum assembly as shown in Fig. 3-6.
2) Reconnect connector DA.
3) Carefully holding the complete drum assembly (with a piece of cotton cloth), slowly insert the drum assembly into its original drum mounting position.
   NOTE: Do not apply excessive force to the video heads as damage will result.
4) Secure with the three drum retaining screws previously removed, as shown in Fig. 3-6.
5) Fasten the Regulator Transistor assembly with mounting screw.
6) Reconnect connector DY as shown in Fig. 3-5.
7) Reinstall the video head shield cover.
8) When the complete drum assembly has been changed, precise alignment is required.
   Check and adjust playback switching point, tracking preset, colour recording level, FM recording level and interchangeability.

3-3. REPLACEMENT OF CAPSTAN MOTOR

[Removal of Capstan Motor]

1) On the underside of the transport deck, remove the two stopper–RD retaining screws (ⓐ and ⓑ) as shown in Fig. 3-7.
2) Remove the belt–R from the pulley-belt.
3) Remove the three Grip rings (ⓒ, ⓓ and ⓔ) retaining the link–B and remove the link–B as shown in Fig. 3-7.
4) Disconnect connector DC as shown in Fig. 3-7.
5) Remove the three screws retaining the Capstan motor as shown in Fig. 3-8.

[Installation of Capstan Motor]

1) Fasten the Capstan motor with the three Capstan motor retaining screws as shown in Fig. 3-8.
2) Reconnect connector DC as shown in Fig. 3-7.
3) Install link–B so the pin fits in the outside slot of CAM-GEAR-M, and install the grip rings at three locations.
4) Install belt–R and stopper–RD.
5) Clean the capstan shaft after its installation by wiping with alcohol.

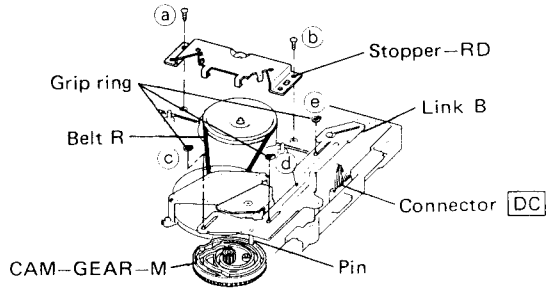

Fig. 3-7

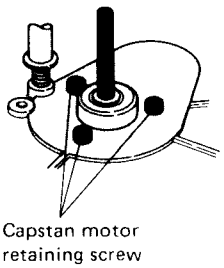

Fig. 3-8

3-4. REPLACEMENT OF BELT–R

[Removal of Belt–R]

1) Remove the two screws (ⓐ and ⓑ) retaining the stopper–RD as shown in Fig. 3-9.
2) Remove the two rotor thrust bearing retaining screws (ⓒ and ⓓ) as shown in Fig. 3-9.
3) Lift the rotor thrust bearing a little and remove the belt–R as shown in Fig. 3-9.

[Installation of Belt–R]

1) Reverse steps 1) ~ 3) in section 3-4. [Removal of Belt–R] to install a new belt–R.

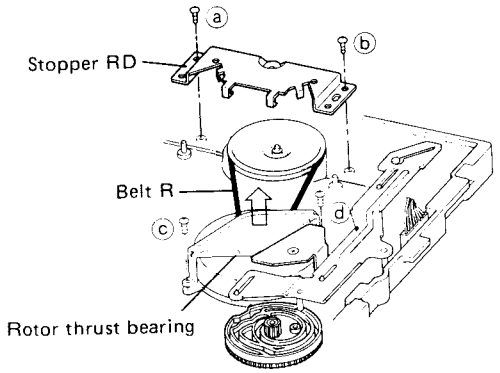

Fig. 3-9

3-5. REPLACEMENT OF LOADING MOTOR

[Removal of Loading Motor]

1) Remove the PCB HEAD AMP.
2) Remove the holder AMP with retaining screw as shown in Fig. 3-10.
3) Disconnect connector DL.
4) Remove the cassette housing loading belt as shown in Fig. 3-10.
5) Remove the loading belt as shown in Fig. 3-10.
6) Unlock the three supports (ⓐ , ⓑ and ⓒ) shown in Fig. 3-10 and remove the holder-worm.
7) Unlock the two Motor supports (ⓓ and ⓔ) as shown in Fig. 3-10 and remove the loading motor.

[Installation of Loading Motor]

1) Reverse steps 1) ~ 7) in section 3-5. [Removal of Loading Motor] to install a new loading motor.

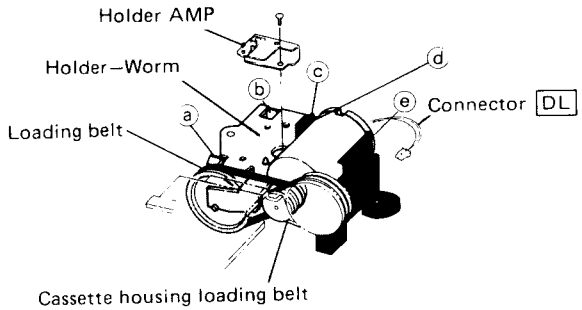

Fig. 3-10

3-6. REPLACEMENT OF PINCH ROLLER

1) Pull Pinch roller cap upward to remove. (Refer to Fig. 3-11).
2) Insert new Pinch roller. (Refer to Fig. 3-11).
3) Replace the pinch roller cap. Make sure that the direction of the cap is within the range shown in Fig. 3-11.

NOTE: It is advisable, when replacing the pinch roller cap, to support the arm-pinch from underneath to prevent it from being bent during this operation.

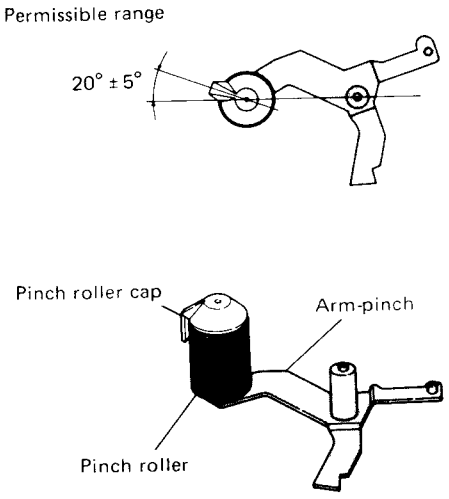

Fig. 3-11

IV. MECHANICAL ADJUSTMENT

NOTE: Some adjustments will require the use of a dummy video cassette tape.
A dummy video cassette tape can be prepared in the following way.
1. Remove both tape reels and the tape protection cover from a video cassette you no longer need.
2. Cover the video cassette's left and right side detection holes with black adhesive tape.

4-1. TENSION POLE POSITION ADJUSTMENT

1) Insert a dummy cassette in the cassette housing and set the recorder to the playback mode.
2) After loading has been completed remove the power cord from AC source.
3) Remove the cassette housing assembly.
4) Make sure that the tension pole is within the range shown in Fig. 4-1.
5) If the tension pole is outside the range, move the holder shown in Fig. 4-2 and adjust the position of the tension pole.

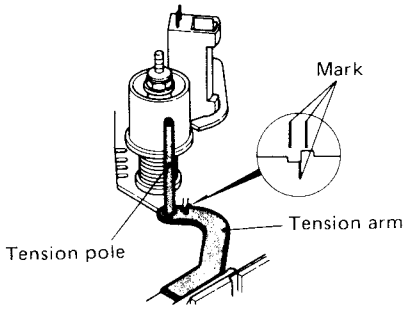

Fig. 4-1

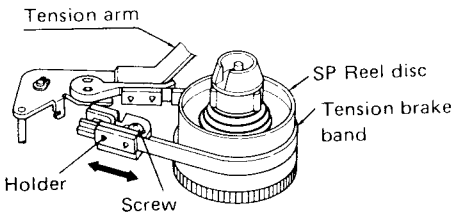

Fig. 4-2

4-2. BACK TENSION CHECK AND ADJUSTMENT

1) Insert the back tension meter and set the recorder to the playback mode.
2) Check that the mean value is 54 ± 4 g-cm on the supply side.
3) If the mean value exceeds 58 g-cm adjust the value to 54 g-cm by adjusting the location of the spring Ⓐ in the direction of arrow ⓐ as shown in Fig. 4-3.
4) If the pointer mean value is much less than 50 g-cm, adjust it to 54 g-cm by adjusting the location of the spring Ⓐ in the direction of arrow ⓑ.
   NOTE: The deviation of back tension value is not specified. However, if it fluctuates by more than 5 g-cm after a stabilizing period, then a problem exists in one of the associated parts.
   Check and repair as required.
5) Check that no skew distortion is observed during playback mode.

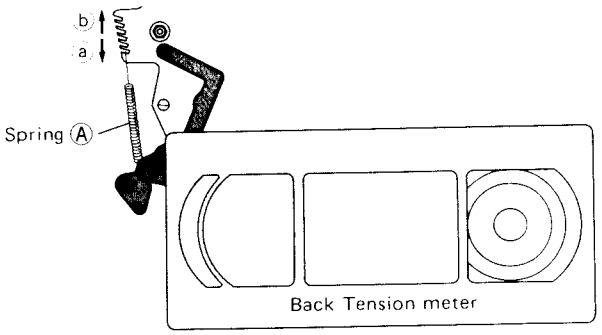

Fig. 4-3

4-3. POSITIONING OF GEARS AND THEIR INSTALLATION SEQUENCE

1) Set the gears so the positioning bore holes both for CAM-GEAR-M and main plate line up with each other (Refer to Fig. 4-7), confirm that the UNIT-ARM-MAIN pin on the front side of deck fits in the 2 mm slot of CAM-GEAR-M, and the LEVER-AP pin shall be fits in the 3 mm slot (Refer to Fig. 4-4).
2) Set ARM-LOAD pin so it fits in the slot of CAM-GEAR-M as shown in Fig. 4-5.
3) Fix CP-BRAKE pin so as to be held outside of CAM-GEAR-M.

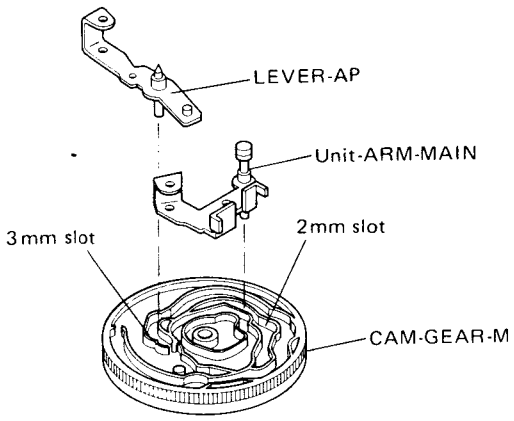

Fig. 4-4

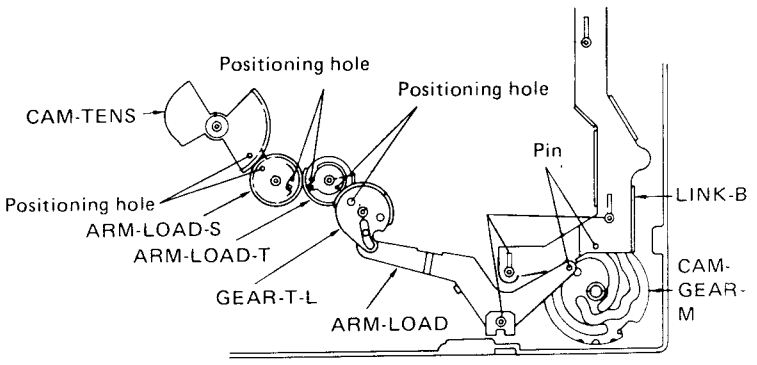

Fig. 4-5

4) Install ARM-LOAD-T, refer to Fig. 4-5.
5) Install GEAR-T-L so it aligns with the positioning hole of ARM-LOAD-T.
6) Install ARM-LOAD-S so the hole lines up with the positioning hole of ARM-LOAD-T.
7) Install CAM-TENS so the positioning hole lines up with the positioning hole of ARM-LOAD, etc.
8) Install LINK-B so the pin fits inside the slot of CAM-GEAR-M as shown in Fig. 4-5.
9) Install GRIP-RINGS, at 8 locations.

4-4. MODE SWITCH ATTACHMENT AND ADJUSTMENT

NOTE: When adjusting or repairing the mode switch ensure that the VCR is turned off in the "STOP" mode. (This time the half loading pole moves nearly to the audio/control head.)

Disconnect the power source plug.

1) Align both matching marks on the mode switch, as shown in Fig. 4-6.
2) The continuity of each of the pins should be checked to ground with an ohmmeter by connecting its red lead to GND, and black lead to each specific pin in sequence. Rotate the gear so the continuity conforms with the that given in Fig. 4-6.

   NOTE: The ohmmeter should be used at a high range (x 1000 or higher)
   Checking with x 1 range allows current of over 40 mA to flow and damage could result.
3) Set the CAM-GEAR-M so the positioning hole in the gear lines up with the positioning hole in the main plate, as shown in Fig. 4-7.

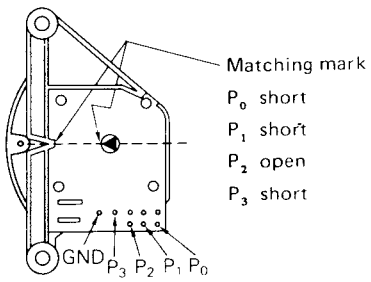

Fig. 4-6

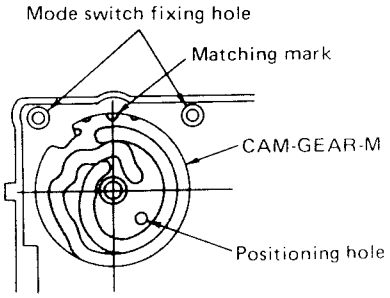

Fig. 4-7

4) Secure the mode switch to deck, taking care that the gears DO NOT ROTATE.
5) Repeat the continuity test given in Item 2), if any deviation is found after the mode switch is mounted, remove the mode switch and repeat the procedures given in Items 2) ~ 5), until correct continuity is achieved.

4-5. HALF LOADING UNIT ADJUSTMENT

4-5-1. Replacement of half loading unit

Remove each parts in the following order.

① Top cover
② Audio/Control head
③ Taper nut
④ Front loading unit
⑤ Half loading unit (Set Screws ⓒ, ⓓ and ⓔ are shown in Fig. 4-8.

For installation of the parts, install in reverse order and after the installation of front loading unit ④ execute the adjustment of the half loading gear position. (See 4-5-2)

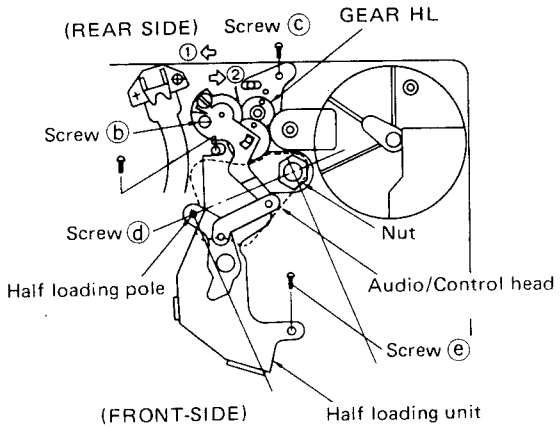

Fig. 4-8

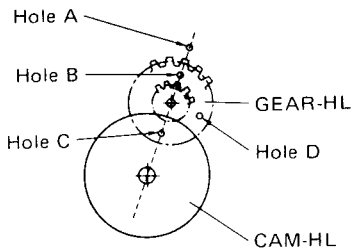

Fig. 4-9

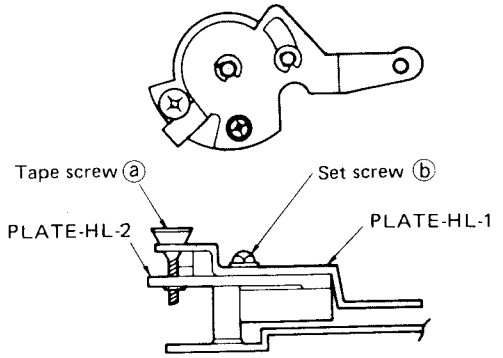
4-5-2. Adjustment of half loading gear position

1) Insert a dummy cassette in the cassette housing (at this time the recorder will go into the PLAY mode), then turn off the VCR. (At this time the half loading pole moves nearly to the audio/control head.)
2) Disconnect the power source plug.
3) Remove the set screw ⓒ in the half loading unit and loosen the set screws ⓓ and ⓔ (see Fig. 4-8). Slide the half loading unit in the direction of the arrow ①⇦ to align the three holes B, C and D in the half loading gear to the position shown in Fig. 4-9.
4) Slide the half loading unit in the direction of the arrow ②⇨ and secure in this position with screws ⓒ, ⓓ and ⓔ. Adjust the half loading pole position according to 4-5-3 before performing interchangeability and A/C HEAD adjustments and secure it with screw ⓑ for the time being.
5) Connect the power source plug and eject the dummy cassette.
6) After performing interchangeability and audio/control head adjustments, readjust the half loading pole position.

4-5-3. Adjustment of half loading pole position

Adjust the position of the half loading pole after interchangeability and A/C HEAD adjustments are performed.

1) Disconnect the power supply plug with the transport in the FAST FORWARD mode or the REWIND mode.
2) Loosen the set screw ⓑ so that PLATE-HL-1 can be moved.
3) Adjust the taper screw ⓐ so that the gap between the half loading pole and AE-HEAD shall be 0.45 ± 0.15 mm at the top of the pole. (Fig. 4-10).
4) Tighten the set screw ⓑ. After tightening, check again if the gap is 0.45 ± 0.15 mm. If not, loosen the set screw ⓑ and adjust the gap again.
5) On completion of adjustment, lock the taper screw ⓐ and the set screw ⓑ with a locking compound.



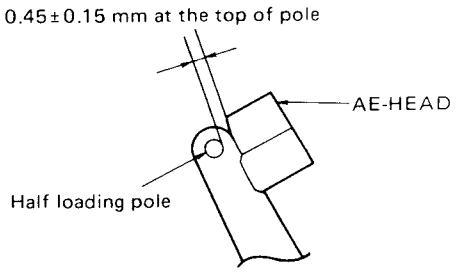


Fig. 4-10

4-6. TAPE PATH CHECK AND ADJUSTMENT

4-6-1. Tape run check

1) Load a recorded tape. Repeat playback and stop several times and check the following.

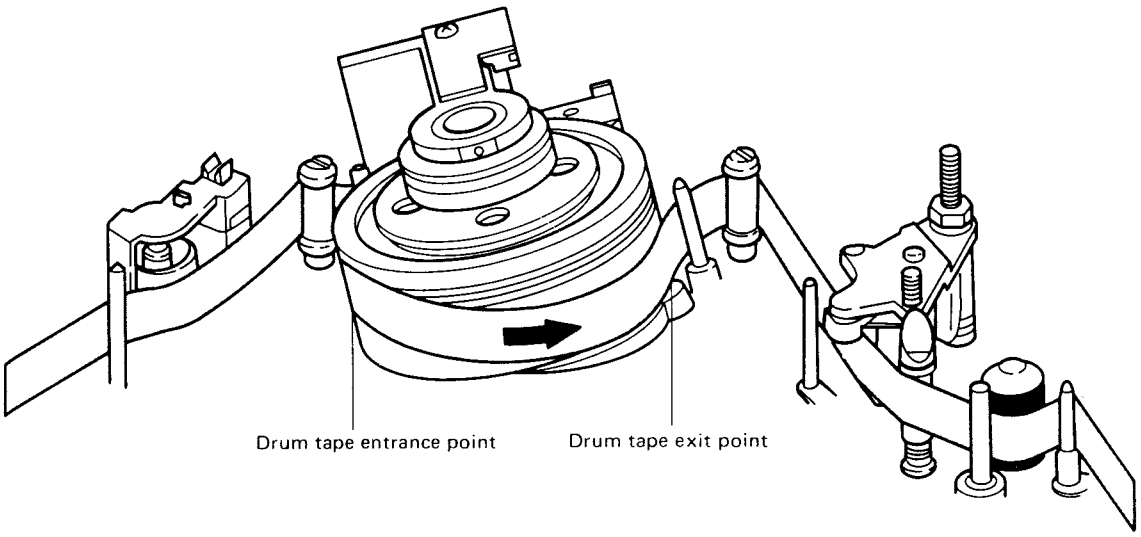

Fig. 4-11

2) Be sure that the tape does not run outside the drum lead path at the drum entrance and exit points in the playback mode.
   NOTE:
   * If the tape runs above the drum lead path, a "pit-a-pat" sound is generated because the video head catches the tape edge.
   * If the tape runs below the drum lead path, it will become curled or creased, and may also cause noise or instability in the picture.
3) Be sure that the tape is not curled or creased at either the guide roller or the guide poles on the supply and take up side, in loading, playback and unloading.

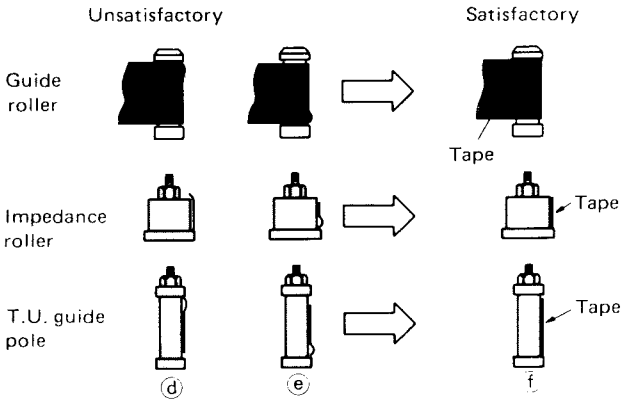

Fig. 4-13

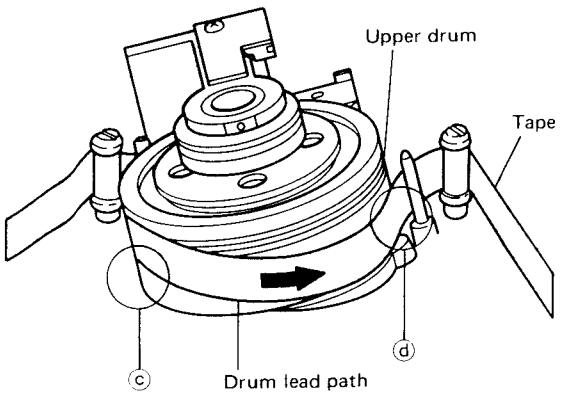

Fig. 4-12

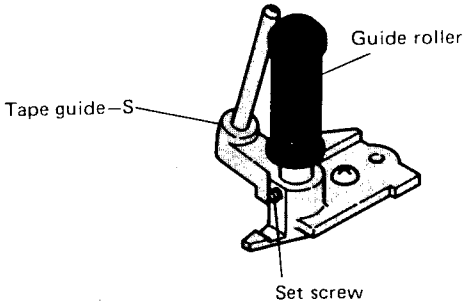
4) Ensure that the tape is not damaged at areas "ⓒ" and "ⓓ" of the drum lead path where the tape is picked up on the drum at loading and separates from the drum at unloading (check at the end of E-180). Also ensure that no noise is generated.

4-6-2. Guide roller height adjustment

The following adjustment is required only when an irregularity is detected in the "Tape run check" stated in section 4-6-1.

1) Slightly loosen the set screws of the supply and the take up guide rollers.



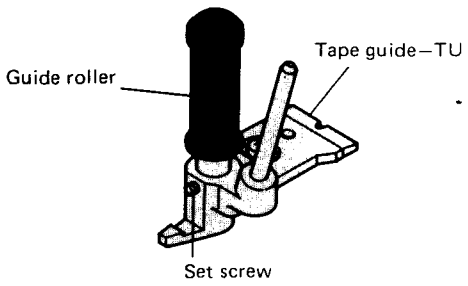


Fig. 4-14

NOTE: Loosen the set screw just enough to be able to move the guide roller with the hex key. If loosened excessively, the guide roller may be moved by the run of the tape. In this case, tighten the set screw slightly.

2) Load the recorded tape and set the recorder to the playback mode.
3) Slowly rotate the supply guide roller with – (minus) driver (Do not rotate more than 180° at a time) and adjust so that the tape will run smoothly over the drum, maintaining contact with the drum lead path.
4) Similarly turn the take up guide roller and adjust the point at which the tape separates from the drum.
   NOTE: Rotate the guide roller a little at a time. Careless rotation may damage the tape.

4-6-3. Take up guide pole and supply impedance roller

NOTE: The height of the take up guide pole and supply impedance roller is not adjusted at this stage since these adjustments are performed precisely at the factory.
If, for some reason, adjustments are necessary, proceed as follows.

* Adjust the height of the take up guide pole's lower flange to 10.8 mm from the chassis using a slide caliper.
* Adjust the height of the supply impedance roller's lower flange to 21.5 mm from the hollow part of the chassis.

1) Load a recorded tape and set the recorder to the playback mode.
2) Rotate the audio/control head inclination adjusting screw ⓒ and adjust so that the tape will run smoothly at the take up guide pole as illustrated in Fig. 4-13 ⓕ.
3) Be sure that the tape is not creased or twisted at the take up guide pole in playback.
4) Should the tape be creased or twisted at the arm take up guide pole, rotate the height adjusting nut until the crease or twist on the tape disappears. (Refer to Fig. 4-11 and Fig. 4-16.
   NOTE: Do not rotate the adjusting nut more than ± one turn.

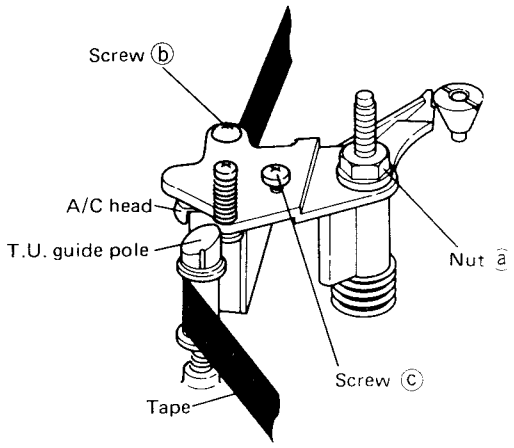

Fig. 4-15

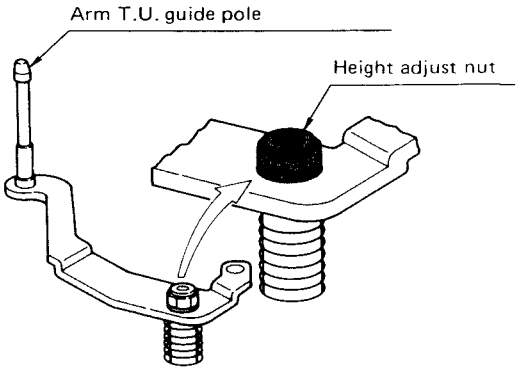

Fig. 4-16

4-6-4. Angle alignment of take-up slant pole

NOTE: Normally the slant pole angle does not require adjustment since it is precisely set at the factory.

1) Loosen the retaining screw shown in Fig. 4-17 slightly, it should be noted that excessively loosening often causes the guide roller to stick, preventing guide roller rotation during tape run.
2) When any tape folding or tape shrinkage is incurred on the top side of guide roller, rotate the slant pole assembly to widen the slant pole angle (Direction Ⓐ).
3) When the tape folding or tape shrinkage is found on the lower side of guide roller or when there is no spacing found between the lower side flange and the lower edge of the tape, rotate the slant pole assembly to decrease the slant pole angle (Direction Ⓑ).
4) After the angle alignment adjustment is made, perform the guide roller height adjustment.

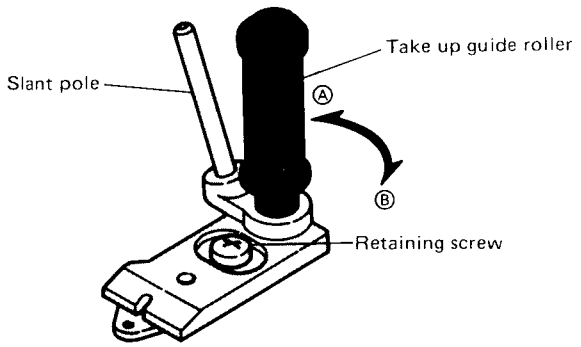

Fig. 4-17

4-7. INTERCHANGEABILITY ADJUSTMENT

Before running the alignment tape TF-530RFS, check and adjust the tape path by using a recorded tape in accordance with section 4-6.

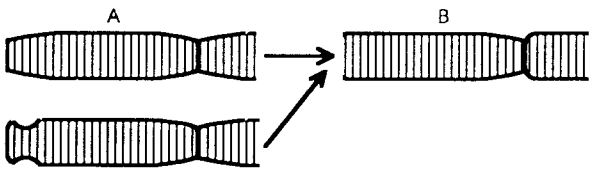
4-7-1. Check and adjustment of FM waveform

1) Connect the oscilloscope to test point TP-2A on the PCB Y-SIGNAL and set to the external synchronization mode.
   Synchronize by connecting EXT trigger to TP-2H on the PCB Y-SIGNAL.
2) Play back the alignment tape and observe the shape of the RF envelope.
3) Set DIGITAL TRACKING SW to MANUAL mode and then rotate the tracking control knob so that the FM waveform output will be maximum.

4-7-2. Drum meeting point adjustment

1) Set DIGITAL TRACKING SW to MANUAL mode and then rotate the tracking control knob so that the FM waveform output will be maximum.
2) Loosen slightly the set screw on supply guide roller.
3) Rotate the supply guide roller so the leading edge (Drum meeting point) of FM waveform is flat as A → B, as shown in Fig. 4-18.

   NOTE: If the guide roller turns too freely, slightly tighten the set screw.
   When adjusting the guide roller, the adjustment should be performed little by little so as not to any damage on the alignment tape. The above operation should be performed with care, checking the FM waveform, and at the same time, checking drum surface and guide pole surface for any tape curling or tape creasing.



Drum meeting point

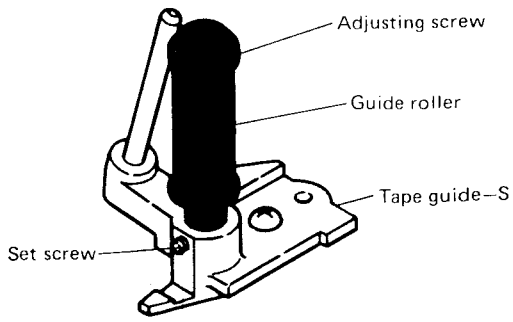


Fig. 4-18

4-7-3. Drum exit point adjustment

1) Set DIGITAL TRACKING SW to MANUAL mode and then rotate the tracking control knob so that the FM waveform output will be maximum.
2) The waveform at the exit point shall be adjusted in the same procedure as given for the drum meeting point. Loosen slightly the set screw on take up guide roller.
3) Rotate and adjust the take up guide roller so the lagging edge of FM waveform (Drum exit point) is flat as C → D, as shown in Fig. 4-19.
4) When the tape is found derailed from the guide, or involved with shrinkage at the take up guide pole part, turn the A/C head adjusting screw ⓒ which is shown in Fig. 4-19 so as for the tape travels flush to the lower edge of the guide pole.
   NOTE: The take up guide pole should not be adjusted.
5) In this case, rotate Audio/control head height adjusting NUT ⓐ until the letting top of the head meets the tape.
   Whether A/C head height shall be raised up or lowered shall be decided on the basis as shown in Fig. 4-19.

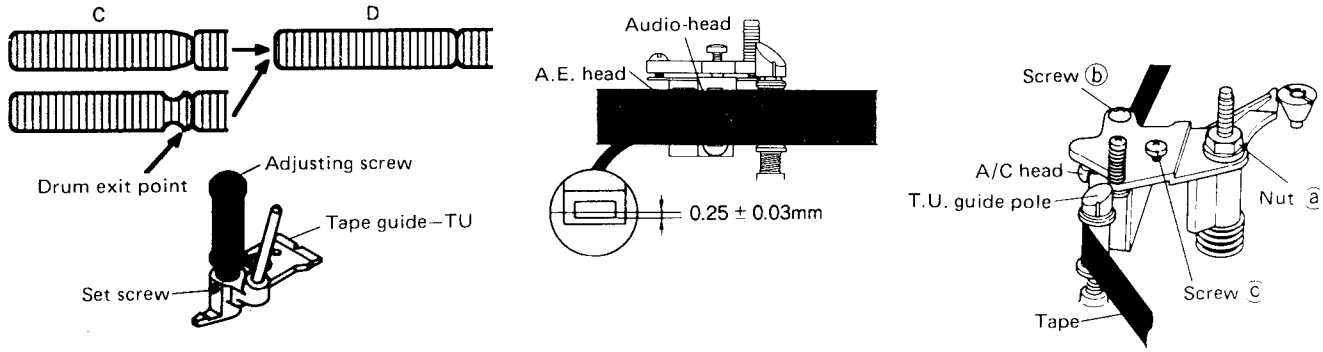

Fig. 4-19

4-7-4. Interchangeability adjustment

1) Connect the oscilloscope to test point TP-2A (PB FM OUT) on the PCB Y-SIGNAL. Set to external synchronization and synchronize by connecting EXT trigger to TP-2H on the PCB Y-SIGNAL. Set the EXT trigger to minus (–).
2) Play back the stairstep waveform of the alignment tape.
3) Turn the tracking control knob and adjust the FM waveform output to minimum.
4) If the FM waveform is similar to (A) or (B) in Fig. 4-20, adjust the height of the supply guide roller until it becomes like (E), (F) or (G) in Fig. 4-21. If the FM waveform fluctuates, adjust to the minimum point of fluctuation.
5) If the FM waveform is similar to (C) or (D) in Fig. 4-20 adjust the height of the take up guide roller until it becomes like (E), (F) or (G) in Fig. 4-21. If the waveform fluctuates, adjust to the minimum point of fluctuation.
6) Set the DIGITAL TRACKING SW to MANUAL mode and then rotate the tracking control knob from maximum to minimum FM waveform output. If the amplitude decrease is non linear finely adjust the height of the supply and take up guide rollers.
7) After ensuring that normal maximum FM waveform output coincides with maximum 6 kHz audio output, and that the tape is not creased along the tape path, secure the guide rollers by tightening the set screws.
   NOTE: Secure in stop mode, and do not apply excessive force to the tape guide.

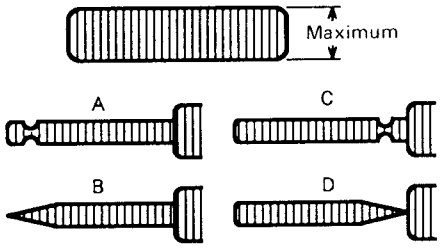

Fig. 4-20

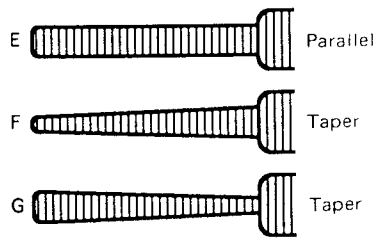

Fig. 4-21

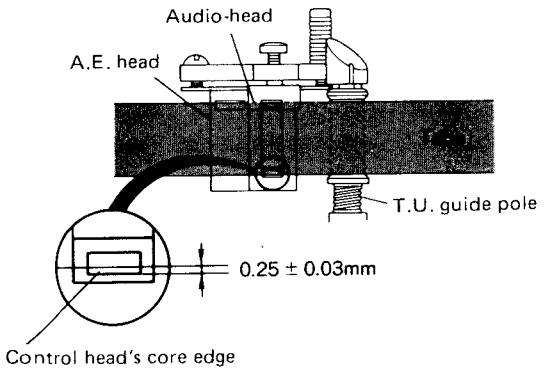
8) After tightening the set screws, check the interchangeability again.

4-7-5. Audio/Control head adjustment

When the audio/control head is adjusted, the phase and azimuth of the control head must also be adjusted.

1) Monitor the audio out signal with the oscilloscope and play back 6 kHz audio signal.
2) Rotate the nut ⓐ and adjust to obtain maximum audio output level and the dimensions shown in Fig. 4-22.



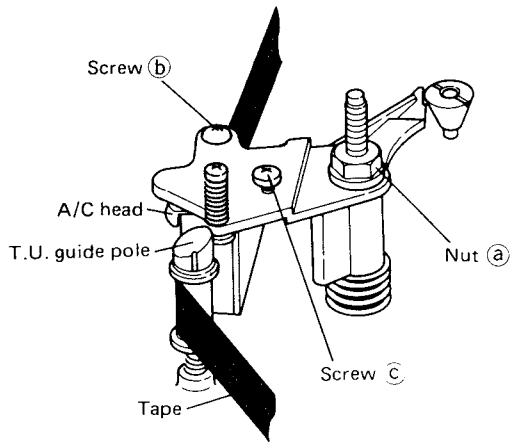


Fig. 4-22

3. Adjust the inclination adjusting screw ⓒ so that the tape will run along the lower edge of the take-up guide pole without creasing as illustrated in Fig. 4-22.

   NOTE: Adjust so that there are absolutely no creases in the tape at the take up guide pole because the tensile force of the tape at this part is very large and creasing will significantly shorten the tape service life.

4) Screw ⓑ is for adjustment of the azimuth. Adjust to 6 kHz maximum audio output.
5) Be sure that audio level fluctuation is below 2 dB peak to peak.
6) If the audio level fluctuation is greater than 2 dB p-p. Recheck the alignment given in item 2). If no improvement is noticed, lower the TU guide pole height slightly within a limit of 0.1 mm. If audio fluctuation is still too great, execute the slant pole angle alignment calibration as given in Item 4-6-4.

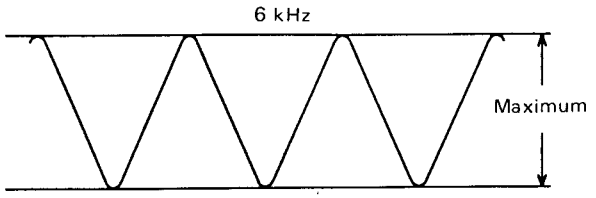

Fig. 4-23

4-7-6. Control head phase control adjustment

1) Set the DIGITAL TRACKING SW to MANUAL mode, and tracking knob to the centre click position.
2) Connect the oscilloscope to test point TP-2A (PB FM OUT) on the PCB Y-SIGNAL. Set up in the external trigger mode by connecting TP-2H on the same PC Board to the external trigger input.
3) Play back the alignment tape (TF-530RFS) and rotate the phase adjusting nut (CAM SCREW) shown in Fig. 4-24 to obtain maximum FM output.
4) Confirm that the FM output level is maximum when the DIGITAL TRACKING SW is set to the AUTO position.
5) Set the DIGITAL TRACKING SW to MANUAL position again, then turn the tracking knob. Confirm that the FM output level becomes maximum at the centre click position.

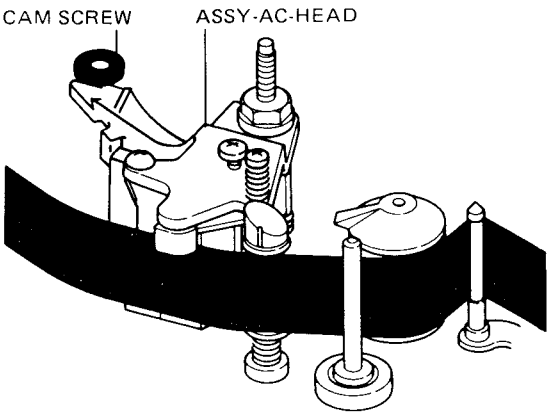

Fig. 4-24

4-7-7. Servo circuit adjustment

Following the completion of compatibility adjustments, check the following points.

1) Playback switching point adjustment. (See 5-2)
2) Tracking preset adjustment. (See 5-3)

4-7-8. Final check

1) By using a self-recording and playback tape, record and play back the staircase and make sure that FM waveform from the self recorded tape is approximately the same as that of the alignment tape reproduction.
2) Adjust the audio playback output level if necessary. (See 5-25)
3) Check the video signal circuit adjustments if necessary. (See 5-4 ~ 5-24)

V. ELECTRICAL ADJUSTMENT

Circuit adjustments become necessary, in most cases, due to the wear of mechanical parts or following the replacement of critical components such as the video head. Certain circuit defects can often cause circuit adjustments to vary considerably. Should this occur, be sure to determine the natûre of the defect and repair prior to proceeding with adjustments.

Always use the test equipment recommended for a given adjustment procedure. If the appropriate test equipment is not available, it is recommended that adjustments NOT be attempted. Refrain from indiscreet adjustment of circuits unless properly equipped to do so.

18	Y/C REC Level	Supply RF signal (colour bar) LP REC mode S-VHS mode Normal VHS mode	• Oscilloscope to TP2Y (HEAD AMP) Signal: Pin ① GND: Pin ③ • Oscilloscope's EXT trigger to TP2S (Y-SIG) * Do not connect the probe GND • VR02, VR01 (HEAD AMP) • VR200 (Y-SIG)	1. Turn VR02 fully clockwise. 2. Adjust VR01 so that the chroma level is 30 mVp-p. 3. Adjust VR02 so that the luminance FM level is 75 mVp-p. 4. Adjust VR2C0 so that the luminance FM level is 75 mVp-p.  PCB HEAD AMP  PCB Y-SIGNAL 19	Demodulation sensitivity/play-back level (S-VHS)	Playback mode self-recorded tape in S-VHS format)	• Oscilloscope to TP25 (Y-SIG) • VR2P0 (Y-SIG) • Oscilloscope to TP2Y (Y-SIG) • VR2B8 (Y-SIG)	1. Adjust VR2P0 so that the level at TP25 is 1.2 Vp-p. 2. Adjust VR2B8 so that the level at TP2Y is 2.0 Vp-p.  PCB Y-SIGNAL 
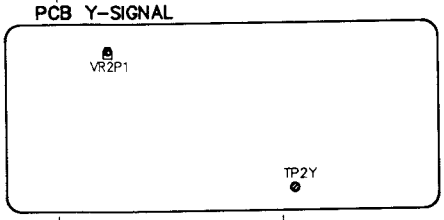
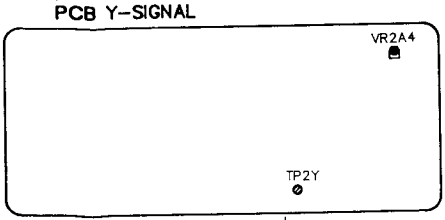
No.	Item	Mode	Adj. Method	Adjustment Procedure
20	Demodulation sensitivity (normal VHS)	Playback alignment tape (TF-510CB)	• Oscilloscope to TP2Y (Y-SIG) • VR2P1 (Y-SIG)	1. Adjust VR2P1 so that the level at TP2Y is 2.0 Vp-p.  DIV 50mV (×10) TIM 10 μ sec
21	SECAM Playback level	Playback mode (SECAM colour bar self-recorded in normal VHS format with S-VHS tape)	• Oscilloscope to TP2Y (Y-SIG) • VR2A4 (Y-SIG)	1. Check that the S-VHS indicator is not illuminated. 2. Adjust VR2A4 so that the level at TP2Y is 2.0 Vp-p.  DIV 50mV (×10) TIM 10 μ sec

PCB Y-SIGNAL



PCB Y-SIGNAL



No.	Item	Mode	Adj. Method	Adjustment Procedure
22	CCD bias	Playback alignment tape (TF-510CB)	• Oscilloscope to TP2R (Y-SIG) • VR2A1 (Y-SIG)	1. Perform that VR2A0 is middle position. 2. Adjust VR2A1 so that the SYNC signal and upper side of waveform is not strained. 23	Noise cancel	Playback alignment tape (TF-510CB)	• Oscilloscope to TP2L (Y-SIG) • VR2A0 (Y-SIG)	1. Adjust VR2A0 so that the video signal disappears. 2. Check that the video signal level is less than 30 mVp-p. 

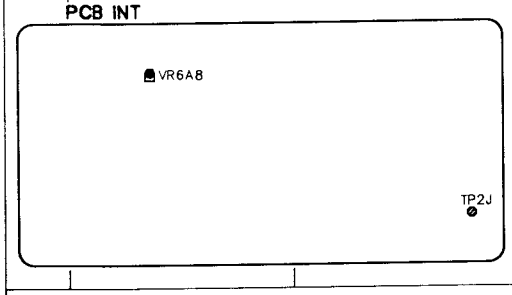
No.	Item	Mode	Adj. Method	Adjustment Procedure
24	Chroma carrier leak	Playback alignment tape (TF-510CB)	• Oscilloscope to TP2J (INT) • VR6A8 (INT)	1. Adjust VR6A8 so that the carrier leak for minimum amplitude at the point. 
PCB INT

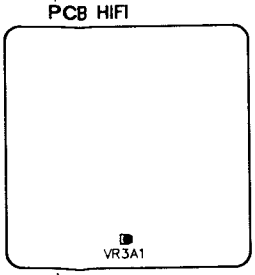


Normal Audio Circuit

‡1. Set the audio monitor SW to normal mode.
‡2. Set the input select SW to EXT mode.
‡3. Supply video signal to the video input jack.

25	Playback audio level	Playback alignment tape TF-532CBS	• AC voltmeter to audio output terminal (L-CH or R-CH) • VR3A1 (Hi-Fi)	1. Set the video mute SW to OFF. 2. Adjust VR3A1 for an audio output level of −8 dBs. ‡ (310 mV. r.m.s): 1 mW 600Ω 0.775 V. r.m.s input impedance = 47 kΩ 3. Confirm that the level fluctuation is less than ±1 dB. If level fluctuation is over ±1 dB then check that the mechanical adjustment.

PCB HIFI



No.	Item	Mode	Adj. Method	Adjustment Procedure
26	Audio bias level	SP REC mode 	• AC voltmeter to TP3E (Hi-Fi) and TP3F (Hi-Fi) throug a high pass filter. Note: Be careful that the AC voltmeter housing does not touch the VCR chassis. • VR3A0 (Hi-Fi)	1. Insert a shorted RCA type phonoplug into the AUDIO IN terminal. 2. Confirm that the monitor TV etc. does not affect the indication of the AC voltmeter and then adjust VR3A0 for a level of 2.8 mV. r.m.s. Note: Do not set the VCR to PLAY mode with the AC voltmeter connected. (The audio amplifier will be over-loaded.) Hi-Fi Audio Circuit				
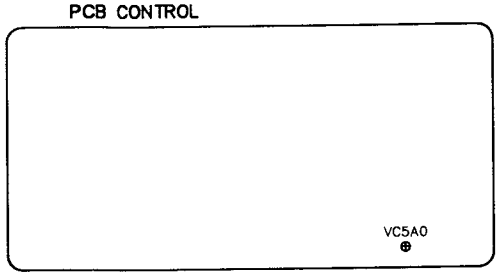
‡1. Set the audio monitor SW to Hi-Fi mode. ‡2. Set the input select SW to EXT mode.				
27	OSC frequency 	REC mode	• Frequency counter to TP3L • VR3301 (Hi-Fi) • Frequency counter to TP3R (Hi-Fi) • VR3302 (Hi-Fi)	1. Short circuit audio input jack (L-CH and R-CH). 2. Adjust VR3301 so that frequency at TP3L is 1.40 MHz ± 3 kHz. 3. Audio VR3302 so that frequency at TP3R is 1.80 MHz ± 3 kHz.

No.	Item	Mode	Adj. Method	Adjustment Procedure
28	E-E level  	Supply audio signal (1 kHz, – 8 dBs) to audio input jack (R-CH and L-CH)	• AC voltmeter to audio output jack • L-CH audio out • VR3307 (Hi-Fi) • R-CH audio out • VR3308 (Hi-Fi)	1. Set the REC LEVEL ADJ to centre click stop position. 2. Adjust VR3307 so that the audio output level at L-CH is –8 dBs. 3. Adjust VR3308 so that the audio output level at R-CH is –8 dBs.
29	FM REC level  	REC mode	• Oscilloscope to TP3T (HEAD AMP) Signal: Pin ① GND: Pin ③ • VR3201 (HEAD AMP)	1. Shoft circuit audio input jack (L-CH and R-CH). 2. Adjust VR3201 so that the level at TP3T is 320 mVp-p.  DIV 5mV (×10) TIM 10 μ sec

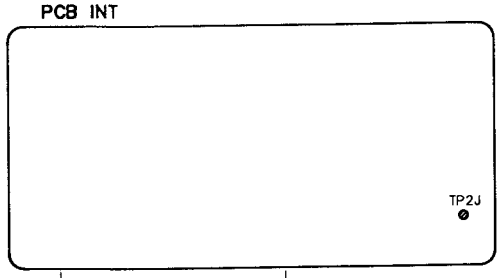
No.	Item	Mode	Adj. Method	Adjustment Procedure
30	Playback level  	Playback mode (1 kHz, −8 dBs audio signal self-recorded tape)	• AC milli-voltmeter to audio output jack • L-CH audio out • VR3303 (Hi-Fi) • R-CH audio out • VR3304 (Hi-Fi)	1. Set the REC LEVEL ADJ to centre click stop position. Record a short segment of 1 kHz signal at −8 dBs and play it back. 2. Adjust VR3303 so that the L-CH audio output level is −8 dBs. 3. Adjust VR3304 so that the R-CH audio output level is −8 dBs.
Timer Circuit				
31	Timer frequency  	Power OFF	• Frequency counter to TP8A • VC801 (TIMER)	1. Adjust VC801 so that the frequency at TP8A is 6.835938 ± 0.000030 mSec.

No.	Item	Mode	Adj. Method	Adjustment Procedure
32	Display position	Supply RF signal (colour bar) program REC setting mode	• Oscilloscope to TP2J (INT) • VC5A0 (CONTROL)	1. Check that the picture is in the centre of the screen. 2. Adjust VC5A0 so that the time difference between the falling edge of H-SYNC and end of character signal is 54 ± 1 μ sec.  DIV 20mV(×10) TIM 10μsec
33	List 2 H-SYNC frequency	Non signal STOP mode input select SW to EXT	• Frequency counter to TP21 (INT) • TP22 (INT) • VR200 (INT)	1. Video must SW (S801) to OFF. 2. Ground TP22 (INT). 3. Adjust VR200 so that the frequency at TP21 is 15.725 kHz ± 0.01 kHz. Note: This adjustment value varies with temperature. If VCR has been ON for 30 minutes or longer to 15.625 kHz ± 0.01 kHz.

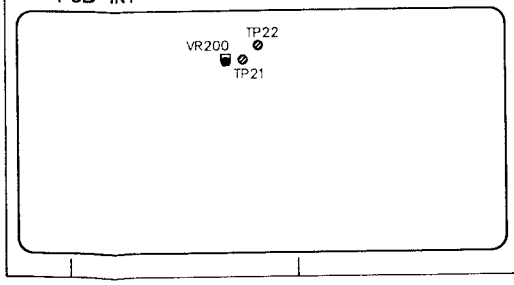
PCB CONTROL



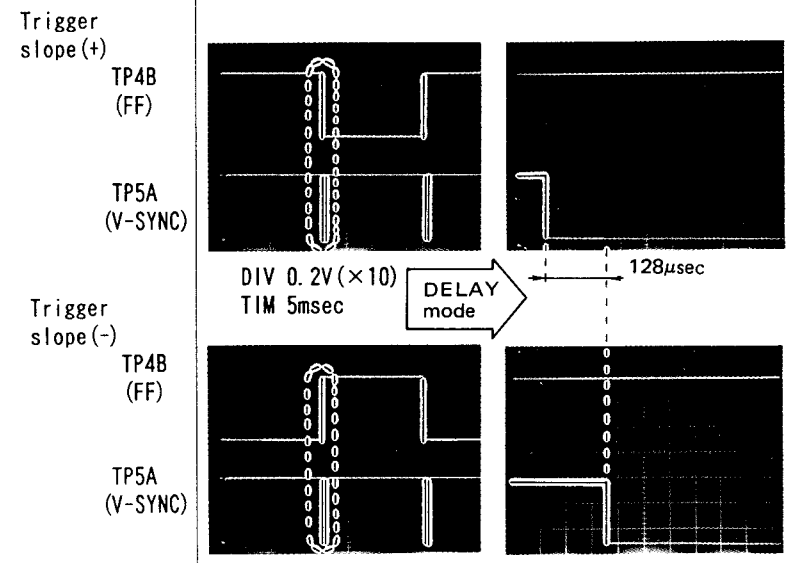
PCB INT

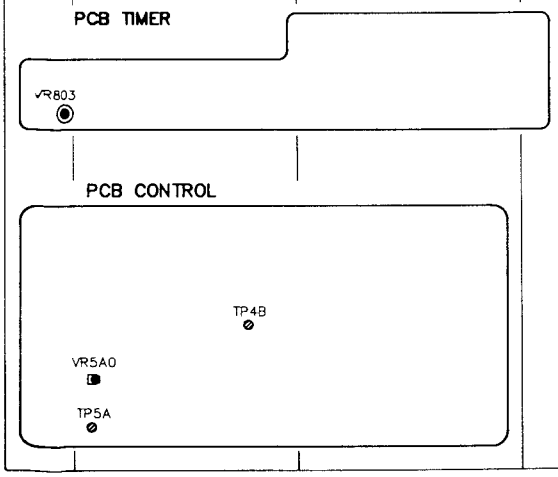


PCB INT

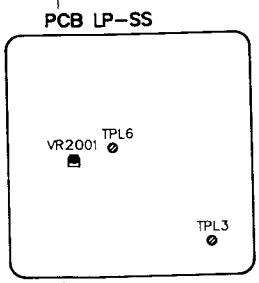


No.	Item	Mode	Adj. Method	Adjustment Procedure
34	List 2 still jitter	Playback SP self-recorded tape STILL mode	• Oscilloscope's CH1 to TP4B (CONTROL) • Oscilloscope's CH2 to TP5A (CONTROL) • Set TRIG. SOURCE SW to CH1 • Trigger slope (+) • Trigger slope (−) • VR5A0 (CONTROL)	1. Active the still function and adjust VR803 (STILL ADJUST) to eliminate picture jitter. 2. Set the horizontal display SW of oscilloscope to DELAY mode and monitor the waveform in the area of the falling edge at CH1. (TIM 50 μ sec) 3. Set DELAY TIME of the oscilloscope until falling edge of V-SYNC waveform at CH2 coincide with second vertical scale on the left of the oscilloscope. 4. Set the oscilloscope to minus (−) slope. 5. Adjust VR5A0 so that the time difference between the falling edge of V-SYNC waveform at CH2 in the area of the falling edge of FF waveform at minus (−) trigger by CH1 and the falling edge of V-SYNC waveform at CH2 in the area of the rising edge of FF waveform at plus (+) trigger by CH1 is 128 μ sec as shown below.

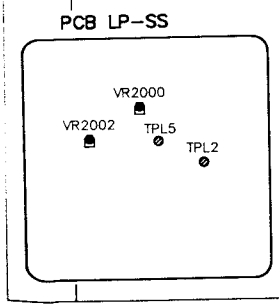




No.	Item	Mode	Adj. Method	Adjustment Procedure
LP-SS Circuit				
35	VCO	STOP mode	• Oscilloscope's CH-1 to TPL3 (LP-SS) • Oscilloscope's CH-2 to TPL6 (LP-SS) • Set TRIG. SOURCE SW to to CH1 • VR2001 (LP-SS)	1. Check that the frequency of waveform at CH-2 is approximately 2 times as frequency of waveform at CH-1. 2. Adjust VR2001 so that the time difference between the rising edge of CH-1 and bottom edge of CH-2 is 20 ± 1 μsec.  DIV 0.2V(×10) TIM 5msec



No.	Item	Mode	Adj. Method	Adjustment Procedure
36	Demodulation Gain	Fast playback mode (LP colour bar)	• Oscilloscope's CH-1 to TPL5 (LP-SS) • Oscilloscope's CH-2 to TPL2 (LP-SS) • Set TRIG. SOURCE SW to CH1 • VR2002 (LP-SS) • VR2000 (LP-SS)	1. Turn VR2002 fully clockwise as seen from the component side. 2. Adjust VR2000 so that the level of waveform at A is 2.0 Vp-p. Note: When adjusted waveform is saturated, it is no problem.  3. Adjust VR2002 so that the waveform is not saturated and level of waveform at B is 2.0 Vp-p.  4. Adjust VR2000 so that the sync tip level of each waveform is same level. At this time, if level of waveform at B is changed then readjust VR2002 so that the level is 2.0 Vp-p. 



No.	Item	Mode	Adj. Method	Adjustment Procedure
NICAM Circuit (EK model only)				
37	Carrier VCX0	Supply RF signal (STEREO or DUAL SOUND) STOP mode	• Oscilloscope's CH-1 to TP3 (NICAM) • Oscilloscope's CH-2 to TP4 (NICAM) • Oscilloscope to X-Y mode • VC7A0 (NICAM)	1. Adjust VC7A0 to obtain the waveform illustrated.  DIV 20mV (×10) 38	Clock VCX0	Supply RF signal (STEREO or DUAL SOUND) STOP mode	• Digital voltmeter to TP5 and TP6 (NICAM) • VC7A1 (NICAM)	1. Adjust VC7A0 to obtain the waveform as illustrated.

VI. PARTS LIST

ATTENTION

1. **When placing an order for parts, be sure to list Part No., Model No. and the description of eachpart. Otherwise, the non-delivery of the part or the delivery of a wrong part may result.**
2. **Please make sure that Part No. is correct when ordering. If not, a part different from the one you ordered may be delivered.**
3. **Since the parts shown in Parts List of Preliminary Service Manual may have been the subject of changes, please use this Parts List for all future reference.**

HOW TO USE THIS PARTS LIST

1. This Parts List lists those parts which are considered necessary for repairs. Other common parts, such as resistors and capacitors, are listed in the "Common List for Service Parts" from which these parts should be selected and stocked.
2. The Recommended Spare Parts List shows those parts in the Parts List which are considered particularly important for service.
3. Parts not shown in the Parts List and "Common List for Service Parts" will not in principle be supplied.
4. How to read the Parts List.

SCHEMATIC DIAGRAM

NOTE 1:

1. DC voltages were measured from points indicated to the circuit ground with a valve voltmeter.
2. The voltages parenthesised are on SP recording mode. While those without parenthesised on SP play back mode.

NOTE 2:

1. The unit of resistance "ohm" entirely omitted.
   Accordingly, K = 1000 ohms
   M = 1000K ohms.
2. The wattage of resistor, not specifically designated, is 1/4 watt.
3. Resistors, not specifically designated, are carbon resistors.
4. The marks of resistors are as follows.
   (CE) : Cemented resistor
   (MB) : Metal oxide film resistor (type 8)
   (S) : Fixed composition resistors
   (W) : Wire wound resistor
   (M) : Metal film resistor
5. The tolerance of resistor value, not specifically designated, is: ±5%, K = ±10% M = ±20%
6. The unit of capacitance, not specifically designated, is:
   a) μF, for numbers less than 1
   b) PF, for numbers more than 1
7. Capacitors, not specifically designated are Ceramic capacitors except electrolytic capacitors.
8. The marks of capacitors are as follows:
   (ALM) : Aluminus electrolytic capacitor
   (MF) : Polyester capacitor
   (PP) : Polypropylene film capacitor
   (TAN) : Tantalum capacitor
   (SC) : Semiconductor Ceramic Capacitors
   (TF) : Twin film capacitor
   (NP) : Non polarized electrolytic capacitor
   ✱ : Electrolytic capacitor
9. The DC working voltage of capacitor, not specifically designated is: 50V
10. The tolerance of capacitor value, not specifically designated is: ±10%
    and J = ±5% K = ±10% M = ±20% P = +100% −0%
    C = ±0.25PF D = ±0.5PF F = ±1PF Z = +80% −20% N=±30%
11. Ceramic capacitors with the marks RH, UJ, SL. etc. are temperature compensating types.

SPECIFIC SYMBOL	
Zener Diode	Crystal unit
Varicap	LE Diode
Posistor	Photo Diode
Thermistor	Ceramic filter
Fusible Resistor	

This is a basic schematic diagram. Some sets may be subject to modification according to engineering improvement.

⚠
SERVICING PRECAUTION
SYMBOLS INDICATE COMPONENTS HAVING SPECIAL CHARACTERISTICS IMPORTANT TO SAFETY AND PERFORMANCE. THEREFOR REPLACEMENT OF ANY SAFETY PARTS SHOULD BE IDENTICAL IN VALUE AND CHARACTERISTICS.
DON'T DEGRADE THE SAFETY OF THE RECEIVERS THROUGH IMPROPER SERVICING.
