

TELEQUIPMENT

®

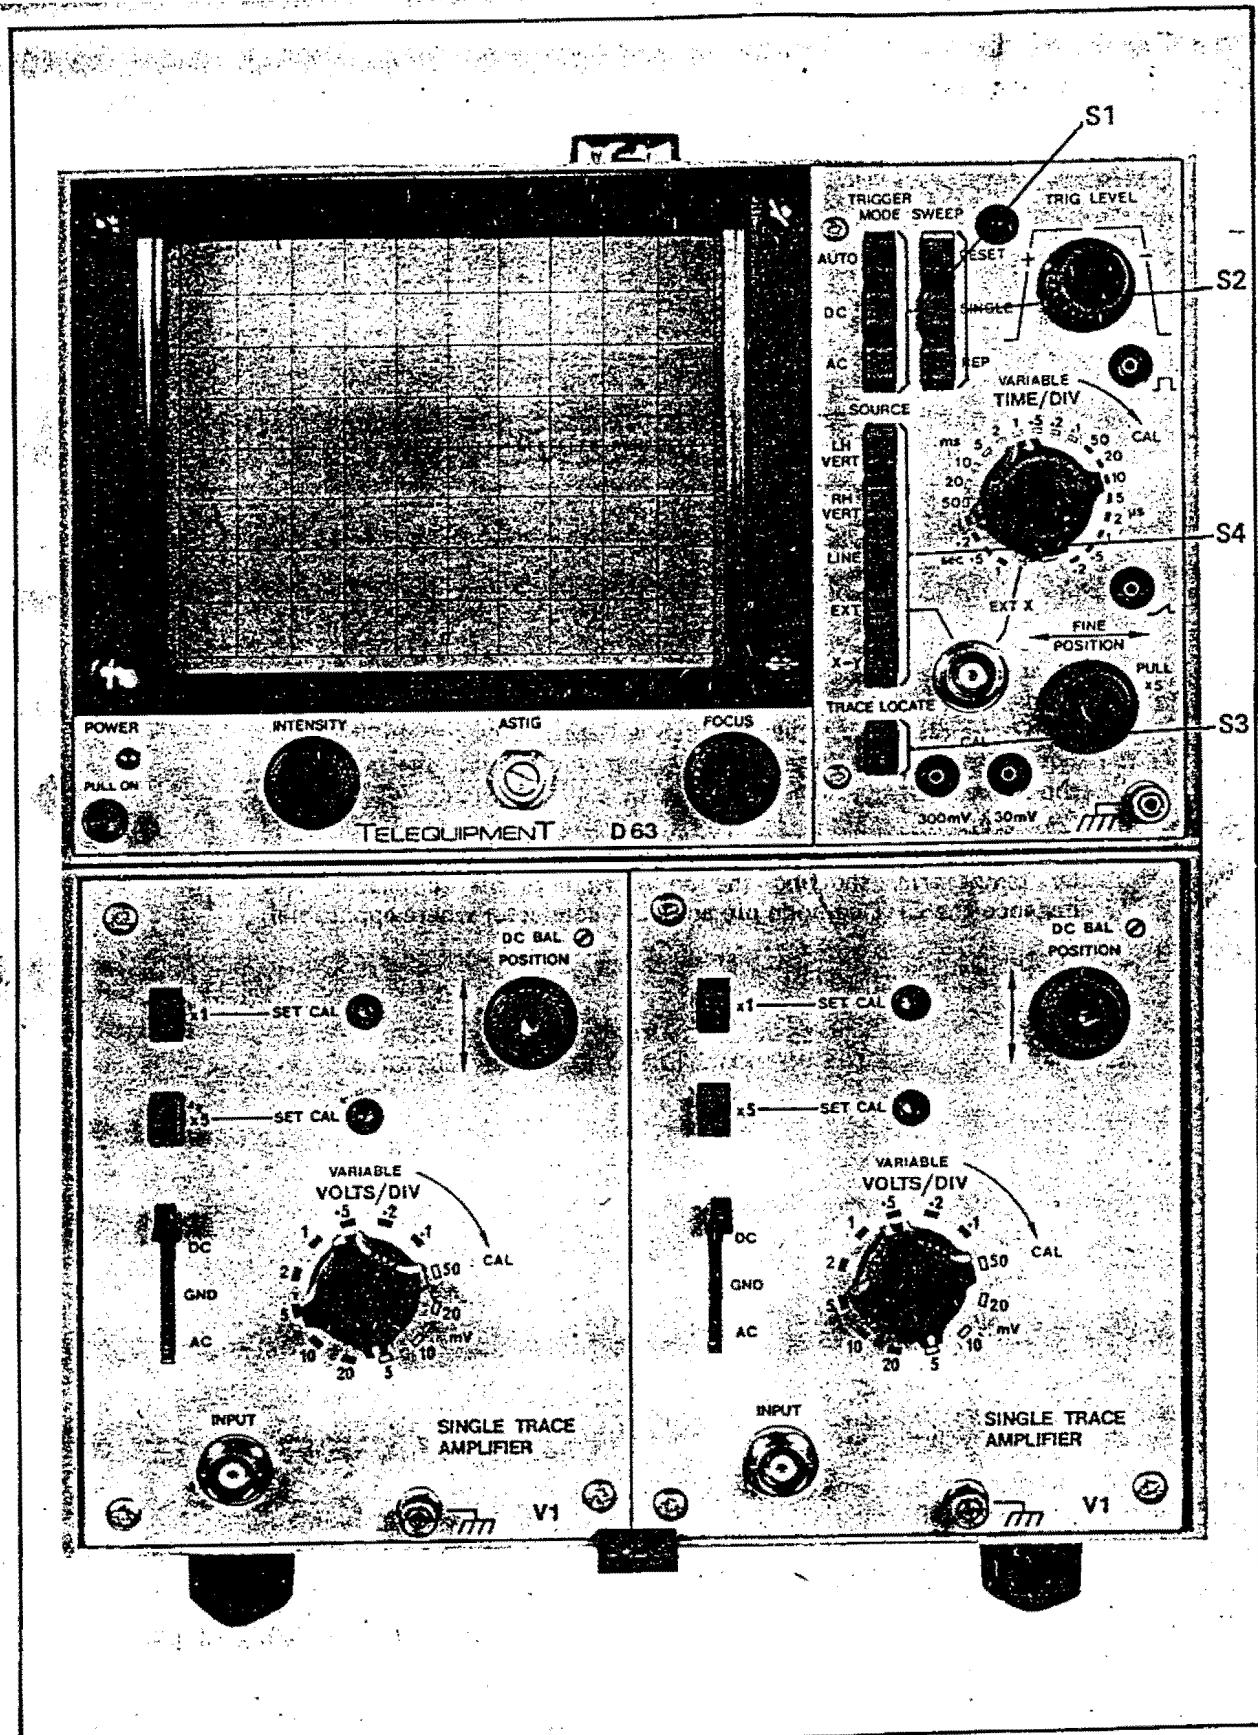

D A N G E R

It is not possible to screen all high voltages, so care should be taken not to touch high voltage tags. Also where possible the instrument should be unplugged AND switched off during servicing. A BLEEDER PATH FOR THE EHT IS NOT PROVIDED, so after switching off and before touching any internal parts, the EHT should be discharged by temporarily shorting the appropriate points to chassis, (for instance the CRT cathode pin and PDA connector where applicable).

FOR SERVICING AND SPARES ENQUIRIES
SEE THE INFORMATION AT START OF SECTION 5.

TELEQUIPMENT is a registered trade mark of TEKTRONIX U.K. LTD.

OSCILLOSCOPE
TYPE D63

INTRODUCTION

The D63, with two vertical plug-ins, is an all solid state dual beam oscilloscope with a single sweep horizontal system. An 8 x 10 div. CRT provides a bright and clear display. The features of the vertical system depend on the type of plug-in used and are given in the appropriate manuals.

The manual covers the mainframe, which houses the following.

- Calibrator
- Sweep Generator and Horizontal Amplifier
- Power Supplies
- Un-blanking Amplifier
- Vertical Amplifier, Output Stage

The design of this instrument is subject to continuous development and improvement, consequently this instrument may incorporate minor changes in detail from the information contained herein, which would, in the main, affect the Components List and Circuit Diagrams. The reader should pay particular attention to the notes at the beginning of Chapter 5.

NOTICE TO OWNER

To obviate the risk of damage during transit and facilitate packaging, the owner is requested to remove the power supply plug and NOT send the following items unless they are suspect, should this instrument be returned to TELEQUIPMENT for servicing:—

- Manual
- Probes
- Power Supply Lead
- Plug Assemblies

SPECIFICATION

1.0 VERTICAL AMPLIFIER

provided by two of the following:—
 V1 Single trace
 V3 High gain differential
 V4 Dual trace
 V5 Single trace with signal delay

Reference should be made to the appropriate manual for details.

X — Y Mode

Operation	Two identical plug-ins
'Y'	L.H. plug-in
'X'	R.H. plug-in
Phase response	< 1° up to 100 kHz

2.0 HORIZONTAL AMPLIFIER

2.1 SWEEP OPERATING MODE

Repetitive
Single shot

2.2 TRIGGER

Mode	Bright line 10 Hz — 15 MHz	
Auto	DC — 15 MHz	
DC	10 Hz — 15 MHz	
AC	< 0.2 division at 1 MHz	
Sensitivity	< 0.5 division at 15 MHz	
Internal	100 mV at 1 MHz	
External	150 mV at 15 MHz	
Polarity	From positive signal edge } By Rotation of + From negative signal edge } LEVEL CONTROL —	

Source		
Internal	From L.H. Amplifier	
L.H. Vert	From R.H. Amplifier	
R.H. Vert	From external source, DC or AC coupled	
External	From supply frequency

CHAPTER 2

OPERATING INSTRUCTIONS

2.1 FUNCTION OF CONTROLS AND CONNECTORS

These are situated on the front panel except where otherwise specified. For those controls not covered below, reference should be made to Chapter 2 of the manual for "V" plug-in.

2.1.1 CRT

POWER	power supply ON-OFF switch.
PULL ON	
INTENSITY	varies the intensity of the display.
ASTIG	a preset used in conjunction with FOCUS for achieving the best overall definition.
FOCUS	controls the definition of the display.
TRACE LOCATE	when pressed brings the trace onto the screen and free runs the timebase.
POSITION	varies the position of the trace in the horizontal axis.
FINE	is a fine horizontal position control.
X5	when pulled magnifies trace 5 times in the horizontal axis; sweep calibrations must be divided by 5.
TRACE ROTATION	preset situated on the rear panel, used to align the trace in the horizontal axis.

2.1.2 SWEEP

TIME/DIV	controls the speed of the sweep. The sweep rates indicated are only valid if VARIABLE is fully clockwise and X5 is not selected. If X5 is selected and VARIABLE at CAL, the calibrations should be divided by 5 to ascertain the sweep speed.
VARIABLE	provides continuous coverage of sweep speeds in between those selected by TIME/DIV switch.
REP	pressed, selects repetitive triggering.
SINGLE	assists in viewing or photographing a non-recurrent signal. Upon application of a trigger pulse a single sweep only takes place. Sweep circuit is then disabled until the RESET button is pressed.
X - Y	connects R.H. VERT to 'X' and L.H. VERT to 'Y'.

2.1.3 TRIGGER

TRIG LEVEL	Selects the point on the waveform at which the sweep starts.
TRIG MODE	
AUTO	provides a horizontal trace in the absence of signal by permitting the timebase to free run until signal is applied. LEVEL range is reduced to approximately 1 division.
AC or DC	relates to the coupling of the trigger circuit. For very low input frequency signals, DC should be selected.

POLARITY

±

selects triggering from the positive or negative-going slope of a waveform. Coupled to trig-level control.

L.H.VERT R.H.VERT }	selects the respective vertical trigger signal.
LINE	provides trigger signal at the power supply frequency.
EXT	enables the sweep to be triggered from an external source.

2.1.4 VERTICAL

2.1.5 CONNECTORS

INPUT	
EXT TRIG EXT X	share a common input BNC socket located on the front panel. Signals are then applied to the required circuit by selection of either the EXT TRIG button or EXT X on T/B switch.
Z MOD	input socket situated on the rear panel is DC coupled via Z mod amp. to the CRT grid. A negative-going signal is necessary to intensify the trace while a positive-going signal will blank it.
OUTPUTS	
CAL	output sockets provide a 1 kHz waveform for checking the calibrations of the vertical channels and setting up probes. The two outputs provide 300 mV and 30 mV 1 kHz (approx.) squarewave, when linked a 3 mA peak to peak current passes.
SAWTOOTH	provides a positive-going ramp waveform when the sweep is running. A recurring sawtooth is produced when AUTO is selected. The resistance of an applied load should exceed 10 kΩ.
GATE OUT	provides fast-edged positive-going rectangular pulse lasting for the duration of the sweep. The resistance of an applied load should exceed 4.7 kΩ.

2.2 PRE-OPERATIONAL CHECKS

2.2.1 POWER SUPPLY

Check the following:

- 1 Correct plug-ins are plugged in.
- 2 Rear voltage-selector plug is indicating the local supply voltage or nearest value.
- 3 Fuse fitted is a 2 A for 100-125 V operation or 1 A for 220-250 V.

NOTE: The 3-core supply lead is colour coded as follows:

Line	Neutral	Earth (Chassis)
or Brown Black	Blue White	Green/Yellow Green

- 4 The power supply cord is secured to the instrument with the nuts and screws provided.

2.2.2 Set controls as follows:

1 CRT

INTENSITY	Central
FOCUS	Central
TRACE ROTATION	As set

POWER	Depressed
POSITION	Central and depressed
SWEEP	REP
TIME/DIV	5 ms
VARIABLE	Fully clockwise
TRIG MODE	Auto
POLARITY	Rotate to + 
SOURCE	INT

2 Set 'V' plug-in controls as given in appropriate 'V' manuals.

2.3 OPERATION

- 1 Plug into the supply; pull POWER ON.
- 2 Allow a few minutes for warm up then press TRACE LOCATE and adjust POSITION controls for a display.
- 3 Adjust TRACE ROTATION, if necessary, to align trace horizontally.
- 4 Connect the CAL 30 mV to JINPUT via co-axial lead.
- 5 Set DC-GND-AC to DC.
- 6 Check amplitude is 6 divisions.

CHAPTER 3

CIRCUIT DESCRIPTION

3.1 VERTICAL AMPLIFIER

3.1.1 As both channels of the main amplifier are similar in design, only the left hand (LH) channel will be described in detail, the differences in the right hand (RH) channel will be described separately.

3.1.2 The interface, reference Figure 1, with the vertical plug-ins is via two 16 way sockets mounted on the mother board PC175. The sockets are designated SK802 (LH) channel and SK803 (RH) channel. The signal is carried via pins 5 and 13 to the shunt feedback amplifier TR801, TR802. To ensure that the main amplifier always has the same sensitivity, the gain is set by the series elements, R809, R812 and the shunt elements R805 R806. The total gain adjustment is approximately 18%.

3.1.3 The output of the shunt feedback amplifier drives directly into the output stage amplifier TR812, TR813. The collectors are connected to the CRT 'Y' plates. Adjustment of R869 sets the mean plate potential to 50 V. Emitter resistors, R845 R846, are normally earthed in the timebase via SK804/13. H.F. peaking is achieved by the network between the emitters formed by R849, C812.

3.1.4 TR805, TR806 are driven from the output of the shunt feedback stage and form the trigger amplifier. The output from TR805 collector is controlled via the switching diode D805, by the potential existing on SK802 pin 6. D803 is the path by which the trigger signal is fed to the timebase via SK804 pin 11. A second source of trigger signal is also applied to SK804 pin 11, and is derived from SK802 pin 7. If a V1 plug-in is plugged into SK802 the only trigger source available is from TR805, therefore a +24 V control voltage is applied to SK802/6 reverse biasing D805, the signal is therefore allowed to pass via D803 to the timebase socket SK804/11. If, however, the V1 plug-in is exchanged for a V5 plug-in, (This plug-in contains the delay cable), a pre-delay line trigger signal is required via SK802 pin 7. Therefore in this case SK802 pin 6 is connected to potential of -24 V, thereby forward biasing D805 and reverse biasing D803, thus switching off the source of trigger signal from TR805 collector.

3.1.5 SK804/13 and SK804/14 are joined together inside the timebase, via switch S4e/5, S4e/4 (X-Y switch) and then to earth via S3 (TRACE LOCATE). When the TRACE LOCATE button is pressed, the total current of both output stages is limited by R843 thus restricting the available collector swing of both output stages to within the confines of the tube, regardless of the POSITION. The POSITION control may then be set to centre the trace.

3.1.6 When the D63 is switched to X - Y mode, the LH vertical plug-in is used in the 'Y' axis but the RH plug-in is now used to drive the 'X' axis. However, as the D63 uses a split beam tube it becomes necessary to shift the RH channel beam off the screen. This is achieved in the following manner. When the X - Y switch S4 is pressed, the emitter resistors R847, R848 become disconnected from earth via SK804/14, hence the collectors of TR814 and TR815 rise to HT. However at the same time, S4 switches SK804/12 to earth, D811 (normally reverse biased by R868) becomes forward biased and the collector voltage of TR815 is lowered due to the potential divider formed by R865, collector load, and R861. Sufficient voltage differential now exists between the 'Y' plates to position the trace off the screen.

3.1.7 Whilst in X-Y mode, the timebase uses the RH trigger signal to drive the 'X' axis. As already explained, it is possible to obtain a trigger signal from two sources, i.e. direct from SK803/7

or from the collector of TR807 via D804, depending upon the type of 'V' plug-in used. Therefore to ensure the same amplitude of signal regardless of 'V' plug-in used, it is very desirable to use one trigger source only i.e. that from TR807. This is achieved in the following manner. The trigger source from TR807 is connected permanently to SK804/10. SK803/7 is connected to SK804/10 via diode D809. SK803/6, the trigger amplifier controlling voltage, is connected to diode D808. TR809 and TR811 form a bistable circuit. Now consider a V1 plug-in plugged into the RH channel, and the oscilloscope working normally, SK803/6 is at +24 V, therefore diode D808 is conducting, and TR811 is 'on' its collector is therefore at approximately -24 V, diode D807 is therefore conducting, D809 being reverse biased. No signal is therefore able to pass D809 to SK804/10. However TR809 is 'off', its collector being at approximately +24 V reverse biases D806, allowing D804 to pass the signal onto SK804/10. Now switching to X - Y mode, the junction of R847 and R848 rises in potential to approximately +17 V and thereby aiding TR811 to stay 'on'. The signal source remains as before i.e. via D804. However, consider a V5 plug-in in the RH channel and working normally. SK803/6 is now at -24 V, reverse biasing diode D808. SK804/14 is at earth therefore TR811 is 'off' its collector being at approx. +24 V reverse biasing D807. However, TR809 is now 'on' its collector being at approx. -24 V forward biasing D806 and switching off this signal source. But SK803/7 can now feed its signal via D809 to SK804/10. Now switching to X - Y, R847 R848 junction rises to +17 V and this is sufficient to turn TR811 'on' and once again D807 is forward biased, shunting the signal from SK803/7 to -24 V and also TR809 is once again 'off', reverse biasing D806 and permitting the signal to pass on to SK804/10 via D804. So, whichever amplifier is in situ, when X - Y is pressed the signal source is via TR807.

3.1.8 The RH channel trigger amplifier contains in its emitter circuit a DC TRIG BAL potentiometer. It is used to ensure that the start of a dc triggered trace is the same for RH channel as for LH channel.

3.2 TRIGGER AMPLIFIER

3.2.1 INTERNAL TRIGGER

Part of the signal to be displayed is "picked-off" from the appropriate vertical amplifier and fed via the 16 way socket, SK804, to diode D11 or D12, reference Figure 2. Selecting S4a or S4b causes the correct diode to conduct and passes the trigger signal on to the trigger pre-amplifier stage TR2. Switches S1b and S1c select DC and AC TRIG, respectively, while S4c allows triggering at supply frequency. Level and polarity controls are achieved with centre-tapped dual ganged potentiometer, R38 and R61. Operating the pot between its fully anti-clockwise end and the centre tap selects the positive slope region of the displayed waveform while the range between the centre tap and the clockwise end selects the negative slope. The AUTO mode is selected with S1a, part of whose action is to reduce the triggerable range of the display to within 1 division on the screen.

The output of the trigger pre-amplifier TR2 is DC coupled via current limiting circuitry and a frequency compensation network, which improves the H.F. response at 5 MHz, to provide an analogue signal at pin 4 of I.C.1 the Sweep Control I.C. TR7 functions as a slope selector switch converting the positive or negative voltage at the wiper of R61 into corresponding logic levels for application to pin 5 of I.C.1.

3.2.2 EXTERNAL TRIGGER

The signal from an external triggering source is connected to the BNC socket on the timebase unit front panel. This is then coupled via emitter follower, TR1, to the base of TR2 through diodes D3, D7, which are turned on when S4d is selected.

When DC Trig Mode switch is selected the trigger signal is DC coupled all the way to the base of TR2 as both C1 and C11 are by-passed.

The circuit has an input impedance of approximately 100 k and is protected from voltage overloads by C2, R4.

3.3 SWEEP GENERATOR

3.3.1 The sweep generator, reference Figure 2, is basically a very high gain Miller integrator and a voltage comparator contained within a 10 pin integrated circuit in a TOS package, I.C.2. Interlinked with this unit is the "control" integrated circuit, I.C.1, in a 16 pin D.I.L. package.

The "control" I.C. is driven with positive logic, the convention used being, positive = logic '1', ground = logic '0'.

The operation of the two interlinked integrated circuits is best understood by referring to Tables 1, 2 and 3.

3.3.2 The 10 V sawtooth output produced at pin 8 of I.C.2 is converted into a current via R74 and fed to the base of TR101 in the X amplifier. Trimmer C22 in parallel with R74 is a sweep linearity control, while trimmer C19 is an adjustment for setting the timing on the fastest settings of the Time/Div switch. A measure of variable Hold-off is incorporated, when the trig level control is operated, by feeding back a portion of the volts via R37 to pin 11 of I.C.1. TR4 supplies a regulated +5 V to supply I.C.1.

3.4 HORIZONTAL AMPLIFIER

The input to the horizontal amplifier, reference Figure 4 is at the base of TR101 where the sweep is mixed with fine and coarse shift levels. The junction of R12/C5 and C7/R25, where the signal currents from External X and X - Y respectively are taken, is also connected to the base of TR101. The differential output from the collectors of TR102, TR103, drives the 'X' plates of the C.R.T. The amplifier incorporates a catching network D101/R104, to prevent TR102 from saturating. The X5 gain switch is incorporated in the emitters of the output pair.

R110, across the collectors of TR102 and TR103 is fitted for the DM63, storage version. This effectively reduces the gain of the stage by approximately 10% as the storage C.R.T. is that much more sensitive.

3.5 EXTERNAL X

When switched to this mode, (with the Time/Div switch) all functions of the timebase unit are overridden except the X - Y facility and Trace Locate button. The external driving voltage is applied to the BNC socket on the T.B. unit front panel and after passing through emitter follower TR1 passes to the horizontal amplifier via D1 and D4 reference Figure 2.

'Bright-up' is achieved by holding pin 15 of I.C.1 at about +0.8 V when R14 is connected to the -24 V line. At the same time pin 10 of I.C.1 rises to logic '1' to "lockout" the sweep.

3.6 X-Y MODE

In this mode all functions of the timebase unit are overridden except Trace Locate. Its function is such that a calibrated 'Y' co-ordinate (in the vertical direction) is available using the LH channel of the oscilloscope and also a calibrated 'X' co-ordinate (in the horizontal direction) via the RH channel. The 'Y' signal passes through the LH plug-in via the vertical amplifier on the mother board to the 'Y' plates of the CRT. The 'X' signal passes through the RH plug-in via SK804 on the mother board to D12 in the timebase unit. When S4e is selected, D12 conducts and the 'X' signal is passed to the base of TR101 in the horizontal amplifier via R29/R25/C7. S4e also disables the coarse shift control and unbalances the RH channel output amplifier. Bright-up is accomplished by taking pin 15 of I.C.1 to logic '1' when R6 is connected to the -24 V line. Pin 10 of I.C.1 also rises to logic '1' and the sweep is locked out.

3.7 TRACE LOCATE

When S3 is depressed and held, the currents of the horizontal amplifier and both vertical output amplifiers are reduced by about 50% restricting the display to within the screen area of the CRT. Also pin 2 of I.C.1 rises to logic '1' enabling the timebase to "free run". Trace Locate functions for all modes of operation of the oscilloscope.

3.8 CALIBRATOR

This (reference Figure 4) is a simple multivibrator running at about 1 kHz. Accuracy depends on resistors R124, R125, R128 and the -24 V line. Potentiometer R127 takes up the tolerance of R128. When S401 and SK102 are shorted, 3 mA passes through the short circuit.

3.9 POWER SUPPLY

The -105 V, +24 V and -24 V lines, reference Figure 6, are all self regulating and protected from short circuits, they are connected to the remainder of the instrument via two plugs and sockets.

3.9.1 +24 V

Diodes D405, D406, D407 and D408 form a full wave bridge rectifying circuit whose reservoir capacitor is C405. The output of this line is dependent on -24 V line setting, the sampling chain resistors R424 and R426 provide bias to the control loop of TR408, TR406 and TR405. TR402, R407, R425 and R413 form a current limiting and foldback network to protect the output under overload conditions.

3.9.2 -24 V

This is used as a reference voltage for the other two lines and when set accurately will bias the +105 V and +24 V lines to their correct output voltages. Diodes D409, D411 and D413 form a full wave bridge rectifying circuit. TR411 and TR407 are a long tailed pair and in conjunction with TR409 and TR413 stabilise the circuit.

Current foldback and limiting is provided by TR403, R433, R420 and R405.

3.9.2 +105 V

Diodes D401, D402, D403 and D404 provide full wave bridge rectification. If a short circuit occurs on this line the instrument must be switched off and on again before the line returns to its normal voltage. Transistors TR414, TR412, TR415 and TR416 stabilise the output and TR401 and TR404 provide short circuit protection in the form of a bistable.

3.10 E.H.T.

The E.H.T. (reference Figure 5) is derived from a class C oscillator operating at approximately 28 kHz. The oscillator amplifying transistor TR303 uses transformer T301 as its load and main frequency determining component. R301 sets the cathode potential which is regulated by a feedback loop including a high gain amplifier formed by TR301 and TR302. The grid is set to the correct tube cut-off potential by adjusting R315. The output voltage is limited at switch on by thermistor TH301 whilst C304 inhibits E.H.T. feedback into the unregulated +30 V line. Diodes D303 and D304 provide half wave rectification from T301 for the cathode and grid supplies. The PDA is derived from a five stage multiplier (quintupler) whose input is taken from the same tapping on T301 as that used for the cathode supply. Tube focusing is achieved by adjusting R327 which is on the front panel.

3.11 UNBLANKING AMPLIFIER

The amplifier is a current in voltage out stage. A 2 mA change of input current produces an anti-phase 30 V output. The internal unblanking and external Z MOD signals are fed into TR351 emitter in current form at each potential. This current is transferred to the base of TR352 where it is mixed with the intensity control current. TR352 and TR353 form a stage whose gain is determined by R358.

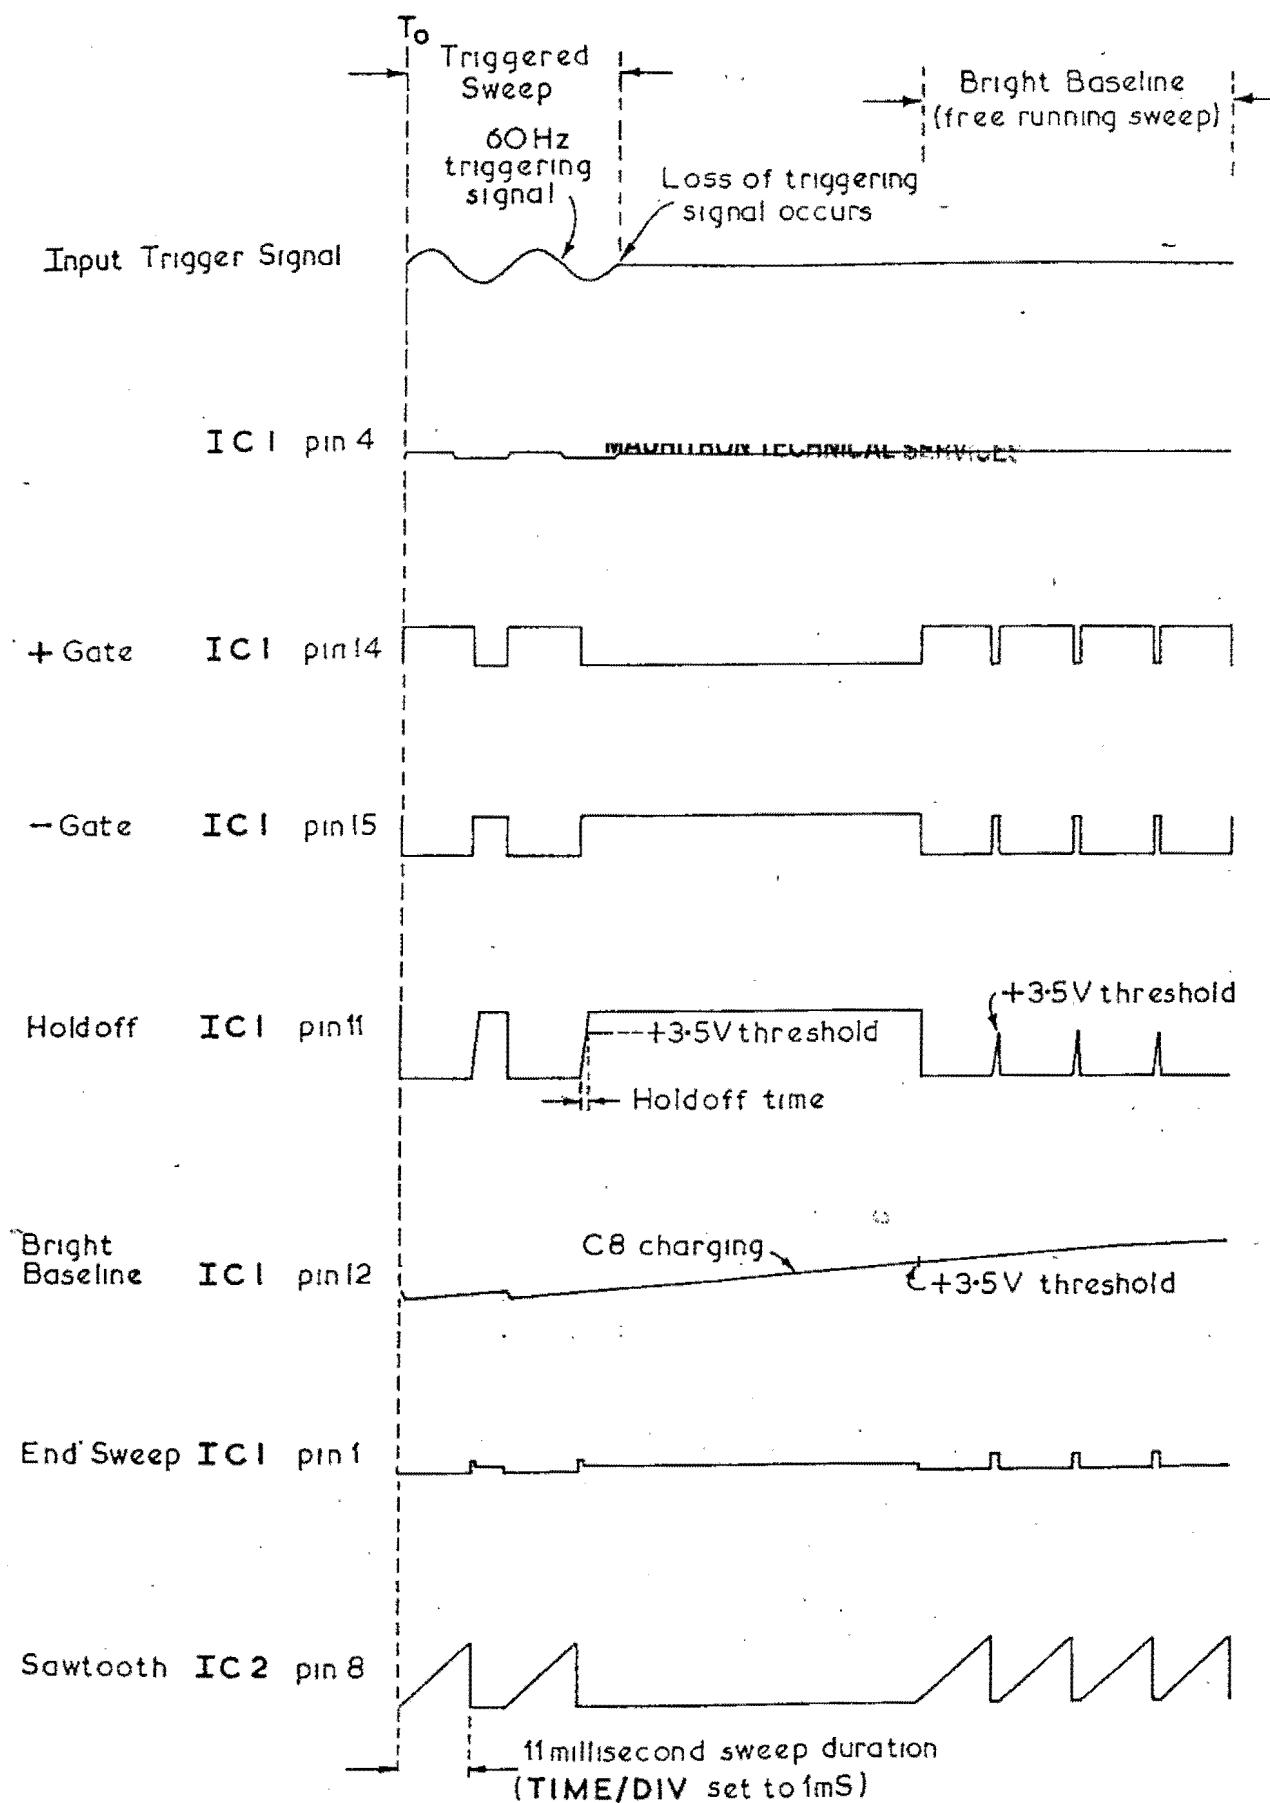

TABLE 1
I.C.1. Sweep Control I.C.

Pin No.	Function	Operation
1	END SWEEP	A logic '1' input causes logic '0' at pin 14 to end sweep (see pin 14).
2	FREE RUN	A logic '1' input causes logic '1' at pin 14 which if maintained, enables the sweep to free run at its "natural" selected frequency. Used to free run timebase when "Trace Locate" button is pushed.
3	INDEPENDENT GROUND	Connected to pin 8.
4	TRIGGER INPUT	Analogue input current from trigger pre-amp produces a train of "internal" pulses, in conjunction with a logic level at pin 5.
5	SLOPE SELECTOR	A logic '1' input allows a positive analogue signal at pin 4 to produce "internal" pulses. Logic '0' allows negative going analogue at pin 4 to produce "internal" pulses.
6	SINGLE SHOT CONTROL	A logic '1' input enables a repetitive sweep to continue. Logic '0' input allows a single sweep to be produced.
7	RESET	A logic '1' arms the timebase to receive a trigger signal and produces a single sweep. When Reset button is released pin returns to logic '0'.
8	SUBSTRATE	Connected to ground.
9	READY LAMP OUTPUT	A logic '0' output is produced when Single Shot button is pushed. This state allows ready state indicator, light emitting diode, to come on.
10	LOCKOUT	A logic '1' input disables the sweep, i.e., it cannot be started. A logic '0' allows normal operation.
11	HOLD-OFF TIMING	On receipt of an internal pulse, (generated at the end of the sweep), the timing components are connected allowing the pin to rise to threshold voltage of 3.5 V. A new sweep can commence upon receipt of next trigger pulse or if pin 12 is above its upper threshold voltage (see pin 12).
12	BRIGHT BASE LINE TIMING	Pin is allowed to rise to its threshold of 3.5 V when AUTO switch is selected. This then produces a logic '1' at pin 14 to start sweep and free run at "natural" selected frequency. If trigger signal is present or has a repetition rate >15 Hz, threshold voltage is never reached, pin goes to logic '0' and timebase is "triggered" in normal manner.
13	BRIGHT BASE LINE CONTROL	A logic '1' input keeps pin 12 at ground and disables B.B.L. operation. A logic '0' allows B.B.L. to function.
14	+ GATE OUTPUT	A logic '1' output is applied to pin 1 of I.C.2 to start the sweep and is maintained for duration of sweep. Logic '0' output to pin 1 of I.C.2 ends ramp and is maintained for whole of retrace period.
15	- GATE OUTPUT	Logic output is exactly 180° out of phase with pin 14. Output used as the bright up pulse.
16	POWER SUPPLY	Taken to +5 V line.

TABLE 2
I.C.2. Sweep Generator

Pin No.	Function	Operation
1	SWEEP GATE IN	Logic '1' input starts sweep and results in sawtooth output at pin 8.
2	OSCILLATION SUPPRESSOR	C17 and R65 connected to ground reduce gain of integrator and prevent internal oscillation.
3	GROUND	Connected to ground.
4	END SWEEP PULSE	Logic '1' output produced when ramp reaches its allowed maximum amplitude. Applied to pin 1 of I.C.1.
5	DELAYED GATE	Not used.
6	DELAY CONTROL IN	Maintained at +9.8 V and applied to one side of a voltage comparator inside i.e. the amplitude of the ramp is established at the other side.
7	POWER SUPPLY	Held at approximately +15.8 V by Zener diode, D24.
8	SAWTOOTH OUTPUT	Ramp output of approximately 10 V amplitude starting from 0 V, when logic '1' applied to pin 1.
9	TIMING CURRENT IN	Junction of timing capacitors and resistors taken to pin.
10	SUBSTRATE	Taken to -24 V line via R69, sits at approximately -6.7 V.

TABLE 3. RELATIONSHIP OF EVENTS IN AUTO MODE

CHAPTER 4

MAINTENANCE AND CALIBRATION

4.1 INTRODUCTION

4.1.1 The solid - state design of the instrument makes frequent adjustment of the internal components unnecessary. The appropriate part of the calibration procedure should be performed whenever the instrument fails to meet its specification or whenever a defective component is replaced. However, if R428 is adjusted to set the -24 V line, the full calibration procedure should be carried out.

4.1.2 For calibration procedure of VERTICAL plug-ins, see appropriate Vertical plug-in MANUAL.

4.1.3 For calibration, the tools and equipment required are:

Low-capacitance trimming tool (for preset controls)
Small screwdriver (for preset potentiometers)
Two Vertical plug-ins V1
Vertical Calibration Unit 067-0672-00
D.C. Voltmeter $\pm 0.5\%$ accurate for measuring power supply voltages
D.C. Voltmeter of input impedance greater than $25 \text{ M}\Omega$ and $\pm 0.5\%$ accurate for measuring cathode potential (-1.35 kV)
Squarewave Generator providing outputs of 25 mV and 250 mV at 1 kHz accuracy $\pm 1\%$
Squarewave Generator providing 1 MHz rise time $\leq 3 \text{ ns}$
Sinewave Generator providing 500 Hz to 50 kHz
Constant Amplitude Sinewave Generator providing 50 kHz to 20 MHz for measuring bandwidth
Time-mark Generator providing markers of 1 ms and 1 μs .

4.2 MECHANICAL

4.2.1 ACCESS TO INTERIOR

The instrument has two vertical plug-ins, a timebase unit, a power supply unit and a EHT unit. The two cabinet covers of the instrument are removed as follows:

- 1 Disconnect the power lead.
- 2 Turn four buttons, two on each side cover, to release.
- 3 Lift the two side covers.

To remove the vertical plug-in(s):

Depress the plug-in retaining clip on the front and withdraw the plug-in(s).

To remove the sweep unit:

- 1 Unplug the two output leads from the CRT top pins.
- 2 Loosen one screw at the rear securing the unit.
- 3 Withdraw the unit.

To gain access to the preset controls inside the EHT box:

Remove the L-cover (one screw).

Power supply unit can be withdrawn from the rear of the instrument by removing the two retaining screws.

4.2.2 CRT REMOVAL

- 1 Remove the side covers as detailed above.
- 2 Earth the PDA connector with a screwdriver.
- 3 Disconnect the PDA connector.
- 4 Remove the rear cover (two screws).
- 5 Disconnect the CRT base connector.
- 6 Disconnect the CRT neck pins.
- 7 Unsolder the trace rotation coil connections.
- 8 Slacken CRT front clamp held by two screws on the top.
- 9 Slacken the top screw of the clamp holding the mumetal screen.
- 10 Remove the 2 clamp securing screws.
- 11 Remove CRT and mumetal screen by moving the CRT

backwards then to the side and forward.

- 12 Withdraw CRT from the screen.
- 13 Remove trace rotation coil from neck of tube.

4.2.3 CRT FITTING

Follow the above removal detail in reverse order.

4.3 CALIBRATION PROCEDURE

4.3.1 POWER SUPPLY

Adjustment of -24 V line or replacement of any of the transistors TR407, TR409, TR411 and TR413 would necessitate carrying out the entire calibration procedure as detailed in this chapter.

A voltmeter of better than 0.5% accuracy should be used for measuring the power supply voltages.

- 1.0 Check line voltages.
- 1.1 Remove cabinet covers.
- 1.2 Set meter range to cover -24 V DC.
- 1.3 Connect meter between earth and -24 V output (junction of R429 and C415).
- 1.4 Adjust R428 for -24 V.
- 1.5 Set meter range to cover +105 V DC.
- 1.6 Connect meter between earth and +105 V output (junction of R432 and C416).
- 1.7 Check voltage is within $\pm 2\%$ of +105 V i.e. +107.1 V, +102.9 V.
- 1.8 Set meter range to cover +24 V DC.
- 1.9 Connect meter between earth and +24 V output (junction of R424 and C414).
- 1.10 Check voltage is within $\pm 2\%$ of +24 V i.e. +24.48 V, +23.52 V.

4.3.2 E.H.T. and DISPLAY ADJUSTMENTS

A voltmeter of input impedance greater than $25 \text{ M}\Omega$ and accuracy better than 0.5% should be used for measuring the cathode potential.

CAUTION : HIGH VOLTAGE

- 1.0 Check cathode potential.
- 1.1 Remove cabinet covers, EHT cover and rear cover plate.
- 1.2 Set meter range to cover -1.35 kV DC.
- 1.3 Connect meter between earth and pin 7 on tube base.
- 1.4 Adjust R301 for -1.35 kV.
- 2.0 Check beam equalisation.
- 2.1 Display two traces.
- 2.2 Turn INTENSITY control such that the two traces are just visible.
- 2.3 Rotate magnet at rear of the CRT to equalise intensity of the two traces.
- 3.0 Check grid cut-off.
- 3.1 Remove cabinet covers and EHT cover.
- 3.2 Check INTENSITY range.
- 3.3 Set TIME/DIV to EXT X
- 3.4 Turn INTENSITY fully anti-clockwise.
- 3.5 Adjust R317 for extinction of spot.
- 3.6 Set TIME/DIV to 10 ms.
- 3.7 Check INTENSITY range.
- 4.0 Raster distortion.
- 4.1 Apply 100 kHz sinewave to vertical input.
- 4.2 Adjust controls for 10×8 divs raster.
- 4.3 Adjust TRACE ROTATE to align the axes.
- 4.4 Adjust R332 (Geometry) for minimum raster distortion.

4.3.3 VERTICAL AMPLIFIER PC175 (Final Stage)

Switch off the instrument. Remove left-hand V plug-in and replace with vertical calibration unit 067-0672-00. Switch on

the instrument.

- 1.0 Set LH Y plate potential (R869).
- 1.1 Switch calibration unit to CALIBRATE.
- 1.2 Connect voltmeter of at least 1% accuracy between TR812 and TR813 collectors.
- 1.3 Adjust POSITION to achieve 0 V between collectors.
- 1.4 Connect voltmeter from one collector to earth.
- 1.5 Adjust R869 to obtain a reading of 50 V.
- 1.6 Repeat Ops 1.2 to 1.5.
- 1.7 Disconnect voltmeter.
- 2.0 Set LH channel gain (R805).
- 2.1 Connect 1 kHz squarewave of 250 mV amplitude to INPUT.
- 2.2 Set TIME/DIV to 1 ms.
- 2.3 Adjust R805 for precisely 5 divisions.
- 3.0 Set LH channel pulse response (R849 and C812).
- 3.1 Connect 200 mV 1 MHz \leq 3 ns risetime squarewave to INPUT.
- 3.2 Set TIME/DIV to 0.2 μ s.
- 3.3 Adjust R849 and C812 for best pulse response.
- 4.0 Check LH channel bandwidth.
- 4.1 Connect 50 kHz sinewave to INPUT.
- 4.2 Adjust generator to give 5 div trace.
- 4.3 Set TIME/DIV to 1 ms.
- 4.4 Switch generator to 18 MHz.
- 4.5 Check amplitude $>$ 3.5 divisions.
- 5.0 Set RH Y plate potential (R871).
Note: Place vertical calibration unit 067-0672-00 into right-hand channel.
- 5.1 Switch vertical calibration unit to CALIBRATE.
- 5.2 Connect voltmeter of at least 1% accuracy between TR814 and TR815 collectors.
- 5.3 Adjust POSITION to achieve 0 V between collectors.
- 5.4 Connect voltmeter from one collector to earth.
- 5.5 Adjust R871 to obtain a reading of 50 V.
- 5.6 Repeat Ops 5.2 to 5.5.
- 5.7 Disconnect voltmeter.
- 6.0 Set RH channel gain (R807).
- 6.1 Connect 250 mV 1 kHz squarewave to INPUT.
- 6.2 Set TIME/DIV to 1 ms.
- 6.3 Adjust R807 for precisely 5 divisions.
- 7.0 Set RH channel pulse response (R851 and C813).
- 7.1 Connect 200 mV 1 MHz \leq 3 ns risetime squarewave to INPUT.
- 7.2 Set TIME/DIV to 0.2 μ s.
- 7.3 Adjust R851 and C813 for best pulse response.
- 8.0 Check RH channel bandwidth.
- 8.1 Connect 50 kHz sinewave to INPUT.
- 8.2 Adjust generator to give 5 div trace.
- 8.3 Set TIME/DIV to 1 ms.
- 8.4 Switch generator to 18 MHz.
- 8.5 Check amplitude $>$ 3.5 divisions.
Note: Replace vertical calibration unit with normal 'V' plug-in.

4.3.4 VERTICAL PLUG-IN

See appropriate MANUAL.

4.3.5 TIME BASE PC158

- 1.0 Set trigger.
- 1.1 Select AUTO Trigger Mode and LH VERT Source buttons.
- 1.2 Set TIME/DIV switch to 1 ms.
- 1.3 Ensure that the main frame contains two calibrated V1, vertical plug-ins. Centralise traces of both channels.
- 1.4 Apply a 500 Hz sinewave to LH channel input socket and adjust its amplitude to display 0.5 division on the screen.

- 1.5 Adjust R57 so that the display "free runs" when the TRIG LEVEL control is at either extremity of its front panel + and - slope regions.
- 1.6 Select AC Trigger Mode button.
- 1.7 Increase amplitude of display to 8 divisions on the screen.
- 1.8 Check that by operating the TRIG LEVEL control the displayed waveform can be made to start at any point on its + or - slope.
- 1.9 Set start point of display on centre graticule line.
- 1.10 Select DC Trigger Mode button.
- 1.11 Adjust R32 for < 0.4 division change in position of the start point of the display when the Trigger Mode is switched between AC and DC on both + and - slopes.
- 1.12 Select DC Trigger Mode button. Apply the same signal also to RH channel input socket and ensure that both displayed waveforms are superimposed.
- 1.13 Adjust R841 on rear of Mother Board PC175 for no change in start point of display when switching between LH VERT and RH VERT Source buttons.
- 1.14 Disconnect the signal from both input sockets.
- 2.0 Set timing.
- 2.1 Set TIME/DIV switch to 1 ms, VARIABLE to CAL and horizontal gain to $x 1$. Select LH VERT Source button.
- 2.2 Apply 1 ms markers to LH channel input socket and adjust to a suitable amplitude on the screen.
- 2.3 Adjust R114 for 1 marker per division.
- 2.4 Pull gain switch for $x 5$ and adjust R108 for 1 marker per 5 divisions.
- 2.5 Alter input signal to 1 μ s markers.
- 2.6 Set TIME/DIV switch to 1 μ s.
- 2.7 Push gain switch for $x 1$.
- 2.8 Adjust C19 for 1 marker per division.
- 2.9 Set TIME/DIV switch to 0.2 μ s.
- 2.10 Pull gain switch for $x 5$.
- 2.11 Remove marker input signal and apply a 15 MHz sinewave.
- 2.12 Adjust C22 for best linearity at the start of the trace.
- 3.0 Set external trig.
- 3.1 Remove signal from inputs and connect LH channel input socket to Ext X socket on timebase front panel.
- 3.2 Push AUTO and DC Trigger buttons together and select EXT Source button.
- 3.3 Set LH channel VOLTS/DIV switch to 0.1 V and select $x 1$ gain.
- 3.4 Set LH channel DC-GND-AC switch to GND, and centre the trace.
- 3.5 Set DC-GND-AC to DC and adjust R2 to return trace to centre of screen.
- 3.6 Repeat 3.4 and 3.5 until there is no more movement of trace.
- 3.7 Disconnect LH channel input and EXT X sockets op. 3.1.
- 4.0 Set X-Y gain.
- 4.1 Select RH VERT Source button on time base front panel.
- 4.2 Set RH channel DC-GND-AC switch to DC and LH channel DC-GND-AC switch to GND.
- 4.3 Set RH channel VOLTS/DIV switch to 5 mV.
- 4.4 Apply a 25 mV 1 kHz squarewave to RH channel input socket and ensure that the squarewave is 5 divisions high on the screen.
- 4.5 Select X-Y Source button.
- 4.6 Adjust R25 for 2 spots, 5 divisions apart in the horizontal direction on the screen.

4.3.6 CALIBRATOR ADJUSTMENT

Normally, no further amplitude adjustments are required to the calibrator outputs. In the event of its failure requiring resistor replacement then the amplitude should be checked and if required R127 should be adjusted.

CHAPTER 5

COMPONENT LIST

Values of resistors are stated in ohms or multiples of ohms; ratings at 70° C are in watts or sub-multiples of watts. Values of capacitors are stated in sub-multiples of farads; ratings at 70° C are in volts or kilovolts.

Whenever possible, exact replacements for components should be used, although locally available alternatives may be satisfactory for standard components.

Any order for replacement parts should include:

- | | |
|--------------------------------|--------------------------|
| 1. Instrument type | 4. Component part number |
| 2. Instrument serial number | 5. Component Value |
| 3. Component circuit reference | |

CIRCUIT REFERENCE BLOCKS

The table below gives the blocks of circuit references, so that the reader can relate the items listed in this chapter and their location in the circuitry and printed circuit boards in Chapter 8.

Circuit Reference		Circuit	Fig.	P.C. Board No.
From	To			
1	100	Trigger and Sweep Generator	2	158
101	140	X-Amplifier and Calibrator	4	158

CHAPTER 6

CIRCUIT DIAGRAMS AND PC BOARDS

To minimize the risk of misinterpretation of component values on circuit diagrams, the decimal point has been replaced by the multiplier or sub-multiplier of the basic unit. For instance, 2.2 megohms is shown as 2M2 and 1.8 picofarads is shown as 1p8.

To aid the reader further, in addition to the block Circuit Reference Table in Chapter 5.1, to locate a component in the circuit diagrams, a table is provided at the top of each circuit diagram, in which the circuit reference will appear, where practicable, directly above the component being sought.

PRINTED CIRCUIT

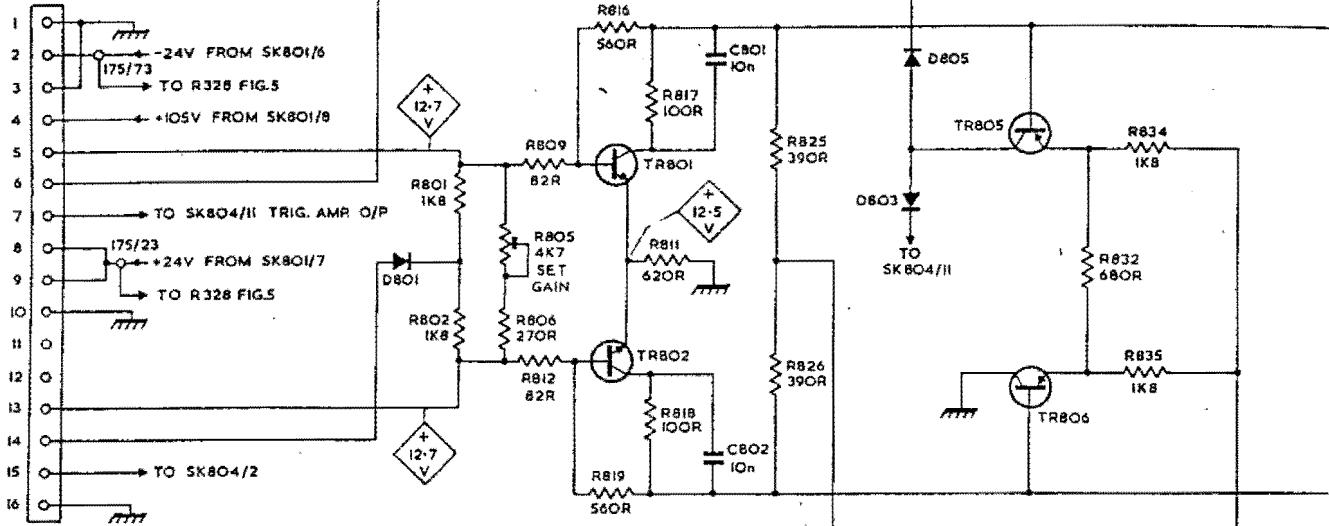

Brown shows the rear track as seen through the board, blue the component side track.

Location of components are listed on the page preceding the PCBs.
