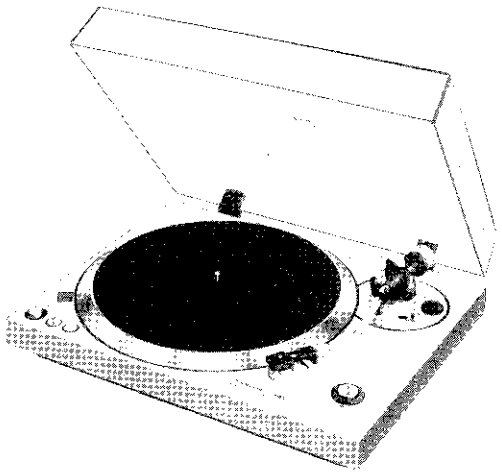
QUARTZ

Direct Drive Automatic Turntable System

261 SL-1401 (MC)

SL-1401



- The model SL-1401 (MC) is available in Canada only.

SPECIFICATIONS

Specifications are subject to change without notice for further improvement.

General	
Power supply:	AC120V, 50 or 60 Hz
Power consumption:	9.5W
Dimensions: (H x W x D)	12.5 x 45.3 x 36.9 cm 4-15/16 x 17-3/4 x 14-9/16
Weight:	9.3 kg (20 lb.)
Turntable section	
Type:	Automatic turntable, Auto return, Auto stop.
Drive method:	Direct drive
Motor:	Brushless DC motor
Drive control method:	Quartz-phase locked control
Turntable platter:	Aluminum die-cast Diameter 33 cm (13 inches) Weight 2.2 kg (4.8 lb.) Moment of inertia 310 kg·cm^2 (106 lb·in^2)
Turntable speeds:	33-1/3 rpm and 45 rpm
Starting torque:	1 kg·cm (0.9 lb·in)
Braking system:	Electronic brake
Speed fluctuation due to load torque:	0% within 0.9 kg·cm (0.8 lb·in)
Speed drift:	Within ±0.002%
Wow and flutter:	0.025% WRMS (JIS C5521) ±0.035% peak (IEC 98A Weighted)
Rumble:	−73 dB (IEC 98A Weighted) −50 dB (IEC 98A Unweighted)
Tonearm section	
Type:	Universal tonearm Gimbal suspension "S" shaped tubular arm Static balanced type
Effective length:	230 mm (9-1/16 inches)
Overhang:	15 mm
Tracking error angle:	+3° at the outer groove of 30 cm (12") record +1° at the inner groove of 30 cm (12") record
Offset angle:	21.5°
Friction:	Less than 7 mg (lateral, vertical)
Effective mass:	22 g (with 6 g cartridge weight, 1.75 g stylus pressure)
Stylus pressure adjustment range:	0 – 3 g
Applicable cartridge weight range:	5 – 11 g
Headshell weight:	9.5 g

Weights and dimensions shown are approximate.

■ PARTS IDENTIFICATION

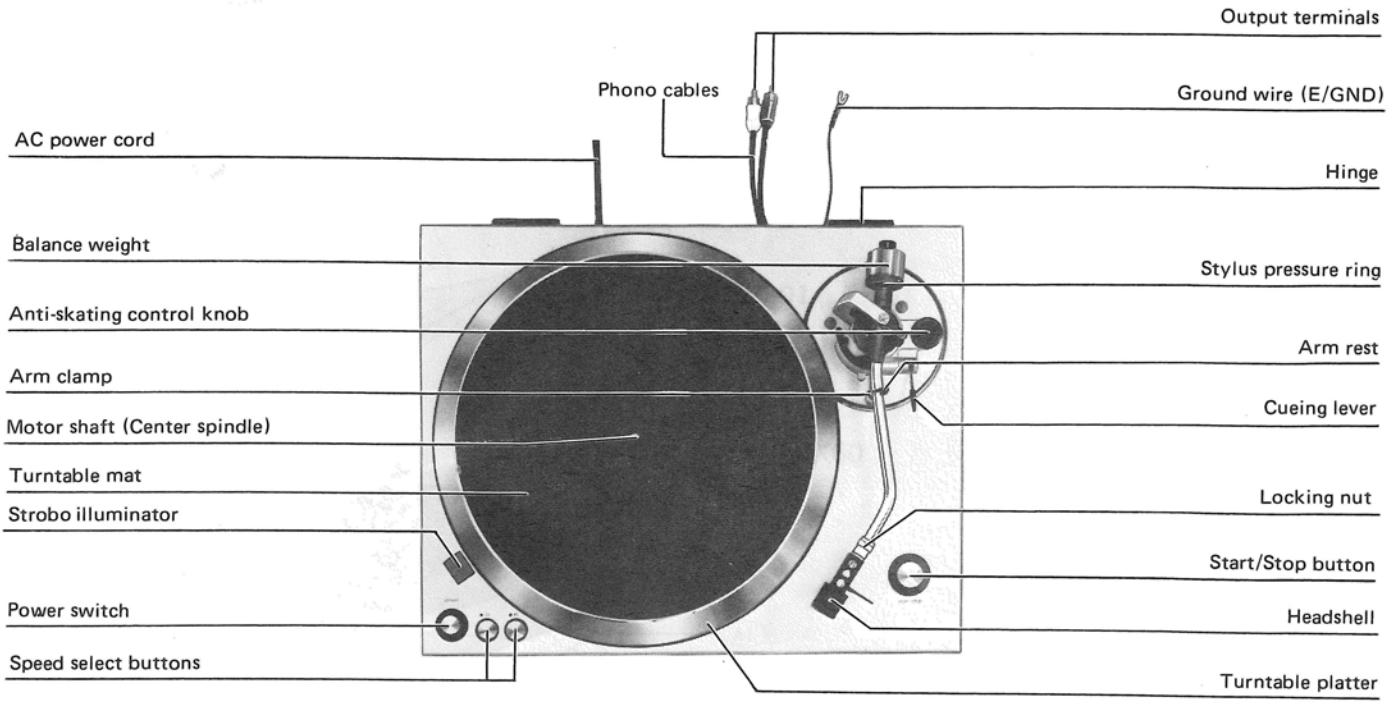

Fig. 1

■ FEATURES

Three kinds of high integration IC's.
In high accuracy quartz control, advanced electronic circuit technique and IC formation technique are required.
Technics employs the three kinds of high density IC, i.e., IC for frequency divider (DN860) adpoting I^2L and ECL. IC for phase and speed control (AN660), and IC for driving (AN640), and thus has produced a high accuracy quartz-locked turntable with a less than ±0.002% speed drift. (In conditions for normal use in which the temperature is stable, the drift is only approximately ±0.00001%)

Double isolator with particular emphasis on prevention of acoustic feedback.
Rotational accuracy may be said to have reached the ultimate with the superior quartz control system. In order to maximize such high performance, the double isolator (double-isolated vibration-damping mechanism), unique in Technics has been employed, while the turntable and tonearm are installed on a base weighted by the integrated construction of the main base and bottom cover, with the entire base floating in stable equilibrium with respect to the main turntable base through special isolators. Additionally, the main turntable base is also provided with an isolator superior in vibration damping characteristics. The combined effect obtained from the two kinds of isolators results in extremely superior vibration cut-off and absorption characteristics against external vibrations and local resonance from the direct sound pressure of the speakers, the floor etc. giving a marked improvement in prevention of howling.

Highly sensitive gimbal suspension system.
With the high precision pivot bearings employed for the horizontal and vertical journals of the tonearm, in concert with the adoption of the gimbal suspension system, a high sensitivity arm of less than 7 mg friction has been attained, thus making it possible to fully display the performance of the high compliance cartridge.

Motor construction unique to Technics in which the motor rotor is integrally connected to the turntable platter.
The large, heavy weight class precision aluminum diecast finished turntable has the remarkable moment of inertia of 310 $kg \cdot cm^2$.

Precision aluminum diecase cabinet unique to Technics is used.

Superior load fluctuation characteristics.
By using the high precision quartz phase-locked control system and high-torque motor, stable load fluctuation characteristics are obtained, with no speed change even at a stylus pressure of 180 g.

Smooth braking is achieved with the fully electronic system which also makes possible almost instantaneous speed change.

■ DISASSEMBLY INSTRUCTIONS

1. Remove headshell and balance weight.
2. Clamp tone arm to the arm rest.
3. Remove turntable platter.
4. Close dust cover
5. Turn unit upside down taking special care not to damage or scratch the dust cover.
6. Remove the 4 screws from the Insulator. (See Fig. 2)
7. Holding the player firmly with both hands, to prevent separation of upper section (turntable base) from lower section (main base), turn it carefully upwards.
8. Remove dust cover.
9. Remove the 4 screws from the panel cover.
10. Unplug the 3 plug-in connectors and 2 cord clamps.
11. To remove the turntable base from the main base bottom section, turn cueing lever upward (cueing position) and move tone arm towards center of spindle. Top section can be lifted up easily.
12. Remove the 3 screws from the start/stop circuit board (See Fig. 3)
13. To reassemble, perform steps 1 through 11 in reverse.

Note: The turntable horizontally to the panel face is already adjusted before shipment.
If deviated, correct it by means of the adjust screws using a 4mm box spanner.

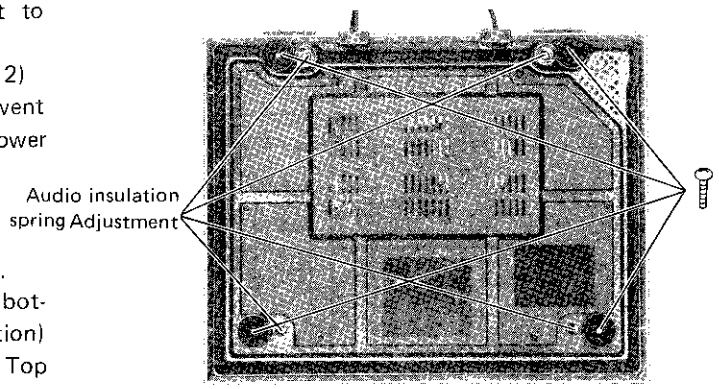

Fig. 2

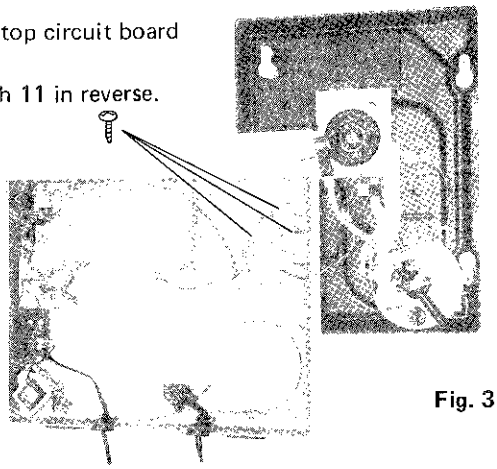

Fig. 3

■ CONNECTOR CONNECTION POINTS FOR INSPECTION

Connect the disassembled main unit and main base as shown in the figure below.

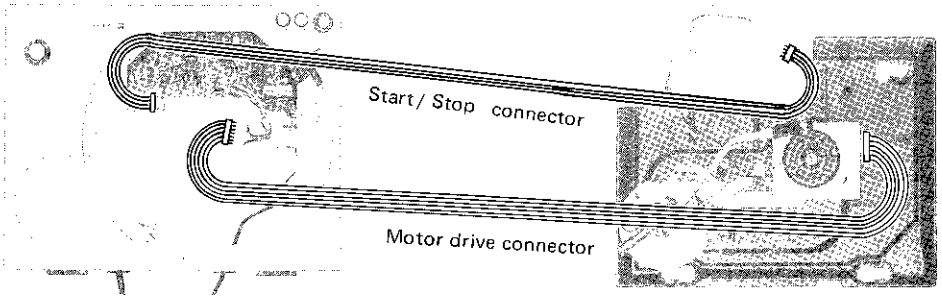

Fig. 4

■ ADJUSTMENTS

Adjustment for automatic return position

(See Fig. 5)
(Remove the turntable mat.)
In cases where the tonearm tends to return before the playing has finished.

– **Move counterclockwise.**

In cases where the tonearm fails to return after the last groove of the record.

– **Move clockwise.**

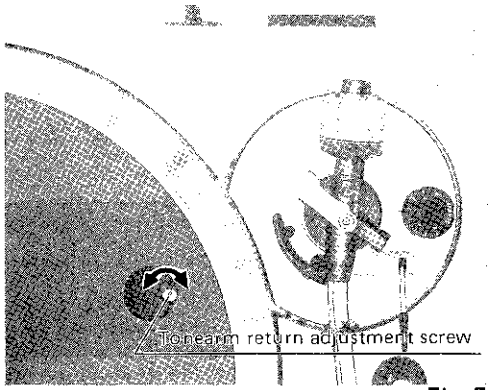

Fig. 5

■ ADJUSTMENTS

Adjustment Points of Electrical System

NOTE: Make the following adjustments after replacing parts such as IC's, transistors, diodes, etc.

	Adjustment	Connection Points	Adjustment Point	Adjustment Method
A	Adjustment of standard voltage (VS)	DC voltmeter or Oscilloscope ⊕ → TP8 ⊖ → GROUND	**VR203**	Turn start switch on to begin turntable rotation. For 33 rpm . . . adjust VR203 for DC 2.10V ±0.05V. For 45 rpm . . . confirm that there is DC 2.80 ~ 2.86V.
B	Adjustment of current source (IR)	DC voltmeter or Oscilloscope ⊕ → TP10 ⊖ → TP17	**VR201**	Turn start switch on to begin turntable rotation. Adjust VR201 for 0V potential difference of TP10 and TP17.
C	Tracking adjustment (TRACKING)	Oscilloscope ⊕ → TP11 ⊖ → GROUND	**VR101**	**TP11 waveform**  For 33 rpm . . . adjust VR101 for $8 \leqq To \leqq 8.5$ ms. For 45 rpm . . . confirm that $5.8 \leqq To \leqq 6.4$ ms.
D	Braking adjustment (BRAKE)	——	**VR202**	 Adjust VR202 for complete stop within 150°~ 240° after stop signal initiated. (Turntable becomes free a few seconds after stop.)

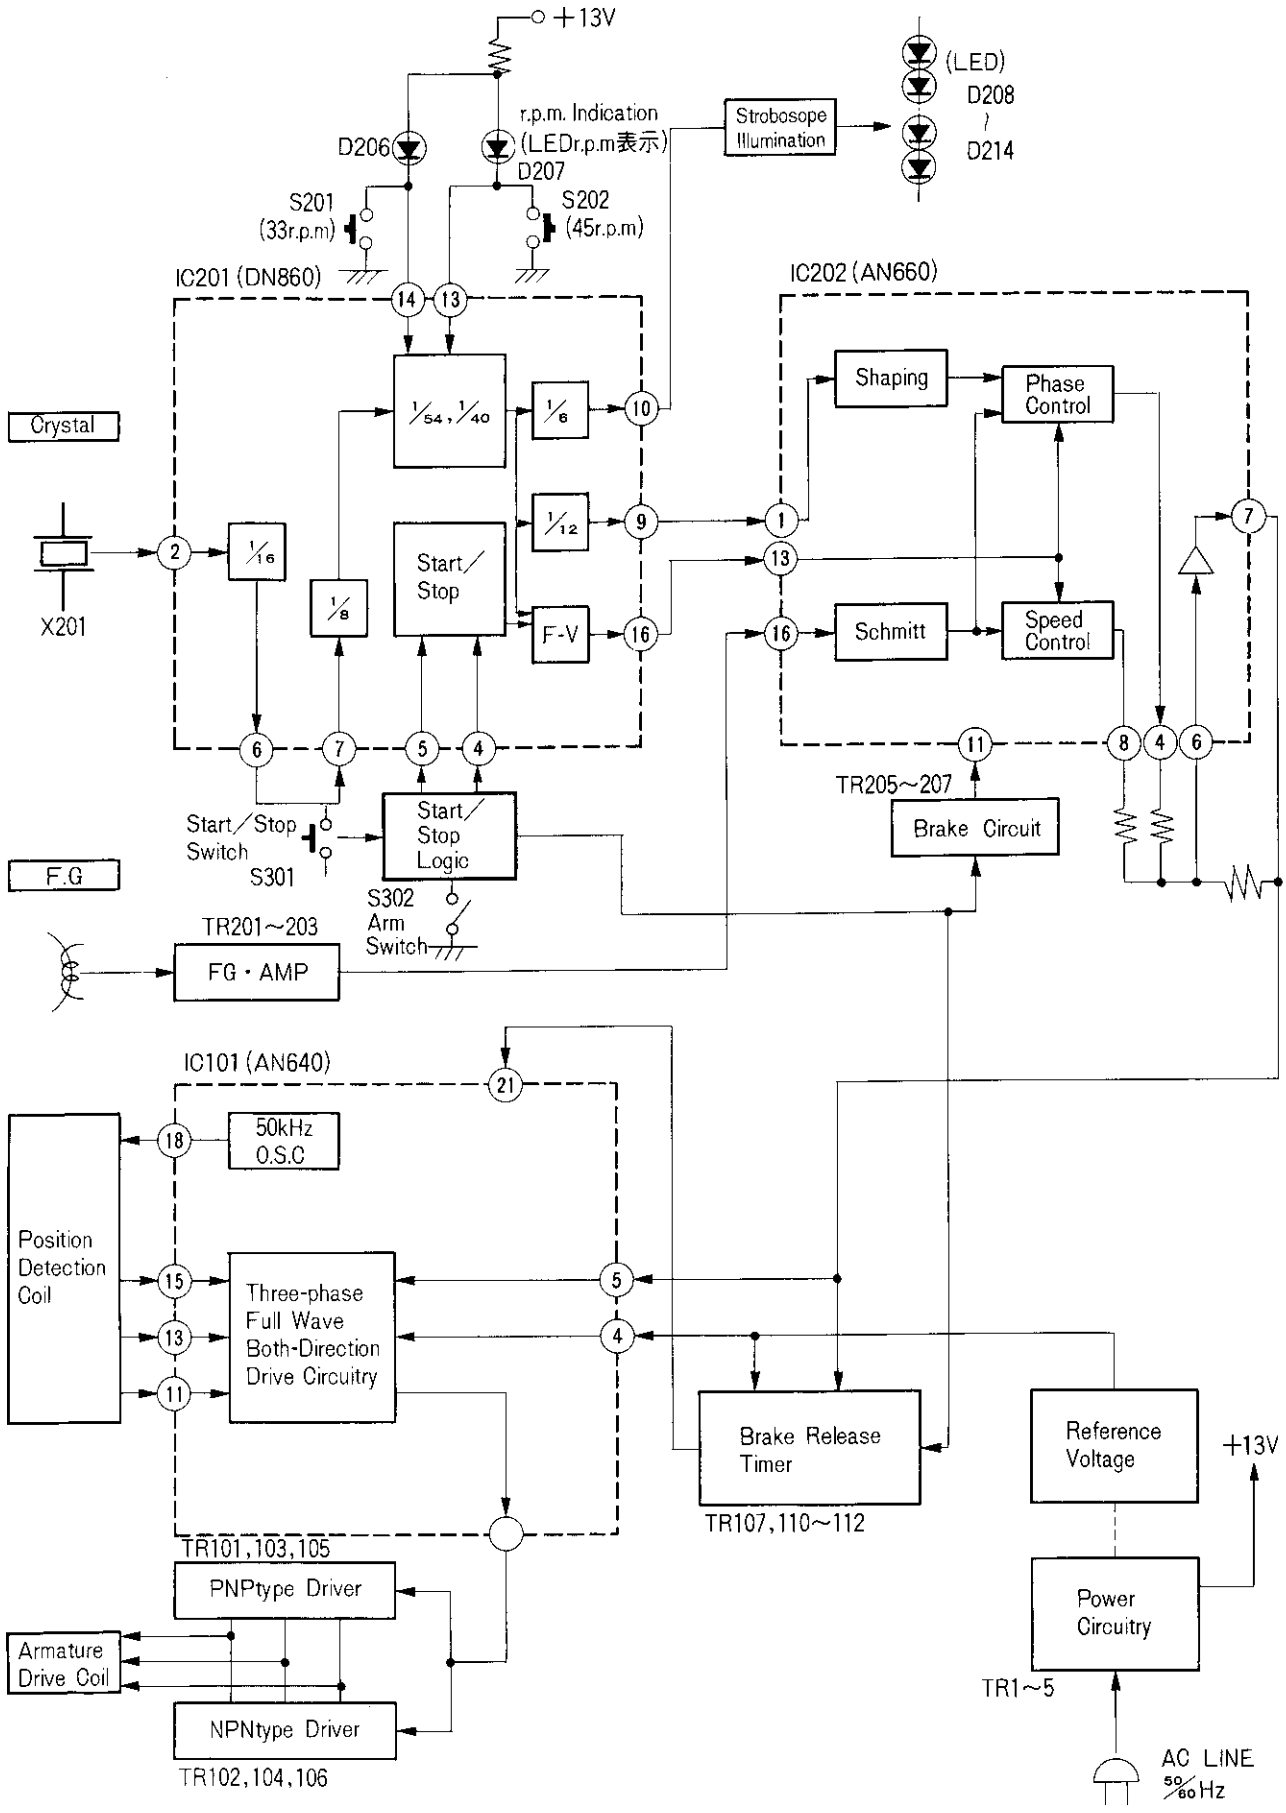
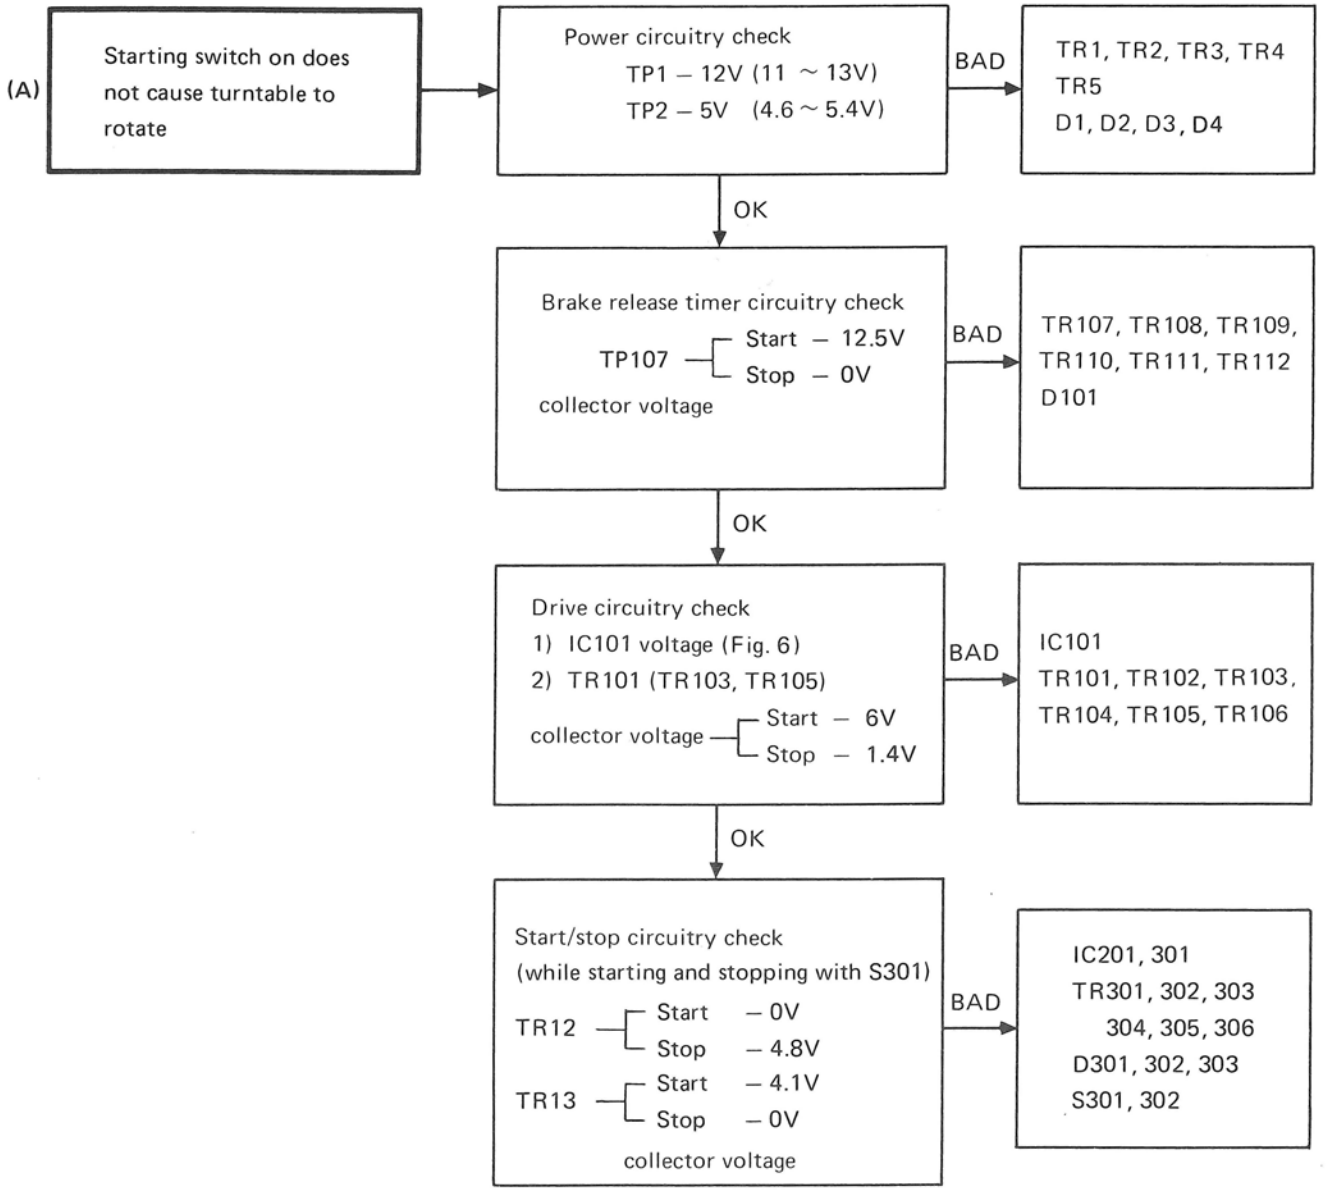
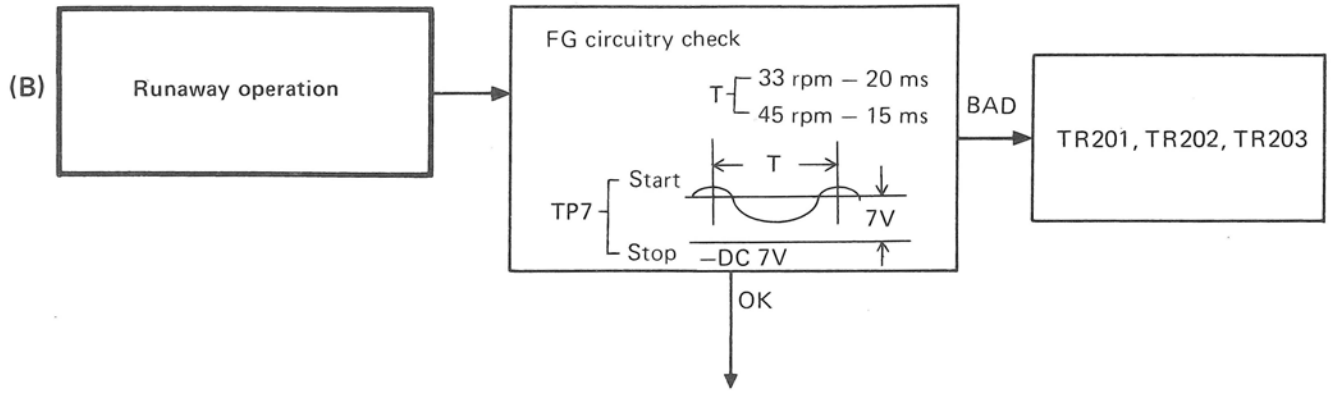
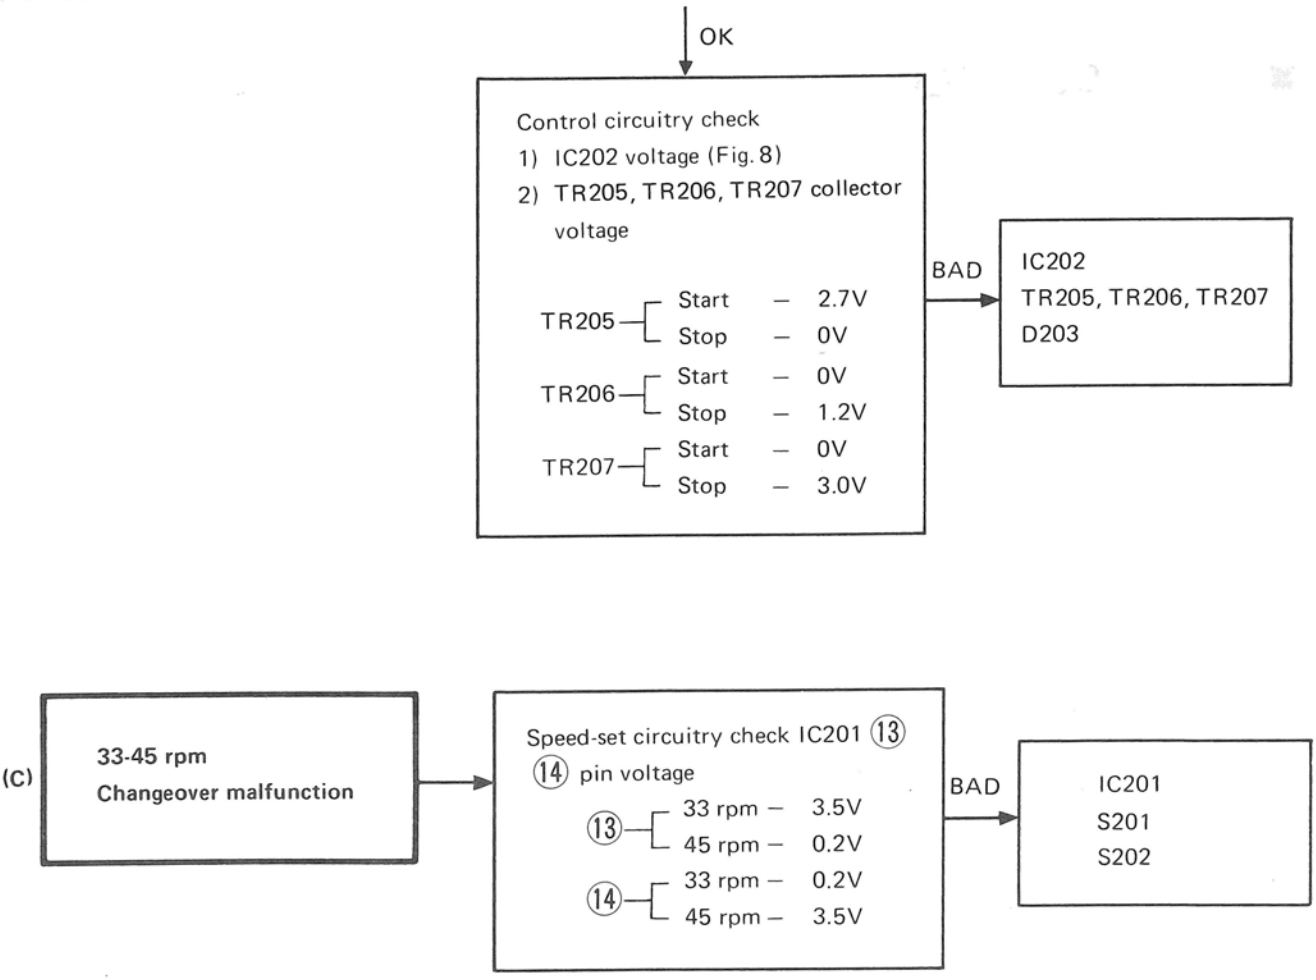
■ BLOCK DIAGRAM



■ TROUBLE SHOOTING







■EXPLANATION OF START/STOP CIRCUITRY

Notes: (1) The start/stop circuitry is composed of a combination of logic circuitry and the mechanism.
(2) The "H" and "L" logic values are positive logic.
1 = H 0 = L

The number 4 and 5 terminals of IC201 (DN860) are the start/stop circuitry terminals. When number 4 terminal is "L" and the number 5 terminal is "H" the motor will operate, and will stop when they are the reverse.

(1) When power switch S1 is turned on (motor stopped):
TR301 and TR302 compose the RS flip-flop circuitry, and TP12 is set to "H" and TP13 to "L" by C304.

(2) When start/stop switch S301 is pushed one time (motor operates):
When S301 is pushed, the flip-flop circuitry, through D302, reverses TP12 to "L" and TP13 to "H."

(3) Circuitry condition during operation:
When S301 is released, number 8 and 9 terminals of IC301 become "H" the time of the integrating circuit (consisting of R302, C302 and R303) is delayed, and "H" voltage is applied to the base of TR303.

(4) When start/stop switch S301 is pushed again:
It becomes on because bias is applied between the base and emitter of TR303, and, because TR304, TR305 and TR306 also become on, the MGK is driven, and the arm is returned by the main gear.

(5) When the arm returns (motor stopped):
When the arm returns, number 1 and 2 terminals of IC301 (on" during operation) become "H" so that number 3 terminal momentarily becomes "L" and, therefore, a positive pulse is generated at number 4 terminal of IC301, which, through D301, inverts the flip-flop circuitry, changing TP12 to "H" and TP13 to "L."
