

STEREO CASSETTE DECK WITH DOLBY SYSTEM AND DNL

MODEL AD-1800 EE, UK

AIWA®

(SERVICE MANUAL)

Set using ISO screws

DATE OF ISSUE 25/12/1975

SPECIFICATIONS

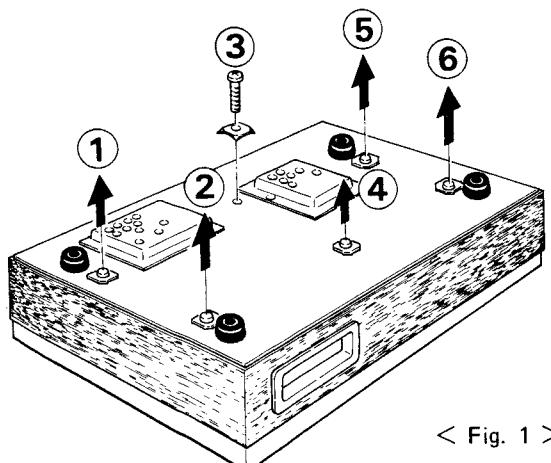

Type:	Hi-Fi stereo cassette tape deck with Dolby system and DNL	LINE (IN):	Max. input sensitivity: 50 mV Impedance: 100 k ohms or higher
Recording track system:	4-track, 2-channel	DIN (IN):	Max. input sensitivity: 0.1mV/k ohm Impedance: 2.7 k ohms
Circuit:	1 IC, 62 transistors, 43 diodes, 2 FET, 3 LED	Output:	Standard output level: 0.775V (0 VU) Optimum load impedance: 50 k ohms or higher
Power source:	"EE" model AC 110 ~ 120V/220 ~ 240V switch changeable, 50/60 Hz "UK" model AC 120V/240V switchable 50 Hz	LINE (OUT):	Standard output level: 0.775V (0 VU) Optimum load impedance: 50 k ohms or higher
Power consumption:	24W	DIN (OUT):	Load impedance: 8 ohms
Frequency response:	LH tape, 30 ~ 14,000 Hz Fe-Cr tape, 30 ~ 18,000 Hz CrO ₂ tape, 30 ~ 17,000 Hz	Headphone:	Dimensions (w.h.d): 423 x 152 x 295 mm (with dust cover)
SN ratio:	65 dB (Dolby NR/DNL ON, Fe-Cr tape)	Weight:	7.5 kg (with dust cover)
Wow & flutter:	0.05% (WRMS)	Accessories:	Dust cover x 1 Tape cassette x 1 DIN cord x 1 Head cleaning pole x 1
Tape speed:	4.76 cm/sec. (1-7/8 ips) ±1.0%		
Recording system:	AC bias		
Erasing system:	AC erase		
Rewind time:	95 sec. (w/ C-60)		
FF time:	95 sec. (w/ C-60)		
Usable cassette tape:	C-30, C-60, C-90, (C-120)		
Motor:	AC hysteresis synchronous motor		
Head:	Ferrite guard head (FGH)		
Input:			
MIC:	Max. input sensitivity: 0.25 mV Impedance: 200 ohms ~ 10k ohms		

- The external design and the specifications are subject to change without prior notice.

DISASSEMBLY INSTRUCTIONS

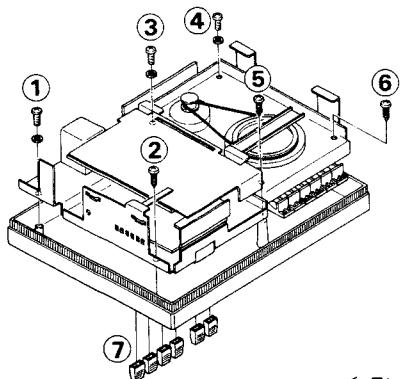

1. To Remove Wooden Cover

- (1) Remove six screws, (1) through (6).
(Refer to Fig. 1)

2. To Remove Chassis

- (1) Pull off the six control knobs. (7)
(2) Remove six screws, (1) through (6).
(Refer to Fig. 2)

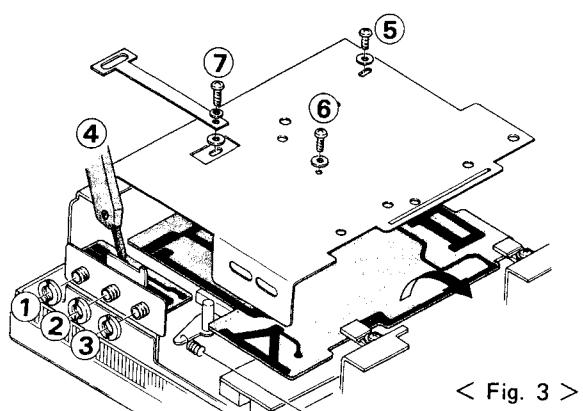

3. To Remove Jack-1 Circuit Board

- (1) Remove three nuts ((1) through (3)) and unsolder lead of capacitor (4). (Refer to Fig. 3)

4. To Remove Rec./Pb Circuit Board

- (1) Remove three screws, (5) through (7).
(Refer to Fig. 3)

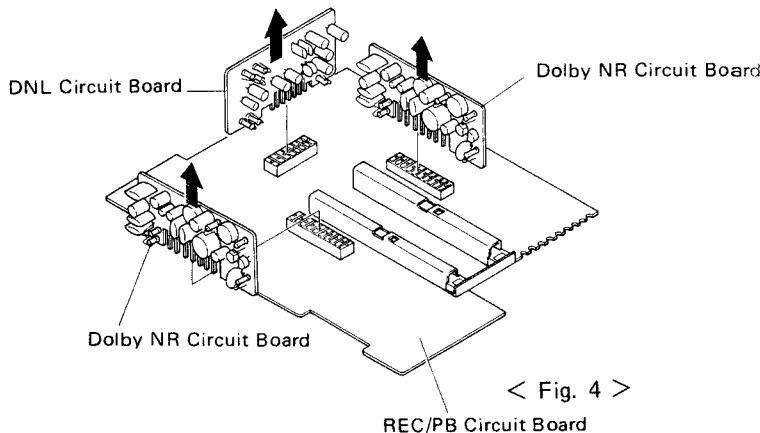

5. To Remove Dolby-NR Circuit Board.

- (1) Pull off the Dolby-NR circuit board.
(Refer to Fig. 4)

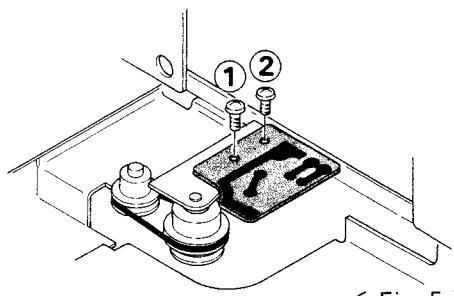

6. To Remove DNL Circuit Board

- (1) Pull off the DNL circuit board.
(Refer to Fig. 4)

7. To Remove Auto-Stop Detectron Circuit Board.

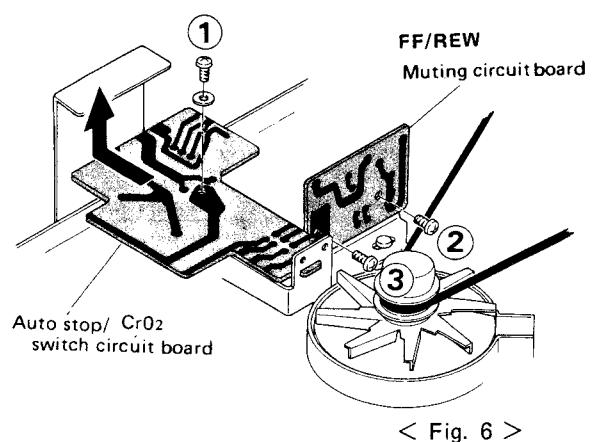

- (1) Remove two screws, (1) and (2).
(Refer to Fig. 5)

8. To Remove Auto-Stop/CrO₂ Switch Circuit Board

- (1) Remove one screw (1).
(Refer to Fig. 6)

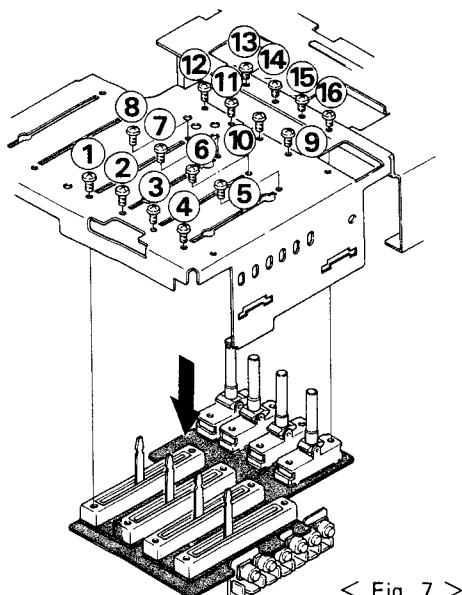

9. To Remove FF/REW Muting Circuit Board

- (1) Remove two screws, (2) and (3).
(Refer to Fig. 6)

10. To Remove Switch/Volume Circuit Board

- (1) Remove sixteen screw, (1) through (16).
(Refer to Fig. 7)

< Fig. 7 >

11. To Remove LAMP Circuit Board

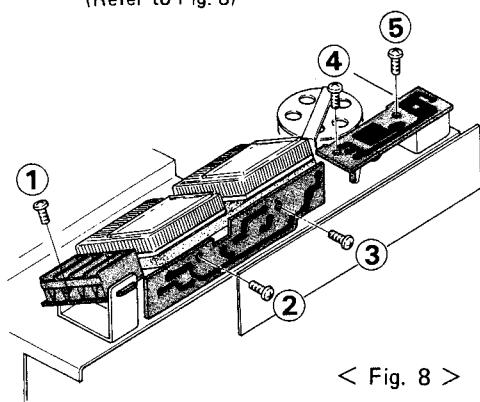

- (1) Remove one screw, (1).
(Refer to Fig. 8)

12. To Remove Meter Circuit Board

- (1) Remove two screws, (2) and (3).
(Refer to Fig. 8)

13. To Remove Bias Osc Circuit Board

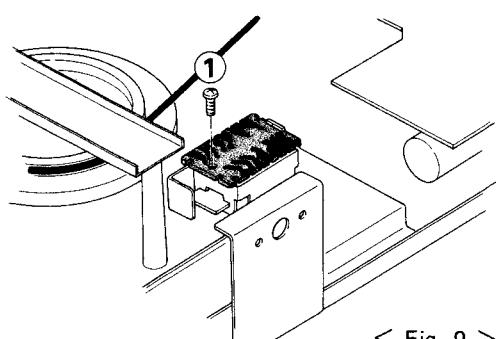

- (1) Remove two screws, (4) and (5).
(Refer to Fig. 8)

< Fig. 8 >

14. To Remove Stop Muting Circuit Board

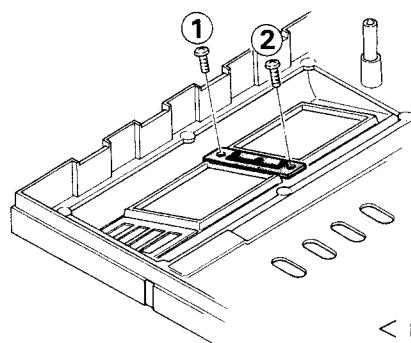

- (1) Remove one screw (1).
(Refer to Fig. 9)

< Fig. 9 >

15. To Remove LED Circuit Board

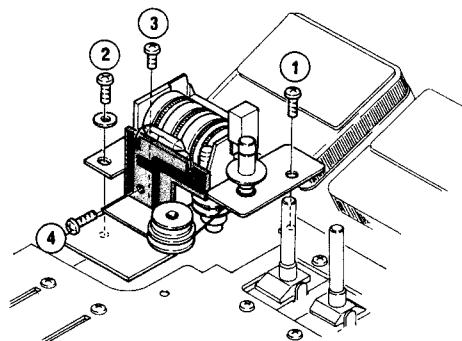

- (1) Remove two screws, (1) and (2).
(Refer to Fig. 10)

< Fig. 10 >

16. To Remove Counter Lamp Circuit Board

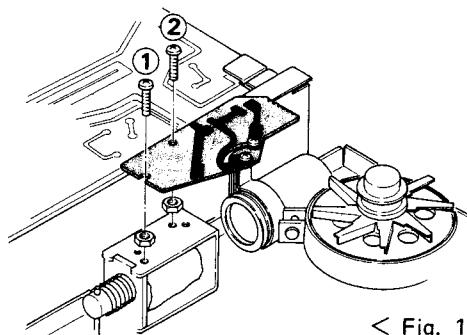

- (1) Remove four screws, (1) through (4).
(Refer to Fig. 11)

< Fig. 11 >

17. To Remove Motor Circuit Board

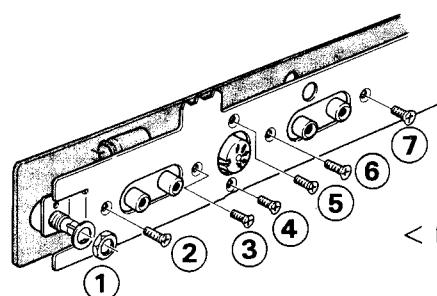

- (1) Remove two screws, (1) and (2).
(Refer to Fig. 12)

< Fig. 12 >

18. To Remove Jack-2 Circuit Board

- (1) Remove the nut and washer (1).
- (2) Remove six screws, (2) through (7).
(Refer to Fig. 13)

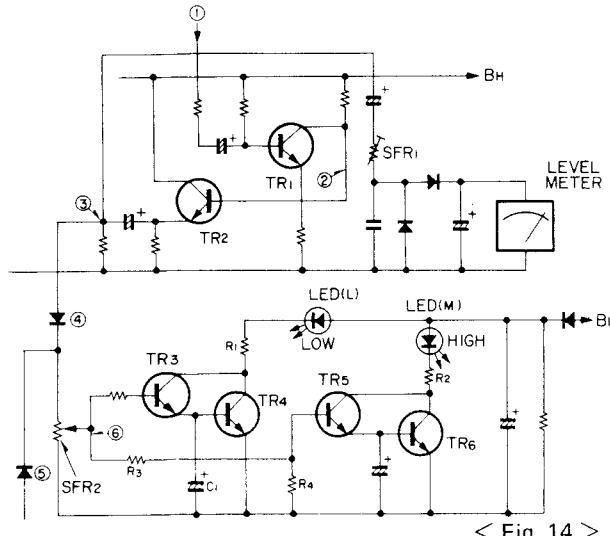

< Fig. 13 >

NEW CIRCUIT DESCRIPTION

2. Point Peak Indicators

- Peak indicator circuit diagram

Presently employed VU meters are capable of indicating continuous wave signals of approximately 300msec. They are incapable of following faster pulse type signals however, resulting in an indicated value considerably lower than the actual level. Thus if the recording level is set in reference to the VU meters, an instantaneous high level input can cause an over level, resulting in distortion.

Peak indicators are provided for preventing this situation and are capable of indicating to about 1msec instantaneous inputs. Earlier single point designs (a single peak indicator which lights at +6VU) however, were ambiguous and difficult to interpret. The indicator was not supposed to light, but if it did not light, the level could not be determined.

The 2 point peak indicator system employed in the AD-1800 represents an improvement over earlier systems. Two peak indicators are used with different lighting levels (+2.5~3VU and +6~7VU), allowing more accurate peak indication.

- Circuit Description

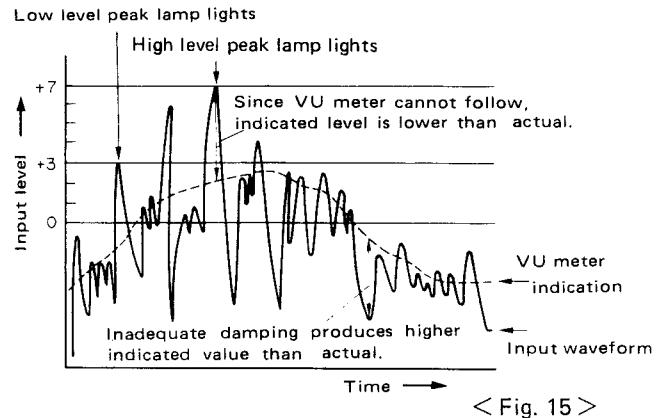

Input signal (1) is amplified approximately 10dB by TR1. Previously, it passed from (2) through the SFR and was rectified and connected to the meter. However, since the meter load is heavy, TR1 output voltage became varied by SFR adjustment, preventing connection to the peak indicator circuit.

TR2 is therefore inserted at that point as an emitter follower, reducing meter amplifier output impedance in order not to influence meter and peak indicators.

The signal to the meter amplifier is divided at (3). The peak indicator signal is rectified at (4) and the voltage is applied to SFR2. At this point the signal from the other channel is mixed, while the peak indicator lighting level is determined by adjusting SFR2.

When (6) reaches a specified voltage, TR3 and TR4 Darlintons become on, and LED (L) lights. C1 is inserted at this point to provide a certain degree of lighting time, since instantaneous lighting with a pulse signal input would be difficult to observe.

The voltage at (6) is divided at R3 & R4. By a higher level than TR3 on level, TR5 and TR6 become on. R1 and R2 are inserted as protector resistors to control the current flow through the LED.

< Fig. 15 >

- Recording Level Settings According to Tape

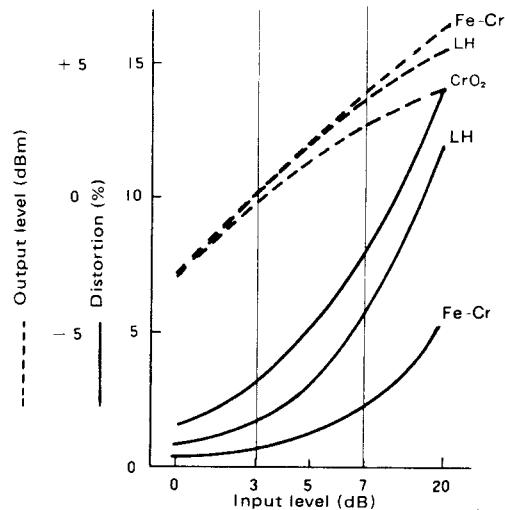

Distortion can be suppressed to below 3% and optimum recording performed by setting the recording levels as follows.

LH Tape: Lights occasionally at +3dB; does not light at +7dB

Fe-Cr Tape: Lights often at +3dB; lights occasionally at +7dB

CrO₂ Tape: Does not light at either +3dB or +7dB

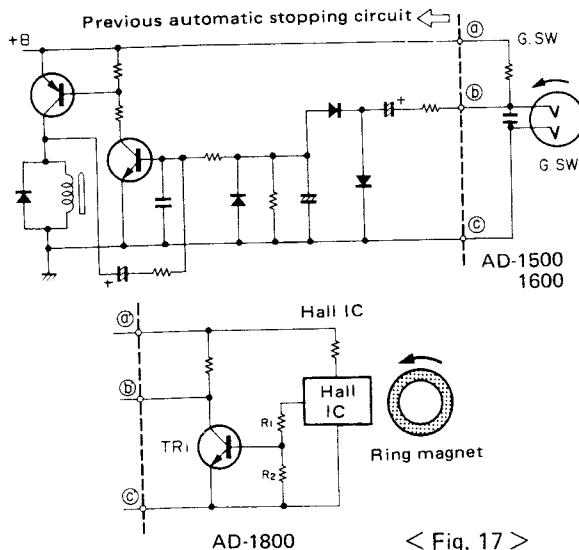

Input and output level distortion characteristics

< Fig. 16 >

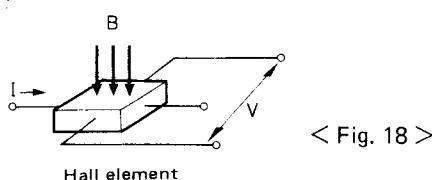

■ Hall IC Tape End Detector Circuit

In order to remedy the drawbacks (noise, life, maintenance, etc.) of earlier mechanical contact type tape end detectors (G. switch and reed switch), a magnet and Hall IC are employed in the AD-1800.

● Automatic Stopping Circuit Diagram

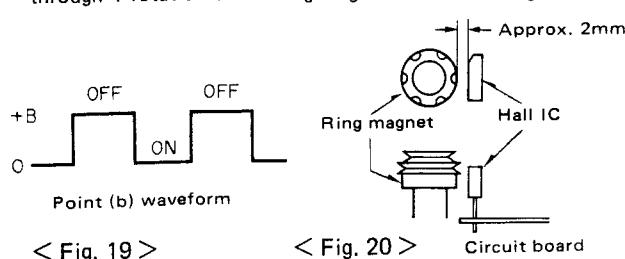

When a magnetic field is applied at right angles to the current flow in a Hall element, an emf (Hall voltage) becomes generated at right angles to the magnetic field and current flow. As the output of the Hall element is small (0.3V at $I = 20\text{mA}$, $B = 1000$ Gauss), the AD-1800 element is incorporated into an IC amplifier (more than 2.5V at $I_{cc} = 13.5\text{mA}$, $B = 350$ Gauss).

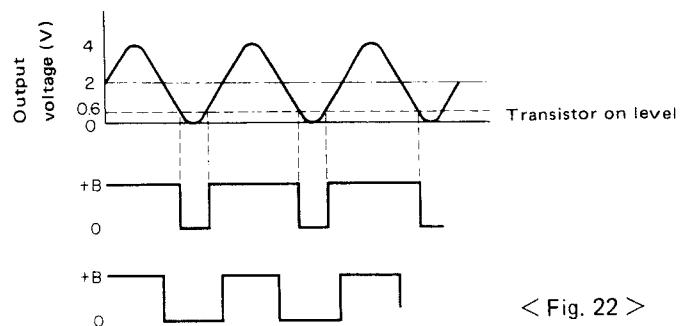

Hall element

● Operating Description

The waveform at point (b), shown in Fig. 19, pertains to previous automatic stopping circuits. An identical waveform can also be obtained from a ring magnet and Hall IC. Six magnetic poles are provided at the outer circumference of the ring magnet, producing more than 500 Gauss at 2mm from the outer circumference. The magnetic flux pattern through 1 rotation of the ring magnet is shown in Fig. 21.

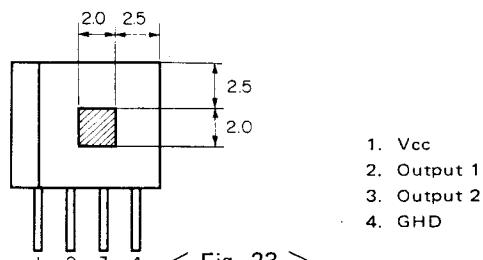

The flux variation through ring magnet rotation (coupled with counter pulley rotation) imparted to the Hall IC results in an output as shown in Fig. 22.

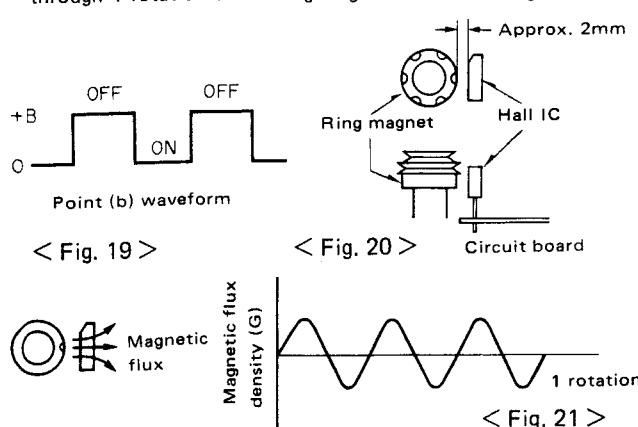

If this voltage were applied directly to TR1 base, the transistor on and off times would differ, since the voltage is 2V even with 0 magnetic flux. R1 and R2 perform dividing in order to equalize on and off times. TR1 collector output voltage waveform (at b) becomes the waveform applied to (b).

● Hall IC Handling Cautions

The Hall element is located within the IC as illustrated in Fig. 23. If the magnet position becomes disturbed, or its distance increased, the IC output declines. Caution is therefore needed.

Specified position is approximately 2mm from magnet.

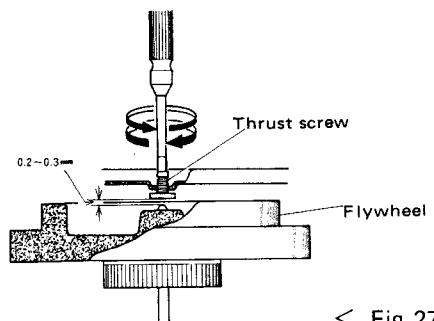

ADJUSTMENTS

Mechanical Section

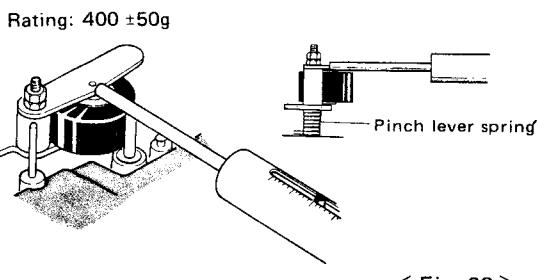

1. Thrust Adjustment

- Turn thrust screw to move flywheel assembly vertically to obtain 0.2~0.3mm thrust. (Refer to Fig. 27).

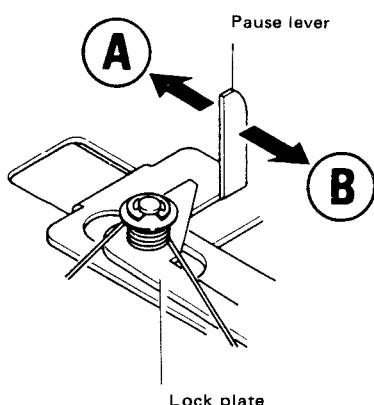

2. Pinch Pressure

- With set in play mode, apply 500g cylindrical tension gage to pinch lever center. Press slowly and measure pinch pressure when pinch roller separates from capstan. (Refer to Fig. 28).

3. Pause Timing

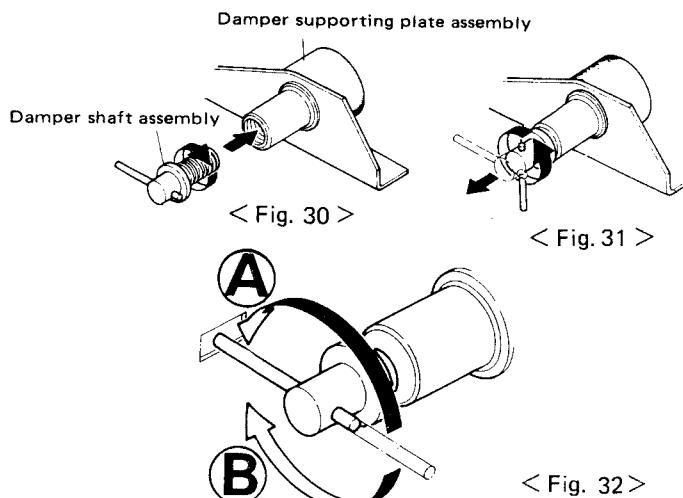

- Press FWD button for play mode, then slowly press pause button. Observe stopping times of take up reel hub and pinch roller rotations.
- If pinch roller quickly separates from capstan, while tape is running, adjust by bending pause lever in direction B.
- If pinch roller separation is delayed and tape winds onto pinch roller without take up reel hub rotation, adjust by bending pause lever in direction A. (Refer to Fig. 29).

4. Supporting Plate Assembly Adjustments

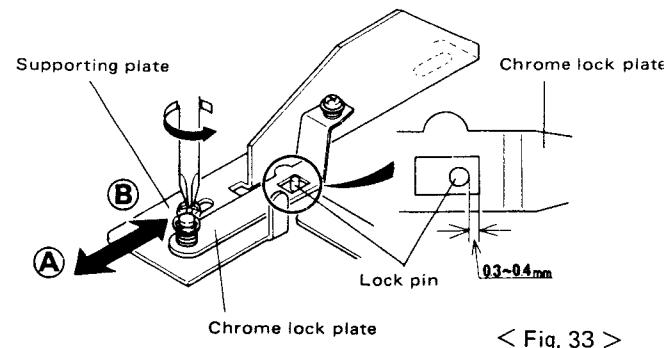

4-1 Damper Adjustments

- Screw damper shaft assembly fully into damper supporting plate assembly (Refer to Fig. 30).
- When damper shaft assembly is turned 2 rotations clockwise, observe that shaft pin becomes positioned toward square hole of supporting plate (Refer to Fig. 31).
- If shaft pin is in range A, turn counter-clockwise to adjust; if in range B turn clockwise (Refer to Fig. 32).

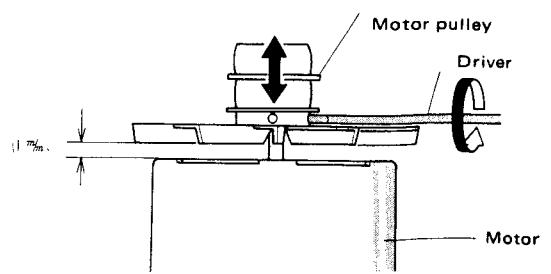

4-2 Supporting Plate Adjustment

- Lock pin of tape selector lever should engage with chrome lock plate when cassette elevating plate raises during eject. Loosen supporting plate screw and adjust by moving in A-B direction. Adjust so that lock pin spacing from right side of chrome plate square hole becomes 0.3~0.4mm (Refer to Fig. 33).

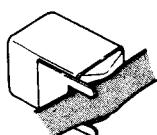

5. Motor Pulley Thrust

- Adjust by raising or lowering motor pulley so that space between pulley rim and motor becomes 1mm (Refer to Fig. 34).

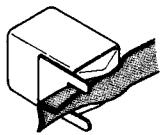

6. Tape Running

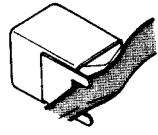

- 1) Adjust so that tape does not contact tape guide when running (Refer to Fig. 35).
- 2) If tape contacts upper portion of guide (Fig. 36), move adjusting nut in direction A (Refer to Fig. 38).
- 3) If tape contacts lower portion of guide (Fig. 37), move adjusting nut in direction B (Refer to Fig. 38).

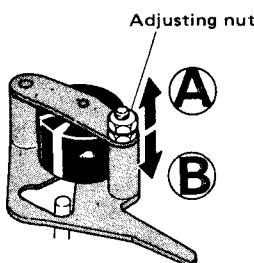

< Fig. 35 >

< Fig. 36 >

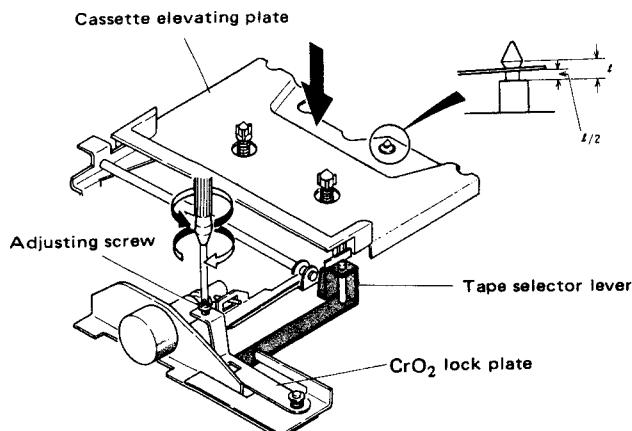

< Fig. 37 >

< Fig. 38 >

7. CrO₂ Lock Plate

- 1) Confirm that CrO₂ lock plate separates from tape selector lever when cassette elevating plate is in 1/2 range.
- 2) If it fails to separate, adjust by turning CrO₂ lock plate adjusting screw clockwise or counter-clockwise to obtain separation in the 1/2 range. Apply screw locking compound after adjusting. (Refer to Fig. 39)

< Fig. 39 >

8. Tape Speed

3kHz ±1%

Use a standard test tape, TTA-111A (3kHz) or equivalent.

9. Wow and Flutter

0.05% (WRMS) at PB

Use a standard test tape, TTA-11A (3kHz) or equivalent.

10. Take-up Torque

40 ~ 60g·cm

11. FF and Rewind Torque

90 ~ 160g·cm

12. FF and Rewind Time

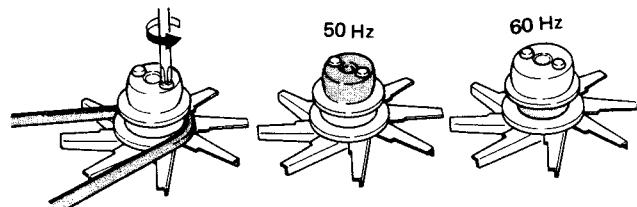

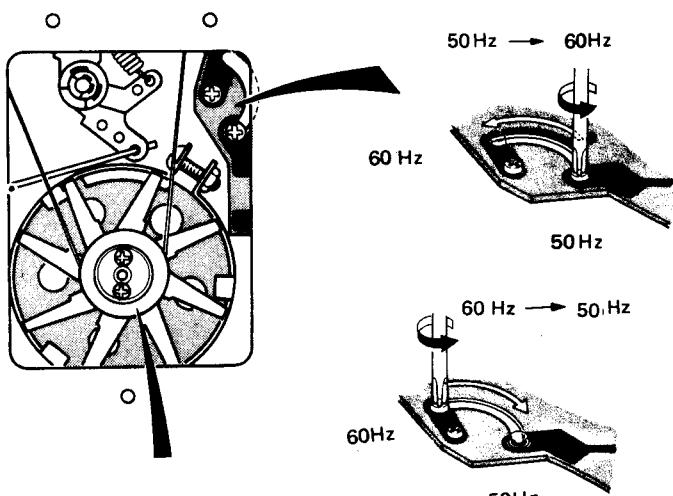

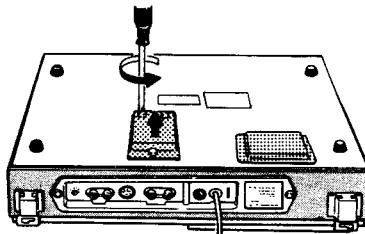

90 ±10 sec. (at C-60 cassette tape)

13. Automatic shut-off Time

4 ±1 sec.

CYCLE CONVERSION**Conversion Steps**

1. Observe that POWER switch is OFF and AC cord unplugged from power outlet.
 2. Turn the set upside down, take out 3 screws from the motor cover, and remove the motor cover.
 3. Disengage belt from motor pulley and temporarily position it on the motor fan securing screw.
 4. Take out 2 motor pulley setscrews and remove motor pulley.
 5. Turn motor pulley upside down and reinstall it with setscrews.
 6. Engage belt on lower portion of motor pulley.
 7. Install motor cover.
- The thicker side of the motor pulley upward is for 60 Hz operation, while for 50 Hz operation, the thinner side of the pulley should be upward.

ADJUSTMENTS

ELECTRICAL SECTION

- Preparations for Adjustment

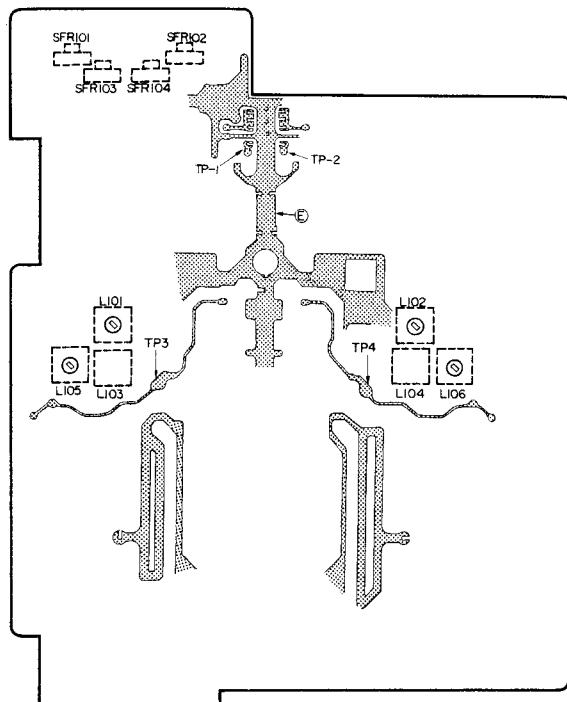

- Required Equipment

- Low frequency oscillator (signal generator)
- Variable resistance attenuator
- VTVM
- Oscilloscope
- Resistors: 600Ω , $100k\Omega$, $27k\Omega$, $5.6k\Omega$
- Test tapes: TTA-117E/TTA-161/TTA-119D (CrO_2)/TTA-119E (FeCr)/TTA-119A (LH)

- Adjustment Cautions

- Before adjusting, clean heads, capstan and pinch roller with gauze moistened in alcohol.
- Demagnetize record/play head with head eraser.
- Thoroughly demagnetize adjusting driver.
- Set playback volume to maximum.
- Except where otherwise indicated, set DOLBY-NR and DNL switches to OFF, employ MIC jacks for input and LINE OUT for output.
- Standard inputs ($0\text{dB} = 0.775\text{V}$)
 - MIC Jack: 65dB
 - LINE-IN: 20dB
- Connect $100k\Omega$ load resistor to LINE-OUT.

- Main Component Locations

PLAYBACK ADJUSTMENTS

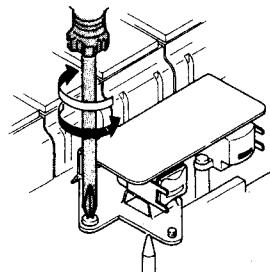

- Azimuth

TAPE SELECTOR: CrO_2

Play 10kHz portion of test tape TTA-117E (CrO_2) and turn azimuth adjusting screw to obtain maximum output from left and right channels.

Do not rotate screw more than $1/4$ turn.

After adjusting, apply locking compound to screw.

- Playback Frequency Response

TAPE SELECTOR: CrO_2

Play test tape TTA-117E (CrO_2) and adjust high frequency trimmer resistor SFR101 for equal outputs at 1kHz and 10kHz . In the same manner, adjust SFR102 for the right channel.

Rating: $1\text{kHz} \sim 10\text{kHz}$ flat

- Level Meters

With set in record mode, apply $400\text{Hz} \pm 25\text{dB}$ signal. Adjust LINE IN volume for 580mV output from TP-3.

Adjust meter trimmer resistor SFR201 so that level meter indicates the Dolby mark. In the same manner, measure TP-4 and adjust SFR202 for the right channel.

- Playback Level

TAPE SELECTOR: LH

Play test tape TTA-161 and adjust playback output trimmer resistor SFR103 so that level meter indicates the Dolby mark. In the same manner, adjust SFR104 for the right channel.

RECORDING ADJUSTMENTS

- Bias Trap Coil

TAPE SELECTOR: CrO_2

With set in recording mode, adjust trap coil L107 for minimum voltage at test point TP-5. In the same manner, measure TP-6 and adjust L108 for the right channel.

- Dolby Trap Coil

TAPE SELECTOR: CrO_2

With set in recording mode, adjust Dolby trap coil L101 for minimum bias leakage to LINE OUT. In the same manner, adjust L102 for the right channel.

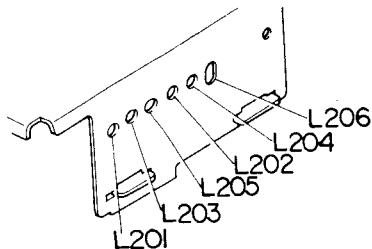

- Bias Current

TAPE SELECTOR: CrO_2

With set in recording mode, adjust bias current trimmer TC701 for 2mV ($200\mu\text{A}$) voltage at test point TP-1. In the same manner, measure TP-2 and adjust TC202 for the right channel.

Rating: 2mV ($200\mu\text{A}$)

4. Record/Playback Frequency Response

1) CrO₂TAPE SELECTOR: CrO₂

Test Tape: TTA-119D

Apply 500Hz (-25dB) signal via LINE IN jack and adjust line volume for 77.5mV output at LINE OUT. Record 500Hz and 5kHz signals on test tape TTA-119D and play back. Confirm that the 1kHz level is within ±0.5dB in respect to the 500Hz level.

If the 5kHz level is higher, set the bias current higher than 2mV.

If the 5kHz level is lower, set the bias current lower than 2mV.

Perform adjustment in the same manner as described in Step 3 Bias Current adjustment.

Record and play back 500Hz, 5kHz, 10kHz and 15kHz signals. Adjust CrO₂ hi peaking coil L201 so that with respect to the 500Hz signal, 5kHz and 10kHz become within ±0.5dB and 15kHz within ±1dB. In the same manner, adjust L202 for the right channel.

2) Fe-Cr

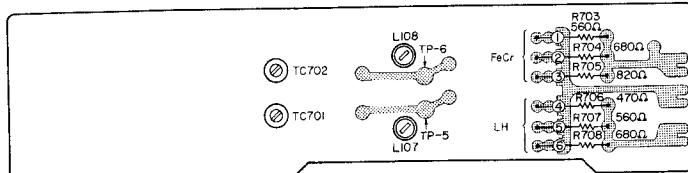

Test Tape: TTA-119E

TAPE SELECTOR: Fe-Cr

Record and play back with TTA-119E test tape as described for CrO₂ in step 1. If results are not within ratings, adjust as follows.

Playback Level (1kHz ref.)	Connection	Bias Voltage
5kHz level higher	(1)	Increases
5kHz level lower	(3)	Decreases

Short one of the circuit patterns among 1~3.

Record and play back 500Hz, 10kHz and 15kHz signals. Adjust FeCr hi peaking coil L203 so that with reference to the 500Hz level, 10kHz becomes within ±0.5dB and 15kHz within ±1dB. In the same manner, adjust L204 for the right channel.

3) LH-NORMAL

Test Tape: TTA-119A

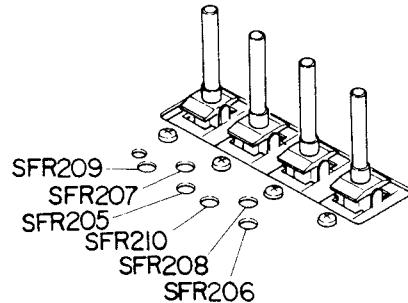

TAPE SELECTOR: LH-NORMAL

Record and play back with TTA-119A test tape as described for CrO₂ in step 1. If results are not within ratings, adjust as follows.

Playback Level (1kHz ref.)	Connection	Bias Voltage
5kHz level higher	(4)	Increases
5kHz level lower	(6)	Decreases

Record and play back 500Hz and 10kHz signals. Adjust LH hi peaking coil L205 so that with reference to the 500Hz level, 10kHz becomes within -1.5 +1dB. In the same manner, adjust L206 for the right channel.

5. Record/Playback Level

1) CrO₂

Test Tape: TTA-119D

TAPE SELECTOR: CrO₂

With set in recording mode, apply 2kHz 77.5mV signal. Record and play back this signal on TTA-119D test tape. Adjust CrO₂ recording current trimmer resistor SFR205 so that playback level becomes 77.5mV ±0.25dB. In the same manner, adjust SFR206 for the right channel.

2) Fe-Cr

Test Tape: TTA-119E

TAPE SELECTOR: Fe-Cr

Employ TTA-119E test tape and perform the same operation as for CrO₂ above. Adjust SFR207 for the left channel, and SFR208 for the right channel.

3) LH-NORMAL

Test Tape: TTA-119A

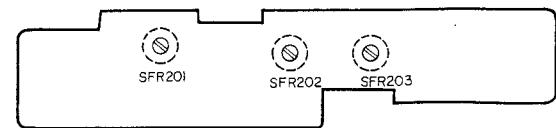

TAPE SELECTOR: LH-NORMAL

Employ TTA-119A test tape and perform the same operation as for CrO₂. Adjust SFR209 for the left channel, and SFR210 for the right channel.

6. Peak Indicator

With set in record mode, apply 1kHz -27dB signal. Adjust LINE IN volume for OVU indication on level meter. Set attenuator to -21dB (level meter indicates +6dB) and turn the peak indicator trimmer resistor SFR203 to the point where the red peak indicator just extinguishes. Next set attenuator to -20dB and confirm that red indicator lights. Vary attenuator in the -24dB area and read the value at the point where yellow indicator just extinguishes.

Rating: -25dB ±1.5dB

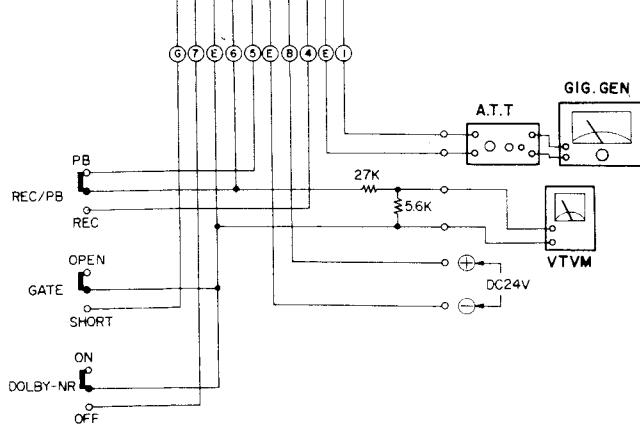

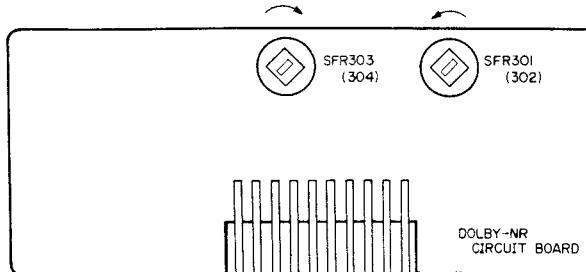

7. MPX Filter

With set in record mode, apply 19kHz signal to LINE IN. Adjust LINE IN volume for 0.77V at LINE OUT. With MPX filter switch of Dolby NR ON, adjust MPX filter coil L105 so that 19kHz signal becomes less than -30dB. In the same manner, adjust L106 for the right channel.

DOLBY NR ADJUSTMENTS

• Main Component Locations and Connections

- 1) Remove Dolby NR circuit board from set and connect as shown in drawing.
- 2) Turn SFR301 (302) and SFR303 (304) fully in the directions shown by arrows.
- 3) Position switches as follows.
REC/PB: PB
GATE: OPEN
DOLBY-NR: OFF
- 4) Apply 400Hz signal and adjust attenuator so that output becomes 7.6mV, then read attenuator value.
Rating: $-49\text{dB} \pm 1\text{dB}$
- 5) Set REC/PB switch to REC and confirm output level difference of $\pm 0.25\text{dB}$. Next at frequencies of 100Hz, 1kHz and 10kHz, confirm an output level difference of $\pm 1\text{dB}$.
- 6) Position switches as follows.
REC/PB: PB
GATE: SHORT
DOLBY-NR: OFF
- 7) Apply 5kHz signal and adjust attenuator so that output becomes 7.6mV, then read attenuator value.
Rating: $-49 \pm 1\text{dB}$
Next set DOLBY-NR switch to ON and adjust SFR303 (304) for 2.4mV output.
- 8) At the above (step 7) condition, set GATE switch to OPEN and adjust SFR301 (302) for 3mV output.
- 9) After adjusting, apply locking compound to trimmer resistors.

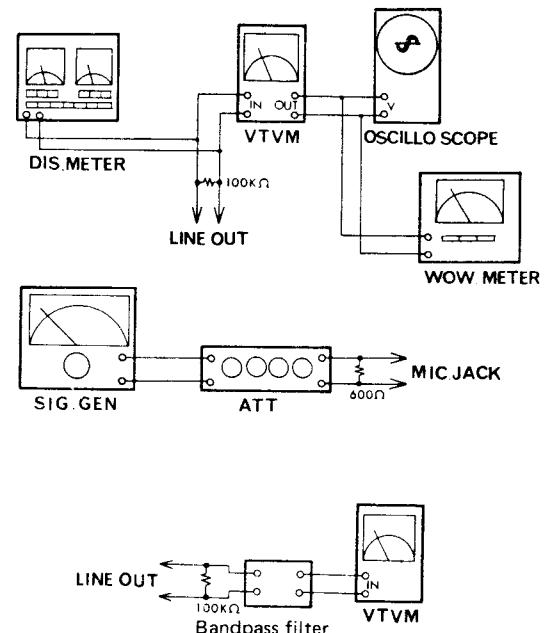

ELECTRICAL MEASUREMENTS

PREPARATIONS FOR MEASURING

1. Required Equipment

- Low frequency oscillator
- Variable resistance attenuator
- Oscilloscope
- 600Ω and $100\text{k}\Omega$ resistors
- Distortion meter
- Wow meter
- 1kHz bandpass filter
- Test tapes: TTA-116/TTA-114/TTA-119D (CrO_2)/TTA-119E (Fe-Cr)/TTA-119A (LH)

2. Connection

3. Measuring Cautions

- 1) Before measuring, demagnetize rec/play and erase heads with head eraser and clean heads with gauze moistened in alcohol.
- 2) Set playback volume to maximum.
- 3) Standard inputs (0dB = 0.775V)
MIC jack 65dB
LINE-IN 20dB
- 4) Connect $100\text{k}\Omega$ load resistor to LINE OUT.

1. Playback Output

Play test tape TTA-161 and measure output level.
Rating: $1.03\text{V} \pm 0.5\text{dB}$

2. Recording/Playback Distortion

Apply 400Hz signal via MIC jack and adjust attenuator for OVU indication on set VU meter. Record this signal on test tape and measure playback distortion.

Ratings:

Test Tape	TAPE SELECTOR	Distortion
TTA-119D (CrO_2 tape)	CrO_2	Less than 2.5%
TTA-119E (Fe-Cr tape)	Fe-Cr	Less than 1.0%
TTA-119A (LH tape)	LH-NORMAL	Less than 1.5%

3. Recording/Playback Frequency Response

Apply 1kHz signal via MIC jack and adjust attenuator for 75mV at LINE OUT. Read the input level. On test tape record 60Hz, 100Hz, 1kHz, 10kHz, and 15kHz signals in sequence and play back. With 1kHz level as reference, measure each frequency level deviation.

Ratings:

Frequency	Test Tape TTA-119D TAPE SELECTOR CrO_2	Test Tape TTA-119E TAPE SELECTOR Fe-Cr	Test Tape TTA-119A TAPE SELECTOR LH-NORMAL
60Hz	+2 dB -3	+2 dB -3	+2 dB -3
100Hz	± 1 dB	± 1 dB	± 1 dB
1kHz	0 dB	0 dB	.0 dB
10kHz	± 1 dB	± 1 dB	± 1 dB
15kHz	+1 dB -3	+1 dB -3	-
12.5kHz	-	-	+1 dB -3

For LH-NORMAL, measure at 12.5kHz instead of 15kHz.

4. Recording/Playback S/N

Apply 400Hz signal via MIC jack and adjust attenuator for OVU indication on set VU meter. Short input and record with no signal. Play back and measure ratio between signal and no-signal portions.

Ratings:

TEST TAPE	TAPE SELECTOR	DOLBY-NR OFF S/N (dB)	DOLBY-NR ON S/N (dB)
TTA-119D (CrO_2)	CrO_2	-45	-49
TTA-119E (Fe-Cr)	Fe-Cr	-40	-49
TTA-119A (LH)	LH-NORMAL	-43	-48

5. Erase Efficiency

TAPE SELECTOR: CrO_2

Apply 1kHz signal via MIC jack and adjust attenuator for OVU indication on set VU meter. On test tape TTA-119D, record signal decreased by +10dB of this attenuation value. Rewind half the recorded portion, set recording volume to minimum and erase. Play back tape and measure signal and erased portion levels. Measure playback level through a 1kHz bandpass filter.

Rating: -65dB

6. Channel Separation

TAPE SELECTOR: LH-NORMAL

Apply 1kHz signal via right channel MIC jack and adjust attenuator for OVU indication on set VU meter. Record and play back with TTA-119A test tape. Measure left channel leakage level with respect to the right channel output level. Measure playback level through 1kHz bandpass filter.

Rating: More than 30dB

7. Crosstalk

TAPE SELECTOR: LH-NORMAL

Turn tape over and measure right channel leakage level with respect to right channel output level of signal recorded for channel separation measurement (step 6 above). Employ bandpass filter.

Rating: More than 60dB

8. Dolby NR Effectiveness

TAPE SELECTOR: LH-NORMAL

Play test tape TTA-114 and measure DOLBY NR switch ON level difference with respect to DOLBY NR switch OFF level.

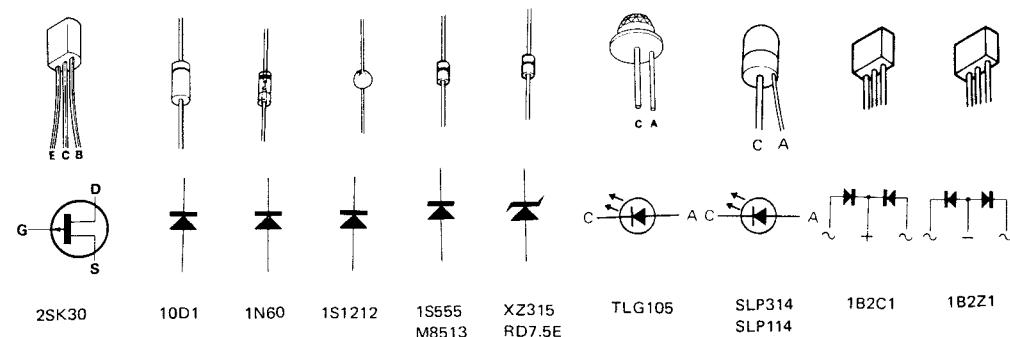

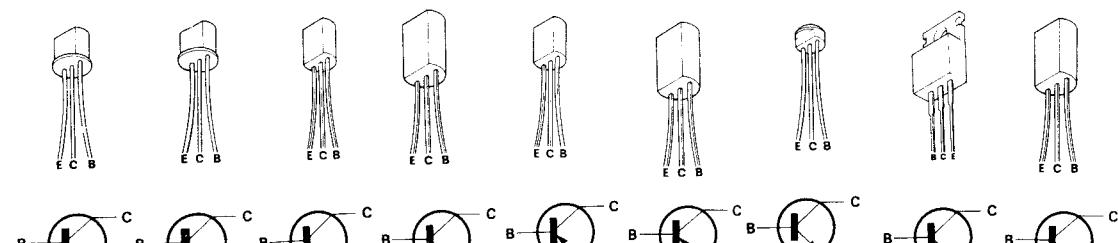

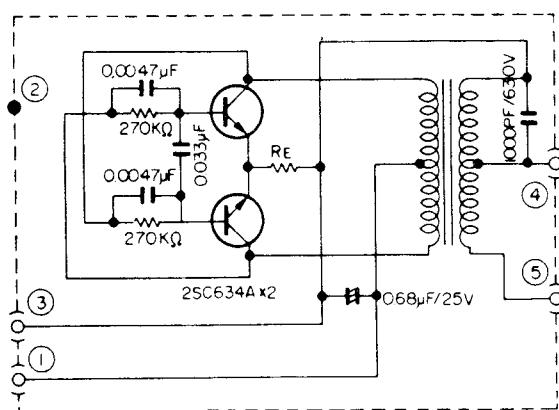

Rating: -4 ± 1 dB

9. DNL Effectiveness

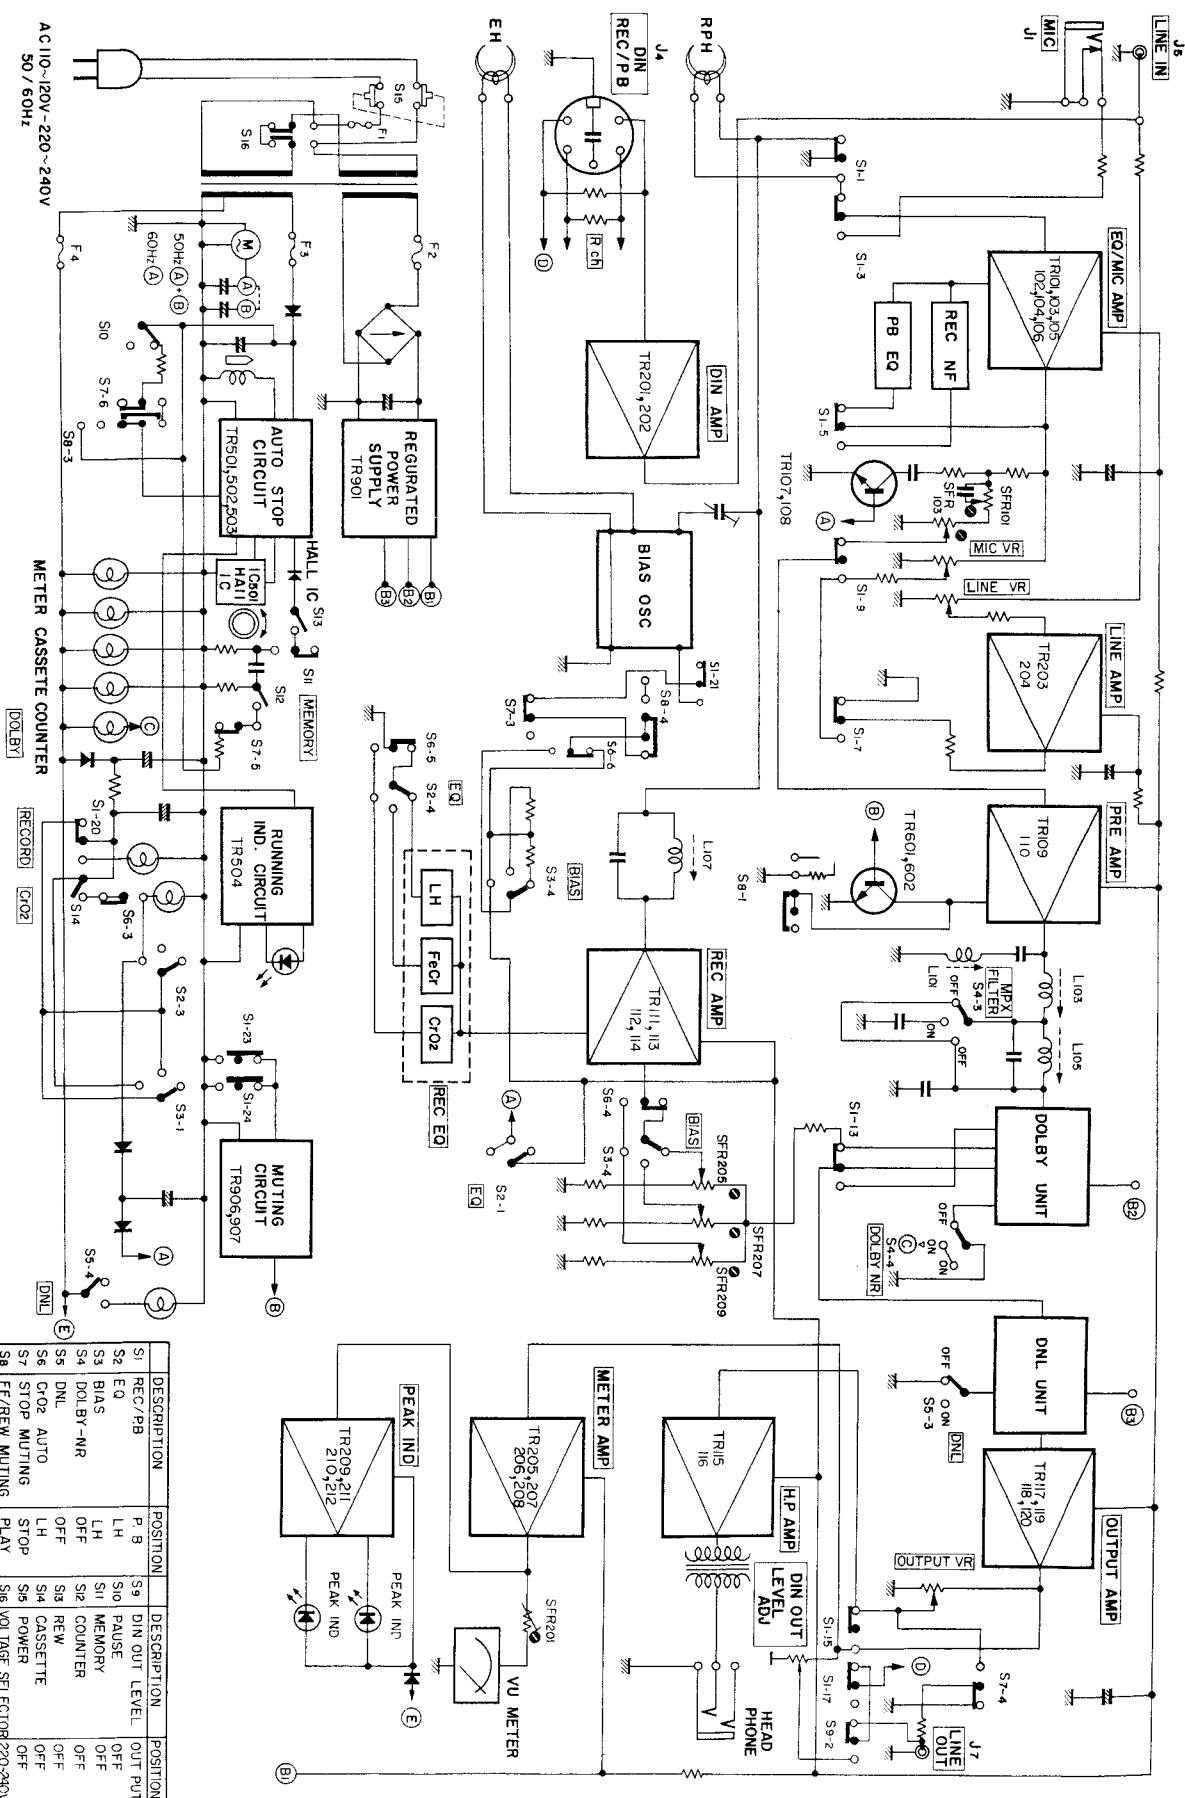

Install test tape and set for playback mode, then set for pause. Measure noise level difference with DNL switch ON in respect to noise level with DNL switch OFF.

Rating: More than 3dB
