SAFETY NOTICE

ANY PERSON ATTEMPTING TO SERVICE THIS CHASSIS MUST FAMILIARIZE HIMSELF WITH THE CHASSIS AND BE AWARE OF THE NECESSARY SAFETY PRECAUTIONS TO BE USED WHEN SERVICING ELECTRONIC EQUIPMENT CONTAINING HIGH VOLTAGES.

Subject to modification

CAUTION: USE A SEPARATE ISOLATION TRANSFORMER FOR THIS UNIT WHEN SERVICING.

TELEVISION/MONITOR SAFETY GUIDELINES FOR THE PROFESSIONAL SERVICE TECHNICIAN

Safety Checks

After the original service problem has been corrected, a complete safety check should be made. Be sure to check over the entire set, not just the areas where you have worked. Some previous servicer may have left an unsafe condition, which could be unknowingly passed on to your customer. Be sure to check all of the following:

Fire and Shock Hazard

- Be sure all components are positioned in such a way as to avoid the possibility of adjacent component shorts. This is especially important on those chassis which are transported to and from the service shop.
- 2. Never release a repaired unit unless all protective devices such as insulators, barries, covers, strain reliefs, and other hardware have been installed in accordance with the original design.
- Soldering and wiring must be inspected to locate possible cold solder joints, solder splashes, sharp solder points, frayed leads, pinched leads, or damaged insulation (including the ac cord). Be certain to remove loose solder balls and all other loose foreign particles.
- Check across-the-line components and other components for physical evidence of damage or deterioration and replace if necessary. Follow original layout, lead length, and dress.
- No lead or component should touch a receiving tube or a resistor rated at 1 watt or more. Lead tension around protruding metal surfaces or edges must be avoided.
- 6. Critical components having special safety characteristics are identified with ans by the Ref. No. in the parts list and enclosed within a broken line * (where several critical components are grouped in one area) along with the safety symbols on the schematic diagrams and/or exploded views.
- When servicing any unit, always use a separate isolation transformer for the chassis Failure to use a separate isolation transformer may expose you to possible shock hazard, and may cause damage to servicing instruments.
- Many electronic products use a polarized ac line cord (one wide pin on the plug.) Defeating this safety feature may create a potential hazard to the service and the user. Extension cords which do not incorporate the polarizing feature should never be used.
- 9. After reassembly of the unit, always perform an leakage test or resistance test from the line cord to all exposed metal parts of the cabinet. Also check all metal control shafts(with knobs removed), antenna terminals, handles, screws, etc. to be sure the unit may be safety operated without danger of electrical shock.

* Broken line

Implosion

- All picture tubes used in current model receivers are equipped with an integral implosion system. Care should always be used, and safety glasses worn, whenever handling any picture tube. Avoid scratching or otherwise damaging the picture tube during installation.
- 2. Use only replacement tubes specified by the manufacturer.

X-radiation

- Be sure procedures and instructions to all your service personnel cover the subject of X-radiation. Potential sources of X-rays in TV receivers are the picture tube and the high voltage circuits. The basic precaution which must be exercised is to keep the high voltage at the factory recommended level.
- 2. To avoid possible exposure to X-radiation and electrical shock, only the manufacturer's specified anode connectors must be used.
- 3. It is essential that the service technician has an accurate HV meter available at all times. The calibration of this meter should be checked periodically against a reference standard.
- 4. When the HV circuitry is operating properly there is no possibility of an x-radiation problem. High voltage should always be kept at the manufacturer's rated value-no higher for optimum performance. Every time a color set is serviced, the brightness should be run up and down while monitoring the HV with a meter to be certain that the HV is regulated correctly and does not exceed the specified value. We suggest that you and your technicians review test procedures so that HV and HV regulation are always checked as a standard servicing procedure, and the reason for this prudent routine is clearly understood by everyone. It is important to use an accurate and reliable HV meter. It is recommended that the HV recorded on each customer's invoice, which will demonstrate a proper concern for the customer's safety.
- 5. When troubleshooting and making test measurements in a receiver with a problem of excessive high voltage, reduce the line voltage by means of a Variac to bring the HV into acceptable limits while troubleshooting. Do not operate the chassis longer than necessary to locate the cause of the excessive HV.

- 6. New picture tubes are specifically designed to withstand higher operating voltages without creating undesirable X-radiation. It is strongly recommended that any shop test fixture which is to be used with the new higher voltage chassis be equipped with one of the new type tubes designed for this service. Addition of a permanently connected HV meter to the shop test fixture is advisable. The CRT types used in these new sets should never be replaced with any other types, as this may result in excessive X-radiation.
- It is essential to use the specified picture tube to avoid a possible X-diation problem.
- Most TV receivers contain some type of emergency "Hold Down" circuit to prevent HV from rising to excessive levels in the presence of a failure mode. These various circuits should be understood by all technicians servicing them, especially since many hold down circuits are inoperative as long as the receiver performs normally.

Leakage Current Cold Check

- 1. Unplug the ac line cord and connect a jumper between the two prongs of the plug.
- 2. Turn on the power switch.
- 3. Measure the resistance value between the jumpered ac plug and all exposed cabinet parts of the receiver, such as screw heads, antennas, and control shafts. When the exposed metallic part has a return path to the chassis, the reading should be between 1 megohm and 5.2 megohms. When the exposed metal does not have a return path to the chassis, the reading must be infinity. Remove the jumper from the ac line cord.

Leakage Current Hot Check

- 1. Do not use an isolation transformer for this test. Plug the completely reassembled receiver directly into the ac outlet.
- 2. Connect a 1.5k, 10w resistor paralleled by a 0.15uf. capacitor between each exposed metallic cabinet part and a good earth ground such as a water pipe, as shown above.
- 3. Use an ac voltmeter with at least 5000 ohms volt sensitivity to measure the potential across the resistor.
- 4. The potential at any point should not exceed 0.75 volts. A leakage current tester may be used to make this test; leakage current must not exceed 0.5 milliamps. If a measurement is outside of the specified limits, there is a possibility of shock hazard. The receiver should be repaired and rechecked before returning it to the customer.
- Repeat the above procedure with the ac plug reversed. (Note: An ac adapter is necessary when a polarized plug is used. Do not defeat the polarizing feature of the plug.)

Picture Tube Replacement

The primary source of X-radiation in this television receiver is the picture tube. The picture tube utilized in this chassis is specially constructed to limit X-radiation emissions. For continued X-radiation protection, the replacement tube must be the same type as the original, including suffix letter, or a Philips approved type.

Parts Replacement

Many electrical and mechanical parts in Philips television sets have special safety related characteristics. These characteristics are often not evident from visual inspection nor can the protection afforded by them necessarily be obtained by using replacement components rated for higher voltage, wattage, etc. The use of a substitute part which does not have the same safety characteristics as the Philips recommended replacement part shown in this service manual may create shock, fire, or other hazards

WARNING : Before removing the CRT anode cap, turn the unit **OFF** and short the HIGH VOLTAGE to the CRT DAG ground. **SERVICE NOTE** : The CRT DAG is not at chassis ground.

Go to cover page

Proper service and repair is important to the safe, reliable operation of all PHILIPS Company** Equipment. The service procedures recommended by PHILIPS and described in this service manual are effective methods of performing service operations. Some of these service operations require the use of tools specially designed for the purpose. The special tools should be used when and as recommended.

It is important to note that this manual contains various CAUTIONS and NOTICES which should be carefully Read in order to minimize the risk of personal injury to service personnel. The possibility exists that improper Service methods may damage the equipment. It also is important to understand that these CAUTIONS and NOTICES ARE NOT EXHAUSTIVE. PHILIPS could not possibly know, evaluate and advise the service trade of all conceivable ways in which service might be done or of the possible hazardous consequences of each way. Consequently, PHILIPS has not undertaken any such broad evaluation. Accordingly, a servicer who uses a service procedure or tool which is not recommended by PHILIPS must first satisfy himself thoroughly that neither his safety nor the safe operation of the equipment will be jeopardized by the service method selected.

* * Hereafter throughout this manual, PHILIPS Company Will be referred to as PHILIPS.

WARNING

Critical components having special safety characteristics are identified with a \mathbf{A} by the Ref. No. in the parts list and enclosed within a broken line* (where several critical components are grouped in one area) along with the safety symbol \mathbf{A} on the schematics or exploded views.

Use of substitute replacement parts which do not have the same specified safety characteristics may create shock, fire, or other hazards.

Under no circumstances should the original design be modified or altered without written permission from PHILIPS. PHILIPS assumes no liability, express or implied, arising out of any unauthorized modification of design.

Servicer assumes all liability.

* Broken Line **- - - - - - - - -**

FOR PRODUCTS CONTAINING LASER :

- DANGER- Invisible laser radiation when open. AVOID DIRECT EXPOSURE TO BEAM.
- **CAUTION-** Use of controls or adjustments or performance of procedures other than those specified herein may result in hazardous radiation exposure.
- **CAUTION-** The use of optical instruments with this product will increase eye hazard.

TO ENSURE THE CONTINUED RELIABILITY OF THIS PRODUCT, USE ONLY ORIGINAL MANUFACTURER'S REPLACEMENT PARTS, WHICH ARE LISTED WITH THEIR PART NUMBERS IN THE PARTS LIST SECTION OF THIS SERVICE MANUAL.

Description of the On Screen Display

What is the On-Screen Display?

This is a feature in all Philips monitors which allows an end-user to adjust screen performance of monitors directly though an on-screen instruction window. The user interface provides user-friendliness and ease-of-use when operating the monitor.

Basic and simple instruction on the control keys.

On the front controls of your monitor, once you press the 🙆 button, the On Screen Display (OSD) Main Controls window will pop up and you can now start making adjustments to your monitor's various features. Use the 🔍 🕑 or 🍊 💌 the keys to make your adjustments within.

The OSD Controls

BRIGHTNESS

To adjust your screen's brightness, follow the steps below. Brightness is the overall intensity of the light coming from the screen. A 50% brightness is recommended.

1) Press the
 or
 button on the monitor. The BRIGHTNESS window appears.

2) Press the • or • button to adjust the brightness.

3) When the brightness is adjusted to the level desired, stop pressing the s or • button and after three seconds the BRIGHTNESS window will disappear with the new adjustment saved.

Smart Help After the BRIGHTNESS window has disappeared, to continue to the CONTRAST window, follow the steps under CONTRAST.

CONTRAST

To adjust your screen's contrast, follow the steps bellow. Contrast is the difference between the light and dark areas on the screen. A 100% contrast is recommended.

1) Press the extbf or extbf on the monitor. The CONTRAST window appears.

2) Press the @ or • button to adjust the contrast.

3) When the contrast is adjusted to the level desired, stop pressing the
or • button and after three seconds the CONTRAST window will disappear with the new adjustment saved.

Smart Help After the CONTRAST window has disappeared, to continue to the MAIN CONTROLS, follow the steps under LANGUAGE

LANGUAGE

The ON SCREEN DISPLAY shows its settings in one of five languages. The default is English, but you can select French, Spanish, German, or Italian.

1) Press the 🥮 button on the monitor. The MAIN CONTROLS window appears. LANGUAGE should be highlighted.

2) Press the 10 button again. The LANGUAGE window appears.

Monitor Specific Troubleshooting Self-Test Feature Check (STFC)

Your monitor provides a self-test feature that allows you to check whether your monitor is functioning properly. If your monitor and computer are properly connected but the monitor screen remains dark, run the monitor self-test by performing the following steps:

- 1. Turn off both your computer and the monitor.
- 2. Unplug the video cable from the back of the computer.
- 3. Turn on the monitor.

If the monitor is functioning properly, you will see a OSD message as shown in the following illustration:

This box also appears during normal system operation if the video cable becomes disconnected or damaged. This box will remain on for one minute, go off five seconds, then on for one minute, and will repeat cycle.

- 1. Turn off your monitor and reconnect the video cable; then turn on both your computer and the monitor.
- 2. While in self-test mode, the LED remains green and the pattern remains on and stationary.

If your monitor screen still remains dark after you use the previous procedure, check your video controller and computer system; your monitor is functioning properly.

NO SIGNAL INPUT

If there is something wrong with the input signal, a message appears on the screen although the power indicator LED is still on. The message may indicate that the monitor is NO SIGNAL INPUT or that you need to check the signal cable.

Warning and Notes

Go to cover page

Warnings

- Safety regulations require that the unit should be returned in its original condition and that components identical to the original components are used. The safety components are indicated by the symbol
- In order to prevent damage to ICs and transistors, all high-voltage flash-overs must be avoided. In order to prevent damage to the picture tube, the method shown in Fig. 1 should be used to discharge the picture tube. Use a high-voltage probe and a multimeter (position DC-V). Discharge until the meter reading is 0 V (after approximately 30 seconds).

3. ESD 📥

All ICs and many other semiconductors are sensitive to electrostatic discharges (ESD). Careless handling during repair can drastically shorten their life. Make sure that during repair you are connected by a pulse band with resistance to the same potential as the ground of the unit. Keep components and tools also at this same potential.

- 4. When repairing a unit, always connect it to the AC Power voltage via an isolating transformer.
- 5. Be careful when taking measurements in the high-voltage section and on the picture tube panel.
- 6. It is recommended that saferty goggles be worn when replacing the picture tube.
- 7. When making adjustments, use plastic rather than metal tools. This will prevent any short-circuit or the danger of a circuit becoming unstable.
- 8. Never replace modules or other components while the unit is switched on.
- **9**. Together with the defleciton unit, the picture tube is used as an integrated unit. Adjustment of this unit during repair is not recommended.
- **10.** After repair, the wiring should be fastened in place with the cable clamps.
- **11.** All units that are returned for service or repair must pass the original manufactures safety tests.

Notes

- 1. The direct voltages and waveforms are average voltages. They have been measured using the Service test software and under the following conditions :
 - Mode : 640 * 480 (31.5kHz / 60Hz)
 - Signal pattern : grey scale
 - Adjust brightness and contrast control for the mechanical mid-position (click position)
- 2. The picture tube panel has printed spark gaps. Each spark gap is connected between an electrode of the picture tube and the Aquadag coating.
- 3. The semiconductors indicated in the circuit diagram(s) and in the parts lists are completely interchangeable per position with the semiconductors in the unit, irrespective of the type indication on these semiconductors.

Fig.1

Mechanical Instructions

0. General

To be able to perform measurements and repairs on the "circuit boards", these unit should placed in the service position first. **1.Remove the rear cover**

-Remove right and left lib (screw cover) on the back cover as shown in Fig. 1.

-Remove 4 screws as shown in Fig. 2.

-Remove back cover as shown in Fig. 3.

2. Remove pedestal as shown in Fig. 4.

3. Video panel

- Disconnect the wire between metal shield of Video panel and CRT neck as shown in Fig. 5.
- Disconnect the CRT ground "1703" from Video panel.

1. General

DDC Data Re-programming

In case the main EEPROM with Software DDC which store all factory settings were replaced because a defect, repaired monitor the serial numbers have to be re-programmed.

It is advised to re-soldered the main EEPROM with Software DDC from the old board onto the new board if circuit board have been replaced, in this case the DDC data does not need to be re-programmed.

Additional information

Additional information about DDC (Display Data Channel) may be obtained from Video Electronics Standards Association (VESA). Extended Display Identification Data(EDID) information may be also obtained from VESA.

DDC EDID structure For the monitor

Fig. 2 Alignment Kits

DDC Instructions (Continued)

4. Configuration and procedure

There is no Hardware DDC (DDC IC) anymore. Main EEPROM stores all factory settings and DDC data (EDID code) which is so called Software DDC. The following section describes the connection and procedure for Software DDC application. The main EEPROM can be reprobrammed by enabling "factory memory data write" function on the DDC program (EDID301.EXE).

*** INITIALIZE ALIGNMENT BOX ***

In order to avoid that monitor entering power saving mode due to sync will cut off by alignment box, it is necessary to initialize alignment box before re-programming DDC Data. Following steps show you the procedures and connection.

- Step 1: Supply 8~12V DC power source to the Alignment box by plugging a DC power cord or using batteries.
- Step 2: Connecting printer cable and video cable of monitor as shown in Fig.3.

Step 3: Installation of EDID301.EXE

Method 1: Start on DDC program

Start Microsoft Windows.

- 1. Insert the disk containing EDID301.EXE program into floppy disk drive._____
- 2. Click **Start**, choose Run at start menu of Windows 95/98 as shown in Fig. 4.

3. At the submenu, type the letter of your computer's floppy disk drive followed by :EDID301 (for example, A:\EDID301, as shown in Fig. 5).

4. Click **OK** button. The main menu appears (as shown in Fig. 6). **This is for initialize alignment box.**

- 1. The data structure of EDID was incorrect.
- 2. DDC IC that you are trying to load data is empty.
- 3. Wrong communication channel has set at configuration setup windows.
- 4. Cables loosed or poor contact of connection.

DDC Instructions (Continued)

Go to cover page

Re-programming EEPROM (Software DDC) Step 1: After initialize alignment box, connecting all cables and

box as shown in Fig. 10

Step 2: Read DDC data from monitor

- 1-1 Click the left key of Mouse, or hit any key on the keyboard, then the characters disappear from the screen.
- 1-2 Click 2 icon as shown if Fig. 11 from the tool bar to bring up the "Configuration Setup" windows as shown in Fig. 12.

 Select the DDC2B as the communication channel. Select "Enable" & fill out "F0" for Mapped EDID page address as shown in Fig. 12.

Configuration Setup	×	
DDC communication channel DDC2B AOC command (107E) AOC command (104E, 105E)	OK Cancel	Fig. 12
Factory memory data write ✓ Enable (Monitor must be enter factory mode) Mapped EDID page address (Hex.) F0		
Software DDC		

3. Click OK button to confirm your selection.

 Click icon (Read EDID function) to read DDC EDID data from monitor. The EDID codes will display on screen as shown in Fig. 13.

Step 3: Modify DDC data (verify EDID version, week, year)

 Click I (new function) icon from the tool bar, bring up Step 1 of 9 as shown in Fig. 14.
 EDID301 DDC application provides the function selection and text change (select & fill out) from Step 1 to Step 9.

Step 1 of 9 : EDID Structure version / Production Identific × EDID Structure Version Load VID / Vendor ID ID Manufacturer Name PHL Fig. 14 PID / vendor assigned Product ID ID Product Code ← Hex ← Dec
 □ Byte swap SNO / Serial Number ID ID Serial Number • Hex C Dec C ASCII □ Unused Date Code Week of Manufacture (0 - 53), use 0 if unused. Year of Manufacture (1990 - 2053) Next > Cancel

Step 4: Modify DDC data (Monitor Serial No.)

- 1. Click **Next** till the Step 7 of 9 window appears as shown in Fig. 15.
- 2. Fill out the new Serial No. (for example, TY 503960, TY 123456).
- 3. Click **Next** till the last step window appears, then click **Finish** to exit the Step window.

Step 7 of 9 : Detailed timing a	nd Descriptor description (BL	.OCK 2) 🛛 🗙	1

Step 5: **Configuration Setup & Enter Factory Mode ** for "write EDID data"

 Click 2 icon from the tool bar to bring up the Configuration Setup windows again. Then, select "Software DDC only" as shown in Fig. 16. Click "OK".

If you do not select "Software DDC only", when you execute "write EDID", it will bring up an error message as below.

To access factory mode

- 1. Turn off monitor (don't turn off PC)
- Press " (•) " and " (0) " simultaneously on the front control panel, then press " (10) ", wait till the OSD menu with characters M 30 107E P V0.81 20010207 (below OSD menu)" come on the screen of monitor.

If OSD menu disappears on the screen of monitor, press " 🧐 " again (anytime), then the OSD menu comes on the screen again.

If you do not access "Factory mode", when you execute "write EDID", it will bring up an error message as below.

Factory	write error
8	EEPROM verified error (0x01, 0x00)
	ОК

Step 6: Write DDC data

- Click (I) (Write EDID) icon from the tool bar to write DDC data. Bring up "Writing 0%~100%, ready" a progressing bar on the left down corner.
- 2. Click (Read EDID) to confirm it.

Step 7: Confirm Serial Number in User Mode

- 1. Press the (0) button to turn off the monitor. Press the (0) button again to turn on the monitor.
 - Press the 🥘 button to bring up the OSD Main Menu.
- 3. Press the 📀 button to select Extra Controls, press the 🞯 button to contirm your selection.
- 4. Confirm the Serial Number "123456" is updated as shown in Fig. 18.

Step 8: Save DDC data

Sometimes, you may need to save DDC data as a text file for using in other IC chip. To save DDC data, follow the steps below:

 Click (Save) icon (or click "file"-> "save as") from the tool bar and give a file name as shown in Fig. 19. The file type is EDID301 file (*.ddc) which can be open in WordPad. By using WordPad, the texts of DDC data & table (128 bytes, hex code) can be modified. If DDC TEXTS & HEX Table are completely correct, it can be saved as .ddc flie to re-load it into EEPROM for DDC Data application.

Save As	? ×

Save as type: Edid30 Files (*.ddc)		

2. Click Save.

DDC Instructions (Continued)

Go to cover page

Step 9: Load DDC data

- 1. Click From the tool bar.
- 2. Select the file you want to open as shown in Fig. 20.
- 3. Click Open.
- 4. Access "Factory Mode" and enable "Software DDC only" as shown in Fig. 17 & Fig. 16.
- 5. Write EDID (click 🔛).

Note 2 : In Factory Mode => Proceed "Read/Write DDC data" Before Read/Write EDID code, please confirm that the Software DDC only was enabled as shown in Fig. 23.

Step 10: Exit DDC program

Pull down the File menu and select Exit as shown in Fig. 21. (EDID Tool 3.01)

Note1 : In User Mode: Proceed "Read DDC data only" Before read EDID code, please confirm that the Software DDC only was disabled as shown in Fig. 22.

Configuration Setup	×	
DDC communication channel DDC2B ADC command (107E) ADC command (104E, 105E) Factory memory data write Factory memory data wr	OK Cancel	Fig. 22

If you do not disable "Software DDC only", when you execute "read EDID", it will bring up an error message as below.

Electrical Adjustments

0. General

When carry-out the electrical settings in many cases a video signal must be applied to the monitor. A computer with :

- ATI GPT-1600 (4822 397 10065), Mach 64 (up to 107kHz)

are used as the video signal source. The signal patterns are selected from the "service test software" package, see user guide 4822 727 21046 (GPT-1600).

0.1 This monitor has 8 factory-preset modes as below. 720 x 400 31.5 kHz/70 Hz 1024 x 768 68.7 kHz/85 Hz 640 x 480 31.5 kHz/60 Hz 640 x 480 43.3 kHz/85 Hz 800 x 600 46.9 kHz/75 Hz 800 x 600 53.6 kHz/85 Hz 1024x768 60.0 kHz/75 Hz 1280 x 1024 64.0kHz/60Hz

14 factory-preload modes as below

640 x 350 31.5 kHz/70 Hz	800 x 600 48.1 kHz/72 Hz
640 x 350 37.9 kHz/85 Hz	800 x 600 63.9 kHz/100 Hz
640 x 480 37.5 kHz/75 Hz	832 x 624 49.7 kHz/75 Hz
640 x 480 37.9 kHz/72.8 Hz	1024 x 768 48.4 kHz/60 Hz
640 x 480 50.6 kHz/100 Hz	1024 x 768 56.5 kHz/70 Hz
720 x 400 37.9 kHz/85 Hz	1152 x 864 67.5 kHz/75 Hz
800 x 600 37.90kHz/60Hz	1280 x 960 60.0 kHz/60 Hz

1. With normal VGA card:

If not using the ATI card during repair or alignment, The service engineer also can use this service test software adapting with normal standard VGA adaptor and using standard VGA mode 640 x 480, 31.5 kHz/60 Hz (only) as signal source.

2. AC/DC Measurement:

The measurements for AC waveform and DC figure is based on 640 x 480 31.5 kHz/60 Hz resolution mode with test pattern "gray scale". Power input: 110V AC

3.Monitor the following auxiliary voltages.

SOURCE ACROSS 7114 Pinout and GRN	+5 V	+/- 0.25 VDC
SOURCE ACROSS C2155	+6.3 V	+/- 0.3 VDC.
SOURCE ACROSS C2141	+8.0 V	+/- 0.5 VDC.
SOURCE ACROSS C2153	+13.1V	+/- 1.0 VDC.
SOURCE ACROSS C2154	- 13.1V	+/- 1.0 VDC.
SOURCE ACROSS C2151	+83.0V	+/- 1.0 VDC.
SOURCE ACROSS C2609	- 170 V	+/- 15.0 VDC.
SOURCE ACROSS C2152(+ to Gnd)	+180.0\	/ +/-2.0 VDC.

4. General conditions for alignment

- 4.1 During all alignments, supply a distortion free AC mains voltage to set via an isolating transformer with low internal impedance.
- 4.2 Align in pre-warmed condition, at least 30 minutes warm-up with nominal picture brightness.
- 4.3 Purity, geometry and subsequent alignments should be carried out in magnetic cage with correct magnetic field.

Northern hemisphere : H=0, V=450 mG, Z=0 Southern hemisphere : H=0, V=-500 mG, Z=0 Equatorial Support : H=0, V=0 mG, Z=0

- 4.4 All voltages are to be measured or applied with respect to ground. Note: Do not use heatsink as ground.
- 4.5 Adjust brightness controls to center position except for contrast control which should be set to MAX.

5. To access factory mode

- 5.1 Turn off monitor (don't turn off PC)
- 5.2 Press " (•) " and " (0) " simultaneously on the front control panel, then press " (e) ", wait till the OSD menu with characters M 30 107E P V0.81 20010207 (below OSD menu)" come on the screen of monitor.

5.3 If OSD menu disappears on the screen of monitor, press " again (anytime), then the OSD menu comes on the screen again. 5.4 Using " 🍝 💎 " : to select OSD menu.

5.5 Using " (•) " : to increase or decrease the setting.
5.6 Using " (a) " to access/confirm the selection.

To leave factory mode

5.7 After alignment of factory mode, turn off monitor (if you do not turn off monitor, the OSD menu is always at the factory mode), then turn on monitor again (at this moment, the OSD menu goes back to user mode).

6. Picture geometry setting

- Apply a video signal with cross-hatch pattern.
- Apply a video signal in the 1024 x 768 with 68.7 kHz/85 Hz mode. - Set contrast control at Max. position, and brightness control in the
- mid-point.
- 6.4 Alignment of horizontal geometry and vertical geometry
- 6.4.1 Adjust the H-width to 306 mm
- 6.4.2 Adjust the H-phase to center position.
- 6.4.3 Adjust V-size to 230mm.
- 6.4.4 Adjust V-Position to center.

Adjust Trapezoid/pincushion/balance pincushion/paralleogram

- 6.4.5 Adjust picture tilt via I²C BUS for correct top/bottom lines. 6.4.6 Adjust the top and bottom corner by I²C to get optimum
- corner geometry.

6.4.7 Adjust the parallelogram by I²CBUS to get optimum vertical line.

- 6.4.8 Adjust the balance pincushion by I²C BUS to get optimum vertical line.
- 6.4.9 Adjust the trapezoid to get optimum vertical line.
- 6.5 Adjust size/centering/trapezium/pincushion/parallelogram of all other preset modes via I²C bus.
- (to repeat from step 6.4.1 to step 6.4.9)

Electrical Adjustments (Continued)

Go to cover page

7. Alignment of Vg2 cut-off point, white tracking

Equipment : 1. Video Test Generator-801GC (Quantum Data) 2. Color-analyzer (Minolta CA-100)

- 7.1 Apply a video signal in the 1024 x 768 with 68.7 kHz/85 Hz mode, select the "full white pattern" (sizes 306 x 230 mm).
- * Use color-analyzer (Minolta CA-100) to adjust R/G/B cutoff and gain.

OSD R/G/B cut-off and R/G/B gain can be accessed (for Philips CRT), with initial data:

9300 °K R cutoff = 50%, R gain = 73% (I^2 C) G cutoff = 50%, G gain = 73% (I^2 C) B cutoff = 50%, B gain = 73% $(I^2 C)$ 6500 °K R cutoff = 50%, R gain = 71% (I^2 C) G cutoff = 50%, G gain = 71% (I^2 C) B cutoff = 50%, B gain = 71% (I^2 C)

Brightness = 50%, Sub-Contrast = 86%, ABL = 63% (I^2 C)

Step 1: To access factory mode

- Turn off monitor (don't turn off PC)

- Press " (•) and " (0) " simultaneously on the front control panel, then press " ig ", wait till the OSD menu with characters M 30 107E P V0.81 20010207 (below OSD menu)" comes on the screen of monitor as shown in Fig. 2.1.

7.2 Connect the video input, set brightness control at center, and contrast control at maximum

7.3

- set R,G,B cut-off at 127 9300k and 6500K(EEPROM preload value) R,G,B gain at 185 9300k and
 - 180 6500K(EEPROM preload value)
 - at 160 9300k (EEPROM preload value) ABL
 - SUB-CON at 220 9300k (EEPROM preload value)

7.4 Adjust 9300K color:

With color analyzer CA 100,

- set R,G,B cut-off x=0.283, y=0.297, Y=0.10
- 7.5 Set R,G,B gain Y= 41+/- 1FL, x=0.283, y=0.297 7.6 Repeat 7.4,7.5 until RGB three guns get x=0.283, y=0.297,
- readings on low Y=0.10+/-0.05FL and high Y=41+/-1FL brightness of 9300.
- 7.7 Adjust 6500K color:
- With color analyzer CA 100, set R,G,B cut-off x=0.313, y=0.329, Y=0.10
- 7.8 Set R,G,B gain Y= 36+/- 1FL, x=0.313, y=0.329
- 7.9 Repeat 7.7,7.8 until RGB three guns get x=0.313, y=0.329, readings on low Y=0.10+/-0.05FL and high Y=36+/-1FL brightness of 6500.
- 7.10 Adjust SUB-CON to get Y=41+/-1FL. (at 9300 high brightness of R/G/B gain, contrast at 100%)
- 7.11 Apply full white pattern of 9300 mode, adjust ABL to reach 30 +/- 1FL.

Electrical Adjustments (Continued)

M30 107E2 GS_3 31

8. Focus adjustment

Apply a signal of " me " character. at 68.7 kHz/85 Hz mode set the brightness to mid-position , contrast to 25FL at the corner of the screen and adjust the focus for optimal sharpness in the area within 2/3 from the screen center.

9. Loading DDC code

The DDC HEX data should be written into the EEPROM (7803) by EDID301.EXE Program(3138 106 10103) and software DDC Alignment kits (4822 310 11184).

10. Purity adjustment

- Make sure the monitor is not exposed to any external magnetic field.
- Produce a full red pattern on the screen, adjust the purity magnet rings on the PCM assy (on CRT) to obtain a complete field of the color red. This is done by moving the two tabs (2-pole) in such a manner that they advance in an opposite direction but at the same time to obtain the same angle between the two tabs, which should be approximately 180 degree.
- Check by full green pattern and full blue pattern again to observe their respective color purity.

11. Static convergence

Introduction

Slight deviation in the static convergence can be corrected by using two permanent pairs of magnets which are fitted around the neck of the CRT. These are the 4-pole magnet and the 6-pole magnet. The 4-pole magnet move the outermost electron beams (R and B) parallel in the opposite direction from the other. The 6-pole magnet moves the outermost electron beam (R, B and G) parallel in the opposite direction from the other. The magnetic field of the above magnets do not affect the center of the CRT neck.

Setting

- Before the static convergence setting can be made, the monitor must be switched on for 30 minutes.
- The focus setting must be made correctly.
- Signal: 640 * 480, 31.5 kHz/60 Hz mode.
- Set the tabs of the 4-pole magnet in the neutral position. This is when the tabs are opposite one another. In this position the magnets do not affect the deflection of the R and B electron beams.
- Set the tabs of the 6-pole magnet in the neutral position. This is when the tabs are opposite one another. In this position the magnets do not affect the deflection of the R, B, and G electron beams.
- First set the 4-pole magnet optimally.
- Then set the 6-pole magnet optimally.
- If the convergence is not now optimal, then adjust to the optimal setting with the 4-pole magnet and then with the 6- Pole magnet again.
- Set the tabs of the 6-pole magnet in the neutral position. This is when the tabs are opposite one another. In this position the magnets do not affect the deflection of the R, B, and G electron beams.
- First set the 4-pole magnet optimally.
- Then set the 6-pole magnet optimally.
- If the convergence is not now optimal, then adjust to the optimal setting with the 4-pole magnet and then with the 6- pole magnet again.

Safety test requirements

Go to cover page

All units that are returned for service or repair must pass the original manufactures safety tests. Safety testing requires both **Hipot** and **Ground Continuity** testing.

HI-POT TEST INSTRUCTION

1. Application requirements

- 1.1 All mains operated products must pass the Hi-Pot test as described in this instruction.
- 1.2 This test must be performed again after the covers have been refitted following the repair, inspection or modification of the product.

2. Test method

- 2.1 Connecting conditions
- 2.1.1 The test specified must be applied between the parallelblade plug of the mainscord and all accessible metal parts of the product.
- 2.1.2 Before carrying out the test, reliable conductive connections must be ensured and thereafter be maintained throughout the test period.
- 2.1.3 The mains switch(es) must be in the "ON" position.
- 2.2 Test Requirements

All products should be HiPot and Ground Continuity tested as follows:

Condition	HiPot Test for products where the mains input range is Full range(or 220V AC)	HiPot Test for products where the mains input is 110V AC(USA type)	Ground Continuity Test requirement
Test voltage	2820VDC (2000VAC)	1700VDC (1200VAC)	Test current: 25A,AC Test time:
Test time (min.)	3 seconds	1 second	3 seconds(min.) Resistance
Trip current (Tester)	set at 100 uA for Max. limitation; set at 0.1 uA for Min. limitation	5 mA	<pre><=0.09+R ohm, R is the resistance of the mains cord.</pre>
Ramp time	set at 2 seconds		

- 2.2.1 The test with AC voltage is only for production purpose, Service center shall use DC voltage.
- 2.2.2 The minimum test duration for Quality Control Inspector must be 1 minute.No breakdown during the test.
- 2.2.3 The test voltage must be maintained within the specified voltage + 5%.
- 2.2.4 The grounding blade or pin of mains plug must be conducted with accessible metal parts.

3. Equipments and Connection

- 3.1. Equipments
 - For example : - ChenHwa 9032 PROGRAMMABLE AUTO SAFETY
 - TESTER
 - ChenHwa 510B Digital Grounding Continuity Tester
 - ChenHwa 901 (AC Hi-pot test), 902 (AC, DC Hi-pot test) Withstanding Tester
- 3.2. Connection

* Turn on the power switch of monitor before Hipot and Ground Continuity testing.

(ChenHwa 9032 tester)

4. Recording

Hipot and Ground Continuity testing records have to be kept for a period of 10 years.

0. Warning

All ICs and many other semi-conductors are susceptible to electrostatic discharges (ESD). Careless handling during repair can reduce life drastically. When repairing, make sure that you are connected with the same potential as the mass of the unit via a wrist wrap with resistance. Keep components and tools also at the same potential !

1. Servicing of SMDs (Surface Mounted Devices)

1.1 General cautions on handling and storage

- Oxidation on the terminals of SMDs results in poor soldering. Do not handle SMDs with bare hands.
- Avoid using storage places that are sensitive to oxidation such as places with sulphur or chlorine gas, direct sunlight, high temperatures or a high degree of humidity. The capacitance or resistance value of the SMDs may be affected by this.
- Rough handling of circuit boards containing SMDs may cause damage to the components as well as the circuit boards. Circuit boards containing SMDs should never be bent or flexed. Different circuit board materials expand and contract at different rates when heated or cooled and the components and/or solder connections may be damaged due to the stress. Never rub or scrape chip components as this may cause the value of the component to change. Similarly, do not slide the circuit board across any surface.

1.2 Removal of SMDs

 Heat the solder (for 2-3 seconds) at each terminal of the chip. By means of litz wire and a slight horizontal force, small components can be removed with the soldering iron. They can also be removed with a solder sucker (see Fig. 1A)

- While holding the SMD with a pair of tweezers, take it off gently using the soldering iron's heat applied to each terminal (see Fig. 1 B).
- Remove the excess solder on the solder lands by means of litz wire or a solder sucker (see Fig. 1C).

1.3 Caution on removal

- When handling the soldering.iron. use suitable pressure and be careful.
- When removing the chip, do not use undue force with the pair of tweezers.
- The soldering iron to be used (approx. 30 W) should

preferably be equipped with a thermal control (soldering temperature: 225 to 250 $^{\circ}$ C).

- The chip, once removed, must never be reused.

1.4 Attachment of SMDs

- Locate the SMD on the solder lands by means of tweezers and solder the component on one side. Ensure that the component is positioned correctly on the solder lands (see Fig.2A).
- Next complete the soldering of the terminals of the component (see Fiq. 2B).

2. Caution when attaching SMDs

- When soldering the SMD terminals, do not touch them directly with the soldering iron. The soldering should be done as quickly as possible, care must be taken to avoid damage to the terminals of the SMDs themselves.
- Keep the SMD's body in contact with the printed board when soldering.
- The soldering iron to be used (approx. 30 W) should preferably be equipped with a thermal control (soldering temperature: 225 to 250 °C).
- Soldering should not be done outside the solder land.
- Soldering flux (of rosin) may be used, but should not be acidic.
- After soldering, let the SMD cool down gradually at room temperature.
- The quantity of solder must be proportional to the size of the solder land. If the quantity is too great, the SMD might crack or the solder lands might be torn loose from the printed board (see Fig. 3).
