INTRODUCTION

For many years, vacuum tubes were standard components in all electronic equipment. Now that times have changed and the industry has advanced, tubes are considered by many to be obsolete. Although the days of running to any corner store for a needed tube are gone, many technicians and hobbyists still repair and use tube-based equipment. *Tube Substitution Handbook* is written for this group.

Tube substitution is one of the only feasible methods to repair or restore original tube equipment, but it should not be performed haphazardly. This handbook, itemizing all known vacuum tubes that have been or are still being manufactured, along with their replacements, will make tube substitution not only possible, but relatively straight-forward and efficient.

This guide is divided into three parts:

Section 1: Vacuum Tube Substitution, listing all known vacuum tubes (excluding picture tubes) in numeric-alphabetic order, with reference to appropriate substitutions and diagrams detailing base pin arrangement.

Section 2: Picture Tube Substitution, listing all known picture tubes in numeric-alphabetic order, with reference to appropriate substitutions and diagrams detailing base pin arrangement.

Section 3: Base Diagrams, illustrating nearly 900 pin arrangements which detail each of the tubes listed in the handbook.

Vacuum Tube Substitutes

This section lists, in numeric-alphabetic order, all known receiving tubes. To use this listing, look in the first column for the tube type you want to replace, then find a suitable substitute in the third column. The substitutes are only those tubes which have similar or improved characteristics and can be inserted directly into the socket. No rewiring or mechanical changes are needed, although the associated service controls may have to be readjusted. The symbols which may follow a substitute, refer to special characteristics of the tube and are shown in the key below. **When no substitutes are shown, none are recommended.** The second column contains the basing code. To use this number, turn to Section 3 to reference your tube substitution selection against the diagrammed pin connections.

You should not replace a tube in the third column with one from the first column as this may result in a less than satisfactory match. For example, where a high heater-to-cathode potential exists, a 6AX4GTA will hold up, but a 6W4 will not. You will find 6AX4GTA listed as a substitute for 6W4, but not vice versa.

In some instances of tube replacement, the space available should be taken into consideration. For example, although electrically identical to a 6L6GB, a 6L6G is more than one inch taller and a half inch larger in diameter, making the substitution physically impossible in some compact equipment.

The X-radiation levels emitted from all television receivers produced after January 15, 1970 must meet rigid government standards. These radiations are primarily produced by high-voltage rectifier tubes, shunt-regulator tubes, and picture tubes. The radiation, however, is carefully controlled in tubes of later design. Whenever possible, only tubes produced after 1970 are suggested for substitution. Although other tubes may appear to be acceptable substitutes, they have not been listed because of the possibility of radiation hazard.

Key to Symbols:

- * Appropriate for parallel-filament circuits.
- ! Appropriate for series circuits not requiring controlled warm-up.
- # May not work in all circuits.

Picture Tube Substitutes

This section lists, in numeric-alphabetic order, all known receiving tubes. To use this listing, look in the first column for the tube type you want to replace, then find a suitable substitute in the third column. The substitutes are only those tubes which have similar or improved characteristics and can be inserted directly into the socket. No rewiring or mechanical changes are needed, although the associated service controls may have to be readjusted. The symbols which may follow a substitute, refer to special characteristics of the tube and are shown in the key below. **When no substitutes are shown, none are recommended.** The second column contains the basing code. To use this number, turn to Section 3 to reference your tube substitution selection against the diagrammed pin connections.

The X-radiation levels emitted from all television receivers produced after January 15, 1970 must meet rigid government standards. These radiations are primarily produced by high-voltage rectifier tubes, shunt-regulator tubes, and picture tubes. The radiation, however, is carefully controlled in tubes of later design. Whenever possible, only tubes produced after 1970 are suggested for substitution. Although other tubes may appear to be acceptable substitutes, they have not been listed because of the possibility of radiation hazard.

Key to Symbols:

- ~ Omit ion trap.
- & Add ion trap.
- + May require longer or shorter HV lead.
- @ Connect pin 6 to pin 2 or pin 10.

- % Parallel-filament circuits only.
- ^ In some cases it may be necessary to reverse the red and green cathode lead to achieve proper balance.

- < Add high-voltage filter capacitor.
- > Ground the aquadag coating.
- | Change the anode connector.
- ? Change the ion trap.

Tube Substitution Handbook

Complete Handbook
to Replacements
for Vacuum Tubes
and Picture Tubes

Revised Edition

This is the most accurate, up-to-date guide available to determine direct substitutes for receiving tubes and picture tubes.

Tube Substitution Handbook will be useful to antique radio buffs, classic car enthusiasts, ham operators, and collectors of vintage ham radio equipment. In addition, marine operators, microwave repair technicians, TV and radio technicians will find the *Handbook* to be an invaluable reference tool.

Tube Substitution Handbook is divided into three sections, each preceded by specific instructions. Those sections are as follows:

Section 1: Vacuum Tubes

Section 2: Picture Tubes

Section 3: Tube Basing Diagrams: The diagrams provide a handy reference to pin numbers for the tubes listed in the above sections.
