STEREO CASSETTE TAPE DECK

CT-X9

MODEL CT-X9 COMES IN FOUR VERSIONS DISTINGUISHED AS FOLLOWS:

Type	Voltage	Remarks
KU	AC120V only	U.S.A. model
HE	AC220V and 240V (Switchable)	Europe model
HB	AC220V and 240V (Switchable)	United Kingdom model
D	AC120V, 220V and 240V (Switchable)	General export model

- This service manual is applicable to the KU type. When repairing the HE, HB and D types, please see page 77.
- For the mechanism description, please refer to the supplement of model CT-7R service manual <ARP-001>.
- Ce manuel d'instruction se réfère au mode de réglage, en français.
- Este manual de servicio trata del método de ajuste escrito en español.

1. SPECIFICATIONS

System	Compact cassette, 2-channel stereo
Heads	"Ribbon Sendust" recording/playback combination head x 1, Erasing head x 2
Motor	DC servo D.D. motor x 1 (For driving the capstan) Brushless D.D. motor x 2 (For driving the reel)
Wow and Flutter	No more than 0.04% (WRMS)
Fast Winding Time	Approximately 90 seconds (C-60 tape)
Frequency Response	
-20 dB recording:	
Normal tape	30 to 16,000 Hz ± 3 dB (25 to 17,000 Hz)
Chrome tape	30 to 17,000 Hz ± 3 dB (25 to 18,000 Hz)
Metal tape	30 to 17,500 Hz ± 3 dB (25 to 18,500 Hz)
0 dB recording:	
Normal tape	30 to 9,000 Hz
Chrome tape	30 to 10,000 Hz
Metal tape	30 to 15,000 Hz
Signal-to-Noise Ratio	
Dolby NR OFF	More than 58 dB
Noise Reduction Effect	
Dolby B-type NR ON	More than 10 dB (at 5 kHz)
Dolby C-type NR ON	More than 19 dB (at 5 kHz)
Harmonic Distortion	No more than 0.8% (0 dB)
Input (Sensitivity/Maximum allowable input/Impedance)	
LINE (INPUT)	50 mV/25 V/50 kΩ, Pin jacks
Output (Maximum level/Load impedance)	
LINE (OUTPUT) x 2	450 mV/50 kΩ

Subfunctions

- 3 Motor direct-drive mechanism
- Playback auto reverse, Recording auto reverse
- Auto repeat function
- Music search function with LED indicator lamp
- Index scan function with LED indicator lamp
- Dolby NR system (B type/C type/OFF) with LED indicator lamp
- One-touch recording function
- REC muting function with LED indicator lamp
- Auto tape selector (NORM/CrO₂/METAL)
- Timer stand-by function
- One-touch auto function
- 4-digit tape counter
- Cassette compartment illumination

Miscellaneous

Power Requirements	AC 120 V, 60 Hz
Power Consumption	42 watts
Dimensions	320 (W) x 99.5 (H) x 213.3 (D) mm 12-10/16 (W) x 3-15/16 (H) x 8-6/16 (D) in
Weight (without package)	4.8 kg (10 lb 9 oz)

Furnished Parts

Operating instructions	1
Connection cord	2

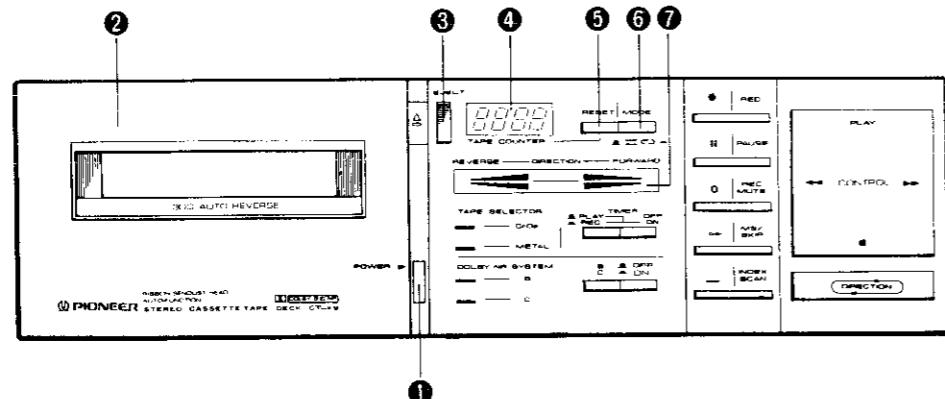

NOTE:

Specifications and the design subject to possible modifications without notice due to improvements.

NOTES:

1. Reference Recording Level: -7 dBv level at line out (160 nwb/m magnetic level = Philips cassette reference level)
2. Reference Signal: 333 Hz
3. Wow & Flutter: • JIS [3 kHz, with acoustic compensation (weighted), rms value]
4. Frequency Response: • Measured at -20 dB level, DOLBY NR OFF, level deviation is ± 6 dB without indication.
5. Signal to Noise Ratio: • Measured at the third harmonic distortion 3% level, weighted.
6. Sensitivity: Input level (mV) required for reference recording level with input (REC) controls set to maximum.
7. Maximum Allowable Input: While decreasing settings of input (REC) level controls and increasing level at input jacks, this is the maximum input level (mV) at the point where recording amplifier output waveform becomes clipped.
8. Reference Output Level: -7 dBv level at line out during playback

2. FRONT PANEL FACILITIES

① POWER SWITCH

When this switch is depressed, power is turned ON, and when it is depressed again, power is turned OFF. When you push the power switch, be sure the timer switch (TIMER) is set to the OFF position.

- When the power switch is turned ON without a cassette tape inserted, the tape indicator METAL will light.
- After turning the power switch ON, the muting circuit will function for about four seconds before the tape deck operates.

② CASSETTE HOLDER

The cassette holder opens when the eject button (EJECT ▲) is depressed. Insert the cassette with the exposed tape side facing down. The cassette holder cannot be opened while the tape is playing.

③ EJECT BUTTON (EJECT ▲)

When the button is depressed, the cassette holder opens. Do not depress this button while the tape is playing or if the tape is stopped temporarily during recording or playback. In these cases, the cassette holder will not open even if the eject button is depressed.

④ TAPE COUNTER

The numbers change as the tape is playing. Tape position is indicated with a four-column digital counter.

⑤ RESET BUTTON

Depressing this button resets the tape counter to "0000". Depress this button before recording or playback to reset the counter to "0000". If you make a memo of the tape contents and corresponding tape counter numbers during recording and playback, you will have an index of the programs on the tape enabling you to conveniently find any desired program on the tape.

⑥ MODE SWITCH

This switch selects the tape mode.

When this button is in the OFF position, the tape will be transported in one direction only. When the tape comes to the end of its transport, tape transport will be automatically stopped.

When the button is in the ON position, tape transport will be in the automatic reverse mode. When one side of the tape comes to its end, tape direction will be reversed, playing the other side. In this way, you can play both A and B sides up to four times automatically. After the fourth full play, the tape transport will be automatically stopped. If the pause switch (PAUSE) is depressed in the middle of play, and then depressed again, tape play will recommence for another four full plays.

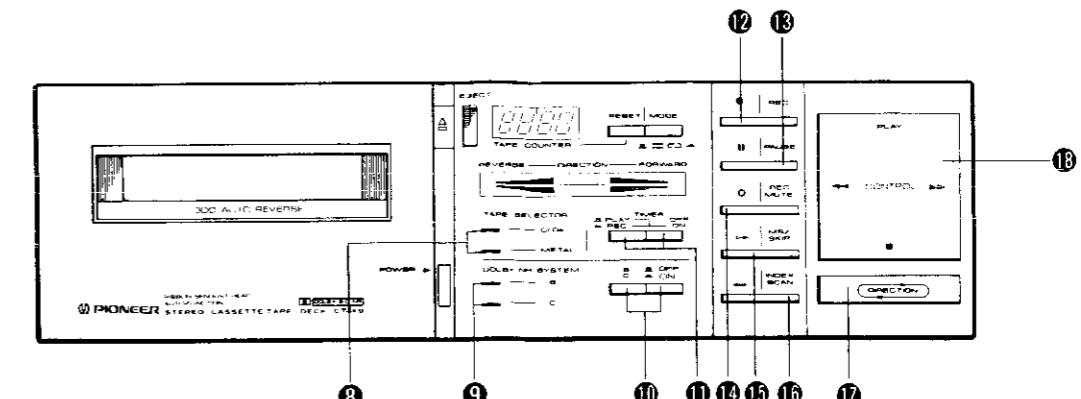

When recording, begin from the forward mode. In this way, when the tape comes to the end of the first side, tape direction will be automatically reversed to record the second side. If recording is begun from the reverse mode, the tape will not automatically reverse itself, so be careful to note the position of the direction switch and the position of the cassette when inserting it into the unit.

⑦ DIRECTION INDICATOR

This indicates the direction of tape transport. When the tape travels from the left to the right, it is said to be in the forward mode. In this case, the FORWARD (◀▶) indicator will light.

When the tape travels from the right to the left, it is said to be in the reverse mode. The REVERSE (◀▶) indicator will light.

The tape transport direction is changed by depressing the DIRECTION switch.

⑧ TAPE SELECTOR

This mechanism uses the sensor holes on the cassette to detect the type of tape being used. It then automatically adjusts the proper recording bias and equalization for the tape. The type of tape is then shown on the tape indicator. Refer to page 8 for the different types of cassette tapes and their hole positions.

CrO₂: This indicator lights when CrO₂ tapes are used.
METAL: This indicator lights when metal tapes are used.

NOTE:

- When normal tapes are used, the indicator does not light.
- When using metal tapes without sensor holes, the tape selector will be set on the CrO₂ position. In this case, optimum recording and erasure may not be possible. We thus recommend that you use metal tapes with sensor holes. Pre-recorded metal tapes can be played as is on this unit.

⑨ DOLBY INDICATOR

This indicates whether the Dolby NR (Noise Reduction) type used is the B type or C type. When the Dolby NR switch is pushed to the ON position (■), one of these indicators will light, showing that the Dolby circuit is in operation.

⑩ DOLBY NR SWITCH

When the Dolby NR (Noise Reduction) system is used to record a tape, or when playing back a tape recorded on Dolby, the switch on the right is pushed to the ON position (■). There are two types of Dolby NR System, B-type and C-type. Use the switch on the left to choose the type. To choose B-type, the switch should be in OFF position (B ■). To choose C-type, the switch should be in ON position (C ■).

When playing a tape which has not been recorded on Dolby, set the switch on the right so that it is in OFF position (B ■).

⑪ TIMER SWITCH

This switch is used to automatically begin recording or playback at a selected time when you are away from the unit.

For unattended recording

Depress both the switches on the right and the one on the left.

For wake-up playback

Depress the switch on the right to the ON position (■), and depress the switch on the left to the OFF position (PLAY ■).

When not using the timer

Depress the right switch to the OFF position (■). Normally this switch is left in the OFF position. When the POWER switch is turned "ON" with the unit in the "REC" or "PLAY" mode, recording or playback will automatically begin.

⑫ RECORDING SWITCH

This switch is depressed to record a tape. The recording indicator (●) will light. The switch cannot be placed in the ON position if the accidental erasure prevention tabs on the cassette have been broken out, or if no cassette is in the unit.

⑬ PAUSE SWITCH

Depress this switch to stop the tape travel temporarily during recording or playback. Depress this switch again to allow the tape to continue to travel. When this switch is depressed to the ON position, the OPERATION MODE indicator (PAUSE ■) will be illuminated.

The tape does not stop during fast forward or rewind operations even when the PAUSE switch is depressed.

⑭ REC MUTE SWITCH

Depressing this switch during recording makes it possible to create an unrecorded blank on the cassette tape only for the time during which the switch is kept depressed. (This switch is not locked.) When this switch is depressed, the REC MUTE indicator (○) will be illuminated.

⑯ MUSIC SEARCH/SKIP SWITCH (MS/SKIP)

Depress this switch and then the ▶▶ (Fast Forward) or ◀◀ (Rewind) switch. The ▶▶ indicator will light. While on fast forward or rewind, the unit will automatically detect non-recorded intervals of 4 seconds or longer, and switch automatically to playback mode. This function is called Music Search.

While in the playback mode, if the non-recorded interval exceeds 8 seconds, the unit will revert automatically to the previously selected fast forward or rewind mode and search for the next program on the tape, then switching again automatically to the playback mode. This function is called SKIP function. To release the unit from these functions, depress the MS/SKIP switch once again.

⑯ INDEX SCAN SWITCH

Use this function when you want to find a particular selection on a music tape. When the switch is depressed, the ■ indicator will light, and the selected transport mode (fast forward or reverse) will operate and the unit will search for the beginning of the next selection on the tape. It will play the beginning of the selection for approximately 7 seconds, and then switch again to the fast forward or rewind function, searching for the next selection. When it comes to the selection you want to hear, depress the PLAY switch.

⑰ DIRECTION SWITCH (DIRECTION)

This switch is used to select the direction of tape transport. If depressed when the unit is in the forward mode, it will switch to reverse play. If depressed when the unit is in the reverse play mode, it will switch to the forward play mode. The direction indicators will light to indicate the direction of tape transport.

- If the switch is depressed when the unit is in the playback pause mode, the tape transport direction will still be changed to the opposite direction.
- If the switch is depressed during tape recording, the tape will reverse its direction.

⑱ FUNCTION SWITCHES

PLAY:

Depress this switch to playback a tape.

◀◀ (Rewind):

Depress this switch to rewind the tape quickly right to left. It is also depressed when using Music Search function.

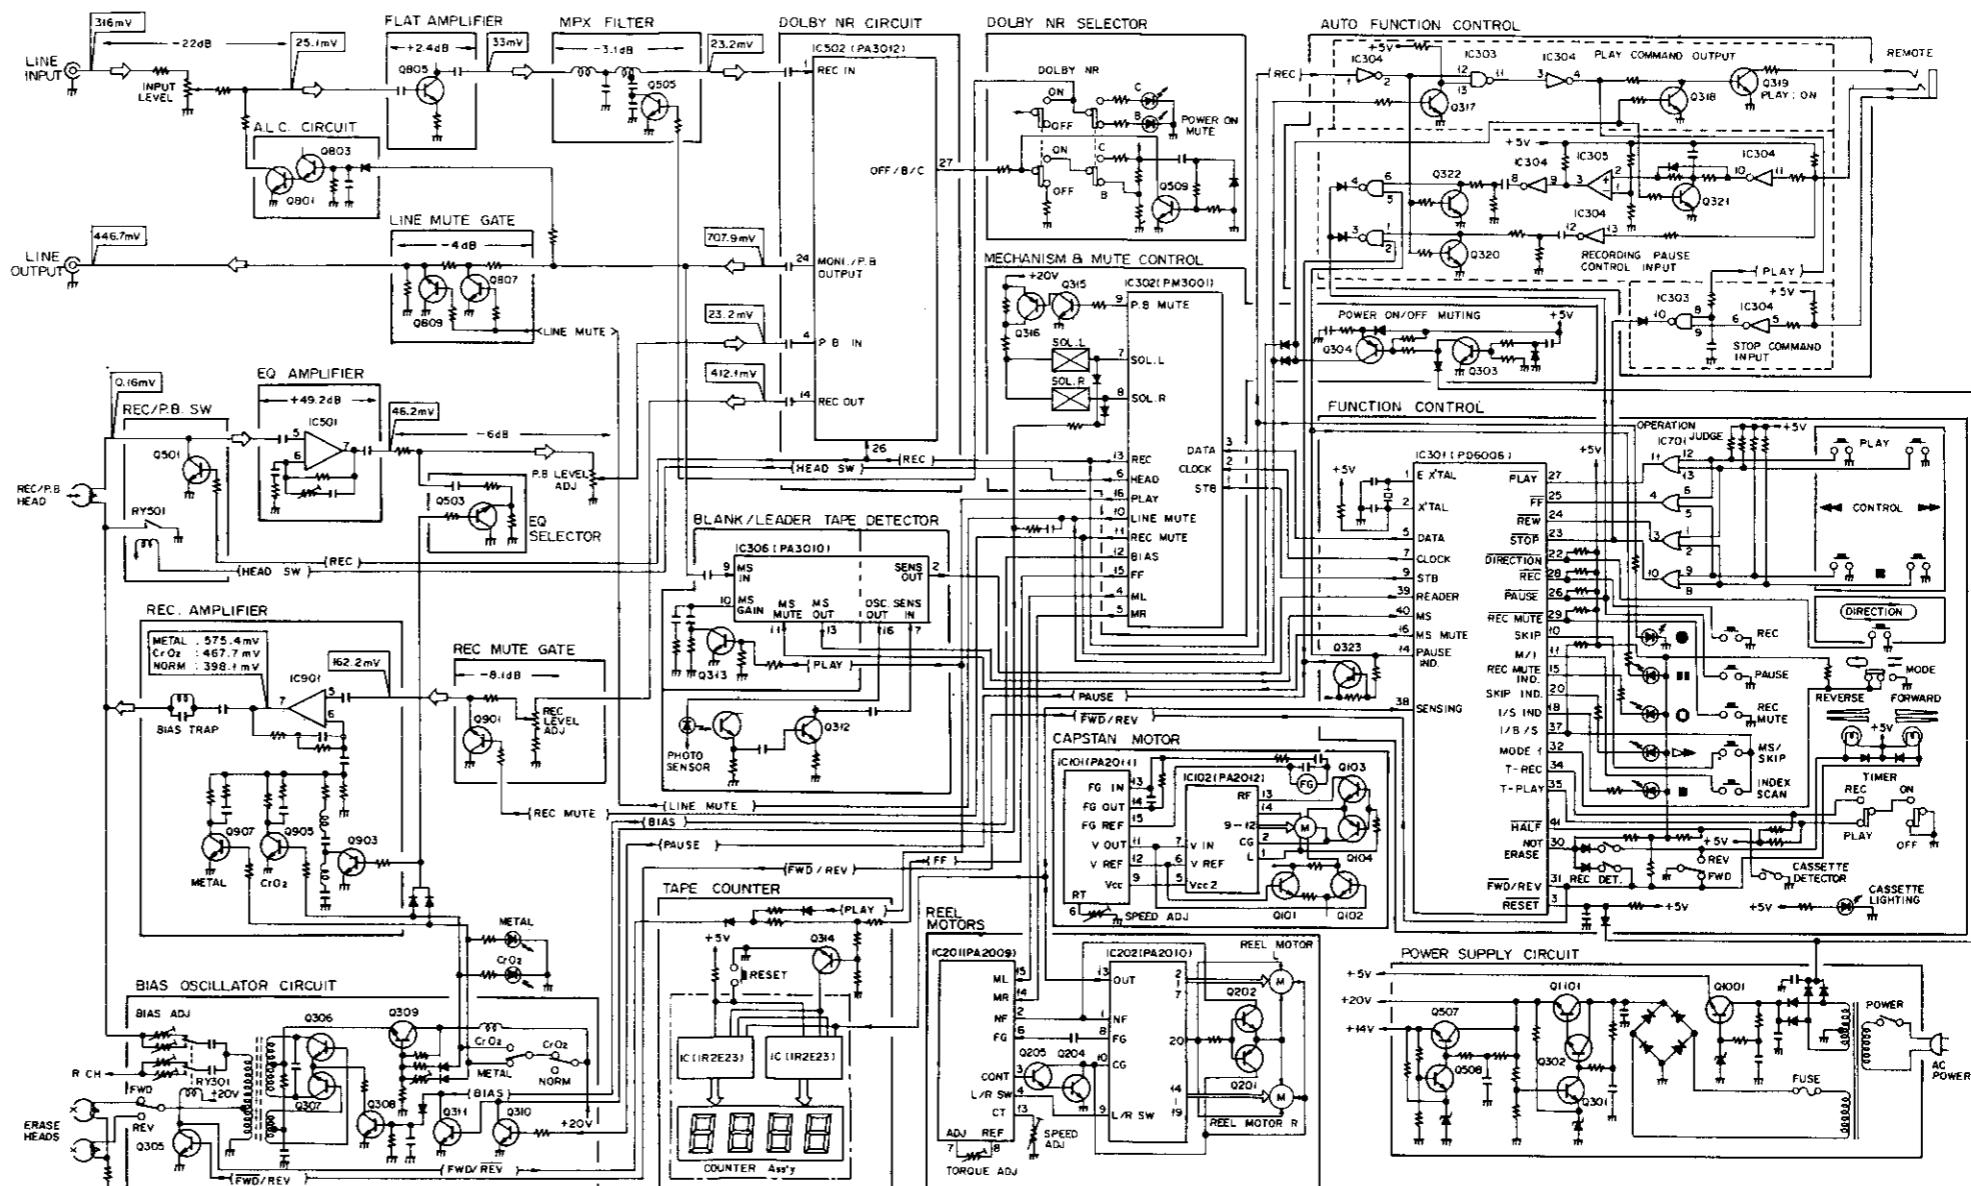

▶▶ (Fast Forward):

Depress this switch to wind the tape quickly from left to right. It is also depressed when using Music Search function.

■ (Stop):

Depress this switch to stop tape transport.

3. BLOCK DIAGRAM

4. CIRCUIT DESCRIPTIONS

4.1 CONTROL CIRCUIT

The CT-X9 tape transport mechanism is set to the different modes by microcomputer control of two solenoid plungers and by utilizing the drive power of the capstan motor. The basic operations for these mechanisms are described in the CT-7R Service Manual (ARP-001-0).

In the CT-X9, operation is controlled by three custom ICs (PD6006, PM3001, and PA3010). The 4-bit CPU PD6006 controls the tape transport mechanism, audio signal circuit switching, and the operation involved in each function. PM3001 consists of a circuit which converts PD6006 output control signals (16-bit serial data) into the format necessary for actual operational control, and a current amplifier circuit for driving external elements. PA3010 includes a circuit for detecting unrecorded blank portions of tape required for

MS/SKIP and INDEX SCAN operations, and a circuit for detecting the cassette leader tape for quick reversing operation.

When the mode KEY is switched on, the 16-bit serial data shown in Fig. 4-2 appears at pin 5 of PD6006, and a clock pulse output appears at pin 7 (data and clock outputs are generated each time a key is switched on, and also by each relevant timing). The 16-bit serial data is applied to pin 3 of the extended IC PM3001, and is read by the PM3001 shift register at the rising edge of the clock pulse applied to pin 2. Upon completion of the data reading, an STB (strobe) pulse is applied to pin 1, resulting in the appearance of control output signals at the relevant output pins of PM3001 according to the key input. (See Fig. 4-4).

POWER is ON

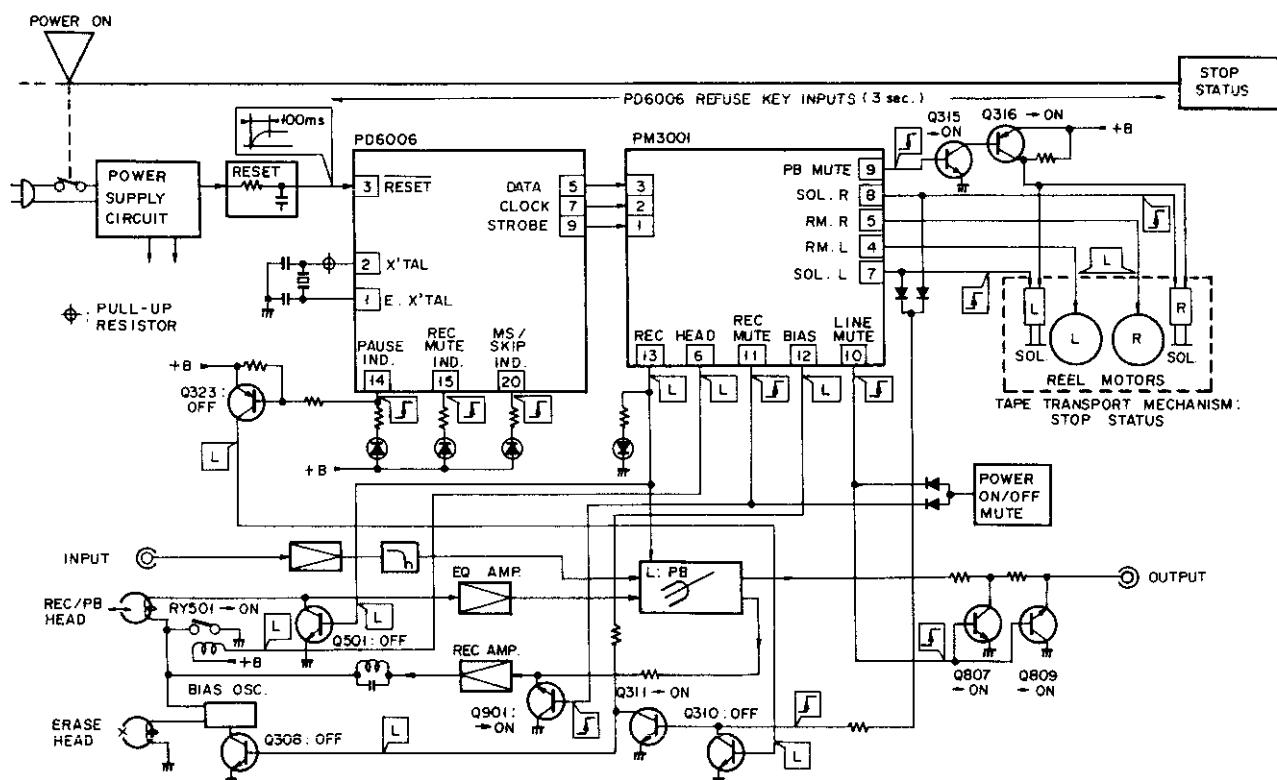

Fig. 4-1 Power is ON

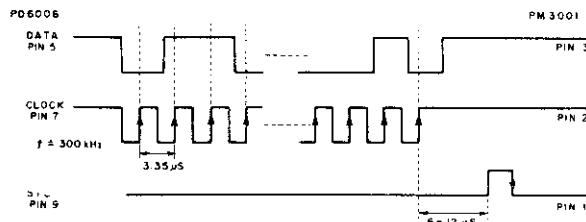

Fig. 4-2 PD6006 Data output

PD6006 Key Input Circuit

The play, fast forward, rewind, and stop modes in the CT-X9 are all switched by the same one CONTROL button. The CONTROL button includes four separate non-lock type switches, one under each corner of the button. The selected mode is detected by a combination of two switches being turned on, depending on what part of the CONTROL button is pressed. This detection signal is judged by OR gate (used as negative logic AND gate) with the resultant key input being applied to PD6006. (See Fig 4-3).

Tape Leader Detector Circuit

The tape leader detection circuit functions in the auto-reverse mode to detect the point of transition from the coated portion to the leader portion of the tape. It then directs the mechanism to reverse the direction of travel, or places the unit in a STOP status when this event occurs from the fast-forward (FF) or rewind (REW) mode.

The detector uses an optical system based on an infrared LED whose emission is picked up by a phototransistor. The circuit is activated by detecting a difference in the amount of light passed by

the coated portion of tape, and the amount passed by the transparent leader.

The output from pin 16 of PA3010 is converted to light by the LED, and passes through the path shown in Fig. 4-20 to be picked up by the phototransistor. During tape travel, the amount of light received by the phototransistor is quite small, so the input level at pin 7 is held low. This causes the charge and voltage at pin 3 and 4 to also be held low, presenting a low logic input to the + and - terminals of comparator. This results in a low output from pin 2. But as the transparent leader

Pin No.	Symbol	I/O Status	Description
1	GND	—	
2	SENSING OUT	OUT	L level (0.5V max.) at magnetic coat portion of tape, and output of 100msec (min.) 4.9V (min.) pulse when leader portion of tape is reached.
3	SENSING T2	—	
4	SENSING T1	—	When the quantity of light received by the photo-sensitive transistor increases sharply, a comparator located in a later stage is activated (thereby generating output pulses) due to the difference in the charging time constants of the capacitors connected to pins 3 and 4. Output pulses appear when there is a sharp increase of at least 6dB in the input voltage.
5	VR2	—	
6	VR1	—	Terminals for control of the feedback current capable of altering the gain of the compression circuit (compensation possible when there is fluctuation in the photo-sensitive transistor input).
7	SENSING IN	IN	Photo-sensitive transistor output is applied to pin 7 after amplification (20dB).
8	Vcc1	—	20V DC
9	MS IN	IN	Tune interval detection input. A playback signal input above -73dBv denotes "tune", while an input level below that denotes a blank portion of tape between tunes. (Playback mode).
10	MS GAIN	—	Determines the gain of the tune-interval detection circuit.
11	MS MUTE	IN	Muting pin. Muting is applied if voltage greater than 1.6V is applied. Tune-interval detection circuit consequently stops operating (no tune-interval output).
12	MS T	—	Pin for determining the tune-interval detection time and the tune detection time by the capacitance of externally connected capacitors.
13	MS OUT	OUT	Tune-interval detection pin. L level (0.5V max.) for "tune" status, and H level (3.9V min.) for "tune-interval" status.
14	Vcc 2	—	5V DC
15	OSC C	—	Determination of the frequencies for activation of the infrared LED in the leader tape detector sensor utilizing externally connected capacitors.
16	OSC OUT	OUT	Infrared LED drive pin. 2kHz 40% duty pulse signal

NOTE:

The leader tape detector circuit generates pulse outputs when the leader tape is reached. Note, however, that PD6006 is not activated in the first few seconds after start of tape deck operation (playback, fast forward etc). Leader tape detection during that period, therefore, is not possible.

Fig. 4-19 PA3010 Pin description

passes into the light path, the amount of light picked up by the phototransistor suddenly increases the input to pin 7. This causes pin 3 to snap high, consequently applying a high input to the + terminal of the comparator. Output from pin 2 then goes high. As pin 3 goes high, the capacitor connected to pin 4 starts charging, raising the input level to the - terminal of the comparator. When the level of the - terminal reaches that of the + terminal, the output from the comparator snaps from high to low, and the output pulse taken from pin 2 appears as shown in Fig. 4-22.

CPU PD 6006 uses this output pulse to control the various mechanisms performing the mechanical functions of auto-reverse and automatic stop.

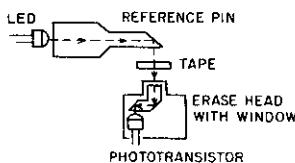

Fig. 4-20 Tape leader detector section

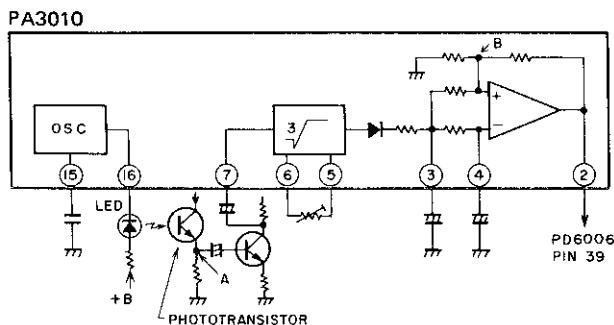

Fig. 4-21 Tape leader detector circuit

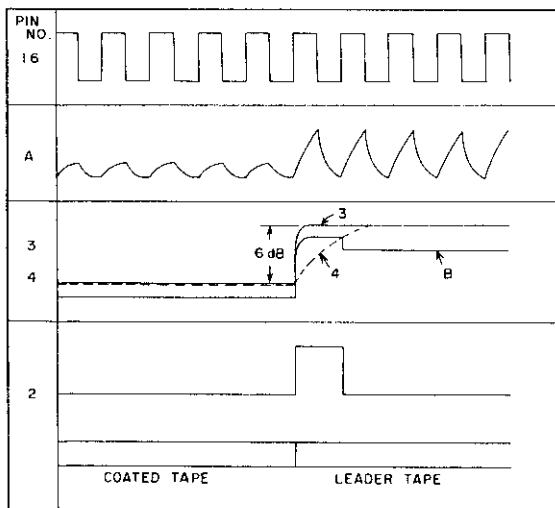

Fig. 4-22 Tape leader detector waves

Tape End Detector Circuit

When the reel motor starts turning, a sensing pulse is transmitted from pin 13 of IC PA2010 (used to control the reel motor) to pin 38 of PD6006. (This pulse is taken from the Hall element and shaped into a square wave by PA2010.) When this pulse is maintained at either a low (L) or high (H) level for a period exceeding three seconds, PD6006 interprets that to mean the end of the tape and thus switches to the next mode of operation.

If the mechanism is in the fast-forward (FF), rewind (REW), or record-playback (REC/PLAY) mode, the next mode entered is STOP. If it is presently in the PLAY mode and the \leftrightarrow reverse mode switch is selected, it also enters the STOP mode. But if \Rightarrow is selected, it first goes through a direction operation, then into a PLAY status.

Since CT-X9 is equipped with a tape leader detector circuit, it goes into a STOP status or goes through a direction operation before reaching the point where the end sensor circuit is activated, so normally the end sensor circuit will not operate. However, where there is no leader on the cassette tape, or where there is an insufficient difference in the infrared transmission factor between the coated portion and leader portion of the tape, or in case the reel motor stops rotating before the tape leader is detected, the end sensor circuit is then activated, placing the unit in the STOP mode. However, in the REC/PLAY or PLAY mode, a direction operation may be called for depending on the position of the reverse mode switch.

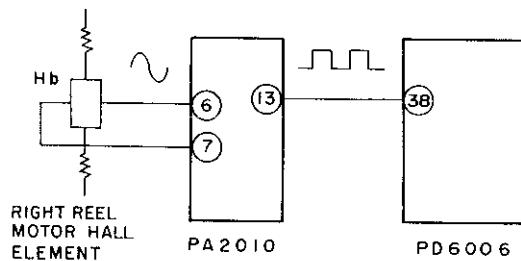

Fig. 4-23 Tape end detector circuit

Unrecorded Blank Detector Circuit

When the function key is placed ON, and the reel motor starts turning, pin 16 of PD6006 goes to a low level. When pin 16 goes low, pin 11 of the blank detector IC (PA3010) also goes low, lifting MS (Music Search) muting and commencing MS operations.

As MS MUTE is lifted, the signal is first amplified, then applied to pin 9, and its level is determined by the comparator in the next stage. Comparator output at point A is as shown in the accompanying table.

This output is used to turn Tr1 ON, and this in turn allows capacitor C connected to pin 12 to dump its charge through Tr1. Thus, pin 13 goes to a low level.

When there is no input signal present, Tr1 turns OFF, capacitor C starts recharging, and approximately 70msec later, a high level is output from pin 13.

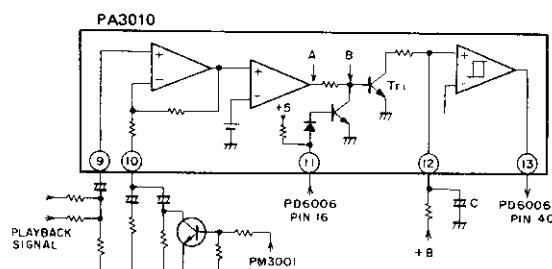

Fig. 4-24 Blank detector circuit

Consequently, when an input signal is present, pin 13 is at a low level, and no signal produces a high output. This output is used by each of the function operations (MS/SKIP, INDEX SCAN).

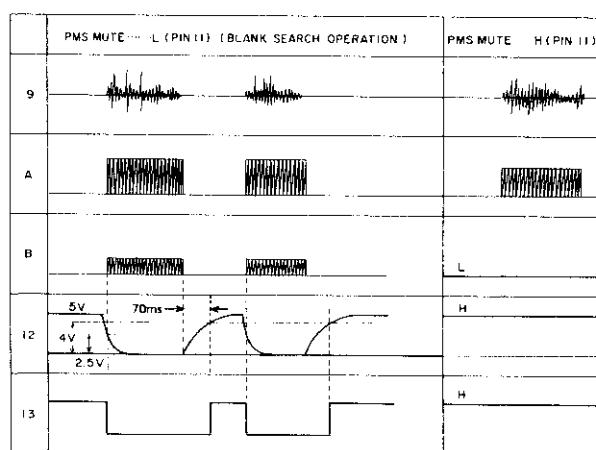

Fig. 4-25 Blank detector waves

Function Key Operation

The various functions (MS/SKIP, INDEX SCAN) are activated by placing the respective key to the ON position.

The timing chart for the pulses output from pins 10 and 11 of CPU PD6006 are shown in Fig. 4-26. As a function key is placed in the ON position, a pulse train is input to 37 of the CPU. The CPU then determines the timing of the pulse train, and starts operation of the selected mode accordingly.

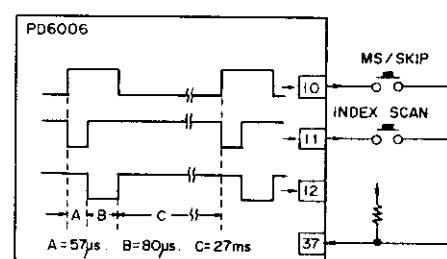

Fig. 4-26 Function key diagram

MS/SKIP Operation

When the MS/SKIP Key is placed ON, the FF (▷▷) key is activated, and when the beginning of a music selection is located, pin 13 of PA3010 drops from high to low. The trailing edge of the pulse effecting the level drop at the PD6006 pin sets the REWIND mode and rewinds the tape back to the beginning of the selection, and enters the PLAY mode.

At the end of the selection, if the unrecorded section of the tape (functioning to change the output from pin 13 from low to high) holds the level continuously high for over 8 seconds, PD6006 then selects the FF mode, continuing in that mode until the beginning of the next selection drops the level at pin 13 low. It then rewinds (◁◁) back out to the beginning of the selection, and enters the PLAY mode.

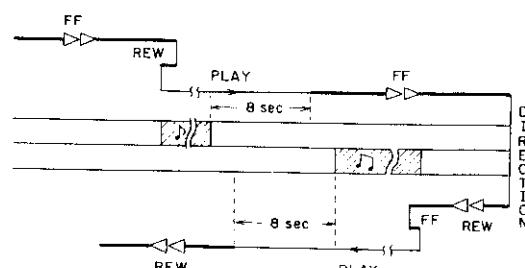

Fig. 4-27 MS/SKIP operation

INDEX SCAN Operation

When INDEX SCAN is activated, if the unit is operating in the FWD direction, the FF (\gg) mode is entered; if in REV, REW (\ll) is entered. The unit then cycles through a search operation to locate the beginning of a selection, then goes into the PLAY mode. Playback of the selection starts and continues for the 7 seconds that pin 13 of PA3010 is held low.

After this 7 seconds has elapsed, it once again returns to the FF or REW mode and cycles through another search operation until all selections on the tape are thus indexed.

If the tape should end while the unit is in FWD FF, or REV REW, either the STOP status would be entered, or a direction operation would allow search to continue, depending on the reverse mode switch setting.

When in INDEX SCAN operation, REW KEY (FF KEY in REV direction) is placed ON, INDEX SCAN is operated in REW mode as shown in Fig. 4-28.

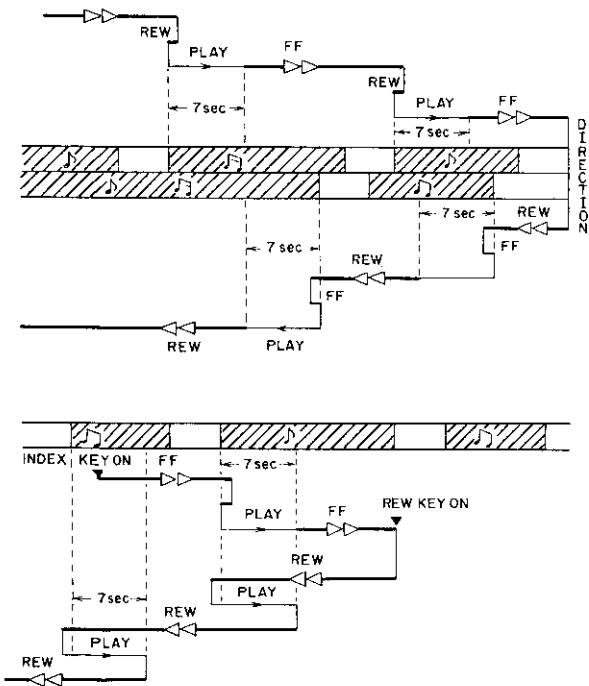

Fig. 4-28 INDEX SCAN operation

Auto Function Operations

- **PLAY command output**

When PLAY mode is selected in the CT-X9, an output signal (L level = ground) is generated to automatically switch the auto function type amplifier (such as the A-X7 or A-X8 stereo amplifier of the same series) to tape playback mode.

Pin 10 (LINE MUTE) of PM3001 (see Fig. 4-29) is switched to L level only when the tape deck is switched to recording or playback mode. In this case, Q317 is turned off, resulting in an H level appearing at the collector. Pin 13 (REC) of PM3001 is switched to H level only during recording mode. The REC signal (L level only during recording mode) is obtained by passing the REC signal via an inverter. The NAND 1 output, therefore, is at L level only during playback mode, and by passing this output via another inverter, Q319 is turned on during playback mode, and an L level (ground) output is obtained.

- **STOP command input**

When the auto function type amplifier (such as A-X7 or A-X8) is switched from tape playback mode (CT-X9 in playback mode) to another mode, the CT-X9 is stopped automatically by a circuit in the tape deck. A negative input pulse signal from the amplifier is applied to this circuit when the amplifier FUNCTION switch is switched from tape playback to another mode. This input is inverted to a positive pulse by an inverter and is subsequently applied to NAND 2. Since the other input of this NAND gate is the PLAY signal (at H level only during playback mode), the NAND 2 output will be a negative pulse signal if the CT-X9 is in playback mode. This output pulse is applied to pin 23 (\bar{STOP}) of PD6006, thereby switching the tape deck to stop mode.

- **Recording pause control input (for synchronized recording)**

If an auto function type turntable (such as PL-X7 or PL-X9) is put into playback status (when tonearm is lowered onto a record) with the CT-X9 in recording pause mode, the pause is released and the tape deck put into REC/PLAY (recording) mode. The same circuit is also involved in switching the tape deck back to recording pause mode if turntable playback is stopped (when the tonearm is lifted).

When the tonearm is lowered, the turntable (PL-X7 or PL-X9) control signal circuit is switched to L level (ground). This signal is passed to the CT-X9 via the amplifier (A-X7 or A-X8 Stereo Amplifier), and is inverted to become a positive pulse signal by inverter and C344 before being

applied to NAND 3. Since Q320 is off during recording mode, the other NAND 3 input (PAUSE signal) is switched to H level when the deck is in pause mode. Hence, if the CT-X9 is in recording pause mode, the negative pulse output from NAND 3 is applied to pin 26 ($\overline{\text{PAUSE}}$) of PD6006. CT-X9 is thus switched to recording mode. When the tonearm is lifted, the control signal circuit is switched to H level. (With the turntable end open, the same circuit is connected to a +B pull-up resistance). C345 is consequently charged up, and there is a drop in the input voltage of the voltage comparator, the comparator output being switched

to L level if the decreasing input voltage drops below a specific level. The output signal is converted by an inverter and C346 to become a positive signal before being applied to NAND 4. Since Q322 is off during recording mode, the other NAND 4 input ($\overline{\text{PAUSE}}$ signal) is an H level signal except during pause mode. Consequently, the negative pulse output from NAND 4 is applied to pin 26 ($\overline{\text{PAUSE}}$) of PD6006 if the CT-X9 is in recording mode at the time. The CT-X9 recording mode is thus switched to recording pause mode to temporarily interrupt the recording.

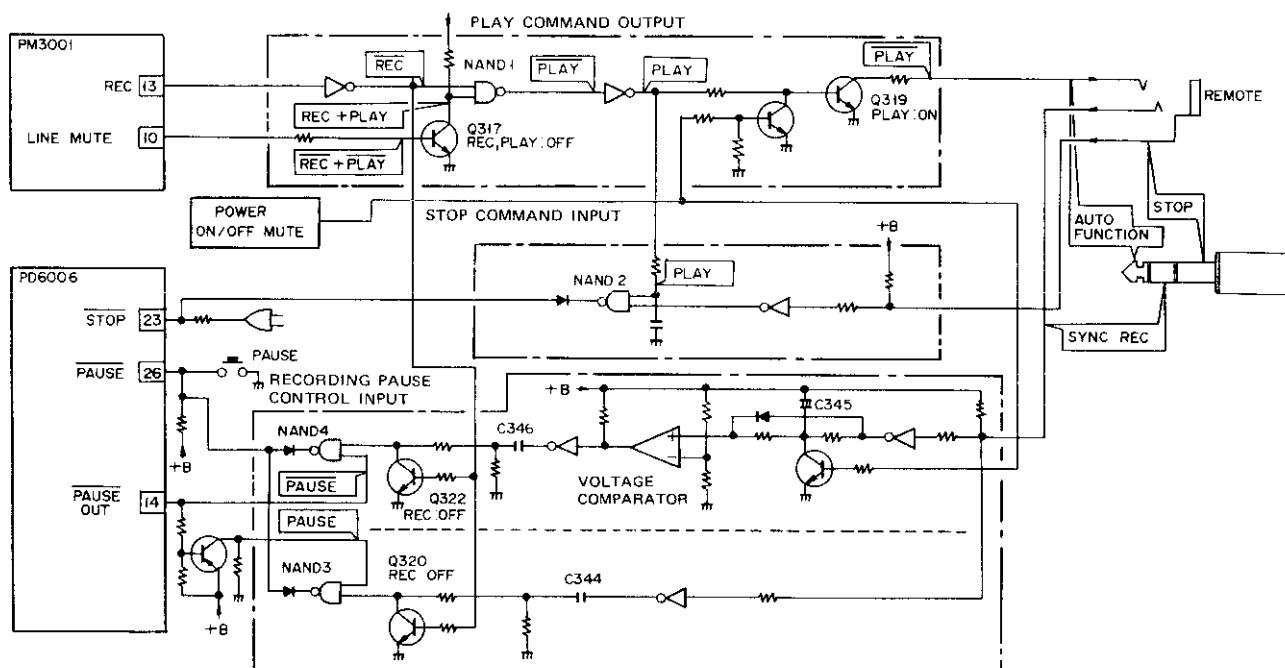

Fig. 4-29 Auto function control circuit

5. DISASSEMBLY

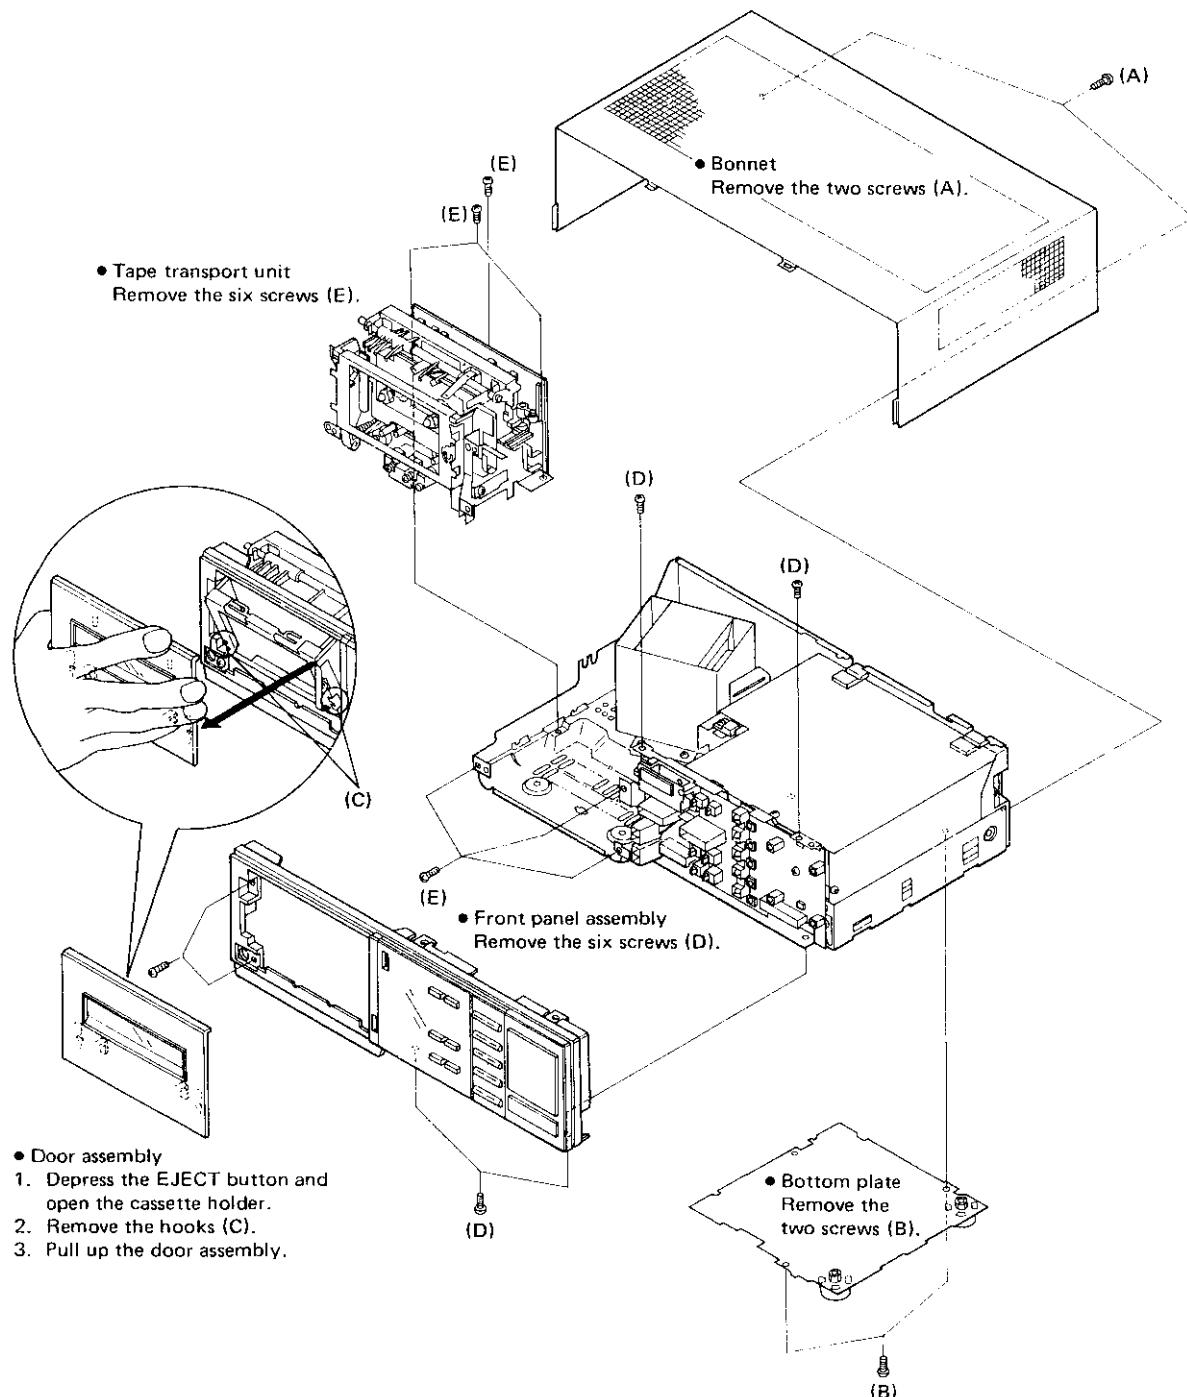

Fig. 5-1 Disassembly

Removing the Head Assembly

1. Remove the two azimuth adjustment screws and remove the stopper holder.
2. Remove the stopper.
3. Push the slide plate all the way to the right (the forward position) and pull the head assembly in the direction of the arrow to remove it.

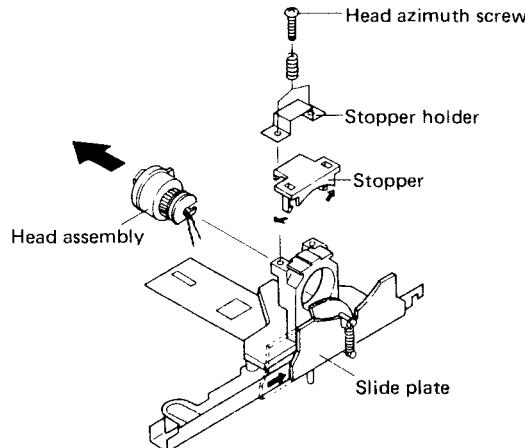

Fig. 5-2 Disassembly of the head assembly

Reassembly Precautions

When replacing the head assembly, be sure the gears mesh as shown in Fig. 5-3.

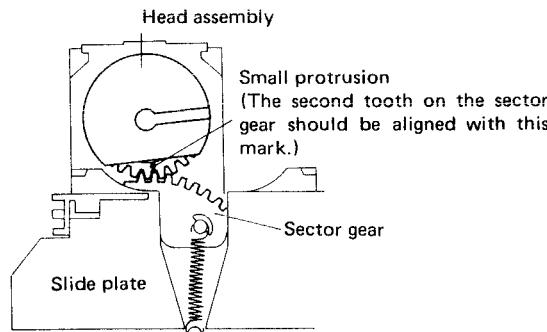

Fig. 5-3 Relationship between head assembly and sector gear

Removal of the Capstan Belt

Undo screws (F), remove the capstan motor control ass'y, and then remove the capstan belt.

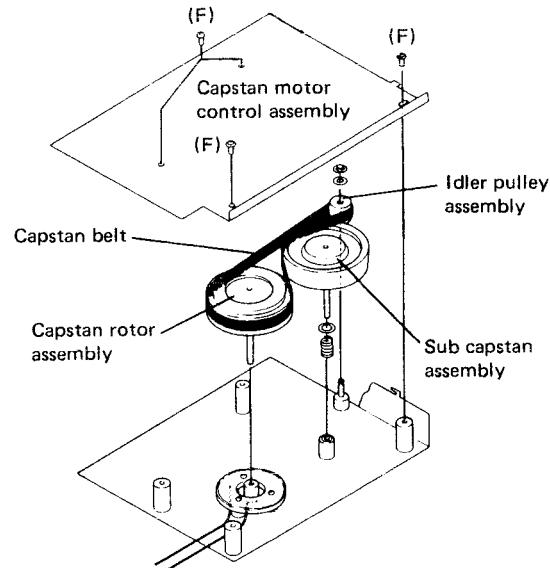

Fig. 5-4 Removal of the capstan belt

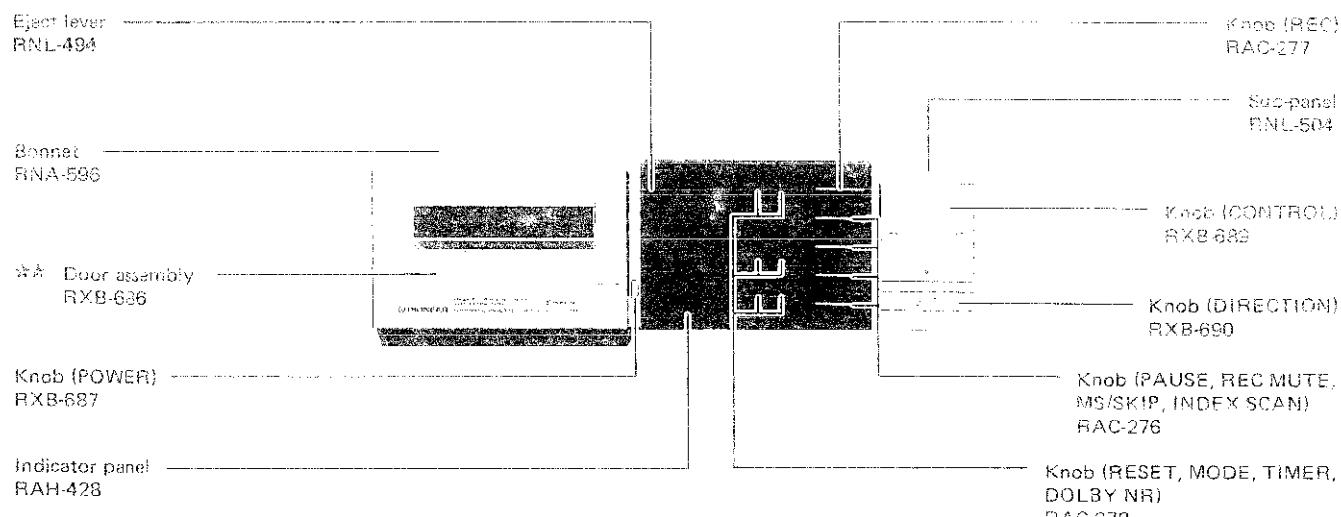

6. PARTS LOCATION

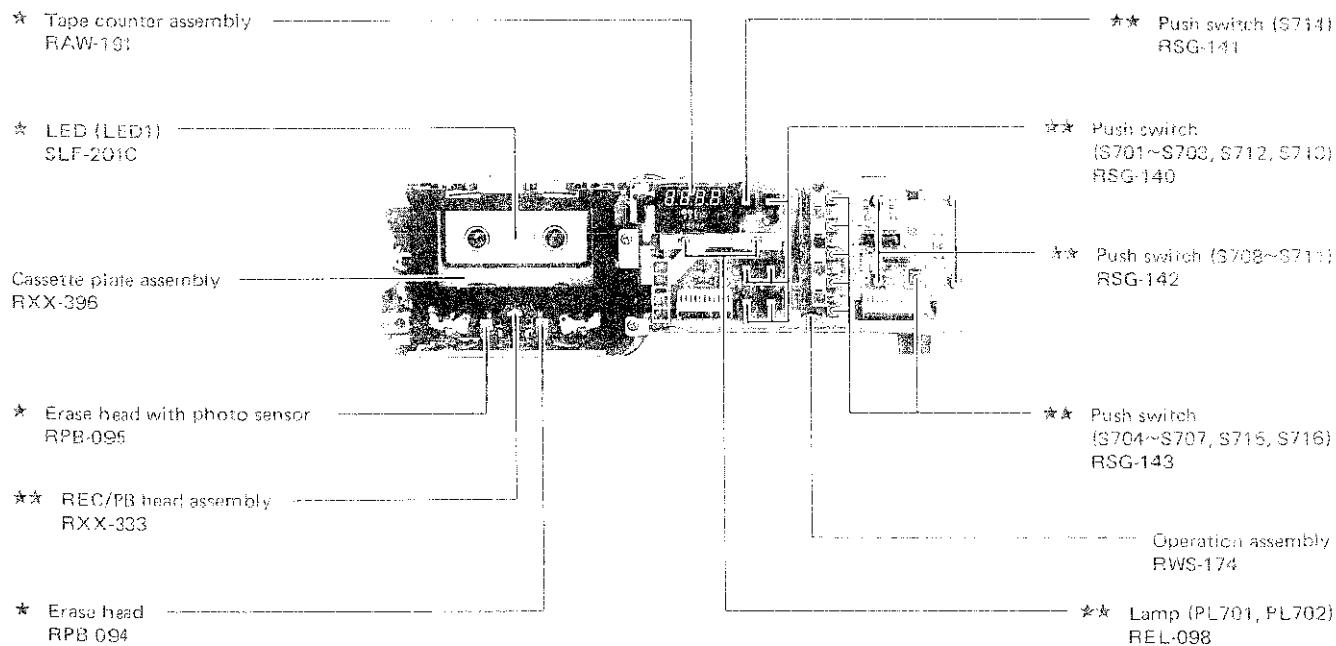

NOTES:

- Parts without part number cannot be supplied.
- The **A** mark found on some component parts indicates the importance of the safety factor of the part. Therefore, when replacing, be sure to use parts of identical designation.
- For your Parts Stock Control, the fast moving items are indicated with the marks **★** and **★★**.
- **★★ GENERALY MOVES FASTER THAN ★.**
This classification shall be adjusted by each distributor because it depends on model number, temperature, humidity, etc.

12. ADJUSTMENTS

12.1 MECHANICAL ADJUSTMENTS

12.1.1 Pinch roller pressure adjustment

- Set to forward direction, and switch to playback mode without loading a cassette half.
- Using a tension gauge as shown in Fig. 12-1, gently press against the pinch roller arm. The tension gauge reading should lie between 250g and 400g at the moment that the pinch roller is separated from the capstan, and the capstan stops rotating.
- If the reading lies outside the above range, replace the pinch roller pressure spring.
- Set to reverse direction and measure the pinch roller pressure for the pinch roller on the other side in the same way as described above.

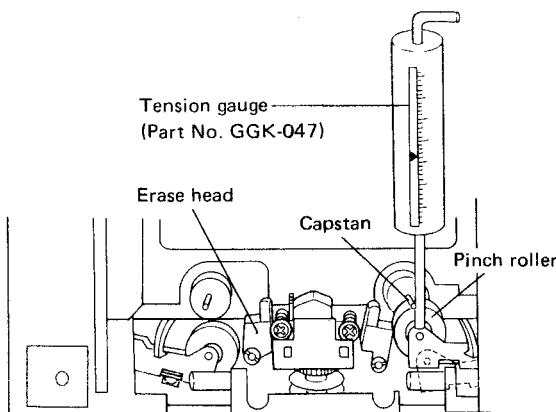

Fig. 12-1 Pinch roller pressure adjustment

12.1.2 Preliminary azimuth adjustment

- Set to forward direction, and switch to stop mode.
- Using a screwdriver as shown in Fig. 12-2, adjust gap A between the housing and the revolving base to 1.5mm by turning screw ①.
- Set to reverse direction.
- Using the screwdriver again, adjust gap B between the housing and the revolving base to 1.5mm by turning screw ②.

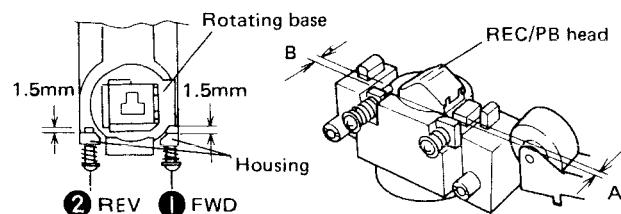

Fig. 12-2 Azimuth adjustment point

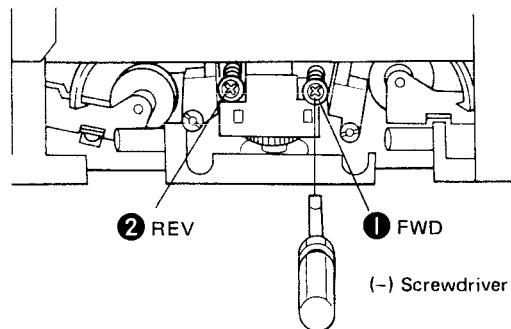

Fig. 12-3 Azimuth preadjustment

12.1.3 Tape travel adjustment

- Set to forward direction, load a mirror-equipped cassette, and switch to playback mode.
- Adjust nut ① to ensure that no tape curling occurs in the guide section of the recording and erase heads as shown in Fig. 12-4.
- Set to reverse direction.
- Adjust nut ② to ensure that no tape curling occurs in the guide section of the recording and dummy heads.
- Check that there is no tape curling during repeated forward and reverse tape travel.

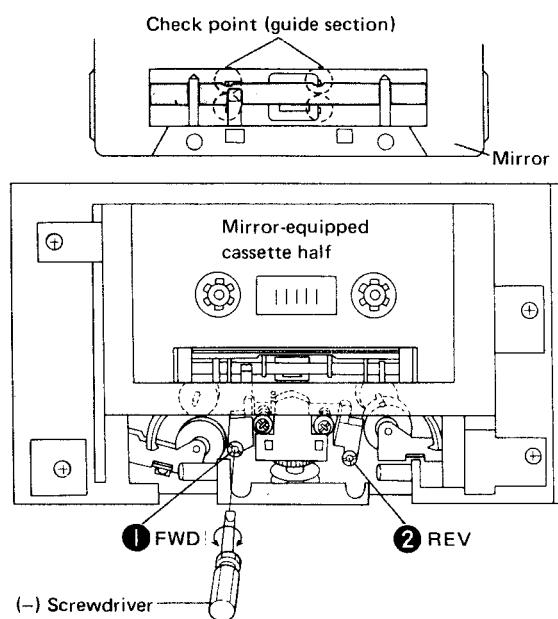

Fig. 12-4 Tape travel adjustment

12.1.4 Fast forward and rewind rotational speed adjustment

1. Connect a frequency counter between the FG and GND terminals on the reel motor control ass'y (see Fig. 12-5).
2. Set to forward direction, and switch to fast forward mode.
3. Adjust the frequency counter reading to 72Hz ± 2 Hz by means of VR202.
4. Switch to rewind mode, and check that the frequency counter reading lies in the 72Hz ± 5 Hz range.

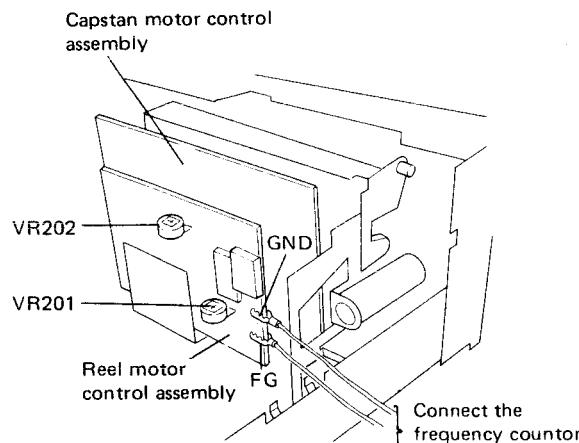

Fig. 12-5 FF/REW Rotating speed adjustment

12.1.5 Playback mode winding torque adjustment

1. Set to forward direction, mount a cassette-type torque meter, and switch to playback mode.
2. Adjust the winding torque to 45g.cm ± 5 g.cm by VR201.
3. Set to reverse direction.
4. Check that the winding torque is 45g.cm ± 10 g.cm.

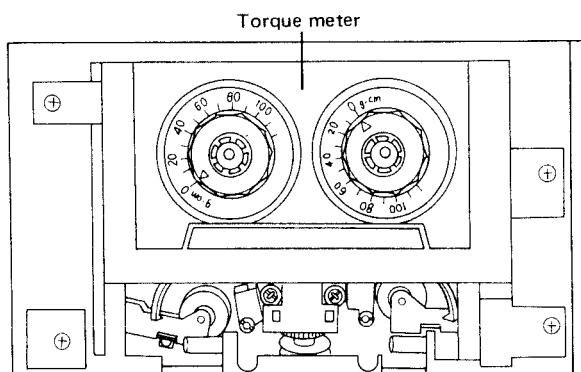

Fig. 12-6 Take-up torque adjustment

12.1.6 Tape speed adjustment

1. Connect the frequency counter to the OUT-PUT terminals.
2. Set to forward direction, load a STD-301 test tape wound to the start of the tape, and switch to playback mode.
3. Adjust the frequency counter reading to 3005Hz ± 10 Hz by VR101.
4. Set to reverse direction, wind the test tape to the start of the tape, and switch to playback mode.
5. Check that the frequency counter reading lies within the 3005Hz ± 20 Hz range.

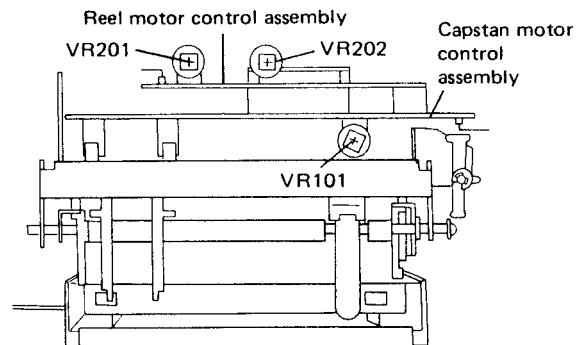

Fig. 12-7 Tape speed adjustment

12.1.7 Fast travel torque check

1. Set to forward direction, mount a cassette-type torque meter, and switch to fast forward mode.
2. Check that the fast forward torque is within the 100g.cm ± 30 g.cm range.
3. Switch the mode to rewind, and again check that the rewind torque lies within the 100g.cm ± 30 g.cm range.

12.1.8 Back-tension torque check

1. Set to forward direction, mount a cassette-type torque meter, and switch to playback mode.
2. Check that the supply reel back-tension lies within the 3.5g.cm ± 1.5 g.cm range.
3. Reverse the direction.
4. Check that the supply reel back-tension again lies within the 3.5g.cm ± 1.5 g.cm range.

12.2 ELECTRICAL ADJUSTMENTS

- Check the following points before starting any electrical adjustments.

 1. All mechanical adjustments must be completed.
 2. Clean the heads and demagnetize the REC/PB head.
 3. Level measurements are based on $0\text{dBv} = 1\text{V}$. Connect a $50\text{k}\Omega$ dummy resistor ($47\text{k}\sim 52\text{k}\Omega$) across the OUTPUT terminals.
 4. Use the specified test tapes for each adjustment. Although test tapes have both A and B sides, use the side with the label (side A).

STD-341A : Playback adjustments
 STD-608A : NORMAL blank tape
 STD-603 : CrO₂ blank tape
 STD-604 : METAL blank tape

 5. Prepare the following measuring equipment. AC millivoltmeter, audio oscillator, attenuator, and oscilloscope.
 6. Unless otherwise specified, always adjust for both left and right channels.
 7. Unless otherwise specified, adjust with the DOLBY NR switch in the OFF position.
 8. Let the deck warm up for a few minutes before starting adjustments. Also leave the deck in playback and recording mode respectively for 3 to 5 minutes before starting playback and recording frequency response adjustments.

12.2.1 Head Azimuth Adjustment

Settings

- AC mV meter Connect to OUTPUT terminals
 Test tape STD-341A
 (10kHz, -20dB)
 Direction switch Forward
 Mode Playback
 VR503 and VR504 ... Turn clockwise to maximum position

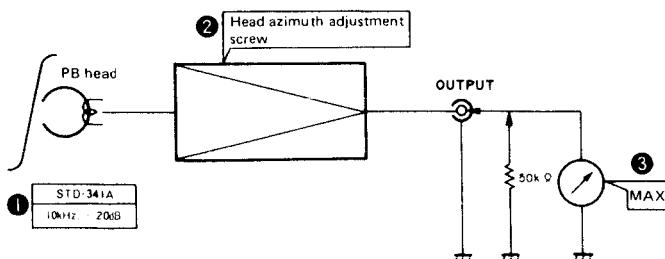

Fig. 12-9 Head azimuth adjustment

9. Proceed according to the specified adjustment sequence. Changing the sequence can prevent proper adjustments from being carried out, and subsequently result in loss of performance.

Adjustment sequence

1. Head azimuth
2. Tape travel check
3. Playback equalization
4. Playback level
5. Erase current
6. Record/playback frequency response
7. Recording level
8. Leader tape detect
9. Limiter effect check

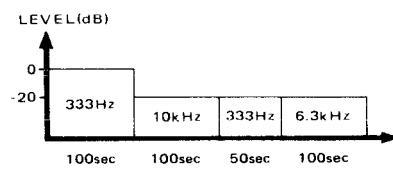

Fig. 12-8 STD-341A test tape

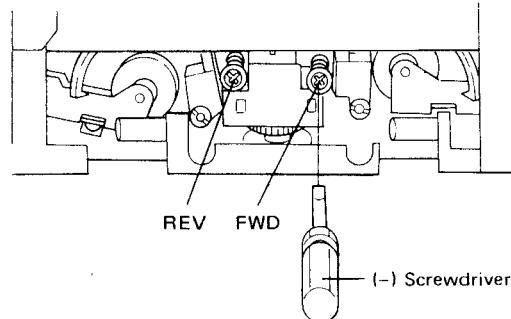

Fig. 12-10 Head azimuth adjustment

1. Turn the forward direction head azimuth adjustment screw to obtain maximum reading in the AC mV meter.
2. Reverse the direction, and turn the reverse direction head azimuth adjustment screw to again obtain maximum reading in the AC mV meter.

11. ELECTRICAL PARTS LIST

NOTES:

- When ordering resistors, first convert resistance values into code form as shown in the following examples.

Ex. 1 When there are 2 effective digits (any digit apart from 0), such as 560 ohm and 47k ohm (tolerance is shown by J = 5%, and K = 10%).

560Ω	56×10^1	561	RD $\frac{1}{4}$ PS	5 6 1 J
47kΩ	47×10^3	473	RD $\frac{1}{4}$ PS	4 7 3 J
0.5Ω	0R5		RN2H	0 5 K
1Ω	010		RS1P	0 1 0 K

Ex. 2 When there are 3 effective digits (such as in high precision metal film resistors).

5.62kΩ	562×10^3	5621	RN $\frac{1}{4}$ SR	5 6 2 1 F
--------	-------------------	------	---------------------	-----------

- The mark found on some component parts indicates the importance of the safety factor of the part. Therefore, when replacing, be sure to use parts of identical designation.

- For your Parts Stock Control, the fast moving items are indicated with the marks ★★ and ★.

★★ GENERALLY MOVES FASTER THAN ★.

This classification shall be adjusted by each distributor because it depends on model number, temperature, humidity, etc.

MARK

<table

3. Return to the forward direction and check that there has been no change in the azimuth adjustment. If there is considerable change, readjust by repeating step 1 and 2. (Lock the screws with screw lock after completing the adjustment).

12.2.2 Tape Travel Check

Setting

- Test tape Mirror-equipped cassette half
Direction switch Forward
Mode Playback

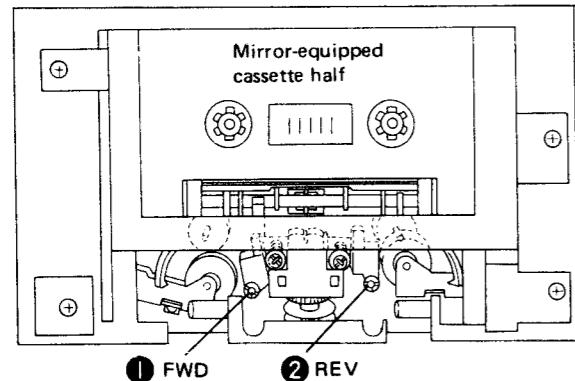

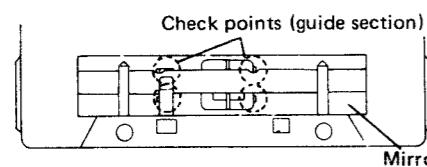

Fig. 12-11 Tape travel check

Procedure

1. Check that tape curling does not occur in the guide section between the recording and erase heads.
2. Reverse the direction of tape travel, and check that tape curling does not occur in the guide section between the recording and dummy heads.
3. If tape curling does occur, adjust tape travel as described in section 12.1.3 on p.50, and repeat the adjustment procedures from section 12.2.1.

12.2.3 Playback Equalization Adjustment

Settings

- AC mV meter Connect to OUTPUT terminals
Test tape STD-341A (333Hz, -20dB) (6.3kHz, -20dB)
Direction switch Forward
Mode Playback

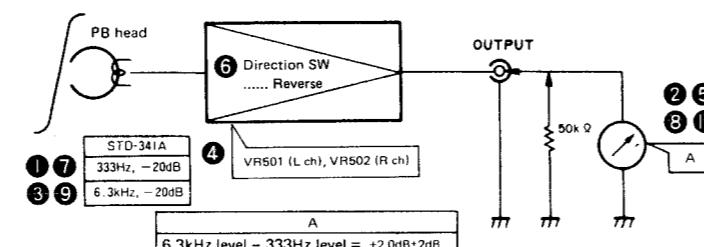

Fig. 12-12 Playback equalization adjustment

Procedure

1. Play the 333Hz, -20dB portion and record the AC mV meter reading.
2. Then play the 6.3kHz, -20dB portion, and adjust VR501 (L ch) and VR502 (R ch) so that the difference in the playback output signal level with 333Hz level as the reference level is +2.0dB.
3. Reverse the direction, and play the test tape again as described in steps 1 and 2, checking that the output difference is no greater than $+2.0\text{dB} \pm 2\text{dB}$.

12.2.4 Playback Level Adjustment

Since this adjustment determines the DOLBY NR level during playback, it should be performed precisely.

Settings

- AC mV meter Connect to TP (DOL.L) and TP (DOL.R)
Test tape STD-341A (333Hz, 0dB)
Direction switch Forward
Mode Playback

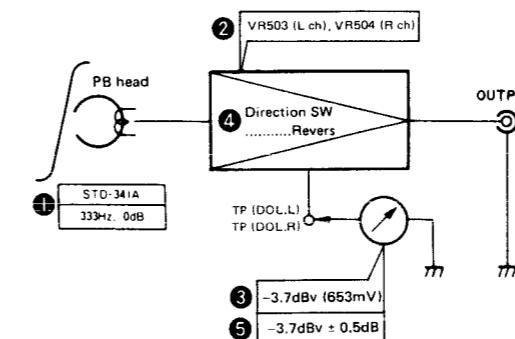

Fig. 12-13 Playback level adjustment

Procedure

1. Adjust VR503 (L ch) and VR504 (R ch) so that the meter reads of -3.7dBv (653mV).
2. Set to reverse direction, and check that the AC mV meter reading lies within the -3.7dBv $\pm 0.5\text{dB}$ range.
3. If the reading does not lie within the specified range, check tape travel and repeat this adjustment from step 1.

12.2.5 Erase Current Adjustment

Settings

- AC mV meter Connect to TP (IE)
Test tape STD-604
INPUT volume control Minimum level
Direction switch Forward
Mode Record

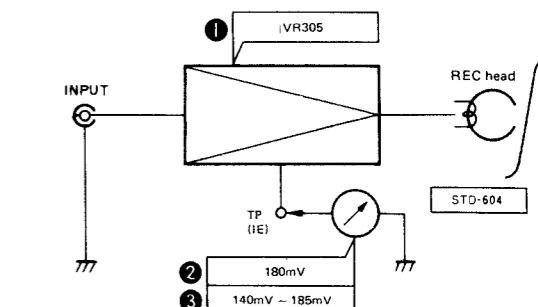

Fig. 12-14 Erase current adjustment

Procedure

1. Adjust VR305 to obtain a meter reading of 180mV in the AC mV meter.
2. Reverse the direction, and check that the AC mV meter reading lies within 140mV~185mV.
3. If the reading does not lie within the specified range, adjust VR305 on the condition that the meter reading in the both directions lie within 140mV~185mV.

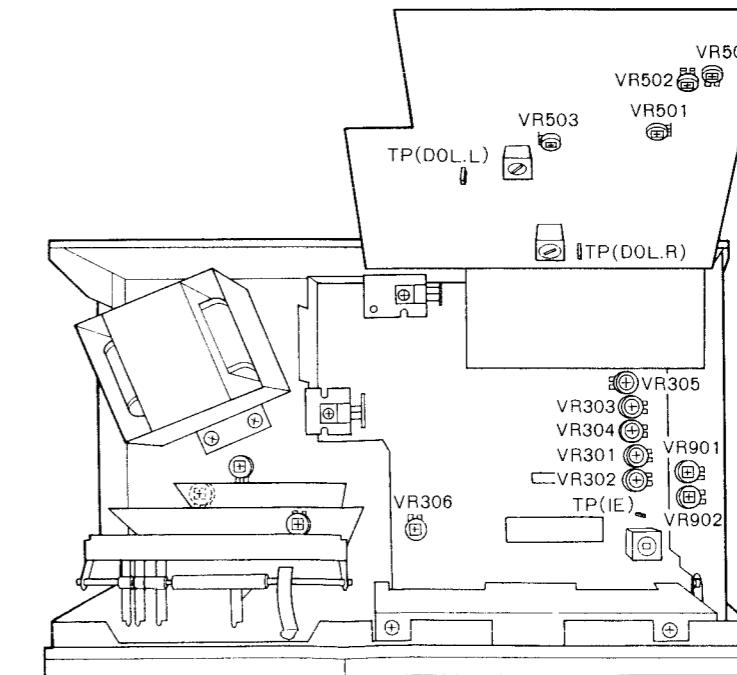

Fig. 12-15 Adjustment point

12.2.6 Record/Playback Frequency Response Adjustment

Settings

AC mV meter	Connect to OUTPUT terminals
Input signal	333Hz, -30dBv (31.6mV) to LINE INPUT terminals
Test tape	STD-608A (STD-603, STD-604)
Direction switch	Forward
Mode	Record

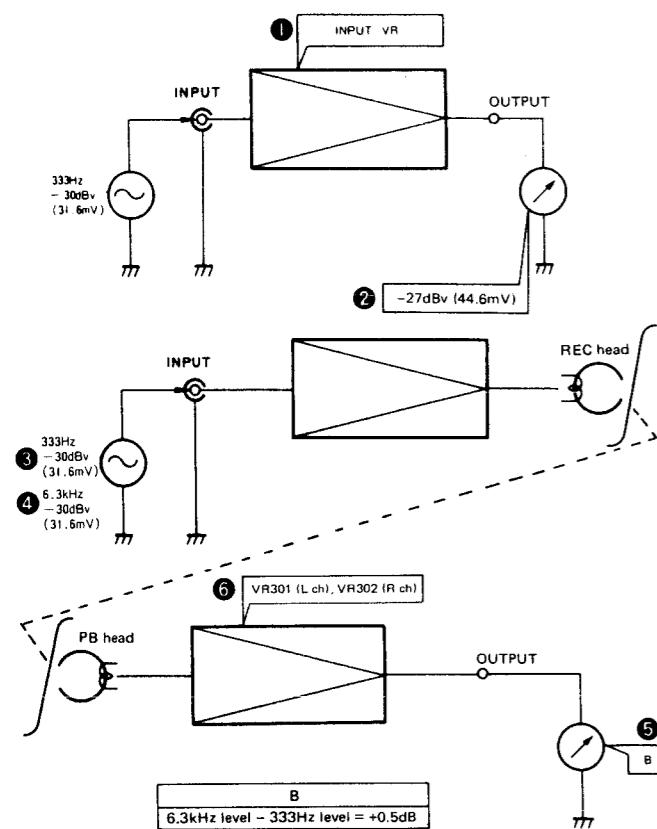

Fig. 12-16 Record/playback frequency response adjustment

Procedure

1. Adjust the INPUT level control so that the meter reads -27dBv (44.6mV).
2. Record the 333Hz, -30dBv and 6.3kHz, -30dBv signals, and adjust VR301 (L ch) and VR302 (R ch) so that the difference in the playback output signal level with the 333Hz level as the reference level is +0.5dB.
3. Change the DOLBY NR switch positions (See Fig. 12-17 and 18), and check that the frequency response is satisfactory.
4. Likewise adjust VR303 (L ch) and VR304 (R ch) in the reverse direction.

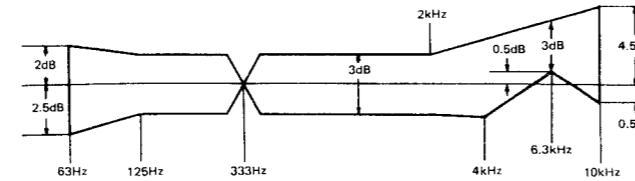

5. If the playback response is not met the specifications, adjust VR305 on the condition that TP (IE) terminal lies within 140mV~185mV, and repeat this adjustment from step 1.

Playback Frequency Response

Test tape STD-341A
DOLBY NR switch OFF

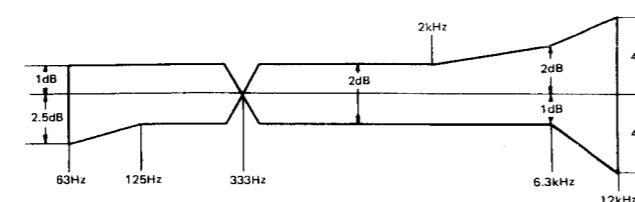

NOTE:

Due to "edge effect", compensate the right channel by -0.5dB at 125Hz and -1dB at 63Hz.

Test tape STD-604
DOLBY NR switch ON (C Type)

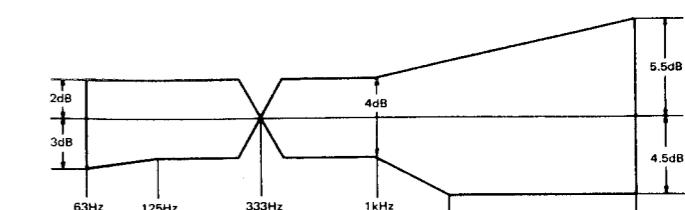

Fig. 12-18 Frequency response

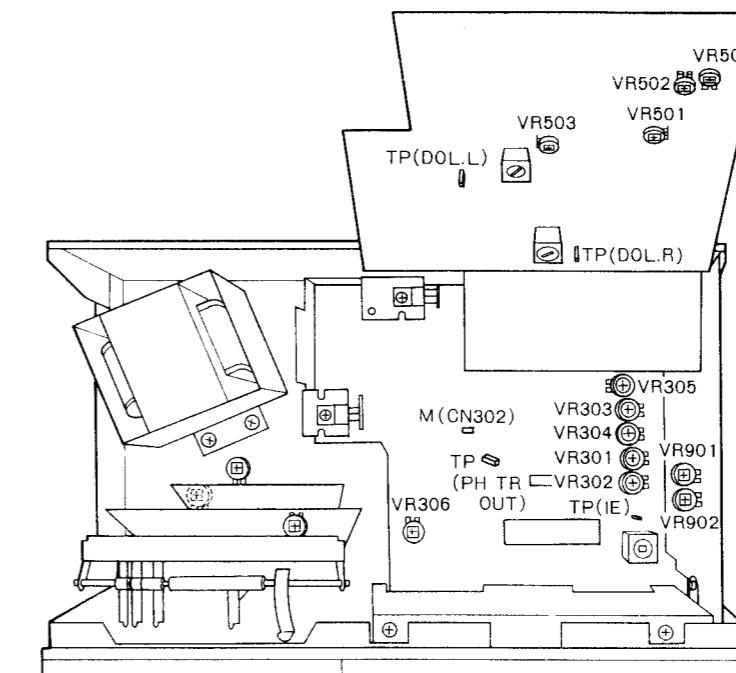

Fig. 12-19 Adjustment points

12.2.7 Recording Level Adjustment

Settings

- AC mV meter Connect to TP (DOL.L) and TP (DOL.R)
 Input signal 333Hz, -10dBv (316mV) to LINE INPUT terminals
 Test tape STD-608A (STD-603, STD-604)
 Mode Record

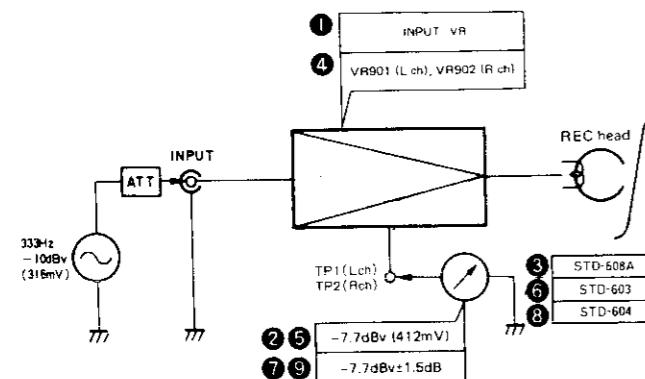

Fig. 12-20 Recording level adjustment

Procedure

1. Adjust the INPUT level control so that the meter reads -7.7dBv (412mV).
2. Set the DOLBY NR B switch to ON position.
3. Record the 333Hz, -10dBv signal on the STD-608A test tape. Then adjust VR901 (L ch) and VR902 (R ch) so that the meter reads of -7.7dBv (412mV) when the recorded signal is played back.
4. Repeat step 3 using the STD-603 test tape. The playback output level should lie within -7.7dBv±1.5dB.
5. Repeat using the STD-604 test tape. The playback output level should again lie within the -7.7dBv±1.5dB range.

12.2.8 Leader Tape Detect Adjustment

Settings 1

- Input Signal 2kHz, -17dBv (0.4V P-P Sin wave) to TP (PH TR OUT) terminal
 DC mV meter Connect to pin 4 of IC306 (PA3010)

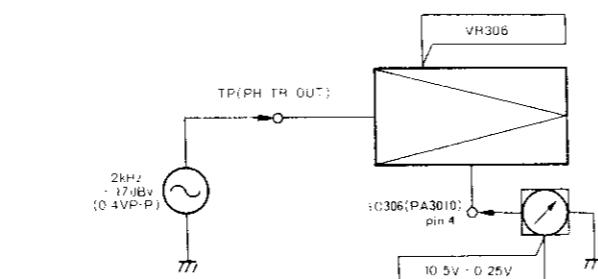

Fig. 12-21 Leader tape detect adjustment

Procedure 1

1. Remove the connector CN302 of the Control assembly.
2. Adjust the VR306 so that the DC mV meter reads 10.5V±0.25V.
3. Return the connector CN302 to the original position.

Settings 2

- Mode Playback
 Tape Cassette half without tape
 Oscilloscope Connect to TP (PH TR OUT) terminal

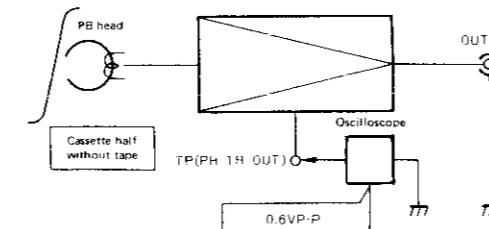

Fig. 12-22 Leader tape detect adjustment

Procedure 2

1. Confirm that the wave form is 0.6Vp-p square wave.
2. If 0.6Vp-p is exceeded, bridge the section A shown in Fig. 12-24.

12.2.9 Limiter Effect Check

Setting

- Mode Record
 Input signal 333Hz, 0dBv (1V) to LINE INPUT terminal
 Test tape STD-608A
 AC mV meter Connect to LINE OUTPUT terminal
 Direction switch Forward
 INPUT level control Click position

Procedure

- Check that the ACmV meter reading lies -2dBv ±1.5dB.

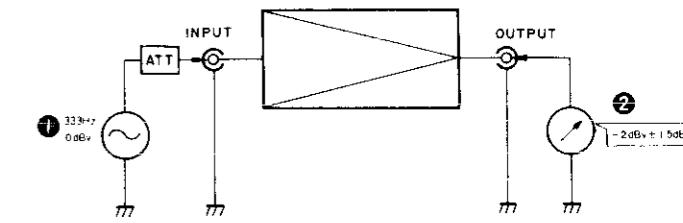

Fig. 12-23 Limiter effect check

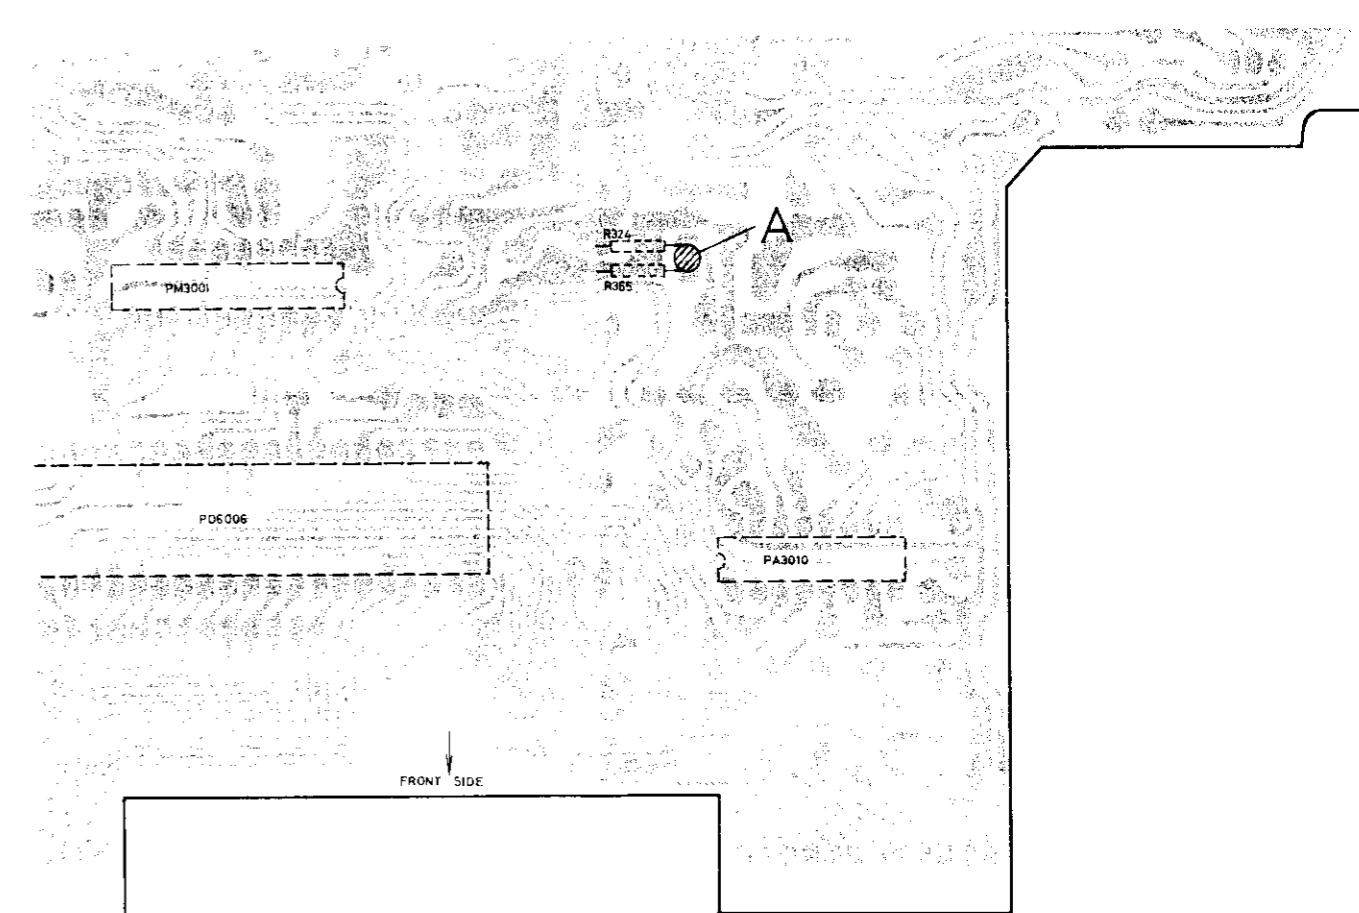

Fig. 12-24 Soldering point (Control assembly foil side)

12. RÉGLAGE

12.1 RÉGLAGES MÉCANIQUES

12.1.1 Réglage de la pression du rouleau de serrage

- Faire marcher le magnétophone en direction avant et commuter le mode de lecture sans insérer de cassette.
- Pousser doucement contre le bras du rouleau de serrage avec un étalon de tension comme indiqué Fig. 12-1. La lecture doit se situer entre 250 et 400gr. au moment où le rouleau de serrage est séparé du cabestan, et où le cabestan se arrête à tourner.
- Si la lecture se situe hors de ces limites, remplacer le ressort de serrage.
- Faire marcher en direction opposée et mesurer la pression du rouleau de serrage de l'autre côté de la même manière que précédemment.

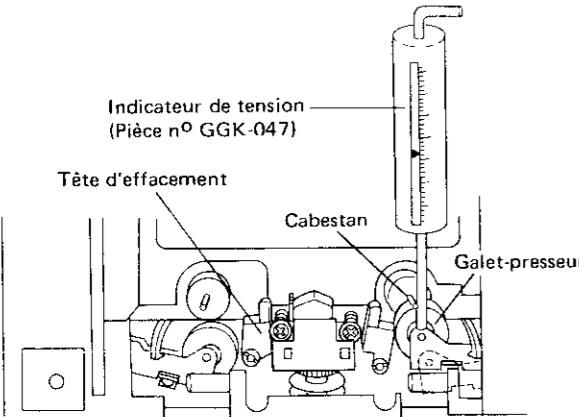

Fig. 12-1 Réglage de la pression du rouleau de serrage

12.1.2 Réglage préliminaire d'azimuth

- Mettre en marche le magnétophone vers l'avant, en mode d'arrêt.
- Au moyen d'un tournevis, comme il est montré Fig. 12-2 régler l'intervalle A à 1,5mm. entre le logement et la base tournante, en tournant la vis ①.
- Faire marcher en direction inverse.
- Au moyen du même tournevis, régler l'intervalle B à 1,5mm entre le logement et la base tournante, en tournant la vis ②.

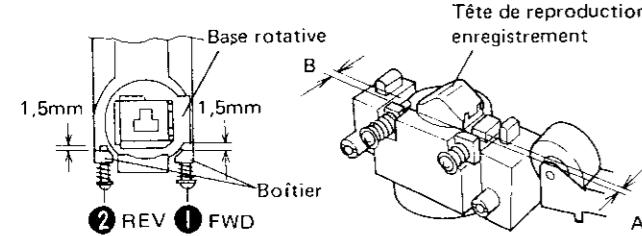

Fig. 12-2 Réglage préliminaire d'azimuth

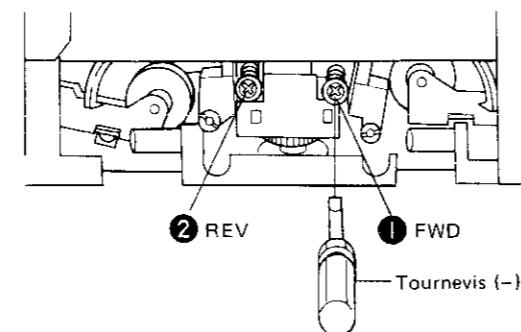

Fig. 12-3 Préréglage d'azimuth

12.1.3 Réglage du défilement de bande

- Faire marcher en direction avant et insérer une cassette munie d'un miroir, puis commuter en mode de lecture.
- Régler l'écrou ① pour assurer qu'entre les guides et les têtes d'enregistrement et d'effacement, la bande ne se gondole pas. Voir Fig. 12-4.
- Faire marcher en direction opposée.
- Régler l'écrou ② pour assurer qu'entre les guides et la tête d'enregistrement et la tête factice, la bande ne se gondole pas.
- Vérifier qu'il n'y a pas de gauchissement de la bande en répétant plusieurs fois le défilement dans les deux sens.

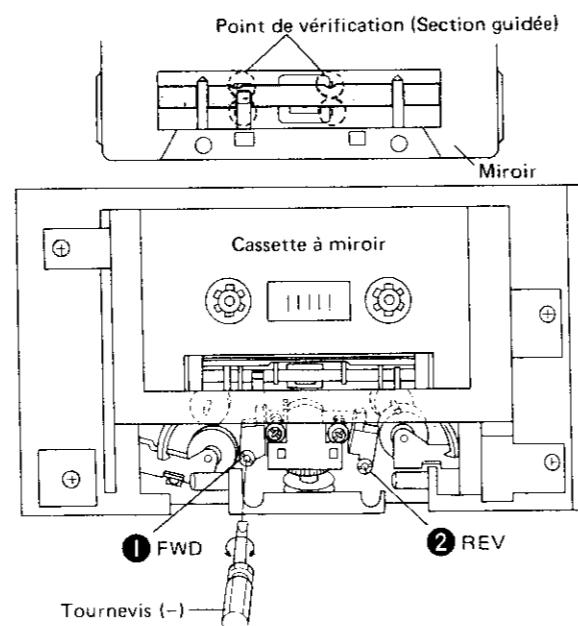

Fig. 12-4 Réglage du défilement de bande

12.1.4 Réglage de la vitesse de rotation rapide de déroulement de d'enroulement

- Brancher un mesureur de fréquence entre les bornes FG et GND sur l'ensemble de contrôle du tambour de moteur. Voir Fig. 12-5.
- Mettre en marche vers l'avant et commuter en mode de déroulement rapide.
- Régler la lecture du mesureur à $72\text{Hz} \pm 2\text{Hz}$ au moyen de VR202.
- Commuter en mode d'enroulement et vérifier que la lecture du mesureur se trouve proche de $72\text{Hz} \pm 5\text{Hz}$.

Moteur d'entraînement du mécanisme de bobinage

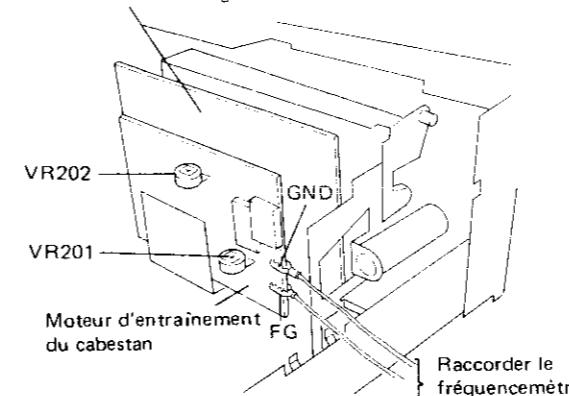

Fig. 12-5 Réglage de la vitesse de rotation rapide de déroulement de d'enroulement

12.1.5 Réglage du couple de torsion à l'enroulement en mode de lecture

- Mettre en marche en direction avant, insérer une cassette mesureur de couple de tension et commuter en mode de lecture.
- Régler le couple de torsion d'enroulement à $45\text{g}\cdot\text{cm} \pm 5\text{g}\cdot\text{cm}$ au moyen de VR201.
- Faire marcher en direction opposée.
- Vérifier que le couple de torsion d'enroulement est de $45\text{g}\cdot\text{cm} \pm 10\text{g}\cdot\text{cm}$.

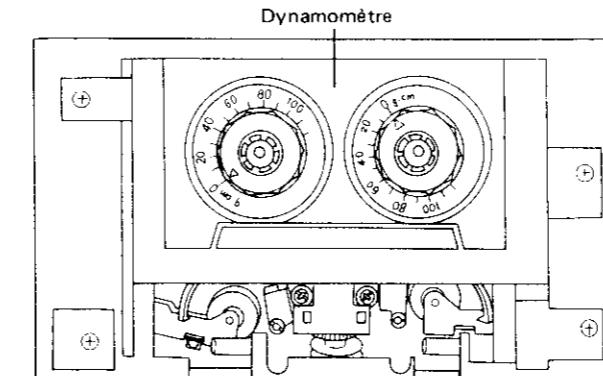

Fig. 12-6 Réglage du couple de torsion à l'enroulement en mode de lecture

12.1.6 Réglage de la vitesse de défilement de la bande

- Brancher le mesureur de fréquence sur les bornes de sortie.
- Faire marcher en direction avant, insérer une bande d'essai STD-301 enroulée à son début et commuter en mode de lecture.
- Régler la lecture du mesureur de fréquence à $3005\text{Hz} \pm 10\text{Hz}$ au moyen du VR101.
- Faire marcher en direction opposée, enrouler la bande à son commencement, puis commuter en mode de lecture.
- Vérifier que la lecture du mesureur de fréquence est proche de $3005\text{Hz} \pm 20\text{Hz}$.

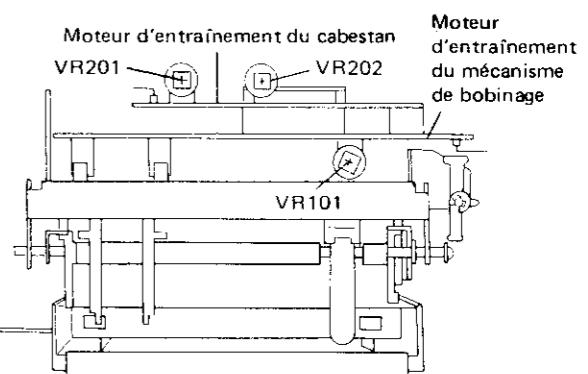

Fig. 12-7 Réglage de la vitesse de défilement de la bande

12.1.7 Vérification du couple de torsion en défilement rapide

- Faire marcher en direction avant, insérer une cassette mesureur de couple de torsion, puis commuter en mode de défilement rapide vers l'avant.
- Vérifier que le couple de torsion de défilement rapide vers l'avant se situe aux environs de $100\text{g}\cdot\text{cm} \pm 30\text{g}\cdot\text{cm}$.
- Commuter en mode d'enroulement et vérifier que le couple de torsion d'enroulement se situe aux environs de $100\text{g}\cdot\text{cm} \pm 30\text{g}\cdot\text{cm}$.

12.1.8 Vérification du couple de torsion de la contre-tension

- Faire marcher en direction avant, insérer un mesureur de couple de tension en forme de cassette, et commuter en mode de lecture.
- Vérifier que la contre-tension se trouve proche de $3,5\text{g}\cdot\text{cm} \pm 1,5\text{g}\cdot\text{cm}$.
- Faire marcher en direction inverse.
- Vérifier que la contre-tension de nouveau se trouve proche de $3,5\text{g}\cdot\text{cm} \pm 1,5\text{g}\cdot\text{cm}$.

12.2 RÉGLAGES ÉLECTRIQUES

- Vérifier les points suivants avant de faire aucun réglage électrique.
 - 1. Tous les réglages mécaniques doivent être terminés.
 - 2. Nettoyer les têtes et démagnétiser la tête d'enregistrement/lecture.
 - 3. Les mesures de niveau sont basées sur $0\text{dBv} = 1\text{V}$. Brancher une fausse résistance de $50\text{k}\Omega$ ($47\text{k}\Omega \sim 52\text{k}\Omega$) sur les bornes de sortie.
 - 4. Utiliser les bandes d'essai spécifiées pour chaque réglage. Bien que ces bandes aient deux côtés, A et B, utiliser le côté identifié par A.
- STD-341A : Réglage de lecture (PLAYBACK)
 STD-608A : Bande vierge NORMALE
 STD-603 : Bande vierge CrO_2
 STD-604 : Bande vierge MÉTAL
- 5. Préparer les instruments de mesure suivants: Millivoltmètre AC, oscillateur audio, atténuateur et oscilloscope.
 - 6. Sauf indication contraire, régler toujours les canaux droite et gauche.
 - 7. Sauf indication contraire, régler avec le bouton DOLBY NR en position OFF.

8. Laisser chauffer le magnétophone pendant quelques minutes avant de faire un réglage. Également, faire marcher le magnétophone en mode lecture et enregistrement respectivement de 3 à 5 minutes avant d'opérer les réglages de réponse de fréquence de lecture et d'enregistrement.
9. Procéder en suivant la séquence spécifiée de réglage. Un changement dans la séquence peut empêcher un réglage correct d'être fait et peut produire, par la suite, une perte de qualité.

Séquence de réglage

1. Azimuth de têtes
2. Vérification du défilement de bande
3. Equilibrage de reproduction
4. Niveau de lecture
5. Courant d'effacement
6. Réponse de fréquence enregistrement/lecture
7. Niveau d'enregistrement
8. Détection de guidage de bande
9. Vérification d'effet de limiteur

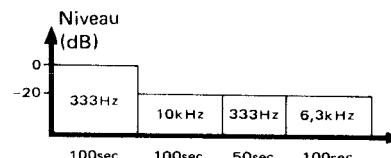

Fig. 12-8 Bande d'essai STD-341A

12.2.1 Réglage de l'azimuth de têtes

Positions

- Millivoltmètre AC... Brancher sur les bornes de sortie
 Bande d'essai STD-341A (10kHz, -20dB)
 Commutateur de direction Vers l'avant
 Mode Lecture
 VR503 et VR504 ... Tourner vers la droite pour position maximum

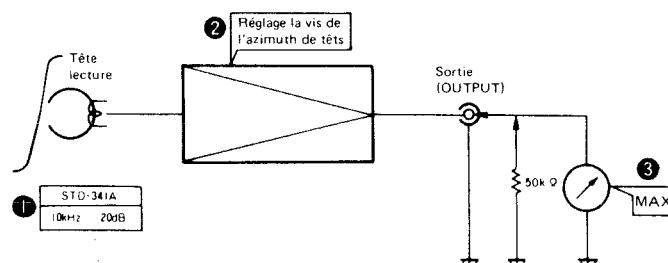

Fig. 12-9 Réglage de l'azimuth de têtes

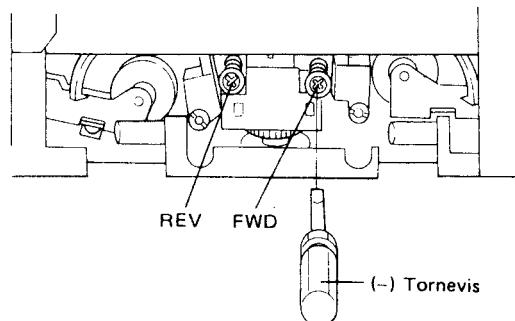

Fig. 12-10 Réglage de l'azimuth de têtes

Marche à suivre

1. Tourner la vis de réglage de l'azimuth vers l'avant pour obtenir une indication maximum du millivoltmètre AC.
2. Changer de direction et tourner la vis de réglage de l'azimuth pour la direction opposée afin d'obtenir une indication maximum du millivoltmètre AC.

3. Reprendre la direction vers l'avant et vérifier qu'il n'y a aucun changement dans le réglage de l'azimuth. Dans le cas de différence notable, refaire le réglage en suivant 1 et 2. (Bloquer les vis avec un vernis de blocage une fois le réglage terminé.)

12.2.2 Vérification de défilement de bande

Disposition

Bandé d'essai Demi-cassette équipée d'un miroir

Commutateur de direction Vers l'avant
Mode Lecture

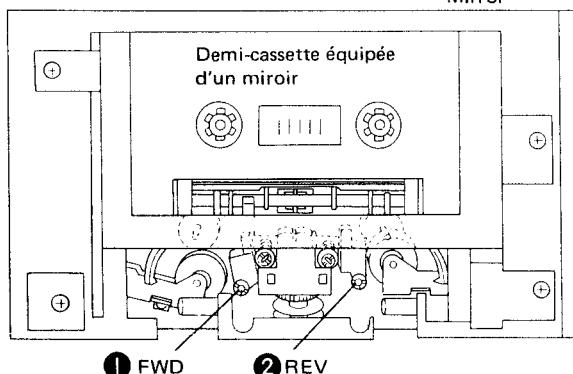

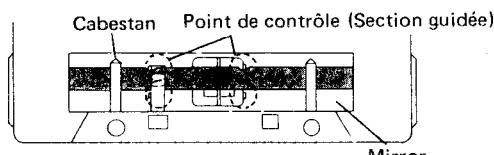

Fig. 12-11 Vérification du défilement de bande

Marche à suivre

1. Vérifier que la bande ne se gondole pas dans la section guidée entre les têtes d'enregistrement et d'effacement.
2. Renverser la direction du défilement de la bande et vérifier que la bande ne se gondole pas dans la section guidée entre la tête d'enregistrement et la tête factice.
3. S'il y a gondolement de la bande, régler le défilement ainsi qu'il est décrit dans la section 12.1.3, page 50, et répéter la marche à suivre de réglage de la section 12.2.1.

12.2.3 Réglage d'équilibrage de reproduction

Positions

Millivoltmètre AC Brancher les sur bornes de sortie

Bandé d'essai STD-341A (333Hz, -20dB) (6,3kHz, -20dB)

Commutateur de direction Vers l'avant
Mode Lecture

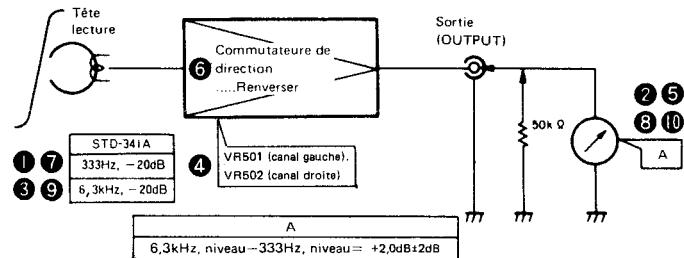

Fig. 12-12 Vérification du filtre de lecture

Marche à suivre

1. Faire marcher la portion de 333Hz, -20dB et enregistrer les lectures du millivoltmètre AC.
2. Puis, faire passer la portion de 6,3kHz, -20dB et régler VR501 (canal gauche) et VR502 (canal droite) de telle sorte que la différence du signal de sortie de reproduction est au niveau de 333Hz puisque le niveau de référence est +2,6dB.
3. Renverser la direction et lire la bande d'essai à nouveau comme il est décrit en 1 et 2, vérifier que la différence de sortie n'est pas au-delà de +2,0dB±2dB.

12.2.4 Réglage du niveau de lecture

Comme ce réglage détermine le niveau du DOLBY NR pendant la lecture, il doit être fait avec précision.

Positions

Millivoltmètre AC Brancher sur TP (DOL gauch) et TP (DOL droite)

Bandé d'essai STD-341A (333Hz, 0dB)

Commutateur de direction Vers l'avant
Mode Lecture

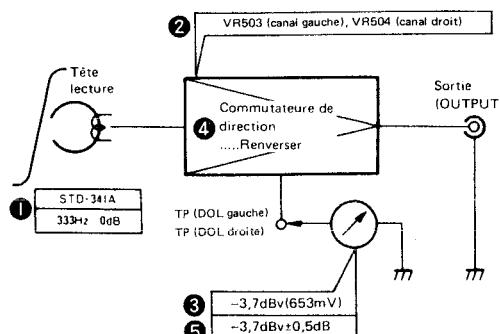

Fig. 12-13 Réglage du niveau de lecture

Marche à suivre

1. Régler VR503 (canal gauch) et VR504 (canal droite) de telle sorte que le mesureur indique - 3,7dBv (653mV).
2. Mettre en direction inverse et vérifier que le millivoltmètre AC indique une position proche de - 3,7dBv ± 0,5dB.
3. Si l'indication n'est pas dans les limites spécifiées, vérifier le passage de la bande et recommencer le réglage à partir de 1.

12.2.5 Réglage du courant d'effacement**Dispositions**

Millivoltmètre AC	Branché sur TP (IE)
Bande d'essai	STD-604
Contrôle de volume	
d'entrée	Niveau Minimum
VR303 et VR403	Positions centrales
Commutateur de direction	Vers l'avant
Mode	Enregistrement

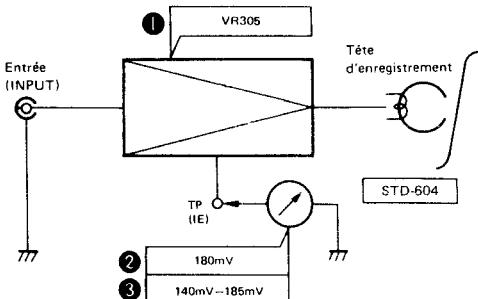

Fig. 12-14 Réglage du courant d'effacement

Marche à suivre

1. Régler VR305 pour obtenir une lecture de 180mV sur le millivoltmètre AC.
2. Changer de direction et vérifier que la lecture du millivoltmètre alternatif se trouve entre 140mV et 185mV.
3. Si l'indication n'est pas dans les limites spécifiées, régler le VR305 de façon à ce que l'indication dans les deux directions soit gardée entre la limite 140mV~185mV.

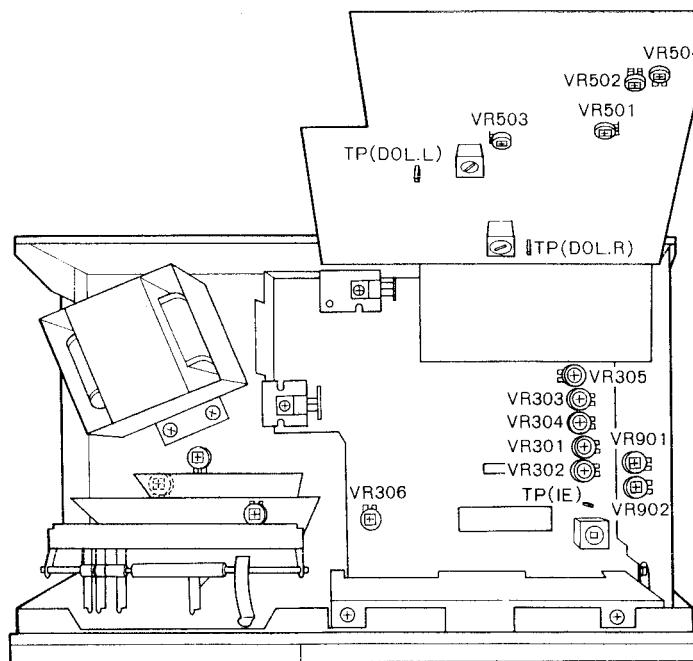

Fig. 12-15 Point de réglage

12.2.6 Réglage de réponse de fréquence enregistrement/lecture

Positions

- Millivoltmètre AC... Brancher sur les bornes de sortie
 Signal d'entrée 333Hz, -30dBv (31,6mV) aux bornes de LINE INPUT
 Bande d'essai STD-608A (STD-603, STD-604)
 Commutateur de direction Vers l'avant
 Mode Enregistrement

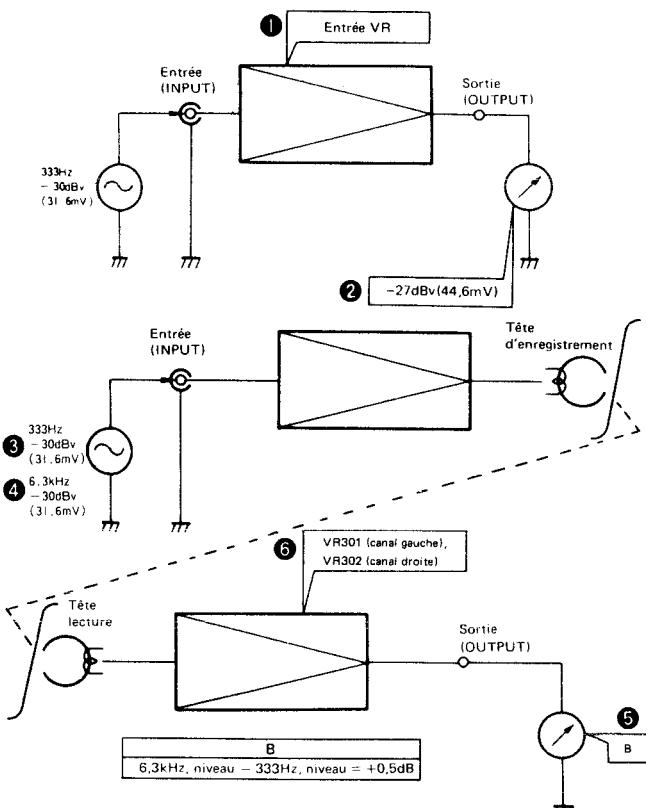

Fig. 12-16 Réglage de réponse de fréquence enregistrement/lecture

Marche à suivre

- Ajuster le contrôle de niveau d'entrée de telle sorte que le mesureur indique -27dBv (44,6 mV).
- Enregistrer les signaux de 333Hz, -30dBv et 6,3kHz, -30dBv et ajuster le VR301 (canal gauche) et le VR302 (canal droite) de telle sorte que la différence du niveau du signal de sortie avec le niveau de 333Hz pris comme référence est de +0,5dB.
- Changer la position du commutateur de DOLBY NR (Voir Figs. 12-17 et 12-18) et vérifier que la réponse à la fréquence est satisfaisante.

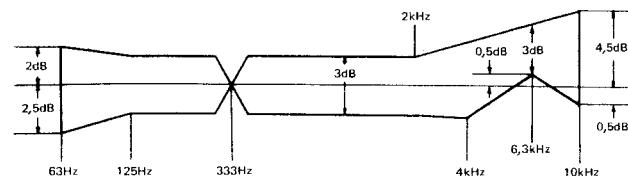

- De même, régler VR303 (canal gauche) et VR304 (canal droite) dans la direction opposée.
- Si la réponse de reproduction ne correspond pas aux spécifications, régler VR305 à la condition que la borne TP (IE) se trouve entre 140mV et 185mV, puis répéter ce réglage à partir du point 1.

Réponse de fréquence de lecture

- Bandé d'essai STD-341A
 Commutateur de DOLBY NR OFF

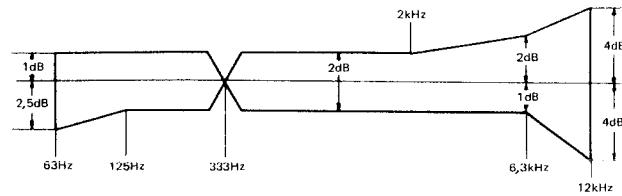

REMARQUE:

En raison d'un effet d'émoisement, compenser le canal droit par -0,5dB à 125Hz et -1dB à 63Hz.

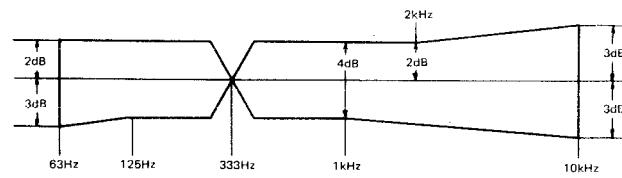

Réponse générale à la fréquence

- Bandé d'essai STD-608A
 Commutateur de DOLBY NR OFF

- Bandé d'essai STD-608A
 Commutateur de DOLBY NR ON (Type B)

- Bandé d'essai STD-608A
 Commutateur de DOLBY NR ON (Type C)

Commutateur de DOLBY NR OFF

Bandé d'essai STD-603
Commutateur de DOLBY NR ON (Type B)

Bandé d'essai STD-603
Commutateur de DOLBY NR ON (Type C)

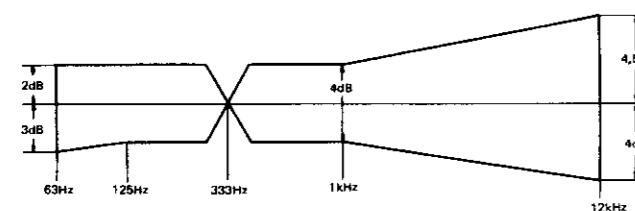

Fig. 12-18 Réponse à la fréquence

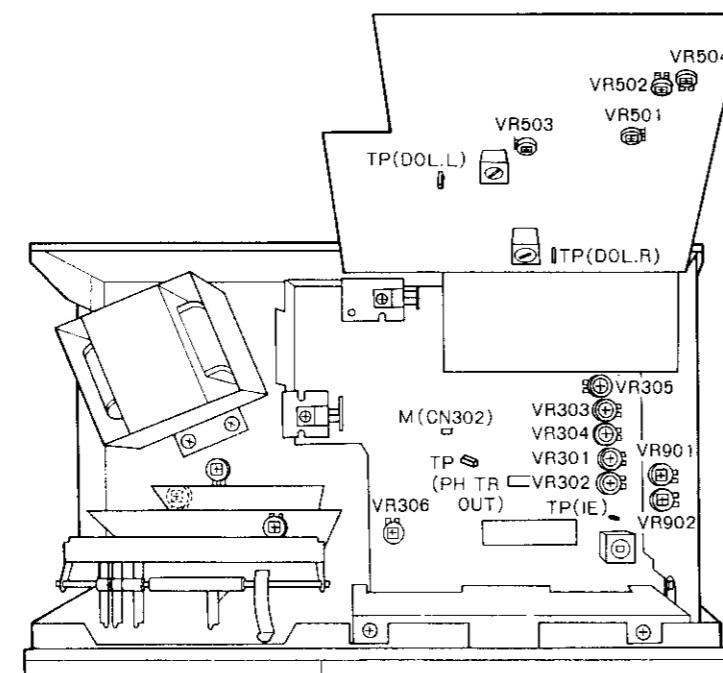

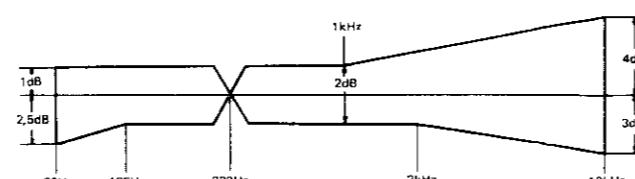

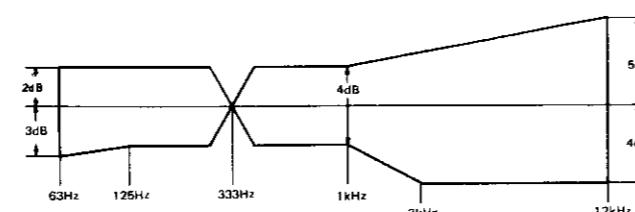

Fig. 12-19 Point de réglage

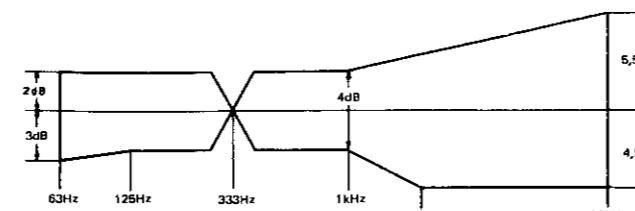

Bandé d'essai STD-604
Commutateur de DOLBY NR OFF

Bandé d'essai STD-604
Commutateur de DOLBY NR ON (Type B)

Bandé d'essai STD-604
Commutateur de DOLBY NR ON (Type C)

12.2.7 Réglage du niveau d'enregistrement

Positions

Millivoltmètre AC Brancher sur TP (DOL gauche) et TP (DOL droite)

Signal d'entrée 333Hz, -10dBv (316mV) sur bornes LINE INPUT STD-608A (STD-603, STD-604)

Bande d'essai NORM (CrO₂, METAL)
Sélecteur de bande .. Mode Enregistrement

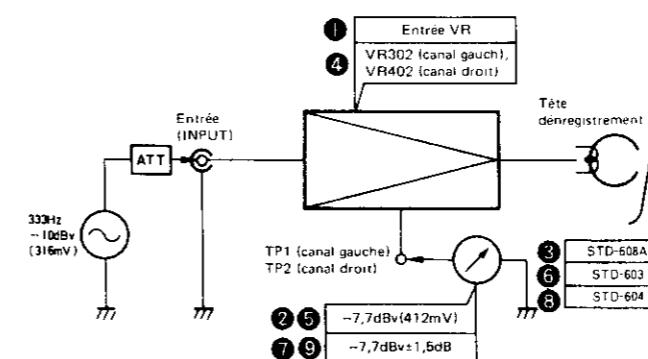

Fig. 12-20 Réglage du niveau d'enregistrement

Marche à suivre

- Ajuster le contrôle de niveau d'entrée de telle sorte que le mesureur indique -7,7dBv (412 mV).
- Positionner le commutateur de DOLBY NR B sur la position ON.
- Enregistrer le signal de 333Hz, -10dBv sur la bande STD-608A. Puis ajuster VR901 (canal gauche) et VR902 (canal droit) de telle sorte que le mesureur indique -7,7dBv (412mV) quand le signal enregistré est passé en lecture.
- Répéter le point 3 en se servant de la bande d'essai STD-603. Le niveau de sortie de reproduction devrait se trouver entre -7,7dBv et ±1,5dB.
- Recommencer en utilisant la bande d'essai STD-604. Le niveau de sortie de reproduction devrait se trouver entre -7,7dBv±1,5dB.

12.2.8 Réglage de détection de guidage de bande

Réglage 1

Mode Arrêt

Signal d'entrée 2kHz, -17dBv (0.4Vp-p onde sinusoïdale) à la borne TP (PH TR OUT)

Millivoltmètre CC Brancher sur pin 4 de IC306 (PA3010)

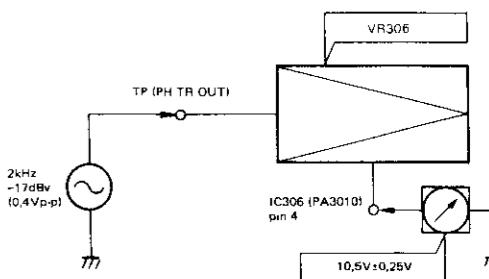

Fig. 12-21 Réglage de la détection d'amorce de bande

Marche à suivre 1

- Débrancher la connection de CN302 du montage de contrôle.
- Régler le VR306 de façon à ce que le millivoltmètre CC indique 10,5V±0,25V.
- Reporter le connecteur CN302 sur sa position originale

Réglage 2

Mode Lecture
Bande Demi-cassette sans bande

Oscilloscope Brancher sur la borne TP (PH TR OUT).

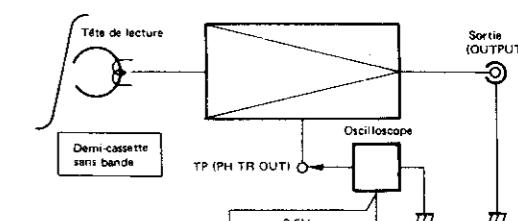

Fig. 12-22 Réglage de la détection d'amorce de bande

Marche à suivre 2

- Confirmer que la forme ondulatoire est carrée de 0,6Vp-p.
- En cas de dépassement de 0,6Vp-p, faire un pont de la section A comme il est montré Fig. 12-24.

12.2.9 Vérification d'effet de limiteur

Réglant

- Mode Enregistrement
 Signal d'entrée 333Hz, 0dBv (1V) sur la borne de LINE INPUT
 Bande d'essai STD-608A
 Millivoltmètre AC Brancher sur la borne LINE
 Commutateur de direction Vers l'avant
 Contrôle de niveau d'entrée Position de cliquet

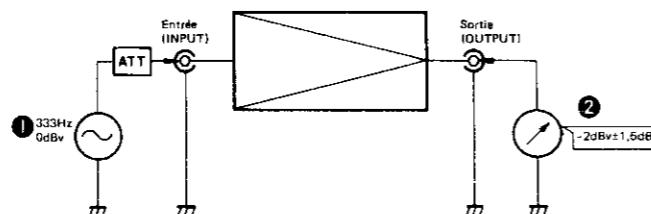

Fig. 12-23 Vérification d'effet de limiteur

Marche à suivre

Vérifier que le millivoltmètre AC montre -2dBv ± 1,5dB.

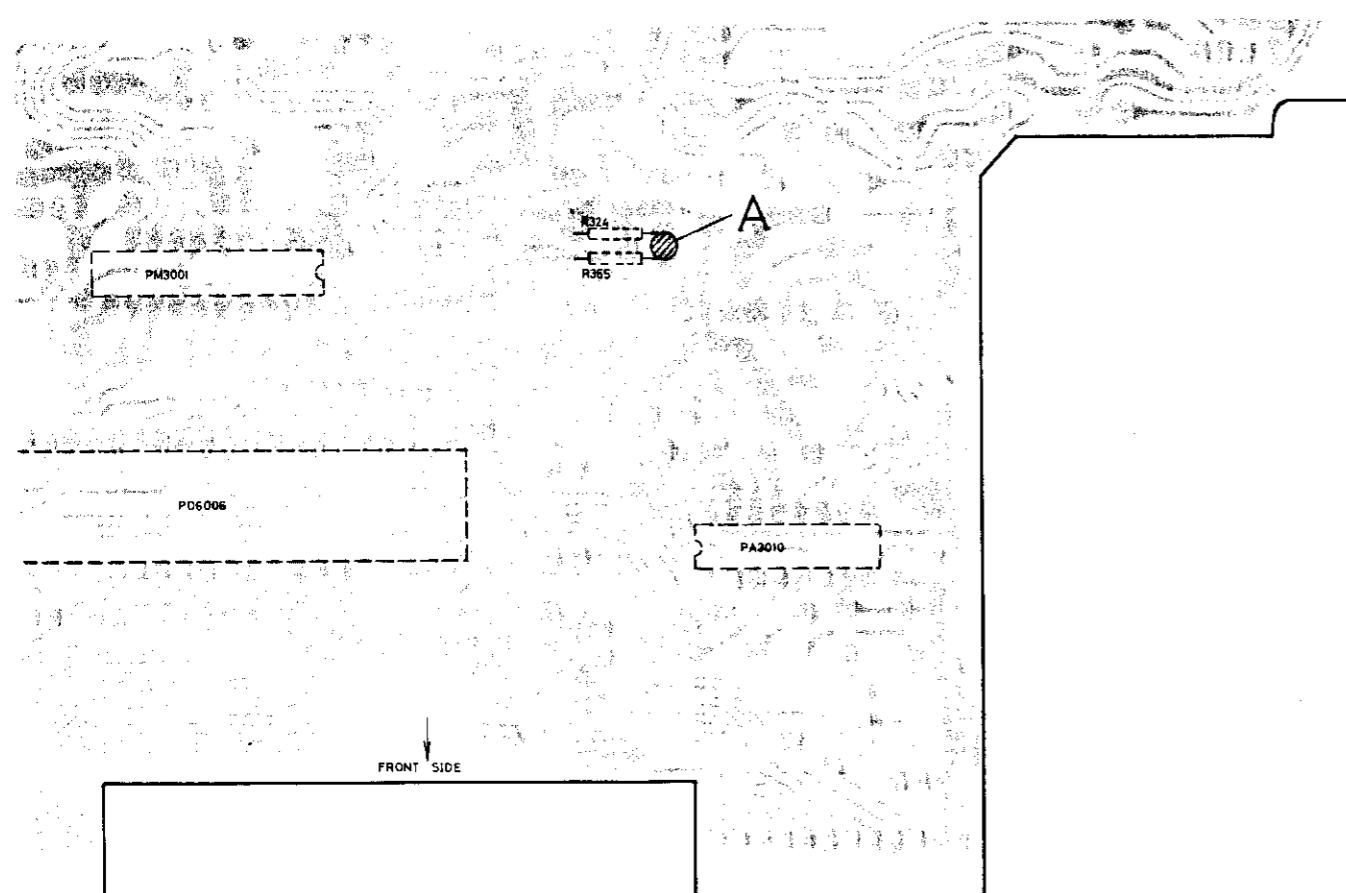

Fig. 12-24 Point de soudage (Montage de contrôle, côté feuille).

12. AJUSTE

12.1 AJUSTES MECÁNICOS

12.1.1 Ajuste del rodillo de presión

- Ajustar la dirección hacia adelante y cambiar al modo de reproducción sin cargar ningún casete.
- Empleando un calibrador de tensión, como se muestra en la figura 12-1, presionar con cuidado contra el brazo del rodillo de presión. El calibrador de tensión deberá indicar entre 250 y 400g en el momento en que el rodillo de presión se separe del eje de arrastre y parar a girar el eje de arrastre.
- Si la indicación cae fuera del margen mencionado, reemplazar el muelle de presión del rodillo.
- Ajustar la dirección inversa y medir la presión del rodillo de presión del otro lado del mismo modo descrito anteriormente.

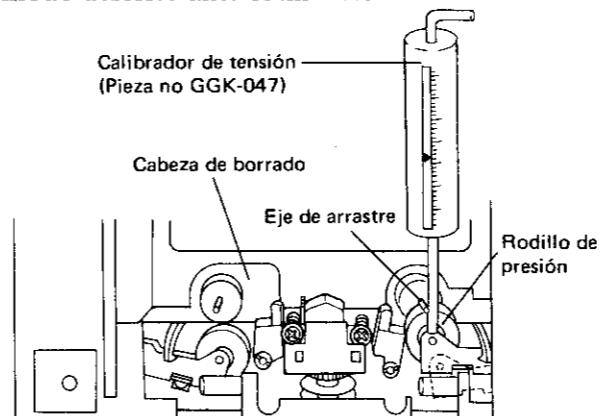

Fig. 12-1 Ajuste del rodillo de presión

12.1.2 Ajuste Preliminar del acimut

- Ajustar la dirección hacia adelante y establecer el modo de parada.
- Empleando un destornillador como se muestra en la figura 12-2, ajustar el hueco entre la envoltura y la base rotativa a 1,5mm girando el tornillo de ajuste ①.
- Ajustar la dirección inversa.
- Empleando un destornillador de nuevo, ajustar el hueco B entre la envoltura y la base rotativa a 1,5mm girando el tornillo ②.

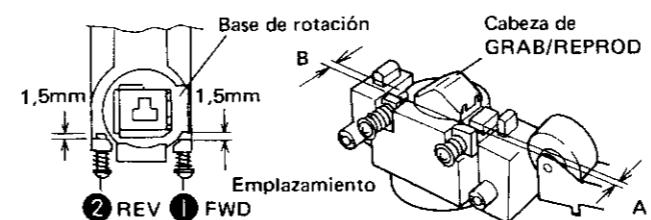

Fig. 12-2 Ajuste preliminar del acimut

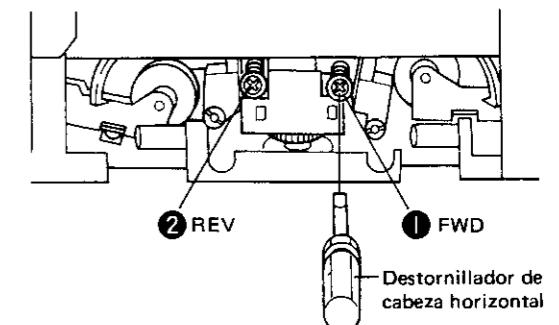

Fig. 12-3 Preajuste del acimant

12.1.3 Ajuste del transporte de la cinta

- Ajustar la dirección hacia adelante, cargar el casete con espejo y establecer el modo de reproducción.
- Ajustar la tuerca ① para asegurarse de que no ocurre enrollamiento de la cinta en la sección guía de las cabezas de grabación y de borrado como se muestra en la figura 12-4.
- Ajustar la dirección inversa.
- Ajustar la tuercas ② para asegurarse de que no ocurre enrollamiento de la cinta en la sección de las cabezas de grabación y fícticia.
- Comprobar que no se enrolla la cinta durante el transporte de la cinta repetido hacia adelante y hacia atrás.

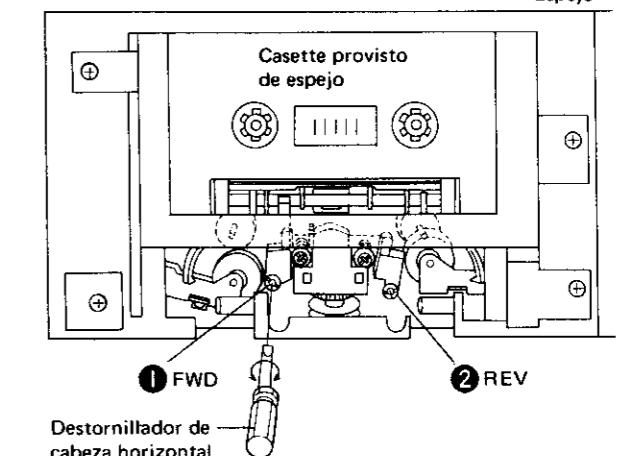

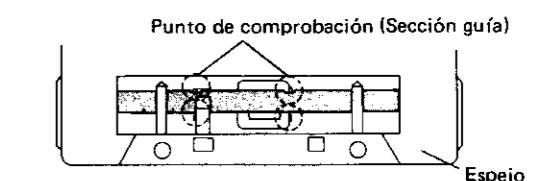

Fig. 12-4 Ajuste del transporte de la cinta

12.1.4 Ajuste de la velocidad de rotación de avance rápido y de rebobinado

1. Conectar un frecuencímetro entre el FG y los terminales de GND del ensamblaje de control del motor de los carretes (ver la figura 12-5).
2. Ajustar la dirección hacia adelante y establecer el modo de avance rápido.
3. Ajustar la indicación del frecuencímetro a 72 Hz ± 2 Hz con el VR202.
4. Establecer el modo de rebobinado y comprobar que la indicación del frecuencímetro cae en el margen de 72Hz ± 5 Hz.

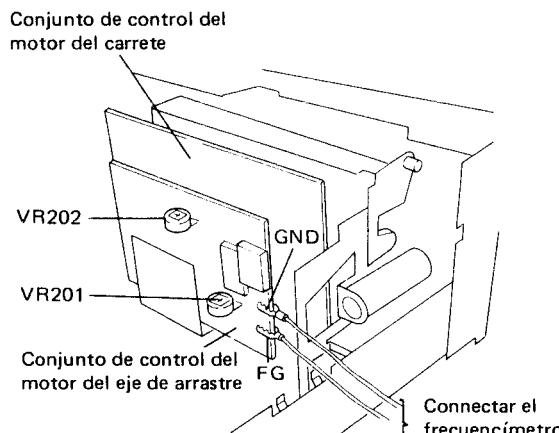

Fig. 12-5 Ajuste de la velocidad de rotación de avance rápido y de rebobinado

12.1.5 Ajuste del par motor de bobinado en el modo de reproducción

1. Ajustar la dirección hacia adelante, cargar un medidor de par motor tipo casete y establecer el modo de reproducción.
2. Ajustar el par motor de bobinado a $45\text{g}\cdot\text{cm} \pm 5\text{g}\cdot\text{cm}$ con el VR201.
3. Ajustar la dirección inversa.
4. Comprobar que el par motor de bobinado sea de $45\text{g}\cdot\text{cm} \pm 10\text{g}\cdot\text{cm}$.

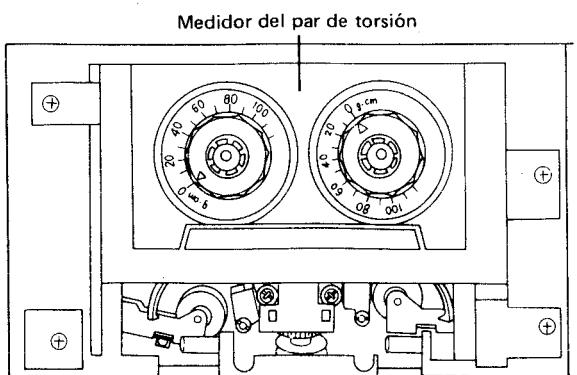

Fig. 12-6 Ajuste del par motor de bobinado en el modo de reproducción

12.1.6 Ajuste de la velocidad de la cinta

1. Conectar un frecuencímetro a los terminales OUTPUT.
2. Ajustar la dirección hacia adelante, cargar una cinta de prueba STD-301, bobinar la cinta hasta el principio y establecer el modo de reproducción.
3. Ajustar la indicación del frecuencímetro a $3005\text{Hz} \pm 10\text{Hz}$ con el VR101.
4. Ajustar la dirección inversa, bobinar la cinta de prueba hasta el principio y establecer el modo de reproducción.
5. Comprobar que el frecuencímetro indique dentro del margen de $3005\text{Hz} \pm 20\text{Hz}$.

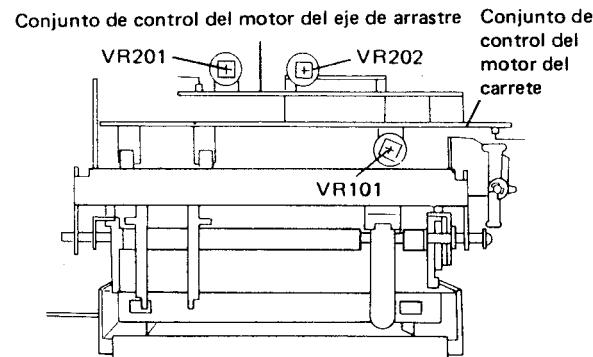

Fig. 12-7 Ajuste de la velocidad de la cinta

12.1.7 Comprobación del par motor de desplazamiento rápido de la cinta

1. Ajustar la dirección hacia adelante, cargar un medidor de par motor tipo casete y establecer el modo de avance rápido.
2. Comprobar que el par motor de avance rápido esté dentro del margen de $100\text{g}\cdot\text{cm} \pm 30\text{g}\cdot\text{cm}$.
3. Establecer el modo de rebobinado, y comprobar de nuevo que el par motor de rebobinado esté dentro del margen de $100\text{g}\cdot\text{cm} \pm 30\text{g}\cdot\text{cm}$.

12.1.8 Comprobación del par motor de retrotensión

1. Ajustar la dirección hacia adelante, cargar un medidor de par motor tipo casete y establecer el modo de reproducción.
2. Comprobar que la retrotensión del carrete de suministro esté dentro del margen de $3,5\text{g}\cdot\text{cm} \pm 1,5\text{g}\cdot\text{cm}$.
3. Invertir la dirección.
4. Comprobar de nuevo que la retrotensión del carrete de suministro esté dentro del margen de $3,5\text{g}\cdot\text{cm} \pm 1,5\text{g}\cdot\text{cm}$.

12.2 AJUSTES ELÉCTRICOS

- Comprobar los puntos siguientes antes de empezar los ajustes eléctricos.
1. Deben estar terminados todos los ajustes mecánicos.
 2. Limpiar las cabezas y desmagnetizar la cabeza de grabación/reproducción.
 3. Las mediciones de nivel se basan en 0dBv = 1V. Conectar un resistor ficticio de 50K ohmios (47K~52K ohmios) entre los terminales de salida (OUTPUT).
 4. Emplear las cintas de pruebas especificadas para cada ajuste. Aunque las cintas de pruebas tienen los lados A y B, utilizar el lado de la etiqueta (lado A).

STD-341 : Ajustes de la reproducción
 STD-608A : Cinta en blanco NORMAL
 STD-603 : Cinta en blanco de CrO₂
 STD-604 : Cinta en blanco de METAL
 5. Preparar el siguiente equipo de medición: Un milivoltímetro de CA, oscilador de audio, atenuador, y un osciloscopio.
 6. A menos que se especifique lo contrario, ajustar siempre los canales izquierdo y derecho.
 7. A menos que se especifique lo contrario, efectuar el ajuste con el interruptor DOLBY NR en la posición OFF.

12.2.1 Ajuste del acimut de la cabeza

Ajustes

- Milivoltímetro de CA ... Conectar a los terminales OUTPUT
 Cinta de prueba STD-341A (10kHz, -20dB)

- Interruptor de dirección Hacia adelante
 Modo Reproducción
 VR301 y VR504 Girar hacia la derecha a la posición máxima

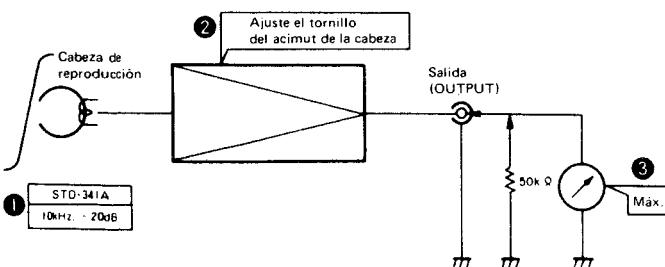

Fig. 12-9 Ajuste del acimut de la cabeza

8. Dejar precalentar el magnetófono durante algunos minutos antes de iniciar los ajustes. Dejar también el magnetófono en los modos de reproducción y de grabación, respectivamente, durante 3 a 5 minutos antes de iniciar los ajustes de la respuesta en frecuencia de reproducción y de grabación.
9. Proceder de acuerdo con la secuencia de ajuste especificada. Si se cambia la secuencia se puede ocasionar el ajuste incorrecto, dando como resultado en una pérdida del rendimiento.

Secuencia de ajuste

1. Acimut de la cabeza
2. Comprobación del transporte de la cinta
3. Ecualización de reproducción
4. Nivel de reproducción
5. Corriente de borrado
6. Respuesta en frecuencia de grabación/reproducción
7. Nivel de grabación
8. Detección de la parte de cinta guía
9. Comprobación del efecto del limitador

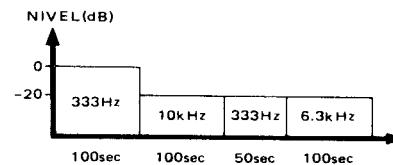

Fig. 12-8 Cinta de prueba STD-341A

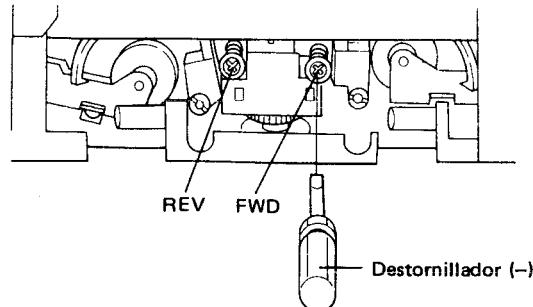

Fig. 12-10 Ajuste del acimut de la cabeza

Procedimiento

1. Girar el tornillo de ajuste del acimut de la cabeza en la dirección hacia adelante para obtener la indicación máxima en el voltímetro de CA.
2. Invertir la dirección y girar el tornillo de ajuste del acimut de la cabeza en la dirección inversa para obtener de nuevo la indicación máxima en el voltímetro de CA.

3. Volver a la dirección hacia adelante y comprobar si no ha habido cambio en el ajuste del acimut. Si ha ocurrido un cambio considerable, reajustar repitiendo los pasos 1 y 2. (Enclavar los tornillos con el enclavador de tornillos después de haber completado el ajuste.)

12.2.2 Comprobación del transporte de la cinta

Ajuste

Cinta de prueba Casete provisto de espejo

Interruptor de dirección Hacia adelante

Modo Reproducción

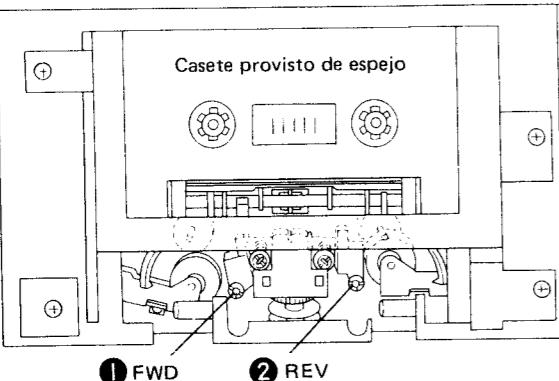

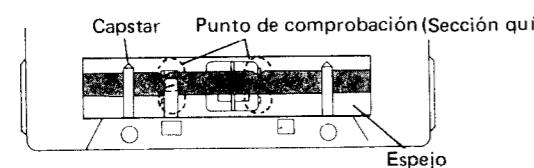

Fig. 12-11 Comprobación del transporte de la cinta

Procedimiento

1. Compruebe que no se enrolle la cinta en la sección guía entre las cabezas de grabación y de borrado.
2. Invierta la dirección del transporte de la cinta y compruebe que no se enrolle la cinta en la sección guía entre las cabezas de grabación y ficticia.
3. Si se enrolls la cinta, ajustar el transporte de la cinta tal y como se ha descrito en la sección 12.1.3 de la página 50 y repetir los procedimientos de ajuste de la sección 12.2.1.

12.2.3 Ajuste de la ecualización de reproducción

Ajustes

Milivoltímetro de CA Conectar a los terminales OUTPUT

Cinta de prueba STD-341A (333Hz, -20 dB) (6,3kHz, -20dB)

Interruptor de dirección Hacia adelante
Modo Reproducción

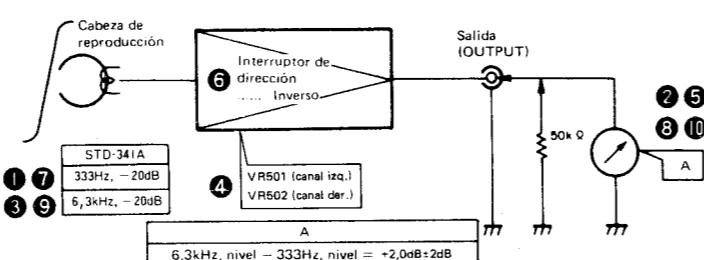

Fig. 12-12 Comprobación del ecualizador de reproducción

Procedimiento

1. Reproducir la parte de 333Hz, -20dB y registrar la indicación del voltímetro de CA.
2. Entonces, reproducir la parte de 6,3kHz, -20dB y ajustar VR501 (canal izq.) y VR502 (canal der.) de modo que la diferencia del nivel de la señal de salida de reproducción con un nivel de 333Hz como nivel de referencia sea de ± 2 dB.
3. Invertir la dirección y reproducir de nuevo la cinta de prueba tal y como se ha descrito en los pasos 1 y 2, comprobando que la diferencia de salida no sea mayor de $+2,0\text{dB}\pm 2\text{dB}$.

12.2.4 Ajuste del nivel de reproducción

Puesto que este ajuste determina el nivel de DOLBY NR durante la reproducción, deberá efectuarse con precisión.

Ajustes

Milivoltímetro de CA Conectar a TP (DOL izq.) y TP (DOL der.)

Cinta de prueba STD-341A (333Hz, 0dB)

Interruptor de dirección Hacia adelante
Modo Reproducción

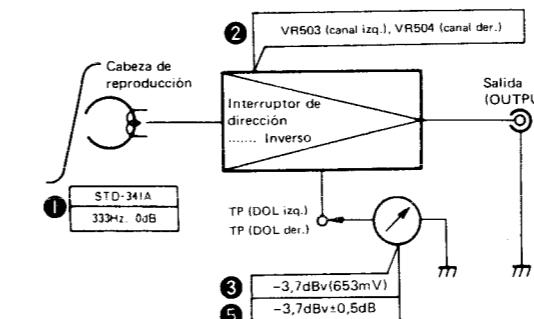

Fig. 12-13 Ajuste del nivel de reproducción

Procedimiento

1. Ajustar VR503 (canal izq.) y VR504 (canal der.) de modo que el voltímetro indique $-3,7\text{dBv}$ (653mV).
2. Ajustar la dirección inversa, y comprobar que la indicación del voltímetro de CA esté dentro del margen de $-3,7\text{dBv} \pm 0,5\text{dB}$.
3. Si la indicación no cae dentro del margen especificado, comprobar el transporte de la cinta y repetir este ajuste desde el paso 1.

12.2.5 Ajuste de la corriente de borrado

Ajustes

Voltímetro de CA Conectar al TP(IE)
STD-604

Nivel mínimo

Avance

Grabación

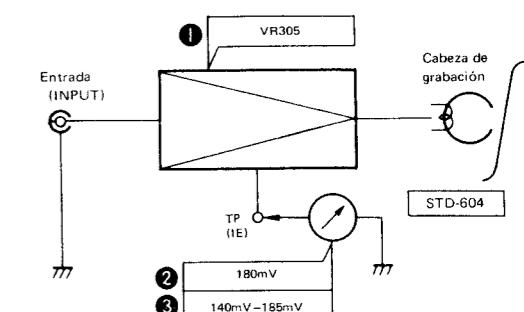

Fig. 12-14 Ajuste de la corriente de borrado

Procedimiento

1. Ajustar el VR305 para obtener una indicación del voltímetro de 180mV en el voltímetro de CA.
2. Invertir la dirección y comprobar que la indicación del voltímetro de CA esté dentro de 140~185mV.
3. Si la indicación no cae dentro del margen especificado, ajustar VR305 a la condición en que la indicación del voltímetro en ambas direcciones esté entre 140mV~185mV.

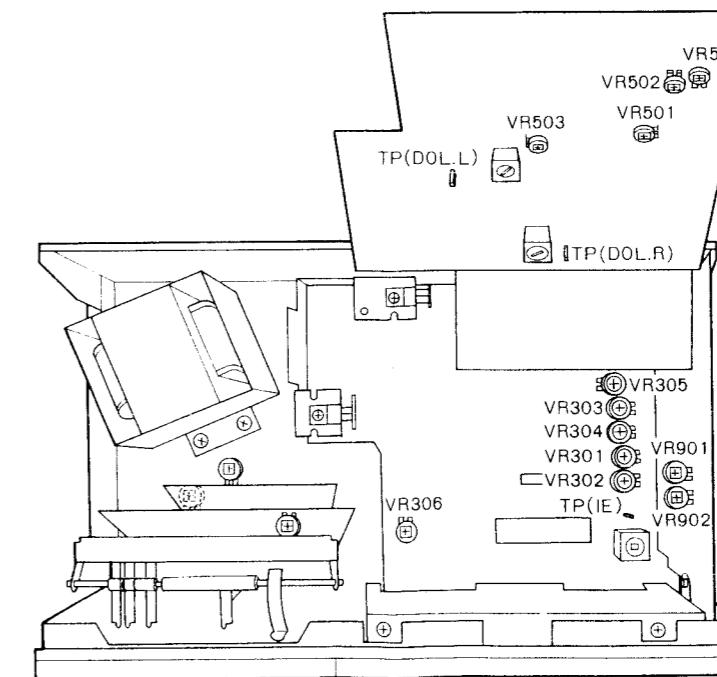

Fig. 12-15 Punto de ajuste

12.2.6 Ajuste de la respuesta en frecuencia de grabación/reproducción

Ajustes

- Milivoltímetro de CA . . Conectar a los terminales OUTPUT
 Señal de entrada 333Hz, -30dBv (31,6mV)
 a los terminales LINE INPUT
 Cinta de prueba STD-608 (STD-603,
 STD-604)
 Selector de dirección . . Avance
 Modo Grabación

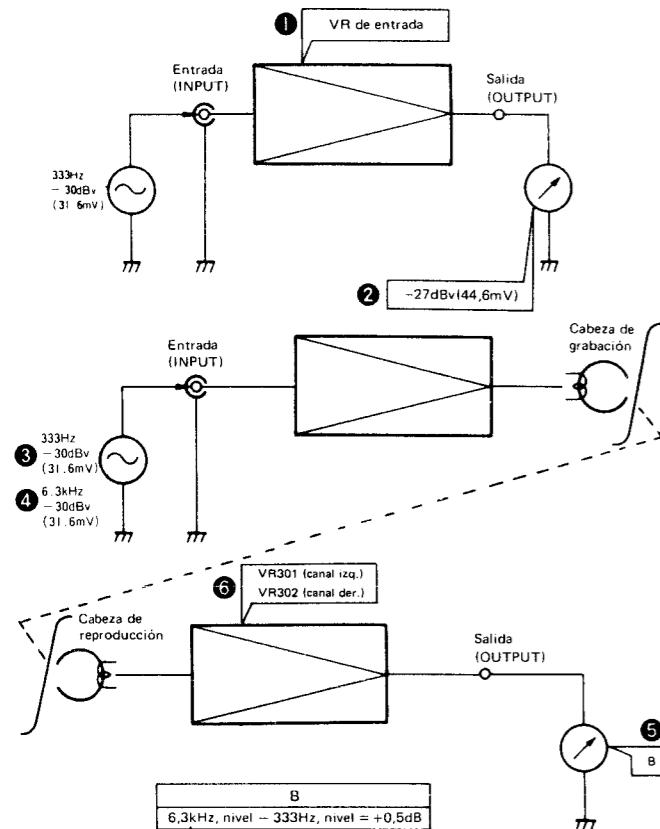

Fig. 12-16 Ajuste de la respuesta en frecuencia de grabación/reproducción

Procedimiento

1. Ajustar el control del nivel de entrada (INPUT) de modo que el voltímetro indique -27dBv (44,6mV).
2. Grabar las señales de 333Hz, -30dBv y 6,3kHz, -30dB, y ajustar el VR301 (canal izq.) y VR302 (canal der.) de modo que la diferencia en el nivel de la señal de salida de reproducción con el nivel de 333Hz como nivel de referencia sea +0,5dB.
3. Cambiar la posición del interruptor DOLBY NR (ver la Fig. 12-17 y 18) y comprobar que la respuesta en frecuencia sea satisfactoria.
4. Del mismo modo, ajustar VR303 (canal izq.) y VR304 (canal der.) en la dirección inversa.

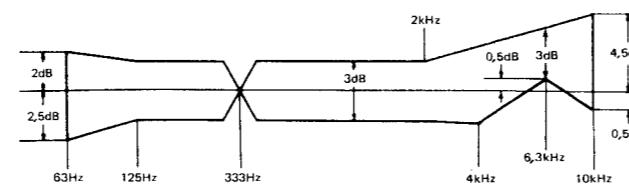

5. Si la respuesta de reproducción no satisface las especificaciones, ajustar VR305 con la condición de que el terminal YP (IE) esté dentro del margen de 140~185mV, y repetir este ajuste desde el paso 1.

Respuesta en frecuencia de reproducción

- Cinta de prueba STD-341A
 Interruptor DOLBY NR OFF

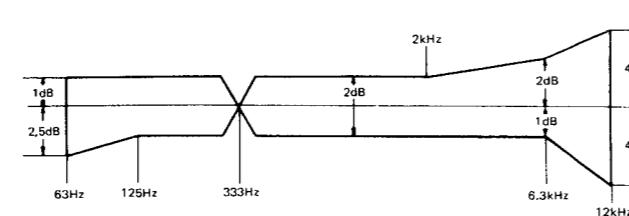

NOTA:

Debido al efecto de borde, compensar el canal derecho en -0,5dB a 125Hz y -1dB a 63Hz.

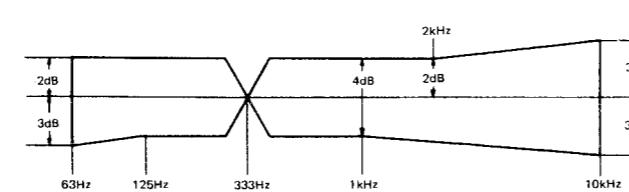

Respuesta en frecuencia global

- Cinta de prueba STD-608A
 Interruptor DOLBY NR OFF

- Cinta de prueba STD-608A
 Interruptor DOLBY NR ON (Tipo B)

- Cinta de prueba STD-608A
 Interruptor DOLBY NR ON (Tipo C)

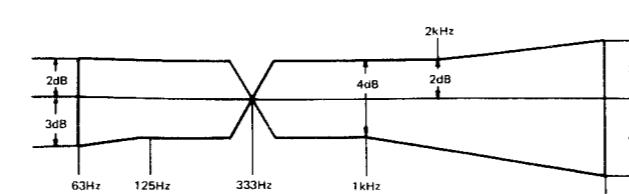

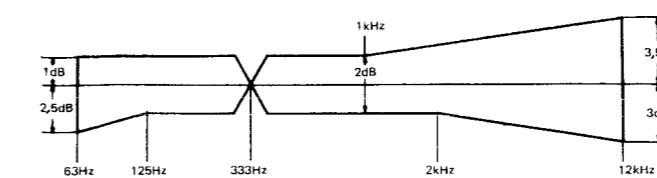

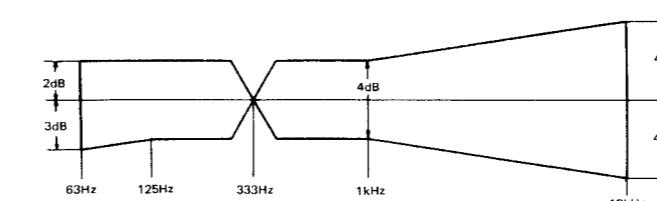

Fig. 12-17 Respuesta en frecuencia

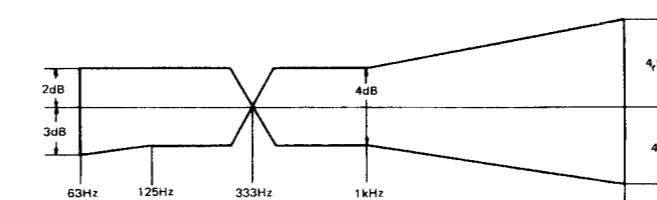

- Cinta de prueba STD-603
 Interruptor DOLBY NR OFF

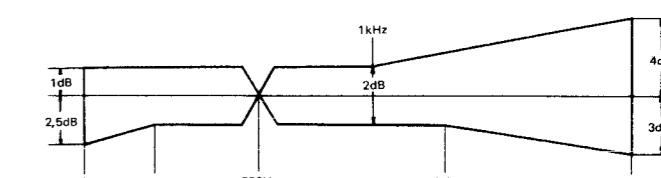

- Cinta de prueba STD-603
 Interruptor DOLBY NR ON (Tipo B)

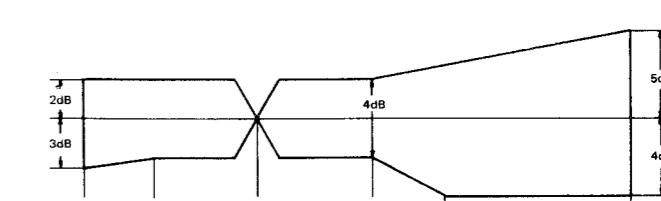

- Cinta de prueba STD-603
 Interruptor DOLBY NR ON (Tipo C)

- Cinta de prueba STD-604
 Interruptor DOLBY NR OFF

- Cinta de prueba STD-604
 Interruptor DOLBY NR ON (Tipo B)

- Cinta de prueba STD-604
 Interruptor DOLBY NR ON (Tipo C)

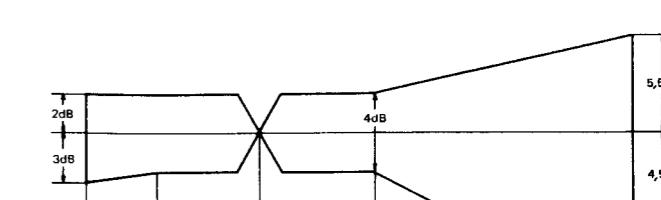

Fig. 12-18 Respuesta en frecuencia

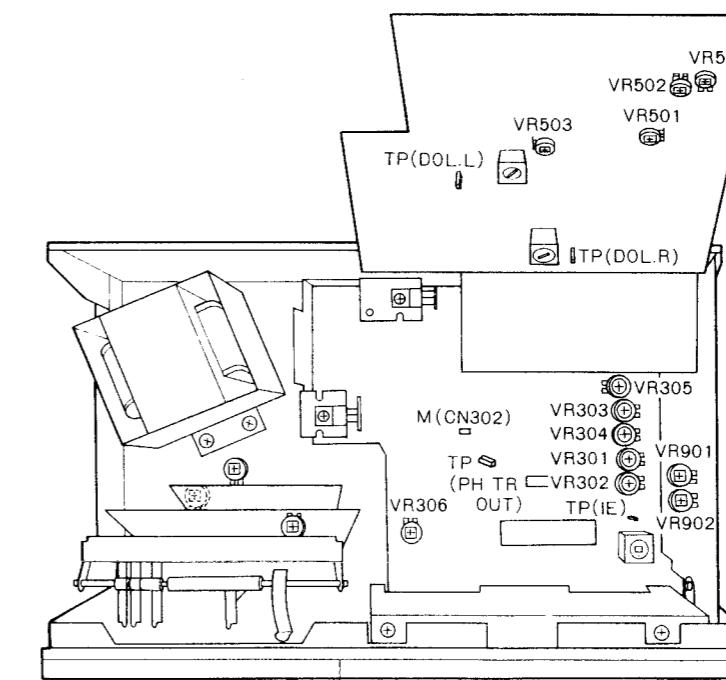

Fig. 12-19 Punto de ajuste

12.2.7 Ajuste del nivel de grabación

Ajustes

- Milivoltímetro de CA . . . Conectar a TP (DOL. izq.) TP (DOL. der.)
 Señal de entrada 333Hz, -10dBv (316mV) a los terminales LINE INPUT
 Cinta de prueba STD-608A (STD-603, STD-604)
 Modo Grabación

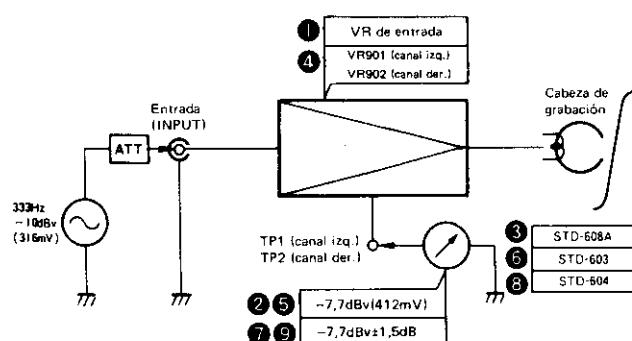

Fig. 12-20 Ajuste del nivel de grabación

Procedimiento

1. Ajustar el control del nivel de entrada (INPUT) de modo que el voltímetro indique -7,7dBv (412mV).
2. Poner el interruptor DOLBY NR B en la posición ON.
3. Grabar la señal de 333Hz, -10dBv en la cinta de prueba STD-608A. Entonces, ajustar el VR901 (canal izq.) y VR902 (canal der.) de modo que el voltímetro indique -7,7dBv (412mV) cuando la señal grabada se reproduzca.
4. Repetir el paso 3 empleando la cinta de prueba STD-603. El nivel de salida de reproducción debe de estar dentro de -7,7dBv±1,5dB.
5. Repetir empleando la cinta de prueba STD-604. El nivel de salida de reproducción debe de estar otra vez dentro de -7,7dBv±1,5dB.

12.2.8 Ajuste de la detección de cinta guía

Ajustes 1

- Modo Parada
 Señal de entrada 2kHz, -17dBv (onda sinusoidal de 0,4Vp-p) al terminal TP (PH TR OUT)
 Voltímetro de CC Conectar a la patilla 4 del IC306 (PA3010)

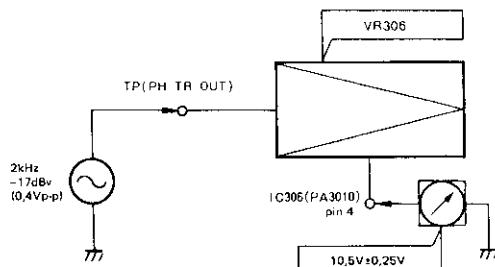

Fig. 12-21 Ajuste de la detección de cinta guía

Procedimiento 1

1. Sacar el conectar CN302 del ensamblaje de control.
2. Ajustar el VR306 de modo que el voltímetro de CC indique $10.5V \pm 0.25V$.
3. Reponer el conector CN302 a la posición original.

Ajustes 2

- Modo Reproducción
 Cinta Casete sin cinta
 Osciloscopio Conectar al terminal TP (PH TR OUT)

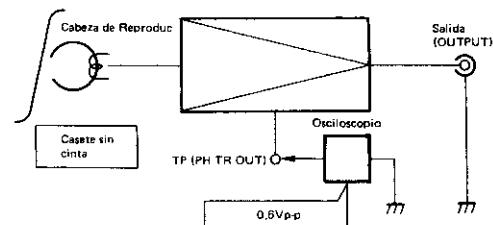

Fig. 12-22 Ajuste de la detección de cinta guía

Procedimiento 2

1. Confirmar que la forma de onda sea una onda cuadrada de $0.6Vp-p$.
2. Si se excede de $0.6Vp-p$, puenteear la sección A mostrada en la Fig. 12-14.

12.2.9 Comprobación del efecto del limitador

Ajuste

- Modo Grabación
 Señal de entrada 333Hz, 0dB (1V) al terminal LINE INPUT
 Cinta de prueba STD-608A
 Voltímetro de CA Conectar al terminal LINE OUTPUT
 Selector de dirección .. Avance
 Control del nivel
 INPUT Posición con parada

Procedimiento

Comprobar que la indicación del voltímetro de CA esté entre $-2\text{dBv} \pm 1,5\text{dB}$.

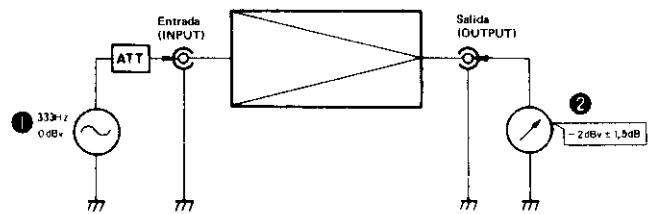

Fig. 12-23 Comprobación del efecto del limitador

P.C. BOARD ASSEMBLYS

Fuse Holder Assembly A

Fuse Holder Assembly B

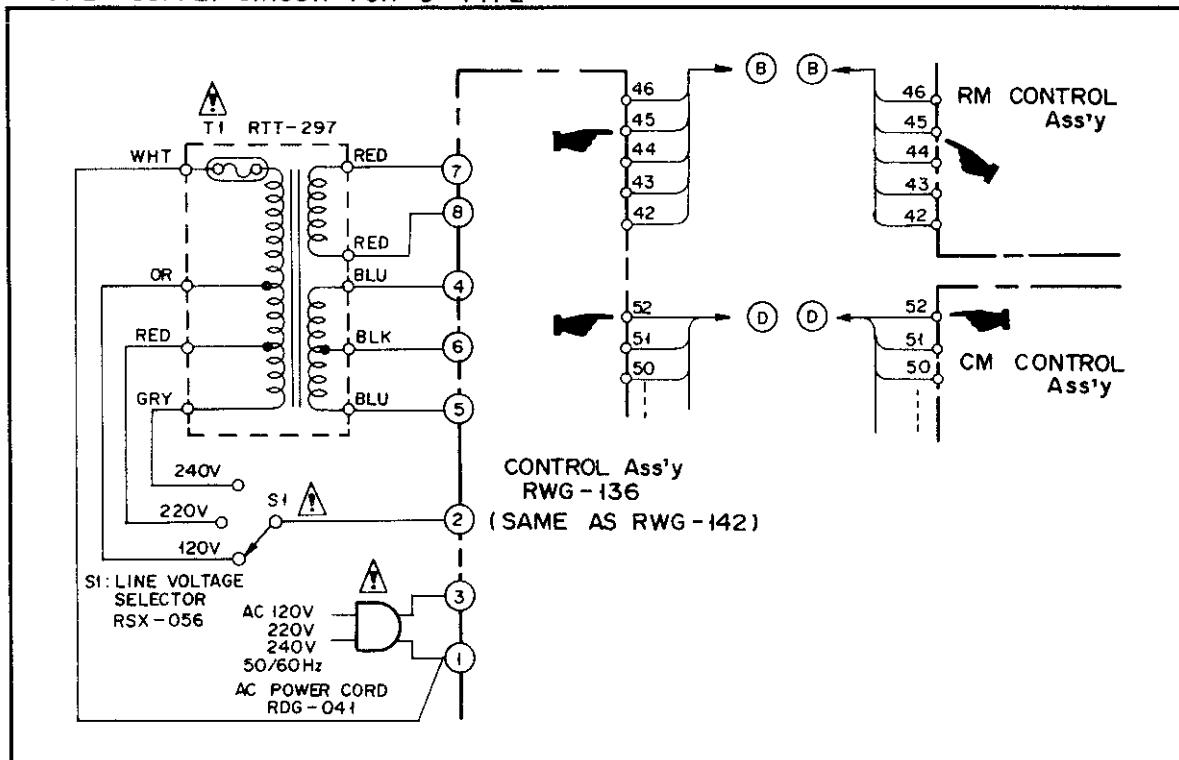

Control Assembly (RWG-140, RWG-136)

- The control assemblies RWG-140 (for HE and HB types) and RWG-136 (for D type) are the same as the RWG-142 (for KU type) with the exception of following table.

Mark	Symbol & Description	Part No.			Remarks
		RWG-142 (KU)	RWG-140 (HE, HB)	RWG-136 (D)	
▲	C301 Ceramic capacitor (0.01/AC250V) (0.01/AC400V)	RCG-008 RCG-009 RS1LF 101J RS2LF 181J RD%PMF 271J 2SC1740LN (2SC1815) (2SC2634NC)	RCG-008 RS1LF 331J RS2LF 111J 2SC1740LN (2SC2634NC)	
▲	R355 Metal oxide film resistor	RS1LF 101J	RS1LF 331J	RS1LF 101J	
▲	R395 Metal oxide film resistor	RS2LF 181J	RS2LF 111J	RS2LF 181J	
▲	R401 Carbon film resistor	RD%PMF 271J	RD%PMF 271J	
Q301	Transistor	2SC1740LN (2SC1815) (2SC2634NC)	2SC1740LN (2SC2634NC)	2SC1740LN (2SC1815) (2SC2634NC)	
CN308	Connector assembly 12-P	RKP-681	RKP-646	RKP-646	
CN309	Connector assembly 5-P	RKP-680	RKP-647	RKP-647	
C327	Electrolytic (100/35) Electrolytic (100/25)	RCH-051 CEA 101M 25 CEA 101M 25	105°C 85°C
