CHANGING OR CLEANING PUSH BUTTON SWITCHES

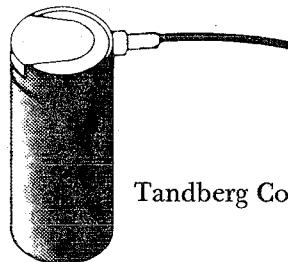

Occasionally the push button switches will need to be cleaned and lubricated to maintain trouble free action. A good cleaning agent should be applied sparingly with a fine brush. We recommend "Tandberg Klüberfett" or "Wählerfett" from our Service Department.

Alcohol or methylated spirit may also be used for cleaning, and vaseline may be used for lubrication afterwards.

NOTE! Avoid touching the contacts with your finger — it could cause corrosion.

Avoid using cleaning agents that could attack the metal parts.

NOTE! We have developed our own cleaning/lubricating agent, "Tandberg Contact Spray" in aerosols, and we recommend it for all types of contacts. These aerosols can be supplied from our district offices and subsidiary companies.

Tandberg Contact Spray

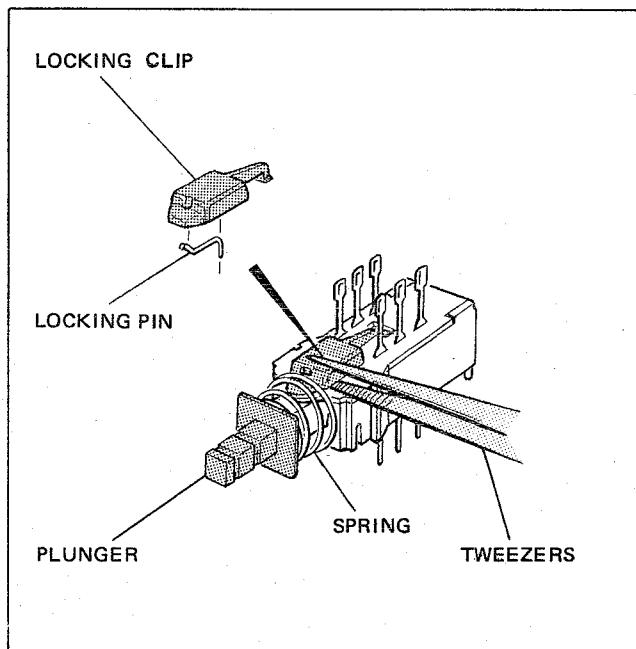

NOTE! Slide switches (mode selectors) are available complete as a replacement part.

If necessary, the switch can be cleaned, and the plunger or the contact unit can be changed. For these operations the switch must be dismantled.

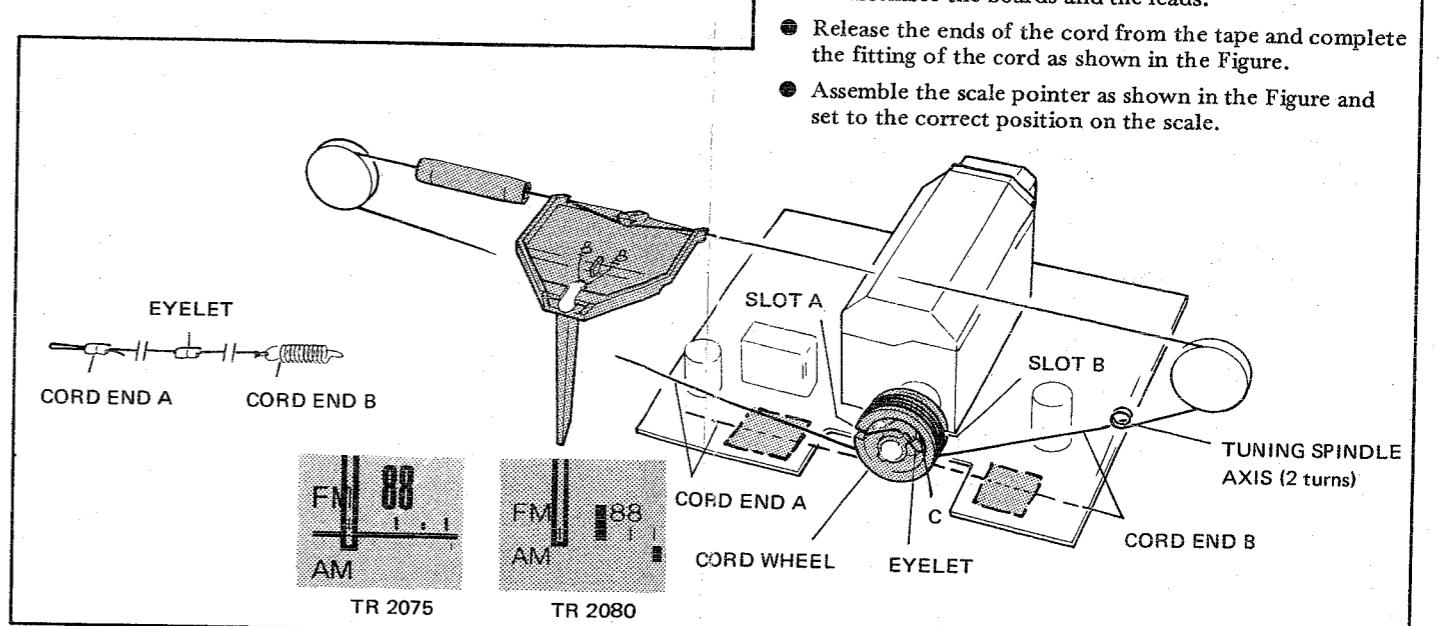

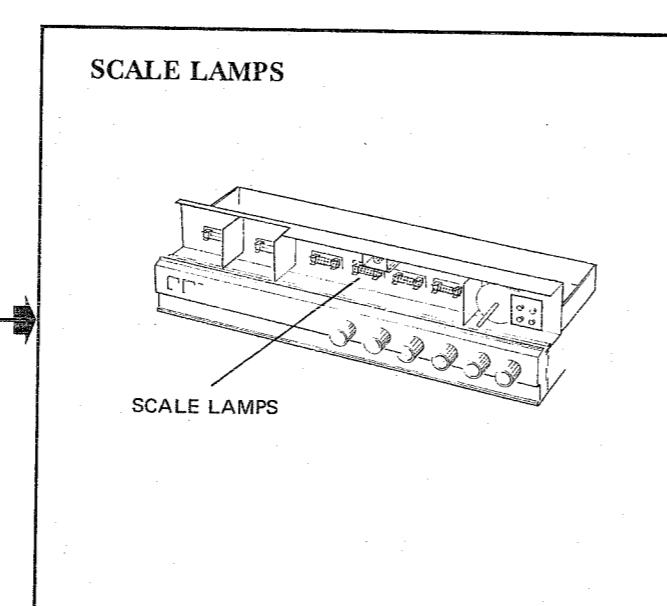

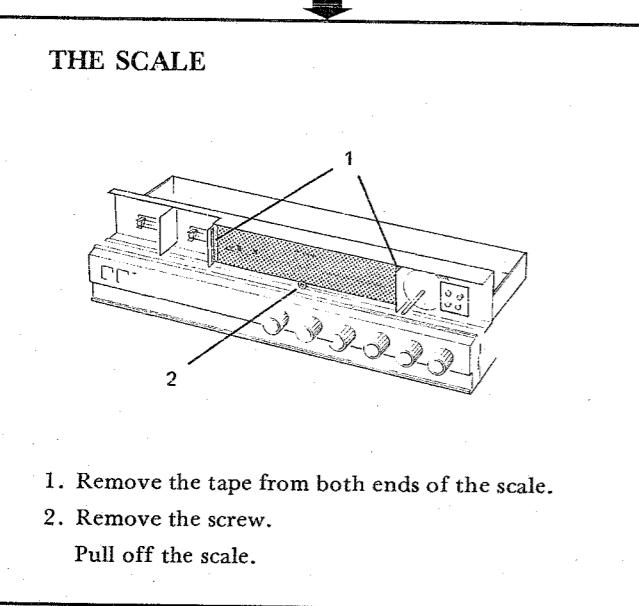

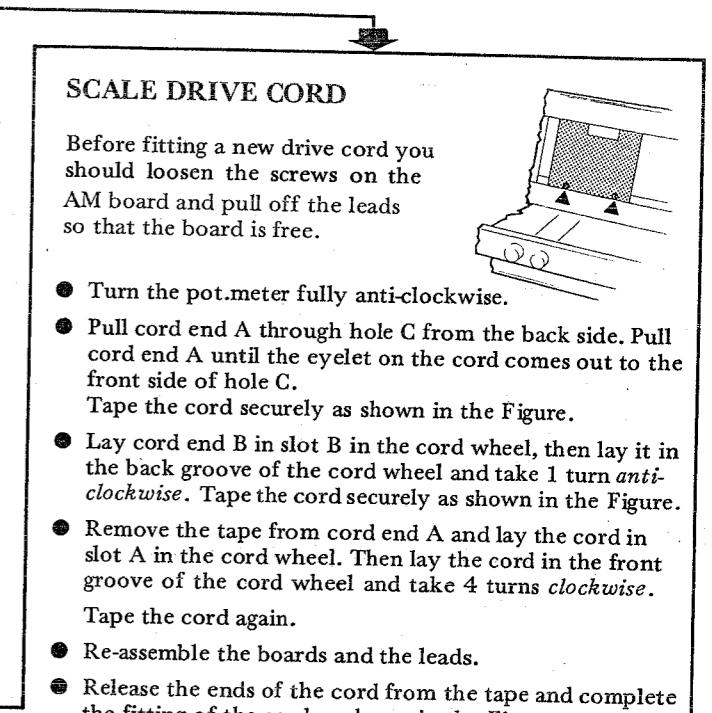

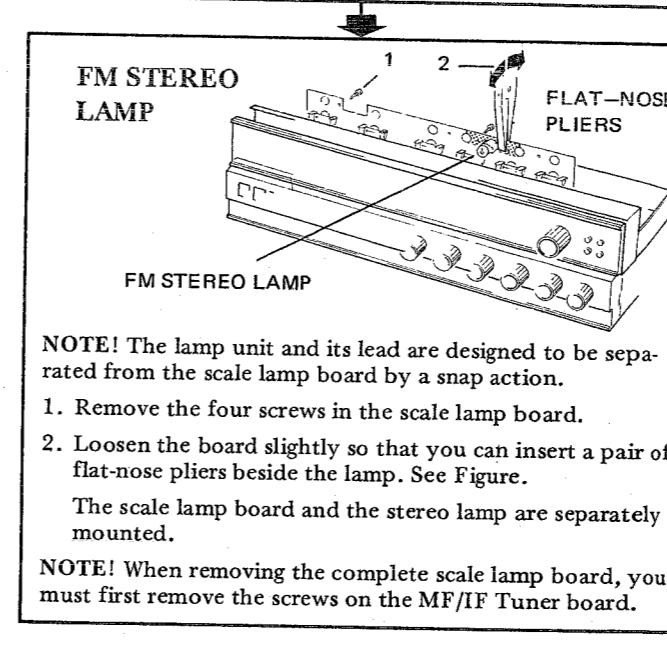

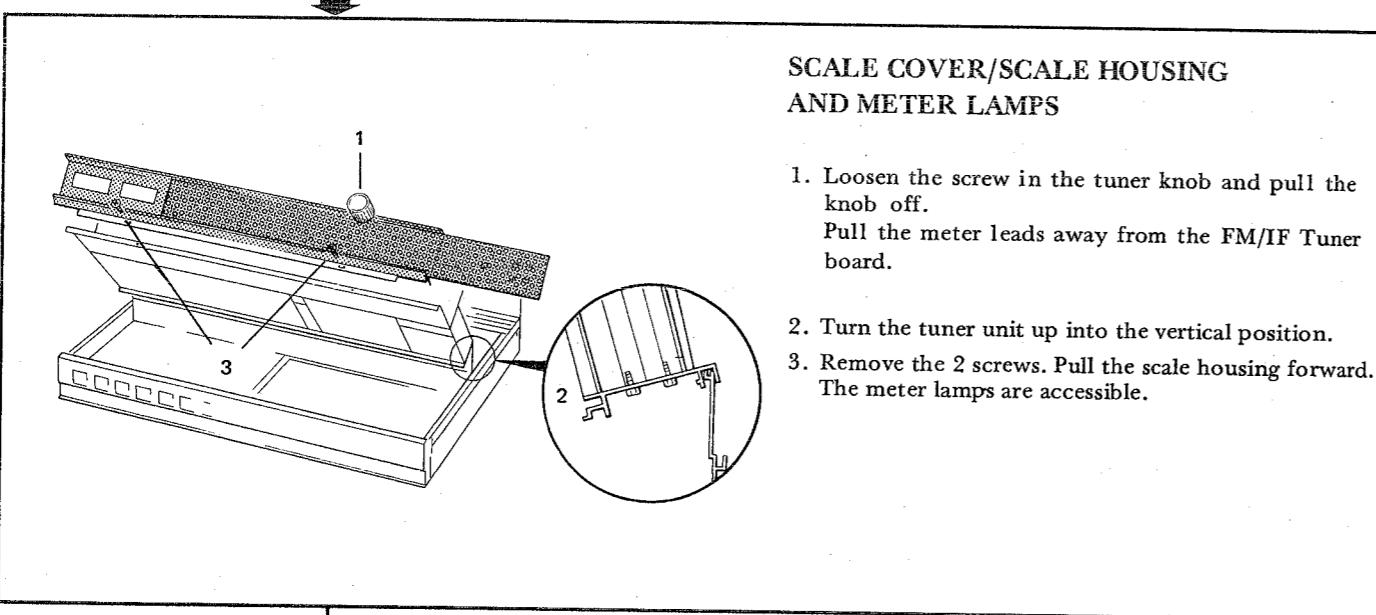

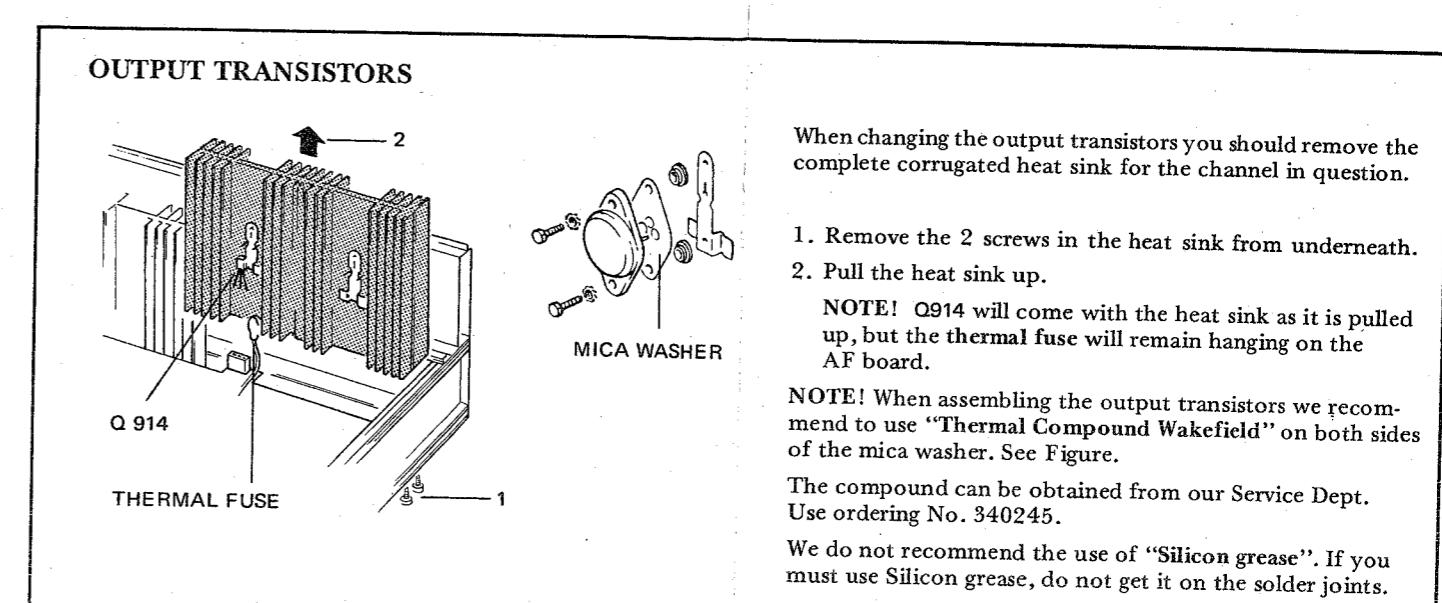

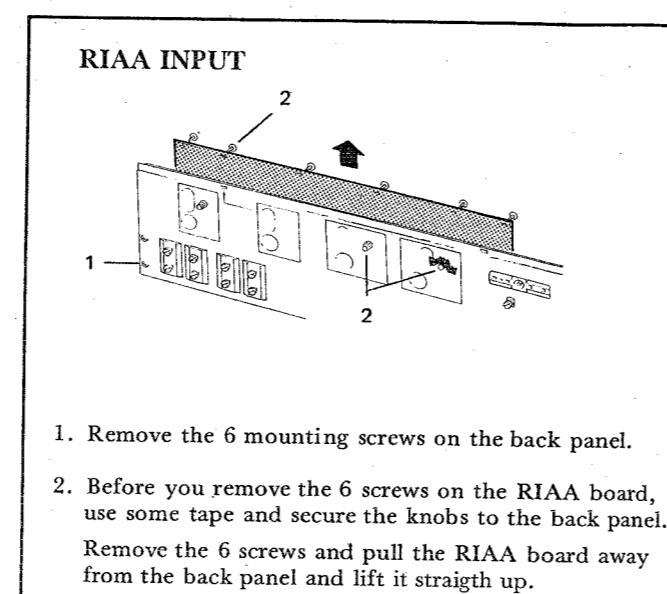

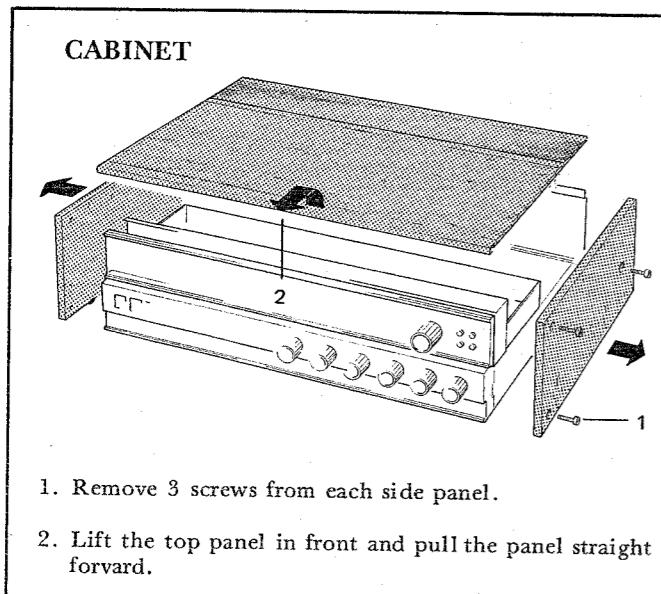

DISMANTLING THE PLUNGER

- Pull the spring slightly forward so that the locking clip is free at the edge.
- Use tweezers as shown in the figure.
- Press the plunger right in. Push the locking clip backwards and lift it up.
NB! The locking pin lies loose in the locking clip.
- The plunger can be pulled out.
NB! The spring contact on the plunger are loose.

The spring is slightly conical so that if you remove it from the plunger, take care to replace it with the smallest end against front of the plunger.

DISMANTLING

AM-ALIGNMENT PROCEDURE

Procedure	Receiver	Generator			Oscilloscope	Frequency counter	Circuits	Notes
	Frequency	Frequency	Modulation	Applied to M	Connected to M	Connected to M	Board No.	
1 A Oscilloscope with frequency counter						M2, see circuit diagram	L401 C402	If available, use a frequency counter to obtain max. accuracy. Use a calibrated signal generator. NOTE! Check the dial pointer zero position, see Fig. 5.
1 B Oscillator	600 kHz 1400 kHz	600 kHz 1400 kHz	30%	* M3 via dummy ant. (Fig. 4)			A4	
2 A AM-IF with wobbler	1400 kHz	Wobb.freq. 1400 kHz	Unmodul.	* M3 via wobbler and dummy ant. (Fig. 3-4)	M1, see circuit diagram		L403 L404	Adjust for max. curve height. See Fig. 6. The center frequency is determined by the fixed ceramic filter.
2 B AM-IF without wobbler	1400 kHz	1400 kHz	30%	* M3 via dummy ant. (Fig. 4)			A4	Adjust for max. output.
3 A Antenna circuit, ferrite and HF circuit with wobbler	600 kHz 1400 kHz	Wobb.freq. 600 kHz 1400 kHz	Unmodul.	* M3 via wobbler and dummy ant. (Fig. 3-4)	M1, see circuit diagram		**L3 - L402 C410 - C417	Adjust for max. curve height.
3 B Antenna circuit, ferrite and HF circuit without wobbler	600 kHz 1400 kHz	600 kHz 1400 kHz	30%	* M3 via dummy ant. (Fig. 4)			A4	Adjust for max. output.
4 Signal meter	1 MHz	1 MHz	30%	* M3 at/20 mV			R405 A4	Adjust to 15 on TR2075 MK II Adjust to $10^2 \mu\text{V}$ on TR2080

*M3, Antenna input.

ALIGNMENT OF STEREO DECODER

Equipment needed:

FM stereo generator
Oscilloscope with sensitivity 5 mV/cm
Frequency counter
Selective voltmeter or a.c. voltmeter and 20 kHz low pass filter.

The decoder oscillator: 19 kHz

Apply a 1 mV signal from the FM stereo generator, unmodulated. (No pilot signal applied.)

- Adjust R304 so that the frequency counter connected to M301 indicates 19 kHz.

Alternative method without the frequency counter:

Apply a 1 mV signal from the FM stereo generator, modulation: 10% pilot signal.

- Turn R304 slowly from one extreme to the point where the stereo indicator lights up. Turn further in the same direction until the light goes out. Then turn in the opposite direction to set R304 in the middle of the range where the indicator lights.

Channel separation:

Apply a 1 mV signal from the FM stereo generator, modulation: 10% pilot signal. Modulate the right channel with 1 kHz at 30% deviation. Connect the oscilloscope to the TAPE OUT (L) socket.

- Adjust R323 to minimum deflection on the scope. Check this adjustment with the 1 kHz signal in the left channel and measure the output of the right channel.

Alternative method without the stereo generator:

- Adjust R323 for minimum signal in left (right) speaker when receiving a test FM stereo, transmission with signal in the right (left) channel only.

Muting and stereo/mono switching threshold:

Muting: Apply a 3 μ V signal from the FM-generator to the 75 ohm antenna input. Adjust the TUNING METER on the radio to center. Set R231 in the middle position and R229 fully clockwise (seen from component side). Turn R229 slowly counter-clockwise until the signal is recovered.

FM alignment procedure

Step	Alignment procedure	Receiver		Generator		Oscilloscope	Circuits		Notes	
		Frequency	Frequency	Deviation	Applied to M		Connected to M	Adjust		
5 ^A	25 V for varicap							R616	A6	Meter connected to M13. A6 page 11. Adjust to 25 V d.c. reading.
5 ^B	FM oscillator	90 MHz 105 MHz	90 MHz 105 MHz	± 22.5 kHz	*M1	**M4 via diode-probe, Fig. 10.	R204 C124	A2 A1	Check the position of the scale cursor (see Fig. 11). Check 95 MHz and 100 MHz.	
6	Aerial circuit	90 MHz 105 MHz	90 MHz 105 MHz	± 200 kHz	*M1	**M4 via diode-probe, Fig. 10.	L101-L102-L103 L104,C104-C110 C112-C113	A1	Adjust for max. curve height (see Fig. 8).	
	FM - IF	90 MHz	90 MHz	± 200 kHz	*M1	**M4 via diode-probe, Fig. 10.	L107-L108	A1	Adjust for max. curve height and symmetry (see Fig. 8). FM - IF 10.6 - 10.8 MHz.	
8	Discriminator	90 MHz	90 MHz	± 75 kHz	*M1 1 mV/75 ohm		L201-L202	A2	Dist./voltm. connected to M5, TAPE OUTPUT socket: Adjust L201 for max. output voltage. Afterwards adjust L202 for min. output voltage and min. distortion. See Fig. 9.	
9	Center tuning meter	90 MHz	90 MHz	± 75 kHz	*M1 1 mV/75 ohm		R239	A2	Adjust for center position of the pointer, when the receiver is tuned to min. distortion. See step 8.	
10 ^A ^B	Signal meter	90 MHz	90 MHz	± 0 kHz	No signal. *M1, 1 mV/75 ohm		R236 R232	A2	Adjust to 0 on SIGNAL METER. Adjust to 20 on TR2075 MK II. Adjust to $10^3 \mu$ V on TR2080	

Stereo/mono switching threshold: Set R231 fully counter clockwise (seen from component side).

* Antenna input (A1) page 9.

** See FM-IF Section (A2) page 9.

*** See Audio Section 1 (A5) page 11.

- Apply 0 μ V from the FM stereo generator to the 75 ohm antenna input modulated with 10% pilot signal.

Increase the signal from the FM-stereo generator from 0 μ V to 7.5 μ V. Turn R231 slowly clockwise until the stereo-indicator light comes on.

NOTE! The adjustments for muting and stereo/mono switching interact.

Alternative method: Stereo/mono switching threshold:

If an FM-stereo generator is not available an ordinary FM-generator can be used for this adjustment.

- Apply a 7.5 μ V signal from the generator to the 75 ohm antenna input, modulated with 10 kHz, deviation 7.5 kHz (10%) (check the modulation frequency with a counter). Proceed as explained above.

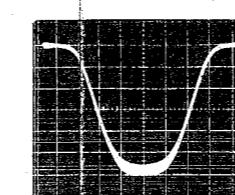

Fig. 8 FM-IF curve

Signal: $U_{in} = 150 \mu$ V/75 ohms, $f = 90$ MHz.
Dev. = ± 200 kHz applied to M1 via ant. plug.

Oscilloscope: Vert.: 5mV/div., Hor.: 50 kHz/div. connected to M4 via diodeprobe (Fig. 10).

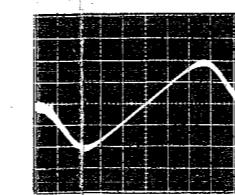

Fig. 9 Discriminator

Signal: $U_{in} = 2 \mu$ V/75 ohms, $f = 90$ MHz.
Dev. = ± 200 kHz applied to M1 via ant. plug.

Oscilloscope: Vert.: 1V/div. Hor.: 50 kHz/div. connected to M5.
