RF & AUDIO GENERATORS

Models **SG-9500** and **SG-9000** are stable high frequency generators capable of AM modulation. They are primarily designed for work on AM and FM radio receivers, but can be used in any project requiring a modulated RF signal.

Model **SG-9200** is a low cost audio generator featuring very low distortion sine wave and a rapid-rise square wave. All models have vernier frequency control for easy tuning and switchable high-low output levels.

Model **SG-9500** has built-in frequency counters which are switchable to measure external frequencies up to 150MHz.

RADIO KIT WITH TRAINING COURSE

MAKES AN EXCELLENT PROJECT FOR CLASSROOM STUDIES

The unique design of these kits allows you to place the parts over its corresponding symbol in the schematic drawing on the surface of the printed circuit board during assembly. This technique maximizes the learning process while keeping the chances for an assembly error at a minimum.

Both kits include an assembly, lesson and theory of operation manual. The actual assembly is broken into simple sections. Each section should be completely tested before moving on. This reduces difficult troubleshooting associated with many similar kits. Both include practical hi-tech blue PC boards with the schematic printed on the surface. The manuals are easy to understand. Each radio kit PC board has been designed so that no cabinet is necessary. A special molded plastic base provides the necessary support to use the radio in any location, displaying the work achievement of the student.

OWI ROBOT KITS

None of our OWI Kits require soldering (unless otherwise noted).

MOON WALKER II MV-979 (Light & Sound Sensor)

Moon Walker II begins to walk when it detects a change in light intensity or sound commands, and continues its four-legged voyage until instructed by an internal timer to stop. This kit presents an engaging opportunity to learn about some of the mechanics, operation and history of robots. When assembled, this robot uses a phototransistor to sense changes in light (such as turning on a lamp) and a condenser microphone to sense changes in sound (such as clapping). It converts those stimuli into electrical signals to power a motor, and the robot walks forward for a preset time. When it stops, affecting another change in area light or sound may activate it again. The sensors may be adjusted for different sensitivity levels. Printed circuit board pre-assembled.

Requires one (1) "AA" battery (part # 590001)

OWI-979K (PCB Unassembled) - Soldering Req'd

SUMO ROBOT OWI-9647 (Infrared Sensor)

Now OWIKIT brings the Sumo tradition to your home. The super warrior, SUMO ROBOT, can be controlled to assault and overpower its opponent or retreat to prepare for battle. An infrared sensor beam is emitted when detecting an opponent. Upon detection, it instructs the brain of SUMO to "charge", thereby creating a bona fide wrestling match!

HYPER LINE TRACKER OWI-9737 (Infrared Sensor)

This cyber bug possesses a sonic tracking system, and is fortified with a multitude of sensors: photo transistors to detect a black line, tracking memory to memorize its last track of the black line, and two red LEDs that to tell you which side of the light sensor is activated.

Hyper Line Tracker follows a designed course. By using an infrared emitter, light sensor circuitry, and tracking memory, it demonstrates how robots "see" a pathway. Make a path with a black felt tip marker or black tape and watch how infrared sensors enable the robot's motors to make course corrections. Printed circuit board pre-assembled.
