Mains Frequency	50Hz
Power Consumption	110° 126W; 90° 75W;
In Stby Mode	110° 8 Watt 90° 5 Watt

RECOMMENDATION FOR SERVICE REPAIRS

- 1- Use only original spare parts. Only use components with the same specifications for replacement.
- 2- Original fuse value only should be used.
- 3- Main leads and connecting leads should be checked for external damage before connection.
Check the insulation.
- 4- Parts contributing to the safety of the product must not be damaged or obviously unsuitable.
This is valid especially for insulators and insulating parts.
- 5- Thermally loaded solder pads are to be sucked off and re-soldered.
- 6- Ensure that the ventilation slots are not obstructed.
- 7- Potentials as high as 25 KV are present when this receiver is operating. Operation of the receiver outside the cabinet or with back cover removed invol-

ve a shock hazard from the receiver.
Servicing should not be attempted by anyone who is not thoroughly familiar with the precautions necessary when working on high voltage equipment. Perfectly discharge the high potential of the picture tube before handling the tube. The picture tube is highly evacuated and if broken. Glass fragments will be violently expelled. Always discharge the picture tube anode to the receiver chassis to keep of the shock hazard before removing the anode cap.

- 8- Keep wire away from the high voltage or high temperature components.
- 9- When replacing a wattage resistor in circuit board, keep the resistor 10 mm away from circuit board.

HANDLING OF MOS CHIP COMPONENTS

MOS circuit requires special attention with regard to static charges. Static charges may occur with any highly insulating plastics and can be transferred to persons wearing clothes and shoes made of synthetic materials. Protective circuits on the inputs and outputs of mos circuits give protection to a limited extend only due to time of reaction.

Please observe the following instructions to protect the components against damage from static charges.

- 1- Keep mos components in conductive package until they are used. Most components must never be sto-

red in styropor materials or plastic magazines.

- 2- Persons have to rid themselves of electrostatic charges by touching MOS components.
- 3- Hold the component by the body touching the terminals.
- 4- Use only grounded instruments for testing and processing purposes.
- 5- Remove or connect MOS ICs when operating voltage is disconnected.

X-RAY RADIATION PRECAUTION

- 1- Excessive high voltage can be produce potentially hazardous X-RAY radiation. To avoid such hazard, the high voltage must not be above the specified limit. The nominal value of the high voltage of this receiver is 25KV at zero beam current (minimum brightness) under 220V AC power source. The high voltage must not under any circumstance, exceed 30KV. It is recommended the reading of the high vol-

tage be recorded as a part of the service record. It is important to use an accurate and reliable high voltage meter.

- 2- The primary source of X-RAY radiation in this TV receiver is the picture tube. For continued X-RAY radiation protection, the replacement tube must be exactly the same type tube as specified in the part list.

SERVICE MENU

The service menu is entered by pressing the <SUB-PAGE> key on the RC and VOLUME-DOWN key on the TV simultaneously when the TV is in TV-mode. The service menu is left by pressing the <TV> key.

When entering the service mode the first menu item is IF (selection of normal IF). Next items can be selected using the keys <PROGRAM-UP> and <PROGRAM-DOWN>. The value of each item can be changed using the keys <VOLUME-UP> and <VOLUME-DOWN>. The item values are displayed as decimal values, except for the tuner-band-selection, BITS and option items.

They are displayed as hexa-decimal values. All values are stored in non-volatile memory when the service menu is left. The "INIT CTV832U" item initializes the NVM: It clears all names and tuning information of all programs and writes default values for the service alignments and preset values in NVM. While doing so, the OSD displays "BUSY". When the initialization is finished, the message "READY" is written on the screen.

Item	Default	Explanation
IF	38.9	IF selection (58.8, 45.8, 38.9 or 38.00 MHz)
IFL1	33.9	IF for SECAM-L1 selection (33.4 or 33.9 MHz)
HP	31	Horizontal parallelogram
HB	31	Horizontal bow
EW	37	East-west Width for picture setting 16:9
PW	18	East-west Parabola for picture setting 16:9
UCP	13	East-west Upper Corner parabola for picture setting 16:9
LCP	13	East-west Lower Corner parabola for picture setting 16:9

16:9 / 4:3 Adjustment

The CTV832U software uses two sets of parameters for the registers HP (horizontal parallelogram), HB (horizontal bow), EW (EW width), PW (parabola/width), UCP (upper corner parabola), LCP (lower corner parabola) and IC (EW trapezium). They occur in the service menu for 16:9 screen with the listed abbreviations.

For the 4:3 screen there is a second set of these registers. They occur in the service menu with the extension '4:3' (i.e. HP4:3, HB4:3,...).

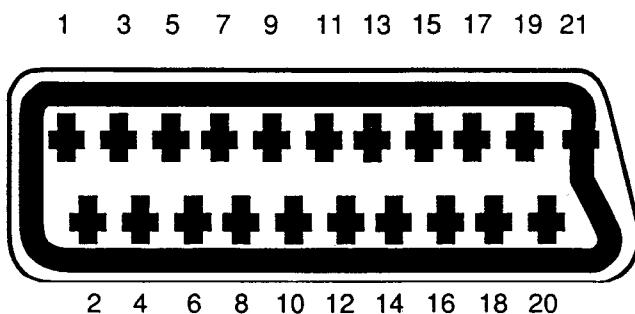

Each register set must be adjusted under the right conditions i.e. the 16:9 settings are adjusted with a 16:9 picture - the 4:3 settings with a 4:3 picture.

The inenu items EW, PW, UCP, LCP, TC, HP4:3, HB4:3,... TC4:3 and VX will only be in the service menu if the option 16:9 is set in 4 th option byte.

TDA16846 Block Diagrams

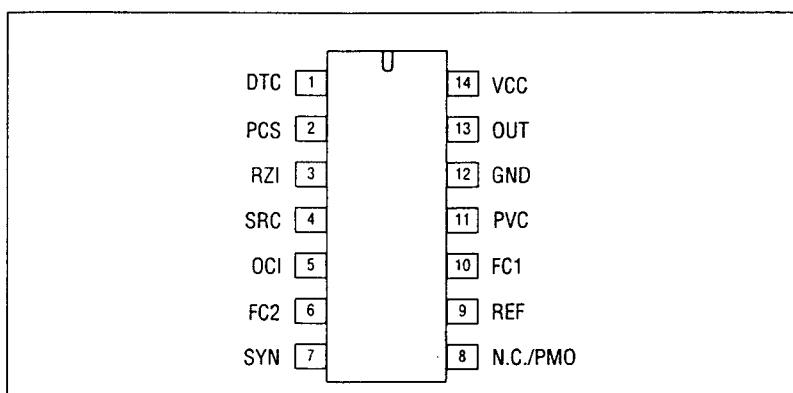

TDA16846**Controller For Switch Mode Power Supplies**

The TDA16846 is suited for TV-, VCR-sets and SAT receivers. It also can be good used in PC monitors.

The TDA 16847 is identical with TDA16846 but has an additional power measurement output (pin 8) which can be used a Temporary High Power Circuit.

Pin Configuration (top view)

Pin Definitions and Functions

Pin	Symbol	Function
1	OTC	Off Time Circuit
2	PCS	Primary Current Simulation
3	RZI	Regulation and Zero Crossing Input
4	SRC	Soft-Start and Regulation Capacitor
5	OCI	Opto Coupler Input
6	FC2	Fault Comparator 2
7	SYN	Synchronization Input
8	N.C./PMO	Not Connected (TDA16846)
9	REF	Reference Voltage and Current
10	FC1	Fault Comparator 1
11	PVC	Primary Voltage Check
12	GND	Ground
13	OUT	Output
14	VCC	Supply Voltage

Short Description of the Pin Functions

Pin	Functions
1	A parallel RC-circuit between this pin and ground determines the ringing suppression time and the standby-frequency.
2	A capacitor between this pin and ground and a resistor between this pin and the positive terminal of the primary elcap quantifies the max. possible output power of the SMPS.
3	This is the input of the error amplifier and the zero crossing input. The output of a voltage divider between the control winding and ground is connected to this input. If the pulses at pin 3 exceed a 5 V threshold, the control voltage at pin 4 is lowered.
4	This is the pin for the control voltage. A capacitor has to be connected between this pin and ground. The value of this capacitor determines the duration of the softstart and the speed of the control.
5	If an opto coupler for the control is used, it's output has to be connected between this pin and ground. The voltage divider at pin 3 has then to be changed, so that the pulses at pin 3 are below 5 V.
6	Fault comparator 2: If a voltage > 1.2 V is applied to this pin, the SMPS stops.
7	If fixed frequency mode is wanted, a parallel RC circuit has to be connected between this pin and ground. The RC-value determines the frequency. If synchronized mode is wanted, sync pulses have to be fed into this pin.
8	Not connected (TDA16846). / This is the power measurement output of the Temporary High Power Circuit. A capacitor and a RC-circuit has to be connected between this pin and ground.
9	Output for reference voltage (5 V). With a resistor between this pin and ground the fault comparator 2 (pin 6) is enabled.
10	Fault comparator i: If a voltage > 1 V is applied to this pin, the SMPS stops.
11	This is the input of the primary voltage check. The voltage at the anode of the primary elcap has to be fed to this pin via a voltage divider. If the voltage of this pin falls below 1 V, the SMPS is switched off. A second function of this pin is the primary voltage dependent fold back point correction (only active in free running mode).
12	Common ground.
13	Output signal. This pin has to be connected across a serial resistor with the gate of the power transistor.
14	Connection for supply voltage and startup capacitor. After startup the supply voltage is produced by the control winding of the transformer and rectified by an external diode.

ELECTRICAL CHARACTERISTICS**Absolute maximum ratings**

All voltages listed are referenced to ground (0V, Vss) except where noted.

Parameter	Symbol	Limit Values		Unit	Remarks
		Min.	Typ.		
Supply Voltage at Pin 14	V _{CC}	-0.3	17	V	-
Voltage at Pin 1, 4, 5, 6, 7, 9, 10	-	-0.3	6	V	-
Voltage at Pin 2, 8, 11	-	-0.3	17	V	-
Voltage at Pin 3	RZI		6	V	-
Current into Pin 3		-10		mA	V ₃ < -0.3V
Current into Pin 9	REF	-1	-	mA	-
Current into Pin 13	OUT	-100	100	mA	V ₁₃ > -V _{CC}
				mA	V ₁₃ < -0V
ESD Protection	-	-	2	kV	MIL STD 883C method 3015.6, 100 PF, 1500Ω
Storage Temperature	T _{stg}	-65	125	°C	-
Operating Junction Temperature	T _j	-	125	°C	-
Thermal Resistance Junction-Ambient	R _{thJA}	-	110	K/W	P-DIP-14-3
Soldering Temperature	-	-	260	°C	-
Soldering Time -	-	10	s	-	

Note: Stresses above those listed here may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

μ-CONTROLLER

- 80C51 μ-controller core standard instruction set and timing
- 1 μs machine cycle
- 32 - 128Kx8-bit late programmed ROM
- 3 - 12Kx8-bit Auxiliary RAM (shared with Display and Acquisition)
- Interrupt controller for individual enable/disable with two level priority
- Two 16-bit Timer/Counter registers
- WatchDog timer
- Auxiliary RAM page pointer
- 16-bit Data pointer
- IDLE and Power Down (PD) mode
- 14 bits PWM for Voltage Synthesis Tuning
- 8-bit A/D converter
- 4 pins which can be programmed as general I/O pin, ADC input or PWM (6-bit) output

DATA CAPTURE

- Text memory for 1 or 10 pages
- In the 10 page versions inventory of transmitted Teletext pages stored in the Transmitted Page Table (TPT) and Subtitle Page Table (SPT)
- Data Capture for US Closed Caption
- Data Capture for 525/625 line WST, VPS (PDC system A) and Wise Screen Signalling (WSS) bit decoding
- Automatic selection between 525 WST/625 WST
- Automatic selection between 625 WST/VPS on line 16 of VBI
- Real-time capture and decoding for WST Teletext in Hardware, to enable optimized μ-processor throughput
- Automatic detection of FASTEXT transmission
- Real-time packet 26 engine in Hardware for processing accented, G2 and G3 characters
- Signal quality detector for video and WST/VPS data types
- Comprehensive teletext language coverage
- Full Field and Vertical Blanking Interval (VBI) data capture of WST data

DISPLAY

- Teletext and Enhanced OSD modes
- Features of level 1.5 WST and US Close Caption
- Serial and Parallel Display Attributes
- Single/Double/Quadruple Width and Height for characters
- Scrolling of display region
- Variable flash rate controlled by software
- Enhanced display features including overlining, underlining and italics
- Soft colours using CLUT with 4096 colour palette
- Globally selectable scan lines per row (9/10/13/16) and character matrix [12x10, 12x13, 12x16 (VxH)]
- Fringing (Shadow) selectable from N-S-E-W direction
- Fringe colour selectable
- Meshing of defined area
- Contrast reduction of defined area
- Cursor
- Special Graphics Characters with two planes, allowing four colours per character
- 32 software redefinable On-Screen display characters
- 4 WST Character sets (GO/G2) in single device (e.g. Latin, Cyrillic, Greek, Arabic)
- G1 Mosaic graphics, Limited G3 Line drawing characters
- WST Character sets and Closed Caption Character set in single device.

TDA935X/6X/8X

TV signal processor-Teletext decoder with embedded µ-Controller

GENERAL DESCRIPTION

The various versions of the TDA935X/6X/8X series combine the functions of a n/ signal processor together with a µ-Controller and US Closed Caption decoder. Most versions have a Teletext decoder on board. The Teletext decoder has an internal RAM memory for 1 or 10 page text. The ICs are intended to be

used in economy television receivers with 90° and 110° picture tubes.

The ICs have supply voltages of 8 V and 3.3 V and they are mounted in S-DIP envelope with 64 pins.

The features are given in the following feature list. The differences between the various ICs are given in the table on page 4.

FEATURES

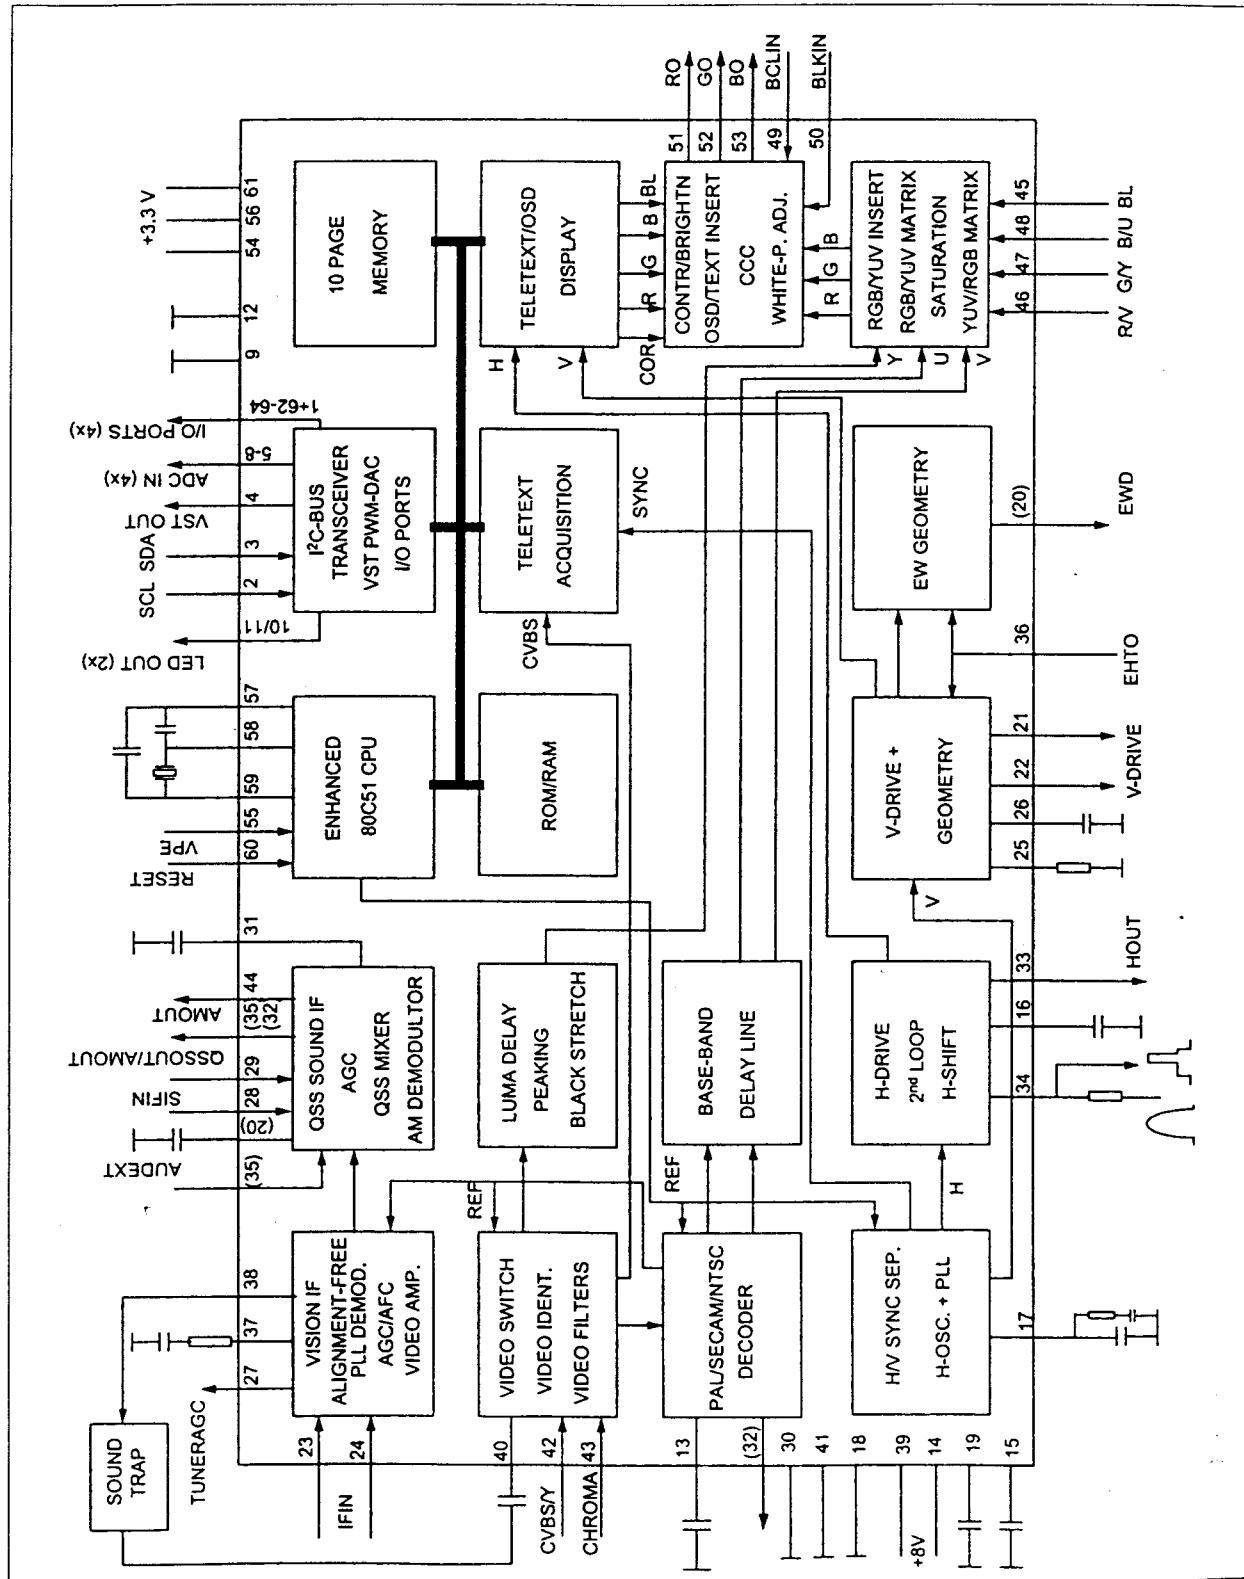

TV-signal processor

- Multi-standard vision IF circuit with alignment-free PLL demodulator
- Internal (switchable) time-constant for the IF-AGC circuit
- A choice can be made between versions with mono intercarrier sound FM demodulator and versions with QSS IF amplifier.
- The mono intercarrier sound versions have a selective FM-PLL demodulator which can be switched to the different FM sound frequencies (4.5/5.5/6.0/6.5 MHz). The quality of this system is such that the external band-pass filters can be omitted.
- Source selection between 'internal' CVBS and external CVBS or Y/C signals
- Integrated chrominance trap circuit
- Integrated luminance delay line with adjustable delay time
- Asymmetrical 'delay line type' peaking in the luminance channel
- Black stretching for non-standard luminance signals
- Integrated chroma band-pass filter with switchable centre frequency
- Only one reference (12 MHz) crystal required for the CL-Controller, Teletext- and the colour decoder
- PAL/NTSC or multi-standard colour decoder with automatic search system
- Internal base-band delay line
- RGB control circuit with 'Continuous Cathode Calibration', white point and black level off set adjustment so that the colour temperature of the dark and the light parts of the screen can be chosen independently.
- Linear RGB or YUV input with fast blanking for external RGB/YUV sources. The Text/OSD signals are internally supplied from the µ-Controller/Teletext decoder
- Contrast reduction possibility during mixed-mode of OSD and Text signals
- Horizontal synchronization with two control loops and alignment-free horizontal oscillator
- Vertical count-down circuit
- Vertical driver optimized for DC-coupled vertical output stages
- Horizontal and vertical geometry processing
- Horizontal and vertical zoom function for 16 : 9 applications
- Horizontal parallelogram and bow correction for large screen picture tubes

QUICK REFERENCE DATA

PINNING

SYMBOL	PIN	DESCRIPTION
GND1	41	ground 1 for TV-processor
CVBS/Y	42	external CVBS/Y input
CHROMA	43	chrominance input (SVHS)
AUDOUT / AMOUT ⁽¹⁾	44	audio output / AM audio output (volume controlled)
INSSW2	45	2 nd RGB /YUV insertion input
R2/VIN	46	2 nd R input / V (R-Y) input
G2 YIN	47	2 nd G input Y input
B2 UIN	48	2 nd B input / U (B-Y) input
BCLIN	49	beam current limiter input/V-guard input
BLKIN	50	black current input
RO	51	Red output
GO	52	Green output
BO	53	Blue output
VDDA	54	analog supply of Teletext decoder and digital supply of TV-processor (3.3 V)
VPE	55	OTP Programming Voltage
VDDC	56	digital supply to core (3.3V)
OSCGND	57	oscillator ground supply
XTALIN	58	crystal oscillator input
XTALOUT	59	crystal oscillator output
RESET	60	reset
VDDP	61	digital supply to periphery (+3.3 V)
P1.0/INT1	62	port 1.0 or external interrupt 1 input
P1.1/T0	63	port 1.1 or Counter/Timer 0 input
P1.2/INT0	64	port 1.2 or external interrupt 0 input

Note

1. The function of pin 20, 28, 29, 31, 32, 35 and 44 is dependent on the IC version (mono intercarrier FM demodulator / QSS IF amplifier and East-West output or not) and on some software control bits. The valid combinations are given in table 1.

Table 1 Pin functions for various versions

IC version	FM-PLL version			QSS version							
East-West Y/N	N	Y		N			Y				
CMB1/CMB0 bits	-	00	01/10/11	00	01/10/11	00	01/10/11

TDA9870A

Digital TV sound processor (DTVSP)

FEATURES

1.1 Demodulator and decoder section

- Sound IF (SIF) input switch e.g. to select between terrestrial TV SIF and SAT SIF sources
- SIF AGC with 24 dB control range
- SIF 8-bit Analog-to-Digital Converter (ADC)
- Two-carrier multistandard FM demodulation (B/G, D/K and M standard)
- Decoding for three analog multi-channel systems (A2, A2+ and A2*) and satellite sound
- Programmable identification (B/G, D/K and M standard) and different identification times.

1.2 DSP section

- Digital crossbar switch for all digital signal sources and destinations
- Control of volume, balance, contour, bass, treble, pseudo stereo, spatial, bass boost and soft-mute
- Plop-free volume control
- Automatic Volume Level (AVL) control
- Adaptive de-emphasis for satellite
- Programmable beeper
- Monitor selection for FM/AM DC values and signals, with peak detection option
- I²S-bus interface for a feature extension (e.g. Dolby surround) with matrix, level adjust and mute.

1.3 Analog audio section

- Analog crossbar switch with inputs for mono and stereo (also applicable as SCART 3 input), SCART 1 input/output, SCART 2 input/output and line output
- User defined full-level/-3 dB scaling for SCART outputs
- Output selection of mono, stereo, dual A/B, dual A or dual B
- 20 kHz bandwidth for SCART-to-SCART copies
- Standby mode with functionality for SCART copies
- Dual audio digital-to-analog converter from DSP to analog crossbar switch, bandwidth 15 kHz
- Dual audio ADC from analog inputs to DSP
- Two dual audio Digital-to-Analog Converters (DACs) for loudspeaker (Main) and headphone (Auxiliary) outputs; also applicable for L, R, C and S in the Dolby Pro Logic mode with feature extension.

2 GENERAL DESCRIPTION

The TDA9870A is a single-chip Digital TV Sound Processor (DTVSP) for analog multi-channel sound systems in TV sets and satellite receivers.

2.1 Supported standards

The multistandard/multi-stereo capability of the TDA9870A is mainly of interest in Europe, but also in Hong Kong/Peoples Republic of China and South East Asia. This includes B/G, D/K, I, M and L standard. In other application areas there exists only subsets of those standard combinations otherwise only single standards are transmitted.

M standard is transmitted in Europe by the American Forces Network (AFN) with European channel spacing (7 MHz VHF, 8 MHz UHF) and monaural sound.

Korea has a stereo sound system similar to Europe and is supported by the TDA9870A. Differences include deviation, modulation contents and identification. It is based on M standard.

An overview of the supported standards and sound systems and their key parameters is given in.(Table 1).

The analog multi-channel sound systems (A2, A2+ and AP) are sometimes also named 2CS (2 carrier systems).

Table 2 Identification for A2 systems

PARAMETER	A2/A2*	A2+ (KOREA)
Pilot frequency	54.6875 kHz = 3.5 x line frequency	55.0699 kHz = 3.5 x line frequency
Stereo identification frequency	117.5 Hz = <u>line frequency</u> 133	149.9 Hz = <u>line frequency</u> 105
Dual identification frequency	274.1Hz = <u>line frequency</u> 57	276.0 Hz = <u>line frequency</u> 57
AM modulation depth	50%	50%

2.1.2 SATELLITE SYSTEMS

An important for satellite TV reception is the 'Astra specification'. The TDA9875A is suited for the reception of Astra and other satellite signals.

Table 3 FM satellite sound

CARRIER TYPE	CARRIER FREQUENCY (MHz)	MODULATION INDEX	MAXIMUM FM DEVIATION (kHz)	MODULATION	BANDWIDTH DE-EMPHASIS (kHz/μs)

sub	8.10/8.28	0.15	50	m/st/d ⁽²⁾	15/adaptive ⁽³⁾

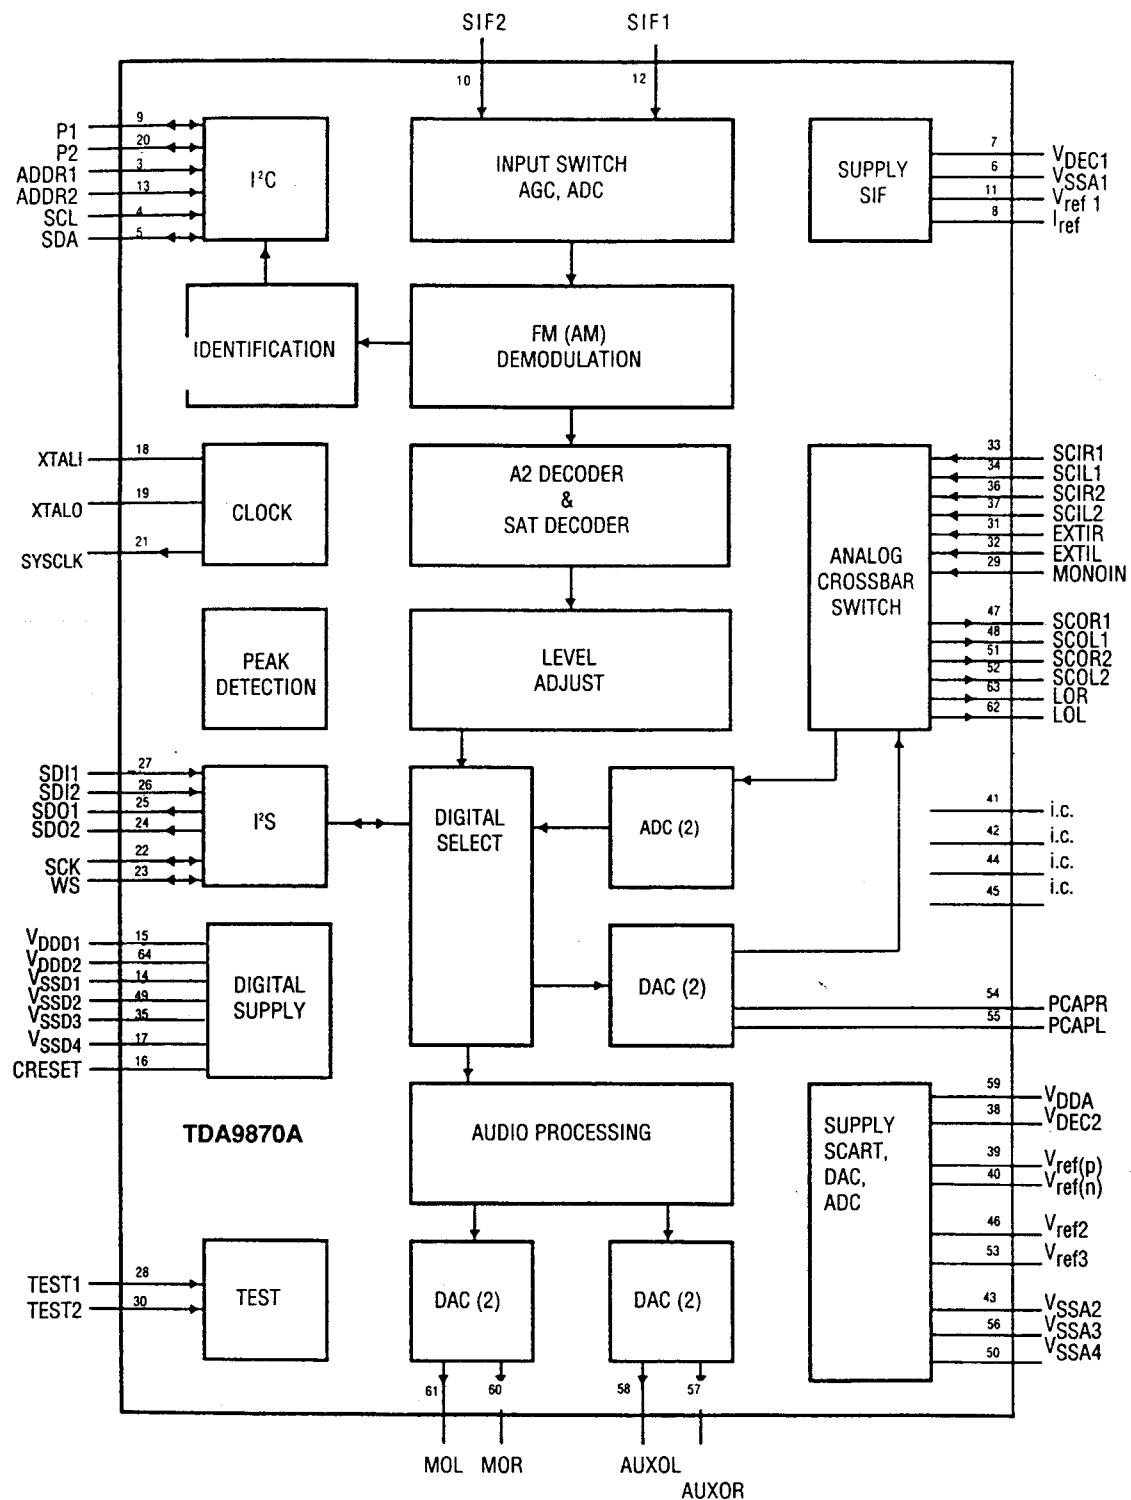

Notes

- For other satellite systems, frequencies of, for example, 5.80, 6.60 or 6.65 MHz can also be received. A de-emphasis of 60 μs, or in accordance with J17, is available.
- m/st/d = mono or stereo or dual language sound.
- Adaptive de-emphasis = compatible to transmitter specification.

2. Test pin, CMOS level input, pull-up resistor, can be connected to V_{SS} .
3. Test pin, CMOS 3-state stage, can be connected to V_{SS} .

Pin configuration

FUNCTIONAL DESCRIPTION

Description of the demodulator and decoder section

6.1.1 SIF INPUT

Two input pins are provided, SIF1 e.g. for terrestrial TV and SIF2 e.g. for a satellite tuner. For higher SIF signal levels the SIF input can be attenuated with an internal switchable -10 dB resistor divider. As no specific filters are integrated, both inputs have the same specification giving flexibility in application. The selected signal is passed through an AGC circuit and then digitized by an 8-bit ADC operating at 24.576 MHz.

6.1.2 AGC

The gain of the AGC amplifier is controlled from the ADC output by means of a digital control loop employing hysteresis. The AGC has a fast attack behaviour to prevent ADC overloads and a slow decay behaviour to prevent AGC oscillations. For AM demodulation the AGC must be switched off. When switched off, the control loop is reset and fixed gain settings can be chosen (see table 14; subaddress 0). The AGC can be controlled via the I²C-bus. Details can be found in the I²C-bus register definitions (see Chapter 10).

6.1.3 MIXER

The digitized input signal is fed to the mixers, which mix one or both input sound carriers down to zero IF. A 24-bit control word for each carrier sets the required frequency. Access to the mixer control word registers is via the I²C-bus.

6.1.4 FM AND AM DEMODULATION

An FM or AM input signal is fed via a band-limiting filter to a demodulator that can be used for either FM or AM demodulation. Apart from the standard (fixed) de-emphasis characteristic, an adaptive de-emphasis is available for encoded satellite programs. A stereo decoder recovers the left and right signal channels from the demodulated sound carriers. Both the European and Korean stereo systems are supported.

6.1.5 FM AND AM DEMODULATION

The identification of the FM sound mode is performed by AM synchronous demodulation of the pilot signal and narrow-band detection of the identification frequencies. The result is available via the I²C-bus interface. A selection can be made via the I²C-bus for B/G, D/K and M standard and for three different modes that represent different trade-offs between speed and reliability of identification.

6.1.6 CRYSTAL OSCILLATOR

The crystal oscillator (XO) is illustrated in Fig.8 (see Chapter 12). The circuitry of the XO is fully integrated, only the external 24.576 MHz crystal is needed.

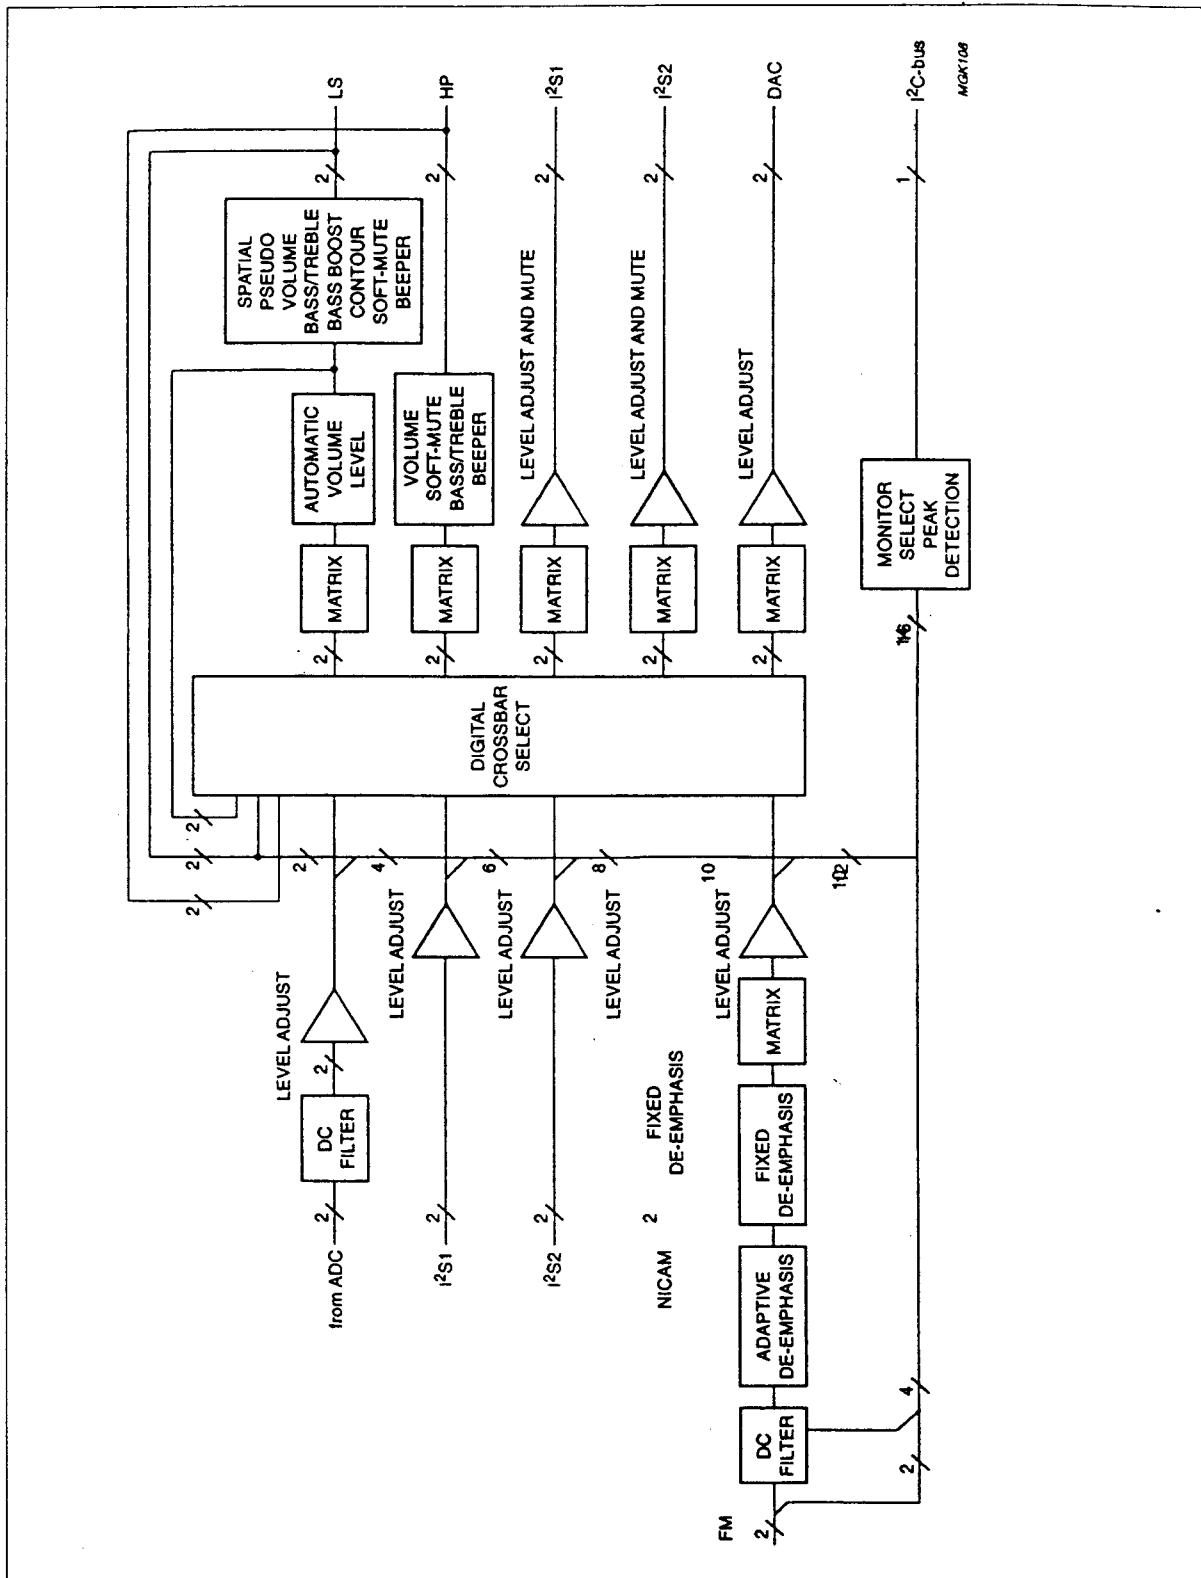

6.1.7 TEST PINS

Both test pins are active HIGH, in normal operation of the device they are wired to V_{SSD1}. Test functions are for manufacturing tests only and are not available to customers. Without external circuitry these pads are pulled down to LOW level with internal resistors.

6.1.8 POWER-ON RESET FLIP-FLOP

The power-on reset flip-flop monitors the internal power supply for the digital part of the device. If the supply has temporary been lower than the specified lower limit, the power-on reset bit FOR, transmitter register subaddress 0 (see Section 10.4.1), will be set to HIGH. The CLRPOR bit, slave register subaddress 1 (see Section 10.3.2), resets the power-on reset flip-flop to LOW.

Description of the DSP

6.2.1 LEVEL SCALING

All input channels to the digital crossbar switch (except for the loudspeaker feedback path) are equipped with a level adjust facility to change the signal level in a range of ± 15 dB. It is recommended to scale all input channels to be 15 dB below full scale (-15 dB full scale) under nominal conditions.

6.2.2 FM (AM) PATH

A high-pass filter suppresses DC offsets from the FM demodulator, due to carrier frequency offsets, and supplies the monitor/peak function with DC values and an unfiltered signal, e.g. for the purpose of carrier detection.

The de-emphasis function offers fixed settings for the supported standards (50 μ s, 60 μ s and 75 μ s). An adaptive de-emphasis is available for Wegener-Panda 1 encoded programs.

A matrix performs the dematrixing of the A2 stereo, dual and mono signals.

6.2.3 MONITOR

This function provides data words from a number of locations of the signal processing paths to the I²C-bus interface (2 data bytes). Signal sources include the FM demodulator outputs, most inputs to the digital crossbar switch and the outputs of the ADC. Source selection and data read-out is performed via the I²C-bus.

Optionally, the peak value can be measured instead of simply taking samples. The internally stored peak value is reset to zero when the data is read via the I²C-bus. The monitor function may be used, for example, for signal level measurements or carrier detection.

6.2.4 LOUDSPEAKER (MAIN) CHANNEL

The matrix provides the following functions; forced mono, stereo, channel swap, channel 1, channel 2 and spatial effects.

There are fixed coefficient sets for spatial settings of 30%, 40% and 52%.

The Automatic Volume Level (AVL) function provides a constant output level of -23 dB full scale for input levels between 0 and -29 dB full scale. There are some fixed decay time constants to choose from, i.e. 2, 4 and 8 s.

Pseudo stereo is based on a phase shift in one channel via a 2nd-order all-pass filter. There are fixed coefficient sets to provide 90 degrees phase shift at frequencies of 150, 200 and 300 Hz.

Volume is controlled individually for each channel ranging from +24 to -83 dB with 1 dB resolution. There is also a mute position. For the purpose of a simple control software in the microcontroller, the decimal number that is sent as an I²C-bus data byte for volume control is identical to the volume setting in dBs (e.g. the I²C-bus data byte +10 sets the new volume value to +10 dB).

Balance can be realized by independent control of the left

and right channel volume settings. Contour is adjustable between 0 and +18 dB with 1 dB resolution. This function is linked to the volume setting by means of microcontroller software.

Bass is adjustable between +15 and -12 dB with 1 dB resolution and treble is adjustable between +12 dB with 1 dB resolution.

For the purpose of a simple control software in the microcontroller, the decimal number that is sent as an I²C-bus data byte for contour, bass or treble is identical to the new contour, bass or treble setting in dBs (e.g. the I²C-bus data byte +8 sets the new value to +8 dB).

Extra bass boost is provided up to 20 dB with 2 dB resolution. The implemented coefficient set serves merely as an example on how to use this filter.

The beeper provides tones in a range from approximately 400 Hz to 30 kHz. The frequency can be selected via the I²C-bus. The beeper output signal is added to the loudspeaker and headphone channel signals. The beeper volume is adjustable with respect to full scale between 0 and -93 dB with 3 dB resolution. The beeper is not effected by mute.

Soft mute provides a mute ability in addition to volume control with a well defined time (32 ms) after which the soft mute is completed. A smooth fading is achieved by a cosine masking.

6.2.5 HEADPHONE (AUXILIARY) CHANNEL

The matrix provides the following functions; forced mono, stereo, channel swap, channel 1 and channel 2 (or C and S in Dolby Surround Pro Logic mode).

Volume is controlled individually for each channel in a range from +24 to -83 dB with 1 dB resolution. There is also a mute position.

For the purpose of a simple control software in the microcontroller, the decimal number that is sent as an I²C-bus data byte for volume control is identical to the volume setting in dB (e.g. the I²C-bus data byte +10 sets the new volume value to +10 dB).

Balance can be realized by independent control of the left and right channel volume settings.

Bass is adjustable between +15 and -12 dB with 1 dB resolution and treble is adjustable between +12 dB with 1 dB resolution.

For the purpose of a simple control software in the microcontroller, the decimal number that is sent as an I²C-bus data byte for bass or treble is identical to the new bass or treble setting in dB (e.g. the I²C-bus data byte +8 sets the new value to +8 dB).

The beeper provides tones in a range from approximately 400 Hz to 30 kHz. The frequency can be selected via the I²C-bus. The beeper output signal is added to the loudspeaker and headphone channel signals. The beeper volume is adjustable with respect to full scale between 0 and -93 dB with 3 dB resolution. The beeper is not effected by mute.

Soft mute provides a mute ability in addition to volume control with a well defined time (32 ms) after which the soft mute is completed. A smooth fading is achieved by a cosine masking.

6.2.6 FEATURE INTERFACE

The feature interface comprises two I²S-bus input/output ports and a system clock output. Each I²S-bus port is equipped with level adjust facilities that can change the signal level in a range of ± 15 dB with 1 dB resolution.

Outputs can be disabled to improve EMC performance. The I²S-bus output matrix provides the following functions; forced mono, stereo, channel swap, channel 1 and channel 2.

One example of how the feature interface can be used in a TV set is to connect an external Dolby Surround Pro Logic DSP, such as the SAA7710, to the I²S-bus ports. Outputs must be enabled and a suitable master clock signal for the DSP can be taken from pin SYSCLK.

A stereo signal from any source will be output on one of the I²S-bus serial data outputs and the four processed signal channels will be entered at both I²S-bus serial data inputs. Left and right could then be output to the power amplifiers via the Main channel, centre and surround via the Auxiliary channel.

6.2.7 CHANNEL FROM THE AUDIO ADC

The signal level at the output of the ADC can be adjusted in a range of ± 15 dB with 1 dB resolution. The audio ADC itself is scaled to a gain of -6 dB.

6.2.8 CHANNEL TO THE ANALOG CROSS-BAR PATH

Level adjust with control positions 0 dB, +3 dB, +6 dB and +9 dB.

6.2.9 DIGITAL CROSSBAR SWITCH (See Fig.6)

Input channels to the crossbar switch are from the audio ADC, I²S1, I²S2, FM path and from the loudspeaker channel path after matrix and AVL.

Output channels comprise loudspeaker, headphone, I²S1, I²S2 and the audio DACs for line output and SCART.

The I²S1 and I²S2 outputs also provide digital outputs from the loudspeaker and headphone channels, but without the beeper signals.

6.2.10 GENERAL

There are a number of functions that can provide signal gain, e.g. volume, bass and treble control. Great care has to be taken when using gain with large input signals in order not to exceed the maximum possible signal swing, which would cause severe signal distortion. The nominal signal level of the various signal sources to the digital crossbar switch should be 15 dB below digital full scale (15 dB full scale). This means that a volume setting of, say, +15 dB would just produce a full scale output signal and not cause clipping, if the signal level is nominal.

Sending illegal data patterns via the I²C-bus will not cause any changes of the current setting for the volume, bass, treble, bass boost and level adjust functions.

6.2.11 EXPERT MODE

The TDA9870A provides a special expert mode that gives direct write access to the internal Coefficient RAM (CRAM) of the DSP. It can be used to create user-defined characteristics, such as a tone control with different corner frequencies or special boost/cut characteristics to correct the low-frequency loudspeaker and/or cabinet frequency responses by means of the bass boost filter. However, this mode must be used with great care.

More information on the functions of this device, such as the number of coefficients per function, their default values, memory addresses, etc., can be made available

ST24C16, ST25C16, ST24W16, ST25W16

Serial 16 K (2K x 8) Eeprom

- 1 million erase/write cycles, with 40 years data retention
- Single supply voltage:
 - 4.5V to 5.5V for ST24x16 versions
 - 2.5V to 5.5V for ST25x16 versions
- Hardware write control versions:
 - ST24W16 and ST25W16
- Two wire serial interface, fully I2C Bus compatible
- Byte and Multibyte write (up to 8 bytes) for the ST24C16
- Page write (up to 16 bytes)
- Byte, random and sequential read modes
- Self timed programming cycle
- Automatic address incrementing
- Enhanced ESD/Latch up performances

DESCRIPTION

This specification covers a range of 16K bits I2C bus EEPROM products, the ST24/25C16 and the ST24/25W16. In the text, products are referred to as ST24/25x16 where "X" is: "C" for Standard version and "W" for hardware Write Control version.

The ST24/25x16 are 16K bit electrically erasable programmable memories (EEPROM), organized as 8 blocks of 256 x 8 bits. These are manufactured in SGS-Thomson's Hi-Endurance Advanced CMOS technology which guarantees an endurance of one million erase/write cycles with a data retention of 40 years. The ST25x16 operates with a power supply value as low as 2.5V. Both Plastic Dual-in-Line and Plastic Small Outline packages are Available.

Table 1. Signal Names

PRE	Write Protect Enable
PB0, PB1	Protect Block Select
SDA	Serial Data Address Input/Output
SCL	Serial Clock
MODE	Multybyte/Page Write Mode (C version)
WC	Write Control (W version)
Vcc	Supply Voltage
Vss	Ground

Notes: 1. Except for the rating "Operating Temperature Range", stresses above those listed in the Table "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the Operating sections of this specification is not implied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability. Refer also to the SGS-THOMSON SURE Program and other relevant quality documents.

2. 100pF through 1500Ω; MIL-STD-883C, 3015.7

3. 200pF through 0Ω; EIAJ IC-121 (condition C)

DESCRIPTION

The memories are compatible with the I²C standard two wire serial interface which uses a bi-directional data bus and serial clock. The memories carry a built-in 4 bit, unique device identification code (1010) corresponding to the I²C bus definition. The memories behave as slave devices in the I²C protocol with all memory with all memory operations synchronized by the serial clock. Read and write operations are initiated by a START condition generated by the bus

master. The START condition is followed by a stream of 4 bits (identification code 1010), 3 block select bits, plus one read/write bit and terminated by an acknowledge bit. When writing data to the memory it responds to the 8 bits received by asserting an acknowledge bit during the 9th bit time. When data is read by the bus master, it acknowledges the receipt of the data bytes in the same way. Data transfers are terminated with a STOP condition.

TDA8351

DC-coupled vertical deflection circuit

FEATURES

- Few external components
- Highly efficient fully DC-coupled vertical output bridge circuit
- Vertical flyback switch
- Guard circuit
- Protection against:
 - short - circuit of the output pins (7 and 4)
 - short - circuit of the output pins to V_p
- Temperature (thermal) protection
- High EMC immunity because of common mode inputs
- A quard signal in zoom mode.

GENERAL DESCRIPTION

The TDA8351 is a power circuit for use in 90° and 100° colour deflection systems for field frequencies of 50 to 120 Hz. The circuit provides a DC driven vertical deflection output circuit, operating as a highly efficient class G system.

QUICK REFERENCE DATA

FUNCTIONAL DESCRIPTION

The vertical driver circuit is a bridge configuration. The deflection coil is connected between the output amplifiers, which are driven in phase opposition. An external resistor (RM) connected in series with the deflection coil provides internal feedback information. The differential input circuit is voltage driven. The input circuit has been adapted to enable it to be used with the TDA9150A, TDA9151B, TDA9160A, TDA9162, TDA8366 and TDA8376 which deliver symmetrical current signals. An external resistor (RCON) connected between the differential input determines the output current through the deflection coil. The relationship between the differential input current and the output current is defined by:

$I_{diff} \times R_{CON} = I_{coil} \times R_M$. The output current is adjustable from 0.5 A (p-p) to 3 A (p-p) by varying RM. The maximum input differential voltage is 1.8 V. In the application it is recommended that $V_{diff} = 1.5$ V (typ). This is recommended because of the spread of input current and the spread in the value of R_{CON} .

The flyback voltage is determined by an additional supply voltage V_{FB} . The principle of operating with two supply voltages (class G) makes it possible to fix the supply voltage V_p optimum for the scan voltage and the second supply voltage V_{FB} optimum for the flyback voltage. Using this method, very high efficiency is achieved.

The supply voltage V_{FB} is almost totally available as flyback voltage across the coil, this being possible due to the absence of a decoupling capacitor (not necessary, due to the bridge configuration). The output circuit is fully protected against the following:

- thermal protection
- short-circuit protection of the output pins (pins 4 and 7)
- short-circuit of the output pins to V_p .

A guard circuit $V_{O(guard)}$ is provided. The guard circuit is activated at the following conditions:

- during flyback
- during short-circuit of the coil and during short-circuit of the output pins (pins 4 and 7) to V_p or ground
- during open loop
- when the thermal protection is activated.

This signal can be used for blanking the picture tube screen.

LIMITING VALUES

In accordance with the Absolute Maximum Rating System (IEJ 134)

FUNCTIONAL DESCRIPTION

The vertical driver circuit is a bridge configuration. The deflection coil is connected between the output amplifiers, which are driven in phase opposition. An external resistor (R_M) connected in series with the deflection coil provides internal feedback information. The differential input circuit is voltage driven. The input circuit has been adapted to enable it to be used with the TDA9150, TDA9151B, TDA9160A, TDA9162, TDA8366 and TDA8376 which deliver symmetrical current signals. An external resistor (R_{CON}) connected between the differential input determines the output current through the deflection coil.

The relationship between the differential input current and the output current is defined by: $I_{diff} \times R_{CON} = I_{coil} \times R_M$. The output current is adjustable from 0.5 A (p-p) to 2 A (p-p) by varying R_M . The maximum input differential voltage is 1.8 V. In the application it is recommended that $V_{diff} = 1.5$ V (typ). This is recommended because of the spread of input current and the spread in the value of R_{CON} .

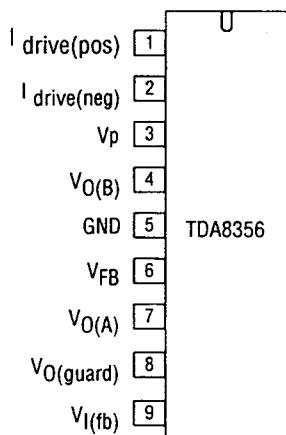

The flyback voltage is determined by an additional supply voltage V_{FB} . The principle of operating with two supply voltages (class G) makes it possible to fix the supply voltage V_p optimum for the scan voltage and the second supply voltage V_{FB} optimum for the flyback voltage. Using this method, very high efficiency is achieved. The supply voltage V_{FB} is almost totally available as flyback voltage across the coil, this being possible due to the absence of a decoupling capacitor (not necessary, due to the bridge configuration). The output circuit is fully protected against the following:

- thermal protection
- short-circuit protection of the output pins (pins 4 and 7)
- short-circuit of the output pins to V_p .

A guard circuit $V_{O(guard)}$ is provided. The guard circuit is activated at the following conditions:

- during flyback
- during short-circuit of the coil and during short-circuit of the output pins (pins 4 and 7) to V_p or ground
- during open loop
- when the thermal protection is activated.

This signal can be used for blanking the picture tube Screen.

Metal block connected to substrate pin 5.

TDA2616**2x12W Hi-Fi Audio Power Amplifiers with Mute****GENERAL DESCRIPTION**

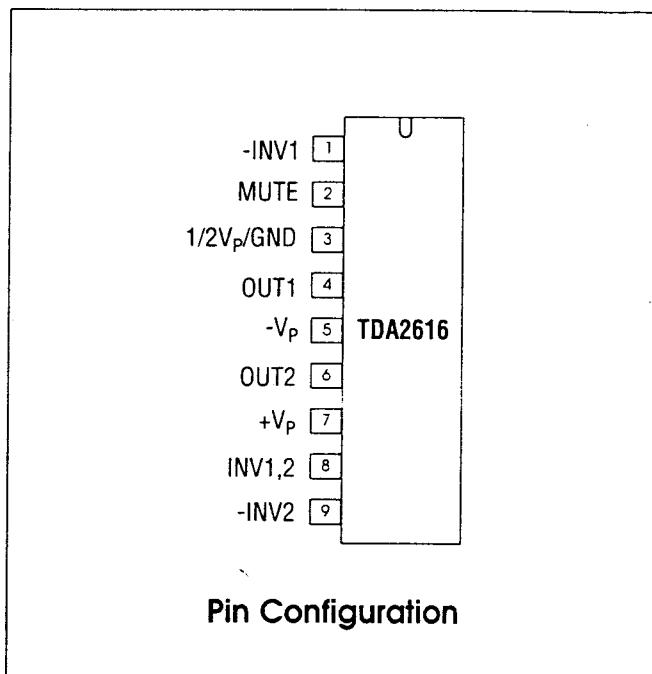

The TDA2616 is a dual power amplifiers. It has been especially designed for mains fed applications such as stereo radio and stereo TV.

FEATURES

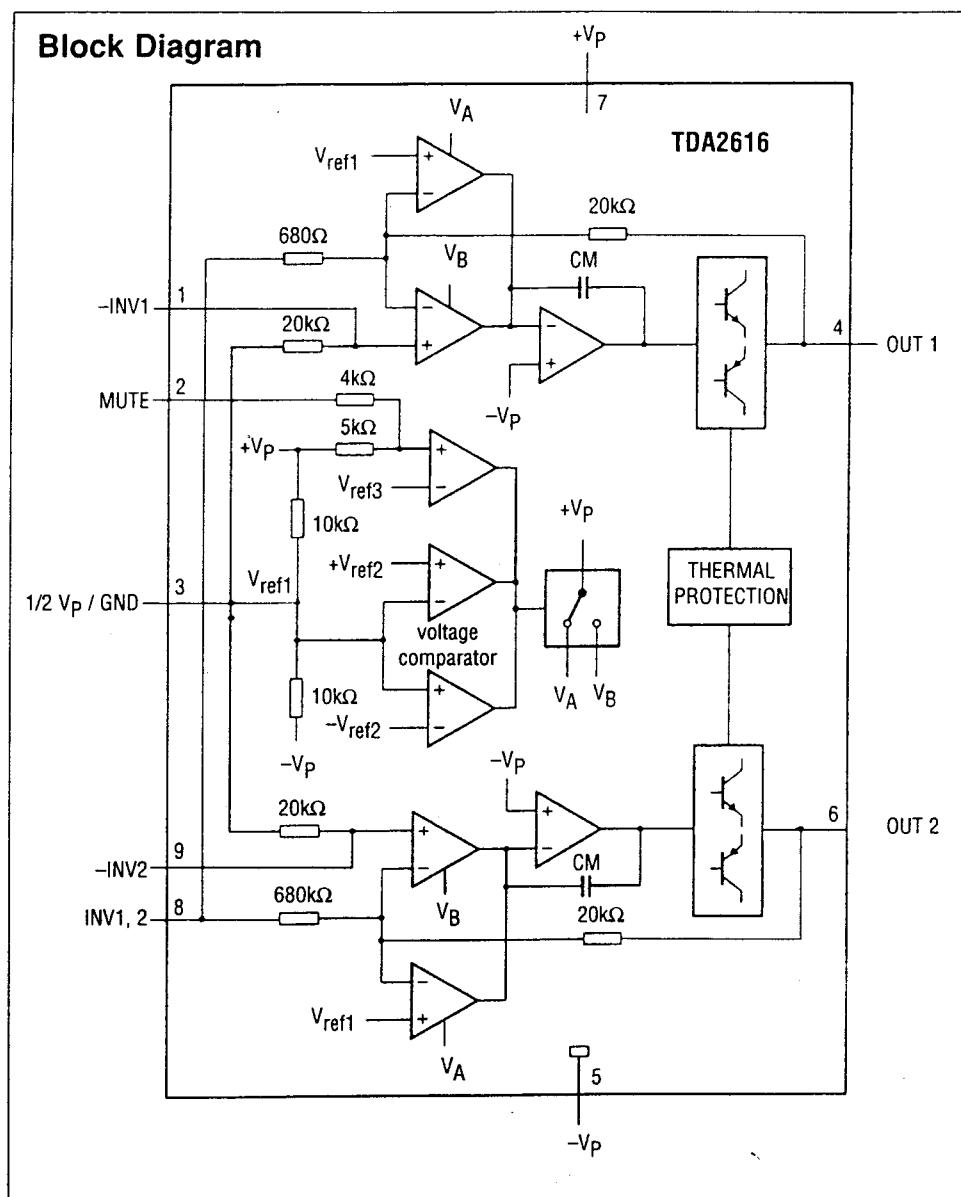

- Requires very few external components
- No switch-on/switch-off clicks
- Input mute during switch-on and switch-off
- Low offset voltage between output and ground
- Excellent gain balance of both amplifiers
- Hi-Fi accordance with IEC 268 and DIN 45500
- Short-circuit proof and thermal protected
- Mute possibility.

Block Diagram

FUNCTIONAL DESCRIPTION

The TDA2615 is a hi-fi stereo amplifier designed for mains fed applications, such as stereo radio and TV. The circuit is optimally designed for symmetrical power supplies, but is also well-suited to asymmetrical power supply systems.

An output power of $2 \times 6\text{ W}$ ($\text{THD} = 0.5\%$) can be delivered into an $8\text{ }\Omega$ load with asymmetrical power supply of $\pm 12\text{ V}$. The gain is internally fixed at 30 dB , thus offering a low gain spread and a very good gain balance between the two amplifiers (0.2 dB).

A special feature is the input mute circuit. This circuit disconnects the non-inverting inputs when the supply voltage drops below $\pm 6\text{ V}$, while the amplifier still retains its DC operating adjustment. The circuit features suppression of unwanted signals at the inputs, during switch-on and switch-off.

The mute circuit can also be activated via pin 2. When a

current of $300\text{ }\mu\text{A}$ is present at pin 2, the circuit is in the mute condition.

The device is provided with two thermal protection circuits. One circuit measures the average temperature of the crystal and the other measures the momentary temperature of the power transistors. These control circuits activate at temperatures in excess of $+150\text{ }^{\circ}\text{C}$, so a crystal operating temperature of max. $+150\text{ }^{\circ}\text{C}$ can be used without extra distortion. With the derating value of 6 K/W , the heatsink can be calculated as follows:

at $R_L = 8\text{ }\Omega$ and $V_S = \pm 12\text{ V}$. The measured maximum dissipation is 7.8 W .

With a maximum ambient temperature of $+60\text{ }^{\circ}\text{C}$, the thermal resistance of the heatsink is:

$$R_{th} = \frac{150 - 60}{7.8} - 6 = 5.5\text{ K/W.}$$

The internal metal block has the same potential as Pin 5.

FUNCTIONAL DESCRIPTION

The TDA7056 is a mono output amplifier, designed for battery-fed portable radios and mains-fed equipment such as television. For space reasons there is a trend to decrease the number of external components. For portable applications there is also a trend to decrease the number of battery cells, but still a reasonable output power is required. The TDA7056 fulfills both of these requirements. It needs no peripheral components, because it makes use of the Bridge-Tied-Load (BTL) principle. Consequently it has, at the same supply voltage, a higher output power compared to a conventional Single Ended output stage. It delivers an output power of 1 W into a loudspeaker load of 8 Ω with 6 V supply or 3 W into 16 Ω loudspeaker at 11 V without need of an external heatsink. The gain is internally fixed at 40 dB. Special attention is given to switch-on/off click suppression, and it has a good overall stability. The load can be short circuited at all input conditions.

Description of the DSP

CHARACTERISTICS

At Tamb = 25 °C; f = 1kHz; Vp = 11V; RL = 16Ω (see Fig. 2)

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Unit
Vp	operating supply voltage		3	11	18	V
Iopm	repetitive peak output current		-	-	0.6	A
Ip	total quiescent current	note 1 RL = ∞	-	5	7	mA
Po	output power	THD = 10%	2.5	3	-	W
THD	total harmonic distortion	Po = 0.5W	-	0.25	1	%
Gv	voltage gain		39	40.5	42	dB
Vno	noise output voltage	note 2	-	180	300	µV
Vno	noise output voltage	note 3	-	60	-	µV
f	frequency response		-	20 to 20.000	-	Hz
RR	ripple rejection	note 4	36	50	-	dB
ΔV	DC-output offset voltage	note 5	-	-	200	mV
Z _{in}	input impedance		-	100	-	kΩ
I _b	input bias current		-	100	300	nA

Notes to the characteristics

- With a load connected to the outputs the quiescent current will increase, the maximum value of this increase being equal to the DC output offset voltage divided by R_L.
- The noise output voltage (RMS value) is measured with R_S = 5 kΩ unweighted (20 Hz to 20 kHz).
- The noise output voltage (RMS value) at f = 500 kHz is measured with R_S = 0 Ω and bandwidth = 5 kHz. With a practical load (R_L = 16Ω, L_L = 200 µH) the noise output current is only 50 nA.
- The ripple rejection is measured with R_S = 0 Ω and f = 100 Hz to 10 kHz.
The ripple voltage (200 mV) is applied to the positive supply rail.
- R_S=5kΩ.

TDA7057AQ

2 x 5 W stereo BTL Audio Output Amplifier with DC Volume Control

FEATURES

- DC volume control
- Few external components
- Mute mode
- Thermal protection
- Short-circuit proof
- No switch-on and switch-off clicks
- Good overall stability
- Low power consumption
- Low HF radiation
- ESD protected on all pins.

GENERAL DESCRIPTION

The TDA7057AQ is a stereo BTL output amplifier with DC volume control. The device is designed for use in TV and monitors, but are also suitable for battery-fed portable recorders and radios.

Missing Current Limiter (MCL)

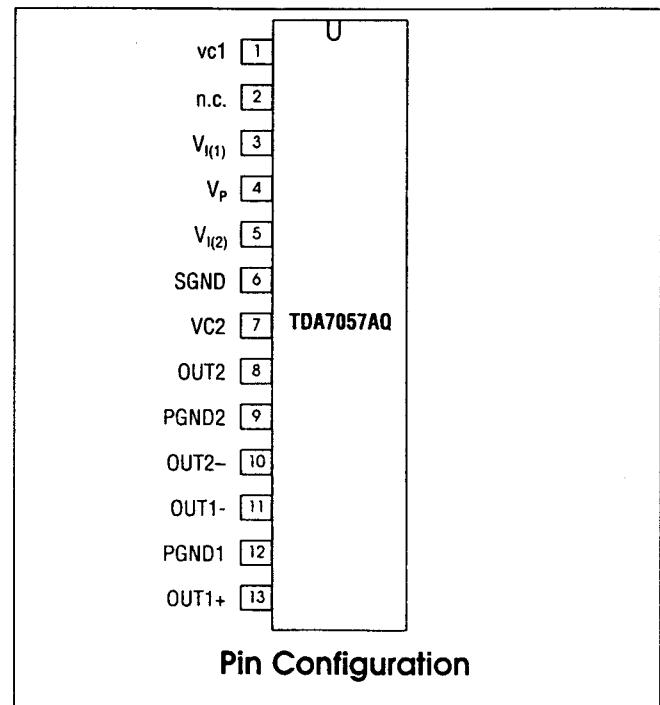

A MCL protection circuit is built-in. The MCL circuit is activated when the difference in current between the output terminal of each amplifier exceeds 100 mA (typical 300 mA). This level of 100 mA allows for headphone applications (single-ended).

FUNCTIONAL DESCRIPTION

The TDA7057AQ is a stereo output amplifiers with two DC volume control stages. The device is designed for TV and monitors, but also suitable for battery-fed portable recorders and radios.

In conventional DC volume control circuits the control or input stage is AC coupled to the output stage via external capacitors to keep the offset voltage low.

In the TDA7057AQ the two DC volume control stages are integrated into the input stages so that no coupling capacitors are required and a low offset voltage is still maintained. The minimum supply voltage also remains low.

The BTL principle offers the following advantages:

- Lower peak value of the supply current
- The frequency of the ripple on the supply voltage is twice the signal frequency.

Consequently, a reduced power supply with smaller capacitors can be used which results in cost reductions.

For portable applications there is a trend to decrease the supply voltage, resulting in a reduction of output power at conventional output stages. Using the BTL principle increases the output power.

The maximum gain of the amplifier is fixed at 40.5 dB. The DC volume control stages have a logarithmic control characteristic. Therefore, the total gain can be controlled from +40.5 dB to -33 dB. If the DC volume control voltage falls below 0.4 V, the device will switch to the mute mode.

The amplifier is short-circuit protected to ground, V_p and across the load. A thermal protection circuit is also implemented. If the crystal temperature rises above 150 °C the gain will be reduced, thereby reducing the output power.

Special attention is given to switch-on and switch-off clicks, low HF radiation and a good overall stability.

TDA7050**Low voltage mono/stereo power amplifier****GENERAL DESCRIPTION**

The TDA7050 is a low voltage audio amplifier for small radios with headphones (such as watch, pen and pocket radios) in mono (bridge-tied load) or stereo applications.

FEATURES

- Limited to battery supply application only (typ. 3 and 4 V)
- Operates with supply voltage down to 1.6 V
- No external components required
- Very low quiescent current
- Fixed integrated gain of 26 dB, floating differential input
- Flexibility in use - mono BTL as well as stereo
- Small dimension of encapsulation (see package design example)

TDA6107Q

triple video output amplifier

FEATURES

- Typical bandwidth of 5.5 MHz for an output signal of 60 V (peak-to-peak value)
- High slew rate of 900 V/ μ s
- No external components required
- Very simple application
- Single supply voltage of 200 V
- Internal reference voltage of 2.5 V
- Internal reference voltage of 2.5 V
- Fixed gain of 50
- Black-Current Stabilization (BCS) circuit
- Thermal protection.

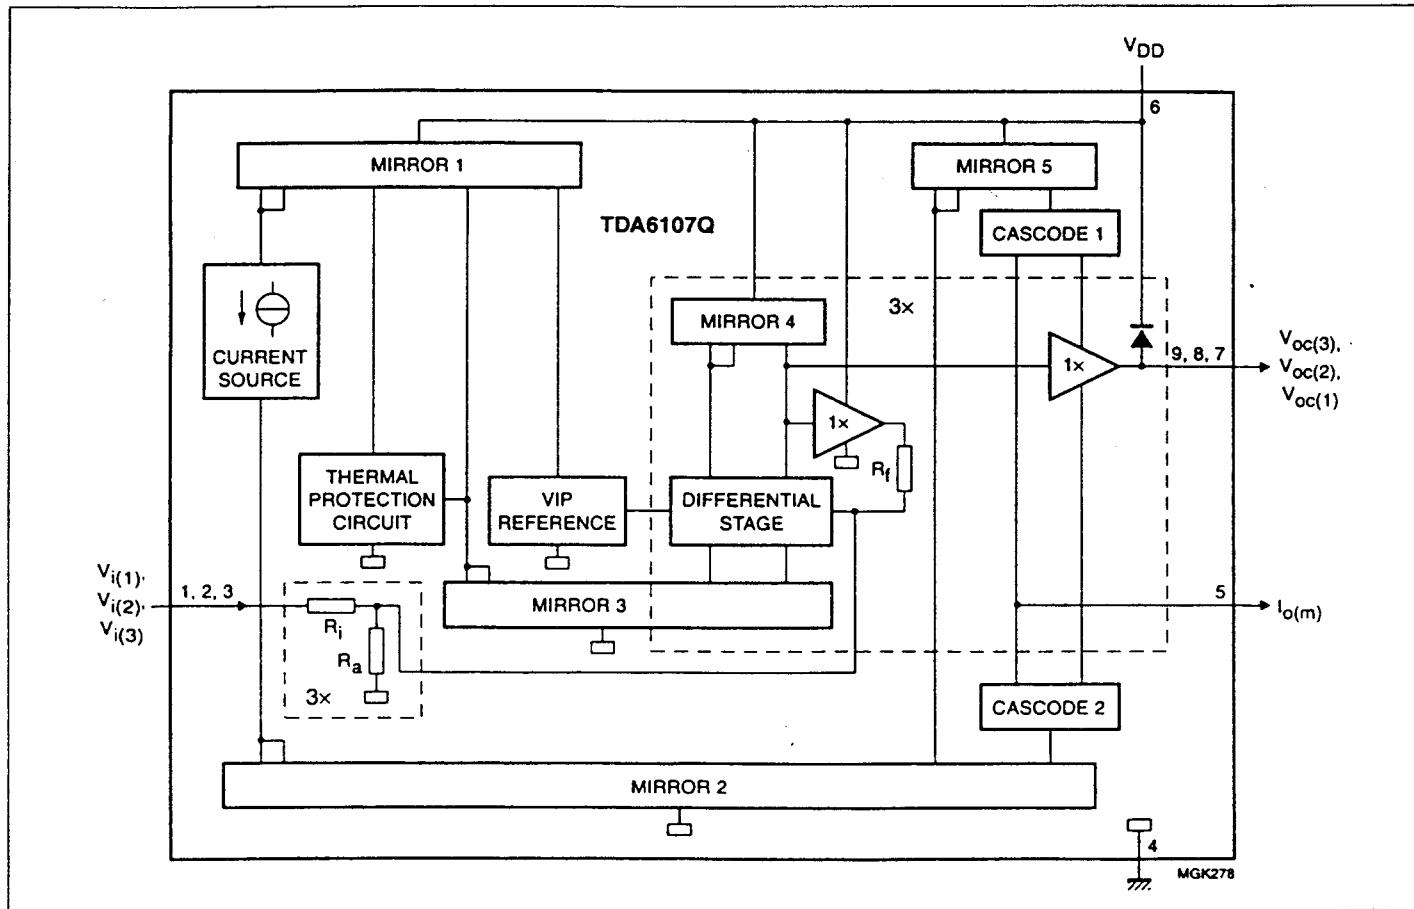

GENERAL DESCRIPTION

The TDA6107Q includes three video output amplifiers in one plastic DIL-bent-SIL 9-pin medium power (DBS9MPF) package (SOT111-1), using high-voltage DMOS technology, and is intended to drive the three cathodes of a colour CRT directly. To obtain maximum performance, the amplifier should be used with black-current control.

110		Machine Model (MM)	-	300	V

HANDLING

Inputs and outputs are protected against electrostatic discharge in normal handling. However, to be totally safe, it is desirable to take normal precautions appropriate to handling MOS devices (see "Handling MOS Devices").

QUALITY SPECIFICATION

Quality specification "SNW-FQ-611 part D" is applicable and can be found in the "Quality reference Handbook".

The handbook can be ordered using the code 9397 750 00192.

CDT1100(G) Series

Optocoupler with Phototransistor Output

FEATURES

According to VDE 0884:

- Rated impulse voltage (transient overvoltage)
VIOTM = 6 kV peak
- Isolation test voltage (partial discharge test voltage)
Vpd = 1.6 kV
- Rated isolation voltage (RMS includes DC)
VIOWM = 600 VRMS (848 V peak)
- Rated recurring peak voltage (repetitive)
VloRM = 600 VRMS
- Creepage current resistance according to
VDE 0303/IEC 112
Comparative Tracking Index: CTI = 275
- Thickness through insulation \geq 0.75 mm

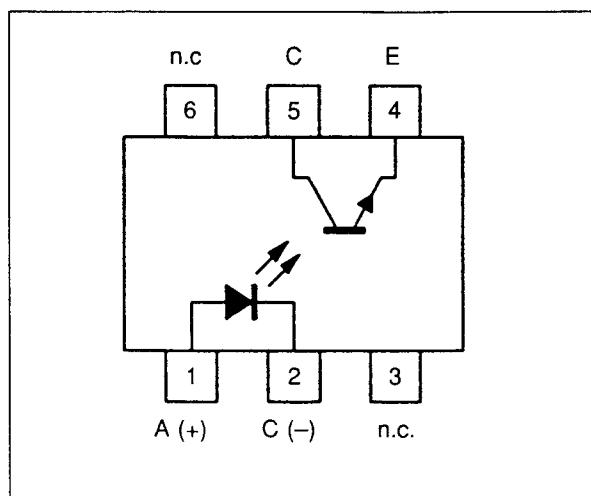

- Further approvals:
BS 415, BS 7002, SETI: IEC 950,
UL 1577: File No: E 76222
- Base not connected
- CTR offered in 4 groups
- Isolation materials according to UL94-VO
- Pollution degree 2 (DIN/VDE 0110 / resp. IEC 664)
- Climatic classification
55/100/21 (IEC 68 part 1)
- Special construction:
Therefore extra low coupling capacity of typical
0.2 pF, high Common Mode Rejection
- Low temperature coefficient of CTR

ORDER SCHEMATIC

PART NUMBERS	CTR-RANKING
TCDT1100/TCDT1100G	>40%
TCDT1101/TCDT1101G	40 to 80%
TCDT1102/TCDT1102G	63 to 125%
TCDT1103/TCDT1103G	100 to 2000%

Suffix: G = Leadform 10.16 mm

Pin Connection

ABSOLUTE MAXIMUM RATINGS

Input (Emitter)

Parameters	Test Conditions	Symbol	Value	Unit
Reverse voltage		V_R	5	V
Forward current		I_F	60	mA
Forward surge current	$t_p \leq 10\mu s$	I_{FSM}	3	A
Power dissipation	$T_{amb} \leq 25^\circ C$	P_v	100	mW
Junction temperature		T_j	125	°C

Output (Detector)

Parameters	Test Conditions	Symbol	Value	Unit
Collector emitter voltage		V_{CEO}	32	V
Emitter collector voltage		V_{ECO}	7	V
Collector current		I_C	50	mA
Collector peak current	$t_p/T = 0.5, t_p \leq 10ms$	I_{CM}	100	mA
Power dissipation	$T_{amb} \leq 25^\circ C$	P_v	150	mW
Junction temperature		T_j	125	°C

Coupler

Parameters	Test Conditions	Symbol	Value	Unit
Isolation test voltage (RMS)		V_{IO}	3.75	kV
Total power dissipation	$T_{amb} \leq 25^\circ C$	P_{tot}	250	mW
Ambient temperature range		T_{amb}	-55 to +100	°C
Storage temperature range		T_{stg}	-55 to +125	°C
Soldering temperature	2 mm from case $t \leq 10 s$	T_{sd}	260	°C

BU2508AF

Silicon Diffused Power Transistor

GENERAL DESCRIPTION

Enhanced performance, new generation, high voltage, high-speed switching npn transistor in a plastic full-pack envelope intended for use in horizontal deflection circuits of colour television receivers. Features exceptional envelope to base drive and collector current load variations resulting in a very low worst case dissipation.

QUICK REFERENCE DATA

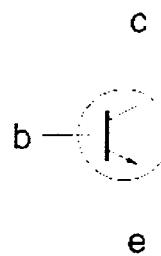

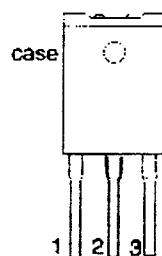

Symbol	Parameter	Conditions	Typ.	Max.	Unit
V _{CESM}	collector - emitter voltage peak value	V _{BE} = 0V	-	1500	V
