

AM/FM STEREO RECEIVER

SX-980

SERVICE MANUAL

 PIONEER

MODEL SX-980 COMES IN FIVE VERSIONS DISTINGUISHED AS FOLLOWS:

Type	Voltage	Remarks
KU	120V only	U.S.A. model
KC	120V only	Canada model
HG	220V and 240V (Switchable)	Europe or Oceania model
S	110V, 120V, 220V and 240V (Switchable)	General export model
S/G	110V, 120V, 220V and 240V (Switchable)	U.S. Military model

NOTICE:

- This service manual is applicable to the SX-980/KU.
- The SX-980/HG, S, S/G service manual is issued as an appendix.

Miscellaneous

Power Requirements	120V 60Hz
Power Consumption	260W (UL), 560VA (CSA) 800W (max.)
Dimensions	526(W) x 176(H) x 440(D) mm 21-11/16(W) x 6-15/16(H) x 17-5/16(D) in
Weight Without Package	18.8kg (41lb 6oz)
With Package	21.7kg (47lb 12oz)

Furnished Parts

FM T-type Antenna	1
Operating Instructions	1
Hex. Wrench	1

**Measured pursuant to Federal Trade Commission's Trade Regulation rule on Power Output Claims for Amplifiers.*

NOTE:

Specifications and the design subject to possible modification without notice due to improvements.

HEX WRENCH

The accessory hexagonal wrench is provided for removing the TUNING knob and VOLUME knob or tightening their set screws should they become loose.

If required, loose the set screw by inserting the wrench into the hole on the side of the knob and turning the wrench counter-clockwise. Be particularly careful not to scratch the front panel when employing the wrench.

2. FRONT PANEL FACILITIES

POWER SWITCH

Flip this switch to the ON position to supply power to the stereo receiver. There will be a short delay when it is set to ON, because the muting circuit has been actuated to suppress the unpleasant noise that is sometimes generated when the power is switched on and off.

PHONES JACK

Plug the headphones into this jack when you want to listen through your stereo headphones. Release both SPEAKERS buttons if you want to listen to the sound through your headphones only. (This means that both buttons will be released).

POWER METERS

These power meters allow you to read out the rated power level when speakers with a nominal impedance of 8 ohms are connected to the receiver's speaker terminals.

NOTE:
These values are related to the impedance of the speakers and they vary according to the frequency. In order to find out the exact output level, connect an 8-ohm dummy load instead of the speakers.

FUNCTION INDICATOR

MEMORY MARKERS

These are very convenient for frequent tuning in to the same broadcasting station.

SPEAKERS BUTTONS

Press the button corresponding to the speakers connected to the SPEAKERS terminals (A or B) on the rear panel. You can press both of these buttons to listen to sound from two pairs of speaker systems at the same time.

BALANCE CONTROL

Use this control to balance the volume of the left and right channels. First, however, set the MODE switch to MONO, and adjust so that the sound appears to come from somewhere exactly between the two speakers. If the sound appears to be louder on the right, it means that the volume of the right channel is higher. Turn the BALANCE control to the left and adjust. Conversely, if the sound appears to be louder on the left, it means that the volume of the left channel is higher. Therefore, turn the BALANCE control to the right and adjust. After adjusting, return the MODE switch to STEREO.

MUTING SWITCH

Set this switch to the -20dB position to attenuate the audio output indicated by the VOLUME control by 20dB. There is no need to adjust the VOLUME control if you use this switch when turning down the audio output temporarily and when changing over records or tapes.

VOLUME CONTROL

Use this control to adjust the output level to the speakers and headphones. Turn it clockwise to increase the output level. No sound will be heard if you set it to ∞. The scale is graduated in dB which indicate the attenuation when the maximum output level is 0dB.

TONE SWITCH

Set this switch to ON when adjusting the BASS and TREBLE controls. In the OFF position, it causes the amplifier to operate with a flat frequency response.

FUNCTION BUTTONS

Press the function button which corresponds to the program source. Turn the VOLUME control down first before selecting a different function button while the sound from one program source is being reproduced.

FM Press this button for FM broadcasts. The FM STEREO indicator lights up when the receiver is tuned into an FM stereo broadcast. The sound is automatically received monophonically during FM monophonic broadcasts.

AM Press this button for AM broadcasts.
AUX Press this button when listening to an audio component connected to the AUX input jacks.
PHONO 2/MIC Press this button when playing a record on the turntable connected to the PHONO 2 jacks, or when using a microphone which you have plugged into the MIC jack.
PHONO 1 Press this button when playing a record on the turntable connected to the PHONO 1 jacks.

NOTES:

1. Unplug the microphone from the MIC jack when you do not intend to use the microphone otherwise you will not be able to use the PHONO 2 jacks.
2. Only one function button should be pressed at a time.

BASS AND TREBLE CONTROLS

Use these controls to adjust the bass and the treble. If you set the TONE switch to ON and turn the BASS control to the right from its center position, you will be able to emphasize the sound in a frequency range which is lower than that selected by the BASS TURNOVER switch. Conversely, turning this control from the center position to the left will attenuate the sound. You can use the TREBLE control to adjust the sound in a frequency higher than that selected by the TREBLE TURNOVER switch.

BASS TURNOVER SWITCH

Use this switch to change over the frequency at which the sound adjustment with the BASS control is starting to take effect. Select 200Hz or 400Hz in accordance with the characteristics of your listening room and of your speakers, and with your general preference.

TAPE MONITOR SWITCHES (1, 2)

Set switch 1 to ON with a tape deck which is connected to the TAPE 1 jacks (REC and PLAY) when you want to monitor the playback or recording of a tape. The tape on a deck which is connected to the TAPE 2 jacks (REC and PLAY) can be similarly monitored by setting switch 2 to ON.

NOTE:

Set these switches to the upper (off) position when listening to records or a broadcast.

TREBLE TURNOVER SWITCH

Use this switch to change over the frequency at which the sound adjustment with the TREBLE control is starting to take effect. Select 2.5kHz or 5kHz in accordance with the characteristics of your listening room and of your speakers, and with your general preference.

TUNING METER

When tuning in to an FM station, the optimum reception position is indicated when the meter pointer deflects to dead center. Check that the SIGNAL meter pointer has deflected as far to the right as possible.

SIGNAL METER

When tuning in to an AM or FM station, the optimum reception position is indicated by the maximum deflection of the meter pointer to the right.

FM MUTING BUTTON

ON (released position) . . . Release this button to suppress unpleasant inter-station noise when tuning between FM stations.
 OFF (depressed position) Depress this button to pick up weak stations.

MIC JACK

Plug your microphone into this jack.
 The microphone signals are reproduced in mono through the left and right speakers.

NOTE:
 A high impedance (approx. 50 kilohms) dynamic type microphone with a standard plug can be connected to this jack.

TUNING KNOB

Use this to tune in to broadcasting stations.
 Select the station and tune for optimum reception by observing the SIGNAL meter for AM stations and both the SIGNAL and TUNING meters for FM stations.

STEREO INDICATOR

This indicator lights up when the receiver is tuned to receive a stereo broadcast.

FILTER BUTTONS

15Hz . . . When this button is pressed, a 6dB/oct attenuation can be provided for frequencies below 15Hz. This means that you can cancel out noise in the ultra-low frequencies which is generated by low-pitched rumble from a turntable and other forms of distortion. Although this noise cannot be heard, it can generate intermodulation distortion and damage the speakers.

6kHz . . . Press this button to provide a 6dB/oct attenuation at frequencies above 6kHz. Set it to this position when you find high-frequency noise, such as that from scratched records, unpleasant.

FM 25μs BUTTON

Press this button when listening to a Dolby* FM broadcast; otherwise keep this button at the released position.

LOUDNESS SWITCH

Set this switch to ON when listening at a low volume. The frequency response of the human ear varies according to the listening volume, and setting this switch to the ON position compensates for hearing response by emphasizing the bass and treble.

MODE SWITCH

Use this switch for selecting mono or stereo performances.
STEREO: Set to this position for normal stereo operation.
MONO: When set to this position, the left and right channel signals will be mixed and reproduced monophonically from both speaker systems.

TAPE DUPLICATE SWITCH

Set this switch to ON when you want to duplicate or edit a pre-recorded tape using two tape decks.

3. CONNECTION DIAGRAM

PRE/POWER AMP

The bridge connecting plugs between PRE AMP OUT and POWER AMP IN jacks should always be left in position in normal use. If they are disconnected or removed no sound will come from the speakers. Always be sure to switch off the power supply before attempting to remove them.

CONVENIENCE OUTLETS

SWITCHED:
(150W MAX)

A frequently used component (turntable, tape deck, etc.) can be plugged into this outlet. By leaving the power switch of that component in the ON position, power supply to the component will be coupled with the receiver switch operation.

UNSWITCHED:
(TOTAL
200W MAX)

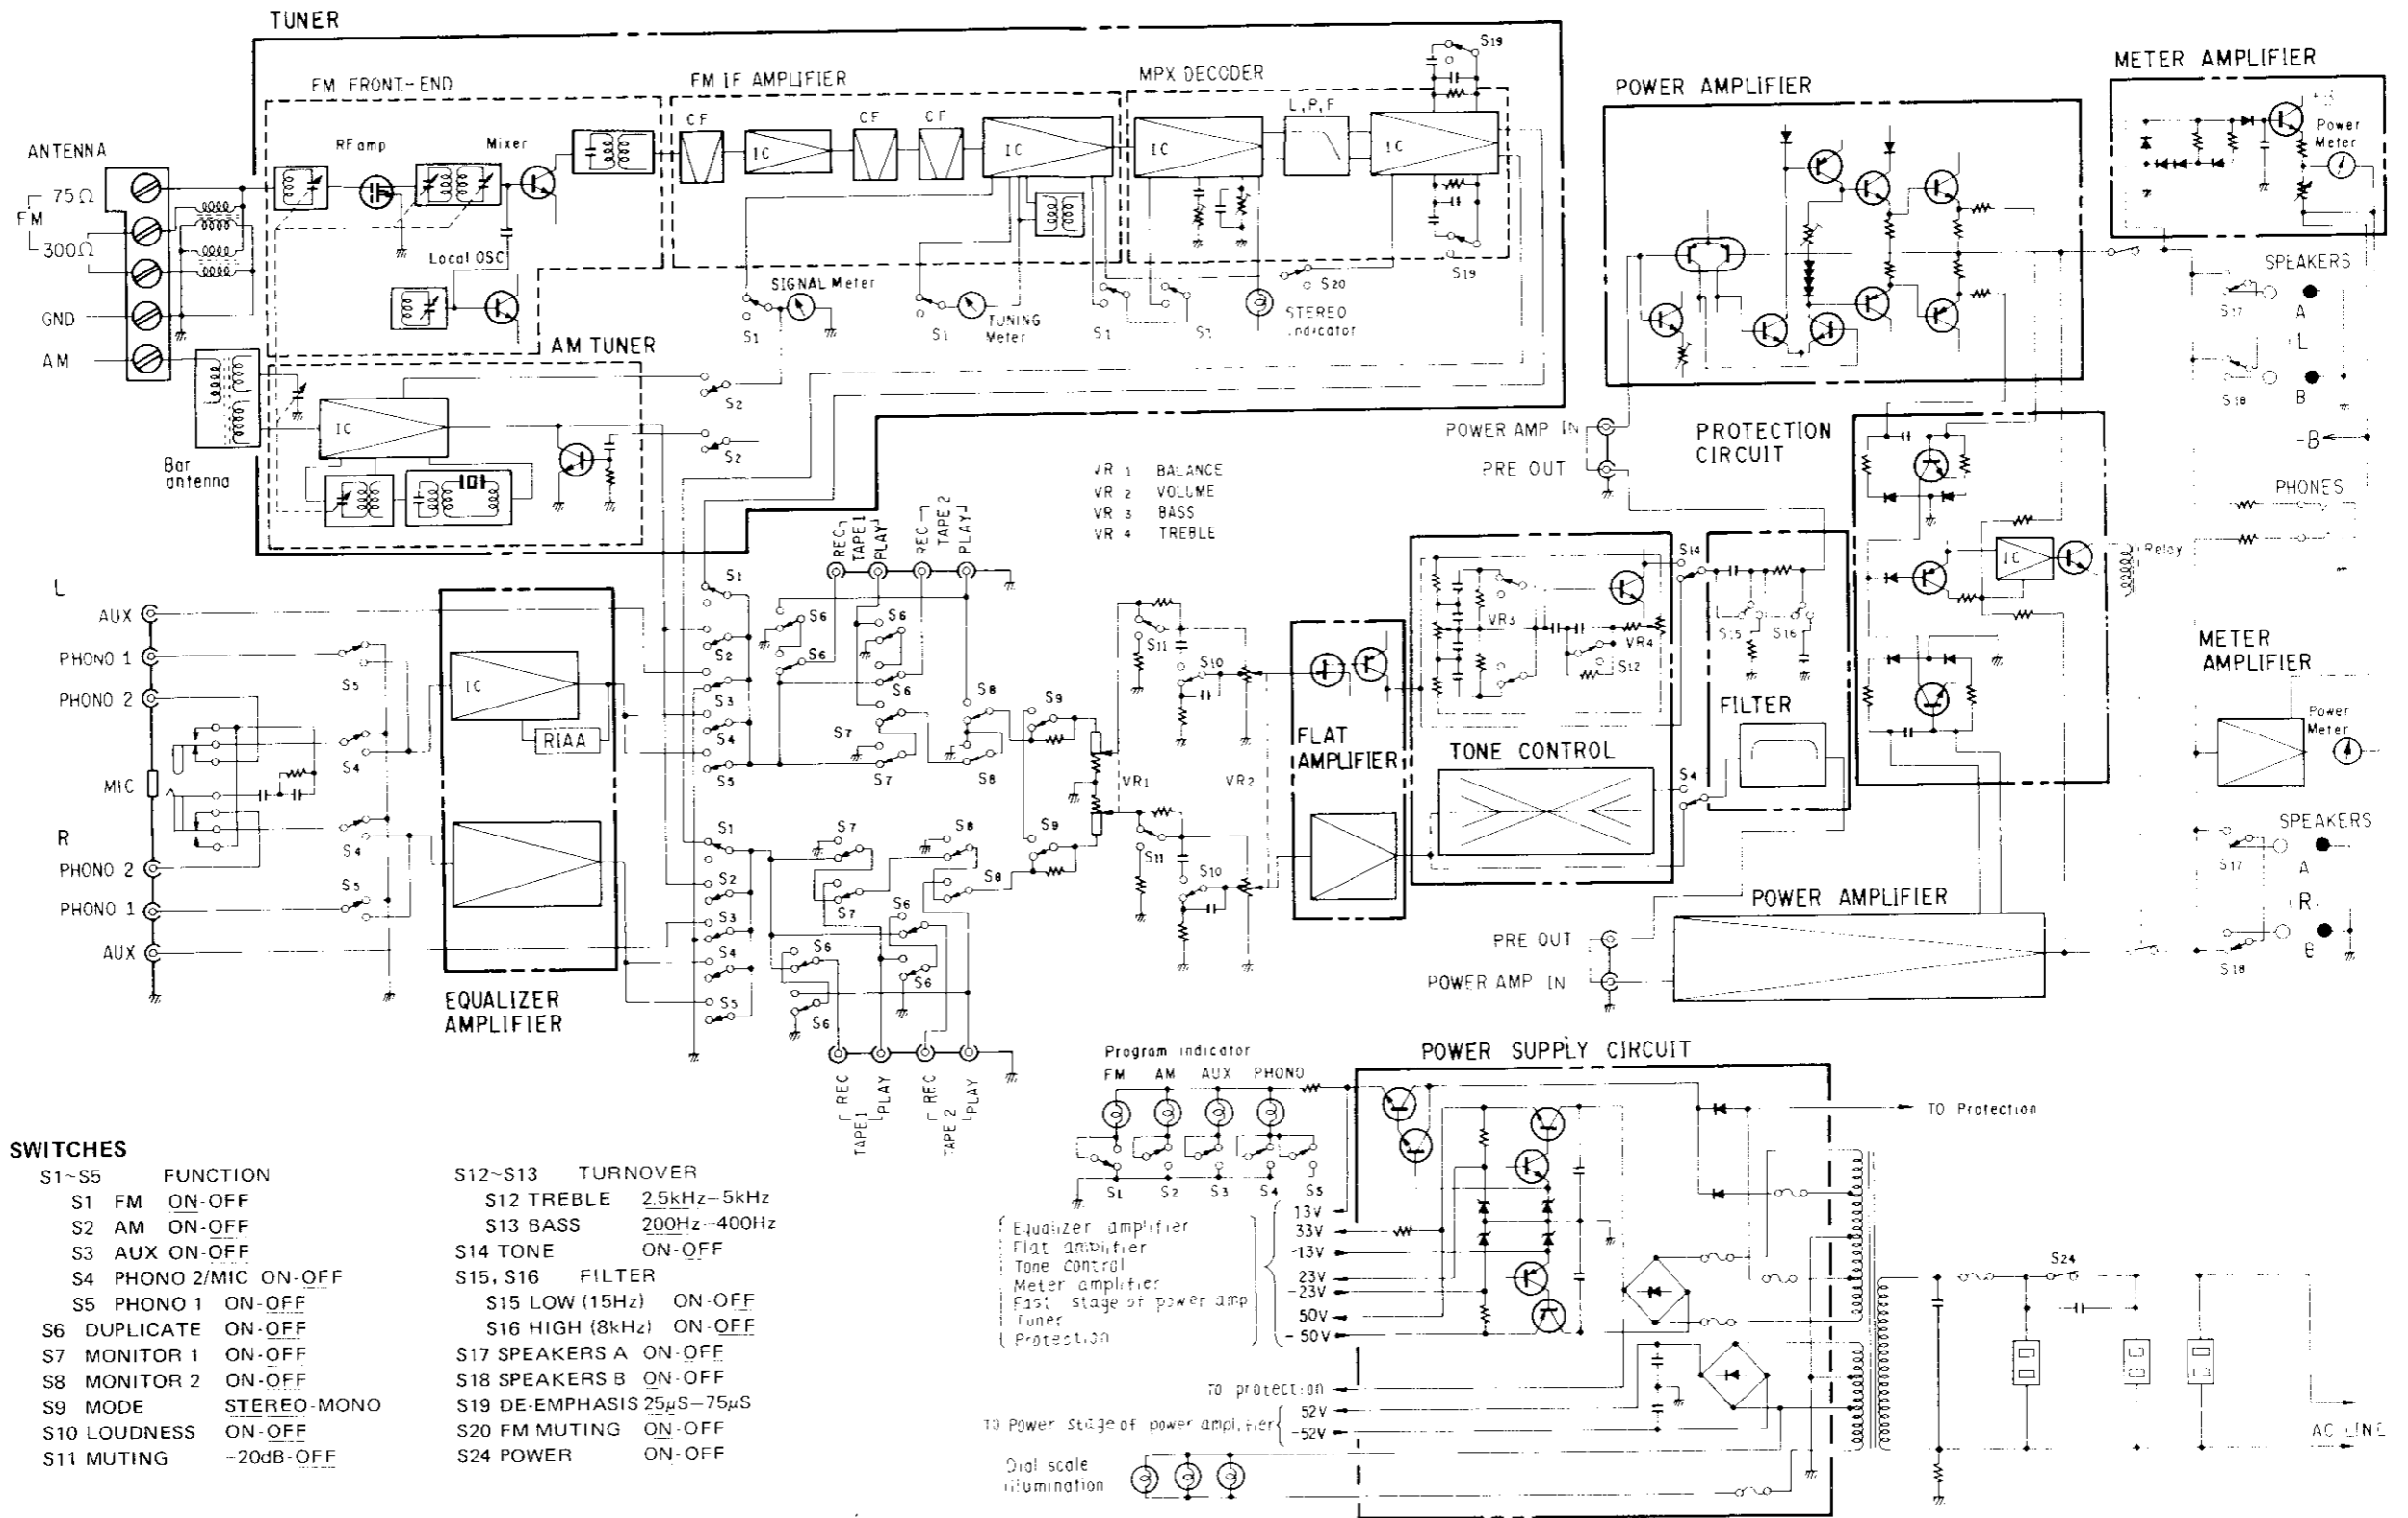

Less frequently used components, which do not require coupled power, can be plugged into either of these outlets.

4. LEVEL DIAGRAM

5. BLOCK DIAGRAM

FM Multiplex Decoder

1. The FM multiplex decoder is a PLL (Phase-Locked Loop) MPX IC (PA1001-A). Its block diagram is given in Fig. 3.

Fig. 3 Block diagram of PA1001-A

2. PA1001-A contains a PLL VCO circuit, double-balance type differential demodulator with NFB amplifier, and pilot auto cancel circuit to improve the distortion characteristics, frequency response, and S/N.

The nonlinear distortion produced at the demodulator has been improved by adding the NFB amplifier to the double balance type differential demodulator.

The pilot auto cancel circuit eliminates carrier leakage (19kHz), without a loss of demodulated signal frequency response. Moreover, since the cancel signal level tracks the input pilot signal level, the rejection ratio does not drop even if the input pilot signal level changes.

FM Output Amplifier

The FM output amplifier is an IC (PA1002-A). PA1002-A contains an AF amplifier, muting gate circuit and power ON/OFF muting control circuit. Its block diagram is given in Fig. 4.

Fig. 4 Block diagram of PA1002-A

The AF amplifier is a differentially coupled NFB amplifier featuring excellent dynamic ranges, S/N and distortion characteristics. A de-emphasis

characteristic is obtained by providing a frequency selection characteristic at the NFB loop of this amplifier.

The muting circuit electronically grounds the signal circuit when a control voltage of 1.4V or greater has been applied to pin 8 of the PA1002-A. This control voltage is applied from pin 12 of the PA3001-A thru the MUTING switch. A 1.4V DC voltage is generated at pin 12 of the PA3001-A when de-tuned more than $\pm 70\text{kHz}$ and at weak inputs (antenna input conversion $5\mu\text{V}$ or less).

6.2 PHONO, MIC INPUT CIRCUIT

PHONO 1, PHONO 2/MIC input switching is performed by the switch and the MIC jack.

When a microphone plug is inserted into the MIC jack, the input is switched to MIC at both the L and R channels. Since the IC (HA1457) is used as both a microphone amplifier and equalizer amplifier, a circuit having a reverse RIAA curve is provided at the MIC input circuit to obtain a flat frequency response.

6.3 FLAT AMPLIFIER

This amplifier is located in front of the tone control circuit. It amplifies the signal to the required level and sends a low impedance signal to the control circuit.

6.4 TONE CONTROL

The tone control circuit is an NFB type inserted in front of the power amplifier.

Bass turnover (200Hz \leftrightarrow 400Hz) and treble turnover (2.5kHz \leftrightarrow 5kHz) switches and a tone defeat circuit which bypasses the tone control circuit to obtain a flat characteristic are provided, in addition to a variable resistor, which adjusts the rise and fall.

6.5 POWER AMPLIFIER

The power amplifier is an all-stage direct-coupled pure complementary OCL circuit having a differential amplifier at the first stage, current mirror circuit at the predriver stage. (Fig. 5)

The first stage (Q_1) is a PNP type dual transistor differential amplifier that amplifies the input signal and stabilizes the center voltage of the power stage. Q_3 and Q_4 are driven by the opposite phases of the output of Q_1 . The output of Q_4 is applied to the current mirror circuit consisting of D_2 and Q_5 and phase inverted.

Consequently, Q_3 and Q_5 are in-phase signals, and are operated as a push-pull predriver.

6. CIRCUIT DESCRIPTIONS

Refer to the block diagram on page 11 and the schematic on page 37 for the circuit composition of this unit.

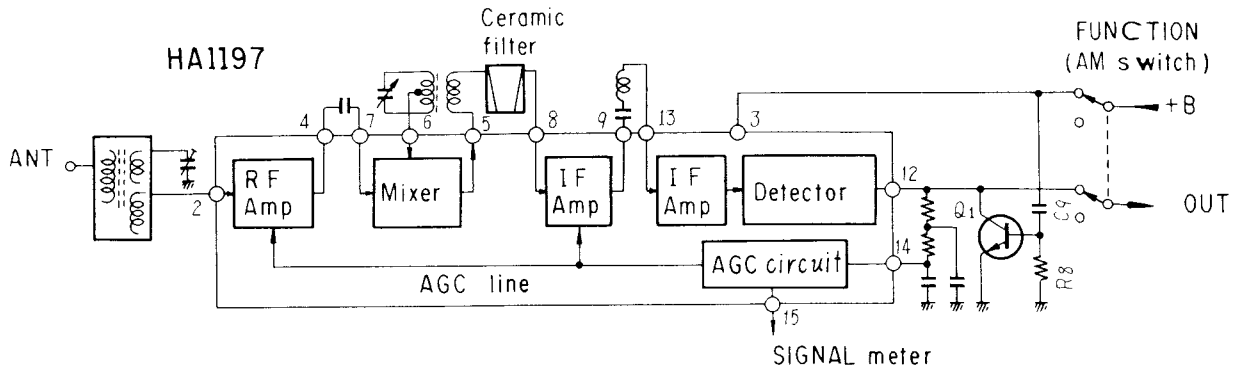

Fig. 1 Block diagram of AM tuner

6.1 AM-FM TUNER

AM Tuner

The AM tuner employs a 2-stage variable capacitor, one IC (HA1197) and one AM ceramic filter. Its block diagram is given in Fig. 1. HA1197 is an IC containing an RF amplifier, converter, 2-stage IF amplifier, detector, and AGC circuit, and features excellent AF frequency response and distortion. Q_1 of the output circuit is a special AM muting circuit. This circuit is operated until the AM tuner stabilizes immediately after the FUNCTION AM switch has been set to ON. The instant the AM switch is set to ON, +B is supplied to R_8 , thru C_9 , and the base of Q_1 is forward biased. Consequently, Q_1 is turned ON, and the AM output signal is shorted to ground during the time constant of C_9 , R_8 .

FM Front End

The FM front end employs a 4-stage variable capacitor in the tuning circuit, dual gate MOS FET at the RF amplifier and the local oscillator is a variation of a Clapp circuit.

The FM front-end input is a 75Ω unbalanced single-tuned circuit. The RF amplifier is a dual gate MOS FET. An M-coupled double-tuned circuit is inserted between stages. The dual gate FET is an amplifying element suitable for RF circuits, and features extremely stable amplification because of its low NF (Noise Figure), high PG (Power Gain) and low feedback capacitance. Local oscillator

voltage is passed through a low value capacitor to the mixer transistor base.

IF Amplifier

Three 2-dual element ceramic filters are used as the selection elements, and one IC (HA1201) containing one differential amplifiers and one FM IF IC (PA3001-A) are used as the amplification elements.

The HA1201 compensates for the filter insertion loss, and also limits the amplitude of the FM signal. The PA3001-A performs IF amplification, amplitude limiting and FM detection. It also drives the TUNING and SIGNAL meters and controls muting.

The block diagram of the PA3001-A is given in Fig. 2.

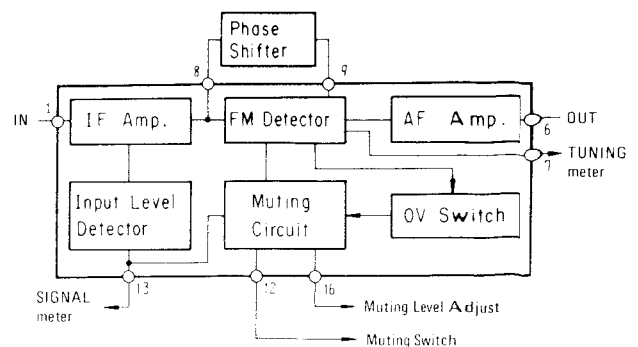

Fig. 2 Block diagram of PA3001-A

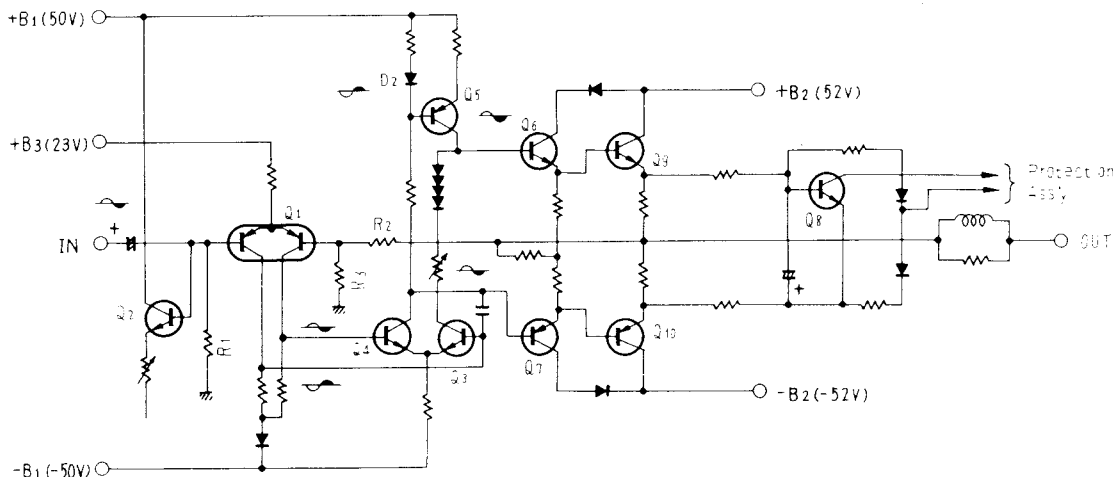

Fig. 5 Block diagram of power amplifier

Low distortion and improved rise characteristic at high amplitudes have been realized by making the predriver stage push-pull.

Overcurrent is detected and destruction of the power transistor prevented by Q_8 .

Q_2 is a Q_1 temperature compensation transistor which prevents changes in the center voltage due to the temperature characteristic of Q_1 . Since the output center voltage is applied to the feedback side base of Q_1 by R_2 and R_3 , the input side base potential of Q_1 becomes the standard. Therefore, the input side base potential of Q_1 must be maintained constant at 0V. The voltage generated across R_1 by the input side base current of Q_1 is cancelled by the base current of Q_2 to maintain the input side base potential of Q_1 constant at 0V.

6.6 METER AMPLIFIER

In order to indicate the 0.01W-160W range with one meter without range switching, a logarithmic indication type meter must be employed and the input signal must be logarithmically compressed. The meter amplifier circuit is shown in Fig. 6. This circuit consists of a logarithmic compression circuit and a meter drive circuit. The output signal of the power amplifier is applied

Fig. 6 Schematic diagram of meter amplifier

to the logarithmic compression circuit, and its dynamic range is compressed. The principles of the logarithmic compression circuit are given in Fig. 7. The output voltage of this circuit is the value divided by R_9 and Z . The attenuation at low signal input is reduced and the attenuation at large signal input is increased, by using the rise of the diode current - voltage characteristic at Z .

The compressed signal is shaped by D_5 and applied to Q_1 of the meter drive circuit. Q_1 current amplifies the DC voltage from D_5 to drive the power meter.

Fig. 7 Schematic diagram of logarithmic compressor

6.7 PROTECTION CIRCUIT

The purpose of this circuit is to protect both the speakers and the power amplifiers. The relay in the output circuit is automatically opened in any of the following cases:

1. During the "transient operations" when the power supply is turned on and off.
2. Upon detection of an overload, caused by a short circuit in the load.
3. Upon detection of a DC voltage in the output circuit, caused by component failure or accident.

An outline of this circuit is shown in Fig. 8. The relay-activating transistor (Q_r) is controlled by the IC (PA3004).

Muting Operation When Power Supply Is turned Off and On

When the power supply is first turned on, the voltages on pins 1, 7 and 6 of PA3004 will exceed a prescribed level. If there is no input (DC) on pin no.4, S_2 will be off, and a charging current will commence to flow to the timing capacitor (C_t) connected to pin no.8. Once C_t has been charged up to a level where the voltage on pin no.8 exceeds a prescribed level, S_1 will turn on, thereby applying a bias current from pin no.3 to the relay driving transistor (Q_r). Consequently Q_r will turn on, and current will flow through the relay coil to activate the relay, and close the connection in the output circuit. The time required for this connection to close after the power supply is first turned on is several seconds. During this period, any unwanted transient noises will be therefore muted.

When the power supply is turned off, the input (AC) applied to pin no.7 ceases immediately, resulting in S_2 turning on, C_t discharging rapidly, and S_1 and Q_r both turning off. The relay is thus opened, disconnecting the output circuit.

DC Voltage Detector

The output circuit is connected to pin no.4 via a low-pass filter (R_8 and C_2). Any DC voltages appearing in the output circuit will also be applied to pin no.4, turning S_2 on. C_t will thus discharge rapidly, turning S_1 and Q_r off, thereby releasing the relay, and disconnecting the output circuit from the load.

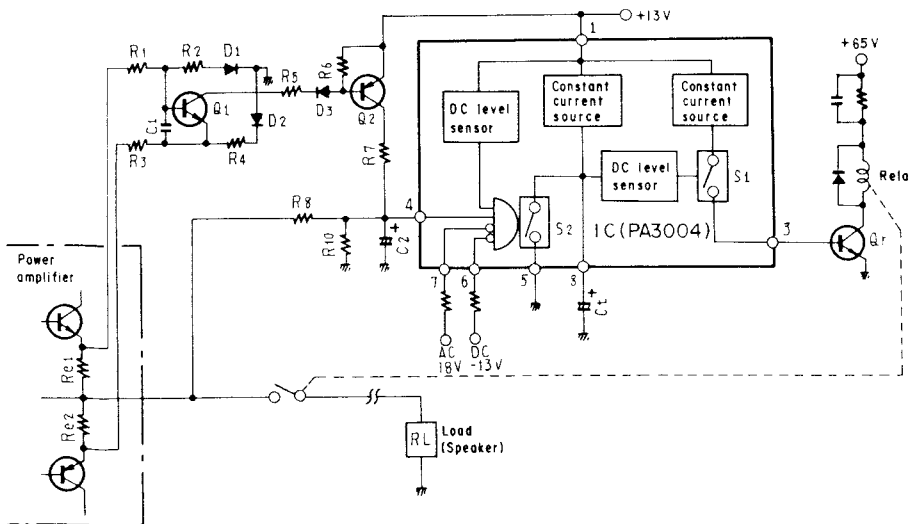

Fig. 8 Schematic diagram of protection

Overload Detection

The overload detector circuit incorporates the load (R_L) in one side of a Wheatstone bridge (see Fig. 8-1). The base and emitter of a sensing transistor (Q_1) are connected to the opposite corners of the bridge, so if R_L decreases, Q_1 will become forward biased. If R_L falls below a prescribed value, Q_1 will turn on, thereby passing a current through R_5 , D_3 and R_6 . Due to the voltage difference generated across R_6 , Q_2 will become forward biased, and consequently turn on. A DC voltage will then be applied to pin no.4, turning S_2 on, and resulting in the rapid discharge of C_t , and S_1 and Q_r both turning off. The relay will again be released to disconnect the output circuit.

6.8 POWER SUPPLY

The power amplifier and power stage plus and minus supply voltages ($\pm 50V$) are obtained by means of a bridge full-wave rectification system. 18,000 $\mu F/63V \times 2$ electrolytic capacitors are used.

Plus and minus voltages are supplied to the small signal circuit of the AF section thru a constant voltage circuit by full-wave rectification from a winding separate from the power stage supply. Tuner section, lamp circuit and protection circuit power is supplied thru transistor (Q_5 , Q_6) Darlington connected ripple filter, after full-wave rectification.

(a) Positive half-cycle bridge

(b) Negative half-cycle bridge

Fig. 8-1 Over load sensor

7. DISASSEMBLY

1. Remove screws ① - ④ and remove the bonnet.
2. Remove all the knobs, and remove the two nuts and two washers at the front panel.
(However, loosen the set screws with the accessory allen wrench before attempting to remove the TUNING and VOLUME knobs.)
Front panel can then be removed after taking out screws ⑰ and ⑱.
3. Remove Screws ⑤ - ⑯ and remove the bottom plate.

9. ADJUSTMENTS

9.1 AM TUNER

Confirm that the dial pointer is at the start point.

Connect as shown in Fig. 9, and set the FUNCTION switch to "AM".

1. Set an AM signal generator to 400Hz, 30% modulation, 30dB output, at no input from AGC.
2. Set the AM signal generator and the SX-980 dial pointer to 600kHz, and adjust T_7 for maximum output.

3. Set the AM signal generator and the SX-980 dial pointer to 1,400kHz, and adjust TC_6 maximum output.
4. Repeat steps 2 and 3 until reception is perfect at 600kHz and 1,400kHz.
5. Adjust F_6 for maximum output.
6. Adjust the core of the bar antenna (at 600kHz reception) and trimmer TC_5 (at 1,400kHz reception) for maximum output and minimum output deviation at 600kHz and 1,400kHz.

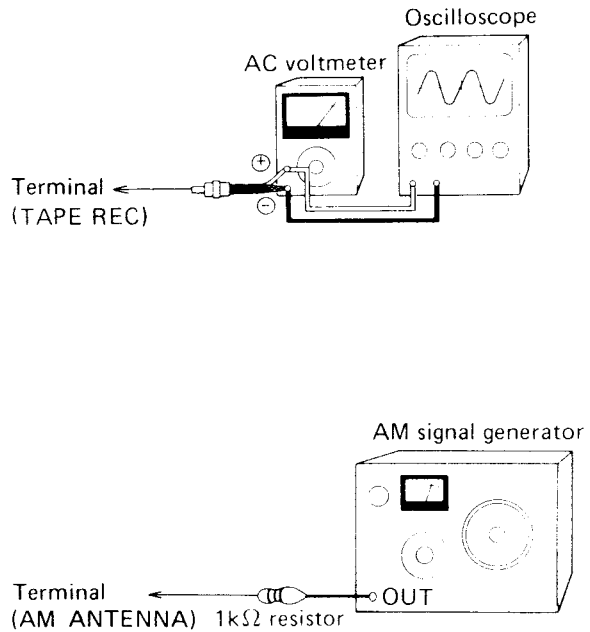

Fig. 9 Connection of AM tracking adjustment

9.2 FM TUNER

Confirm that the dial is set to the start point. Connect as shown in Fig. 10, and set the FUNCTION switch to "FM" and the MUTING switch to "OFF".

1. Set an FM signal generator to 400Hz, 100% modulation, 106dB output.
2. Set TC₄ to near center capacitance, set the FM signal generator and the SX-980 dial to 90MHz, and adjust T₄ for maximum deflection at the signal meter.
3. Under the state of "2" above, adjust the primary (bottom) core of T₆ so that the pointer of the tuning meter deflects to the center of the scale.
4. Set the FM signal generator output to 15dB, and adjust T₁, T₂, T₃ for maximum output.
5. Set the FM signal generator and the SX-980 dial pointer to 106MHz, and adjust TC₄ for maximum deflection at the signal meter. (Make the FM signal generator output 10dB.)
6. Set the FM signal generator output to 15dB, and adjust TC₁, TC₂, TC₃ for maximum output.

7. Repeat steps 2 - 6 until reception at 90MHz and 106MHz is perfect. At this time, adjust T₅ for maximum output.
8. Adjust the primary core (bottom) of T₆ so that the pointer of the tuning meter deflects to the center of the scale in the untuned state (noise only).
9. Set the FM signal generator output to 66dB, set the SX-980 dial pointer to 98MHz, and tune the FM signal generator at the tuning meter. (Pointer of tuning meter deflects to the center of the scale.)
10. Adjust the secondary side (top) of T₆ for minimum distortion.
11. Repeat steps 8 - 10 until the minimum distortion point does not change.
12. Set the FM signal generator output to 10dB, and adjust VR₂ for maximum deflection at the signal meter (Fig. 11).
13. Set the FM signal generator output to 26dB. Set the MUTING switch to "ON" and adjust VR₁ so that the output waveform disappears.

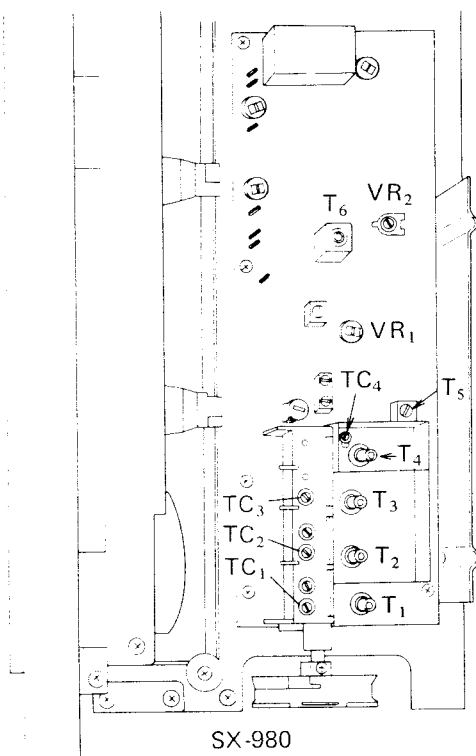

Fig. 10 Connection of FM tracking adjustment

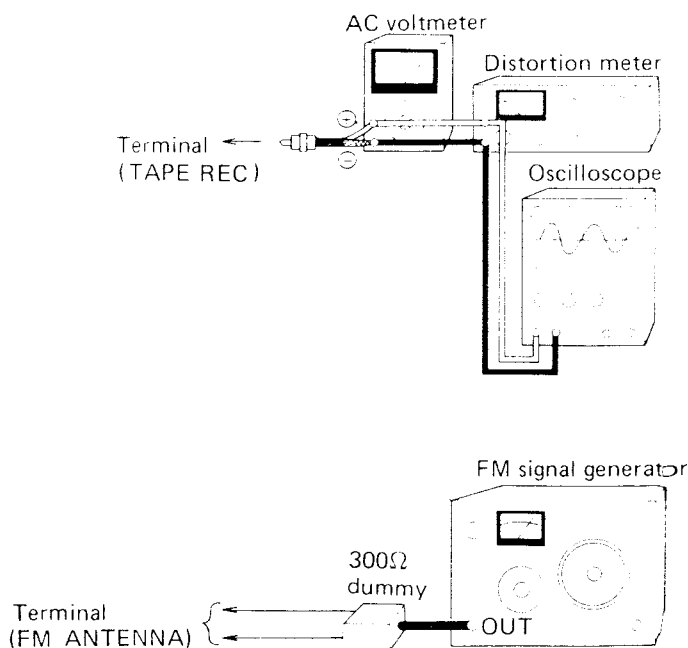

Fig. 11 Meter deflection

9.3 FM MPX

Connect as shown in Fig. 12, and set the FUNCTION switch to "FM" and the MUTING switch to "OFF".

1. Set the FM signal generator to 98MHz unmodulated, 66dB output.
2. Connect the output of the MPX SG PILOT OUT terminal to the horizontal axis input terminal of an oscilloscope and tuner assembly terminal 13 to the vertical axis input.
3. Set the SX-980 dial pointer to 98MHz and adjust the FM signal generator so that the tuning meter deflects to the center of the scale.
4. Adjust VR₃ so that a Lissajous pattern is traced on the oscilloscope (Fig. 13).

5. Next, set the MPX SG to 7.5kHz by pilot signal (19kHz).
6. Adjust VR₅ for minimum output.
7. Modulate the MPX SG at L + R (1kHz) to deviate the 67.5kHz pilot signal (19kHz) 7.5kHz.
8. Adjust T₅ for minimum L channel or R channel distortion. (However, within $\pm 90\%$ of the core adjustment range.)
9. Make the MPX SG main signal L or R and adjust VR₄ for best separation.

Fig. 13 Lissajous pattern

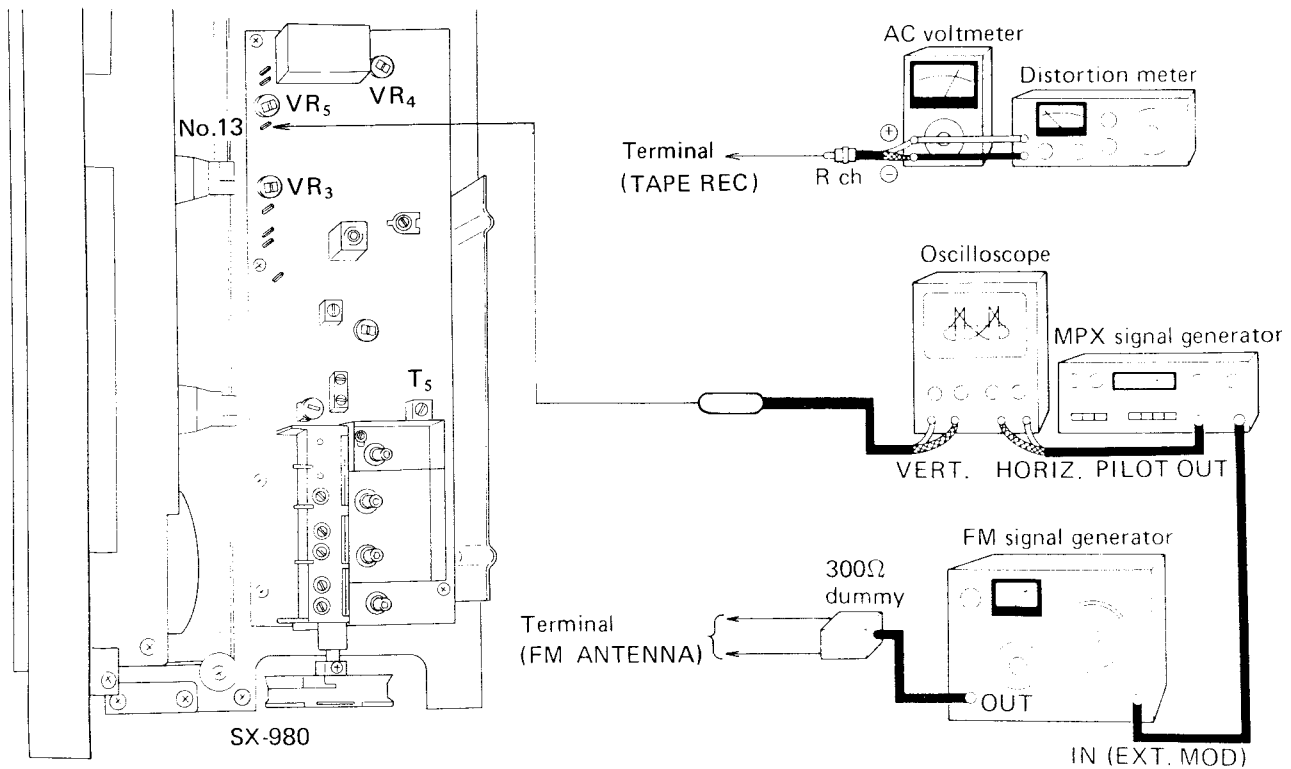

Fig. 12 Connection of FM MPX adjustment

9.4 POWER AMPLIFIER

Turn VR_1 (L and R) fully around in the clockwise direction, but set VR_2 (L and R) to the center positions. Without any, load or input signal, turn the POWER switch ON.

Center Voltage Adjustment

1. Connect a DC voltmeter between power amplifier assembly (AWH-073) L ch terminal 10 and ground as shown in Fig. 14.
2. Check if the voltage between terminal 10 and ground is 0V. When not 0V, adjust to 0V with VR_2 .
3. When 0V cannot be obtained by performing the adjustment of item 2 above, cut the jumper wire shown in Fig. 14 and adjust to $0V \pm 30mV$ with VR_2 .
4. The R ch also uses the power amplifier assembly (AWH-073). Check and adjust this channel in accordance with items 1 - 3 above.

Idle Current Adjustment

1. Connect a DC voltmeter between terminals 13 - 23 of the amplifier assembly (AWH-073) L ch side.
2. Set the power switch to "ON", wait 10 minutes, and then check if the DC voltmeter reads 30mV. If it doesn't read 30mA, adjust to 30mV by turning VR_1 (Fig. 14).
3. The R ch also uses the power amplifier assembly (AWH-073). Check and adjust this channel in accordance with items 1 - 2 above.

Fig. 14 Power amplifier adjustment

9.5 METER AMPLIFIER

1. Push speaker selector switch button "A".
2. Connect an AC voltmeter to speaker output terminal (A).
3. Apply a 1kHz sine wave to the input terminals (AUX) and adjust the input for an AC voltmeter reading of 28V.
4. Adjust VR_1 (L) and VR_2 (R) at the assembly No. AWM-120 printed circuit board for a meter indication of 0dB.

Fig. 15 Meter adjustment

10. DIAL CORD STRINGING

Remove the bonnet and front panel as described in "DISASSEMBLY" on page 17. Loosen screws ① - ③ and remove the blind sash as shown in Fig. 16.

1. Turn the variable capacitor shaft fully clockwise. (Vanes of capacitor fully inside.)
2. Tie one end of the string to the peg on the dial pulley.
3. Position the dial pulley so that the set screw is at the top and tighten the screw.
4. Pass the string through the notch in the dial pulley, wrap it 1/2 turn around the pulley and pass it thru pulley A → pulley B → pulley C → dial shaft (3 turns) → pulley D. Next, wrap the string two turns around the pulley, along the pulley grooves, and tie it to the spring hook.
5. Turn the dial shaft and confirm that the movement of the dial pulley and string is normal, and then cut off the surplus string.
6. Turn the dial shaft counter-clockwise (variable capacitor vanes fully outside) and set the dial pointer to the start point of the scale and attach it to the string.

Fig. 16 Remove blind sash

Service Manual

AM/FM STEREO RECEIVER

SX-980

KC, HG, S, S/G

MODEL SX-980 COMES IN FIVE VERSIONS DISTINGUISHED AS FOLLOWS:

Type	Voltage	Remarks
KU	120V only	U.S.A. model
KC	120V only	Canada model
HG	220V and 240V (Switchable)	Europe or Oceania model
S	110V, 120V, 220V and 240V (Switchable)	General export model
S/G	110V, 120V, 220V and 240V (Switchable)	U.S. Military model

NOTICE:

- This additional service manual is applicable to the SX-980/KC, HG, S, S/G. Connections, set handling, circuitry, and adjustment are basically the same as SX-980/KU.
- The parts which are different from the SX-980/KU are covered in this additional service manual. Please use this manual together with the SX-980/KU service manual which is previously issued when ordering parts and repair.

1. SPECIFICATIONS

The specifications for "HG", "S" and "S/G" types are as "KU" type except for following sections.

HG TYPE

Preamplifier Section

Input (Sensitivity/Impedance)

TAPE PLAY 1, 2 150mV/50kilohms
TAPE PLAY 2 (DIN connector) 150mV/50kilohms

Output Level/Impedance

TAPE REC 1, 2 150mV
TAPE REC 2 (DIN connector) 30mV/80kilohms

Miscellaneous

Power Requirements 220V and 240V (Switchable)
50Hz/60Hz
Power Consumption 800W (max.)

S AND S/G TYPES

Preamplifier Section

Input (Sensitivity/Impedance)

TAPE PLAY 1, 2 150mV/50kilohms
TAPE PLAY 2 (DIN connector) 150mV/50kilohms

Output Level/Impedance

TAPE REC 1, 2 150mV
TAPE REC 2 (DIN connector) 30mV/80kilohms

Miscellaneous

Power Requirements 110V, 120V, 220V and
240V (Switchable) 50Hz/60Hz
Power Consumption 210W

Furnished Parts

Fuse 6A 1
3A 1

2. CONTRAST OF MISCELLANEOUS PART

NOTE:

- Capacitors: in μF unless otherwise noted $p:pF$
- Resistors: in Ω , $\frac{1}{4}W$ unless otherwise noted $k:k\Omega$, $M:M\Omega$

Q4	2SB682-C or D (2SB507P-D or E)	Transistor
Q5	2SD712-C or D (2SD313P-D or E)	Transistor
Q6	2SC945A-Q or R (2SC1914-F)	Transistor
D1	10E2 or SIB01-02	Diode
D2	10E2 or SIB01-02	Diode
D3	10E2 or SIB01-02	Diode
D4	10E2 or SIB01-02	Diode
D6	10E2 or SIB01-02	Diode
D7	10E2 or SIB01-02	Diode
D8	MZ-140 or WZ-140	Zener diode
D9	MZ-130 or WZ-130	Zener diode
D10	LZ-230 or BZ-230	Zener diode
D11	LZ-230 or BZ-230	Zener diode
D12	SR3AM-8	Diode
D13	SR3AM-8	Diode
D14	SR3AM-8	Diode
D15	SR3AM-8	Diode

OTHERS

Symbol	Part No.	Description
	ANH-203	Heat sink
	AKR-013	Fuse clip

Foil side

AC
110V
120V
220V
240V
60Hz/50Hz

5. SX-980/KC

NOTICE:

- The contrast parts, KC type and KU type, are shown in below.
- The circuit diagram and pattern of the power supply assembly for the KC type (AWR-168) are same as the KU type (AWR-156). Only different is parts installation method.

Contrast of Miscellaneous Part

ASSEMBLYS

Symbol	Part Name	Part No.		Remarks
		KU type	KC type	
	Power amplifier assembly	AWH-073	AWH-077	See HG type
	Power supply assembly	AWR-156	AWR-168	

TRANSFORMER

Symbol	Part Name	Part No.		Remarks
		KU type	KC type	
T4	Power transformer	ATT-449	ATT-462	

CAPACITORS

Symbol	Part Name	Part No.		Remarks
		KU type	KC type	
C5	Ceramic 0.01 250V	ACG-001	
	Ceramic 0.01 125V	ACG-014	
C6	Ceramic 0.01 125V	ACG-003	
	Ceramic 0.01 125V	ACG-014	

OTHERS

Symbol	Part Name	Part No.		Remarks
		KU type	KC type	
	Capacitor cover	AEC-294	
	Capacitor cover	AEC-279	
	Capacitor cover	AEC-365	

PACKING

Symbol	Part Name	Part No.		Remarks
		KU type	KC type	
	Packing case	AHD-508	AHD-524
