1. SAFETY INFORMATION

1. SAFETY PRECAUTIONS

The following check should be performed for the continued protection of the customer and service technician.

LEAKAGE CURRENT CHECK

Measure leakage current to a known earth ground (water pipe, conduit, etc.) by connecting a leakage current tester such as Simpson Model 229-2 or equivalent between the earth ground and all exposed metal parts of the appliance (input/output terminals, screwheads, metal overlays, control shaft, etc.). Plug the AC line cord of the appliance directly into a 120V AC 60Hz outlet and turn the AC power switch on. Any current measured must not exceed 0.5mA.

Additional Laser Caution

1. The player microcomputer checks the inserting condition of magazines A, B and C by using the combined signals of the SENS1 (S804), SENS2 (S805), SENS3 (S806), LOCK1 (S801), LOCK2 (S802) and LOCK3 (S803) switches. It is after these three magazines are fully inserted that commands from the control microcomputer are accepted. The laser diode is turned ON for illumination by outputting the laser diode ON signal from the control microcomputer when the CLAMP switch (S1001) (DSK1001), which signals that the tray is to be pulled from the magazine and detects clamping condition, is set to ON and the player receives the "rising command" in the disc clamping condition. If no disc is available, it turns OFF after 20 seconds. The illuminated laser diode goes out when receiving a "Reject command", a "disc change command" or a "magazine eject command."
   The laser diode continues to oscillate when pin ㉘ of CXA1081S (IC1) is connected to GND or to pin ⑤.
2. If the fault condition described in 1 is induced with the cover open and with the servo mechanism block removed to be turned over, close viewing of the objective lens with the naked eye will cause exposure to a class 1 or higher laser beam.

6. NOTES ON REPLACING THE LITHIUM BATTERY AND RAM (IC2 : HM62256LP-12)

- When replacing the Lithium battery (DEM1001) or the RAM (IC2 : HM62256LP-12) in the CONT unit of the commander block, clear RAM data in the following manner.
  If the data is not cleared, a malfunction may occur.

● How to clear

A If the accessory wired-remote control of the CJ-V50A is existed, insert the wired-remote control (accessory of the CJ-V50A) to the mini DIN connector (4P) on the rear panel of the commander.

B If the accessory wired-remote control of the CJ-V50A is not existed, connect four pins of the mini DIN connector (4P) on the RMJB unit to the chassis (GND).

1. Set the power switch to OFF and all the function switches of the commander block to ON.
2. While simultaneously pressing four keys, the volume + and − keys and the cancel A and B keys on the remote control unit, set the power switch to ON. A buzzer sounds in a few seconds, indicating that the clear operation is completed.
   (Note : An error may occur if you set the power switch to OFF while pressing these four keys.)
   When the data is cleared, the rate settings return to their default values and all other data become 0. Be careful when performing this operation as it sets even the non-resettable data all to 0.

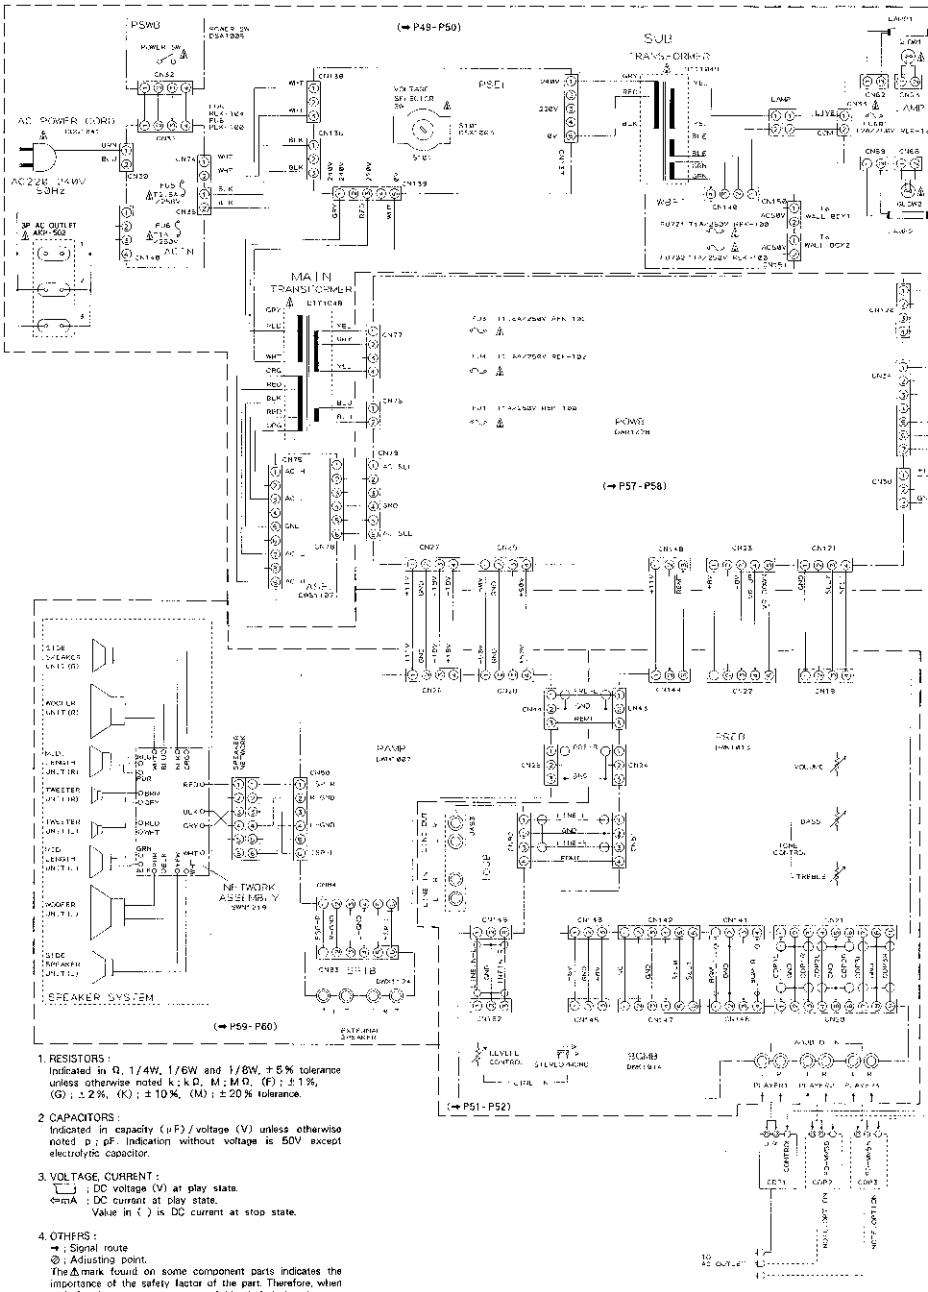
4. SCHEMATIC DIAGRAMS AND P. C. BOARDS PATTERN

4.1 MAIN SECTION

4.1.1 OVERALL CONNECTION DIAGRAM



1. RESISTORS :
Indicated in Ω, 1/4W, 1/6W and 1/8W, ±5% tolerance unless otherwise noted k ; kΩ, M ; MΩ, (F) ; ±1%, (G) ; ±2%, (K) ; ±10%, (M) ; ±20% tolerance.

2. CAPACITORS :
Indicated in capacity (μF) / voltage (V) unless otherwise noted p ; pF. Indication without voltage is 50V except electrolytic capacitor.

3. VOLTAGE, CURRENT :
□ ; DC voltage (V) at play state.
⇦mA ; DC current at play state.
Value in ( ) is DC current at stop state.

4. OTHERS :
→ ; Signal route
Ø ; Adjusting point.
The ⚠ mark found on some component parts indicates the importance of the safety factor of the part. Therefore, when replacing, be sure to use parts of identical designation.
※ marked capacitors and resistors have parts numbers.

This is the basic schematic diagram, but the actual circuit may vary due to improvements in design.

MAIN SECTION

NOTES :
- Parts without part number cannot be supplied.
- Parts marked by "◉" are not always kept in stock. Their delivery time may be longer than usual or they may be unavailable
- The ⚠ mark found on some component parts indicates the importance of the safety factor of the part. Therefore, when replacing, be sure to use parts of identical designation.
- When ordering resistors, first convert resistance values into code form as shown in the following examples.

Ex.1 When there are 2 effective digits (any digit apart from 0), such as 560 ohm and 47k ohm (tolerance is shown by J = 5 %, and K = 10 %).
- 560 Ω → 56 × 10¹ → 561 ····· RD1/4PS 5 6 1 J
- 47k Ω → 47 × 10³ → 473 ····· RD1/4PS 4 7 3 J
- 0.5 Ω → 0R5 ····· RN2H 0 R 5 K
- 1 Ω → 010 ····· RS1P 0 1 0 K

Ex.2 When there are 3 effective digits (such as in high precision metal film resistors).
- 5.62k Ω → 562 × 10¹ → 5621 ····· RN1/4SR 5 6 2 1 F

NOTES :

- Parts without part number cannot be supplied.
- Parts marked by "⊛" are not always kept in stock. Their delivery time may be longer than usual or they may be unavailable.
- The Δ mark found on some component parts indicates the importance of the safety factor of the part. Therefore, when replacing, be sure to use parts of identical designation.
- When ordering resistors, first convert resistance values into code form as shown in the following examples.

Ex.1 When there are 2 effective digits (any digit apart from 0), such as 560 ohm and 47k ohm (tolerance is shown by J = 5%, and K = 10%).

560 Ω → 56 × 10¹ → 561 ····· RD1/4PS 5 6 1 J
47k Ω → 47 × 10³ → 473 ····· RD1/4PS 4 7 3 J
0.5 Ω → 0R5 ····· RN2H 0 R 5 K
1 Ω → 010 ····· RS1P 0 1 0 K

Ex.2 When there are 3 effective digits (such as in high precision metal film resistors).

5.62k Ω → 562 × 10¹ → 5621 ····· RN1/4SR 5 6 2 1 F

7. ADJUSTMENTS

7.1 MECHANICAL ADJUSTMENTS

7.1.1 MAIN SECTION

● Synchronous adjustment of three surfaces of the menu (Fig. 7-1)

PREPARATIONS

- Adjust without installing the motor (menu).
- Fix the center pulley to the menu shaft with the screws.

(1) Apply synchro belt between synchro pulley and center pulley both on the right and left sides.
(2) While applying a spring (tension) to the underframe and tension plate, apply a tension to the synchro belt.
(3) Fix the tension plate to the underframe with screw Ⓓ.
(4) By placing a flat plate such as a ruler on them, align the three surfaces of the menu with each other on the same level.
(5) Fix the menu shaft to the synchro pulley using a hexagonal wrench.
(6) Remove the plate placed on the menu and check the following items while turning the menu by hand.
1. Check that the three surfaces of the menu rotate smoothly.
2. Check that all the three surfaces align with each other on the same level after turning the menu shaft once.

● Adjustment of the stop position of menu rotation

PREPARATIONS

- Loosen screw Ⓐ which holds the encoder disc using a hexagonal wrench.
- Loosen screw Ⓐ which holds the adjustment plate.
- Adjust with the motor (menu) attached.

(1) Set the gap between the encoder disc and photo interrupter of the motor (menu) to $1^{+0.5}_{-0.5}$mm. (Fig. 7-2)
(2) Fix the screw of the encoder disc by tightening with a hex wrench.
(3) Turn screw Ⓑ so that the carved mark on the adjustment plate aligns with the underframe. Then temporarily tighten screw Ⓐ.
(4) Push the ROTATE MENU key on the front panel of the main unit so that menu rotates. Then, perform the following adjustments depending on the condition. (Fig. 7-3)
- When the menu stops after extending the front
  ····· Loosen screw Ⓐ, then tighten screw Ⓑ turning it clockwise.
- When menu stops before reaching the front
  ····· Loosen screw Ⓐ and turn screw Ⓑ counterclockwise to loosen it.

(5) Turn the menu again and firmly tighten screw Ⓐ when the menu stops directing its surfaces to the front. (Fig. 7-4 Ⓒ)
(6) Finally, turn the menu and check that the menu stops directing all of its three surfaces to the front at every 120° rotation.

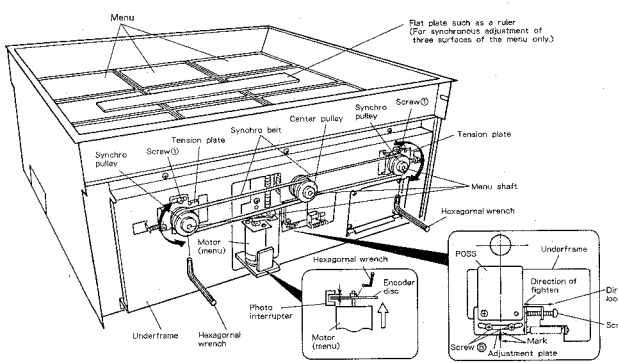

Fig. 7-1 Fig. 7-2 Fig. 7-3

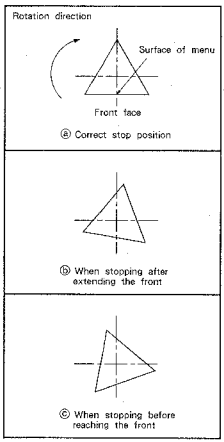

Fig. 7-4

7.1.2 CD SECTION

PREPARATIONS

- Set a magazine in the first and third modules of the CD main unit.
- Connect the remote control unit (RU-V101) to the CD main unit.

1. Rough adjustment of the select position

(1) Set the distance from the upper side of the sensor plate to that of the main chassis to 7mm by turning screw Ⓐ.

2. Adjustment of the select position

(1) First, proceed as follows.

① Press the 10keys in the sequence of 1 + 8 + STILL/STEP⏯▶ (DISC SELECT) key + STILL/STEP◀⏯ (DISC RETURN) key. When the operation is completed, check that the gap between the top of the rotation lever and the upper side of the sixth tray in the magazine is $0.3^{+0.2}_{-0}$.

② If the distance is not within the specified range, turn screw Ⓐ to adjust the position of the sensor plate and press the 10keys again in the sequence of 1 + 8 + STILL/STEP⏯▶ (DISC SELECT) key + STILL/STEP◀⏯ (DISC RETURN) key until the distance comes within the specified range.

③ Push the 10keys in the sequence of 6 + STILL/STEP⏯▶ (DISC SELECT) key + STILL/STEP◀⏯ (DISC RETURN) key and check that the gap between the top of the rotation lever and the upper side of the sixth tray in the magazine is 0.3mm ± 0.1mm.

(Do not close the tracking servo.) ● Observe the waveform of pin 2 TRK. ERR (Tracking error) of TP1 with an oscilloscope. At this point, insert a 4kHz cutoff low-pass filter. (Fig. 7-8)
	0.5V/div	5msec /div	TP1 Pin 2 (TRK. ERR)	Grating	Null point	● Turn the ⊖ screwdriver and find null point. (Photo. 7-1)
				Grating	Maximum amplitude	● Then, turn slowly the ⊖ screwdriver counterclockwise from the null point and adjust at the point where the waveform (Tracking error signal) firstly becomes maximum amplitude. (See Photo. 7-2.) Note : If the ⊖ screwdriver is pressed strongly, the pickup moves toward disc center, accordingly adjustment becomes difficult. ● Finally, be sure to confirm that the tracking error signal (at this time, 4 kHz of cutoff low-pass filter is not inserted) when the pickup is moved toward the disc center and the P-P voltage of the tracking error signal at the outer circumference of the disc are not varied greatly. Pin	Mark	Pin name	I/O	Function
1 4 – 7 22 – 24	D_3 $D_4 - D_7$ $D_0 - D_2$	DATA BUS0 DATA BUS7	I/O	Bilateral data bus which using for data transfer with the CPU. High impedance at the reset.
2	RxD	RECEIVER DATA	I	Serial data input terminal to the reception section. "Mark" : "H", "Space" : "L"
16	TxD	TRANSMITTER DATA	O	Serial data output terminal from the transmission section. "Mark" = "H", "Space" : "L" "H" at the transmission section is not operated, and "H" at the reset.
3	GND	GROUND		Ground
21	Vcc	POWER SUPPLY		+5V power supply.
8	$\overline{TxC}$	TRANSMITTER CLOCK		Clock input terminal of the transmission section. $\overline{TxD}$ is used to synchronize with the transmission data when using the external transmission clock. $\overline{TxC}$ is used for the 1X/16X clock output terminal when using the internal transmission clock. Input state at the reset.
9 11	A_1 A_0	ADDRESS LINE 0, 1		Signal for select the internal register.
10	$\overline{CE}$	CHIP ENABLE		Addressing terminal of the CPU and internal HD64941. • When $\overline{CE}$ = L, perform the reading and writing operation to the internal register which is regulated with R/W, A_0 and A_1 • When $\overline{CE}$ = H, set the D_0 through D_7 to high impedance state.
12	R/W	READ/WRITE		Terminal for control the direction of the data transfer.
13	$\overline{INTR}$	INTERRUPT		Output terminal of the interrupt reguired signal "H" at the reset.
14	$\overline{DCD}$	DATA CARRIER DETECT		Detection input terminal of the data carrier. When $\overline{DCD}$ is "L", reception section is able to operate.
15	$\overline{CTS}$	CLEAR TO SEND		Clear to send (transmission) input terminal. $\overline{CTS}$ have to "L" for operating the transmission section. When becomes "H" during transmit, the end of transmission after complete the character transmission in the shift register for the transmission.
17	BRCLK	BAUD RATE CLOCK		Clock input terminal for generating the internal baud rate. It's useless to use the external transmission and reception clocks ($\overline{TxC}$ and $\overline{RxC}$.)
18	RESET	RESET		"0"clear terminal of the mode register 1 and 2, command register and status register.
19	$\overline{RTS}$	REQUEST TO SEND		General-purpose output terminal. $\overline{RTS}$ outputs which inverting the bit 5 of the command register (CR). Usually, it is used for reguire the transmission.
20	$\overline{RxC}$ /BKDET	RECEIVER CLOCK/ BREAK DETECTION		Clock input terminal of reception section. $\overline{RXC}$ is used to synchronize with the reception data when using the external reception clock. $\overline{RXC}$ is used for the output signal of brake detection (BK-DET) and the 1X/16X clock output terminal when using the internal reception clock. Input state at the reset.
