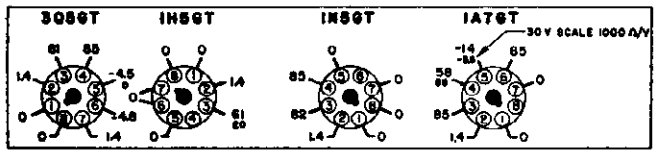
ISSUE B 1946

VOLTAGE CHART — BOTTOM VIEW



VOLTAGE DATA

All readings made between tube socket terminals and chassis. Voltages indicated have been obtained using a Vacuum Tube Voltmeter. A second voltage reading is shown made with a 1000 ohm-per-volt meter, when use of this instrument would result in appreciable lower readings. Measured with a fresh battery, volume control full on, dial at the high frequency end, no signal.

OSCILLATION IN 4A1 BATTERY RADIO CHASSIS

Occasionally audio oscillation may occur in the 4A1 chassis with the volume control in an intermediate position. Should you encounter this trouble, reverse the leads of the primary of the output transformer or ground the speaker frame to the chassis. The speaker leads and the grid lead of the 1H5 should be kept as far as possible from the 3Q5 output tube.

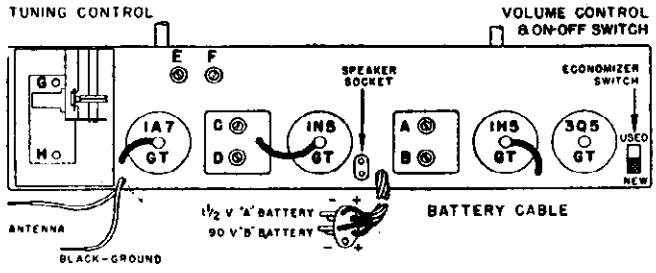
ALIGNMENT PROCEDURE

1. IMPORTANT—Check to see that dial pointer reaches each end of dial scale when Station Selector Control is turned from one end to the other.
2. Volume control—Maximum for all adjustments.
3. Connect radio chassis to ground post of signal generator with a short heavy lead.
4. Connect output meter across voice coil of speaker.
5. Connect dummy antenna value in series with genera output lead, when needed (see below).
6. Allow chassis and signal generator to "heat up" several minutes
7. Use lowest Output setting of Signal Generator capa of producing adequate Output Meter indication and th proceed in the following sequence.

BAND	SIGNAL GENERATOR Frenquency Setting	SIGNAL GENERATOR Dummy Antenna	Connection to Radio	Receiver Dial Setting	Trimmers Adjusted (In Order Shown)	Trimmer Function	Type of Adjustmen
I.F.	455 KC.	.1 mfd.	Grid of 1A7 (Cap)	High Frequency end of dial	C-D—2nd I.F.	Output I.F.	Adjust to maximum output
I.F.	455 KC.	.1 mfd.	Grid of 1A7 (Cap)	High Frequency end of dial	A-B—1st I.F.	Input I.F.	Adjust to maximum output
Broad-cast	1630 KC.	.00029 mfd. Mica	Antenna Lead	High Frequency end of dial	E-(See note below) F-(See note below)	Oscillator Antenna	Adjust to maximum output
Broad-cast	1300 KC.	.00029 mfd. Mica	Antenna Lead	1300 KC.	G H	Oscillator Antenna	Adjust to maximum output

NOTE: Before adjusting trimmers "E" and "F," make sure that each iron core is 1⅛" or more outside of its coil form. If necessary, turn adjustments "G" and "H" to accomplish this.

TUBE AND TRIMMER LOCATION



CIRCUIT

Battery operated 4 Tube Superheterodyne with Single Tuning Range 535 KC. to 1630 KC. Covers standard broadcast band, using antenna and ground. Permeability tuning on Ant. and Osc. circuits. I.F. 455 KC.

POWER SUPPLY

Single unit "AB" battery pack. 90 volt "B" 1½ volt "A." Plug in connection. Use Ensign AB48, Burgess 17G-D60, Eveready 748, General 60DL-11L, Ray-O-Vac AB-82, or Bond 0528 Battery or Equivalent.

ECONOMIZER SWITCH

The battery economizer switch is located on the top of th chassis, right side.

Always have this Economizer Switch in th "NEW" battery position when first placing radi in operation or when installing a new battery

ADMIRAL CORPORATION

MODEL C4

ALIGNMENT DATA

GENERAL DATA

The alignment of this receiver requires the use of a signal generator that will cover the frequencies of 455, 600, 1400 and 1730, and an output meter to be connected across the primary or secondary of the output transformer. If possible, all alignments should be made with the volume control on maximum and the signal generator output as low as possible, to prevent the AVC from operating and giving false readings.

I.F. ALIGNMENT

Adjust the signal generator to 455 KC and connect the output to the grid of the first detector tube (1A7) thru a .05 or .1 mfd. condenser. The ground of the signal generator should be connected to the chassis ground. Align all I.F. trimmers to peak or maximum reading on the output meter.

BROADCAST BAND ALIGNMENT

Connect the output of the signal generator to the antenna and ground leads of the set through a .0002 condenser and adjust the signal generator to 1730 KC. Set the gang condenser to minimum capacity and adjust the oscillator trimmer to receive this signal. After this has been carefully done, the next step is to set the signal generator to 1400 KC and after tuning in the signal adjust the antenna trimmer to peak. The antenna and oscillator trimmers are located on the gang condenser. The trimmer toward the front on the gang condenser is the oscillator trimmer and the one toward the rear the antenna trimmer. This is all that is necessary for the alignment unless the plates of the gang condenser have been bent out of shape. In case of bent plates, set the signal generator and the receiver to 600 KC and bend the plates into the position for maximum sensitivity over the tuning range.

SERVICE INFORMATION

Speaker (Part No. P4925) 5" PM Type

D.C. voice coil resistance.....3.1 ohms
Voice coil impedance at 400 cycles.....3.5 ohms

Antenna Coil (Part No. G-6274)

Looking at the connection end starting at the chassis in a clockwise direction the terminals are: No. 1, AVC; No. 2, grid; No. 3, Ant.; No. 4, ground. No. 4 is grounded to the mounting bracket.

Primary—No. 3 and No. 4—Resistance 24.6 ohms.
Secondary—No. 1 and No. 2—Resistance 2.2 ohms.
A gimmik coil of 5.5 mmfd. connects to terminals No. 2 and No. 3.

Oscillator Coil (Part No. P4308) (Red & Brown Dots)

Looking at the connection end (with dots) starting at the chassis in a clockwise direction the terminals are: No. 1, grid; No. 2, plate; No. 3, B+; No. 4, ground.

Primary—No. 2 and No. 3—Resistance 2.2 ohms.
Secondary—No. 4 and No. 1—Resistance 5.7 ohms.

First I.F. Transformer (Part No. P4323)

Primary—Blue white, plate; red white, B+ — Resistance 12.1 ohms
Secondary—White, grid; black white, AVC — Resistance 24.9 ohms

Second I.F. Transformer (Part No. P3980)

Primary—Blue white, plate; red white, B+ — Resistance 15.1 ohms
Secondary—White, grid; black white, AVC — Resistance 11.8 ohms

ALIGNMENT DATA

MODEL D4 Late

GENERAL DATA

The alignment of this receiver requires the use of a signal generator that will cover the frequencies of 455, 600, 1400 and 1730, and an output meter to be connected across the primary or secondary of the output transformer. If possible, all alignments should be made with the volume control on maximum and the signal generator output as low as possible, to prevent the AVC from operating and giving false readings.

I.F. ALIGNMENT

Remove the chassis from the cabinet, adjust the signal generator to 455 KC and connect the output to the grid of the first detector tube (1A7) thru a .05 or .1 mfd. condenser. The ground of the signal generator should be connected to the chassis ground. Align all I.F. trimmers to peak or maximum reading on the output meter.

BROADCAST BAND ALIGNMENT

Re-install the receiver completely in its cabinet. Connect the output of the signal generator to the antenna and ground terminals of the set through a .0002 condenser and adjust the signal generator to 1730 KC. Set the gang condenser to minimum capacity and adjust the gang condenser trimmer (oscillator) to receive this signal. After this has been carefully done, the next step is to set the signal generator to 1400 KC and after tuning in the signal adjust the antenna trimmer to peak. The antenna and oscillator trimmers are located on the gang condenser. The trimmer toward the front on the gang condenser is the oscillator trimmer and the one toward the rear the antenna trimmer. This is all that is necessary for the alignment unless the plates of the gang condenser have been bent out of shape. In case of bent plates, set the signal generator and the receiver to 600 KC and bend the plates into the position for maximum sensitivity over the tuning range.

SERVICE INFORMATION

Speaker (Part No. P4040) 6" PM Type

D.C. voice coil resistance.....2.6 ohms
Voice coil impedance at 400 cycles.....3.0 ohms

Antenna Coil (Part No. G-5724)

Looking at the connection end starting at the chassis in a clockwise direction the terminals are: No. 1, AVC; No. 2, grid; No. 3, Ant.; No. 4, ground. No. 4 is grounded to the mounting bracket.
Primary—No. 3 and No. 4—Resistance 24.6 ohms.
Secondary—No. 1 and No. 2—Resistance 2.2 ohms.
A gimmik coil of 5.5 mmfd. connects to terminals No. 2 and No. 3.

Oscillator Coil (Part No. 2412) (Red Dot)

Looking at the connection end (with dot) starting at the chassis in a clockwise direction the terminals are: No. 1, grid; No. 2, plate; No. 3, B+; No. 4, ground.
Primary—No. 2 and No. 3—Resistance 2.2 ohms.
Secondary—No. 4 and No. 1—Resistance 5.3 ohms.

First I.F. Transformer (Part No. P3046)

Primary—Blue white, plate; red white B+ — Resistance 12.1 ohms
Secondary—White, grid; black white, AVC — Resistance 24.9 ohms

Second I.F. Transformer (Part No. P2606)

Primary—Blue white, plate; red white B+ — Resistance 15.1 ohms

—Measured on a 117 Volt A.C. line.

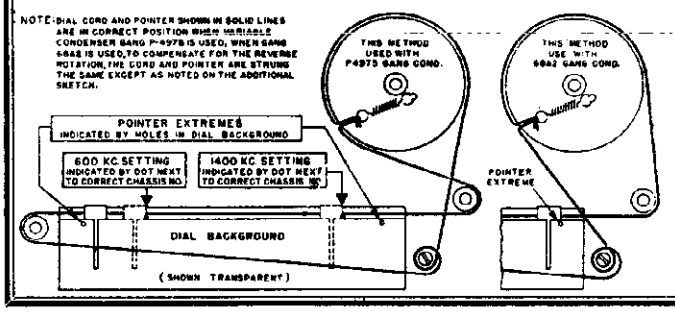
—Volume control full on.

—Dial tuned to low frequency end, no signal.

—Voltages obtained on Vacuum Tube voltmeter.

—A second voltage reading is shown made with a 100 ohm-per-volt meter when use of this instrument woul result in appreciably lower readings.

POINTER SETTINGS AND DIAL CORD STRINGING



RECORD CHANGER SERVICE DATA

Complete service information and parts list are covere by a separate service manual. Check record changer fo model number. The RC150 was used by all models havin serial numbers below 500,000.

RADIO RECEPTION DURING PHONO

It is normal for strong radio stations to be heard faintl when switched to PHONO, unless the radio dial is tune between stations. This interference can sometimes be re duced by moving condenser C4 as far from the 12SQ socket and as close to the chassis as possible. Also mov the I.F. transformer wire, connected to pin 4 or 5 of 12SQ as far from condenser C4 and as close to the chassis a possible.

For Alignment and Parts, see P.15-12

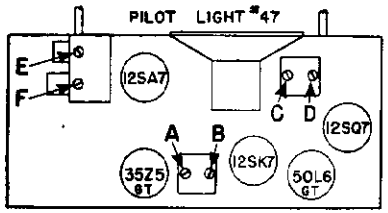
MODEL 6A1, Issue B

ADMIRAL CORPORATION

MODEL 5B1A *ALIGNMENT PROCEDURE* MODEL 5B1

1. Be sure Radio Receiver and Signal Generator are thoroughly warmed up before starting alignment procedure.
2. Check setting of Pointer Extremes and note correct 600 K.C. and 1400 K.C. positions on Dial Background. (See Dial Diagram)
3. Connect Output Meter across Voice Coil.
4. Turn Receiver Volume Control—full on.
5. Use lowest Output setting of Signal Generator capable of producing adequate Output Meter indication and then proceed in the following sequence.
6. Repeat adjustments to insure final overall maximum results.

TOP VIEW — TUBE & TRIMMER LOCATION



BACK OF CHASSIS

Connect Signal Generator to—	Dummy Antenna Between Radio and Generator	Set Generator Frequency to—	Set Receiver Dial Frequency to—	Adjust Following Trimmers	Type of Adjustment
Tuning Condenser Antenna Stator	250 mmfd. Condenser	455 KC.	High frequency end of Dial	C—D 2nd I. F. A—B 1st I. F.	Adjust to maximum Output
Tuning Condenser Antenna Stator	250 mmfd. Condenser	1630 KC.	High frequency end of Dial	E—Osc.	Adjust to maximum Output
Loop radiator (or place pickup lead from gen. close to loop of set to obtain adequate signal).	No actual connection between set and generator.	1400 KC.	Tune in generator signal	F—Ant. (See Note)	Adjust to maximum Output

NOTE: Antenna trimmer "F" must be aligned after chassis and loop are mounted in the cabinet. This adjustment can be made by lifting up the top cover and removing the plug button which is directly above trimmer "F."

6A1-6	Washer, Flat Fibre Insulating
5A2-5	Washer, Offset Fibre Insulating

DIAL DRUM POSITION — MODEL 6A1 - ISSUE B

If the dial drum position is disturbed, it should be carefully re-positioned to insure correct tuning of the permeability tuned coil. When the gang condenser is fully open, the drum will be properly positioned if the center of the condenser shaft and the dial cable hole on the drum are in a straight line parallel to the chassis base. Note that the dial cable hole should be on the left side (looking at front) of the chassis.

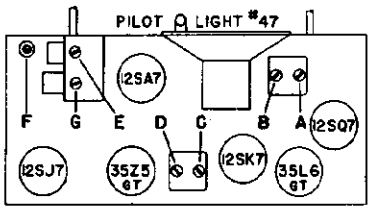
ALIGNMENT PROCEDURE

1. Be sure Radio Receiver and Signal Generator are thoroughly warmed up before starting alignment procedure.
2. Check setting of Pointer Extremes and note correct 600 K.C. and 1400 K.C. positions on Dial Background. (See Dial Diagram on reverse side.)
3. Connect Output Meter across Voice Coil.
4. Turn Receiver Volume Control full on.
5. Use lowest Output setting of Signal Generator capable of producing adequate Output Meter indication and then proceed as outlined in chart below.
6. Repeat adjustments to insure final overall maximum results.

R. F. SLUG POSITION

If the tuned coil slug needs replacing or re-positioning, first see that the dial drum is in its proper position. Then with the threaded stud half-way through the bakelite, note that the top of the slug is flush with the top of coil form. Then re-align.

TOP VIEW — TUBE & TRIMMER LOCATION



BACK OF CHASSIS

Connect Signal Generator To—	Dummy Antenna Between Radio and Generator	Set Generator Frequency To—	Set Receiver Dial Frequency To—	Adjust Following Trimmers	Type of Adjustment
12SA7 Control Grid	250 mmfd. Mica Condenser	455 KC.	High frequency end of Dial	A and B—2nd I. F. C and D—1st I. F.	Adjust to maximum Output
External Antenna Wire on Loop	250 mmfd. Mica Condenser	1630 KC.	High frequency end of Dial	E—Osc.	Adjust to maximum Output
External Antenna Wire on Loop	250 mmfd. Mica Condenser	1400 KC.	Tune in Generator signal	F—R. F. (Iron Core)	See Note Below
Loop radiator (or place pickup lead from gen. close to loop of set to obtain adequate signal).	No actual connection between set and generator.	1400 KC.	Tune in Generator signal	G—Ant.	Adjust to maximum Output

NOTE: Adjustment F is the threaded stud at the top end of the slug wire. Screw stud up or down in the bakelite for maximum output. Alignment is correct if the output is reduced when the position of the lever arm is changed slightly in either direction (up or down).

I.F. 455 Kc.

ALIGNMENT DATA

GENERAL DATA The alignment of this receiver requires the use of a signal generator that will cover the frequencies of 455, 600, 1400, and 1730, and an output meter to be connected across the primary or secondary of the output transformer. If possible, all alignments should be made with the volume control on maximum and the signal generator output as low as possible, to prevent the AVC from operating and giving false readings.

I.F. ALIGNMENT Adjust the signal generator to 455 KC and connect the output to the grid of the first detector tube (1A7) through a .05 or .1 mfd. condenser. The ground of the signal generator can be connected to the chassis ground. Align all I.F. trimmers to peak or maximum reading on the output meter.

BROADCAST BAND ALIGNMENT Adjust the signal generator to 1730 KC and connect the output to the antenna lead (Blue) through a .0002 mfd. mica condenser. Set the gang condenser to minimum capacity and adjust the oscillator trimmer to receive this signal. After this has been carefully done, the next step is to set the signal generator to 1400 KC and after tuning in the signal adjust the antenna trimmer to peak. This is all that is necessary for the alignment unless the plates of the gang condenser have been bent out of shape. In case of bent plates, set the signal generator and the receiver to 600 KC and bend the plates into the position for maximum output.

ADJUSTABLE CONDENSERS

P2448 Gang Condenser

CORRECT ALIGNMENT PROCEDURE The intermediate frequency (I.F.) stage should be aligned properly as the first step. After the I.F. transformers have been properly adjusted and peaked, the Broadcast Band alignment should be the next procedure

I.F. ALIGNMENT Adjust the test oscillator to 456 KC and connect the output to the grid of the first detector tube (6A7) through a .05 or .1 mfd. condenser. The ground on the test oscillator can be connected to the chassis ground. Align all three I.F. trimmers to peak or maximum reading on the output meter.

BROADCAST BAND ALIGNMENT Adjust the oscillator to 1730 KC and connect the output to the antenna lead, through a .0002 mfd. mica condenser. Set the gang condenser to minimum capacity and adjust the gang condenser trimmer (oscillator) to receive this signal. After this has been carefully done, the next step is to set the generator to 1400 KC and after tuning in the signal adjust the antenna trimmer to peak. This is all that is necessary for the alignment unless the plates of the gang condenser have been bent out of shape. In case of bent plates, set the test oscillator and the receiver to 600 KC and bend the plates into the position for maximum output.

ALIGNMENT PROCEDURE

1. Be sure both set and signal generator are thoroughly warmed up before starting alignment.
2. Make alignment using a battery whenever possible.
3. Disconnect Loop Antenna leads from clips on set and remove chassis from cabinet.
4. Connect a 50,000 ohm carbon resistor across the two clips from which the Loop Antenna was removed.
5. Connect Output Meter across the Voice Coil.
6. Connect a fresh battery to the set.
7. Turn receiver Volume Control full on.

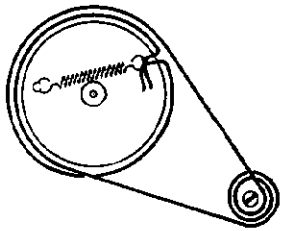
DIAL CORD STRINGING



CIRCUIT CHANGE TO ELIMINATE HUM IN PORTABLE 6E1 CHASSIS

Early production 6E1 chassis sometimes have a rough modulation hum whenever the user's hand is near to or touches certain parts of the cabinet. This happens only when the set is operated on AC power lines.

In most cases this hum can be eliminated or greatly reduced by reversing the power cord plug at the electric outlet. However, we have reports that some sets in some locations still hum excessively even though the line cord plug is reversed.

As soon as this condition was discovered, we changed the circuit slightly on our production line. This change completely eliminates the difficulty. The change is as follows:

The low ends of the loop aerial and variable condenser are disconnected from the AVC circuit and connected to the chassis. A .00025 mica condenser is connected in series with the grid of the 1N5 R.F. tube, and the grid is connected to the AVC circuit through a one megohm resistor.

If any sets are giving this trouble in the field, the circuit change can be easily made without removing the chassis by mounting a small terminal strip for the new parts on the back of the plate which is on the gang condenser. The procedure is as follows:

1. Remove the 1A7GT tube.
2. Remove the left hand screw that holds the mounting plate to the gang condenser. Install the terminal strip with this screw.
3. Mount the condenser (.00025 mfd.) and resistor (1 meg.) on strip. Connect them in series.
4. Remove the green grid lead of the 1N5GT tube from the trimmer condenser and connect it to the junction of the .00025 mfd. condenser and the 1 megohm resistor.
5. Connect the other end of the .00025 mfd. condenser to the trimmer terminal from which the green lead was removed.
6. Disconnect the orange wire that now goes to the lug on the tuning condenser and connect it to the open end of the 1 meg. resistor.
7. Connect a short wire from the tuning condenser stator to chassis.

REPLACING R.F. TUNING SLUG

If the R.F. Tuning Slug has to be changed use the following procedure. Set the gang condenser to the point where the plates are fully meshed. Screw the slug adjusting screw about halfway down. Place the slug in the coil in such a position that the top of the slug is flush with the top of the coil. Solder the slug wire to the adjusting screw. Be sure that the position of the slug does not change during the soldering and that the slug wire is straight. Proceed to realign the set as shown in the chart.

BAND-SWITCH SHOWN AT 2ND POSITION. SHORT WAVE BAND

MODEL M6

ADMIRAL CORPORATION

ALIGNMENT DATA

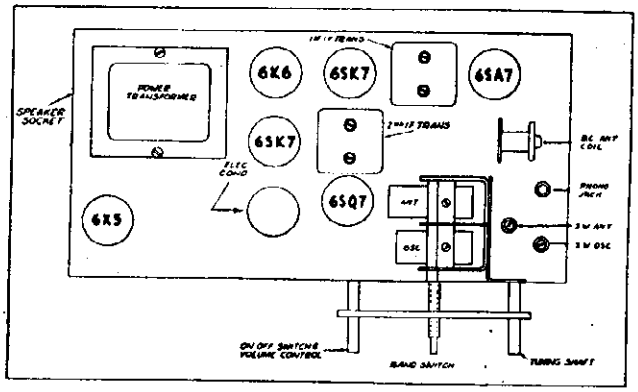

Fig. 2—Top View of Chassis

All of the adjustments have been very carefully set with signal generators at the factory and require no further adjustment, unless it becomes necessary to replace a coil or transformer, or if the adjustments have been tampered with in the field. Under no circumstances attempt any adjustments without first making certain that adjustment is necessary and only after voltages, tubes and condensers have been checked and found to be normal.

The alignment of this receiver requires the use of a signal generator that will cover the frequencies of 455, 1400, 1630 and 9500 kc., and an output meter to be connected across the primary or secondary of the output transformer. All alignments should be made with the volume control in the maximum position, to prevent the AVC from operating and giving false readings.

I.F. ALIGNMENT

Adjust the signal generator to 455 KC and connect the output to the grid of the first detector tube (6SA7) through a .05 or .1 mfd. condenser. Align all I. F. trimmers to peak or maximum reading on the output meter.

B.C. AND S.W. BAND ALIGNMENT

Disconnect loop leads and set the band switch to the broadcast position. Adjust signal generator to 1630 K.C. and connect thru a .0002 mfd. mica condenser to the green loop lead. Set the gang condenser to minimum capacity and adjust the B.C. oscillator trimmer (see fig. 2) to receive this signal. Set the band switch to the short wave position, adjust the signal generator to exactly 9,500 K.C. and connect thru a 400 ohm resistor to the green loop lead. Set the dial pointer at 9.5 megacycles and carefully peak S.W. oscillator trimmer and then peak S.W. antenna trimmer. Re-install chassis in cabinet and connect loop leads. Set the band switch to the broadcast position. Adjust the signal generator to 1400 K.C. and connect the output to a shielded loop radiator and place this loop about two feet from the loop antenna. If no loop radiator is available the output of the signal generator should be connected to the green loop lead thru a .0002 mfd. mica condenser. Tune signal and carefully peak the B.C. antenna trimmer.

SCHEMATIC DIAGRAM
MODEL 7K

SERVICE INFORMATION

Speaker (Part No. P3284)

Field resistance ..... 450 ohms

D.C. voice coil resistance ..... 4.6 ohms

Voice coil impedance at 400 cycles ..... 5 ohms

Oscillator Coil (Part No. P3682)

Looking at the connection end (with dot) in a clockwise direction starting at the chassis the terminals are No. 1, grid;

Primary—No. 2 and No. 3—Resistance 1.5 ohms.

Secondary—No. 4 and No. 1—Resistance 4.5 ohms.

First I.F. Transformer (Part No. P3282)

Primary—Blue white, plate; red white B+—Resistance 24.2 ohms.

Secondary—White, grid; black white, AVC—Resistance 23.6 ohms.

Second I.F. Transformer (Part No. P3283)

Primary—Blue white, plate; red white, B+—Resistance 11.9 ohms.

Secondary—White, grid; black white, AVC—Resistance 16.9 ohms.

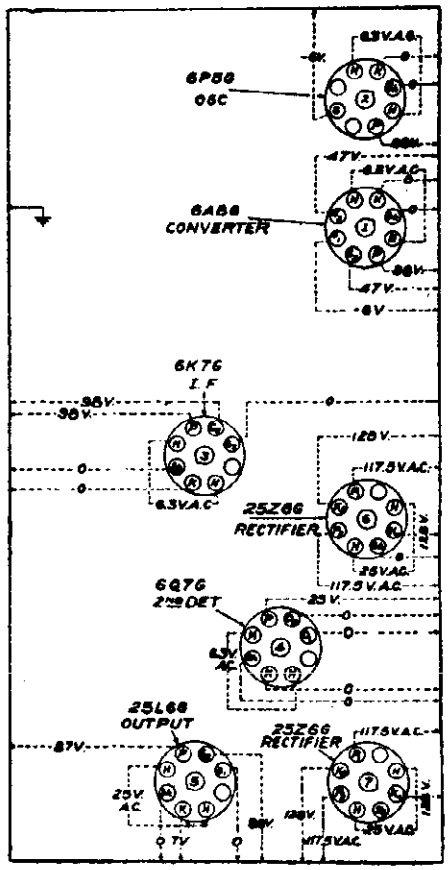
Electrolytic Condenser (Part No. P3531)

Red, 20 mfd., 150 volt; green, 20 mfd., 150 volt; yellow, 20 mfd., 25 volt; black, negative for all three sections.

Loop Antenna

Since the loop antenna acts also as the antenna coil the set will not operate with the loop antenna disconnected.

VOLTAGES AT SOCKETS



Bottom View of Chassis

ADMIRAL CORPORATION

MODEL 7K

ALIGNMENT PROCEDURE

- Volume control—Maximum all adjustments.
- Connect radio chassis to ground post of signal generator with a short heavy lead.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

The following equipment is required for aligning:

- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
- Output indicating meter.
- Non-metallic screwdriver.
- Dummy antennas—.1 mfd., 200 mmf.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Variable Condenser Setting	Trimmers Adjusted (In Order Shown)	Trimmer Function	Adjustment
I. F.	455 KC.	.1 MFD.	Grid of 6K7G I.F. tube	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 2)	Output I.F.	Adjust to maximum output
	455 KC.	.1 MFD.	Grid of 6A8G tube	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 2)	Input I.F.	Adjust to maximum output
BROAD-CAST	1730 KC.	200 mmf.	Antenna lead	Rotor full open (Plates out of mesh)	Trimmer—Top of Left section of gang (See Fig. 2)	Oscillator	Adjust to maximum output
	1400 KC.	200 mmf.	Antenna lead	Set dial at 1400 KC.	Trimmer—Top of Right section of gang (See Fig. 2)	Antenna	Adjust to maximum output

This is all that is necessary for the alignment unless the plates of the gang have been bent out of shape. In case of bent plates, set the signal generator and receiver to 600 KC and bend the plates into the position for maximum output.

Attenuate the signal from the signal generator to prevent the leveling off-action of the AVC. After each band is completed, repeat the procedure as a final check.

FREQUENCY RANGE

540 to 1630 KC

Power output 1 watt undistorted—1.7 watts maximum.

Intermediate Frequency 455 KC.

Power Consumption—50 watts.

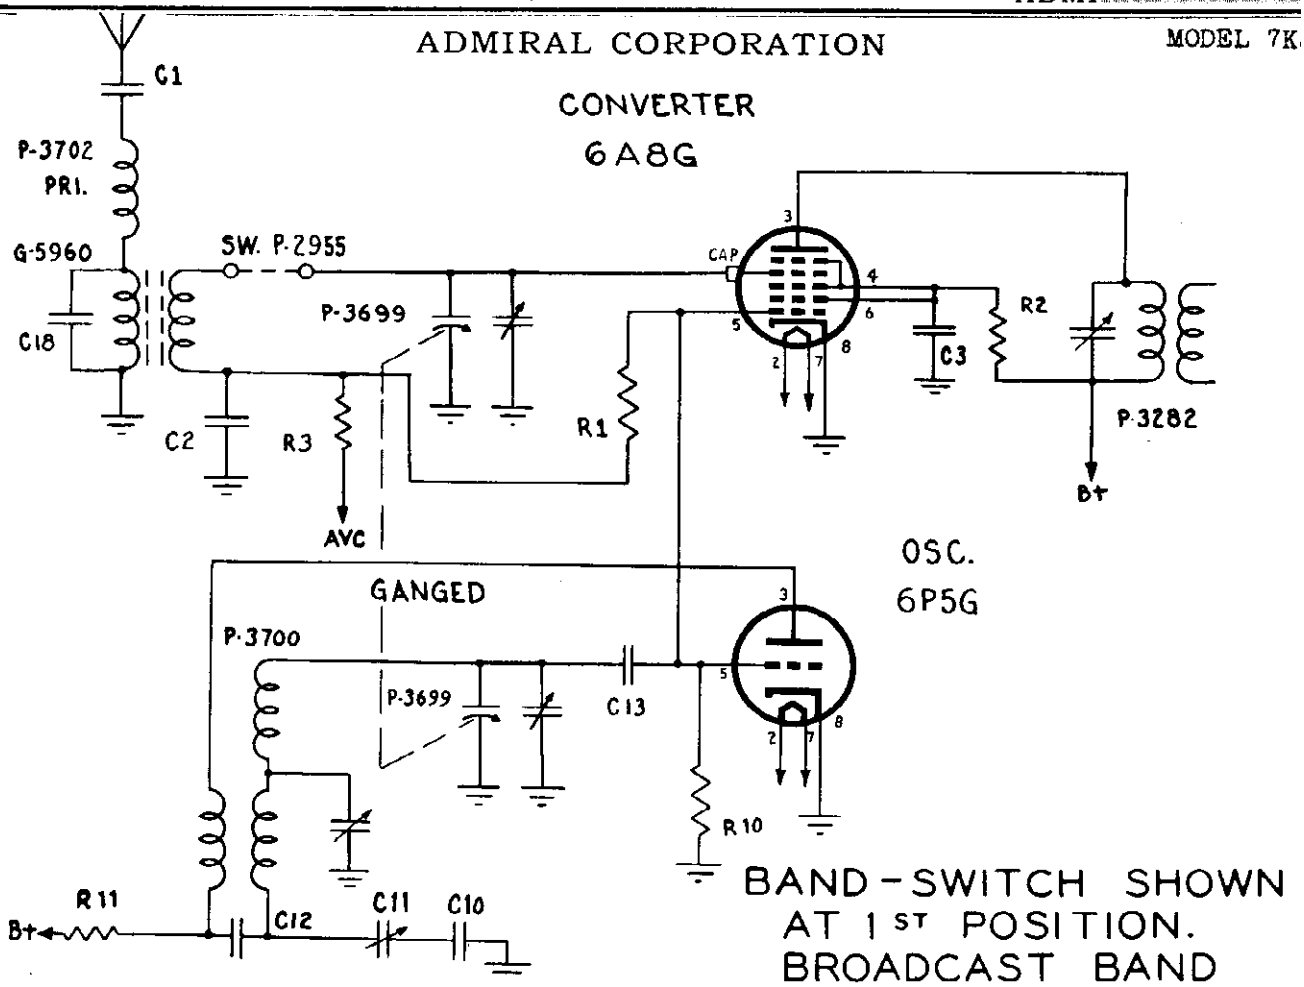
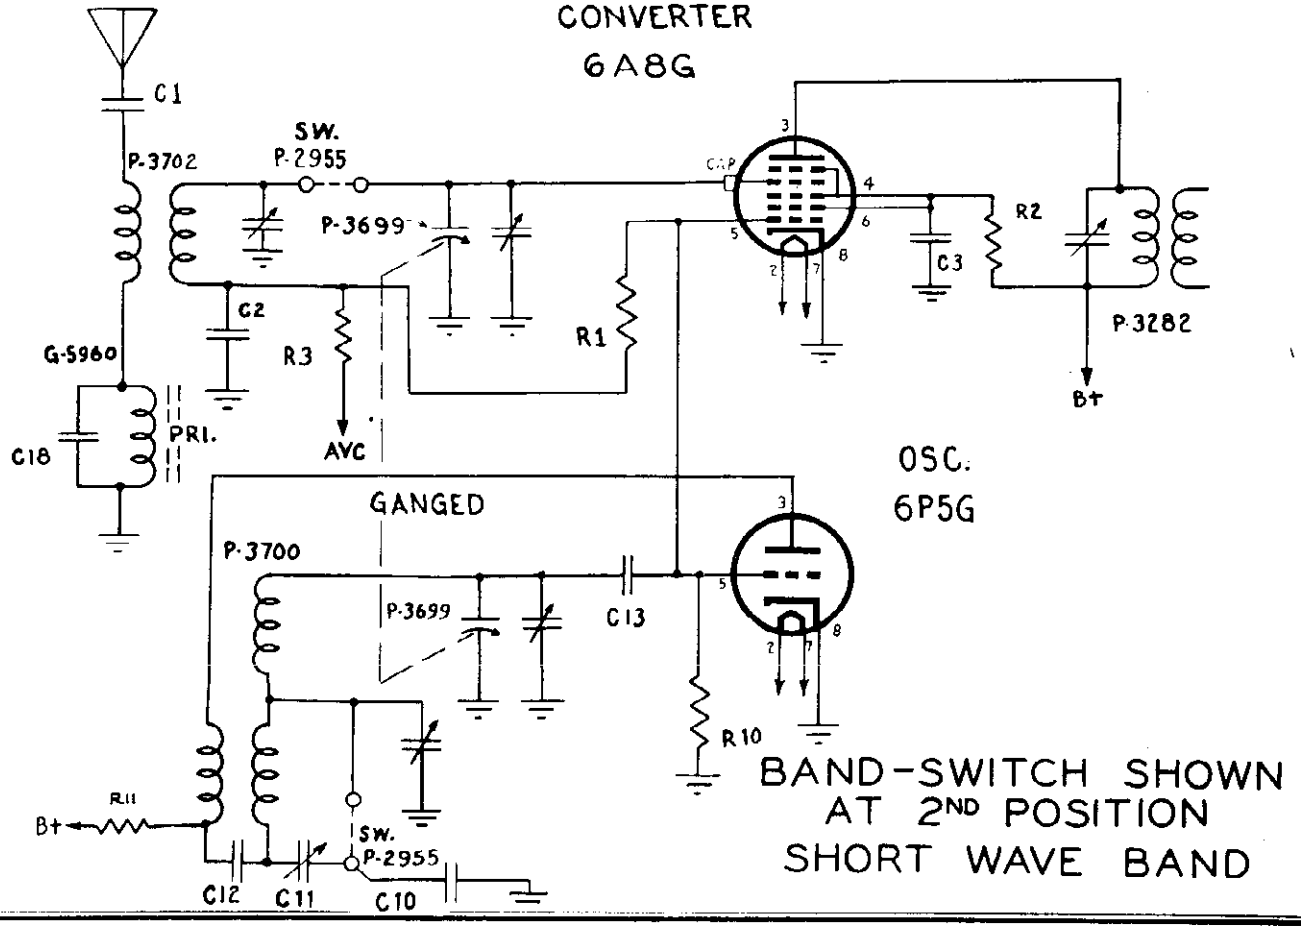
ADMIRAL CORPORATION MODEL 7K



BAND-SWITCH SHOWN AT 1ST POSITION. BROADCAST BAND



BAND-SWITCH SHOWN AT 2ND POSITION SHORT WAVE BAND

SERVICE NOTES

Voltages taken from the different points of the circuit to chassis are measured with volume control in maximum position, all tubes in their sockets and with a volt meter having a resistance of 1000 ohms per volt, on the 150 volt scale. These voltages are clearly indicated on the voltage chart.

In order to prevent signal from acting upon A.V.C. and affecting accuracy of voltage measurements, aerial and ground leads should be short circuited while making measurements.

All voltages should be measured with 117.5 volts A.C. input to receiver. Resistance and actual connections of coils and transformers, electrolytic condenser information and speaker data are given under Service Information.

To check for open by pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating, which is known to be good until the defective unit is located.

Failure to operate, noisy or weak reception is usually due to defective tubes, the tubes making poor contact with sockets or grid clips making poor contact with the caps of the tubes.

ALIGNING INSTRUCTIONS

All of the adjustments have been very carefully set with signal generators at the factory and require no further adjustment, unless it becomes necessary to replace a coil or transformer, or if the adjustments have been tampered with in the field. Under no circumstances attempt any adjustments without first making certain that adjustment is necessary and only after voltages, tubes and condensers have been checked and found to be normal. To properly re-align this receiver, a signal generator as well as an output meter, must be used.

ALIGNMENT PROCEDURE

- Volume control—Maximum all adjustments.
- Connect radio chassis to ground post of signal generator with a short heavy lead.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

The following equipment is required for aligning:

- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
- Output indicating meter.
- Non-metallic screwdriver.
- Dummy antennas—.1 mfd., 200 mmf., 400 ohms.

BAND	SIGNAL GENERATOR Frequency Setting	SIGNAL GENERATOR Dummy Antenna	Connection to Radio	Variable Condenser Setting	Trimmers Adjusted (In Order Shown)	Trimmer Function	Adjustment
I. F.	455 KC.	.1 Mfd.	Grid of 6K7G I.F. tube	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 2)	Output I. F.	Adjust to maximum output
	455 KC.	.1 Mfd.	Grid of 6A8G tube	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 2)	Input I. F.	Adjust to maximum output
SHORT WAVE	18,100 KC.	400 ohms	Antenna lead	Rotor full open (Plates out of mesh)	Trimmer—Top of left section of gang (See Fig. 2)	Short Wave Oscillator	Adjust to receive signal
	16,000 KC.	400 ohms	Antenna lead	Tune signal	Trimmer—On right side of chassis, 3rd from front	Short Wave Antenna	Adjust to maximum output
BROADCAST	1730 KC.	200 Mmf.	Antenna lead	Rotor full open (Plates out of mesh)	Trimmer—On right side of chassis, 2nd from front	Broadcast Oscillator	Adjust to maximum output
	1400 KC.	200 Mmf.	Antenna lead	Set dial at 1400 KC.	Trimmer—Top of right section of gang (See Fig. 2)	Broadcast Antenna	Adjust to maximum output
	600 KC.	200 Mmf.	Antenna lead	Set dial at 600 KC.	Trimmer—On right side of chassis, 1st from front	Oscillator Series Pad.	Adjust to maximum rock dial See Note 'A'

Note "A"—Turn the dial back and forth slightly (rock) and adjust trimmer until the peak of intensity is obtained. Attenuate the signal from the signal generator to prevent the leveling-off action of the A.V.C.

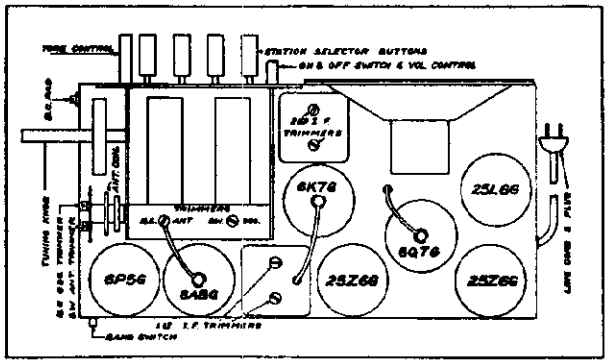
Do not bend variable condenser to correct tracking.

Frequency Range — 535 to 1730 and 5,700 to 18,100 K.C.

Power output 1 watt undistorted—1.7 watts maximum.

Intermediate Frequency 455 K.C.

Power Consumption—50 watts.



TUBE COMPLEMENT

The tube complement of this receiver consists of the following tubes.

1—Type 6A8G—Pentagrid Converter (First Detector)

1—Type 6P5G—Triode Amplifier (Oscillator)

1—Type 6K7G—Remote cut-off Pentode as an IF Amplifier (455 KC).

1—Type 6Q7G—Duplex Diode Triode Second Detector, A.V.C. and First Audio.

1—Type 25L6G—Tetrode Power Amplifier.

2—Type 25Z6G—Twin Diode High Vacuum Rectifiers.

PROCEDURE FOR SETTING UP PUSH BUTTONS

There are four push buttons by means of which four stations may be selected (See Fig. 1). Make a list of four stations tuned in regularly. Loosen one of the push buttons by turning the push button knob counter clockwise a half turn or less and push it in; while holding the button in, tune in a desired station by means of the station selector wheel. Turn the selector very slowly back and forth until the signal is clearest. Now while holding the push button in, tighten it by turning clockwise. Release the push button and turn the station selector to one end of the dial; then check the button by pushing it in and if the station is tuned to the center of the area on the dial covered by the station the adjustment is correct.

Release the push button and loosen another push button and repeat the above procedure, doing this for the remaining buttons.

If it is desired to change a button to a different station simply loosen the push button and re-set.

Punch the correct station call letter tabs from the set of sheets supplied and insert them into the recesses above the push buttons.

The dial is now set up for quick tuning and all that is necessary is to push the button under the desired station all the way in and then release.

SHORT WAVE BAND
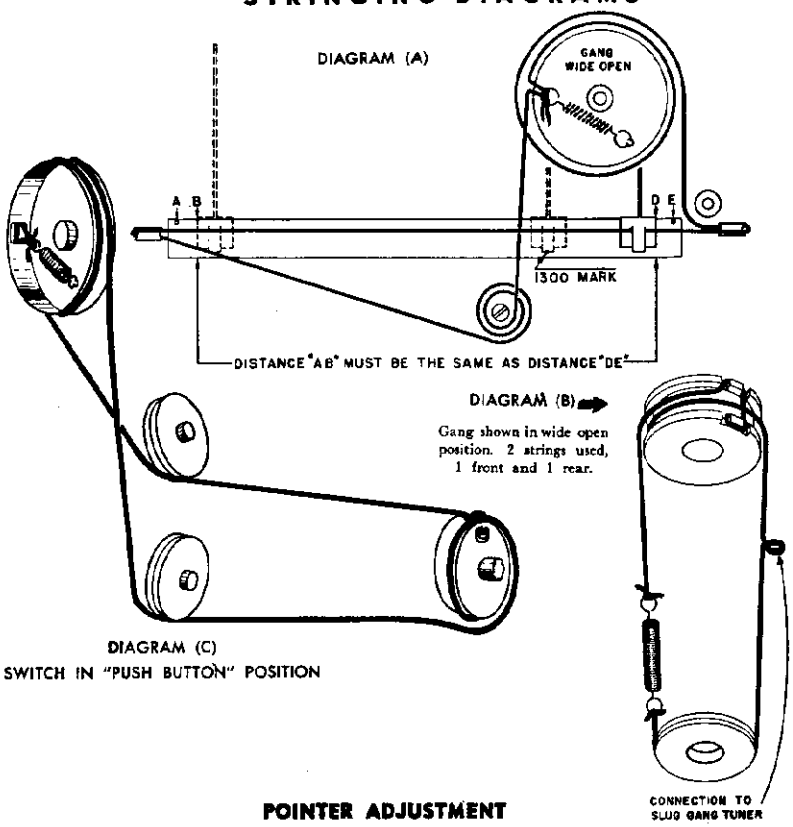
16 TO 19 METERS

ALIGNMENT PROCEDURE

1. Loop must be connected during alignment.
   Check the set screws that hold the tuning drum to the shaft to see that they are tight and that the drum has not slipped on the shaft. The correct position of the drum can be seen on stringing diagram (A).
2. In the wide open position the stop on the rear of the dial drum must be against the stop post.
3. With the gang wide open, all slugs should be 1⅛ inches out of their coil forms. If there is any serious deviation of if there has been any tampering, turn the adjusting screws until this distance is corrected. (See paragraph on Tuning Slug Replacement.)
4. Be sure both the set and the signal generator are thoroughly warmed up before starting alignment.
5. Turn receiver Volume Control full on.
6. Use lowest output setting of signal generator that gives a satisfactory reading on meter.
7. Proceed in sequence as outlined below.

Step	Connect Signal Generator To	Dummy Antenna Between Radio and Signal Generator	Signal Generator Frequency	Tuning Gang Setting	Adj. Trimmers in Following Order To Max.
1	6SA7 Grid (Pin #8)	.1 MFD.	455 K.C.	Pointer to upper limit	E, D, C, B, A
2	Before proceeding to step 3 check pointer travel as outlined under paragraph below headed "Pointer Adjustment." Set Band Change Switch to Broadcast Position.				
3	White Loop Lead	10 MMFD. If not available wrap several turns of the generator lead around the white loop lead.	1605 K.C.	Pointer to upper limit	F, G, H
4	White Loop Lead		1500 K.C.	Set Pointer to 1300 mark on slide rail (See Dial Diagram A)	I, J, K
5	Set Band Change Switch to 49 Meter Position.				
6	White Loop Lead	400 Ohms	7.5 Mc.	Pointer to upper limit	L, M
7	White Loop Lead	400 Ohms	7.2 Mc.	Set Pointer to 1300 mark on slide rail	N, O
8	Set Band Change Switch to 31-25 Meter Position.				
9	White Loop Lead	400 Ohms	12.5 Mc.	Pointer to upper limit	P, Q
10	Set Band Change Switch to 19-16 Meter Position.				
11	White Loop Lead	400 Ohms	18.0 Mc.	Pointer to upper limit	R, S

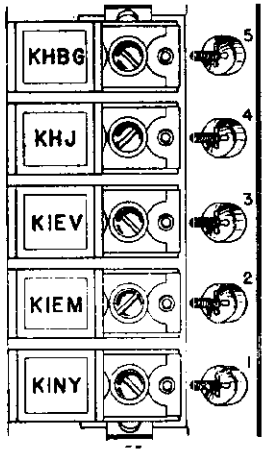
STRINGING DIAGRAMS



POINTER ADJUSTMENT

Move the dial pointer by means of the tuning control knob to see that it reaches the upper and lower limits as shown on stringing diagram (A). In the upper limit position measure the distance D-E and in the lower limit position measure the distance A-B. The distance from A and B must be the same as the distance from D to E. If these distances are not equal, unclamp and move the pointer slide on the string until they are the same. The pointer should be checked again at the upper and lower limit to be sure that it is right. Take care to see that the pointer does not slip during this operation. Reclamp the pointer slide tightly to the string and seal with any quick-drying cement. Set the tuning gang wide open and proceed with operation 5.

PROCEDURE FOR SETTING UP PUSH BUTTONS

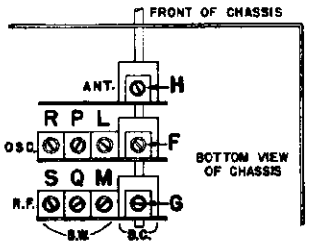


Push Button	Frequency Range
1	795 K.C. - 1600 K.C.
2 & 3	635 K.C. - 1430 K.C.
4 & 5	540 K.C. - 1260 K.C.

Remove the escutcheon covering the push button control unit. Pick the first of the 5 chosen stations. This should be of the proper frequency for button number 5. Set the band switch to broadcast and accurately tune in the station. Now turn the band switch to the push button position and adjust slug screw number 5 until the same station comes in with its loudest volume. Reduce the volume by means of the volume control and adjust the trimmer screw which is adjacent and to the left of the coil just adjusted. Again bring the station to its maximum volume. Set the rest of the push buttons in a like manner, one for each of the stations chosen.

NOTE: *Since each oscillator (slug) in the push button unit will tune over the entire broadcast band, (540 K.C.-1600 K.C.), care should be taken to set up stations* **within** *the frequency ranges associated with each button.*

TRIMMER LAYOUTS



REPLACING TUNING SLUG

If it becomes necessary to change a tuning slug proceed in the following manner: Set the gang to its wide open position, unsolder and remove the old slug. Set the slug adjusting screw about half way down. Place the new slug in such a position that 1⅛ inches of its length is above the coil form. Solder it in this position making sure that it does not slip during the operation and that the slug wire is straight. Proceed to realign the set as shown in the chart.

SHORT WAVE BAND

Band switch shown in broadcast position in schematic and in short wave position in pictorial view in lower left corner.

Speaker (Part No. P4283) 10" PM.

D. C. voice coil resistance	3.7 ohms
Voice coil impedance at 400 cycles	4.1 ohms

S. W. Antenna Coil (Part No. P3198)

Looking at the connection end starting at the chassis in a clockwise direction the terminals are: No. 1, plate; No. 2, B+; No. 3, grid; No. 4, pad.

Primary—No. 3 and No. 4—Resistance	.08 ohm
Secondary—No. 1 and No. 2—Resistance	.37 ohm

Oscillator Coil (Part No. P4194)

Looking at the mounting strip end in a clockwise direction starting at the chassis, the terminals are: No. 1, ground; No. 2, cathode; No. 3, open; No. 4, pad; No. 5, switch; No. 6, grid; No. 7, grid; No. 8, open.

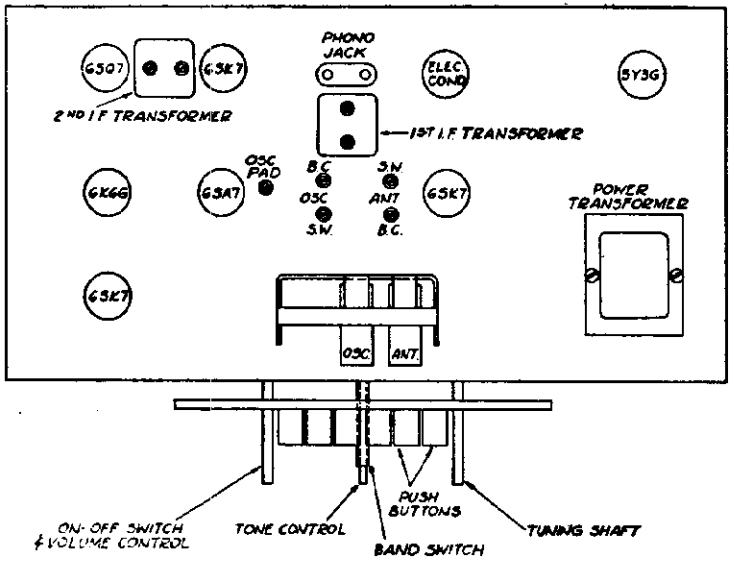
B.C. Primary—No. 1 and No. 5—Resistance	.29 ohm
S.W. Primary—No. 5 and No. 2—Resistance	.06 ohm
B.C. Secondary—No. 4 and No. 6—Resistance	5.7 ohms
S.W. Secondary—No. 2 and No. 7—Resistance	.08 ohm

First I.F. Transformer (Part No. P4108)

Primary—Blue, plate; red, B+—Resistance	18.2 ohms
Secondary—White, grid; black, AVC—Resistance	15.1 ohms

Second I.F. Transformer (Part No. P4109)

Primary—Blue, plate; red, B+—Resistance	20.8 ohms
Secondary—White, diode; black, AVC—Resistance	17.4 ohms



ALIGNMENT DATA

GENERAL DATA

The alignment of this receiver requires the use of a signal generator that will cover the frequencies of 445, 600, 1400, 1630, 6,000, 16,000 and 18,100 K.C., and an output meter to be connected across the primary or secondary of the output transformer. If possible, all alignments should be made with the volume control on maximum and the signal generator output as low as possible, to prevent the AVC from operating and giving false readings.

I.F. ALIGNMENT

Adjust the signal generator to 455 K.C. and connect the output to the grid of the first detector tube (6SA7) through a .05 or .1 mfd. condenser. Align all I.F. trimmers to peak or maximum reading on the output meter.

BROADCAST BAND ALIGNMENT

Adjust the signal generator to 1630 K.C. and connect the output to the antenna lead, through a .0002 mfd. mica condenser. Set the gang condenser to minimum capacity and adjust the B.C. oscillator trimmer to receive this signal. After this has been carefully done, the next step is to set the signal generator to 1400 K.C. and after tuning in the signal adjust the B.C. antenna trimmer to peak. Set the signal generator to 600 K.C., tune the signal and then slowly increase or decrease the B.C. oscillator padding condenser and at the same time continuously tune back and forth across the signal with the receiver until the maximum reading is obtained on the output meter.

Return to 1400 K.C. and again go over the adjustments of this frequency to be certain that they were not put slightly out of alignment when adjustment was made at 600 K.C.

SHORT WAVE BAND ALIGNMENT

Adjust the signal generator to 18,100 K.C. and connect the output to the antenna lead, through a 400 ohm resistor. Set the gang condenser to minimum capacity and adjust the S.W. oscillator trimmer to receive this signal. Set the signal generator to 16,000 K.C., tune signal and adjust the S.W. antenna trimmer to peak. As there is no variable low frequency padding condenser on this band, the sensitivity of the receiver should be checked at 6000 K.C. to determine whether the circuits are in line at this frequency. Should the receiver lack sensitivity at 6000 K.C., the antenna and oscillator coils, as well as the padding condenser, should be tested.

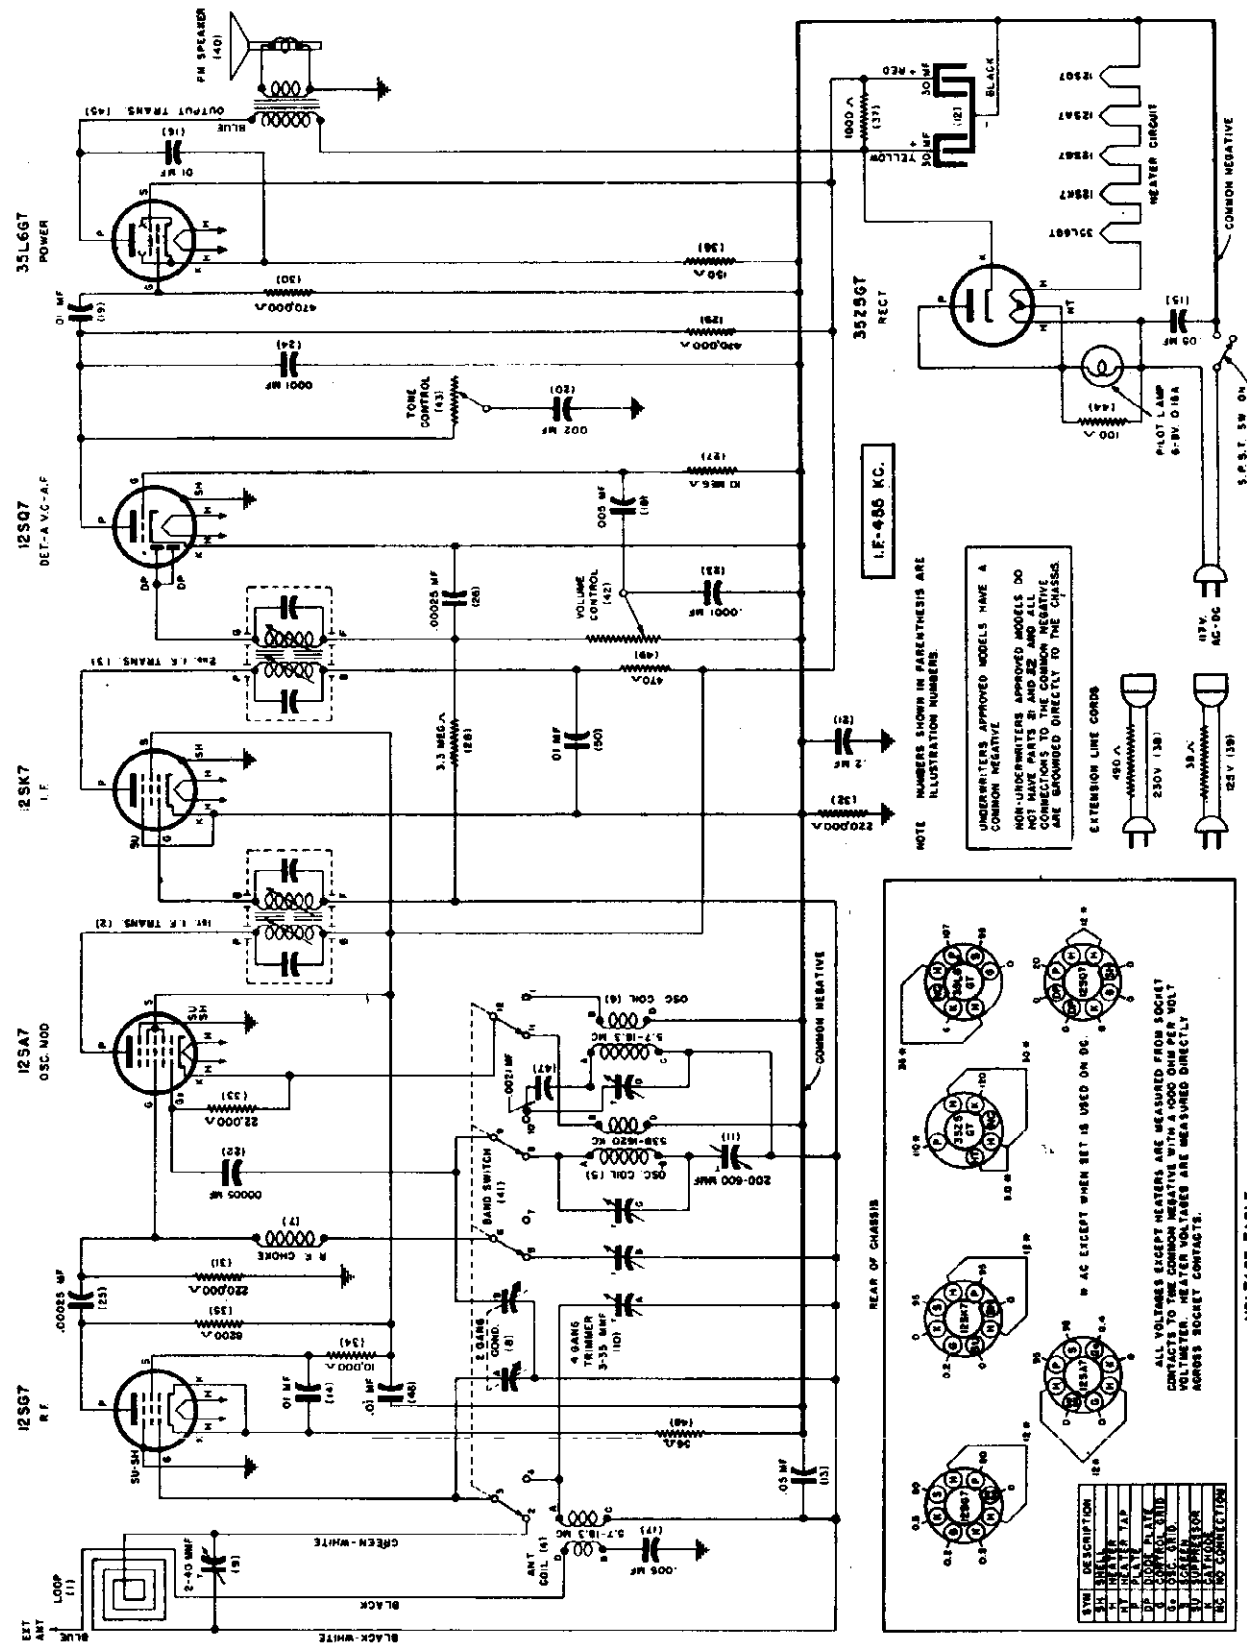
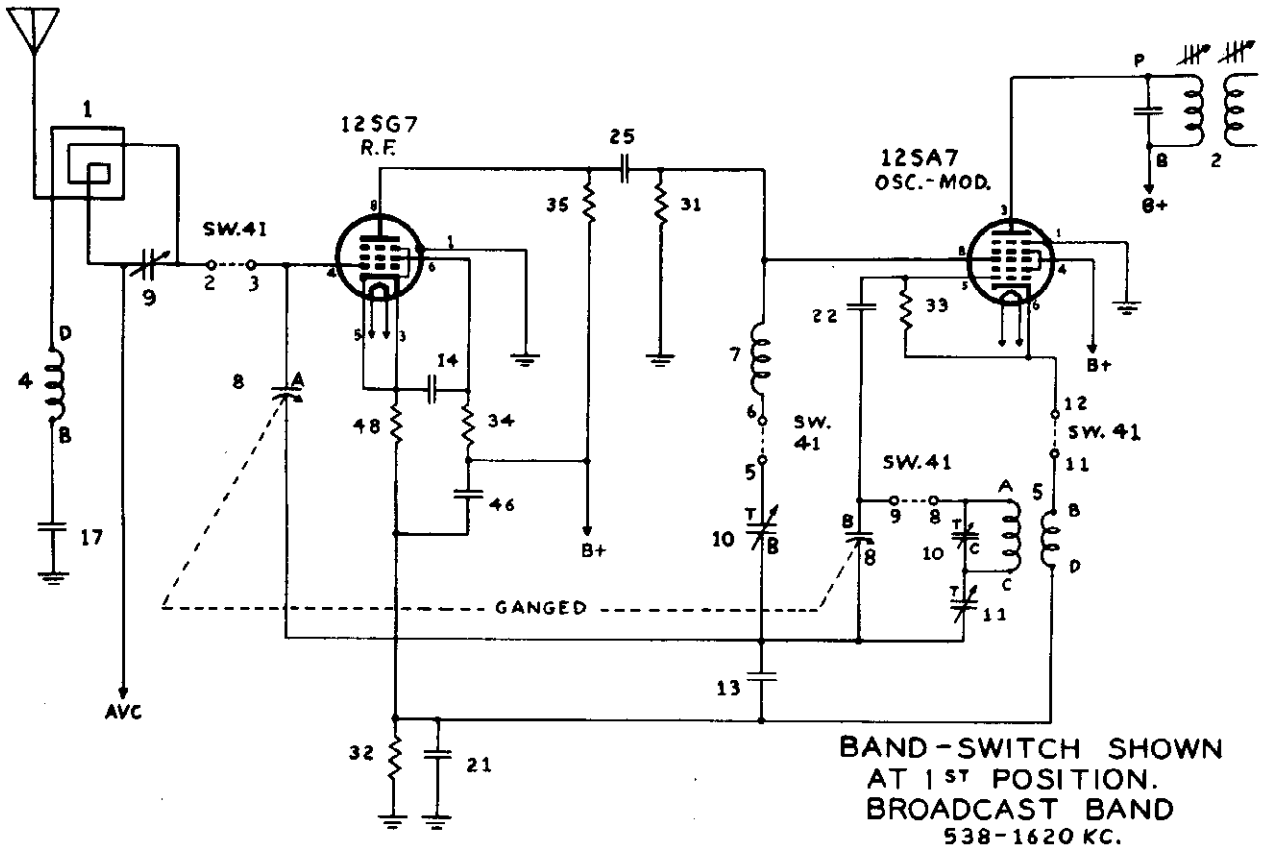
ALLIED RADIO CORP.

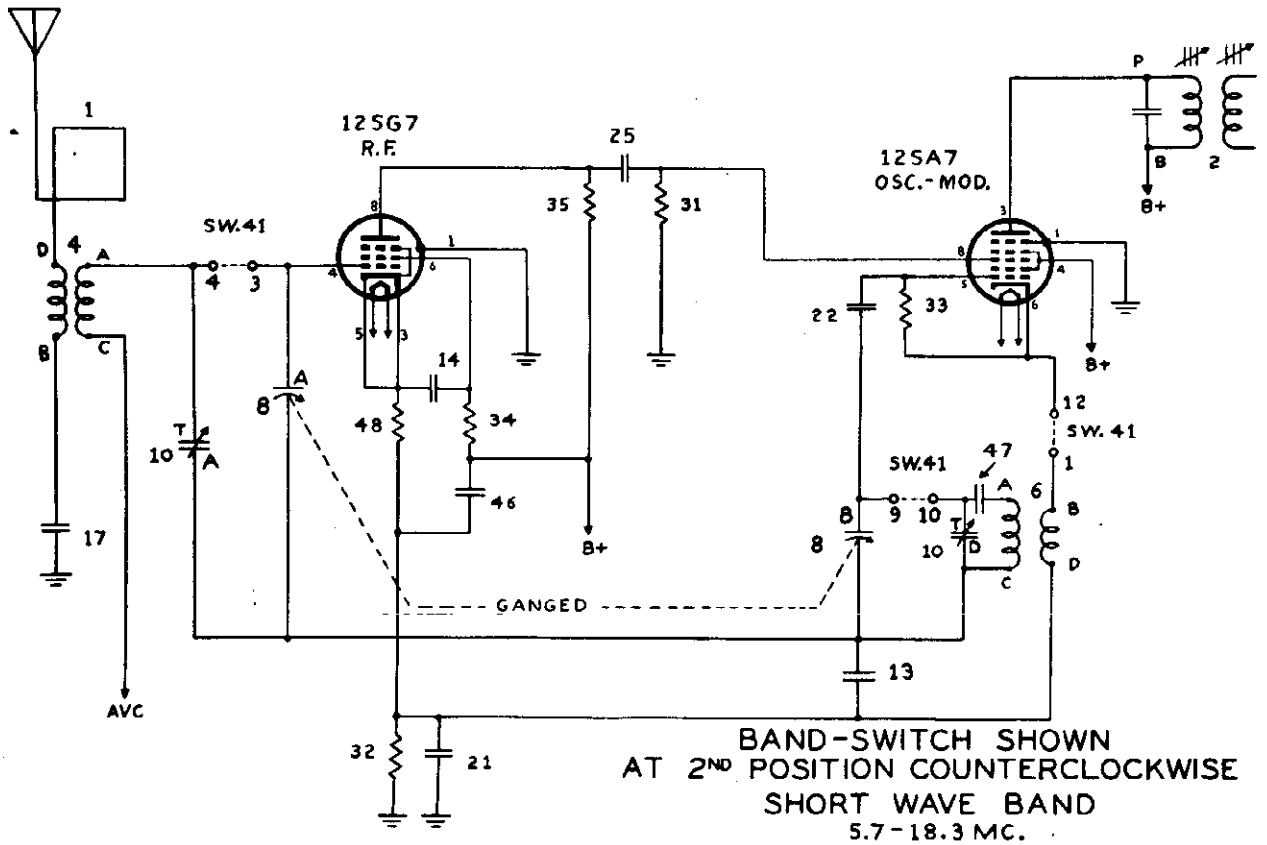


11-45

MODEL 6A-122

ALLIED RADIO CORP.





Be sure to follow procedure carefully and in the order given—otherwise the receiver will be insensitive and the dial calibration incorrect. For alignment procedure read tabulations from left to right. Make the adjustment marked (1) first, (2) next, (3) third, etc.

Before starting alignment:

(a) Check tuning dial adjustment by tuning gang condenser until plates touch maximum capacity stop (completely in mesh) at which point the dial needle must be exactly even with the last line at the low frequency end of the dial calibration. If dial needle does not point exactly to last line move to correct position.

(b) Use an accurately calibrated test oscillator with some type of output measuring device.

(c) Place loop antenna in the same position it will be in when set is in the cabinet.

Steps	Place band switch for operation on:	Set receiver dial to:	TEST OSCILLATOR: Adjust test oscillator frequency to:	TEST OSCILLATOR: Use dummy antenna in series with output of test oscillator consisting of	TEST OSCILLATOR: Attach output of test oscillator to:	Refer to parts layout diagram for location of trimmers mentioned below:
1	I.F. alignment use any band position.	Any point where no interfering signal is received	Exactly 455 K.C.	0.2 Mfd. condenser	High side to rear stator plates of tuning condenser. Low side to frame of condenser through .01 Mfd. condenser	Adjust each of the second I.F. transformer trimmers for maximum output, then adjust each of the first I.F. transformer trimmers for maximum output.
2	1620 to 538 K.C. Band	Rotate gang condenser to Maximum Capacity	Exactly 455 K.C.	.00025 Condenser	High side to BLUE Antenna Lead. Low side to chassis through a .01 mfd. condenser.	Adjust R.F. coil trimmer for minimum 455 K.C. signal.
		Exactly 1620 K.C.	Exactly 1620 K.C.			Adjust 1620 K.C. oscillator trimmer for maximum output.
		Approx. 1400 K.C.	Approx. 1400 K.C.			While rocking gang condenser adjust 1400 K.C. loop trimmer for maximum output.
		Approx. 600 K.C.	Approx. 600 K.C.			While rocking gang condenser adjust 600 K.C. oscillator padder for maximum output.

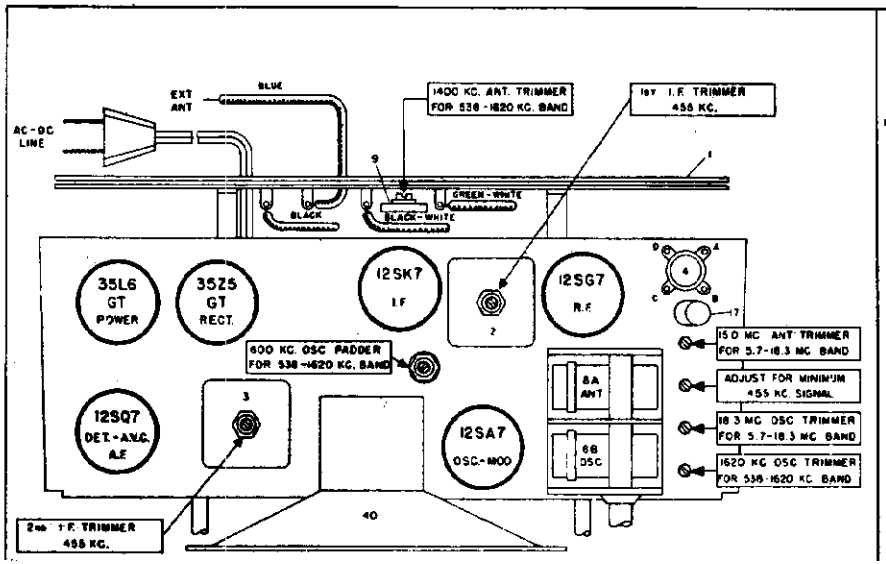
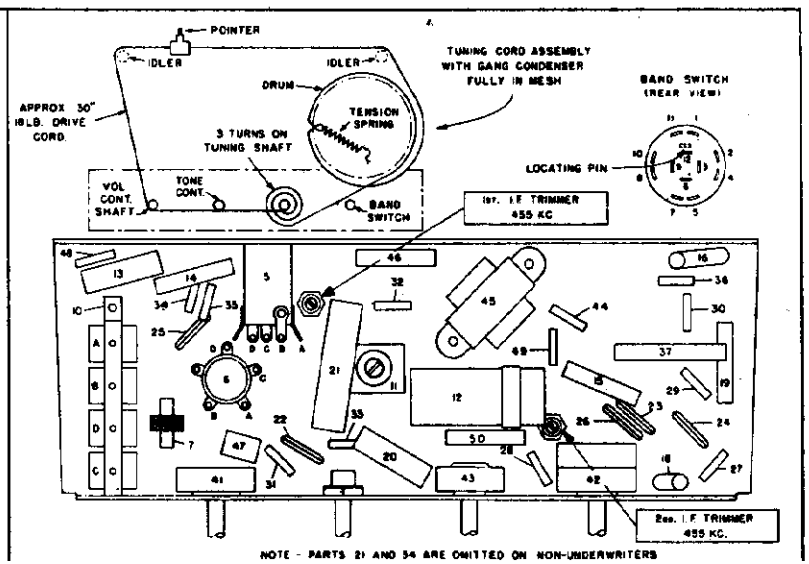
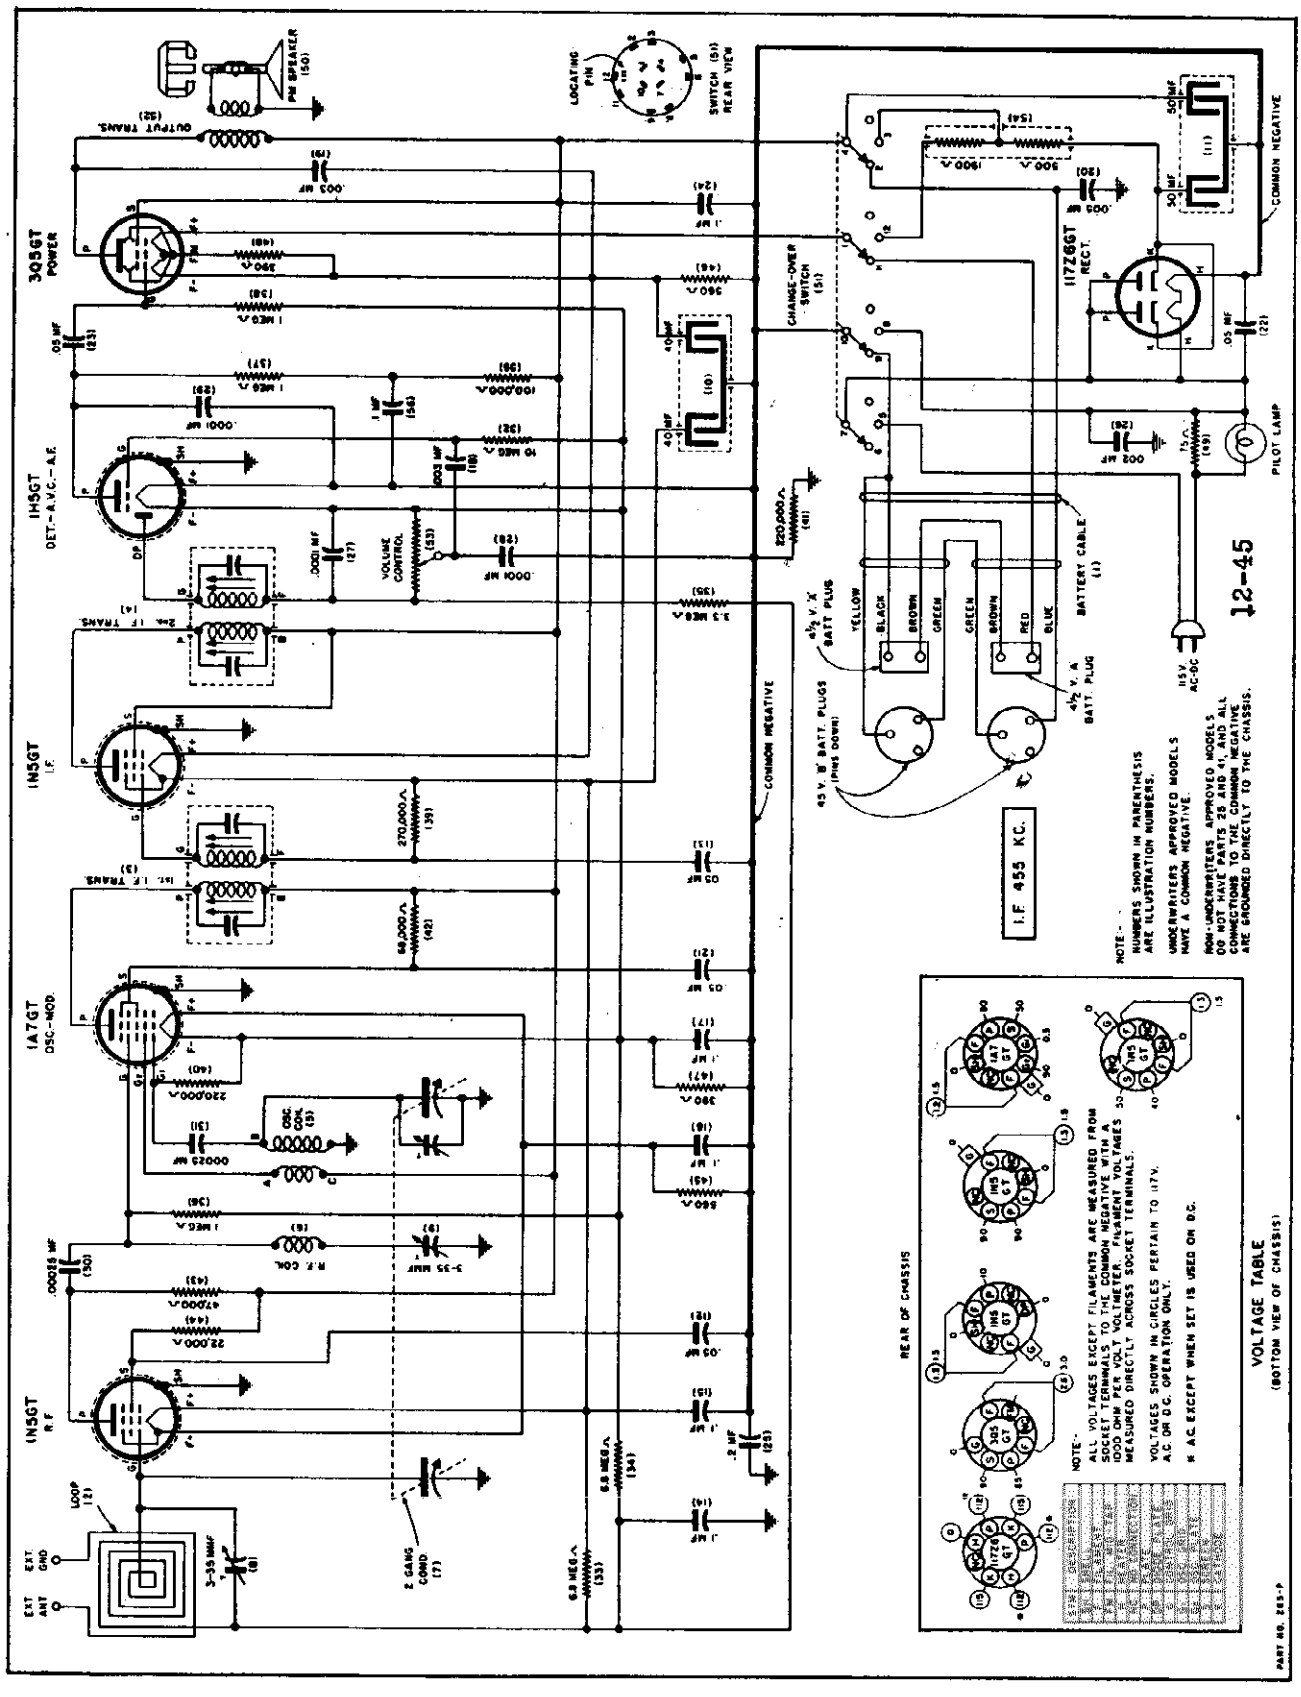
		Approx. 15 M.C.	Approx. 15 M.C.	400 Ohm carbon resistor		While rocking gang condenser adjust 15 M.C. antenna trimmer for maximum output.





MODEL 6A-127

ALLIED RADIO CORP.



Before starting alignment:

(a) Check tuning dial adjustment by tuning gang condenser until plates touch maximum capacity stop (completely in mesh) at which point the dial needle must be exactly even with the last line at the low frequency end of the dial calibration. If dial needle does not point exactly to last line move to correct position.

(b) Use an accurately calibrated test oscillator with some type of output measuring device.

(c) WHEN ADJUSTING 1650 KC OSCILLATOR TRIMMER AND 455 KC TRIMMER remove chassis from cabinet and disconnect the white-green and white-black loop connection wires from the 1400 KC loop antenna trimmer. Attach a 1 megohm resistor across these wires and feed output of test oscillator across the 1 megohm resistor.

(d) THE 1400 KC LOOP ANTENNA TRIMMER is accessible through hole in cabinet back. It should be adjusted only after all other adjustments have been made and with the set mounted in the cabinet and the back IN CLOSED position. When aligning the 1400 KC trimmer connect test oscillator output to the "ANT" and "GND" clips that are attached to the inside of the cabinet back.

TEST OSCILLATOR

Steps	Set receiver dial to:	Adjust test oscillator frequency to:	Use dummy antenna in series with output of test oscillator consisting of:	Attach output of test oscillator to	Refer to parts layout diagram for location of trimmers mentioned below:
1	Any point where no interfering signal is received	Exactly 455 K. C.	0.2 Mfd. Condenser	High side to grid of 1A7GT tube. Low side to chassis (If non-Underwriter Approved) or Common Negative (if Underwriter Approved).	Adjust each of the 2nd I.F. transformer trimmer adjustment screws for maximum output, then adjust each of the 1st I.F. transformer trimmer adjustment screws for maximum output.
2	Rotate gang condenser to maximum capacity	Exactly 455 K. C.	See paragraph (C) above	See paragraph (C) above	Adjust R. F. coil trimmer for minimum 455 K. C. signal.
3	Rotate gang condenser to minimum capacity	Exactly 1650 K. C.			Adjust 1650 K. C. oscillator trimmer for maximum output.
4	Approximately 1400 K. C.	Approx. 1400 K. C.	See paragraph (D) above	See paragraph (D) above	Adjust 1400 K. C. antenna trimmer for maximum output.

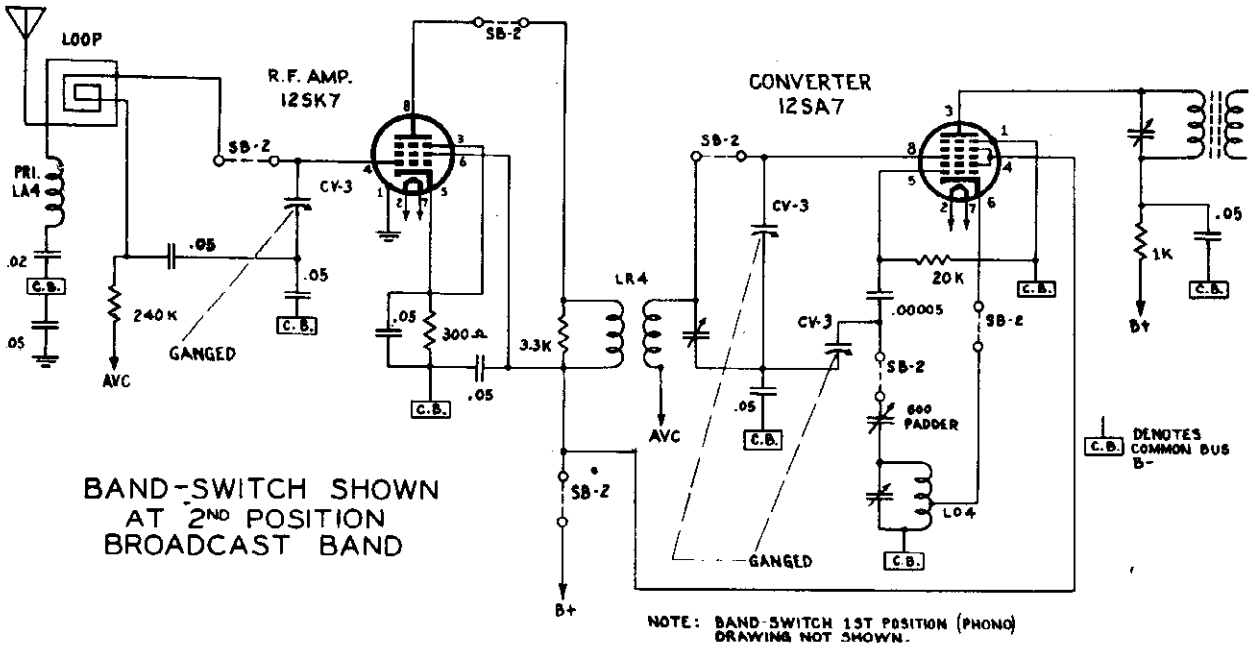
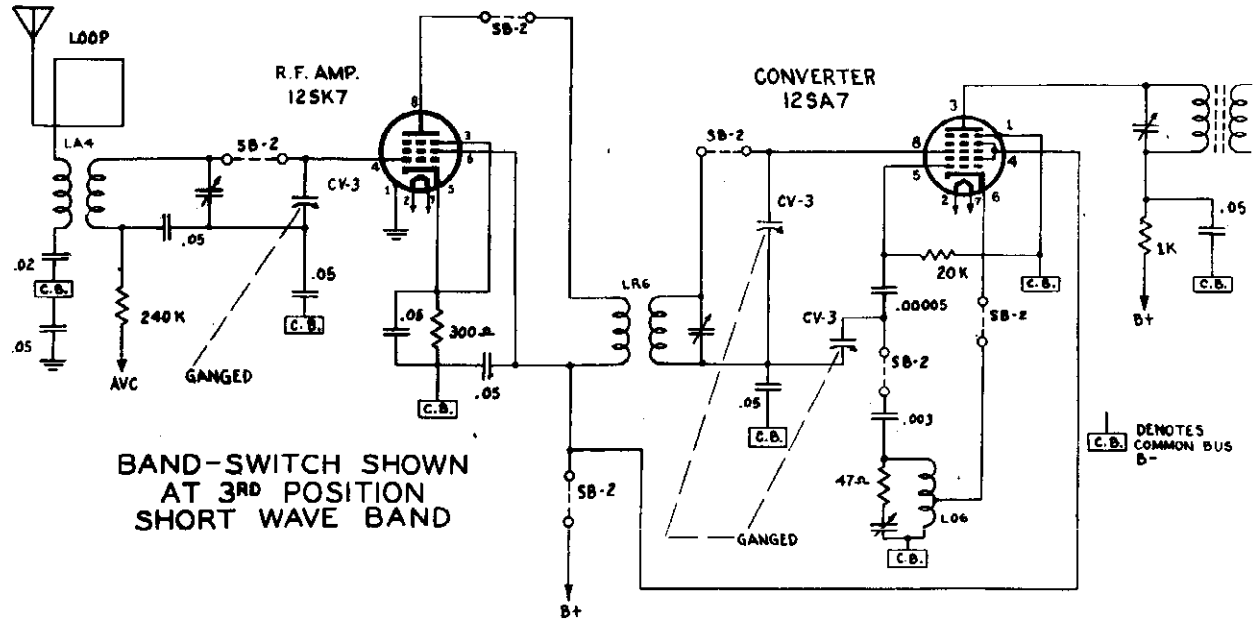
ANSLEY RADIO CORP. MODEL 32





MODEL 32

ANSLEY RADIO CORP.

Alignment Instructions - Model 32

1. It is not necessary to remove the RF and IF/Audio Chassis from the housing to align the RF section. The IF section can be aligned, while in the case, by using an offset screwdriver.

2. After removing the metal case from the cabinet, the interlock switch, located on the IF/Audio chassis, must be closed. This can be done by jamming a wooden block between the chassis and the switch button.

3. Connect output meter across the voice coil. The simplest way of accomplishing this is to clip the meter leads on pins # 1 & 5 of the speaker plug socket - on the underside of the chassis.

4. Insert power plug in socket and turn volume control switch on.

5. Padder adjustments can be made by inserting a long thin - insulated shank - screwdriver, from the front, up under the RF chassis to the padder adjustment screw. Trimmer adjustments can be made directly from the front of the set. Location of the various trimmers from left to right (facing front of set) is as follows: SW Ant. Trimmer, SW RF Coil Trimmer, BC RF Coil Trimmer, SW Oscillator Coil Trimmer and BC Oscillator Coil Trimmer.

6. It is not necessary to connect the loop when aligning the set. To align the Broadcast band, connect the signal generator output across the green wire on the antenna terminal strip and bus. To align the Short Wave band, connect signal generator across the blue wire on the antenna terminal strip and bus.

7. Align set in accordance with the table below (Note: Signal generator should be set for 400 cycle 30% modulated output, receiver volume control is set at maximum, and all adjustments are made for maximum reading).

Dummy Antenna	Sig.Gen. Connection	Sig.Gen. Frequency	Band Sw. Position	Tuning Points	Remarks
.05 MFD	Mixer Grid and Bus	456KC	BC	IF Trimmers	Tuning Cond. at Max.
.05 MFD	Green Wire and Bus	620KC	BC	BC OSC Padder	Set Dial at 62 See Below **
.05 MFD	Green Wire and Bus	1620KC	BC	BC OSC Trimmer	Set Dial at 162 See Below **
.05 MFD	Green Wire and Bus	1620 KC	BC	BC RF Trimmer	Set Dial at 162 See Below *
400 ohms	Blue Wire and Bus	17.6	SW	SW OSC Trimmer	Set Dial at 17.6
400 ohms	Blue Wire and Bus	17.6	SW	SW RF Ant. Trimmers	Set Dial at 17.6 See Below *

* When aligning the SW band use caution not to align on the image frequency, which will be found lower on the dial.

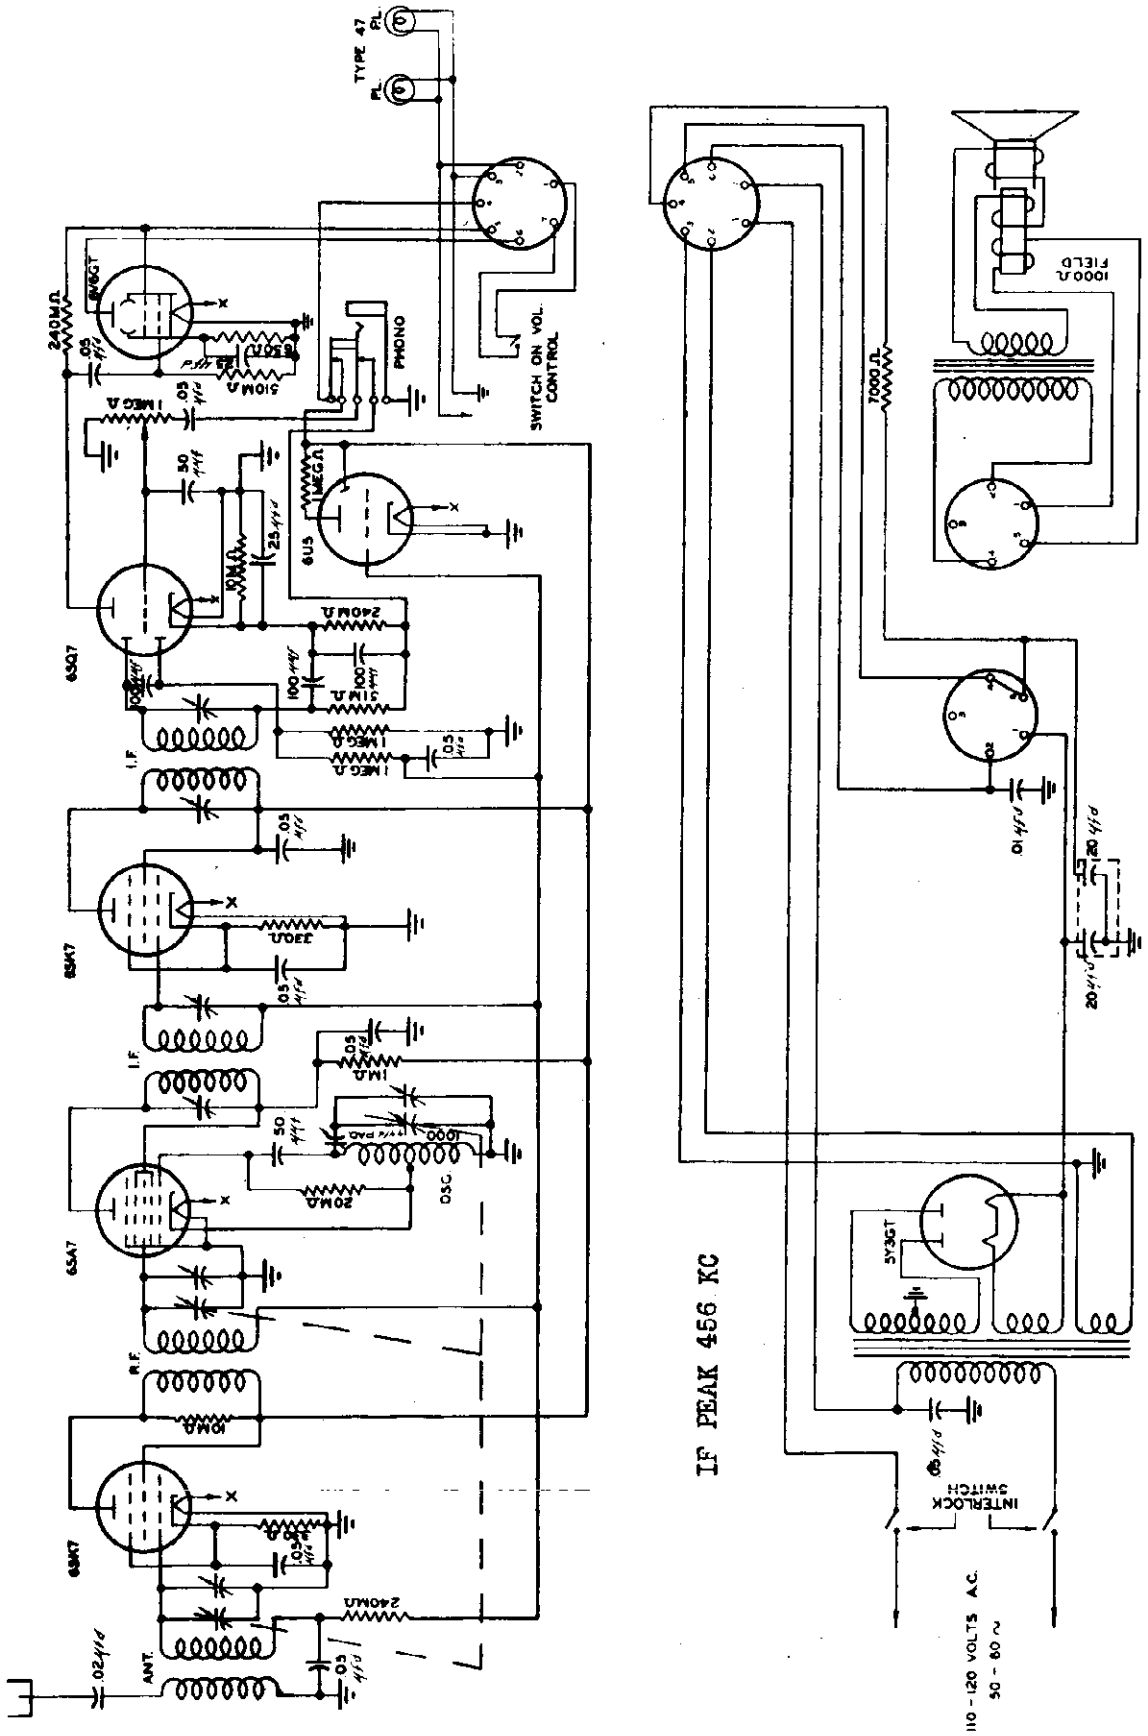
** Repeat these steps as often as necessary until both ends of Broadcast Band are tracking perfectly.

8. Tracking Check Points are:

	620KC	6.7 MC
BC	- 1120KC	SW - 12.2 MC
	1620KC	17.6 MC

MODELS 41,41

ANSLEY RADIO CORP.



MODELS 41,41A

ANSLEY RADIO CORP.

Alignment Instructions - Model 41 & 41A (Paneltone)

To align the Models 41 & 41A, it is not necessary to remove the chassis from the panel. However, the interlock switch - located on the rectifier chassis must be closed. This can best be done by using a U clamp placed over the button and body of the switch. Such a clamp can be made of a piece of steel 3" x 3/4" x 3/33" bent to form a U with a width of 1 3/8".

To align the IF stages proceed as follows:

a. Connect signal generator across Mixer trimmer and chassis. Signal generator should be set for 456 kc, 400 cycle, 30% modulated output. The mixer section of the tuning condenser is the section nearest the tuning dial.

b. Connect output meter across voice coil.

c. Turn set on.

d. Adjust IF trimmers for maximum output.

To align the RF section proceed as follows:

a. Connect signal generator across antenna and ground terminals. Set generator for 620 kc. output (400 cycles, 30% modulated).

b. Set tuning dial at 62.

c. Peak oscillator padder at 620 kc. The oscillator padder is located directly under the tuning dial therefore it is necessary to tune the padder from the underside of the chassis, using either a flexible shaft or offset screwdriver.

d. Retune signal generator for 1670 kc. output and set tuning dial at 167.

e. Peak Oscillator and Mixer trimmers at 1670 kcs.

f. Repeat steps a, b, c, d, & e as often as necessary until set is tracking correctly.

g. Peak Antenna Trimmer at 1670 kcs.

Tracking check points are:- 620, 1140, and 1670 kcs.

Oscillations which develop during alignment of the RF section can usually be cured by keeping the lead from the Antenna Tuning Condenser to the Antenna coil close to the chassis.

ALIGNMENT DATA

Models 601, 611, and 640 are aligned the same as the models listed below except no wave trap and no 12SK7 R. F. stage. I. F. and oscillator range setting to be all done from grid of the 12SA7 tube.

MODELS 612X, 613X, 614X, 616X, 650, 670, and 677

1. Connect signal generator, set at 455 KC, through a .1 mfd coupling condenser to the grid of the 12SA7GT tube.
2. Connect an output meter across speaker voice coil.
3. Adjust trimmers on I. F. transformers for a maximum output as indicated on the output meter.

   NOTE:

   a. Volume Control should be set at the full position.

   b. Keep signal generator output at a low value so that receiver AVC action will not affect alignment.
4. Connect signal generator, still set at 455 KC, to grid of 12SK7 R. F. tube.
5. Adjust wave trap trimmer, located under chassis, for minimum output.
6. Set signal generator to 1685 KC.
7. Turn tuning condenser to the minimum capacity position, plates out.
8. Adjust front (oscillator) trimmer on tuning condenser until generator signal is picked up.
9. Set signal generator to 1400 KC.
10. Connect output leads of signal generator in the form of a single turn loop and place this loop several inches away from the receiver loop antenna.
11. Tune receiver until generator signal is picked up. (It may be necessary to adjust the signal generator output to a maximum in order for the receiver to pick the signal up in this fashion.)
12. Adjust rear (antenna) trimmer on tuning condenser for maximum output.

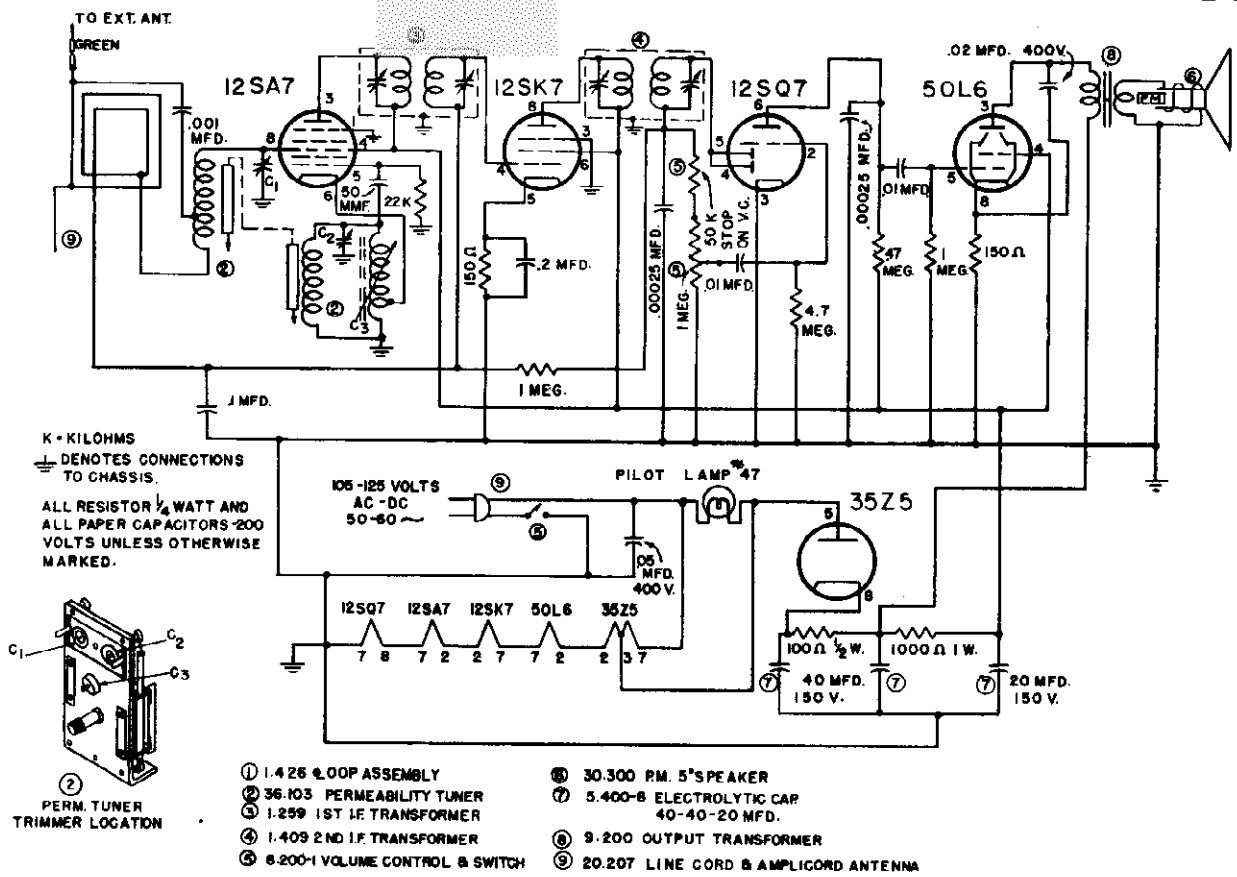
BELLE ELECTRONICS CORP. MODEL 125-I



ALIGNMENT: Should it become necessary at any time to check the alignment of this receiver, proceed as follows:

(1) Set the Signal Generator to 455 KC and connect to the Antenna Trimmer (C1) of the Permeability Tuner. Connect the Signal Generator ground lead to the chassis. Connect a suitable Output Meter across the Speaker Voice Coil Connections. Turn the Volume Control to the maximum position. Turn the Permeability Tuner to the extreme clockwise position (cores out of coils).

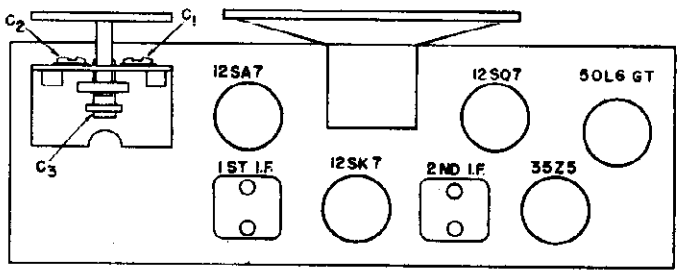
(2) Adjust the trimmers located at the top of the first and second I. F. Transformers for maximum output as indicated on the Output Meter.

(3) Set the Signal Generator to 1620 KC and loosely couple through a 2 or 3 turn loop to the receiver loop.

(4) With the Permeability Tuner set at the extreme clockwise position (cores out of coils), tune in the 1620 KC signal by means of the Oscillator Trimmer (C2).

(5) Set the Signal Generator to 1500 KC and turn the Tuning Control so that this frequency is indicated on the dial. Adjust the Antenna Trimmer (C1) on the Permeability Tuner for maximum output.

(6) Set the Signal Generator to 600 KC and turn the Tuning Control so that this frequency is indicated on the dial. Adjust the Oscillator Shunt Coil (C3) for maximum response while "rocking" the Signal Generator. Recheck the High Frequency Oscillator Trimmer (C2) and re-peak the Antenna Trimmer (C1) for maximum response.



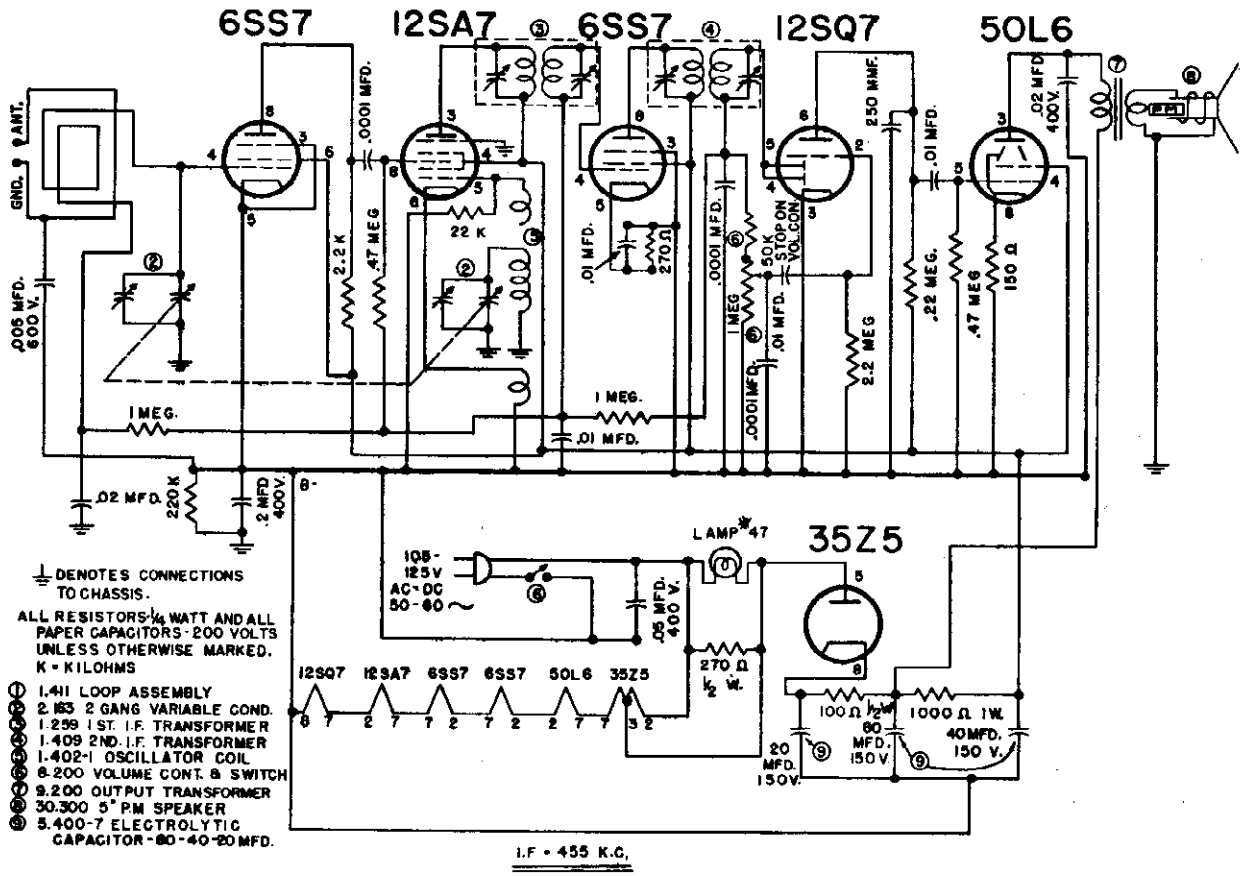
TUBES:

12SA7	Converter
12SK7	I-F Amplifier
12SQ7	Detector, AVC, A-F Ampl.
50L6GT	Beam Power Amplifier
35Z5GT	Rectifier

NOTE: Oscillator and Antenna Coil Saddles have been set and adjusted at the factory. Do not attempt to readjust the Oscillator or Antenna Coil Saddles during the above alignment procedure or serious mis-tracking will occur, resulting in loss of sensitivity at various points in the band.

MODEL 126

BELLE ELECTRONICS CORP.



ALIGNMENT: Should it become necessary at any time to check the alignment of this receiver, proceed as follows:

(1) Set the Signal Generator to 455 KC and connect to the grid of the 6SS7 R. F. Amplifier, or to the Stator Lug on the rear section of the Variable Capacitor. Connect the Signal Generator Ground Lead to a "–B" point underneath the chassis. Connect a suitable output meter across the Speaker Voice Coil Connections. First turn the Volume Control to the maximum position. Turn the Variable Capacitor to the extreme clockwise position.

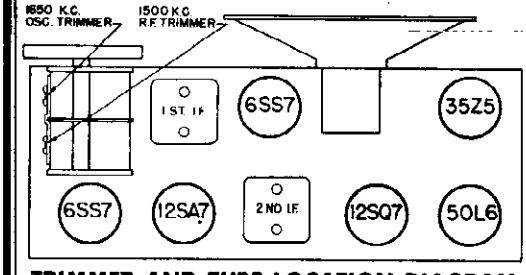
(2) Adjust the trimmers located at the top of the first and second I. F. Transformers for maximum output as indicated on the Output Meter.

(3) Loosely couple the Signal Generator lead to the Loop and set to 1650 KC.

(4) With the Variable Capacitor set at the extreme clockwise position, tune in the 1650 KC signal by means of the Oscillator Trimmer on the Variable Capacitor (front section).

(5) Set the Signal Generator to 1500 KC and turn the Tuning Control so that this frequency is indicated on the dial. Adjust the Antenna Trimmer on the Variable Capacitor (rear section) for maximum output. No other adjustments are necessary.

TUBES:
6SS7 R. F. Amplifier
12SA7 Converter
6SS7 I. F. Amplifier
12SQ7 Detector, Avc and Audio Amp.
50L6GT Beam Power Amplifier
35Z5GT Rectifier



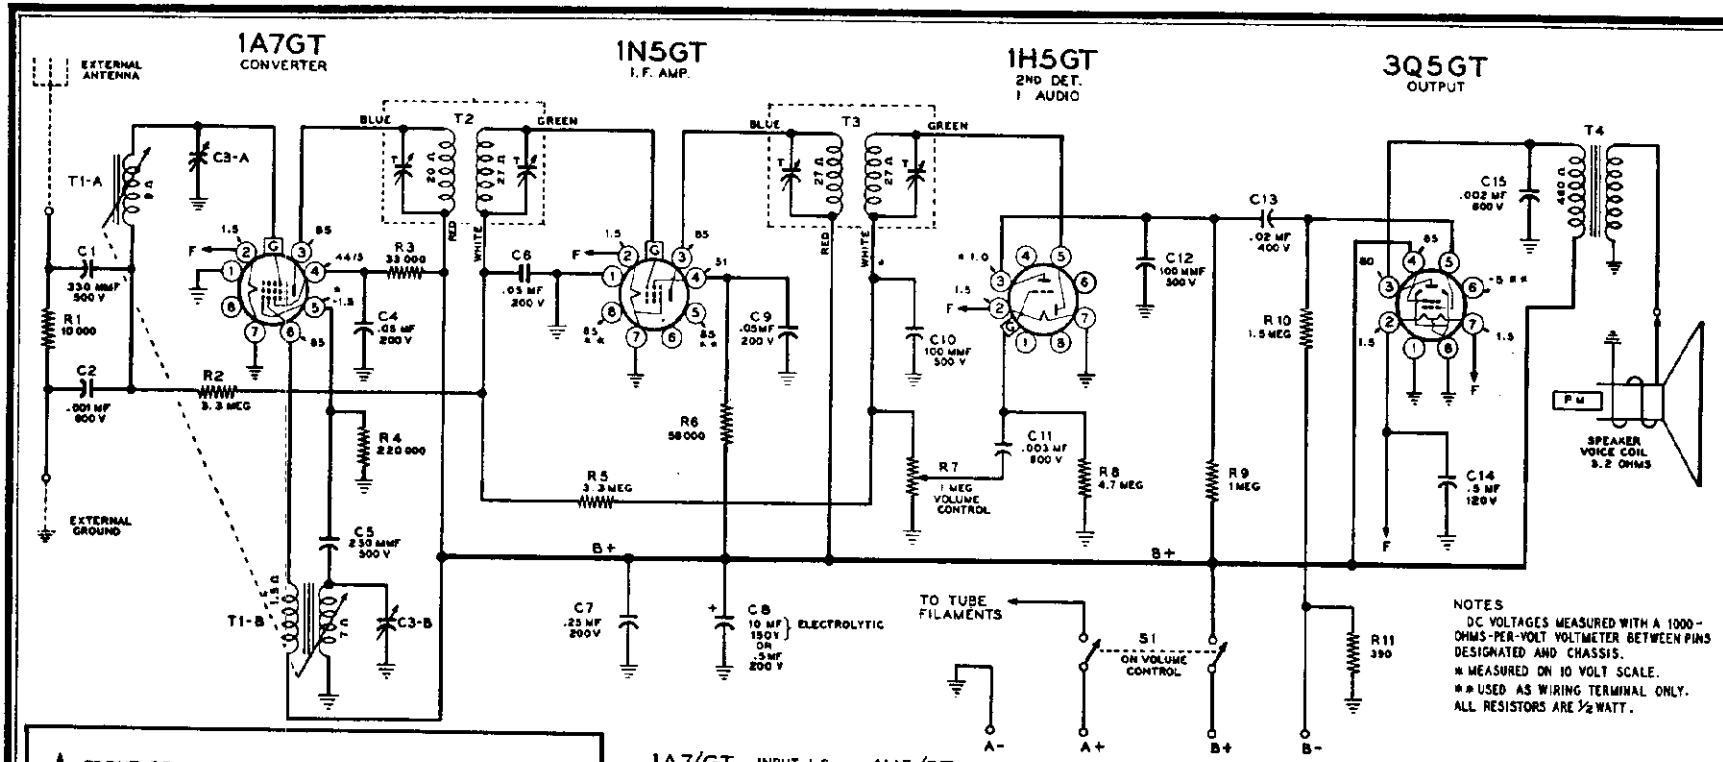
TRIMMER AND TUBE LOCATION DIAGRAM

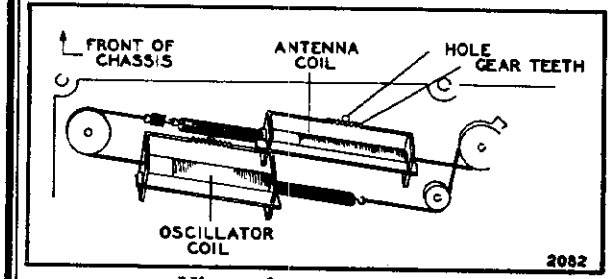
LINE VOLTAGE: This receiver is designed for operation on 105-125 Volts, 50-60 Cycles, either Alternating or Direct Current (AC-DC)

POWER CONSUMPTION: 30 Watts.

TUNING RANGE: Broadcast: 540 to 1650 Kilocycles (180 to 555 meters).

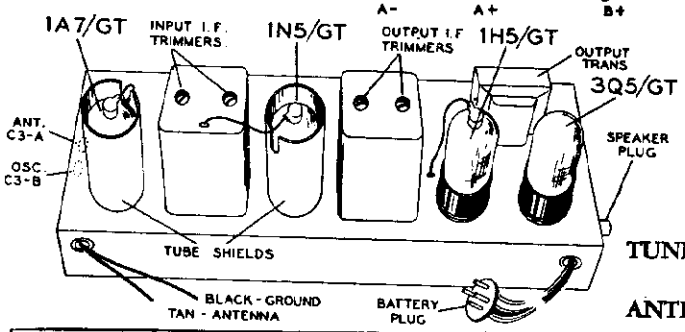
DIAL: The Dial Scale is calibrated in Kilocycles.

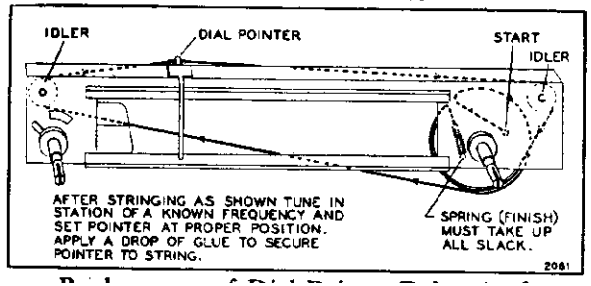




View of Coil Assembly

The antenna coil assembly is movable left or right. When making the adjustment as required in the alignment procedure, move the coil assembly very slowly, either by hand or by pivoting one edge of a screwdriver blade in the hole and engaging the blade in the gear teeth of the coil form.





POWER SUPPLY.....A Battery—1.5 volts, 250 ma.
B Battery—90 volts, 14 ma.
FREQUENCY RANGE.....535 to 1720 kc.
INTERMEDIATE FREQ....455 kc.

TUNING.....Two permeability-tuned circuits.
ANTENNA.....External only. Also external ground.
SPEAKER.....5-inch; P.M., 1.5-ounce magnet; voice coil impedance 3.2 ohms.
POWER OUTPUT.....160 milliwatts undistorted. 250 milliwatts maximum.
SENSITIVITY.....20 microvolts average for 50-milliwatt output.
SELECTIVITY.....48 kc broad at 1000 times

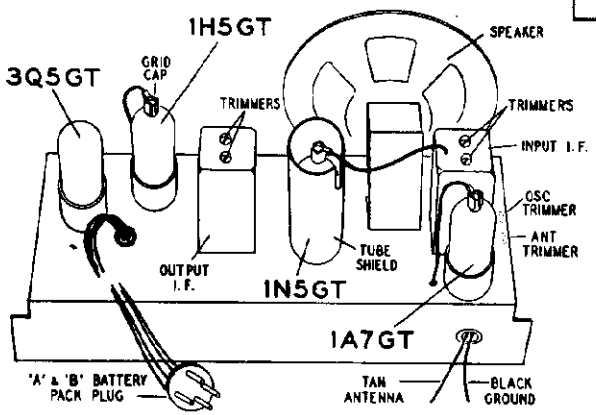
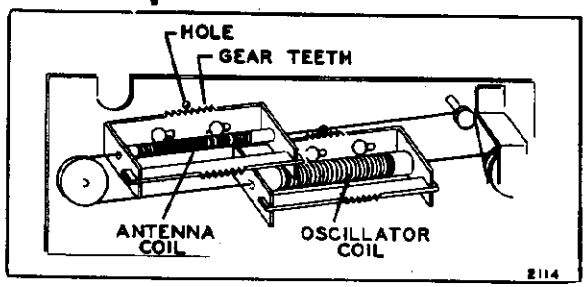
Replacement of Dial Pointer Drive Cord





View of Coil Assembly

The antenna coil assembly is movable left or right. When making the adjustment as required in the alignment procedure, move the coil assembly very slowly, either by hand or by pivoting one edge of a screwdriver blade in the hole and engaging the blade in the gear teeth of the coil form.

SENSITIVITY.....30 microvolts average for 50-milliwatt output.

SELECTIVITY.....48 kc broad at 1000 times signal at 1000 kc.

POWER SUPPLY.....A Battery—1.5 volts, 250 ma.
B Battery —90 volts, 14 ma.

FREQUENCY RANGE.....540 to 1700 kc.

INTERMEDIATE FREQ....455 kc.

TUNING.....Two permeability-tuned circuits.

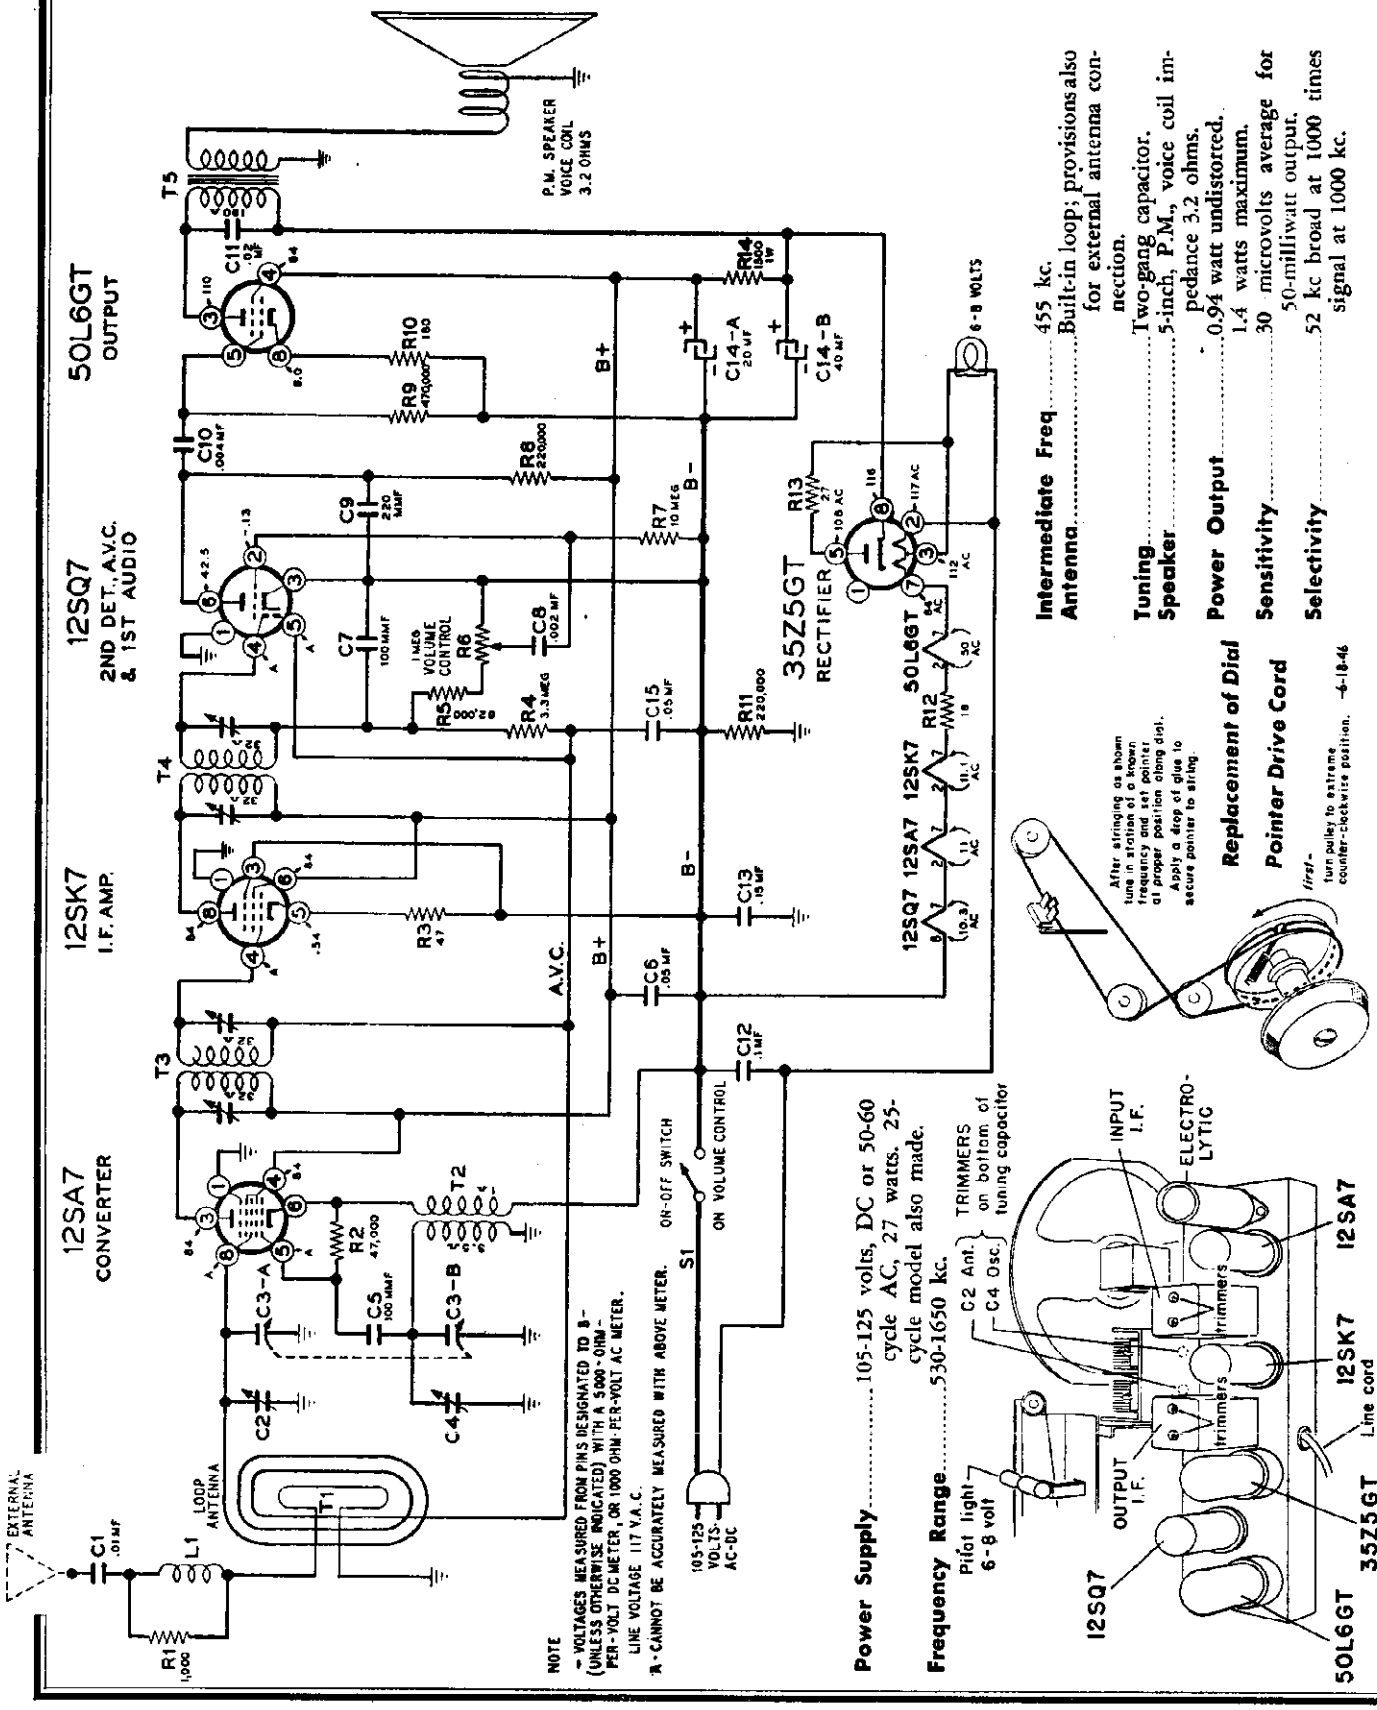
ANTENNA.....External only. Also external ground

SPEAKER.....5-inch; P.M.; voice coil impedance 3.2 ohms.

POWER OUTPUT.....180 milliwatts undistorted. 300 milliwatts maximum.

MODEL 5D128

BELMONT RADIO CORP.



BELMONT RADIO CORP.

ALIGNMENT PROCEDURE

- Output meter across 3.2-ohm output load.
- Volume control at maximum.
- Chassis must be removed from cabinet for proper alignment. Slight adjustments of the oscillator and antenna trimmers can be made, without removing the chassis, through holes provided on the bottom of the cabinet.
- Connect ground post of signal generator to B— of radio.
- Align for maximum output. Reduce input as needed to keep output near 0.4 volts.

SIGNAL GENERATOR			TUNER SETTING	ADJUST TRIMMERS TO MAXIMUM OUTPUT (in order shown)
Frequency	*Coupling Capacitor*	*Connection to Radio*		
455 kc	.1 mf	12SA7 grid	Rotor full open (plates out of mesh)	Input and output trimmers on IF cans
1650 kc	.1 mf	12SA7 grid	Rotor full open (plates out of mesh)	Oscillator trimmer C4
1400 kc†	None	See note below	1400 kc	Antenna trimmer C2

† For this adjustment chassis should be remounted in cabinet and loop connected. Lay generator lead near loop and turn up output. Loop will pick up energy. Antenna trimmer can be reached through a hole in the bottom of the cabinet.

	112784	Set of call letters
	112606	Acetate tabs for pushbuttons

* The values of the resistors listed above are based on RMA standards. Due to conditions beyond our control, some receivers have been shipped with resistors of pre-standardized values. This receiver will operate equally well with resistors of either group. An illustration of the difference follows: Pre-standardized value—200,000 ohms, 1/3 watt, 10%; RMA value—220,000 ohms, 1/2 watt, 10%

SETTING THE PUSHBUTTONS—The pushbuttons may be used, after proper adjustment, for the automatic tuning of any five stations on the standard broadcast band. They can be set up in any order.

1. Turn on the radio.
2. Push out the call letters of the five stations from the call-letter sheets supplied with this manual.
3. Insert one call-letter tab in the rectangular opening in the front of each pushbutton, in any order. Press an acetate tab (supplied in small envelope) into each of the pushbuttons.
4. With the screwdriver supplied, check to see that the locking screw in the center of the tuning knob (see front view) is loose. If it is not, turn it several turns to the left (counterclockwise).
5. Press the first pushbutton down *all the way*. With one hand hold the button down firmly and with the other carefully tune in the desired station. Release the pushbutton.
6. Follow this procedure for each of the four other buttons, setting each one for a different station.
7. Rotate the tuning knob on the side of the cabinet as far to the right as it will go. Tighten the locking screw in the center of the knob. *It is important that this screw be tightened very firmly.*
8. The pushbuttons are now properly set for automatic tuning. Any of the five stations may be tuned in simply by pressing the proper button down as far as it will go. If you wish to reset any of the buttons for a new station, loosen the locking screw, set the pushbutton as described above, and re-tighten the locking screw.

REMOVAL OF CHASSIS—If for any reason you wish to remove the radio chassis from the cabinet, proceed as follows: First be sure the line cord is disconnected from the house power receptacle. Then take off the back as described under "Tubes" above.

Pull the volume control knob off its shaft. Unscrew the locking screw in the center of the tuning knob and pull the knob off its shaft. Remove the four chassis mounting screws from the bottom of the cabinet. The chassis can now be slipped out.

After the chassis is replaced the automatic pushbuttons will probably have to be reset.

DIAL LIGHT—If the dial lamp burns out the set should not be operated until a new lamp has been installed. Failure to heed this caution may result in a burned-out 35Z5GT tube. To replace the lamp it is necessary to remove the back (see under "Tubes" below). Use only a type T-47 lamp for replacement.

TUBES—Tubes which have weakened with age may cause poor or erratic reception; therefore have the tubes tested periodically and replace those which are weak. To reach the tubes, pry off the four snap-in rivets which secure the back to the cabinet. Take care not to break the connections of the three wires to the loop antenna on the inside of the back. Tubes are removed most easily by rocking them back and forth gently while lifting. When replacing tubes, refer to the Chassis View to make sure that the replacements are properly made. *IMPORTANT: See note in parts list concerning tube replacement.*

ANTENNA AND GROUND — If an external antenna is used, check it periodically to make sure that all connections are clean and tight and that the antenna is insulated from the ground at all points.

Sensitivity (for 0.05 watt output)..... 10 microvolts average

Intermediate frequency..... 455 Kc.

Power consumption..... 35 Watts

Selectivity..... 55 Kc. broad at 1000 x signal at 1000 Kc.

Power output (in voice coil)

Undistorted..... 0.8 watt

Maximum..... 1.0 watt

Voice coil impedance..... 3.2 ohms

ALIGNMENT PROCEDURE

- No aligning adjustments should be attempted until all other possible causes of trouble have been checked.
- Chassis must be removed from cabinet for proper alignment. Slight adjustments of the oscillator and antenna circuits can be made, without removing the chassis, through two holes provided on the bottom of the cabinet. The two adjustment screws can be reached with a long insulated screwdriver.
- It is important that during alignment the loop antenna be maintained at the same distance from the chassis as when the chassis is installed in the cabinet.
- Turn volume control to maximum for all adjustments.
- Connect ground post of signal generator to B— of radio through a 0.1 mfd. condenser.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.

Band	Signal Generator Frequency Setting	Dummy Antenna	Connection to Radio	Tuning Condenser Setting	Adjust for Maximum Output (see chassis view)
I.F.	455 Kc.	0.1 mfd.	Grid of 12SA7	Rotor full open (plates out of mesh)	4 trimmers on input and output I.F. transformers
Broadcast	1650 Kc.	0.1 mfd.	Grid of 12SA7	Rotor full open (plates out of mesh)	Oscillator trimmer C7 on bottom of radio
	1400 Kc.	None	See note A	Set dial at 1400 Kc.	Antenna trimmer C2 on bottom of radio

Note A: Lay output lead of generator in back of loop antenna. Turn up generator output. Loop antenna will pick up energy.

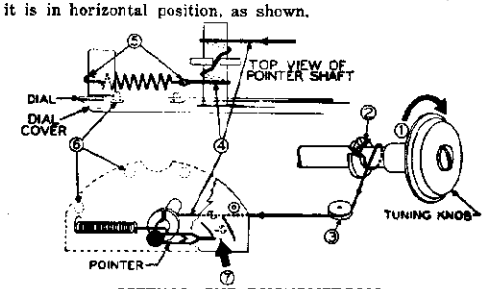
115143		Key washer (13 used on cam shaft)
117528		Brass spacer (one used on cam shaft)
117602		Brass spacer (four used on cam shaft)
131181		Spring washers, for locking collar
117604		Locking collar
117302		Brass spacer (next to locking collar)
115582		Key washer (holds drive cord on end of tuner shaft)
117600		Lever shaft
115361		Lever with roller
120283		Return spring for levers
115449B		Dial bracket assembly
112785		Pointer
1209		Drive cord, 8 inches used
120143		Take-up spring for drive cord
B-8D-10241		Dial scale
112659		Crystal, clear, for dial scale
A-2M-7758		Cinch buttons for fastening scale to bracket
117566-1		Brass spacer (at end of tuner shaft)
117833		Brass spacer (for spacing pointer from dial)
		MISCELLANEOUS
10798		Line cord and plug
101218	R15	Volume control and switch, 1 megohm
B-8A-10211	C	2-gang variable condenser
107249	P1	Pilot light bulb, type T-47
132108		Chassis screws, No. 6 x ½" hex. head
134123		Rubber bumper (bottom of cabinet)
128495		Cardboard back, brown
128495B		Cardboard back, ivory
131193		Cinch buttons, for fastening back to cabinet
13141		Cinch buttons, to cover trimmer holes in cabinet
128292-17		Pushbuttons, walnut
128292-8		Pushbuttons, ivory
112784		Station call letters, set
112606		Acetate tabs for call letters
128473-18		Cabinet, bakelite, walnut
128473-9		Cabinet, bakelite, ivory
128496-17		Knob, volume, walnut
128496-8		Knob, volume, ivory
128527-18		Knob, tuning, walnut
128527-9		Knob, tuning, ivory
117424		Locking screw for tuning knob. (Specify walnut or ivory.)
130388		Locking spring for tuning knob

REPLACING DIAL POINTER DRIVE CORD

Six inches of cord are required in the set. Use a piece slightly longer so that knots may be tied at each end. Numbers below correspond to circled numbers in diagram.

1. Rotate tuning knob to extreme clockwise position. This closes tuning condenser. Knob should remain in this position until installation is completed.
2. Tie knot at one end of cord and place it in key washer as shown. Wind cord one turn around shaft in direction shown.
3. Pass cord over idler pulley.
4. Pass cord over pointer shaft; wind it one turn around shaft; pass it through key washer; wind it one more turn around shaft.
5. Hook spring over end of dial support. Tie cord to spring. IMPORTANT: Before tying knot stretch spring enough so that full contraction of spring will rotate pointer shaft at least one-half turn.
6. Remove dial crystal by removing Cinch buttons.
7. Make sure tuning knob is in extreme clockwise position. Then rotate pointer clockwise, against friction of shaft, until it is in horizontal position, as shown.



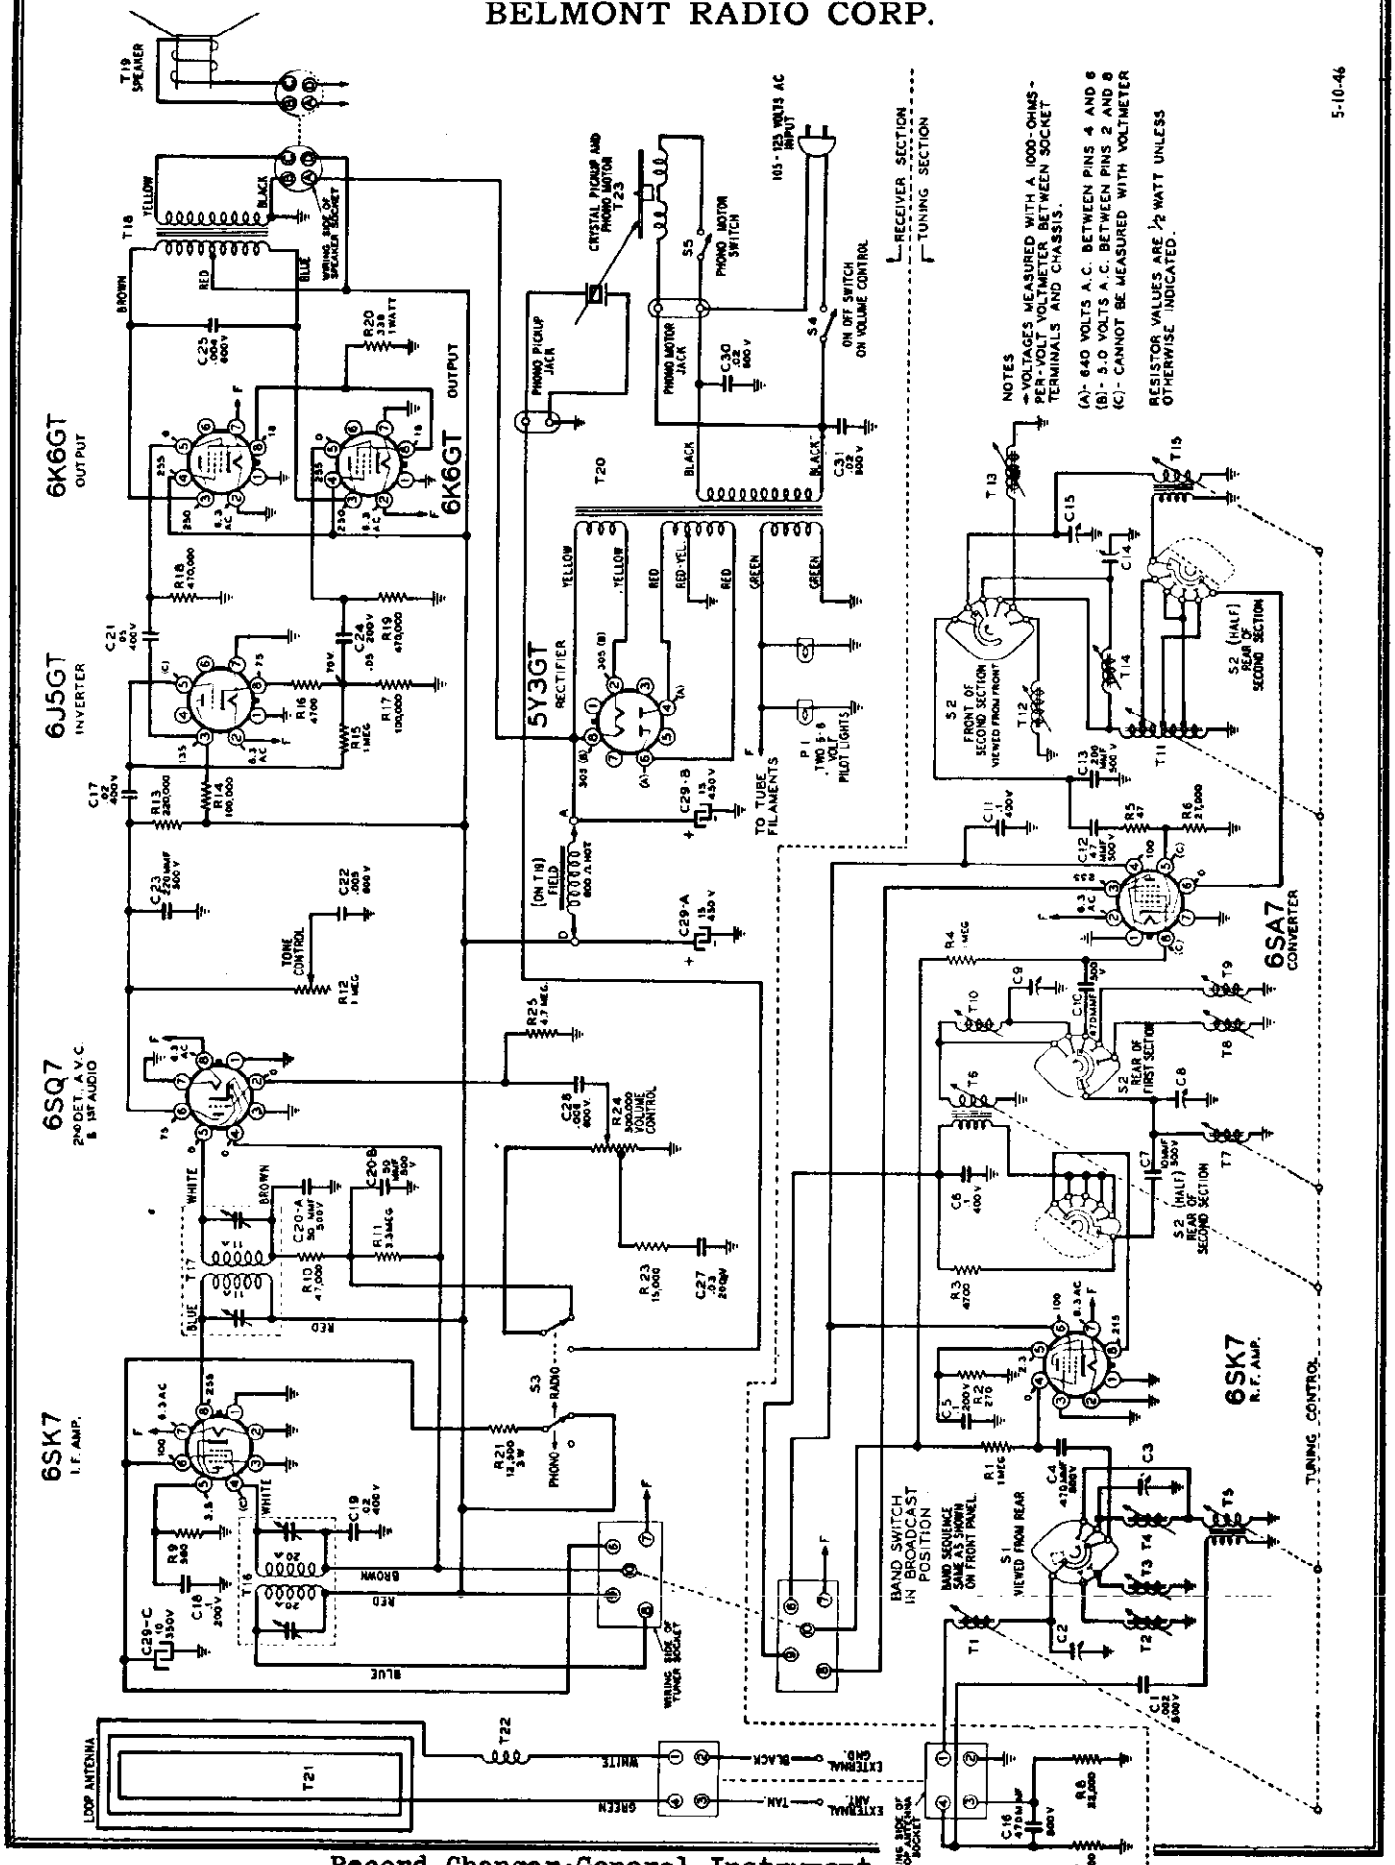
SETTING THE PUSHBUTTONS

The pushbuttons may be used, after proper adjustment, for the automatic tuning of any six stations which you select. They can be set up in any order.

1. Turn on the radio. Allow it to warm up for at least one minute.
2. Push out the call letters of the six stations from the call-letter sheets supplied with this manual. Press an acetate tab (supplied in small envelope) into each of the pushbuttons.
3. Insert one call-letter tab in the rectangular opening in each of the pushbuttons, in any sequence.
4. Check to see that the locking screw in the center of the tuning knob (see illustration) is loose. If it is not, turn it several turns to the left (counterclockwise). A coin may be used for this purpose.
5. Press the first pushbutton down all the way. With one hand hold the button down firmly and with the other carefully tune in the desired station. Release the pushbutton.
6. Follow this procedure for each of the five other buttons, adjusting each one for a different station.
7. Rotate the tuning knob on the side of the cabinet as far to the right as it will go. Tighten the locking screw in the center of the knob. IT IS IMPORTANT THAT THIS SCREW BE TIGHTENED VERY FIRMLY.

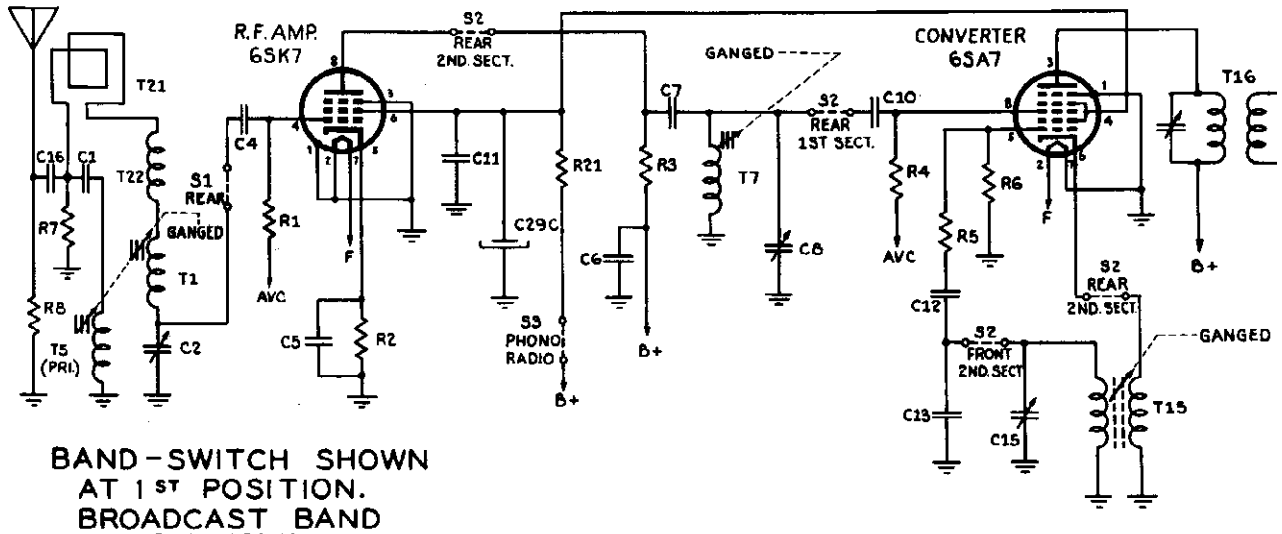
MODEL 8A59

BELMONT RADIO CORP.

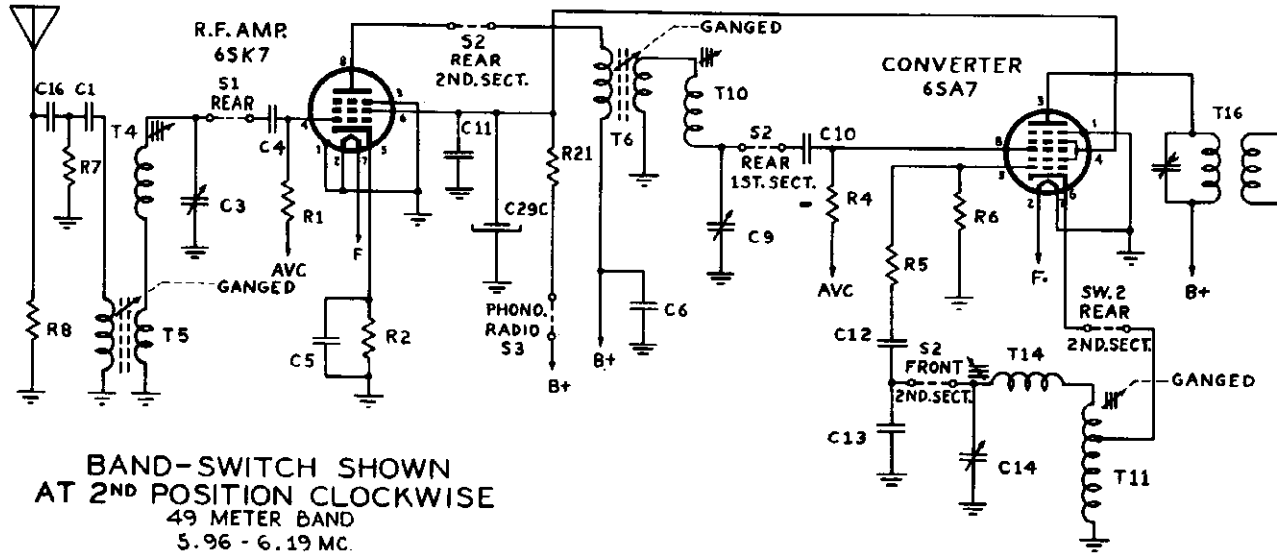


Record Changer: General Instrument
Models 204 and 205

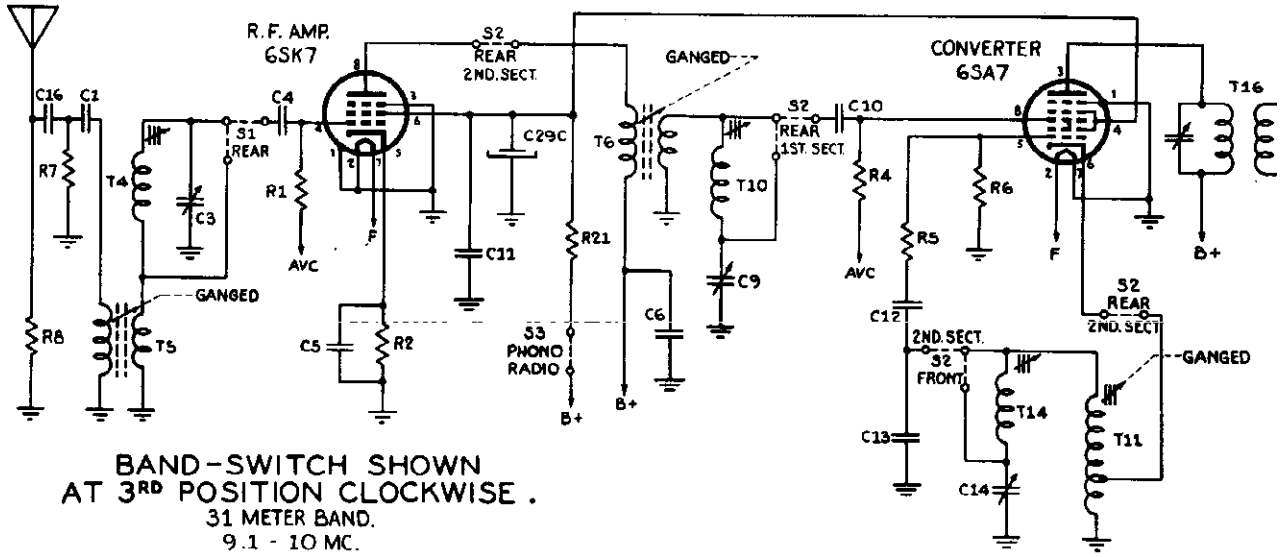
BELMONT RADIO CORP.



BAND-SWITCH SHOWN
AT 1ST POSITION.
BROADCAST BAND
540-1600 KC



BAND-SWITCH SHOWN
AT 2ND POSITION CLOCKWISE
49 METER BAND
5.96 - 6.19 MC.



BAND-SWITCH SHOWN
AT 3RD POSITION CLOCKWISE.
31 METER BAND.
9.1 - 10 MC.

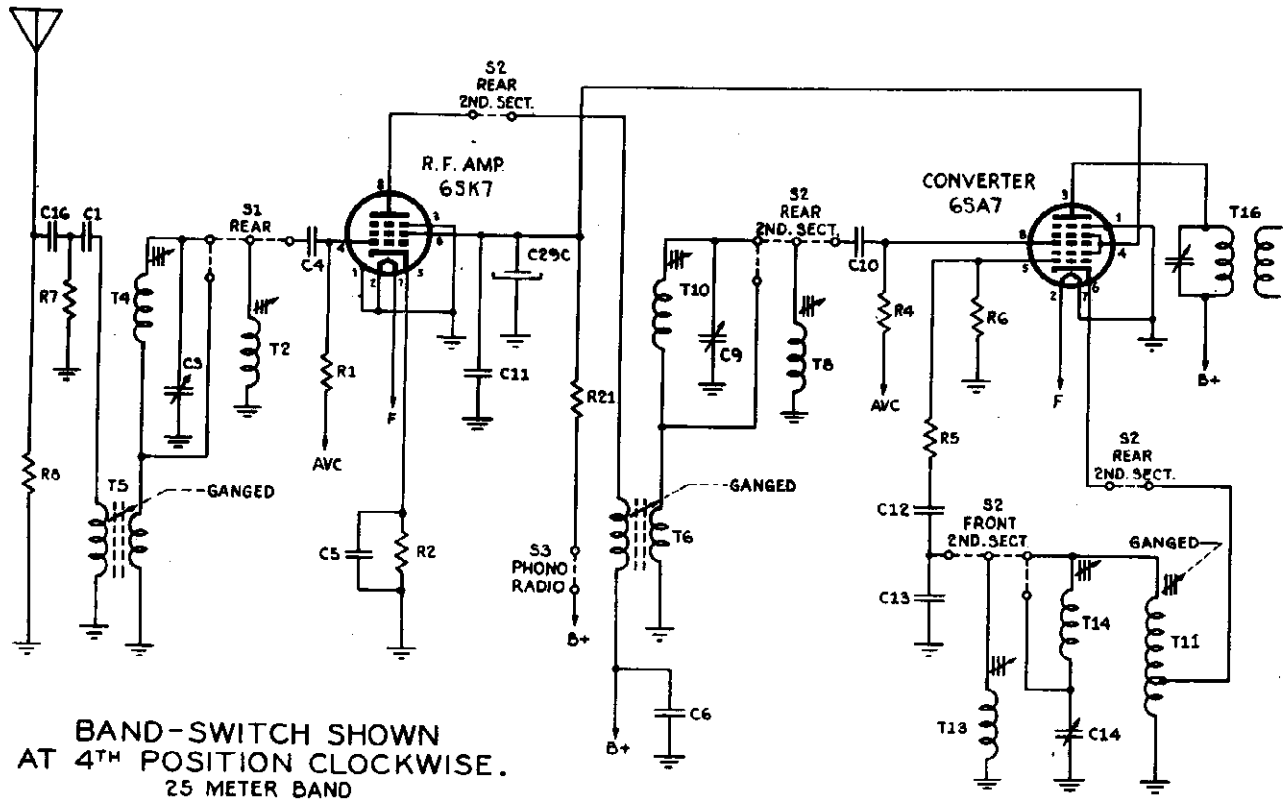
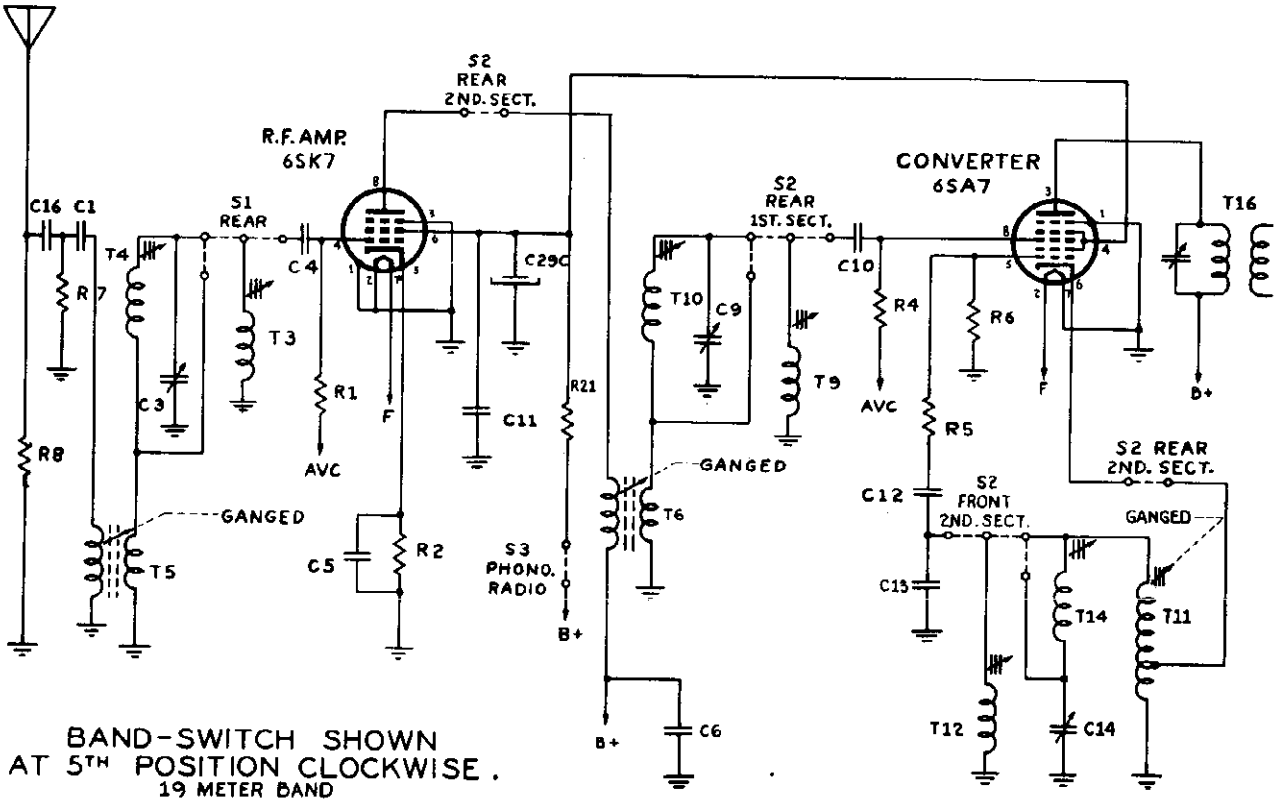
BELMONT RADIO CORP.



BAND-SWITCH SHOWN AT 4TH POSITION CLOCKWISE.
25 METER BAND
11.45 - 12.16MC.



BAND-SWITCH SHOWN AT 5TH POSITION CLOCKWISE.
19 METER BAND
14.94 - 15.46 MC.

MODEL 8A

BELMONT RADIO CORP.

MECHANICAL ADJUSTMENT—The core tuning bar (see illustration of iron cores) and dial pointer must be adjusted mechanically before any electrical alignment is attempted. Rotate the manual tuning control until the core bar is farthest from the coils. For proper adjustment the bar should be approximately 1/32 of an inch from the two rod guide angles.

With the core bar in this position, adjust the dial pointer to coincide with 1600 kc on the dial scale.

Rotate each of the three broadcast coils (see illustration) until the end of the coil is 1-5/32" from the end of the coil form. Rotate the three 9-mc coils until this dimension is 1-1/16" for these coils. After these adjustments have been made, the unit can be aligned electrically.

ELECTRICAL ADJUSTMENT—To align the set make the following preliminary adjustments: Set the tone pushbutton for treble tone; set the volume control at maximum; connect the ground post of the signal generator to the radio chassis; connect the output meter across a 3.2-ohm output load; and allow the receiver and signal generator to warm up for several minutes.

Align the set according to the sequence given in the chart. The indicated dummy antenna is to be connected in series between the signal generator output lead and the receiver. Adjust the set for maximum output; reduce the input as needed to keep the output near 1.3 volts.

Locations of all the trimmers and coils are shown in the illustrations below. After adjustment, seal the coil cores with collodion or a similar substance (do not use cement).

BAND SWITCH SETTING	*SIGNAL GENERATOR*			*DIAL POINTER SETTING*	*ADJUST TO MAXIMUM OUTPUT (in order shown)*
	Frequency	*Coupling Capacitor*	*Connection to Radio*		
Broadcast (for I. F.)	455 kc	.1 mf	Grid (pin 8) of converter (6SA7)	1600 kc	Trimmers on output and input I. F. cans

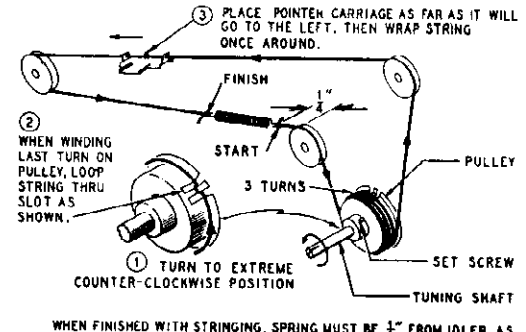
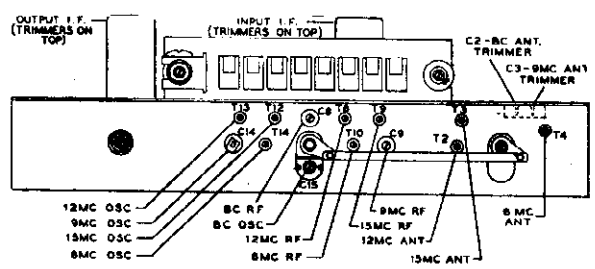
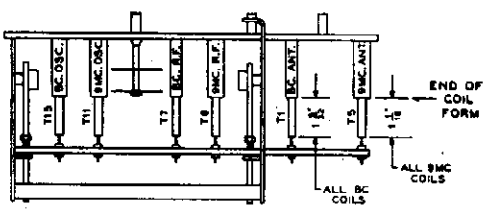
Chassis View



WHEN FINISHED WITH STRINGING, SPRING MUST BE 1/4" FROM IDLER AS SHOWN. TO DO THIS:

4. LOOSEN SET SCREW ON PULLEY.
5. HOLD TUNING SHAFT FIRM IN POSITION INDICATED AND TURN PULLEY BY HAND UNTIL SPRING IS 1/4" AWAY FROM IDLER.
6. TIGHTEN SET SCREW. NOW SPRING SHOULD TRAVEL BACK AND FORTH WITHOUT TOUCHING THE IDLERS.
7. REPLACE CHASSIS IN CABINET. REPLACE POINTER ON CARRIAGE. TUNE IN STATION OF KNOWN FREQUENCY. HOLD TUNING SHAFT FIRM AND SLIDE POINTER TO CORRECT POSITION ALONG DIAL.
8. GLUE POINTER TO STRING.





Coils and Trimmers

REPLACEMENT PARTS LIST

When ordering parts, specify part number, model number, and series

REMOVABLE TUNER ASSEMBLY

CAPACITORS*

Ref. No.	Part No.	Description
C1	B-8F-10767	.002 mf, 500 volts, 10%, mica
C2, C3	124143	Dual, broadcast (67-123 mmf) and 9 mc (95-175 mmf) ant. trimmers
C4, C10	B-8F3-121	470 mmf, 500 volts, 10%, mica
C5	C-8D-10771	.1 mf, 200 volts, +20%—10%
C6, C11	C-8D-10760	.1 mf, 400 volts, +20%—10%
C7	B-8F5-101	10 mmf, 500 volts, 10%, silver mica
C8	A-8G-7205	Broadcast RF trimmer (120-220 mmf)
C9	A-8G-7206	9 mc RF trimmer (60-110 mmf)
C12	B-8F3-109	47 mmf, 500 volts, 10%, mica
C13	B-8F-10763	200 mmf, 500 volts, 5%, silver mica
C14	124145	9 mc oscillator trimmer (7-35 mmf)
C15	124144	Broadcast oscillator trimmer (15-27 mmf)

RESISTORS*

R1, R4	C-9B1-31	1 megohm, ½ watt, 20%
R2	C-9B1-55	270 ohms, ½ watt, 10%
R3	C-9B1-70	4700 ohms, ½ watt, 10%
R5	C-9B1-46	47 ohms, ½ watt, 10%
R6	C-9B1-79	27,000 ohms, ½ watt, 10%

Tubes are coded and guaranteed by the tube manufacturer. Better service can be rendered on adjustments if defective tubes are returned directly to the manufacturer rather than through our factory.

We cannot supply speaker cones or fields separately. We can repair or replace a damaged speaker if it is returned to our factory, transportation charges prepaid.

*The values of all resistors listed above are based on RMA standards. Due to conditions beyond our control some receivers have been shipped with resistors of pre-standardized values. This receiver will operate equally well with resistors of either group. An illustration of the difference follows:

Pre-standardized value—50,000 ohms, ±10%, 1/3 watt
RMA value—47,000 ohms, ±10%, 1/2 watt

COILS (complete with cores)

R23	C-9B1-20	15,000 ohms, ½ watt, 20%
R24, S4	A-10A-10586	Volume control (500,000 ohms) and on-off switch
R25	C-9B1-35	4.7 megohms, ½ watt, 20%

COILS AND TRANSFORMERS

T16	108177	Input IF coil complete in can (Range of trimmers: 110-210 mmf)
T17	108176	Output IF coil complete in can (Range of trimmers: 80-140 mmf)
T18	B-12C-10234	Output transformer
T20	104202B	Power transformer

SOCKETS

121200	Socket, 4-terminal, for loop antenna
121279	Socket, 5-terminal, for tuner
A-15B-11538	Socket, 4-terminal, for speaker
121280	Socket, 1-terminal, for phono pick-up
121199	Socket, 2-terminal, for phono motor
121210	Socket, octal, molded (all tubes except 6SK7, IF amp.)
121273	Socket, octal, laminated (for 6SK7, IF amplifier)
B-47A-10808	Socket assembly for dial light

MISCELLANEOUS

T19	B-18B-10617	Speaker, 10-inch, electrodynamic
T21	A-14MA-11066-3	Loop antenna (ribbon only)
T22	A-16A-11113	Choke on loop terminal board
	A-19A-11322	Plug on loop antenna leads
	107401	Phono motor cable assembly
	10724	Connector, for phono pickup leads
	B-6D-10984	Dial scale
	10794	Dial light, 6-8 volts, type T-44 (2 used)
	B-2G-10588-1	Dial pointer
	A-2J-11041	Pointer spring
	1121035	Pointer carriage
	B-53A-10989	String for dial pointer
	120377	Spring for dial pointer string
	107266	Line cord and plug (9 feet)
	112985-14	Escutcheon (for walnut cabinet)
	112985-41	Escutcheon (for mahogany cabinet)
	A-5B-10893-14	Knob, band switch or radio-phono-tone (for walnut cabinet)
	A-5B-10893-41	Knob, band switch or radio-phono-tone (for mahogany cabinet)
	128523-14	Knob, tuning or volume (for walnut cabinet)
	128523-41	Knob, tuning or volume (for mahogany cabinet)
	A-2L-11293	Bandswitch link
	112961	Station call letters

NOTE: Before removing chassis, take off escutcheon and pull pointer from pointer carriage.

ELECTRICAL SPECIFICATIONS

Power Supply.....105 to 125 volts AC, 60 cycles; 95 watts (118 watts with phono motor operating).

Frequency Ranges....Broadcast band—540 to 1600 kc.
49-meter band—5.96 to 6.19 mc.
31-meter band—9.1 to 10 mc.
25-meter band—11.45 to 12.16 mc.
19-meter band—14.94 to 15.46 mc.

Intermediate Freq....455 kc.

Tuning.....All bands permeability-tuned.

Antenna.....Built-in; provisions also for external antenna and ground.

Speaker.....10" electrodynamic. Voice coil impedance 3.2 ohms.

Power Output.....5.5 watts undistorted.
7.5 watts maximum.

Sensitivity.....4 microvolts average for ½ watt output.

Selectivity.....35 kc. broad at 1000 times signal at 1000 kc.

Tube and Lamp Complement.....6SK7, tuned RF amplifier
6SA7, converter
6SK7, IF amplifier
6SQ7, detector, AVC, 1st audio
6J5GT, phase inverter
6K6GT, push-pull output
6K6GT, push-pull output
5Y3G, rectifier
T-44, dial lamp (2 used)

SETTING THE PUSHBUTTONS—The six pushbuttons may be used, after proper adjustment, for the automatic tuning of any six stations which you select. All the stations need not be in the same band, but probably you will want to set them up in the standard broadcast band. Proceed as follows:

1. Turn the radio on and turn the band switch to the "B.C." position.

2. From the call-letter sheets supplied with this manual, push out the call letters of your favorite six stations. Drop these into the six pushbuttons, preferably but not necessarily in order of frequency (as listed in your newspaper).

3. Next pull a button out as far as it will come.

4. *Very carefully* tune in the station corresponding to the pushbutton call letters.

5. Now push the button in *as far as it will go.*

6. Follow this procedure for each of the five other buttons, setting each one for a different station.

7. The setting of any pushbutton can be changed by following the procedure given above.

If any of the buttons is to be set for a short-wave station, turn the band switch to the proper position before adjustment. The switch must be turned to this position also whenever the pushbutton is used, since pressing the button does not change bands.

RECORD CHANGER

Alignment Procedure

Set volume control at maximum and connect output meter across voice coil. Keep input as low as possible at all times. IF - Set signal generator at 455 KC and connect to converter grid through a .05 mfd. capacitor. Tune progressively the 2nd. and 1st. IF trimmers for maximum output.

RF - Set gang tuning condenser wide open. Set signal generator at 1750 KC and loosely couple to antenna.

nal to 1500 KC, tune receiver to this frequency and peak antenna trimmer for maximum output.

Precautions

An insolating transformer should be used between the power supply and the receiver if any of the test equipment is AC operated. The use of isolating capacitors is not recommended as AC through the capacitor may introduce hum modulation and if the capacitors should

BENDIX RADIO DIV.

Power Consumption-Watts. 30

TUNING RANGE—FREQUENCY IN KC 535-1725

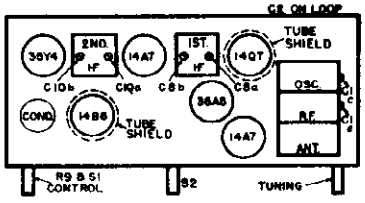
INTERMEDIATE FREQUENCY (KC). 455

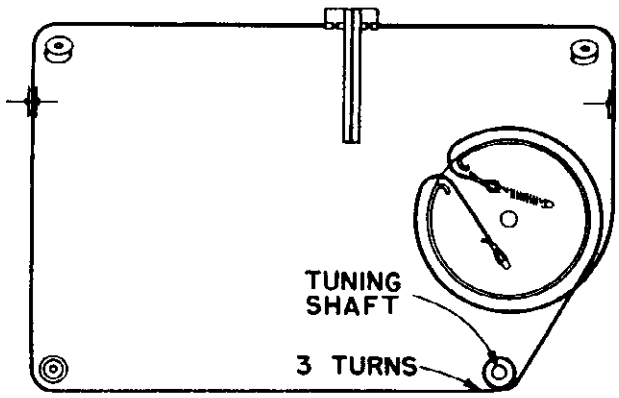
MAXIMUM POWER OUTPUT IN WATTS. 1.2

LOUD SPEAKER—PM-OVAL

Cone diameter—inches. 4x6

Voice Coil Impedence (ohms at 400 cycles) 3.2





Alignment Procedure

Connect line cord plug to 117 volt, 60 cycles AC power source. Set volume control at maximum clockwise position and tone control (S2) in counterclockwise position. Connect output meter across voice coil. Adjust dial pointer by turning tuning control fully counterclockwise and sliding dial pointer on dial cord until it is exactly 2 3/16" from left end of dial back plate. Make all adjustments in order given in table and for maximum output. Dial Pointer Positions given measured from left hand end of dial back plate. Keep input as low as possible at all times.

Circuit Aligned	Input Freq.	Dial Pointer Position	Adjustments
IF	*455 KC	Max. to right	C10b, C10a C8b, C8a
OSC.	**1475 KC	6 3/4"	C1c
RF	**1475 KC	6 3/4"	C1c, C2
	**965 KC	5	Check
	**580 KC	2-23/32"	Calib.

* Applied to Antenna input .1 mfd. or less.

** Applied to Antenna input through 50 mmf. or less.

Precautions

An isolating transformer should be used between the power supply and the receiver if any of the test equipment is AC operated. The use of isolating capacitors is not recommended as AC through the capacitor may introduce hum modulation, and if the capacitors should break down the test instruments will likely be damaged.

Alignment Procedure

Connect line cord plug to 117 volt AC power source. Set volume control at maximum and connect output meter across voice coil. Adjust dial pointer by turning tuning control fully counterclockwise and sliding dial pointer on dial cord until it is exactly 2-3/32" from left end of dial back plate. Make all adjustments in order given in table and for maximum output. Dial pointer position given in inches measured from left hand end of dial back plate. Keep input as low as possible at all times.

An isolating transformer should be used between the power supply and the receiver if any of the test equipment is AC [illegible] and if the capacitors should break down the test instruments will likely be damaged.

Circuit Aligned	Input Freq.	Dial Pointer Position	Adjustments

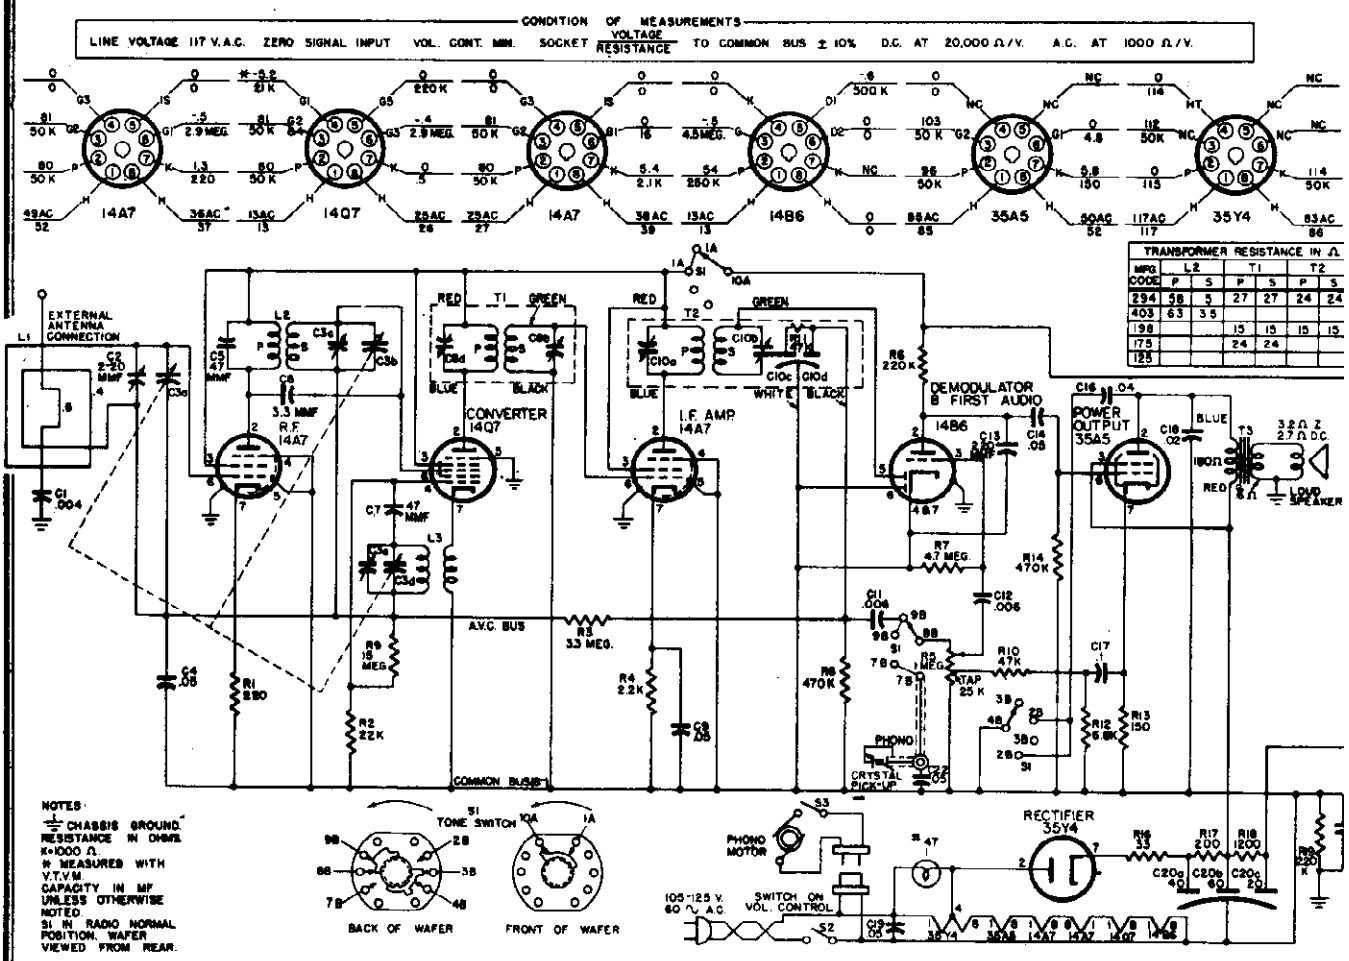
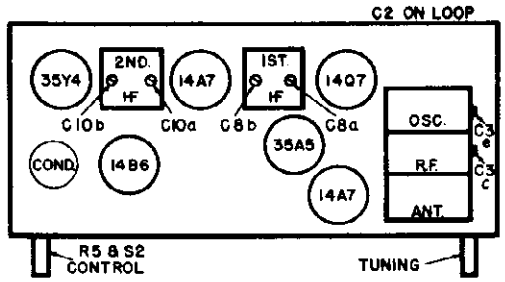
MODEL 656A
Preliminary

BENDIX RADIO DIV.





Power

Voltage Rating, 60 cycles AC	105-125
Power Consumption—Watts	65
Tuning Range—Frequency in KCS	535-1725
Intermediate Frequency—KCS	455
Maximum Power Output—Watts	1.2

Loud Speaker—PM

Cone Diameter—inches	6
Voice Coil Impedance (ohms at 400 cycles)	3.2

Alignment Procedure

Connect line cord plug to 117 volt AC power source. Set volume control at maximum and tone control in radio normal position. Connect output meter across voice coil. Adjust dial pointer by turning tuning control fully counterclockwise and sliding dial pointer on dial cord until it is exactly 2⅜" from left end of dial back plate. Make all adjustments in order given in table and for maximum output. Dial pointer position given in inches measured from left hand end of dial back plate. Keep input as low as possible at all times.

Precautions

An isolating transformer should be used between the power supply and the receiver if any of the test equipment is AC operated. The use of isolating capacitors is not recommended as AC through the capacitor may introduce hum modulation, and if the capacitors should break down the test instruments will likely be damaged.

Circuit Aligned	Input Frequency	Dial Pointer Position	Adjustment
IF	*455 KC	Max. to right	C10b, C10a C8b, C8a
OSC	**1550 KC	7	C3e
RF	**1550 KC ** 965 KC ** 580 KC	7 5¼ 3 1/16	C3e, C2 Check Calib.

*Applied to antenna input through .1 mfd. or less
**Applied to antenna input through 50 mmf. or less

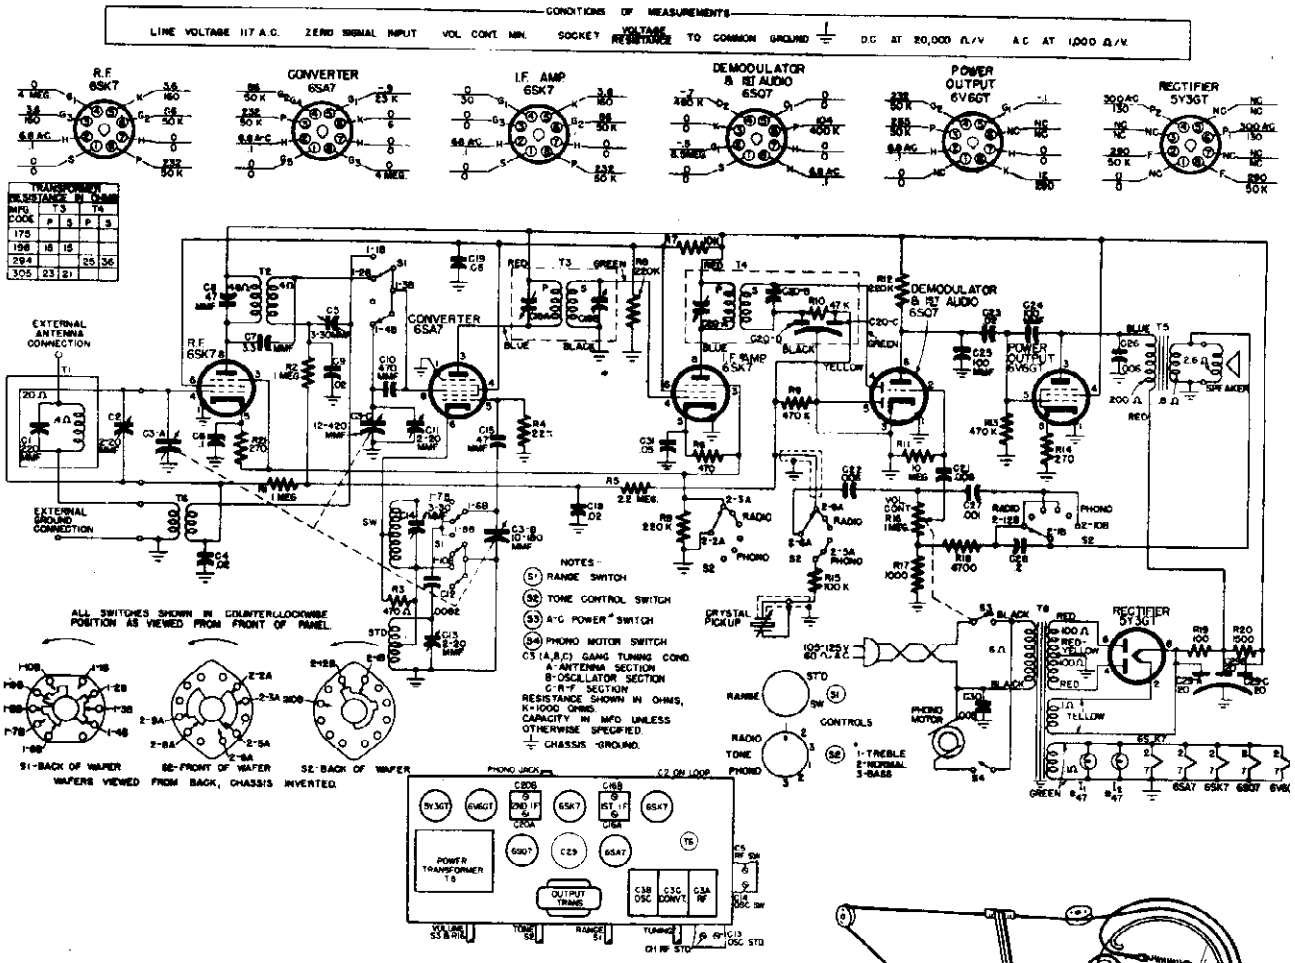
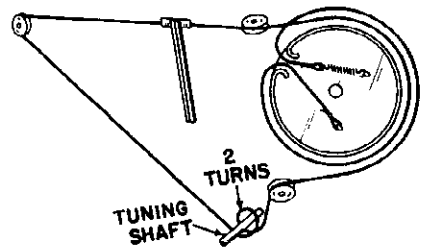
PRINTED IN U.S.A.

BENDIX RADIO DIV.





Power

Voltage Rating, 60 cycles AC 105-125
Power Consumption, including record changer — Watts 95

Tuning Range

Standard Broadcast—Frequency in KCS 540-1620
Shortwave—Frequency in MCS 6-12
Intermediate Frequency—KCS 455
Maximum Power Output—Watts 4
LOUD SPEAKER—Electro dynamic Cone diameter—inches 6
Voice Coil Impedence—(ohms of 400 cycles) 3.2

Alignment Procedure

Connect line cord plug to 117 volt, 60 cycles AC power source. Set volume control at maximum clockwise position and tone control (S2) in counterclockwise (Radio 1) position. Connect output meter across voice coil. Adjust dial pointer by turning tuning control fully counterclockwise and sliding dial pointer on dial cord until it is exactly 2 3/4" from left end of dial back plate. Make all adjustments in order given in table and for maximum output. Dial Pointer Positions given measured from left hand end of dial back plate. Keep input as low as possible at all times. Range switch (S1) in ST'D position except as noted in table.

Circuit Aligned	Input Frequency	Dial Pointer Position	Adjustments

ALIGNMENT PROCEDURE

CIRCUIT	CONTROL POSITIONS	APPLY	THRU	TO	ADJUST
I. F.	Volume—Maximum Tone—Radio Treble Band Switch—Manual Broadcast Tuning Condenser--Fully Meshed (Adjust pointer to reference mark)	455KC	.01 mfd.	Grid 6SF7 I.F. Amp. Grid 6SA7 Conv.	C13b C13a C10b C10a
Broadcast	Pointer at Mark D	1450	200 mmf.	External Antenna Connection	C23 C8 C2
Short Wave Band No. 1	Band Switch—Short Wave No. 1 Pointer at Mark E	12 mc	400 ohms. in series with .01 mfd.	External Antenna Connection	C24 C19
Short Wave Band No. 2	Band Switch—Short Wave No 2 Pointer at Mark F	22mc	400 ohms. in series with .01 mfd.	External Antenna Connection	C25 C20

1. Alignment markers placed along bottom of dial back plate and left edge of pointer used as reference point.
2. Minimum input signal used for perceptible output.
3. After alignment, repeat process for possible slight readjustments.
4. Check calibration of Point A for 600 KC, Point B for 6mc and Point C for 11.5mc. If calibration is inaccurate check gang plates for bending or failure of components.

ALIGNMENT PROCEDURE

Volume Control Maximum.

Signal Generator output minimum for satisfactory output indication.

Series Condenser or Dummy Antenna	Connect To	Tune Receiver To	Signal Generator Frequency	Adjust Screws In Order
0.1 Mfd.	6SA7 Pin #8	No Broadcast Sig.	262 KC	A B C D
*.000060 Mfd.	Antenna Connector	Extreme Hi. Freq. End of Dial	1615 KC	E F G
***.000060 Mfd.	Antenna Connector	Signal Generator	1430 KC	**J K

*Before making this adjustment turn core screws J, K, H by means of a bakelite screwdriver, so that the rear end of the cores are 1⅛" from the rear of the coil form. The purpose of this adjustment is to set the cores at the correct starting point with respect to the windings.

**Cores J and K are adjusted by means of a bakelite screwdriver through the rear end of the coils. There must not be any metal in part of screwdriver inserted in the coil.

***Should it be necessary to calibrate the pointer after this adjustment, tune signal generator to 1300 KC and the receiver to the signal. Loosen dial cord pulley set screws and adjust pointer to 1300 KC. Tighten set screws.

Adjust trimmer G to match car antenna (at approx. 1400 KC) when radio is installed.

N5-RD-251,Chas.9022H

BUTLER BROS.

ALIGNMENT PROCEDURE

1. Remove chassis and loop from cabinet. Solder approximately 8" of insulated wire to any B— connection (see voltage chart on opposite side for convenient B— location). Then reinstall chassis and loop in cabinet. The B— lead should extend from under the chassis at the back.
2. Connect ground lead of signal generator to B— lead.
3. Connect output meter across the speaker voice coil (terminals at back of speaker.)
4. Turn the tuning control knob clockwise as far as it will go (tuner mechanism is now in maximum open position with tuning slugs almost completely withdrawn from coils). Dial pointer should then point to 1600 Kc mark on scale. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.
5. Set volume control at maximum volume position and use a weak signal from the signal generator.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF GENERATOR TO	SIGNAL GENERATOR FREQUENCY	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
Set tuner mechanism to maximum open position by turning the tuning control knob clockwise as far as it will go (Dial pointer at 1600 Kc). Then check whether the positions of the tuning slugs correspond to the positions shown in Fig. 1 below. If settings are incorrect, rotate the individual core and threaded stem until desired position is reached. Note that threaded stem is prevented from moving by a dab of speaker cement at top.						
.1 MFD. Condenser	Ungrounded terminal of trimmer No. 6 (see Fig. 2 below for location of trimmer.)	455 KC	Any point where it does not affect the signal.	1-2	2nd I.F.	Adjust for maximum output. Then repeat adjustment.
				3-4	1st I.F.	
300 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1600 KC	1600 KC	5	Broadcast Oscillator (Shunt)	Adjust for maximum output.
300 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1600 KC	Tune to 1600 KC generator signal	6	Broadcast R.F.	Adjust for maximum output.
				7	Broadcast Antenna	Adjust for maximum output.
300 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1400 KC	Tune to 1400 KC generator signal	Ant. coil tuning slug		Adjust position of slug for maximum output.
				R.F. coil tuning slug		Adjust position of slug for maximum output.
300 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1600 KC	Tune to 1600 KC generator signal	6	Broadcast R.F.	Recheck adjustment for maximum output.
				7	Broadcast Antenna	Recheck adjustment for maximum output.
Apply a coating of speaker cement at top of each tuning core stem to prevent movement.

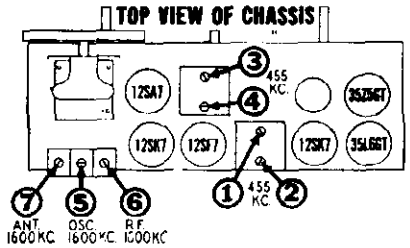

FIG. 2

AUDIO OSCILLATION

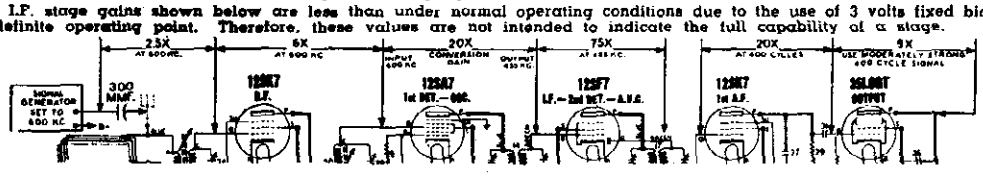
The audio system of this receiver utilizes a two stage type of inverse feed-back arrangement and, should it ever be necessary to replace the speaker or output transformer, it is important to maintain a definite phase relationship in the feed-back circuit. If the connections to the output transformer are reversed or if the feed-back connection is made to the wrong side of the output transformer secondary, the system will become regenerative instead of degenerative. Under those conditions audio oscillation may result. If that occurs, oscillation may be prevented by reversing the connections to the secondary of the output transformer.

APPROXIMATE STAGE GAIN DATA

Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe following precautions:

1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes.)
2. For R.F. and I.F. measurements connect negative terminal of a 3 volt battery (two 1½ volt cells in series) to A.V.C. lead and positive terminal to B—. This provides a definite operating point. IMPORTANT: Disconnect battery when measuring audio stage gains.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
4. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 3 volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.

.000070 Mfd	Antenna Connector	1615 KC	E
.000070 Mfd	Antenna Connector	1430 KC	F G

Adjust trimmer G to match car antenna (1430 KC) when radio is installed.

SPECIAL INSTRUCTIONS

Alignment of Iron Cores: Tune to stop at H. F. end of dial. Adjust cores H, J and K to extend $1\frac{5}{32}$" from end of their coil forms. Adjust trimmers E, F and G (SG at 1615 KC). Adjust cores J and K (SG at 1430 KC). Repeat alignment adjustment of trimmers at 1615 KC. and of cores J and K at 1430 KC.

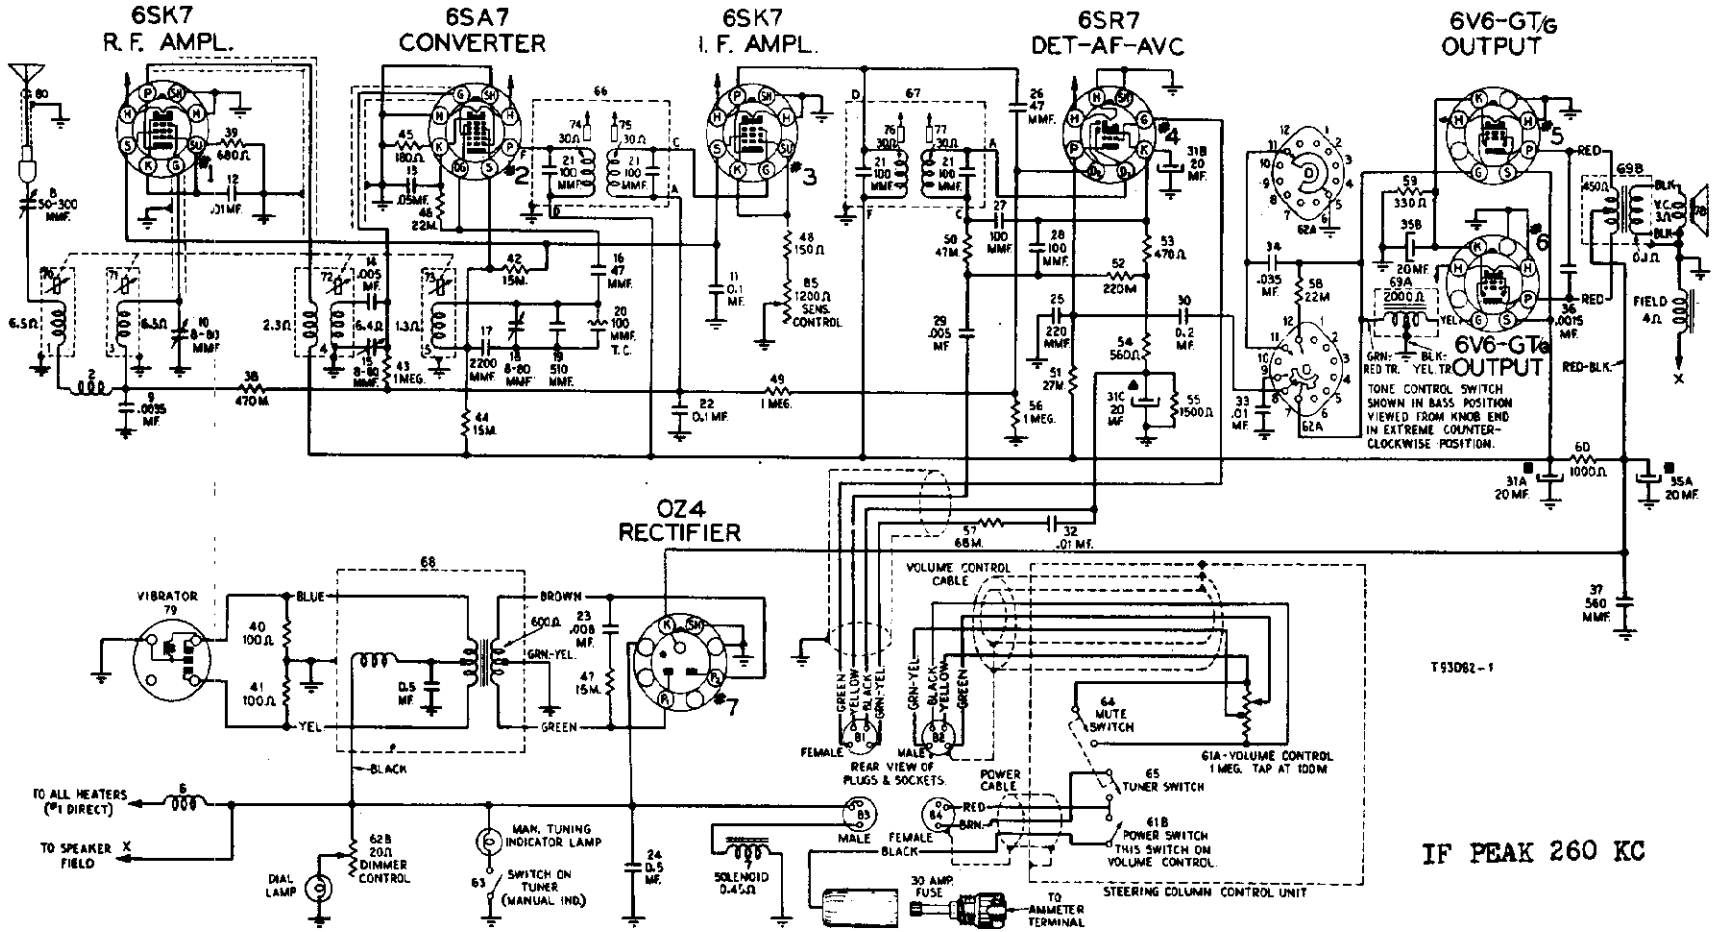
ALIGNMENT PROCEDURE: Volume control - full on.

I-F ADJUSTMENT: Set Signal Generator at 456 kc. and connect it through a 0.1-mf condenser t pin No.4 of 2nd i-f tube, 12SK7. Peak for maximum response.
Connect generator lead to pin No.4 of 1st i-f tube, 12SK7 and peak first i-f transformer fo maximum response.
Repeat above procedure.

OSCILLATOR TRACKING ADJUSTMENT: Set Signal Generator to 600 kc and connect it to independe loop antenna. Place this loop near loop in receiver. Set dial pointer to 600 kc on scale. Adjust C-2 for maximum response, while rocking gang condenser each side of frequency.

R-F ALIGNMENT: Set Signal Generator to 1600 kc. Set dial pointer to 1600 kc on scale.
Adjust C-1 for maximum response.
Disconnect generator lead from loop and connect to Short-Wave Antenna coil primary.
Set frequency of generator to 18 mc. Set dial pointer to 18 mc on SW scale.Turn Band Switch to "SW" position.
Adjust C-5 for maximum response.



Date 5-1-46

IF PEAK 260 KC

FIG. 1—CIRCUIT DIAGRAM—RADIO

Antenna System: There are two antenna systems available for use with this receiver; the cowl rod antenna, and the telescopic reel type antenna. Either of these antennas will operate efficiently with this Chevrolet radio. After installation, the adjustment described in Paragraph 1 should be made.

Circuit Description

The circuit used in this receiver is a conventional superheterodyne type with a stage of tuned RF amplification utilizing a 6SK7 tube, a 6SA7 converter, a 6SK7 IF amplifier, a 6SR7 second detector, audio amplifier and automatic volume control, a push-pull output stage, utilizing two 6V6GT/G tubes, and a rectifier, the rectifier socket being so wired as to permit optional use of either a 0Z4 or a 6X5 type.

The input circuit of the 6SK7 RF amplifier consists of permeability tuned antenna and R.F. coils, with a variable trimmer condenser (10) connected in parallel with the R.F. coil. Connected in series with the antenna lead is a variable trimmer condenser (8) which functions to compensate for slight variations in capacity of the antenna and the shielded antenna cable. The tuned input circuit is kept above ground d.c. potential, to permit application of AVC voltage to the 6SK7 grid. A 680 ohm resistor (39) is in series with the cathode to furnish residual bias for the tube. The output is inductively coupled to the grid circuit of the 6SA7 converter.

The 6SA7 converter has in its input circuit a permeability tuned coil (4) isolated by a blocking condenser (14), and shunted by a variable trimmer (15). AVC voltage is applied to the 6SA7 grid through a 1 Meg. resistor (43). The 180 ohm resistor (45) in series with the cathode is used to furnish residual bias. The oscillator portion of the 6SA7 is a modified Colpitts circuit, consisting of the oscillator coil (5), a fixed series padder condenser (17), and shunt condensers (18, 19 and 20); 20 is a negative temperature coefficient condenser employed to minimize oscillator drift due to temperature variations.

The 260 KC output from the 6SA7 is coupled to the 6SK7 IF amplifier by means of a permeability tuned IF transformer (66).
The 1200 ohm potentiometer (85) in the 6SK7 cathode circuit is a sensitivity control, factory adjusted for standard I.F. amplifier gain. By means of another permeability tuned I.F. transformer (67) the output of the 6SK7 is coupled to the signal diode of the 6SR7 2nd detector. Some signal from the 6SK7 I.F. amplifier plate is coupled to the AVC diode plate of the 6SR7 through a 47 mmf condenser (26). The triode section of the 6SR7 is used for audio amplification.

The AVC voltage is developed across the 1 meg. resistor (56). Since the cathode of the 6SR7 is at a positive potential equal to the sum of the voltage drops in the cathode resistors (53, 54, 55), no AVC voltage is developed until the signal exceeds the 6SR7 cathode potential. The audio signal developed across a 220 M resistor (52) is effectively placed in shunt with the manual volume control (61A). A portion of the audio voltage appearing across the volume control is applied to the grid of the triode section of the 6SR7. Tone compensation is accomplished by means of a tap on the volume control and the compensating resistor and condenser combination (32, 57). A muting switch (64) is mechanically coupled to the tuner switch, and electrically connected in shunt with the volume control, such that when the tuner switch is operated, the audio input to the 6SR7 grid is shorted, and thus the receiver is silent during tuning.

The amplified audio signal from the 6SR7 triode plate is applied to the 6V6GT/G output tubes by way of a four position tone control switch (62A). Phase inversion is accomplished in the center-tapped reactor (69A).

Bias for the 6V6GT/G tubes is obtained through the 330 ohm cathod resistor (59) which is bypassed by a 20 mfd. condenser (35B). The output signal is fed to the speaker by the output transformer (69B).

Tone Control

The four positions of the tone control are: Bass, Soft, Music and Voice. The tone control and its tone compensating network in the circuit are between the audio amplifier and the output stage, as shown in Figure 2. When the switch is in the "Bass" position, a .035 mf. condenser (34) shunts the output of the 6SR7 a.f. amplifier stage, bypassing a large portion of the high audio frequencies to ground, and resulting in minimum high audio frequency response. In the "Soft" position a .01 mf. condenser (33) shunts the output of the 6SR7, but due to it being lower in capacity than 34, the reduction of high frequency response is not so pronounced as in the "Bass" position. In the "Music" position, no shunting capacity is employed, thus resulting in a maximum of high and low frequency response.

In the "Voice" position, the output of the 6SR7 is shunted to ground with a .01 mfd. condenser (33), thus bypassing some of the high frequencies. Simultaneously, a parallel combination of a 22,000 ohm resistor (58), and a .035 mfd. condenser (34) is placed in series with the output of the 6SR7, resulting in reduced low frequency response, thus some attenuation of both high and low frequencies is accomplished, and optimum tone balance for speech programs is reached.

1. Adjusting Antenna Compensating Condenser

This adjustment should be made after the receiver has been properly installed in the car. Tune the receiver to a weak signal at the high frequency end of the band, at about 1200 kilocycles. This signal should be just audible with the volume control on full. Adjust the antenna compensating condenser (8) for maximum signal strength.

Note: When making this adjustment, be sure that the antenna is fully extended.

2. Circuit Alignment

The adjustable condensers and cores in the tuned circuits of this receiver have been carefully adjusted at the factory, and should require no further adjustment unless tempering has occurred, or a defective unit has been replaced. Should the receiver require re-alignment, the following procedure is recommended:

1. **Aligning the IF Stages at 260 KC.** (Refer to Figure 7 for location of adjusting screws, etc.)

   (a) Connect an output meter across the voice coil of the speaker; or connect one terminal of the output meter in series with a .01 mf. condenser to the plate of one of the 6V6 output tubes, and the other terminal of the output meter to the chassis frame.

   (b) Connect output lead of the signal generator through a 0.1 mf. condenser to the grid (pin No. 4) of the 6SK7 IF tube, and the ground lead of the signal generator to the receiver chassis. Set the signal generator to 260 KC.

   NOTE: It is important that the signal generator output be kept as low as possible to avoid AVC action in the receiver.

   (c) Turn receiver volume control full ON.

   (d) Tune receiver dial off any broadcast signal which may be present.

   NOTE: It is more satisfactory to eliminate the possibility of RF-IF beat-note interference by suppressing the oscillator section of the 6SA7 completely. This may be accomplished by temporarily connecting a .01 mf. (or larger) condenser from the 6SA7 oscillator grid (pin No. 5) to the receiver chassis.

   (e) Set sensitivity control 85 to mid position.

   (f) Adjust 2nd IF transformer cores 77 and 76 for maximum output meter reading.

   (g) Connect the signal generator output through the 0.1 mf. condenser to the 6SA7 signal grid (pin No. 8), and adjust the 1st IF transformer core screws 75 and 74 for maximum reading.

CONT'D

2. Aligning the RF, Detector and Oscillator Circuits. (Refer to Figure 7 for location of adjusting screws, etc.)

NOTE: In the following outline of RF, Det. and Osc. circuit alignment, it is important that the output of the signal generator be kept at the minimum level required to obtain a reasonable indication on the output meter. This is to avoid AVC action and resultant broad peaking of the circuits.

(a) Tune receiver dial to the extreme high frequency end of the band.

(b) Turn each of the core adjustment screws 70, 71, 72, 73, several turns in a counterclockwise direction until the threaded stud extends $\frac{1}{8}$" through the core bar. This is done in order to remove the cores from the coil windings so that the cores will have no effect on the frequency of the circuits during initial trimmer adjustments.

(c) Connect the output of the signal generator to the antenna input socket through a 72 mmf. condenser.

(d) Set frequency of signal generator to 1645 KC, and peak trimmers 18, 15, 10, 8, reducing signal generator output as needed to prevent AVC action.

(e) Without changing the receiver dial setting, change frequency of signal generator to 1620 KC, then adjust core screws 73, 72, 71, 70 for maximum signal output.

(f) Change frequency of signal generator to 1200 KC, and tune receiver dial for maximum signal output at 1200 KC.

(g) Re-adjust core screws 72, 71, 70 for maximum signal output.

(h) Change frequency of signal generator to 600 KC and tune receiver dial for maximum signal output at 600 KC.

(i) Re-adjust trimmers 15, 10, 8 for maximum signal output.

(j) Reset frequency of signal generator to 1200 KC and tune receiver for maximum signal output at 1200 KC.

(k) Re-adjust core screws 72, 71, 70 for maximum signal output.

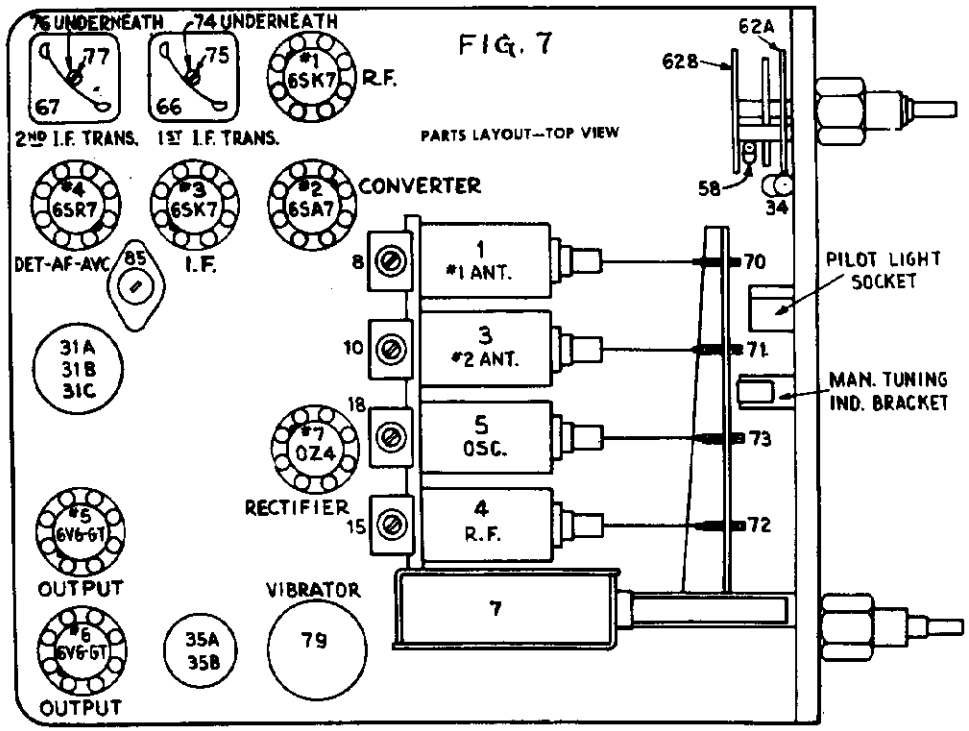
(l) A tabulated summary of the foregoing procedure is given below:

Serial Condenser (Dummy Antenna)	Connect To	Signal Generator Frequency	Tune Receiver To	Adjust Screws in Order Shown
0.1 MF.	6SK7 IF Grid (Pin 4)	260 K.C.	*Quiet point in Broadcast Band	77, 76
	6SA7 Grid (Pin 8)		*Quiet point in Broadcast Band	75, 74
72 mmf.	Antenna Socket	1645 K.C.	Extreme high frequency end	18, 15, 10, 8
72 mmf.	Antenna Socket	1620 K.C.	Extreme high frequency end	73, 72, 71, 70
72 mmf.	Antenna Socket	1200 K.C.	Signal Generator	72, 71, 70
72 mmf.	Antenna Socket	600 K.C.	Signal Generator	15, 10, 8
72 mmf.	Antenna Socket	1200 K.C.	Signal Generator	72, 71, 70

*Or connect a 0.01 mf., or larger, capacitor between the oscillator grid (pin No. 5 of 6SA7 converter) and chassis frame.

3. Tuning Cores in RF Tuned Circuits (Method of Replacement)

In order to provide optimum tracking over the tuning range and thus insure highest sensitivity at all frequencies, **matched** tuning cores are used in items 70, 71, 72, 73.



These cores are coded with a spot of red, yellow, or green paint on the stud end of the core. As these cores are supplied in matched sets, **they positively should not be replaced individually.** To replace the cores, proceed as follows:

a. Remove the escutcheon by removing its four attaching screws.

b. Remove the fibre light baffle from the face plate by disengaging the lower part of the baffle from the lances which secure the baffle to the face plate. The baffle can then be moved downward and removed. Care should be exercised that the dial pointer is not bent.

c. Using a small thin-bladed screw driver, turn the core adjustment screw in a clockwise direction until the screw is disengaged from the core carriage. The tuning core can then be removed by carefully pushing it out through the rear of the coil.

d. Care should be exercised that undue pressure is not applied to the new core when the adjustment screw is engaged into the core carriage.

4. Removal of R.F. Coil Assembly

(a) Remove 6SA7 and OZ4 tubes.

(b) Unsolder the shielded antenna lead to the trimmer condenser (8) and the ground connection from tuner frame to chassis.

CONT'D

(c) Unsolder the four leads from the chassis to the R.F. and oscillator coils.

(d) Remove the two screws located at the top rear of the tuner frame, located near the shielded antenna lead.

(e) Remove the three screws through the holes provided in the chassis (bottom side); two located directly behind the speaker field, and one at the rear of the vibrator transformer can.

(f) The assembly can then be removed by carefully moving toward the rear of the chassis to disengage the coils from the tuning cores.

NOTE: Only in rare cases will it be necessary to remove the entire coil assembly inasmuch as the cores, coils, and coil shield cans can quite easily be removed individually

5. Removal of R.F. Coils

(a) Remove bottom cover of the receiver.

(b) Remove 6SA7, 6SK7, and OZ4 tubes.

(c) Adjust dial pointer to 600 KC.

(d) Unsolder the leads from the base lugs of coil or coils to be changed.

(e) Remove the two screws fastening the fibre coil base to the coil bracket.

(f) Very carefully remove the coil by pulling toward the rear of the chassis until the coil is disengaged from the tuning core.

6. Removal of Tuner Assembly

a. Remove screw from tuner frame located at rear of turret assembly.

b. Remove 6SA7, 6SK7 IF, and OZ4 tubes and vibrator.

c. Unsolder ground lead from tone control assembly to chassis and disengage the tone control from the tuner assembly.

d. Unsolder leads from chassis to RF and oscillator coils and ground strap from tuner frame to chassis.

e. Remove the two ½" x 28 hex. nuts from the tuning and tone control bushings on the front of the receiver.

f. The tuner unit can then be removed by lifting the assembly backwards and upwards from the chassis.

7. Removal of Turret Assembly

a. Remove tuner as described above. (Paragraph 6.)

b. Remove solenoid coil and bracket assembly as described in Paragraph 10.

c. Remove the two screws which fasten the rear turret and core carriage shaft bracket to the tuner frame and remove core carriage return spring.

d. Carefully note locations of the felt washers, then remove the core carriage shaft from the rear of the tuner.

e. Carefully push the core carriage toward the coil shields as far as possible.

f. Carefully move the turret assembly back and forth until the front portion of the shaft is disengaged from the shaft housing. The assembly can then be removed upward and out at the front of the tuner.

NOTE: Extreme care should be exercised during the above operations to prevent damage to the tuning cores and RF coils.

8. Removal of Tuning Shaft Clutch Assembly

a. Remove turret assembly as outlined in Paragraph 7.

b. Remove the "C" washer, spring retaining washer and spring from the front of the tuning shaft.

c. Remove the tuning shaft assembly from the rear of the tuning shaft bushing.

d. Replace with a new tuning shaft assembly.

9. Removal of Dial Pointer Assembly

a. Remove the escutcheon by removing its four attaching screws.

b. Remove the dial face plate by removing its two attaching screws.

c. Remove the two screws which fasten the pointer assembly to the tuner frame.

d. Carefully remove the pointer assembly through the front of the receiver.

10. Removal of Solenoid Coil and Bracket Assembly

a. Remove screw, lock and flat washer and fibre washers from front of plunger.

b. Unsolder coil lead at solder lug on terminal.

c. Using a long thin bladed screw driver, remove the two screws which fasten the solenoid bracket to the tuner frame by inserting the blade between the RF coil shield and underside of the solenoid. Be careful not to bend the RF coil shield down and thereby possibly injure the RF coil and tuning core.

11. Erratic Tuning

a. Weak core carriage spring. Replace spring if weak.

b. Weak turret return leaf spring. Spring is located at rear of turret shaft. Replace with new spring.

c. Lack of lubricating at turret shaft front bushing and at rear bracket.

d. Bent turret guide shaft.

e. Damaged turret setup screw threads. Replace turret assembly.

f. Inability to adjust pre-set positions or tune manually may be due to the tuning shaft clutch slipping. Correct by replacing tuning shaft and clutch assembly.

12. Dial Pointer Sticks

a. This is sometimes caused by lack of lubrication on the pointer assembly and core carriage guide shaft. Use a very light lubrication which is not affected by low temperature conditions.

b. Bent core carriage guide shaft.

c. Pointer rubbing on the inside surface of the escutcheon. This can be corrected by moving the pointer back slightly after loosening the screw provided in the pointer holder.

d. Weak pointer return spring. This spring is located underneath the assembly in a central location. Replace spring.

13. Solenoid Armature Sticks

a. Improper adjustment of the armature adjusting screw. To adjust, turn this screw out of the core several turns, then manually push the armature into the core as far as it will go. Then turn the adjustment screw "in" until it contacts the armature. Then turn the screw out six turns and lock it with the lock nut provided.

Chassis Miscellaneous Parts

1216867		Cable	Antenna lead-in cable and socket	80
1217033		Dial	Dial Assembly	
1216868		Escutcheon	Escutcheon	131
125588		Lamp	Mazda 55	
1216842	604275	Nut	Hex. nut (½-28 x 21/64") for tone switch tuning shaft	130
1216866		Pad	Felt pad for dial window glass	
1216231		Socket	Power cable socket (3 prong male)	83
1213439		Socket	Tube socket	
1216224		Socket	Volume control cable socket (3 contact)	81
1216860		Window	Dial glass window only	

Tuner Miscellaneous Parts

1216843		Armature	Solenoid armature	101
1216861		Bracket	Actuating bracket for solenoid armature	102
1216846		Bracket	Pointer assembly mounting bracket and cam	103
1216845		Carriage	Tuning coil carriage	104
1216840		Nut	Hex. nut on rear of turret shaft to lock rear plate and spring plate	105
1216865		Nut	Locknut for solenoid pole piece	106
1216838		Nut	Manual tuning nut (.1640 dia. triple thread)	107
1216837		Nut	Stop-nut for set-up screw (No. 8-32)	108
		Plate	Turret rear plate	109
1216836		Plate	Turret front plate	110
1216839		Plate	Turret spring plate	111
1216828		Pointer	Dial pointer and holder	112
1216848		Pole Piece	Solenoid pole piece	113
1216835		Screw	Manual tuning screw (.1640 dia. triple thread)	114
1216834		Screw	Set-up screw (No. 8-32)	115
1217028		Shaft	Tuning coil core carriage guide shaft	116
1216851		Shaft	Tuning knob shaft and key	117
1216841		Shaft	Turret shaft	118
1216862		Spacer	Flat bakelite spacer for mounting solenoid armature in front of bracket	119
1216863		Spacer	Shoulder bakelite spacer for mounting solenoid armature in rear of bracket	120
1216847		Spacer	Tuning screw spacer (fibre)	121
1216853		Spring	Coil core carriage return spring	122
1216849		Spring	Pointer return spring	123
1216855		Spring	Tuning shaft return spring	124
1216856		Spring	Turret return spring	124
1216833		Washer	Bearing washer for pointer arm	125
1214609		Washer	"C" washer for mounting pointer arm to bracket and cam	126

Steering Post Control Miscellaneous Parts

1216211		Cable	Power cable complete with socket, female fuse connector, ferrule and spring	
1216204		Cable	Volume control cable with plug	
1216212		Connector	Female fuse connector	
1216213		Connector	Male section fuse connector	
		Cover	Steering post control housing cover	
		Cushion	Rubber cushion for steering post control strap	
1216216		Ferrule	Ferrule and bushing for fuse connector	
147686	603460	Fuse	30 ampere	
1216217		Grommet	Rubber grommet for steering post control housing	
		Housing	Steering post control housing and strap less cover and rubber pad	
1216220		Plug	Power cable plug (3 contact female)	84
1216219		Plug	Volume control cable plug (4 contact)	82
1216228		Screw	No. 4 x 3/16" binder head screw for steering post housing cover	
111583		Screw	No. 2 x 5/8" self-tapping screw to fasten sleeve to volume control shaft	
100978		Screw	No. 10-32 x 1¼" oval head screw to fasten steering post control to steering column	
1216222		Shaft	Steering post control flexible shaft and knob	
1216221		Sleeve	Steering post tuning shaft actuating sleeve	
1836876		Spring	Fuse connector spring	
1216223		Spring	Steering post actuating sleeve spring	
115543		Washer	No. 6 internal lockwasher for volume control bracket screws

CIRCUIT ALIGNMENT

1. Alignment of I. F. at 455 KC.

   (a) Connect test oscillator lead through a .1 mfd. capacitor to the control grid of the 6SA7GT tube (see parts layout - terminal "X" on gang capacitor).

   (b) Connect ground terminal of test oscillator to set chassis.

   (c) If a conventional output meter is used, connect across the speaker voice coil or secondary of the output transformer.

   (d) Turn volume control to maximum.

   (e) Set test oscillator to exactly 455 KC.

   (f) Adjust all of the trimmers on the I. F. transformers (see parts layout - Items 4 and 5) for maximum. These adjustments should be made several times keeping the output of the test oscillator as low as is consistent with obtaining a readable indication on the output meter.

2. Alignment at 1520 KC.

   (a) Leave the test oscillator leads connected the same as for aligning I. F. circuits.

   (b) Turn rotor plates of gang capacitor all the way out against the high frequency stop.

   (c) Set test oscillator to 1520 KC.

   (d) Adjust the oscillator trimmer (see parts layout - Item 25) for maximum output. (It is very important that this frequency be set accurately as a slight missetting will cause the receiver to be out of track over the high frequency end of the dial).

3. Alignment of Antenna Stage.

   (a) Remove the signal lead of the test oscillator from the grid of the 6SA7GT tube and connect to the antenna terminal of the receiver through a .00005 mfd. capacitor connected in place of the .01 capacitor previously used. (It is very important that a .00005 mfd. capacitor be used when aligning the antenna stage of these receivers in order that this circuit can be made to track properly.

   (b) Set the test oscillator to 1400 KC.

   (c) Turn the station selector knob until this frequency is tuned in with maximum output, again keeping the input signal at a low value.

   (d) Adjust the antenna trimmer (see parts layout - Item 22) for maximum output.

4. Alignment at 600 KC.

   (a) Set the test oscillator at 600 KC.

   (b) Turn the station selector knob until the signal from the test oscillator is tuned in with maximum output.

   (c) Maintain a low input signal and adjust the oscillator padding capacitor (Item 23) while turning the station selector knob back and forth tuning through the 600 KC signal. This operation should be continued until no further increase in output can be obtained.

   (d) After the above operation, turn the station selector knob until the rotor plates of the variable capacitors are against the high frequency stop. Check the 1520 KC setting and if necessary readjust the oscillator trimmer. Return to 1400 KC repeating operation 3b, 3c, 3d above.

IMPORTANT NOTE

When the entire alignment procedure has been accomplished accurately, the receiver should be uniformly sensitive over the entire frequency range.

SCHEMATIC DIAGRAM - MOPAR MODEL 600

The power supply uses a gaseous rectifier tube, 0Z4G, in conjunction with a primary four prong, plug in, full wave vibrator.

SOCKET VOLTAGES

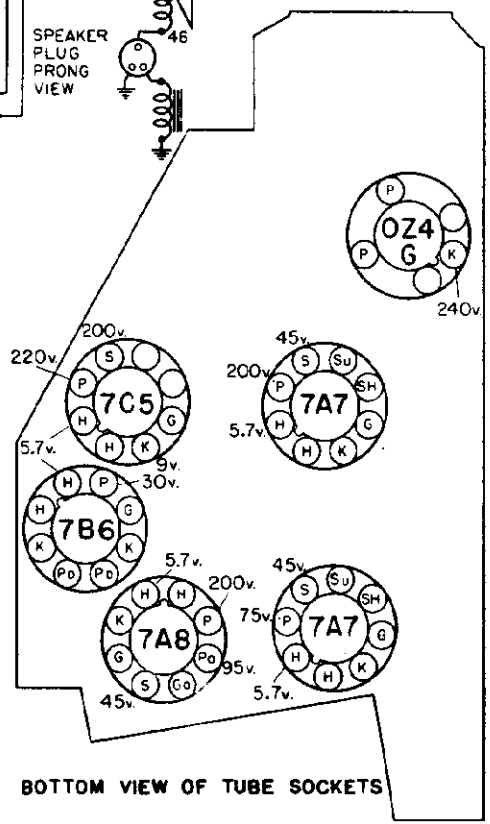
Voltage readings taken from tube socket contacts to ground with a D. C. Voltmeter having a resistance of 1000 ohms per volt.

"A" Battery Voltage 6.0 Volts

"A" Battery Current 6.0 Amps.

"B" Voltage Supply 240 Volts

"B" Current 48 M.A. to 54 M.A.



BOTTOM VIEW OF TUBE SOCKETS

All capacity adjustments, with the exception of the antenna matching capacitor, are carefully made at the factory and should require no further adjustment. The iron cores in the permeability tuning unit are set at the time the receiver is originally calibrated, and are sealed to eliminate possibility of turning due to vibration. No adjustment of these cores should be necessary unless a core or coil must be replaced. If realignment is found to be necessary the circuits can be properly adjusted only with the use of a calibrated test oscillator or signal generator and an output meter using the procedure outlined below:

1. Alignment of I. F. at 260 KC.

   (a) Connect test oscillator lead through a .1 mfd. capacitor to the control grid of the 7A8 oscillator tube (see parts layout - hot terminal of Item 29).

   (b) Connect ground terminal of test oscillator to set chassis.

   (c) If a conventional output meter is used, connect across the speaker voice coil or secondary of the output transformer.

   (d) Turn volume control to maximum.

   (e) Set test oscillator at exactly 260 KC.

   (f) Adjust padders 3B and 3C on first I. F. transformer and 4B and 4C on second I. F. transformer for maximum output. These adjustments should be made several times, keeping the output of the test oscillator as low as is consistent with obtaining a readable indication on the output meter.

2. Alignment at 1610 KC.

   (a) Remove the signal lead of the test oscillator from the grid of the 7A8 tube and connect to the antenna terminal of the receiver through a .00005 mfd. MICA CAPACITOR connected in place of the .1 mfd. capacitor previously used. (It is very important that a .00005 mfd. mica capacitor be used when aligning the antenna stage of these receivers in order that this circuit can be made to track properly).

   (b) Remove high frequency stop (see parts layout - Illustration "A"). This is no longer required.

   (c) Set the test oscillator to 1610 Kilocycles.

   (d) Turn station selector knob clockwise to the high frequency stop (1610 KC). Adjust the oscillator trimmer capacitor (see parts layout - Item 1D) for maximum output. (It is very important that this frequency be set accurately as a slight missetting will cause the receiver to be out of track over the high frequency end of the dial).

   (e) Set test oscillator to 1410 KC and tune receiver to this frequency. (Do <u>not</u> readjust oscillator trimmer).

   (f) Adjust the R. F. trimmer capacitor (see parts layout - Item 29) for maximum output.

   (g) Adjust the antenna trimmer capacitor (see parts layout - Item 28) for maximum output.

With the type of permeability tuning employed, the usual low frequency

IMPORTANT NOTE

Two versions of the MoPar 600, though identical electrically, differed slightly in the mechanical tuning mechanism. These sets differ mechanically only in that one version employs a clutch in the tuning unit. Where this clutch is used, a change of appearance items are necessary and these will differ depending on the car in which the set is installed.

It is important, therefore, to carefully examine the receiver and determine the correct version before ordering replacement parts.

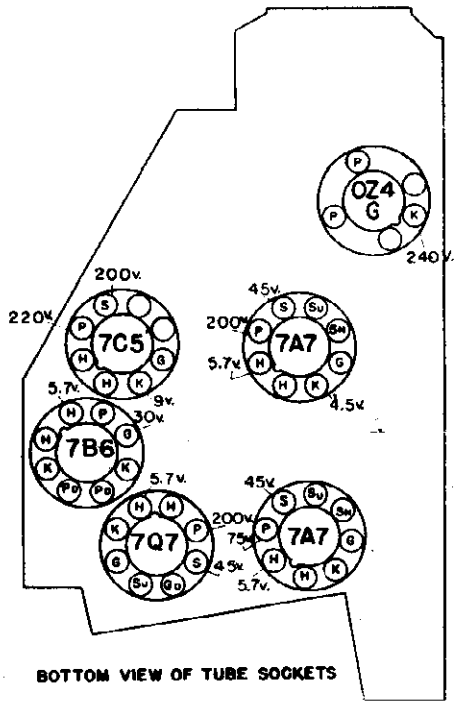
DIAL CORD HOOKUP

POSITION OF DRUM ASSEMBLY WITH COIL CORES FULLY IN.



BOTTOM VIEW OF TUBE SOCKETS

SOCKET VOLTAGES

Voltage readings taken from tube socket contacts to ground with a D. C. Voltmeter having a resistance of 1000 ohms per volt.

"A" Battery Voltage 6.0 Volts
"A" Battery Current 6.0 Amps.
"B" Voltage Supply 240 Volts
"B" Current 48 M.A. to 54 M.A.

All capacity adjustments, with the exception of the antenna matching capacitor, are carefully made at the factory and should require no further adjustment. The iron cores in the permeability tuning unit are set at the time the receiver is originally calibrated, and are sealed to eliminate possibility of turning due to vibration. No adjustment of these cores should be necessary unless a core or coil must be replaced. If realignment is found to be necessary the circuits can be properly adjusted only with the use of a calibrated test oscillator or signal generator and an output meter using the procedure outlined below.

1. Alignment of I. F. at 260 KC.

   (a) Connect test oscillator lead through a .1 mfd. capacitor to the control grid of the 7Q7 oscillator tube (see parts layout - hot terminal of item 30).

   (b) Connect ground terminal of test oscillator to set chassis.

   (c) If a conventional output meter is used, connect across the speaker voice coil or secondary of the output transformer.

   (d) Turn volume control to maximum.

   (e) Set test oscillator at exactly 260 KC.

   (f) Adjust padders 4B and 4C on first I. F. transformer and 5B and 5C on second I. F. transformer for maximum output. These adjustments should be made several times, keeping the output of the test oscillator as low as is consistent with obtaining a readable indication on the output meter.

2. Alignment at 1610 KC.

   (a) Remove the signal lead of the test oscillator from the grid of the 7Q7 tube and connect to the antenna terminal of the receiver through a .00006 mfd. MICA CAPACITOR connected in place of the .1 mfd. capacitor previously used. (It is very important that a .00006 mfd. mica capacitor be used when aligning the antenna stage of these receivers in order that this circuit can be made to track properly).

   (b) Set the test oscillator to 1610 Kilocycles.

   (c) Turn station selector knob clockwise to the high frequency stop (1610 KC). Adjust the oscillator trimmer capacitor (see parts layout - item 31) for maximum output. (It is very important that this frequency be set accurately as a slight missetting will cause the receiver to be out of track over the high frequency end of the dial).

   (d) Set test oscillator to 1410 KC and tune receiver to this frequency. (Do <u>not</u> readjust oscillator trimmer).

   (e) Adjust the R. F. trimmer capacitor (see parts layout - item 30) for maximum output.

   (f) Adjust the antenna trimmer capacitor (see parts layout - item 29) for maximum output.

IMPORTANT NOTE

With the type of permeability tuning employed, the usual low frequency adjustments are not necessary.

When the entire alignment procedure has been accomplished accurately, the receiver should be uniformly sensitive over the entire frequency range.

CIRCUIT DESCRIPTION

Aspecial compensating capacitor in the oscillator circuit miimizes frequency drift due to normal variations in car voltage and temperature. The antenna, high gain radio and oscillator circuits are tuned by varying the inductance of the coils with special iron cores (permeability tuning). Frequency range 540 KC. to 1610 KC.
The circuit employed is of the conventional superheterodyne type with an intermediate frequency of 260 KC.
The triode section of the second detector is a driver resistance coupled tothe 7C5 audio output tube.

POWER SUPPLY

The power supply uses a gaseous rectifier tube, 0Z4G, in conjunction with a primary four prong, plug in, full wave vibrator.

Electrical and Mechanical Specifications

Frequency Range ..... 540-1600 kc.
Intermediate Frequency ..... 455 kc.
Power Supply ..... 105-125 volts AC-DC
Loudspeaker ..... Dynamic
V.C. Impedance ..... 3.5 ohms at 400 cycles

Power Output (Undistorted) ..... .75 watts
Power Output (Maximum) ..... 1.5 watts
Tuning Drive Ratio ..... 3 to 1
Weight 7¼ lbs. (net) ..... 10 lbs. (shipping)

1—12SA7GT Oscillator and Mixer tube
1—50L6GT Power Output tube
1—12SK7GT IF Amplifier tube
1—35Z5GT Rectifier tube
1—12SQ7GT Second Detector and First Audio tube

NOTE: The above glass tubes are interchangeable with their metal equivalent.

ALIGNMENT PROCEDURE

The following equipment is necessary to properly align this chassis:

1. A signal generator which will provide an accurately calibrated signal at the frequencies listed.
2. An output meter.
3. A non-metallic screwdriver.
4. Dummy antenna: — .1 mfd., — RMA loop.

NOTE: Intermediate Frequency and Oscillator adjustments may be made with the loop disconnected provided a resistor of 10,000 to 50,000 ohms is substituted to close the 12SA7GT grid circuit. The loop alignment must be done with the loop and chassis mounted in operating position in the cabinet. A single turn loosely coupled to loop may be substituted for RMA loop.

GENERATOR	CONNECTION AT RADIO	DUMMY ANTENNA	DIAL	TO TUNE TRIMMERS	REMARKS

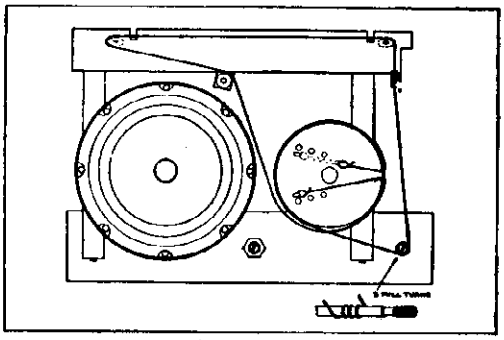
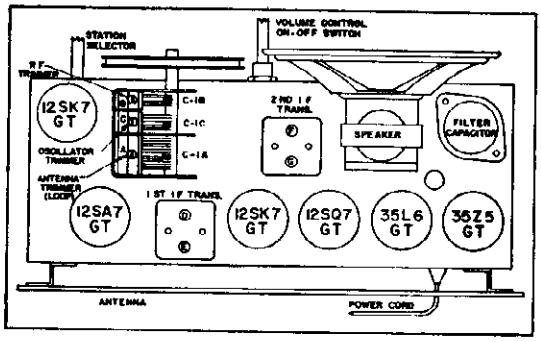
NOTE: The above glass tubes are interchangeable with their metal equivalent.



Dial Mechanism



Tube Layout

The following equipment is necessary to properly align this chassis:

1. A signal generator which will provide an accurately calibrated signal at the frequencies listed.
2. An output meter.
3. A non-metallic screwdriver.
4. Dummy antenna: .1 mfd. — RMA loop.

NOTE: Intermediate Frequency and Oscillator adjustments may be made with the loop disconnected provided a resistor of 10,000 to 50,000 ohms is substituted to close the 12SK7GT grid circuit. The loop alignment must be done with the loop and chassis mounted in operating position in the cabinet. A single turn loosely coupled to loop may be substituted for RMA loop.

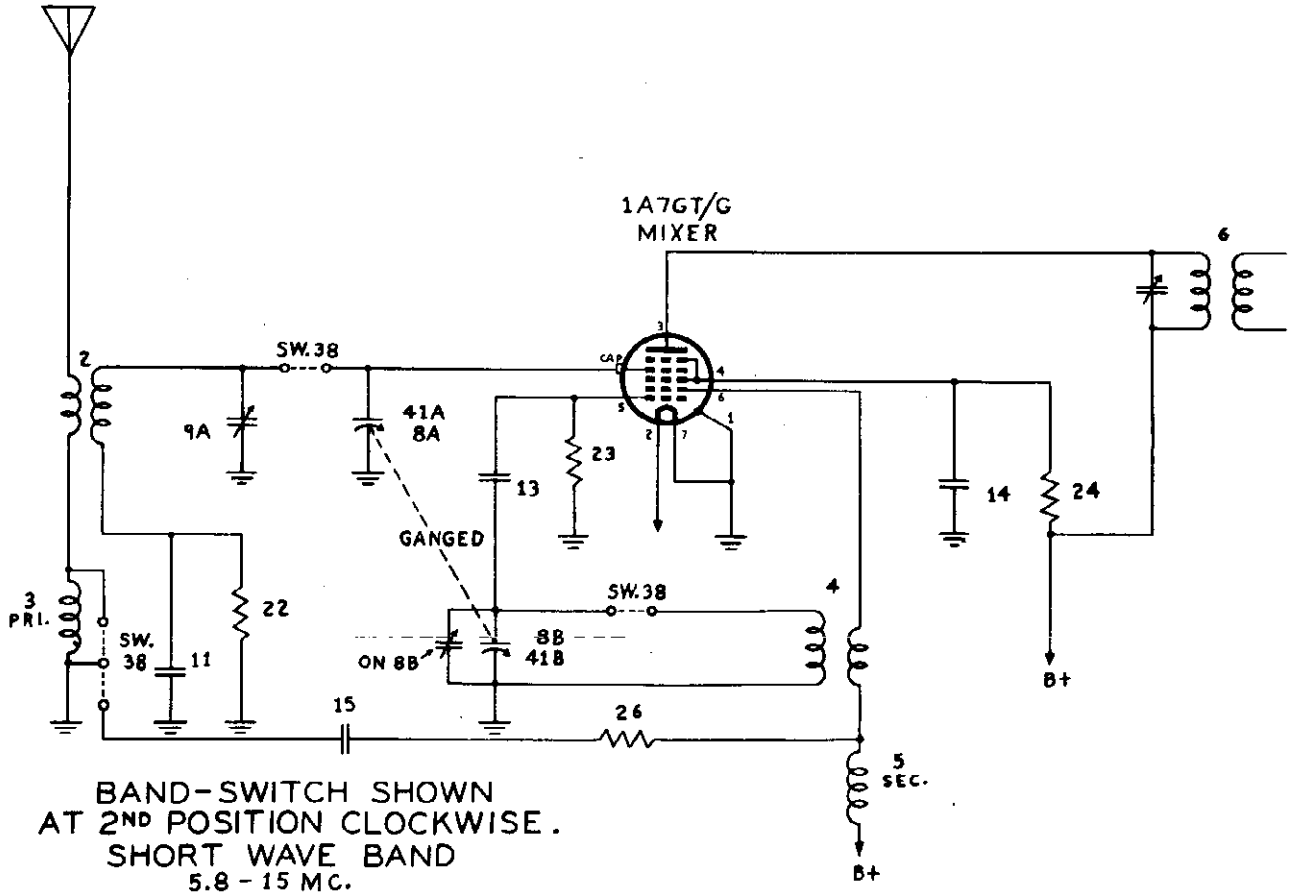
540-1600 KC.

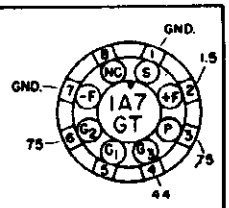


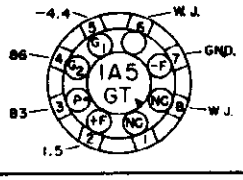
BAND-SWITCH SHOWN
AT 2ND POSITION CLOCKWISE.
SHORT WAVE BAND
5.8 - 15 MC.

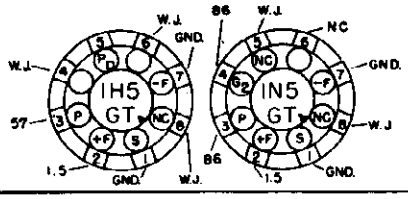
THE CROSLEY CORP.

SOCKET VOLTAGE CHART

NOTES:—
1. THESE ARE BOTTOM VIEWS OF SOCKETS.
2. MEASURE VOLTAGES FROM SOCKET LUGS TO CHASSIS (−B, −A, GROUND).
3. THESE VOLTAGES MEASURED USING AN ELECTRONIC VOLTMETER.
4. W.J. - WIRING JUNCTION.
5. NC — NO CONNECTION.
6. SOCKET VOLTAGE TOLERANCE, 10%.







ALIGNMENT PROCEDURE

1. Turn the tuning condenser to the completely closed position against the stop and set the dial pointer to the reference line at the end of the dial scale.
2. Connect the output meter across the speaker voice coil.
3. The r.f. signal input from the signal generator should be connected to the antenna lead (red) as indicated in the alignment chart. Connect the low side (ground) of the signal generator to the chassis.
4. Turn the volume control on full and adjust the signal generator output to produce approximately mid-scale deflection of the output meter, but maintain signal generator output as low as possible to prevent AVC action in the receiver.

Alignment Sequence	Signal Generator Output			Position of		Adjust for Maximum Output
	Frequency in kc,	In Series with	To	Band Switch	Tuning Dial	
1	455	200 mmf.	Ant.	A	1,620	A & B
2	15,300	400 ohms	Ant.	O	15,300	C*
3	15,000	400 ohms	Ant.	O	15,000	D
4	1,620	200 mmf.	Ant.	A	1,620	E
5	1,400	200 mmf.	Ant.	A	1,400	F

*** NOTE:** When aligning the short-wave oscillator trimmer (C), be sure that the circuit is aligned at the correct frequency and not at the image frequency which is 910 kilocycles lower as indicated by the receiver dial. To check: Tune in the generator frequency, then increase the generator output and tune in the image frequency. The image frequency should be weaker than the fundamental and audible 910 kilocycles lower on the receiver dial. If the image cannot be tuned in, the oscillator trimmer is adjusted to the wrong peak; i.e., the oscillator trimmer may be adjusted to the image or one of the harmonics instead of the fundamental frequency. The correct peak is the second one heard as the trimmer adjustment screw is opened from the completely closed position.

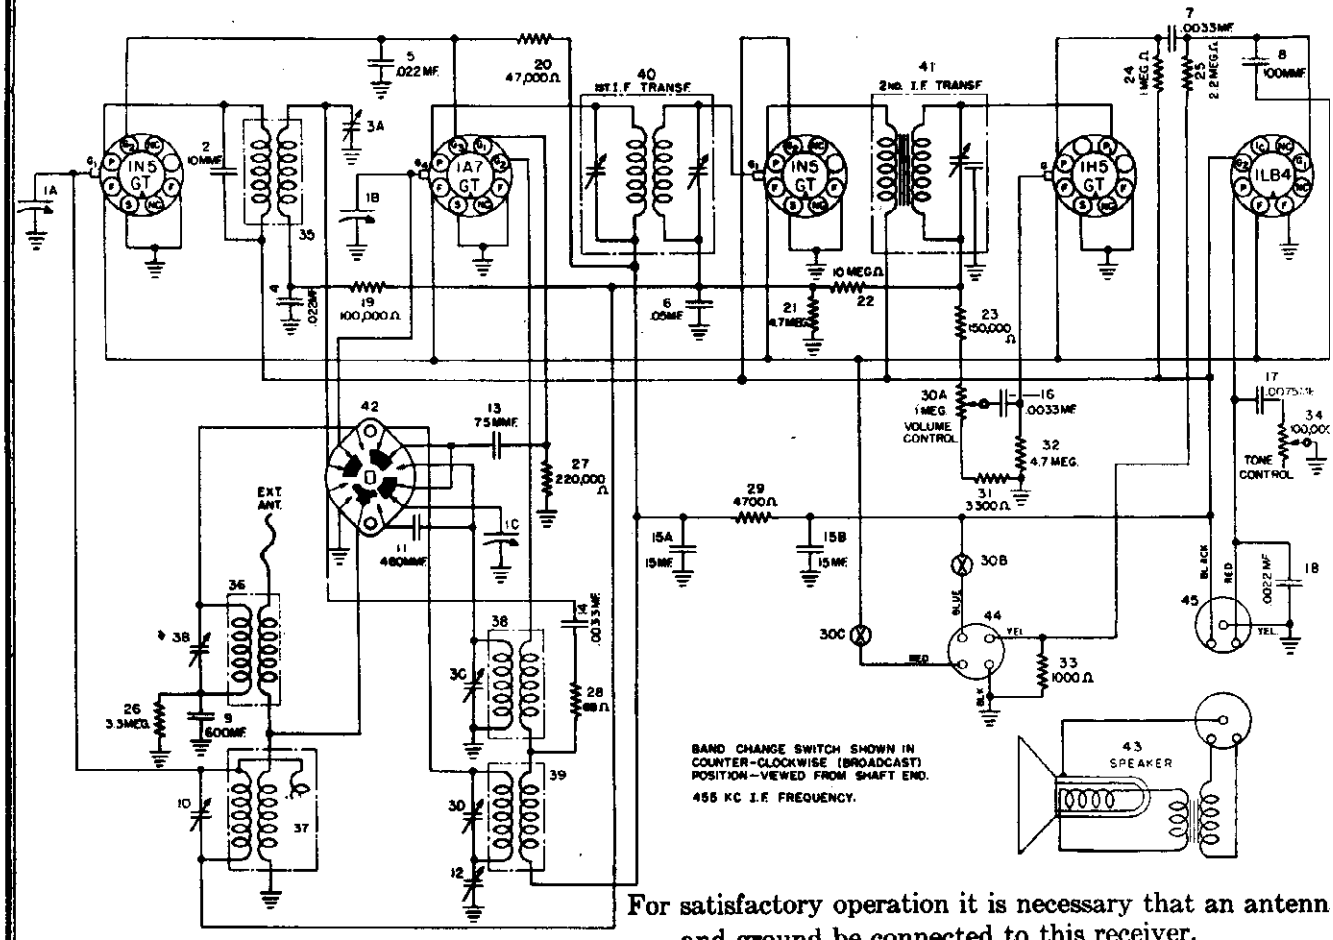
THE CROSLEY CORP.

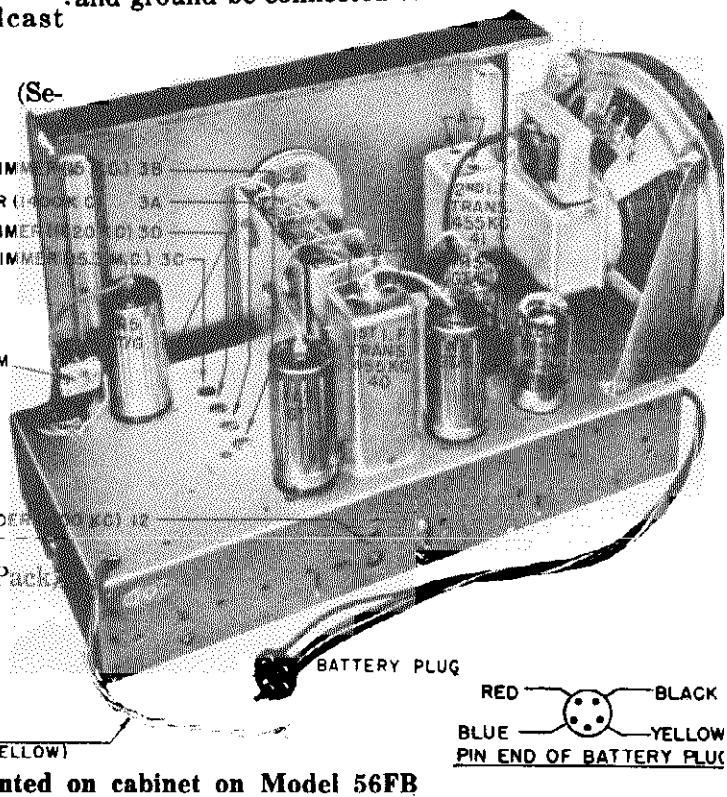


For satisfactory operation it is necessary that an antenn and ground be connected to this receiver.

FREQUENCY RANGE: American Broadcast Band, 540 to 1600 kc. (Selector Switch at A.)

Overseas Short-wave Band, 5.8 to 15 mc. (Selector Switch at 0.)

Type	Function
1A7GT/G	Mixer
1N5GT/G	I. F. Amplifier,
1N5GT/G	R. F. Amplifier
1H5GT/G	Detector, AVC 1st A. F. Amplifier
1LB4	A. F. Power Output



POWER SUPPLY: Crosley "A-B" Battery Pack CR69.

VOLTAGE RATING: 1½ v. "A"; 90 v. "B".

POWER OUTPUT: 170 mw. minimum.

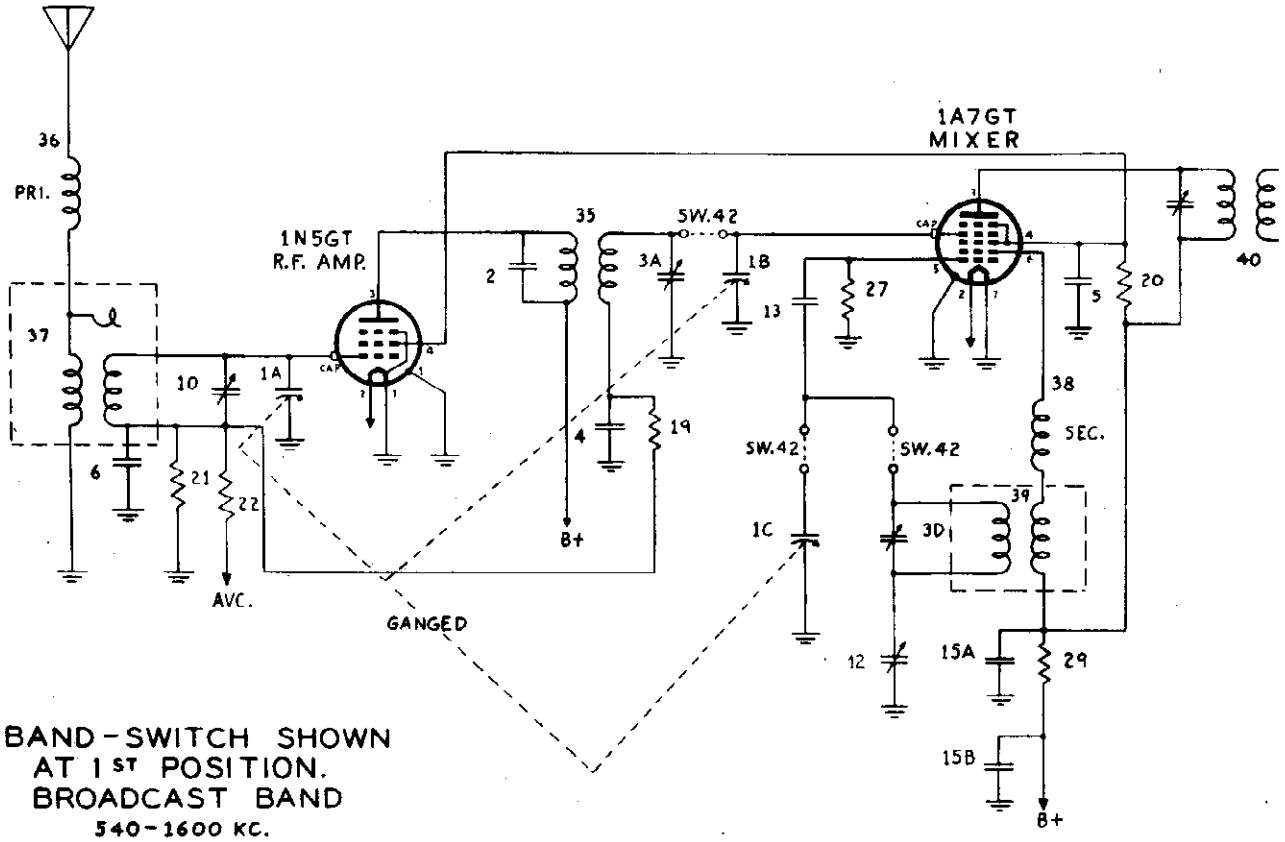
FEBRUARY, 1946 **Speaker mounted on cabinet on Model 56FB**

For Parts List, see P.15

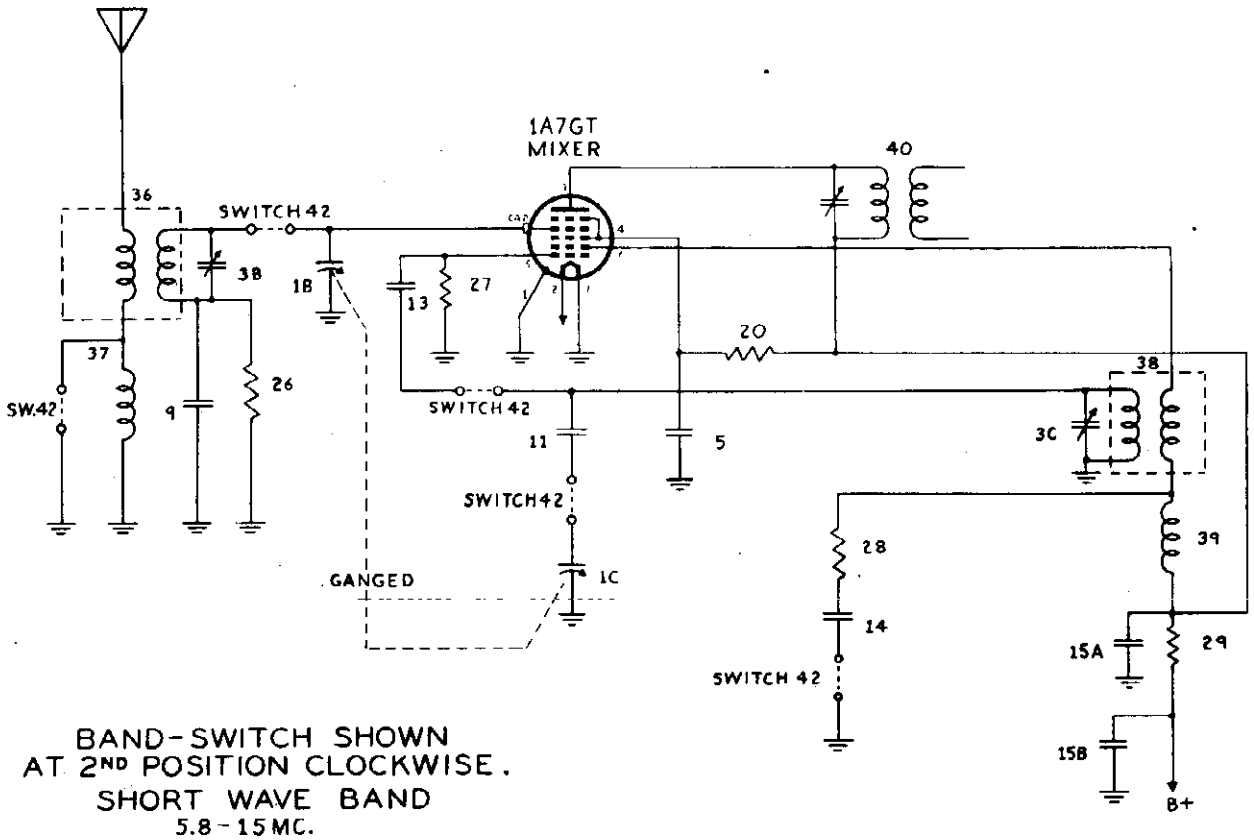
"clarified schematics"

MODELS 56FA, 56FB

THE CROSLEY CORP.



BAND-SWITCH SHOWN
AT 1ST POSITION.
BROADCAST BAND
540-1600 KC.

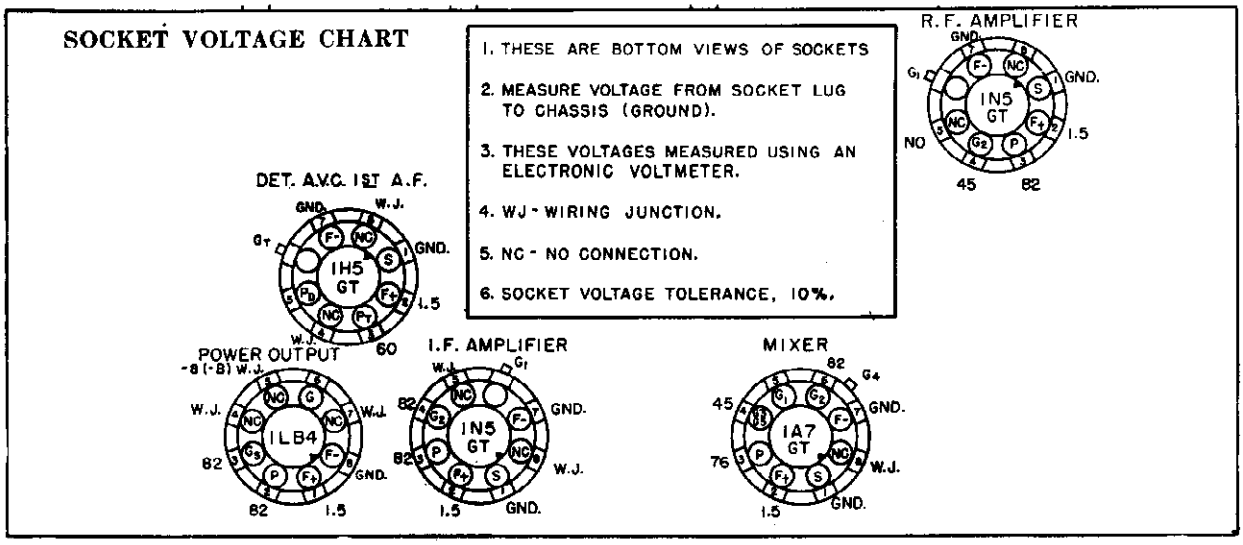


BAND-SWITCH SHOWN
AT 2ND POSITION CLOCKWISE.
SHORT WAVE BAND
5.8-15 MC.

THE CROSLEY CORP.

SOCKET VOLTAGE CHART

1. THESE ARE BOTTOM VIEWS OF SOCKETS
2. MEASURE VOLTAGE FROM SOCKET LUG TO CHASSIS (GROUND).
3. THESE VOLTAGES MEASURED USING AN ELECTRONIC VOLTMETER.
4. WJ - WIRING JUNCTION.
5. NC - NO CONNECTION.
6. SOCKET VOLTAGE TOLERANCE, 10%.



1. Turn the tuning condenser to the completely closed position against the stop and set the dial pointer to the reference line at the end of the dial scale.
2. Connect the output meter across the speaker voice coil.
3. The r.f. signal input from the signal generator should be connected to the antenna lead (red) as indicated in the alignment chart. Connect the low side (ground) of the signal generator to the chassis.
4. Turn the volume control on full and adjust the signal generator output to produce approximately mid-scale deflection of the output meter, but maintain signal generator output as low as possible to prevent AVC action in the receiver.

Alignment Sequence	Signal Generator Output			Position of		Adjust for Maximum Output
	Frequency in kc.	In Series with	To	Band Switch	Tuning Dial	
1	455	200 mmf.	Ant.	A	1,620	A & B
2	1,620	200 mmf.	Ant.	A	1,620	C
3	600	200 mmf.	Ant.	A	600	D
4	1,620	200 mmf.	Ant.	A	1,620	C
5	1,400	200 mmf.	Ant.	A	1,400	E & F
6	600	200 mmf.	Ant.	A	600	D
7	15,300	400 ohms	Ant.	O	15,300	G*
8	15,000	400 ohms	Ant.	O	15,000	H

* **NOTE:** When aligning the short-wave oscillator trimmer (G), be sure that the circuit is aligned at the correct frequency and not at the image frequency which is 910 kilocycles lower as indicated by the receiver dial. To check: Tune in the generator frequency, then increase the generator output and tune in the image frequency. The image frequency should be weaker than the fundamental and audible 910 kilocycles lower on the receiver dial. If the image cannot be tuned in, the oscillator trimmer is adjusted to the wrong peak; i.e., the oscillator trimmer may be adjusted to the image or one of the harmonics instead of the fundamental frequency. The correct peak is the second one heard as the trimmer adjustment screw is opened from the completely closed position.

ALIGNMENT PROCEDURE

MODELS 56TA, 56TW, 56TC — **MODELS 56TA-L, 56TW-L, 56TC-L**

1. Turn the tuning condenser to the completely closed position against the stop and set the dial pointer to the reference line at the end of the dial scale.
2. Connect the output meter across the speaker voice coil.
3. The r.f. signal input from the signal generator should be connected to the external antenna lead. Connect the signal generator ground through a 0.1 mfd. condenser to —B (pin 3 on 12SK7 tube socket Models 56TA, 56TW, 56TC) (pin 4 on 14A7 tube socket Models 56TA-L, 56TW-L, 56TC-L).
4. Turn the volume control on full and adjust the signal generator output to produce approximately mid-scale deflection of the output meter, but maintain signal generator output as low as possible to prevent AVC action in the receiver.

Alignment Sequence	Signal Generator Output			Position of		Adjust for Maximum Output
	Frequency in kc.	In Series with	To	Band Switch	Tuning Dial	
1	455	200 mmf.	Ant.	A	1,620	A & B
2	15,300	400 ohms	Ant.	O	15,300	C
3	15,000	400 ohms	Ant.	O	15,000	D
4	1,400	200 mmf.	Ant.	A	1,400	E & F

NOTE: When aligning the short-wave oscillator trimmer (C), be sure that the circuit is aligned at the correct frequency and not at the image frequency which is 910 kilocycles lower as indicated by the receiver dial. To check: Tune in the generator frequency, then increase the generator output and tune in the image frequency. The image frequency should be weaker than the fundamental and audible 910 kilocycles lower on the receiver dial. If the image cannot be tuned in, the oscillator trimmer is adjusted to the wrong peak; i.e., the oscillator trimmer may be adjusted to the image or one of the harmonics instead of the fundamental frequency. The correct peak is the second one heard as the trimmer adjustment screw is opened from the completely closed position.

THE CROSLEY CORP.

THE CROSLEY CORP.

ALIGNMENT PROCEDURE

Turn the tuning condenser to the completely closed position against the stop and set the dial pointer to the reference line at the end of the dial scale.

Connect the output meter across the speaker voice coil.

The r. f. signal input from the signal generator should be connected to the external antenna post as indicated in the alignment chart. Connect the low side (ground) of the signal generator to the chassis.

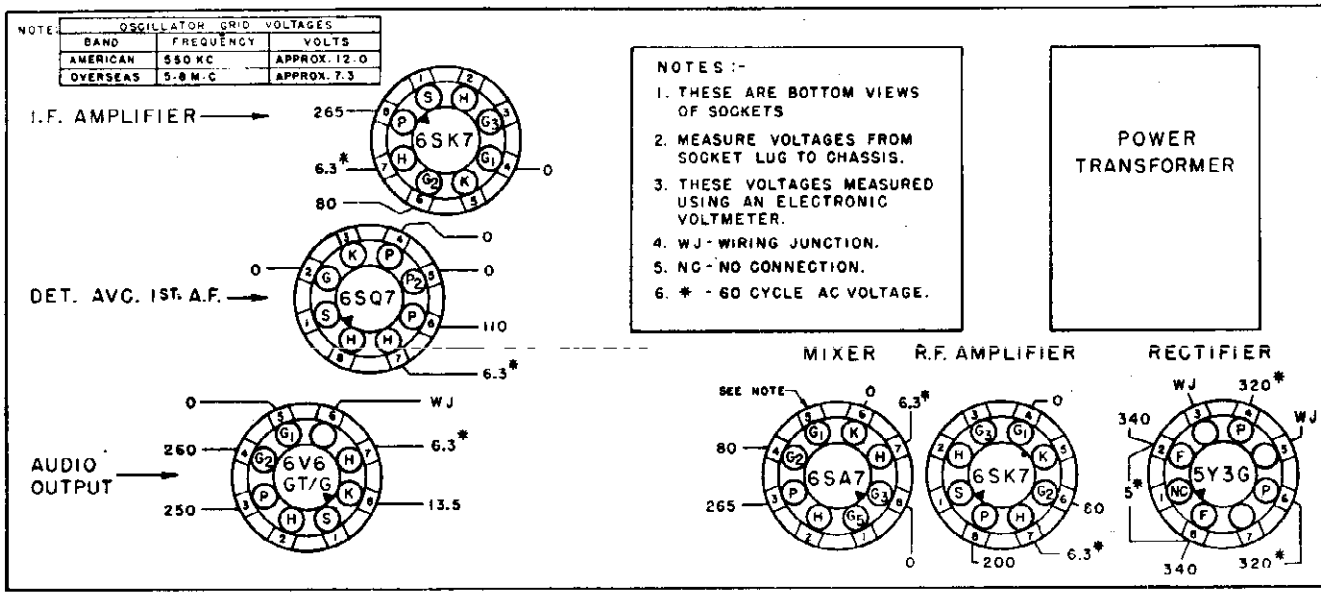
Turn the volume control on full and adjust the signal generator output to produce approximately mid-scale deflection of the output meter, but maintain the signal generator output as low as possible to prevent AVC action in the receiver.

Alignment Sequence	Signal Generator Output			Position of		Adjust for Maximum Output
	Frequency in kc.	In Series With	To	Band Switch	Tuning Dial	
1	455	200 mmf.	Ant.	A	1620	A & B
2	455	200 mmf.	Ant.	A	1620	C*
3	15,300	400 ohms	Ant.	O	15,300	D
4	15,000	400 ohms	Ant.	O	15,000	E
5	1620	200 mmf.	Ant.	A	1620	F
6	1400	200 mmf.	Ant.	A	1400	G
7	600	200 mmf.	Ant.	A	600	H
8	1400	200 mmf.	Ant.	A	1400	Recheck G

*Adjust for Minimum Output (Wave Trap).

NOTE: When aligning the "Overseas" oscillator trimmer (D), be sure that the circuit is aligned at the correct frequency and not at the image frequency which is 910 kilocycles lower as indicated by the receiver dial. To check: tune in the generator frequency, then increase the generator output and tune in the image frequency. The image frequency should be weaker than the fundamental and audible 910 kilocycles lower on the receiver dial. If the image cannot be tuned in, the oscillator trimmer is adjusted to the wrong peak of the trimmer from the closed position.

SOCKET VOLTAGE CHART



MODELS 66CA, 66CP, 66CQ

THE CROSLEY CORP.

FREQUENCY RANGE: American Broadcast Band, 540 to 1600 kc. (Selector Switch at A.)

Overseas Short-wave Band. 5.8 to 15 mc. (Selector Switch at 0.)

INTERMEDIATE FREQUENCY: 455 kc.

POWER SUPPLY: 60 cycle a. c. only.

VOLTAGE RATING: 105-125 volts.

POWER CONSUMPTION: 60 watts maximum.

POWER OUPUT: 4.5 watts minimum.

VOLTAGE DROP ACROSS SPEAKER FIELD: 76 volts.

RESISTANCE OF SPEAKER FIELD: 900 ohms.

*Adjust for minimum output (wavetrap).

NOTE: When aligning the short-wave oscillator trimmer (D), be sure that the circuit is aligned at the correct frequency and not at the image frequency which is 910 kilocycles lower as indicated by the receiver dial. To check: Tune in the generator frequency, then increase the generator output and tune in the image frequency. The image frequency should be weaker than the fundamental and audible 910 kilocycles lower on the receiver dial. If the image cannot be tuned in, the oscillator trimmer is adjusted to the wrong peak; i.e., the oscillator trimmer may be adjusted to the image or one of the harmonics instead of the fundamental frequency. The correct peak is the second one heard as the trimmer adjustment screw is opened from the completely closed position.

THE CROSLEY CORP.

ALIGNMENT PROCEDURE

Turn the tuning capacitor to the completely closed position against the stop, and set the dial poin to the reference line at the end of the dial scale.

Turn the tone control to the high or treble position.

Connect the output meter across the speaker voice coil.

The r.f. signal input from the signal generator should be connected to the external antenna pc Connect the signal generator ground to the chassis.

Turn the volume control on full, and adjust the signal generator output to produce approximat mid-scale deflection of the output meter, but maintain signal generator output as low as possi to prevent AVC action in the receiver.

ALIGNMENT PROCEDURE

Turn the tuning capacitor to the completely closed position against the stop, anl set the dial pointer to the reference line at the end of the dial scale.

Set the tone control buttons all the way out.

NOTE: If the chassis is removed from the cabinet, connect the shorting bar from the volume control (67A) to the coupling capacitor (34) on the tone unit socket.

Connect the output meter across the speaker output transformer connections on the 6K6 tubes.

The r. f. signal input from the signal generator should be connected as indicated in the alignmen chart. Connect the low side (ground) of the signal generator to the chassis.

Turn the volume control on full and adjust the signal generator output to produce a noticeable output meter reading.

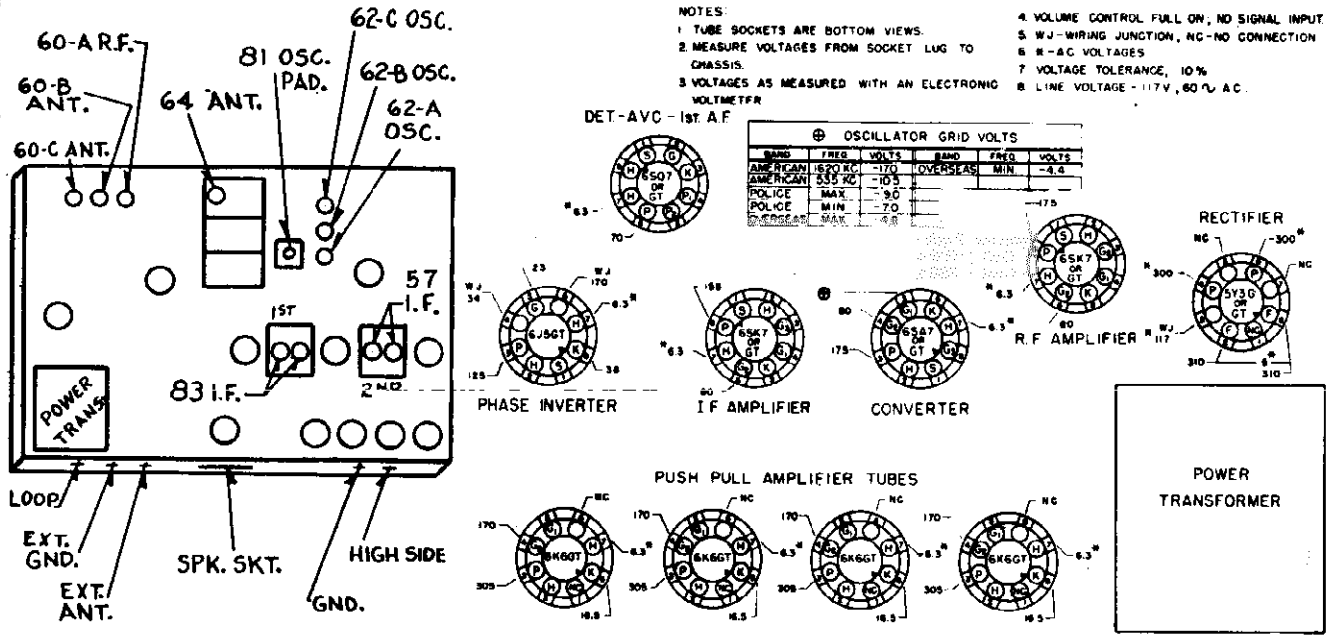
1	455	200 mmf.	Rear Gang Section	American BC	Fully Open	57 & 83
2	1400	200 mmf.	Ext. Ant.	American BC	1400	62-A
3	1400	200 mmf.	Ext. Ant.	American BC	1400	60--A&64
4	600	200 mmf.	Ext. Ant.	American BC	600	81
5	6500	400 ohms	Ext. Ant.	Police	Fully Open	62-B
6	6000	400 ohms	Ext. Ant.	Police	6000	60-B
*7	18,300	400 ohms	Ext. Ant.	Overseas	Fully Open	62 C
8	18,000	400 ohms	Ext. Ant.	Overseas	18,000	60-C

The American Broadcast Band must be aligned with the loop antenna connected.

*NOTE: When aligning the short-wave oscillator trimmer (62C), be sure that the circuit is aligned at the corr frequency and not at the image frequency which is 910 kilocycles lower as indicated by the receiving dial. To che tune in the generator frequency, then increase the generator output and tune in the image frequency. The ima frequency should be weaker than the fundamental and audible 910 kilocycles lower on the receiver dial. If t image cannot be tuned in, the oscillator trimmer is adjusted to the wrong peak; i. e., the oscillator trimmer may adjusted to the image or one of the harmonics instead of the fundamental frequency. The correct peak is the seco one heard as the trimmer adjustment screw is opened from the completely closed position.



MODEL 106CP

THE CROSLEY CORP.

Each of the six push buttons, for automatic tuning, has two adjusting screws by which it may be set to any nearby American broadcast station whose frequency in kilocycles is within the kilocycle range covered by that button. To gain access to these screws, carefully pry off the push button cover.

To set the top push button to a desired position, proceed as follows:

1. Turn the ANTENNA ADJ. SCREW clockwise until moderately tight, then turn the OSCILLATOR ADJ. SCREW counter-clockwise until the threaded portion extends approximately ¾ inch.. **Use a small screw-driver and do not exert pressure.**
2. Turn the band selector switch to the "AMERICAN" position and manually tune in the station to which the push button is to be set. The frequency of the station selected must be between 540 and 900 kilocycles. Carefully adjust the tuning control to the point of clearest reception.
3. Turn the band selector switch to the "AUTOMATIC" position and slowly turn the OSCILLATOR ADJ. SCREW clockwise until the same station is heard. Adjust the screw for the maximum volume.
4. Adjust the ANTENNA ADJ. SCREW for the maximum volume.
5. Turn the band selector switch from "AUTOMATIC" to "AMERICAN" and back again to check if the adjustment has been correctly made. There should be no change in tone quality when switched from one to the other.
6. Place the tab with the call letters of the station, to which the push button has been set, in a celluloid "V" and slide it into the button from the side.
7. The remaining push buttons may be set in a similar manner.
   No adjustment of master tone control push buttons is required.

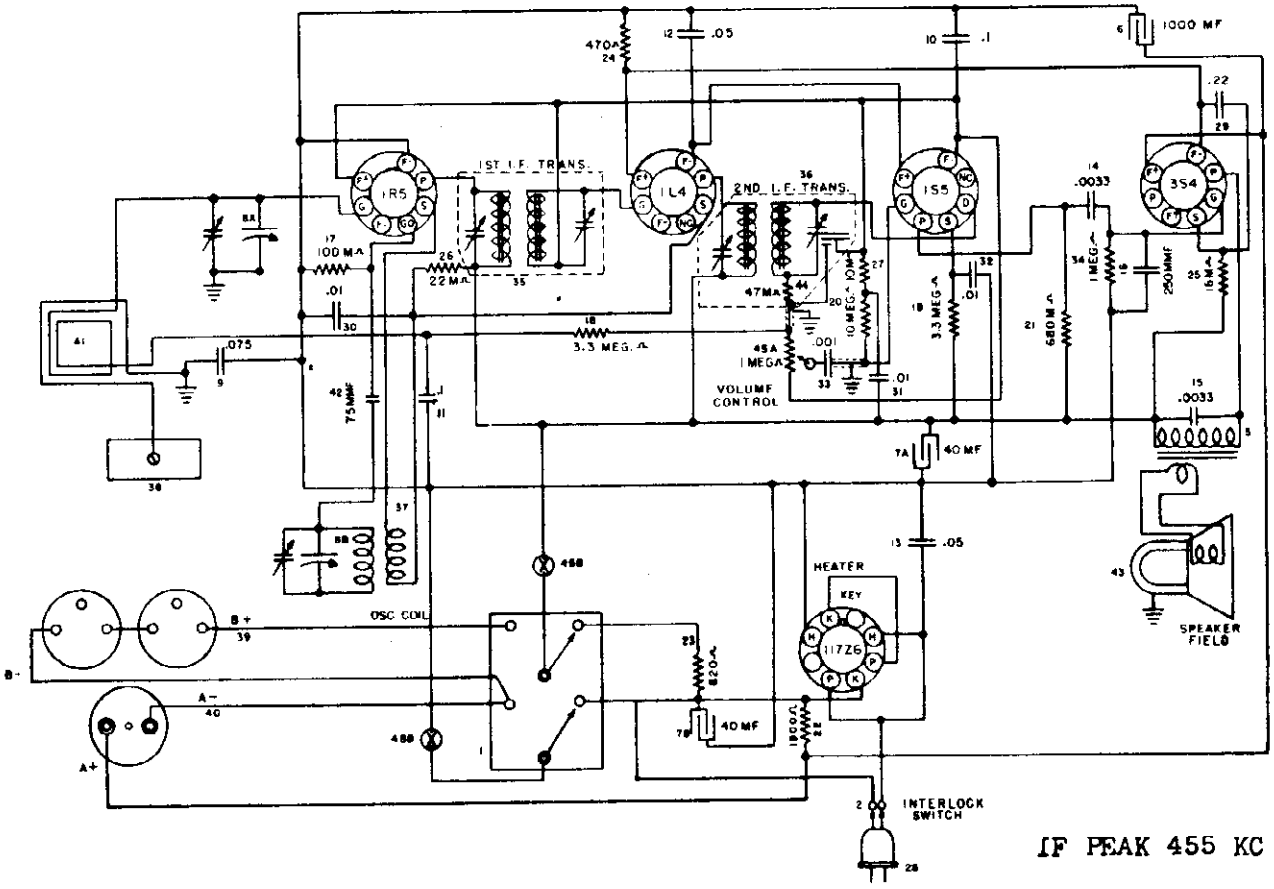
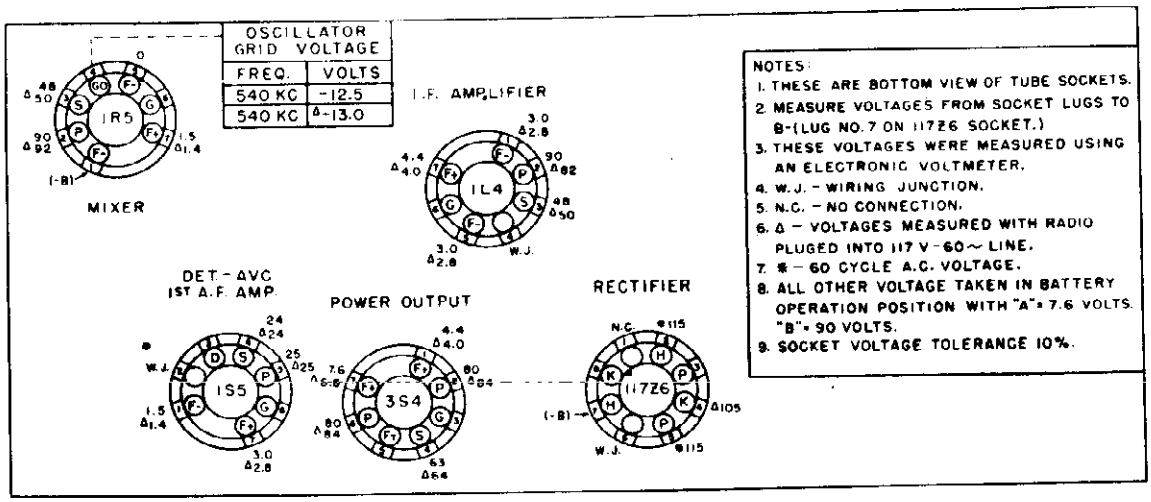
THE CROSLEY CORP.



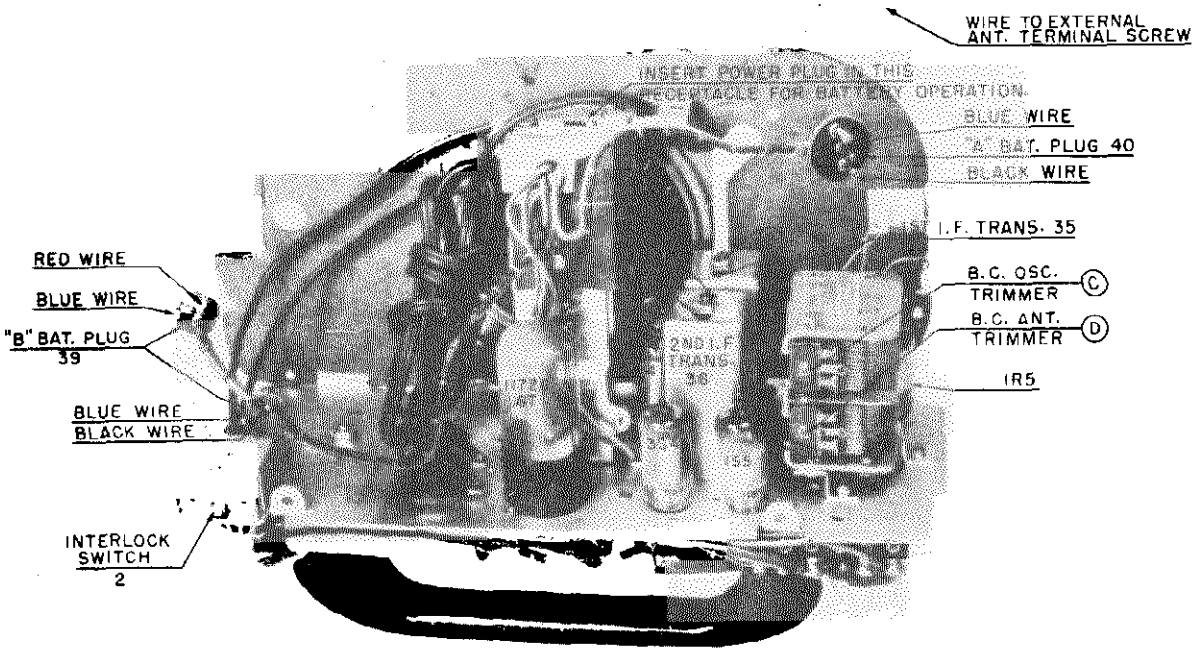
SCHEMATIC DIAGRAM-- MODELS 56PA and 56PB

SOCKET VOLTAGE CHART



October, 1946

THE CROSLEY CORP.



CHASSIS VIEW—MODELS 56PA and 56PB

ALIGNMENT PROCEDURE

1. Turn the tuning condenser to the completely closed position against the stop and set the dial pointer to the reference line at the end of the dial scale.
2. Connect the output meter across the speaker voice coil.
3. Connect the high side of the signal generator to the external antenna wire of the loop, that connects to the terminal screw on the bottom of the cabinet, as indicated in the alignment chart. Connect signal generator ground through a O. 1 mt. condenser to B—. (No. 1 pin on 1R5 tube).
4. Turn the volume control on full and adjust the signal generator output to produce approximately mid-scale deflection of the output meter, but maintain signal generator output as low as possible to prevent AVC action in the receiver.

Alignment Sequence	Signal Generator Output			Position of Tuning Dial KC	Adjust for Maximum Outout
	Frequency in KC	In Series with	To		
1	455	200 mmf.	Ant.	1620	A & B
2	1620	200 mmf.	Ant.	1620	C
3	1400	200 mmf.	Ant.	1400	*D

***NOTE:** Batteries should be placed against battery stop in front half of cabinet when making loop alignment to avoid error due to capacity effect of batteries. If receiver is to be used on AC or DC only (without batteries) it will be necessary to realign loop adjustment "D" for maximum output, after batteries have been removed.

TYPE: Five-tube, combination, battery Portable and AC-DC Superheterodyne.

FREQUENCY RANGE: 540 to 1600 kilocycles.

INTERMEDIATE FREQUENCY: 455 kc.

POWER SUPPLY: AC-DC or BATTERY.

VOLTAGE RATING: AC-DC, 110 to 120 volts. Battery "A" 7½ volts "B" 90 volts.

POWER OUTPUT: 180 M.W. maximum.

POWER CONSUMPTION: 25 watts.

BATTERIES USED: one Crosley CR 90, 7.5 volt "A" Battery. Two Crosley CR 77, 45 volt "B" Batteries.

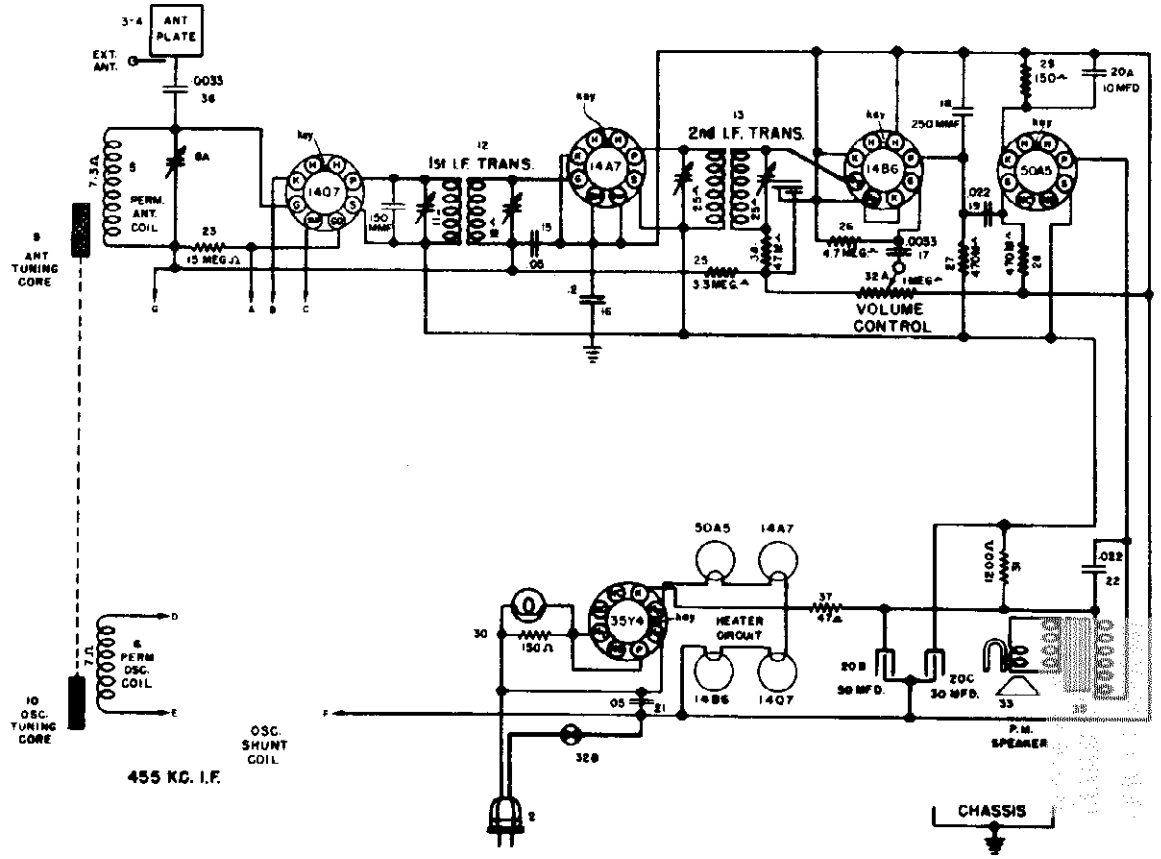
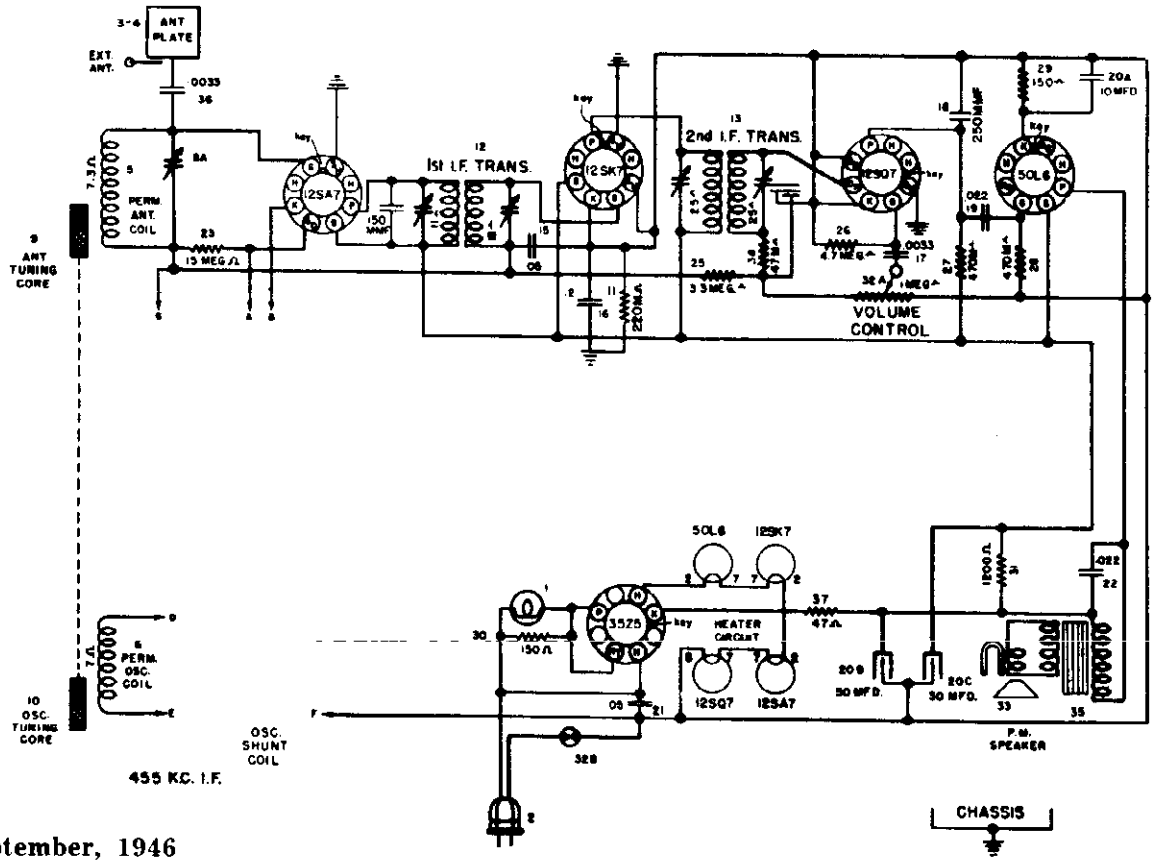
56TG-O,56TH-O,56TJ-O

THE CROSLEY CORP.



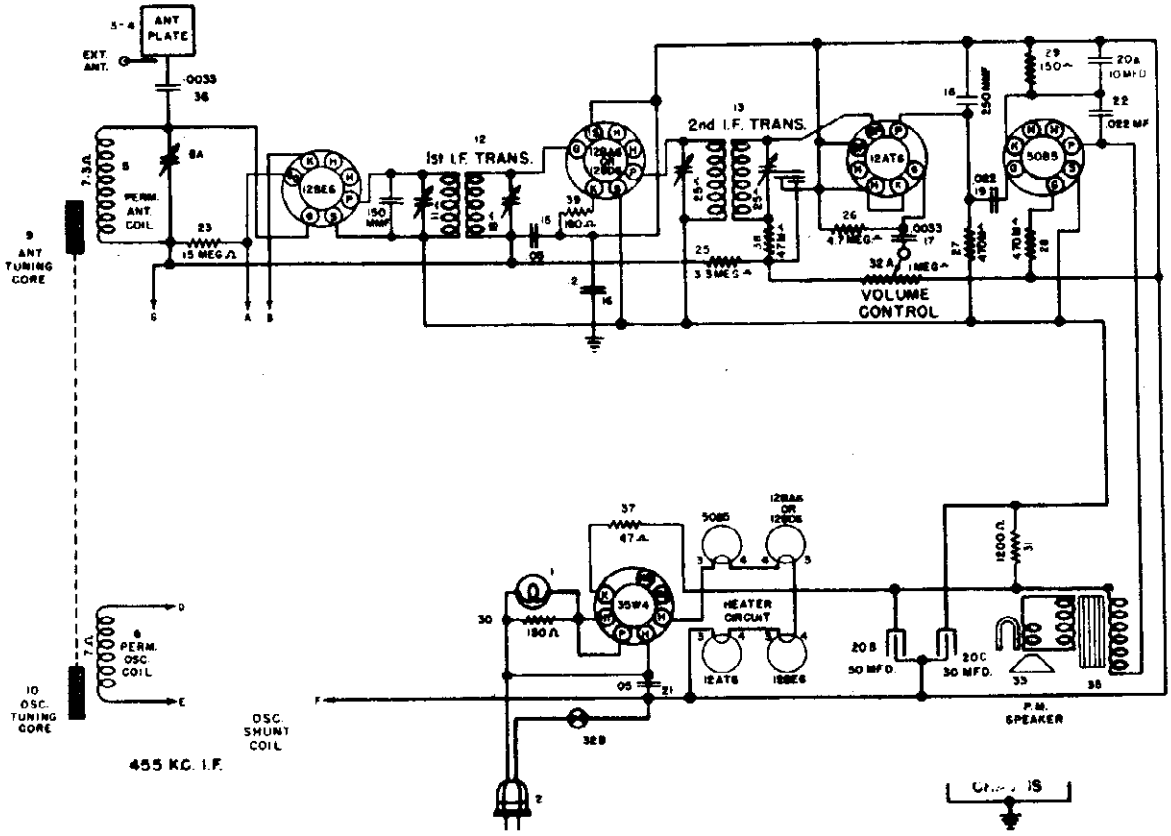
SCHEMATIC DIAGRAM—MODEI 56TG, 56TH, 56TJ (LOCTAL)



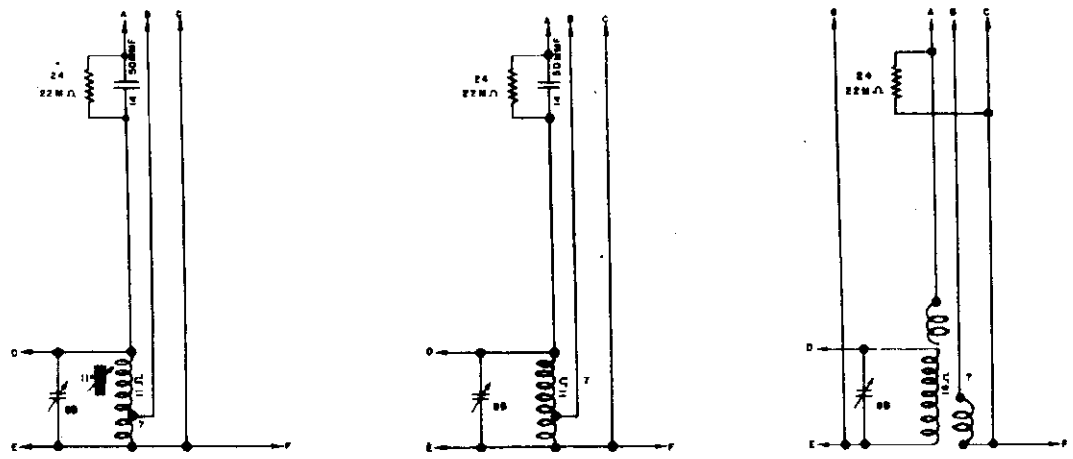
September, 1946

SCHEMATIC DIAGRAM— MODEL 56TG-O, 56TH-O, 56TJ-O (OCTAL)

THE CROSLEY CORP.



SCHEMATIC DIAGRAM—MODEL 56TG-M, 56TH-M, 56TJ-M (MINIATURE)



THE ABOVE OSCILLATOR SHUNT COIL IS USED IN THE FIRST PRODUCTION MODELS. IT IS MOUNTED ON THE PERMEABILITY TUNER AND USES AN ADJUSTABLE IRON CORE. "C" IS NOT USED WITH A MINIATURE OR AN OCTAL TUBE.

THIS OSCILLATOR SHUNT COIL IS USED IN THE SECOND PRODUCTION MODELS. IT IS MOUNTED ON THE REAR OF THE PERMEABILITY TUNER AND DOES NOT USE AN ADJUSTABLE IRON CORE. "C" IS NOT USED WITH A MINIATURE OR AN OCTAL TUBE.

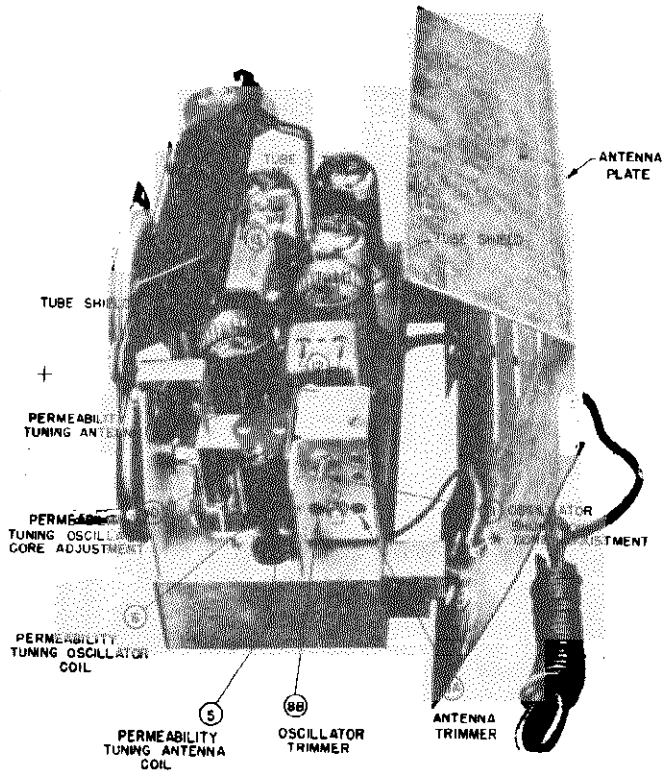
THIS OSCILLATOR SHUNT COIL IS USED IN THE THIRD PRODUCTION MODELS. IT IS MOUNTED UNDER THE CHASSIS AND DOES NOT USE AN ADJUSTABLE IRON CORE. "C" IS NOT USED WITH A MINIATURE OR AN OCTAL TUBE.

OSCILLATOR SHUNT COIL CHARTS

To check circuits and parts find the socket in the preceding SCHEMATIC DIAGRAMS which correspond to the socket in the radio. Connection "G" is used only on 3rd production sets. To check the oscillator shunt coil circuit, choose the circuit (which corresponds to the radio being serviced) from the 3 circuits shown above.

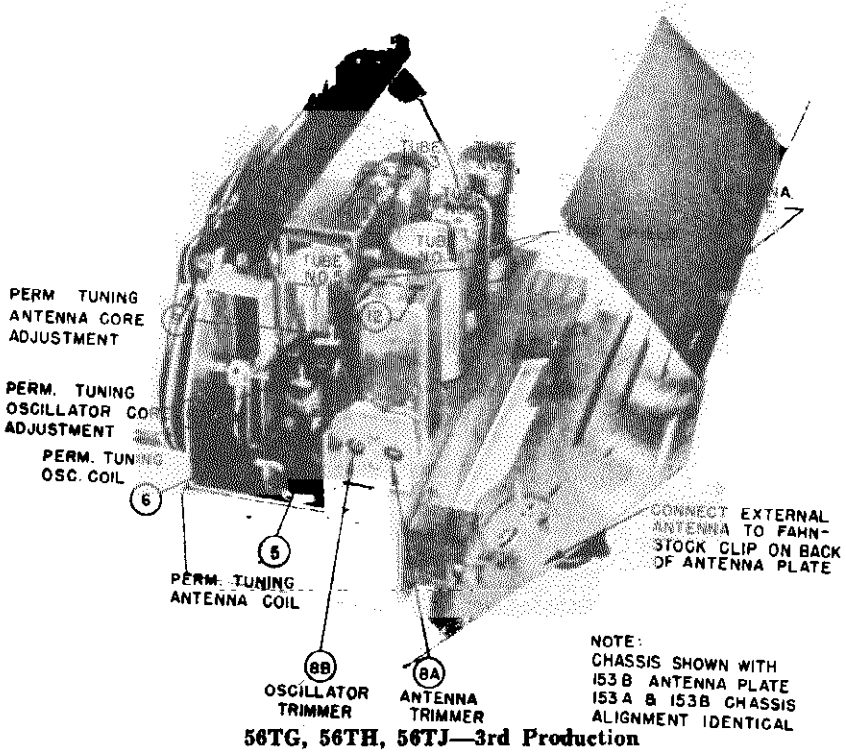
MODELS 56TG,56TH,56TJ
1st, 2nd Production
3rd Production

THE CROSLEY CORP.
CHASSIS SIDE VIEWS



56TG, 56TH, 56TJ—1st and 2nd Production

*The second production models do not have an Oscillator Shunt Core. The alignment procedure is identical to the 3rd production procedure.



56TG, 56TH, 56TJ—3rd Production

The tube numbers 1, 2, 3, 4, 5, which are not circled in the above charts, correspond to the tube numbers in the first column of the TUBE COMPLEMENT COMPARISON CHART shown on page 1.

When using direct current it may be necessary to reverse the position of the power plug in the electric outlet for correct polarity.

Reversing the position of the power plug when alternating current is used may reduce power hum.

Under no circumstances should a ground be connected to the receiver.

ALIGNMENT PROCEDURE
(1st Production Models)

1. With the tuning knob turned to the extreme right against the stop, set the dial pointer to the last reference line at the 540 kilocycle end of the dial.
2. Connect the output of a signal generator directly to the receiver antenna clip. Connect the ground of the signal generator through a .01 mfd. condenser to the receiver chassis.
3. Connect the output meter across the speaker voice coil.
4. Turn the volume control on full and adjust the signal generator output to produce approximately mid-scale deflection of the output meter, but maintain signal generator output as low as possible to prevent AVC action in the receiver.
5. Set the signal generator to 455 Kc. Set the receiver dial pointer against the stop at 1600 Kc. end of the dial. Adjust the 2nd I.F. trimmers (13) and the 1st I.F. trimmers (12), for maximum output. (See CHASSIS SIDE VIEW at top of P.15-34 for adjustment locations.)
6. Open oscillator trimmer (8B) approximately one-half turn from the closed position. Adjust oscillator shunt core (11) to its extreme outer position.
7. Set the dial pointer against the stop at the low frequency (540 Kc.) end of the dial. Tune the signal generator until the signal is heard in speaker of the receiver. The frequency of this signal from the signal generator should be between 500 Kc. and 800 Kc.

   NOTE: Check to make sure the circuit is aligned at the correct frequency and not the image frequency which is a weaker signal, 910 Kc. higher as indicated by the receiver dial.
8. With the dial pointer set against the stop at the 540 Kc. end of the dial, adjust the oscillator iron core (10) to its minimum frequency.
9. Set the signal generator to 535 Kc. and adjust the oscillator shunt core (11) for maximum output.
10. Set the dial pointer against the stop at the high frequency (1600 Kc.) end of dial. Set the signal generator to 1620 Kc. and adjust the oscillator trimmer (8B), for maximum output.

    NOTE: Repeat steps 9 and 10 until correct dial calibration is obtained.
11. Tune both the receiver and the signal generator to 1400 Kc. Adjust the antenna trimmer (8A) for maximum output.
12. Tune both the receiver and the signal generator to 600. Kc. Adjust the antenna trimmer (8A) for maximum output.

    NOTE: If it is necessary to adjust trimmer (8A) closer together, the antenna inductance change is too small and must be increased by adjusting the antenna core (9), farther out of the antenna coil.

    If it is necessary to adjust trimmer (8A) farther apart, the antenna inductance change is too great and must be reduced by adjusting the antenna core (9), farther into the antenna coil.
13. Repeat steps 11 and 12 until (8A) is properly adjusted for maximum output at 600 Kc., as it is at 1400 Kc.

ALIGNMENT PROCEDURE
(2nd and 3rd Production Models)

1. With the tuning knob turned to the extreme right against the stop, set the dial pointer to the last reference line at the 540 Kc. end of the dial.
2. Connect the output of a signal generator directly to the receiver antenna clip. Connect the ground of the signal generator through a .01 mfd. condenser to the receiver chassis.
3. Connect the output meter across the speaker voice coil.
4. Turn the volume control on full and adjust the signal generator output to produce approximately mid-scale deflection of the output meter, but maintain signal generator output as low as possible to prevent AVC action in the receiver.
5. Set the signal generator to 455 Kc. Set the receiver dial pointer against the stop at the high frequency (1600 Kc.) end of the dial. Adjust the 2nd I.F. trimmers (13) and the 1st I.F. trimmers (12) for maximum output. (See CHASSIS SIDE VIEW at bottom of P.15-34 for adjustment locations.)
6. Set the dial pointer against the stop at the low frequency (540 Kc.) end of the dial. Preset the antenna tuning core (9) and the oscillator tuning core (10) so that the top of each core is approximately 1/16-inch below the upper edge of the coil form.
7. Set the signal generator to 535 Kc. and with the dial pointer against the stop at the 540 Kc. end of dial, adjust the oscillator trimmer (8B) for maximum output.
8. Set the signal generator to 1620 Kc. Set the dial pointer against the stop at the high frequency (1600 Kc.) end of the dial. Adjust the oscillator tuning core (10) for maximum output.

   NOTE: Repeat steps 7 and 8 until the correct dial calibration is obtained.
9. Tune both the signal generator and the receiver to 600 Kc. and adjust the antenna trimmer (8A) for maximum output.
10. Tune both the signal generator and the receiver to 1400 Kc. and adjust the antenna tuning core (9) for maximum output.

    NOTE: Repeat steps 9 and 10 until the antenna trimmer (8A) is properly adjusted for maximum output at 1400 Kc. as it is at 600 Kc.

    When the receiver is to be used without an external antenna, disconnect the signal generator output from the receiver. Tune in a weak signal between 1400 Kc. and 1000 Kc. and adjust the antenna trimmer (8A) for maximum output.

Line Cord 560 ohm for 220-volt operation.

TECHNICAL DATA

Tuning range	540 to 1700 Kc.
Intermediate frequency	456 Kc.
Power consumption	35 watts
Sensitivity (for 0.05 watt output)	15 microvolts average
Power output (in voice coil)	
Undistorted	0.8 watts
Maximum	1.0 watts
Voice coil impedance	3.2 ohms

ALIGNMENT PROCEDURE

No aligning adjustments should be attempted until all other possible causes of trouble have been checked.

Turn volume control to maximum for all adjustments.

Keep signal generator output low as possible.

Connect ground post of signal generator to chassis of radio through an 0.1 mfd. condenser.

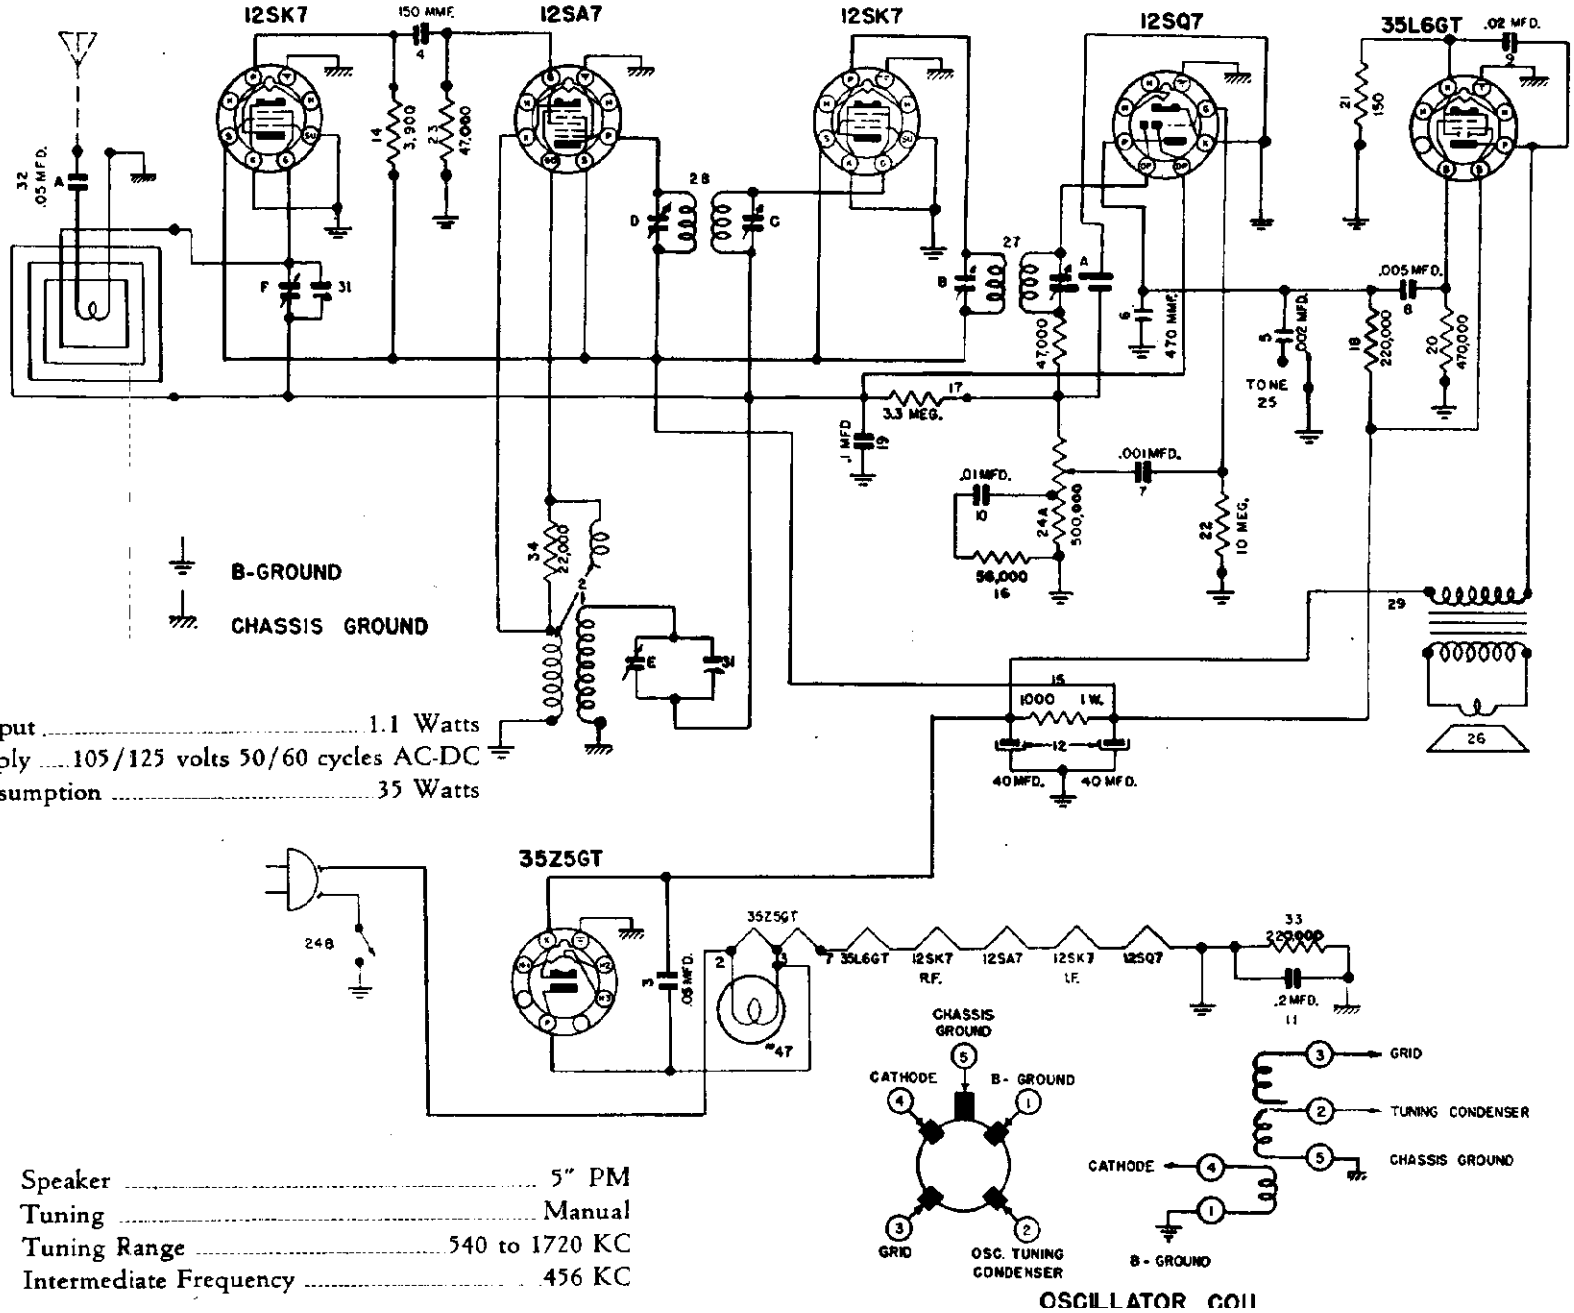
Connect signal generator output leads to antenna leads.

Connect output meter across secondary of output transformers.

Band	Signal Generator Frequency Setting	Dummy Antenna	Connection to Radio	Tuning Condenser Setting	Adjust for Maximum Output
I.F.	456 Kc.	0.1 mfd.	Grid of 14Q7	Slugs out of coil 1700 Kc.	4 trimmers on input and output transformers
Broadcast	1700 Kc.	Antenna lead		Slugs out of coil 1700 Kc.	Osc. slugs, L2, L1, and C6
Broadcast	600 Kc.	Antenna lead		Slugs in coil 600 Kc.	L3
Broadcast	1400 Kc.	Antenna lead		Set dial at 1400 Kc.	C3

FINAL ADJUSTMENT

With the top off the radio, place the band around the set and connect antenna lead to the band and adjust C-3 for greatest noise level at 800 Kc.



Power Output ..... 1.1 Watts
Power Supply ..... 105/125 volts 50/60 cycles AC-DC
Power Consumption ..... 35 Watts

Speaker ..... 5" PM
Tuning ..... Manual
Tuning Range ..... 540 to 1720 KC

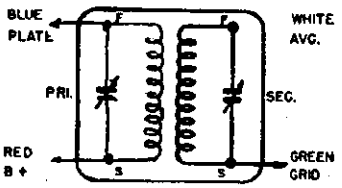
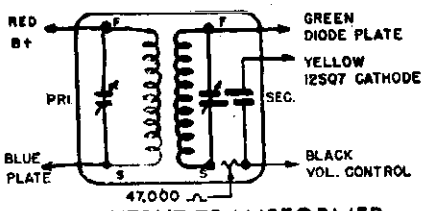
PARTS LAYOUT — CHASSIS VIEW

COIL CONNECTIONS

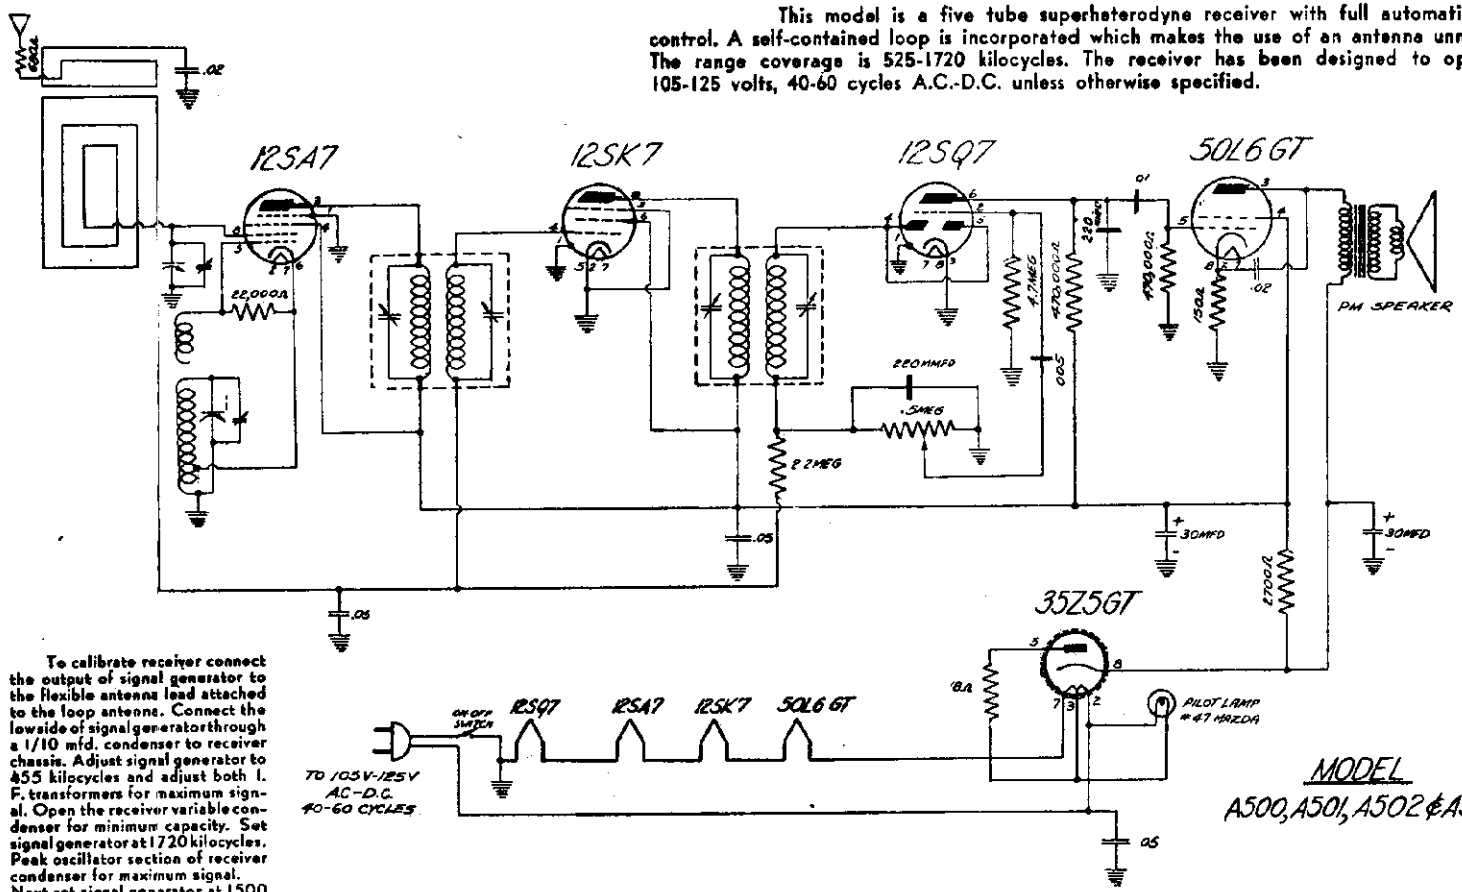


I. F. INPUT TRANSFORMER



I. F. OUTPUT TRANSFORMER

This model is a five tube superheterodyne receiver with full automatic volume control. A self-contained loop is incorporated which makes the use of an antenna unnecessary. The range coverage is 525-1720 kilocycles. The receiver has been designed to operate at 105-125 volts, 40-60 cycles A.C.-D.C. unless otherwise specified.



MODEL
A500, A501, A502 & A503

To calibrate receiver connect the output of signal generator to the flexible antenna lead attached to the loop antenna. Connect the low side of signal generator through a 1/10 mfd. condenser to receiver chassis. Adjust signal generator to 455 kilocycles and adjust both I. F. transformers for maximum signal. Open the receiver variable condenser for minimum capacity. Set signal generator at 1720 kilocycles. Peak oscillator section of receiver condenser for maximum signal.
Next set signal generator at 1500 kilocycles. Tune in this signal. Adjust R. F. section of receiver variable condenser for maximum signal strength. Keep the signal generator output as low as possible when making all of these measurements.

IF PEAK 455 KC

ALIGNMENT INSTRUCTIONS

Connect signal generator to flexible antenna lead attached to the loop antenna; connect low side of signal generator through 0.1-mf condenser to receiver chassis. Open wavetrap condenser. Set signal generator to 455 kc; adjust both i-f transformers for maximum signal. Repeak wavetrap condenser for minimum 455-kc signal. Open receiver variable condenser for minimum capacity. Set signal generator to 1720 kc. Peak oscillator section of variable condenser for maximum signal. Set Signal Generator to 1500 kc; tune in this signal. Adjust r-f section of receiver variable condenser for maximum signal strength. Keep signal generator output to minimum.

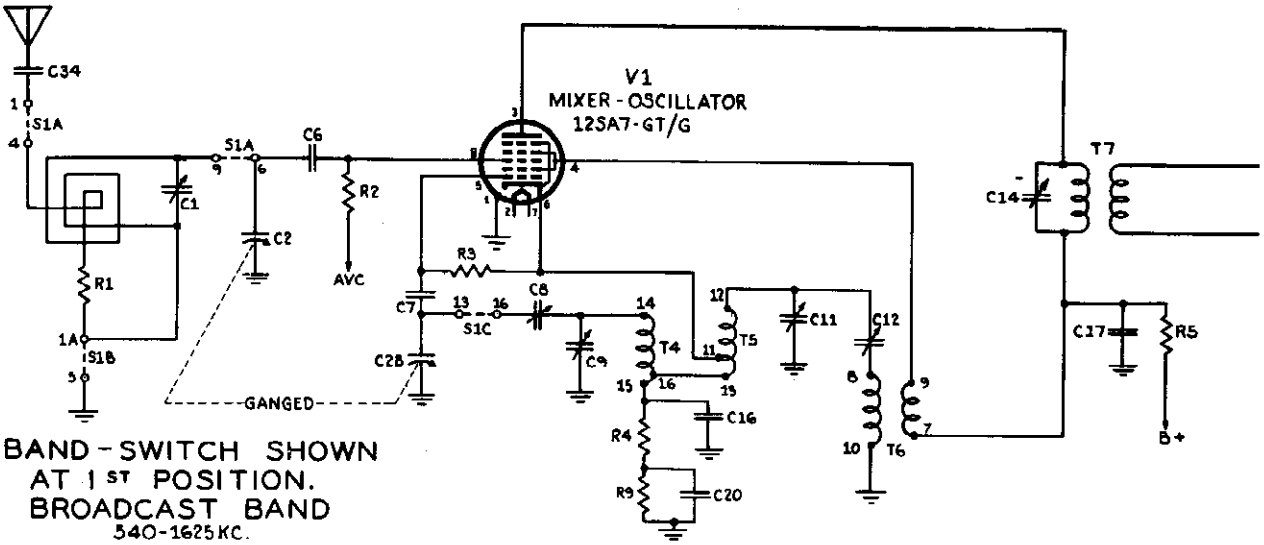
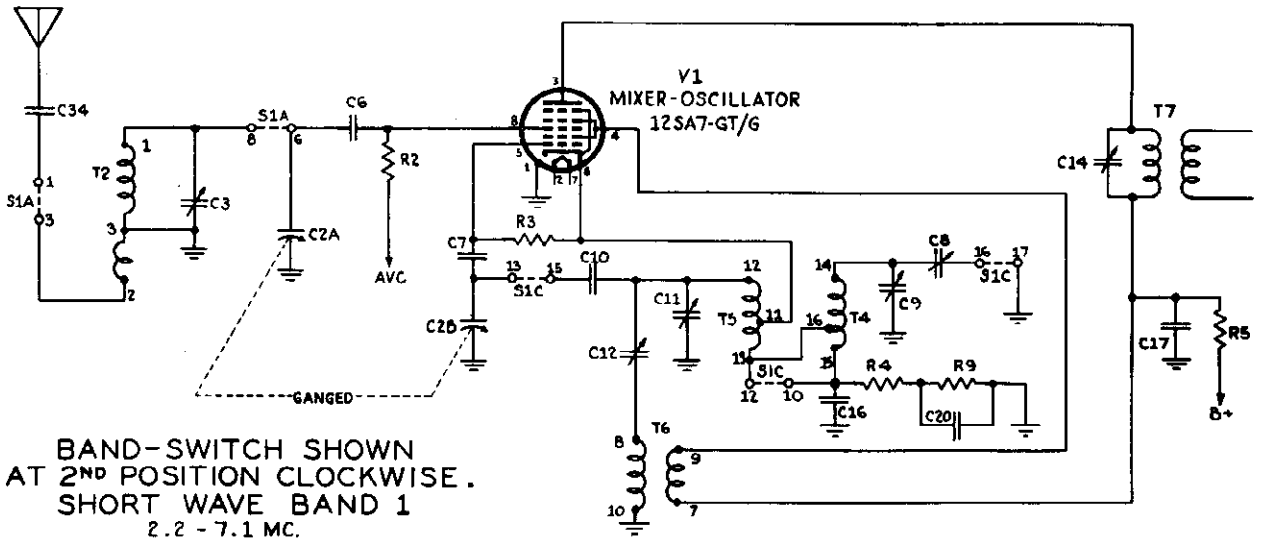
MODELS EC-112, EC-113

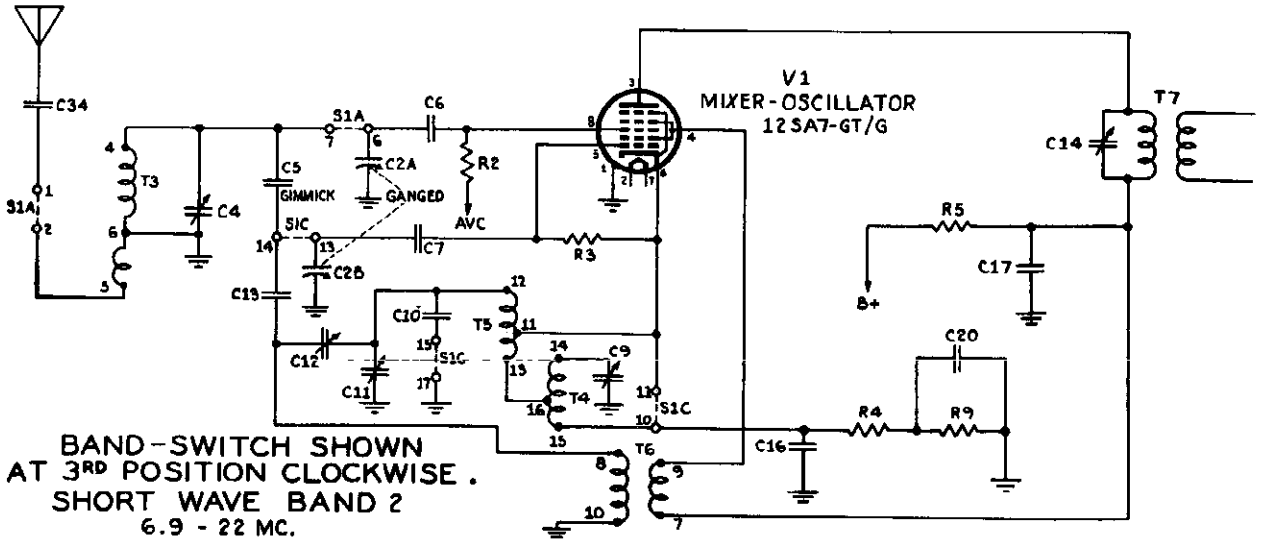
ECHOPHONE RADIO
HALLICRAFTERS PRODUCT



BAND - SWITCH SHOWN AT 1 ST POSITION. BROADCAST BAND
540-1625 KC.



BAND - SWITCH SHOWN AT 2ND POSITION CLOCKWISE. SHORT WAVE BAND 1
2.2 - 7.1 MC.



BAND - SWITCH SHOWN AT 3RD POSITION CLOCKWISE. SHORT WAVE BAND 2
6.9 - 22 MC.

EQUIPMENT:

1. Signal Generator capable of ranges indicated in the ALIGNMENT CHART, including a 400 cycle audio modulator.
2. Output meter capable of handling 1 watt of audio power.
3. Standard RMA dummy antenna consisting of a 200 mmf condenser in series with a 20uh r-f choke, the choke being shunted by a 400 mmf condenser in series with a 400 ohm carbon resistor.
4. Non-metal screw-driver.

CONNECTIONS: Connect the Sig. Gen. "cold" lead to "G" on the antenna terminal strip except for i-f adjustments (see chart below); the "hot" lead is connected as indicated in the chart.

Connect the output meter across voice coil of the speaker and adjust the meter for 3 ohm impedance.

Caution: Set the meter at a sufficiently high range to prevent possible damage from overload. Band 3 must be aligned before band 2 in all instances.

CONTROL SETTINGS: After allowing about a ten minute warm up period, set the receiver's control as follows:

VOLUME control at full clockwise.

BANDSPREAD tuning control at "0", (min. cap.).

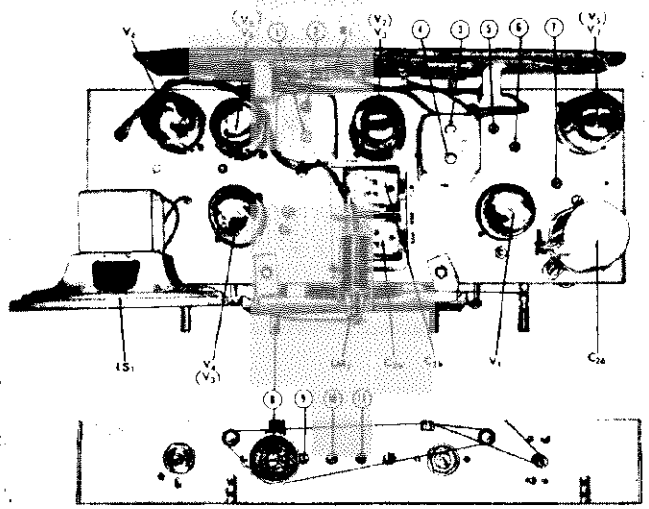


Fig. 6. Top and front views of the receiver showing tube locations and location of padder, trimmer and i-f adjustment points.

NOTE: Bandspread indicator MUST be at ZERO when making all adj. Band 2 osc. trim. (9) must be set AFTER bandspread trim. (8) (Range 3 osc. trim.) is aligned. *Standard RMA dummy ant. consists of a 200mmf cond. in series with a 20uh r-f choke, the choke being shunted by a 400mmf cond. in series with a 400 ohm carbon res. **Connect Sig. Gen. ground lead to receiver negative return, not to chassis. This applies only to I-F adjustment.

455kc	8.5kc wide at 6db down 16kc wide at 20db down 32kc wide at 40db down (for 500 milliwatt output)	65:1 at 1000kc (loop) 20:1 at 2.5mc (ant.) 8:1 at 7.0mc (ant.) 6:1 at 15.0mc (ant.) 3:1 at 20.0mc (ant.)	45 microvolt at 1000 kc 80 microvolt at 2.5 mc 35 microvolt at 6mc 140 microvolt at 8mc 50 microvolt at 20mc	0.8 watt with less than 10% distortion

*Readings for 500 milliwatt constant output. Speaker disconnected and replaced with a 3.2 ohm load resistor. Signal from generator modulated 30% at 400 cycles.

To restring the main tuning dial cord, cut a 25" length of 18 lb test dial cord and tie one end to the tension spring of the main tuning capacitor drive pulley at position "A" on the diagram. Following the letters "A" through "S", wind the cord on the pulley and knob drive shaft. At position "S", stretch the tension spring and tie the cord securely. Cut off the excess cord. Note that three turns are wound on the knob drive shaft.

To restring the bandspread tuning dial cord, cut a 30" length of the dial cord and follow the procedure as explained above, except start at position "1" on the diagram and proceed through position "14". Then turn knob pulley maximum clockwise, slide pointer to 100 and insert cord in clip on pointer. Note that the knob pulley has two turns.

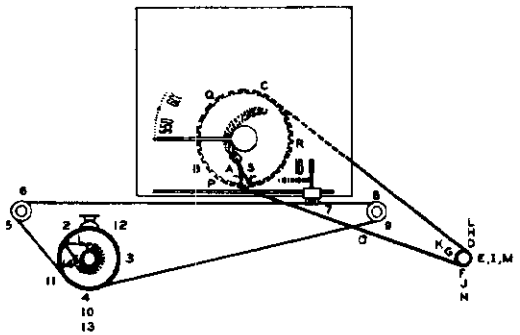

Fig. 3. Dial cable stringing procedure; main tuning is indicated by letters, and band spread tuning is indicated by numbers.

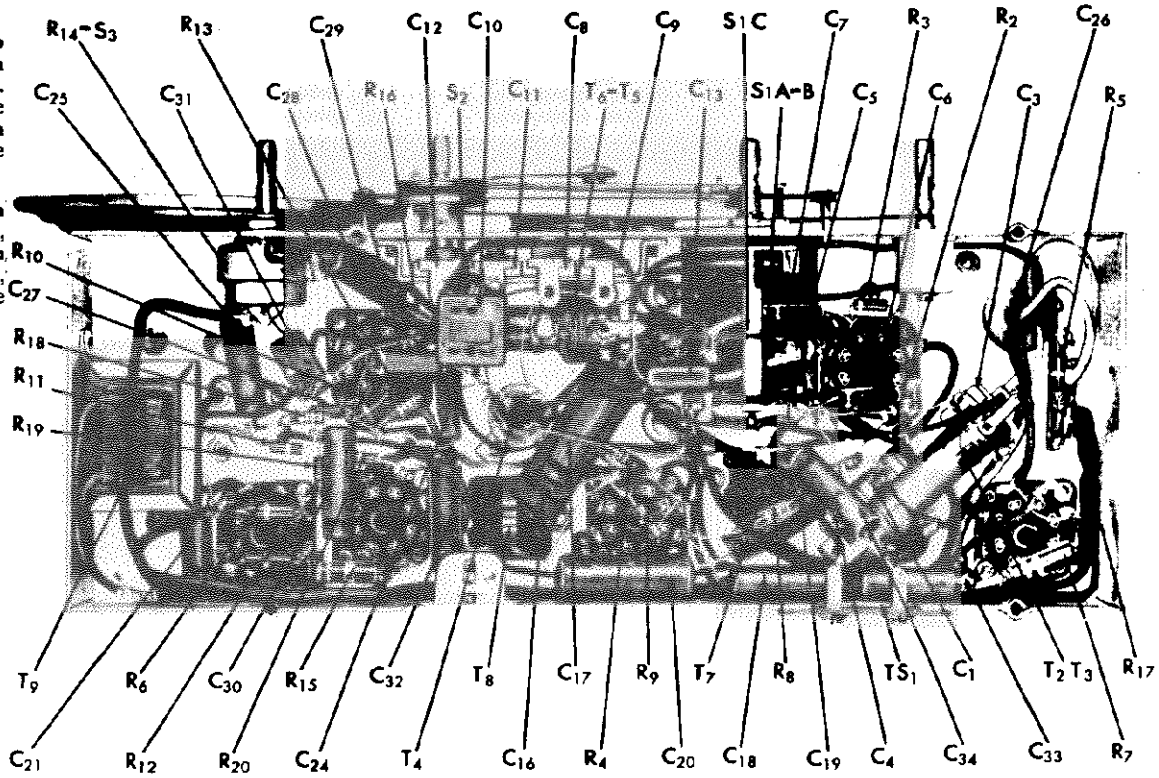

Model EC-112 and EC-113 bottom view of chassis showing location of component parts.

4	Knob; wood	15B075-4	.10
1	Dial escutcheon; brass	7C027	.73
1	Cabinet back; cardboard	32C339	.10

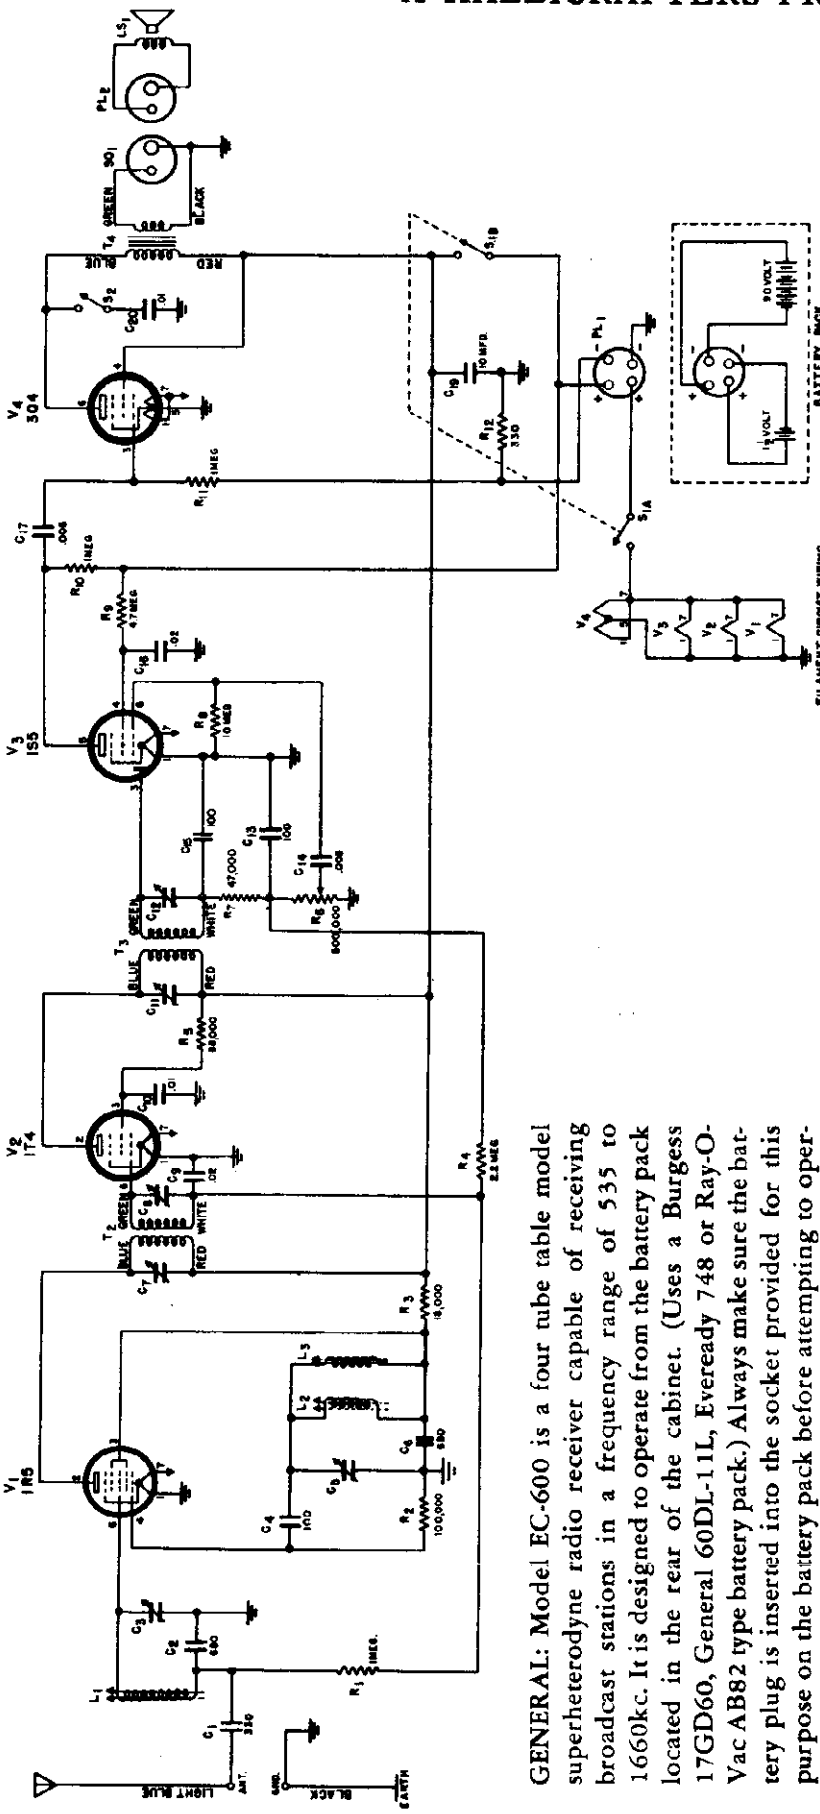
* Prices available on request.
When ordering, please specify Model number of receiver and part number of item.
NOTE: All prices subject to change without notice.

POWER SUPPLY DATA: Both receiver models are designed to operate from a line voltage of 105 to 125 volts AC/DC with a power drain of 30 watts nominal. Power to the receivers is supplied through the line cord extending from the rear of the cabinets.

TUBE TYPES AND FUNCTIONS: 12SA7GT/G-mixer-oscillator; 2-12SK7GT/G's as I-F amplifiers; 12SQ7GT/G-Detector, AVC and First audio amplifier; 35L6GT/G-Audio power amplifier; 35Z5GT/G-Power rectifier for a-c operation.

MODEL EC-600

ECHOPHONE RADIO
A HALLICRAFTERS PRODUCT



GENERAL: Model EC-600 is a four tube table model supertheterodyne radio receiver capable of receiving broadcast stations in a frequency range of 535 to 1660kc. It is designed to operate from the battery pack located in the rear of the cabinet. (Uses a Burgess 17GD60, General 60DL-11L, Eveready 748 or Ray-O-Vac AB82 type battery pack.) Always make sure the battery plug is inserted into the socket provided for this purpose on the battery pack before attempting to operate the receiver. The filament current drain is 0.25 amp.; B plus drain is 14 ma. Leads are provided at rear of chassis for connection to an external antenna and ground. Note that the loudspeaker is connected to the receiver through the plug on the rear of the chassis. Always make sure the speaker is plugged in before turning the set on.

TUBES, TYPES and FUNCTIONS:
Type 1R5-mixer/oscillator
Type 1T4- IF amplifier
Type 1S5- detector, AVC, audio amplifier
Type 3Q4- audio power amp.

DETAILED SERVICE INFORMATION

IF FREQUENCY	RECEIVER OVERALL SELECTIVITY	IMAGE RATIO	RECEIVER OVERALL SENSITIVITY	AUDIO OUTPUT
455 kc	6 kc wide at 6 db down 13 kc wide at 20 db down 41 kc wide at 60 db down (1000 kc input to the antenna; output constant)	83:1 at 1000 kc	50 microvolt at 1000 kc for 0.05 watt output	0.15 watt with less than 10% distortion. Audio section bandpass: 45 to 10,000 C.P.S.

EQUIPMENT:

1. Signal generator capable of the ranges indicated on the alignment chart, including a 400 cycle audio modulator.
2. Output meter capable of handling 1.5 watts of audio power.
3. *Standard RMA dummy antenna.
4. Non-metallic screw driver.

*Standard RMA dummy antenna consists of a 200 mmf condenser in series with a 20uh r-f choke which is shunted by a 400mmf condenser in series with a 400 ohm carbon resistor.

CONNECTIONS: Connect the signal generator "cold" lead to the receiver chassis, the "hot" lead as indicated in the chart.

Connect the output meter across the speaker voice coil.

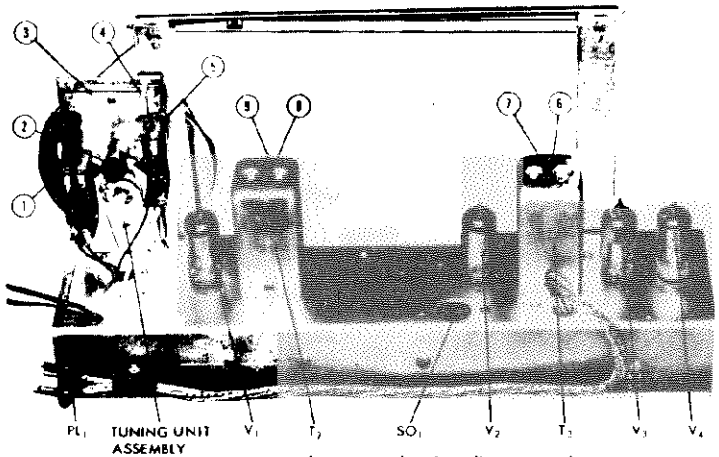


Fig. 6. Top view of receiver showing alignment points.

CONTROL SETTINGS: After allowing about a ten minute warm up period, set the receiver controls as follows: Volume control—maximum clockwise; tuning control is set as indicated in the chart.

ALIGNMENT CHART

NOTE: Repeat adjustments 4 through 7 as often as necessary, in order listed. Do NOT change the position of the OSCILLATOR coil (ref. 1 on Fig. 2). Adjusting the ANTENNA coil location is sufficient.

* Rotate the tuning control when making this adjustment.

MODEL EC-600

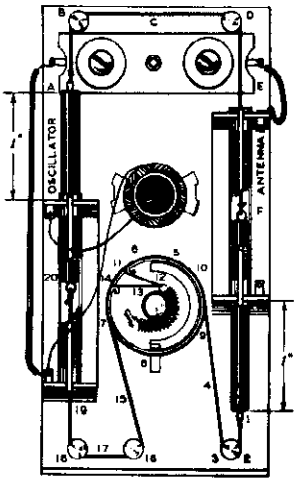
ECHOPHONE RADIO
A HALLICRAFTERS PRODUCT

HOW TO RESTRING TUNING ASSEMBLY DRIVE CORDS

Cut a 6" length of 18 lb. test dial cord and tie one end to osc. coil slug eye at point "A" as shown in diagram. Following letters "A" through "F" tie other end to antenna coil slug at point "F". When complete, be sure slugs take the position shown in diagram. Cut off excess cord.

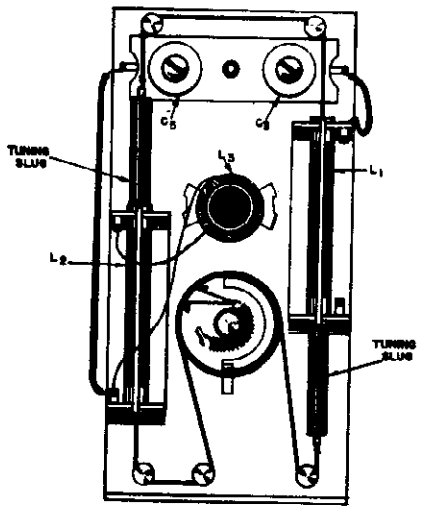
To restring cord at other end of slugs, cut a 9" length of 18 lb. test dial cord and tie one end to slug eye at position "1" as shown on diagram. Following the numbers "1" through "20" bring cord under post, around pulley, through slot to tension spring, back out through slot, then under the two posts to slug eye on oscillator coil slug at position "20." Pull on cord so as to put tension on spring and tie securely. Cut off excess cord.

Receiver calibration will depend on relative position of slugs in coils. Slugs must be in position as shown on drawing.

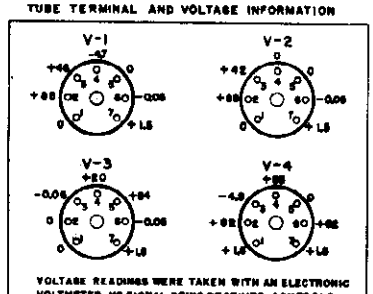


NOTE: TUNING SLUGS FOR L_1 AND L_2 ARE MECHANICALLY GANGED

PICTORIAL VIEW OF TUNING UNIT



TUBE TERMINAL AND VOLTAGE INFORMATION



VOLTAGE READINGS WERE TAKEN WITH AN ELECTRONIC VOLTMETER, NO SIGNAL BEING RECEIVED, CONTROLS SET AS FOLLOWS.

BATTERY SWITCH —— CLOCKWISE (ON)
VOLUME CONTROL —— (MIN) COUNTER CLOCKWISE
TONE —— COUNTER CLOCKWISE ("NORMAL")
TUNING —— SET AT 1000KC ON TUNING DIAL

ALL VOLTAGES ARE POSITIVE D.C. UNLESS OTHERWISE SPECIFIED.

NEG. METER LEAD TO CHASSIS; POS. METER LEAD TO EVERY TERMINAL OF EACH TUBE.

NOTE

RESISTANCE VALUES ARE IN OHMS, MEGA
CAPACITOR VALUES ARE IN MMF, PAPER
CAPACITOR VALUES ARE IN DECIMAL EQUIVALENTS OF MFD. ELECTROLYTIC CAPACITOR VALUES ARE IN MFD.

DENOTES MECHANICAL GANGING.

HOW TO RESTRING DIAL CORD

To restring the main dial cord, cut a 35" length of 18 lb. test dial cord and tie one end to the tension spring of the main tuning dial drive pulley at position "1" on the diagram. Following the numbers 1 through 28, wind the cord on the pulley, knob drive shaft and two pointer drive pulleys. At position "28" stretch the tension spring and tie the cord securely. Cut off the excess cord. Note that four complete turns are wound on the knob drive shaft.

ALIGNMENT PROCEDURE

The following equipment is necessary to properly align this chassis:

1. A signal generator which will provide an accurately calibrated signal at the frequencies listed.
2. An output meter.
3. A non-metallic screwdriver.
4. Any loop similar to the one used in the receiver.

PROCEDURE

1. Mount the loop in a vertical position on a block of wood so that it may be coupled parallel to the set loop.
2. Connect the loop to the output terminals of the signal generator.

INPUT SIGNAL	DISTANCE BETWEEN GEN. AND SET LOOP	SET DIAL AT	TRIMMERS	PURPOSE
455 kc.	Close	HF end	1 2 3 4	Align IF
1720 kc.	Close	HF end	5	Set limit of band
1400 kc.	1½'	1400 kc.	6	Align antenna

In order to make a proper alignment, the following equipment is required:

1. A signal generator capable of providing a modulated radio frequency output over the frequencies required.
2. A suitable output meter or sensitive AC voltmeter with a .1 mfd series blocking condenser.
3. A coupling loop, made of three turns of stiff hookup wire, 4 inches in diameter, mounted on a suitable block of wood or stand.
4. A non-metallic screwdriver.

With the receiver on and the volume control at maximum, connect the signal generator to the coupling loop and bring the loop close to the receiver chassis. Adjust the signal generator output to minimum necessary to give a suitable indication on the output meter, which should be connected from B minus to the plate of one output tube. CAUTION: Make sure the output meter is isolated from DC by a series blocking condenser.

ELECTRONIC CORP. OF AMERICA

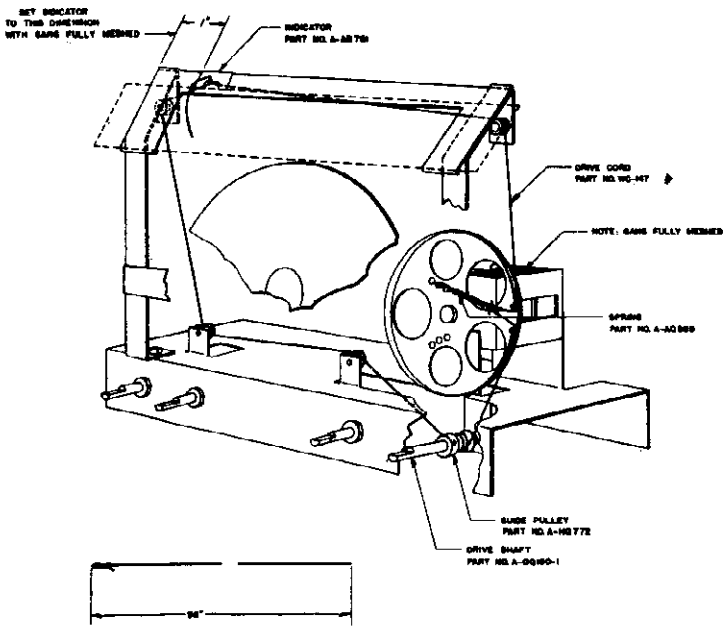
Replacement of Dial Drive Cord

Completely remove remainder of defective dial cord. Inspect all pulleys and make sure they revolve freely. Determine that no grease or oil is present on any pulley surface. Attach the cord spring, part #A-AQ589, to one end of the drive cord. Fully mesh the gang condenser and hook the spring to the hole closest to the cord cutout on the dial drum. Proceed to string dial cord in accordance with the detail drawing. Take two full turns around the drive drum, part #A-HQ772. Pull the cord snug at this point. Wrap one complete turn around gang drum and pull cord snug. Securely tie free end of cord to the cord spring. Next, adjust spring tension by moving the hook end of the spring into the next spring hole.

Clip the pointer on to the dial cord with sufficient tension so as to prevent slippage and adjust pointer position, so that with fully meshed gang, the left edge of the pointer saddle is one inch from the edge of the dial support frame. Insert chassis in cabinet and check pointer and scale agreement. Then make final adjustment of pointer position. Remove the chassis and firmly crimp the pointer prongs on the dial cord, and secure with a small drop of speaker cement.



Replacement of Audio Output Transformers

When replacing the audio output transformer, original lead dress must be maintained. If either primary or secondary windings are reversed, the set will have a a severe audio oscillation, due to the inverse feedback network.

Replacement of I.F. Transformers

When replacing intermediate frequency transformers, either input or output, use caution to observe original lead dress.

Note: All items followed by an asterisk (*) will be stocked by the Electronic Corporation of America. All unmarked items may be replaced by any high quality component of equal electrical value.

All DC voltage measurements in this Service Bulletin have been made with a 20,000 ohms per volt voltmeter, using B minus as a common reference point. All AC voltage measurements are with 1000 ohms per volt voltmeter. Line voltage was maintained at 117 volts for all voltage measurements. The condenser gang should be fully meshed and the volume control at its minimum point. Voltages may vary ±10% from the indicated nominal value.

Measurements of oscillator grid bias voltage should be made with a 50,000 ohm resistor in series with the negative probe of the meter, and the positive prod connected to B minus. Rotate the tuning condenser throughout its complete range with the meter connected. Absence of bias voltage at any point is an indication that the oscillator is not functioning.

MODEL 2701

ELECTRONIC LABORATORIES, INC.

ALIGNMENT PROCEDURE

Volume Control-Maximum All Adjustments.

Allow Chassis and Signal Generator to "Heat Up" for several minutes.

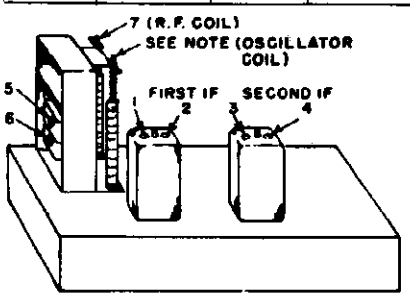
The equipment in column at right is required for Aligning:

Signal Generator which will provide an accurately calibrated signal at test frequencies as listed.

Output Indicating Meter; Non-Metallic Screwdriver.

Dummy Antennas-.01 mf., and 400 ohms.

SIGNAL GENERATOR FREQUENCY SETTING	ANTENNA CONNECTION	COUPLING	DUMMY ANTENNA	TUNER SETTING	TRIMMER ADJUSTMENT (SEE DIAGRAM)	NOTES
I.F. 455 KC	Grid of RF tube 12SK7	Ground generator to chassis	0.01 mfd	Out	Adjust for Max. 1, 2, 3 and 4	No signal will be heard unless trimmer condenser under chassis is unscrewed and reduced from original setting
I.F. 455 KC	Grid of RF tube 12SK7	Ground generator to chassis	0.01 mfd	Out	Trim condenser under chassis for Min. output.	If it is found that regeneration prevails when the loop antenna is put in its normal position close to the tubes, then the under chassis trimmer is incorrectly set, and should be adjusted to prevent the regenerative condition.
1620 KC	Inductive Coupling to Loop	Loop coupling with leads brought out	400 ohms in series with Antenna & Gnd.leads	Out	Adjust Osc. #5 per Max. signal	
1400 KC	Inductive Coupling to Loop	Loop coupling with leads brought out	400 ohms in series with Antenna & Gnd.leads	Dial set for 1400KC	Adjust RF trimmer #6 per Max. Signal.	
700 KC	Inductive Coupling to Loop	Loop Coupling with leads brought out	400 ohms in series with Antenna & Gnd.leads	Dial set for 700KC	Adjust RF tuning core #7 for Max. (care should be taken not to disturb carriage position of tuner)	



ALIGNMENT NOTES

A. MECHANICAL ALIGNMENT:- The following mechanical adjustments should be made before alignment:

1. Rotate shaft of tuning unit until carriage is against top stop position.
2. Space oscillator coil slug 1-5/32" out from top of oscillator coil form.
3. Space R.F. coil slug 1-29/64" out from top end of R.F.coil winding. (Note:-The distance 1 and 2 should be measured from mounted end of the slug)
4. Adjust screw on trimmer of wave trap towards open position so that condenser plates are open at least 1/32".

B. I.F. ALIGNMENT PROCEDURE

1. Feed I.F. frequency from the signal generator through a 0.01 mfd condenser to the control grid of the R. F. tube.
2. No signal will be heard unless trimmer condenser under chassis is unscrewed and reduced from original setting.
3. Turn volume control full on.
4. Make preliminary I.F.adjustment with signal level approximately 50 Mv.
5. Tune I.F. trimmers for maximum signal, reducing I.F. signal input to coupling loop to keep output voltage less than 0.5 V.
6. When maximum output has been secured, adjust trimmer condenser in the I.F. trap (under chassis) by turning clockwise to the minimum signal.

C. R.F. ALIGNMENT PROCEDURE

1. Volume control full on.
2. Adjust tuning unit to top stop position.
3. Feed 1620 kc signal into external loop. Hold audio output below 0.5 V. Adjust the oscillator trimmer condenser to maximum output.
4. Move slugs in by means of tuning dial so that pointer is approximately 1" from the stop end, and a signal received from the external loop on a frequency of 1400 kc. Adjust lower trimmer (R.F. trimmer) to maximum output. Reduce R.F.input to keep signal output voltage below 0.5 V.
5. Rotate tuning shaft until pointer is approximately 1" from the other end of the scale. Feed to the external loop a test signal at 700 kc. Adjust the R. F. coil slug by rotation to maximum output.

D

1. Alternately adjust R.F. trimmers at 1400 kc. and R.F. slug at 700 Kc. until maximum sensitivity is attained at both frequencies.

E. When set is correctly aligned, the low frequency end of the tuning range should fall at 540 Kc.

CAUTION: Extreme care should be taken in the 700 kc. position to make sure that the tuner carriage is not moved by the adjusting tools or hand pressure on the slug screw. Carriage should not be held against the frame, but should be allowed to assume its normal position when adjusting the R.F. coil slug.

DRIVE CORD REPLACEMENT

Turn the tuner to the fully open position. Use a new cord 50" long and tie one end to the tension spring. Fasten the other end of the tension spring to the drive pulley. Pass cord through slot in pulley ring; add spring tension and continue one and one-half turns counterclockwise over top of pulley Then pass cord around idler pulley A, starting over top and going around clockwise. Pass cord over idler pulley B, starting over top and going around counter clockwise.. Wind one full turn counterclockwise around drive mechanism Then wind one full turn counterclockwise around drive pulley, pass through slot in pulley and tie string to tension spring. Cut off excess string.

Attach dial pointer to cord.

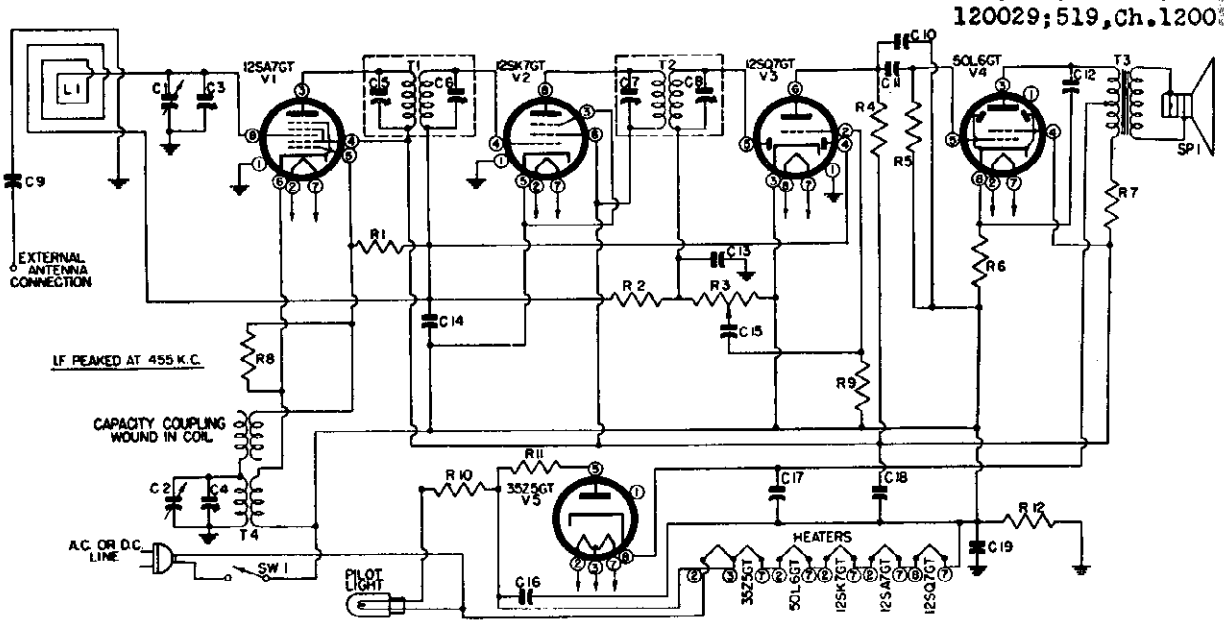
MODELS 501,502,503,504,
510,520,Ch.120,000,
120029;519,Ch.120030



The following voltage readings are d-c measurements taken from B— (line switch) in the indicated tube-socket pin. A 1000 ohms-per-volt meter should be used for all readings except those indicated by an asterisk (*), which should be taken with a d-c vacuum-tube voltmeter. Line voltage for these readings was 117 volts, 60 cycles, a.c. Measurements made with 117 volts d.c. will be lower than those given below. Take readings with the volume control set at minimum and the variable condenser closed.

	PIN NUMBER							
TUBE	1	2	3	4	5	6	7	8
12SA7			89	89	*-10			*-1.6
12SK7				*-1.6		89		89
12SQ7		*-0.7		*-1.6	-0.5	37.5		
50L6GT			110	89				6.2
35Z5GT				116		116		117

An oscillator with frequencies of 455, 600 and 1425 kc is required.

An output meter should be connected across the primary or secondary of the output transformer for observing maximum response.

Always use as weak a test signal as possible when aligning the receiver.

Plug the receiver into the power supply outlet in such a way that the ground side of the power line is connected to the receiver B—.

Location of Coils and Trimmer Adjustments

The first i-f transformer (T1) is mounted on top of the chassis deck to the right of the variable condenser. The trimmers (C5, C6) are accessible through holes in the top of the can.

The second i-f transformer (T2) is mounted on top of the chassis between the variable condenser and the speaker. The trimmers (C7, C8) are accessible through holes in the top of the can.

The trimmer for the antenna (C3) and the trimmer for the oscillator coil (C4) are located on the variable condenser. The trimmer on the front section is for the oscillator coil.

The oscillator coil (T4) is located underneath the chassis. The loop antenna acts as the antenna coil.

FREQUENCY RANGE: 540-1620 kc.

NUMBER OF TUBES: Five.

TYPE OF TUBES:
1—12SA7, pentagrid oscillator-modulator
1—12SK7, first i-f amplifier
1—12SQ7, diode detector, a-f amplifier, a.v.c.
1—50L6GT, beam power output
1—35Z5GT, half-wave rectifier

I-F Alignment

1. Rotate the variable condenser to the minimum capacity position.
2. Feed 455 kc to the converter grid (stator of the r-f section of the variable condenser) and adjust the four i-f trimmers (C5, C6, C7, C8) for maximum response.

R-F Alignment

1. Connect the oscillator to a coil composed of three to four turns of wire wound in a circle approximately 12" in diameter. This coil should be held parallel to and in line with the loop antenna of the receiver at a distance of 15 to 20 inches.
2. Radiate a signal at 1425 kc, set the dial indicator to 1425 kc, and adjust the trimmers on the variable condenser (C3, C4) for maximum response.
3. Radiate a 600 kc signal and tune in the signal on the receiver. Adjust the loose outside turn of the loop antenna for maximum response. This loose turn may be moved to either side of the center. Fasten it in the position which gives maximum response.
4. Repeat steps 2 and 3 until no further improvement is evident.

POWER SUPPLY: A.C. or D.C.

VOLTAGE RATING: 105-125 volts.

POWER CONSUMPTION: 30 watts.

DIAL CORD REPLACEMENT

Draw the cord snugly around the condenser pulley and knot it, with no slack, near the notch in the pulley, after which the spring may be hooked to the cord and pulley.

MODELS 501,502,503,504, 510,520,Ch.120000 and EMERSON RADIO & PHONO. CORP. MODELS 507, 509, 511, 518 120029;519,Ch.120030 Ch.120005,120010,

The color coding of the i-f transformer leads is as follows:
Grid—green Plate—blue
Grid return—black B+—red

All models have self-contained antennas and do not require additional antenna connections. For permanent home installations, however, if it is desired to improve reception of weak stations, an additional outdoor antenna may be used. For this purpose a lead has been brought out of the rear near the line cord.

Models using 120000 chassis use a dial plate on which the frequency is calibrated through 320°. The dial plate on 120029 chassis is calibrated through 180°.

If replacements are made or the wiring disturbed in the r-f section of the circuit, the receiver should be carefully realigned.

In operating the receiver on d.c., it may be necessary to reverse the line plug for correct polarity.

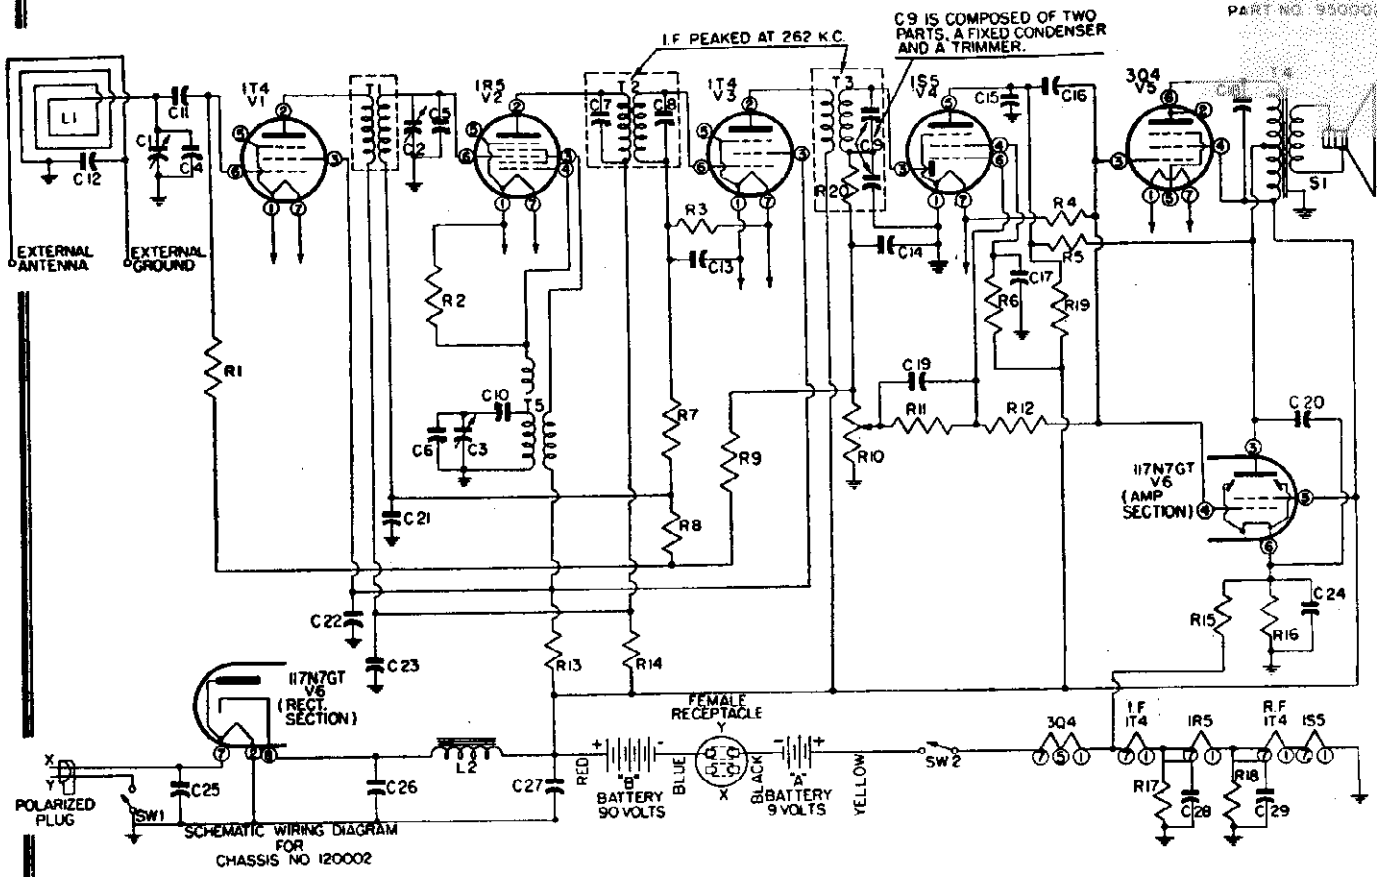
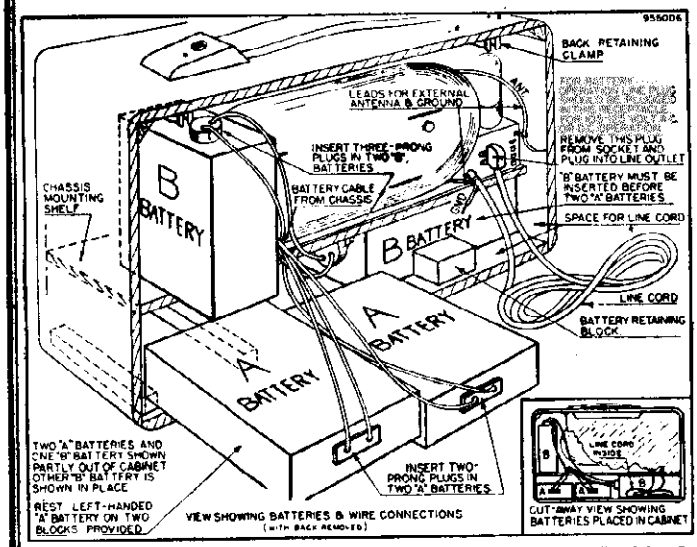
EMERSON RADIO & PHONO. CORP.

MODEL 505, Ch. 120002



Battery Installation



TYPE OF TUBES:

1—1R5, oscillator-modulator

2—1T4, r-f and i-f amplifiers

1—1S5, 2nd detector, a.v.c., a-f amplifier

1—3Q4, beam power output (battery operation)

1—117N7, beam power output and half-wave rectifier (line operation)

POWER SUPPLY: Battery, a.c. or d.c.

VOLTAGE RATING: 105-125 volts a.c.-d.c. (line operation).

POWER CONSUMPTION: 20 watts (line operation).

CURRENT DRAIN:

"A" Battery—0.05 amp.

"B" Battery—0.01 amp.

BATTERY COMPLEMENT

The cabinet is designed to house the complete set of batteries. The battery complement should be as follows:

Battery Type	Number Required	Eveready Part No.	Rayovac Part No.	Burgess Part No.
4½ volt "A"	2	746 (plug-in type)	P83A or EM-83 (plug-in type)	3G (plug-in type)
45 volt "B"	2	482 Minimax (plug-in type)	——	——

MODEL 505, Ch. 120002

	460040	Dial crystal	.75

List price each effective as of January 1, 1946. (Prices subject to change without notice.)

GENERAL NOTES

1. The color coding of the i-f transformer leads is as follows:
   Grid—green Plate—blue
   Grid return—black B+— red
2. The color coding of the battery cable is as follows:
   Red—B+, 90 Volts Yellow—A+, 9 Volts
   Blue—B— Black—A—
3. If replacements are made in the r-f section of the circuit, the receiver should be carefully realigned.
4. A.C.-D.C. Operation: Remove the rear cover; it is held in place by two spring latches. Take out the line cord, removing the plug from its receptacle at the rear of the chassis. Insert the plug in the wall outlet. If the power supply is d.c. and the receiver does not operate at first, remove the plug from the wall outlet, turn it half way around and reinsert it in the outlet, thus obtaining the proper polarity.

An oscillator with frequencies of 262, 600 and 1425 kc is required.

An output meter should be connected across the primary or secondary of the output transformer for observing maximum response.

Always use as weak a test signal as possible, turning down the output of the test oscillator as the alignment of the receiver progresses.

Plug the receiver into the power supply in such a way that the ground side of the power line is connected to the receiver B—.

Location of Coils and Trimmer Adjustments

The oscillator coil (T5) is located beneath the chassis. The trimmer for the oscillator (C6) is on the middle section of the variable condenser.

The interstage coil (T1) is the shielded coil located beneath the chassis. Its trimmer (C5) is on the front section of the variable condenser.

The trimmer for the loop antenna (C4) is on the last section of the variable condenser (the section nearest the loop).

The i-f transformers are mounted on top of the chassis. The first i-f transformer (T2) is mounted next to the loop. The second i-f transformer (T3) is mounted next to the dial.

The series padder (C10) is located on the chassis between the variable condenser and the shielded 1T4 tube.

I-F Alignment

Rotate the variable condenser to the minimum capacity position. Feed 262 kc to the converter grid and adjust the three i-f trimmers for maximum response.

Interstage Alignment

1. Set the dial indicator to 1425 kc, feed 1425 kc to the r-f grid, and adjust the oscillator and interstage trimmers for maximum response.
2. Set the dial indicator to 600 kc, feed 600 kc to the r-f grid, and adjust the oscillator padding trimmer by rocking in the signal for maximum response.
3. Repeat steps 1 and 2 until no further improvement is possible.

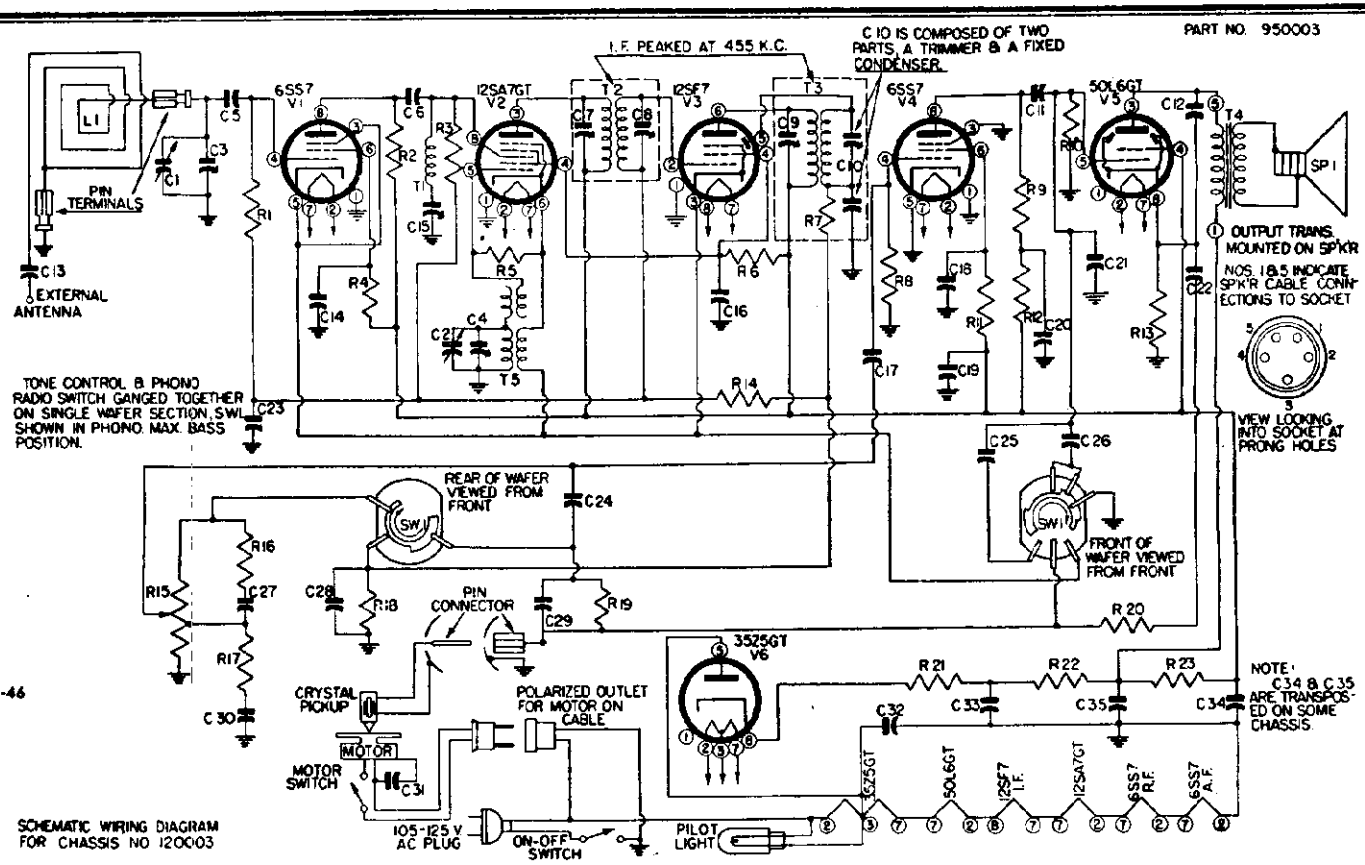
Loop Alignment

Connect the test oscillator to a coil composed of three or four turns of wire wound in a loop approximately 12" in diameter. This coil should be held parallel to and in line with the receiver's loop at a distance of 15 to 20 inches.

1. Radiate a signal at 1425 kc, tune in the signal on the receiver, and adjust the loop trimmer for maximum response.
2. Radiate a signal at 600 kc, tune in the signal on the receiver, and adjust the loose outside turn of the loop antenna for maximum response. This loose turn may be moved to either side of the center. Fasten it in the position which gives maximum response.
3. Repeat steps 1 and 2 until no further improvement is possible.

	PIN NUMBER							
TUBE	1	2	3	4	5	6	7	8
1T4(V1)	1.2	88	56		1.2	*0.3	2.4	
1R5	2.4	88	56	-8	2.4	*1.5	3.7	
1T4(V2)	3.7	98	56		3.7	*2.3	4.9	
1S5	0		*-0.3	*19	*50	*-0.2	1.2	
3Q4	4.9	92	*1.1	98	4.9	92	4.9	
117N7			92	*1.1	98	6.25		125

The following voltage readings are d-c measurements taken with a line voltage of 117 volts, 60 cycles from B— (chassis) to the indicated tube-socket pin. A 1000 ohms-per-volt meter should be used for all readings except those indicated by an asterisk (*), which should be taken with a d-c vacuum-tube voltmeter. Take readings with the volume control set at minimum and the variable condenser closed.



SCHEMATIC WIRING DIAGRAM FOR CHASSIS NO 120003

4-46

The following voltage readings are d-c measurements taken from B— (chassis) to the indicated tube-socket pin. A 1000 ohms-per-volt meter should be used for all readings except those indicated by an asterisk (*), which should be taken with a d-c vacuum-tube voltmeter. Line voltage for these readings was 117 volts, 60 cycles, a.c. Take readings with the volume control set at minimum, the variable condenser closed, and the phonograph-radio switch in the treble radio position.

	PIN NUMBER							
TUBE	1	2	3	4	5	6	7	8
6SS7 (V1)				*-0.9		55		52
12SA7			92	84	*-8.6			*-0.82
12SF7				84		92		
6SS7 (V4)			*	*-7.5		*9		*42
50L6GT			100	93		75		5.6
35Z5GT				115		108		120

The color coding of the i-f transformer leads is as follows:

Grid return—black	Plate—blue
Grid—green	B+—red

2—6SS7, r-f and a-f amplifiers
1—12SA7, pentagrid oscillator-modulator
1—12SF7, diode detector, i-f amplifier, a.v.c.
1—50L6GT, beam power output
1—35Z5GT, half-wave rectifier

POWER SUPPLY: A.C. only, 60 cycles.

VOLTAGE RATING: 105-125 volts.

POWER CONSUMPTION:
30 watts for the receiver.
20 watts for the phono motor.

An oscillator with frequencies of 455, 600, and 1425 kc is required.

An output meter should be connected across the primary or secondary of the output transformer for observing maximum and minimum response, as required.

Always use as weak a test signal as possible, turning down the output of the test oscillator as the alignment of the receiver progresses.

Turn the volume control on full and set the tone control in the most brilliant position.

Location of Coils and Trimmer Adjustments

The first i-f transformer (T2) is mounted on top of the chassis deck next to the 12SA7 tube. The trimmers (C7, C8) are accessible through holes in the top of the can.

The second i-f transformer (T3) is mounted on top of the chassis next to the 50L6 tube. The trimmers (C9, C10) are accessible through holes in the top of the can.

The trimmer (C2) for the oscillator coil (T5) is located on the rear section of the variable condenser.

The antenna trimmer (C3) is mounted on the variable condenser mounting bracket.

The oscillator coil is located underneath the chassis. The loop antenna acts as the antenna coil.

The wave trap (T1) is located on the top deck of the chassis base adjacent to the 12SA7 tube.

I-F Alignment and Wave Trap Alignment

1. Set the variable condenser to the minimum capacity position.
2. Feed 455 kc to the grid (pin 8) of the 12SA7 tube through a 0.01 mfd. condenser and adjust the four i-f trimmers (C7, C8, C9, C10) for maximum response.
3. Feed 455 kc to the external antenna lead and adjust the wave trap (T1, C15) for minimum response.

R-F Alignment

1. Set the variable condenser at maximum capacity and the front edge of the pointer opposite the maximum capacity marker on the lower edge of the dial plate. The markers are small triangular indentations on the front edge. Looking at the front of the set from left to right are calibration points for maximum capacity, 600 kc, 1425 kc, and 1600 kc.
2. Connect the test oscillator to a coil composed of three or four turns of wire wound in a circle approximately 12" in diameter. Place the coil parallel to and in line with the receiver loop at a distance of approximately 15 to 20 inches. During alignment procedure, make sure the relative positions of the receiver and loop are similar to actual operating positions when mounted on the cabinet.
3. Radiate a signal at 1425 kc, set the dial indicator opposite the 1425 kc marker, and adjust both oscillator and antenna trimmers for maximum response.
4. Radiate a 600 kc signal, tune in the signal on the receiver, and adjust the loose outside turn of the loop antenna for maximum response. This loose turn may be moved to either side of the center. Fasten it in the position which gives maximum response.
5. Repeat steps (3) and (4) until no further improvement is possible.

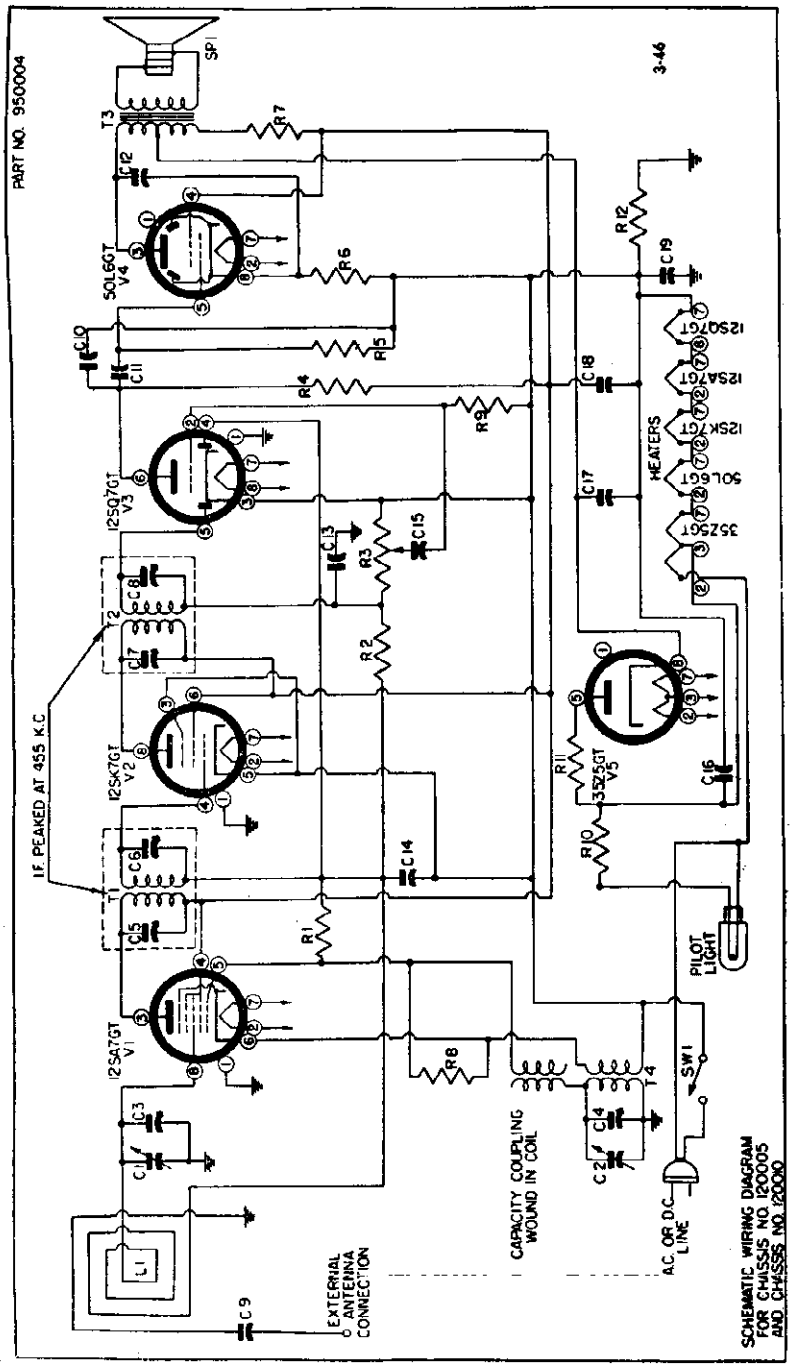
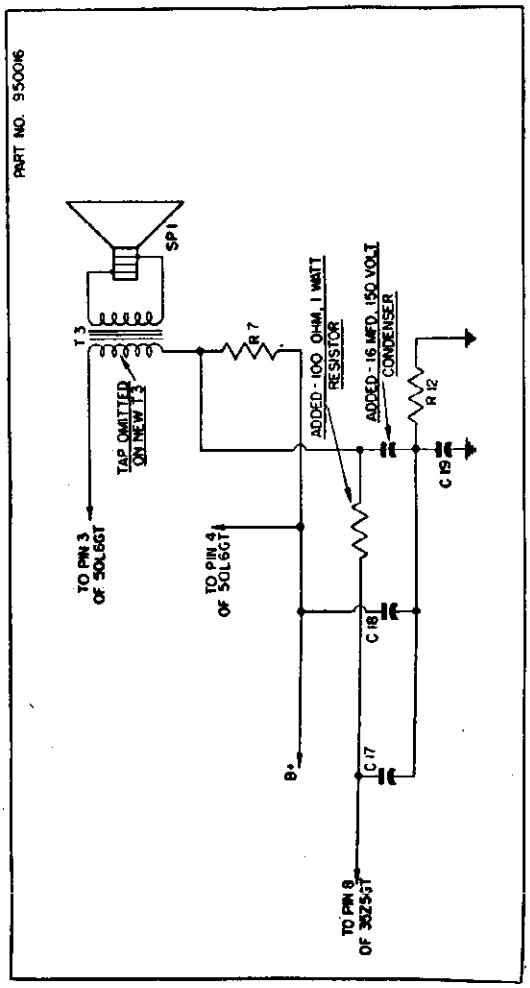
EMERSON RADIO & PHONO. CORP.

MODELS 507,509,511, 518,Ch.120005,120010



NOTE

Some 120005 chassis have a modified filter circuit and untapped output transformer. The partial schematic circuit diagram at the left indicates the revision.



For Parts List, see P.15-

MODELS 507,509,511, 518,Ch.120005,120010 EMERSON RADIO & PHONO. CORP.

An oscillator with frequencies of 455, 600, and 1425 kc. is required.

An output meter should be connected across the primary or secondary of the output transformer for observing maximum response.

Plug the receiver into the power supply outlet in such a way that the ground side of the power line is connected to the receiver B—.

Always use as weak a test signal as possible, turning down the output of the test oscillator as the alignment of the receiver progresses.

Location of Coils and Trimmer Adjustments

The first i-f transformer (T2) is mounted on top of the chassis deck to the right of the variable condenser. The trimmers (C6, C7) are accessible through holes in the top of the can.

The second i-f transformer (T3) is mounted on top of the chassis between the variable condenser and the speaker. The trimmers (C8, C9) are accessible through holes in the top of the can.

The trimmer for the antenna (C5) and the trimmer for the oscillator coil (C11) are located on the variable condenser. The trimmer on the front section is for the oscillator coil.

The oscillator coil (T4) is located underneath the chassis. The loop antenna acts as the antenna coil.

TYPE: Single-band superheterodyne.

FREQUENCY RANGE: 540-1620 kc.

NUMBER OF TUBES: Five.

TYPE OF TUBES:

1—12SA7, pentagrid oscillator-modulator

1—12SK7, first i-f amplifier

1—12SQ7, diode detector, a-f amplifier, a.v.c.

1—50L6, beam power output

1—35Z5, half-wave rectifier

POWER SUPPLY: A.C. or D.C.

VOLTAGE RATING: 105-125 volts.

POWER CONSUMPTION: 30 watts.

I-F Alignment

1. Rotate the variable condenser to the minimum capacity position.
2. Feed 455 kc. to the converter grid (stator of the r-f section of the variable condenser) and adjust the four i-f trimmers for maximum response.

R-F Alignment

1. Connect the oscillator to a coil composed of three to four turns of wire wound in a circle approximately 12" in diameter. This coil should be held parallel to and in line with the loop antenna of the receiver at a distance of 15 to 20 inches.
2. Radiate a signal at 1425 kc., set the dial indicator to 1425 kc., and adjust the trimmers on the variable condenser (C5, C11) for maximum response.
3. Radiate a 600 kc. signal and tune in the signal on the receiver. Adjust the loose outside turn of the loop antenna for maximum response. This loose turn may be moved to either side of the center. Fasten it in the position which gives maximum response.
4. Repeat steps (2) and (3) until no further improvement is evident.

1. If replacements are made or the wiring disturbed in the r-f section of the circuit, the receiver should be carefully realigned.
2. In operating the receiver on d.c., it may be necessary to reverse the line plug for correct polarity.
3. The color coding of the i-f transformer leads is as follows:

Grid—green	Plate—blue
Grid return—black	B+—red

4. All models have self-contained antennas and do not require additional antenna connections. For permanent home installations, however, if it is desired to improve reception of weak stations, an additional outdoor antenna may be used. For this purpose a lead has been brought out of the rear of the chassis near the line cord.
5. Some models have the loop antenna molded into the rear cover and others have a separate loop antenna assembly. Both antennas have directional properties. It is important, therefore, once the station is tuned in, to rotate the cabinet back and forth through a quarter of a circle (90 degrees), leaving it at the position where the station is received with maximum volume.

VOLTAGE ANALYSIS

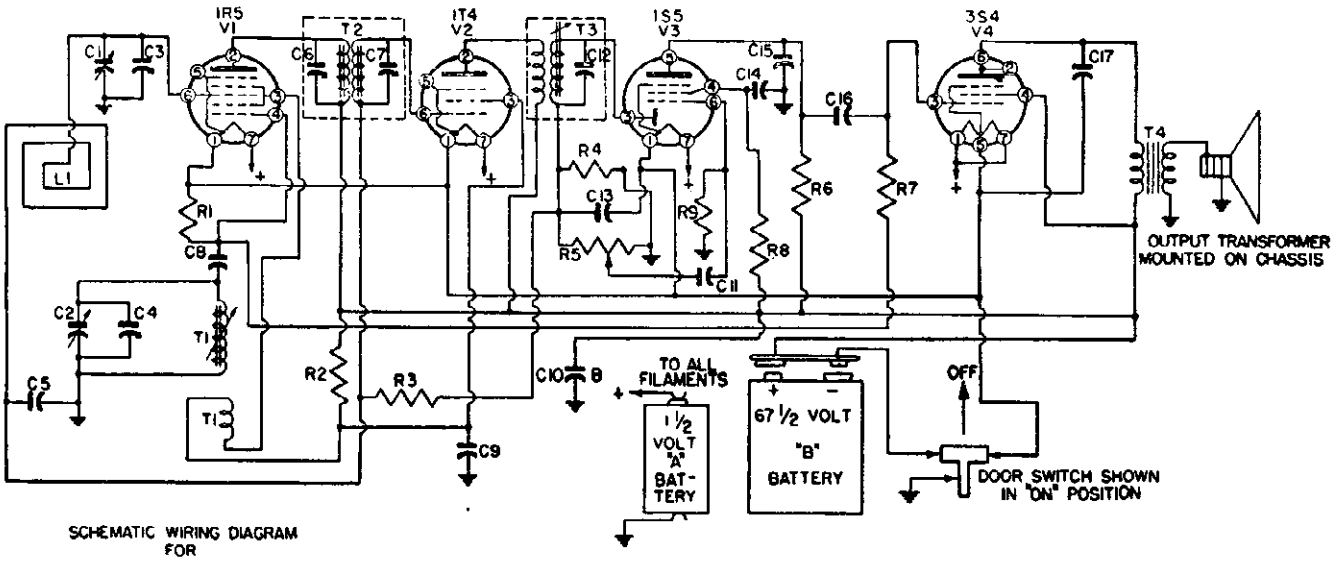
The following voltage readings are d-c measurements taken from B— (line switch) to the indicated tube-socket pin. A 1000 ohms-per-volt meter should be used for all readings except those indicated by an asterisk (*), which should be taken with a d-c vacuum-tube voltmeter. Line voltage for these readings was 117 volts, 60 cycles, a.c. Measurements made with 117 volts d.c. will be lower than those given below. Take readings with the volume control set at minimum and the variable condenser closed.

	PIN NUMBER							
TUBE	1	2	3	4	5	6	7	8
12SA7			89	89	*-10			*-1.6
12SK7				*-1.6		89		89
12SQ7		*-0.7		*-1.6	*-0.5	37.5		
50L6			110	89				6.2
35Z5				116		116		117

MODEL 508, Ch. 120008

EMERSON RADIO & PHONO. CORP.

NO. 950005



SCHEMATIC WIRING DIAGRAM FOR CHASSIS NO. 120008

FREQUENCY RANGE: 540-1600 kc.

NUMBER OF TUBES: Four.

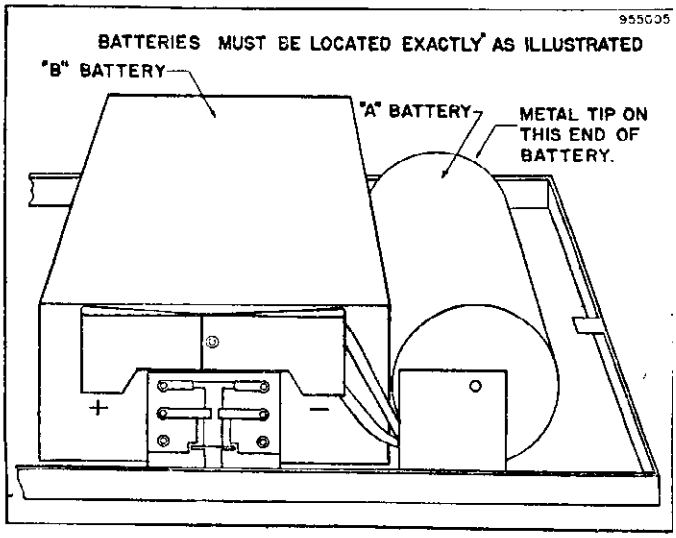
TYPE OF TUBES:
1—1R5, oscillator-modulator
1—1T4, i-f amplifier
1—1S5, 2nd detector, a.v.c., a-f amplifier
1—3S4, pentode output

POWER SUPPLY: "A" and "B" batteries.

VOLTAGE RATING:
"A" Battery—1.5 volts
"B" Battery—67.5 volts

CURRENT DRAIN:
"A" Battery—0.25 amp.
"B" Battery—0.0075 amp.

The receiver is turned on when the door is open and turned off when the door is closed.



1. Slide the button on the catch near the handle in the direction of the arrow. This loosens the rear cover, making the batteries accessible.
2. Insert batteries as shown in the accompanying diagram.
3. To reassemble fit the two slots on the end of the plastic shell opposite the handle to the tongues on the lower end of the metal frame. Keep the "B" battery in place.
4. Carefully close the shell until it fits and catches in place.

VOLTAGE ANALYSIS

The following voltage readings are d-c measurements taken from B— (chassis) to the indicated tube-socket pin. A 1000 ohms per-volt meter should be used for all readings except those indicated by an asterisk (*), which should be taken with a d-c vacuum tube voltmeter. Take readings with the volume control set at minimum and the variable condenser closed. Use fresh batteries.

	PIN NUMBER						
TUBE	1	2	3	4	5	6	7
1R5		67.5	40	*-7.0		*-0.3	1.5
1T4		67.5	40			*-0.3	1.5
1S5			*-0.35	*16.5	*39	*-0.3	1.5
3S4	1.5	65	*-7.0	67.5		65	1.5

MODEL 508,Ch.120008

EMERSON RADIO & PHONO. CORP.

An oscillator with frequencies of 455, 600, 1500, and 1610 kc is required.

An output meter should be connected across the primary or secondary of the output transformer for observing maximum response..

Always use as weak a test signal as possible, turning down the output of the test oscillator as the alignment of the receiver progresses.

Turn the volume control on full.

Location of Coils and Trimmer Adjustments

The first i-f transformer (T2) is located next to the output transformer (T4). The trimmers (C6, C7) are accessible through holes in the top of the can.

The second i-f transformer (T3) is located between the 1T4 and 1S5 tubes. The single trimming core screw (C12) extends from the end of the can.

The oscillator coil (T1) is located next to the first i-f transformer. The trimmer for the oscillator (C4) is located on the smaller variable condenser section. The 600 kc oscillator core adjustment is the brass screw protruding from the end of the oscillator coil.

The loop antenna acts as the antenna coil. The trimmer for the loop (C3) is located on the larger section of the variable condenser.

I-F Alignment

1. Rotate the variable condenser to the minimum capacity position.
2. Feed 455 kc to the grid (pin 6) of the 1R5 tube through a 0.01 mfd. condenser.
3. Adjust the three i-f trimmer screws (C6, C7, C12) for maximum response. (Clip the test signal lead to the stator of the larger capacity section of the variable condenser.)

R-F Alignment

1. Connect the test oscillator to a coil composed of three or four turns of wire wound in a circle approximately 12 inches in diameter. This coil should be placed parallel to and in line with the receiver loop at a distance of approximately 15 to 20 inches.
2. Radiate a signal at 1610 kc, rotate the variable condenser to minimum capacity, and adjust the oscillator trimmer (C4), on the smaller section of the variable condenser, for maximum response.
3. Radiate a signal at 1500 kc, tune in the 1500 kc signal, and adjust the antenna trimmer (C3), on the larger section of the variable condenser, for maximum response.
4. Radiate a signal at 600 kc, set the dial indicator to 60, and adjust the oscillator coil core trimmer while rocking the variable condenser for maximum response.
5. Return to 1610 kc and check alignment. If readjustment is necessary, repeat steps (2) to (4) until no further improvement is noted.

Battery Type	Number Required	Model
1½-volt "A"	1	Standard D-size flashlight cell (1⅛" diameter)
67½-volt "B"	1	Eveready "Minimax" No. 467

Specify part numbers when ordering. List price each effective as of January 1, 1946. (Prices subject to change without notice.)

FOR BATTERY OPERATION:

Insert plug in socket on chassis. Place hanked cord into space under shelf.

IMPORTANT

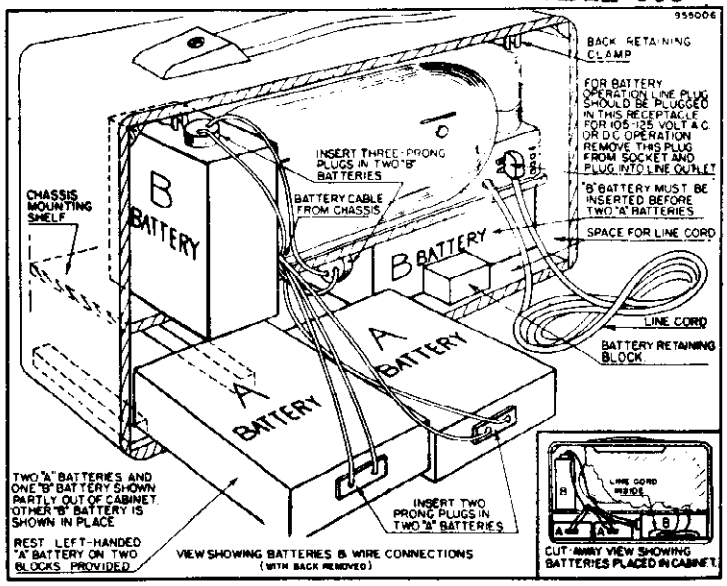
Remove batteries from receiver as soon as they are exhausted.

Batteries for Use with this Receiver

M'f'r.	4½ V. "A"	45 V. "B"
Eveready	746 2 required	482 Minimax 2 required
Ray-O-Vac	P-83A or EM-83 2 required	—
Burgess	G3 2 required	—

FOR 105-125 V. A.C. OR D.C. OPERATION:

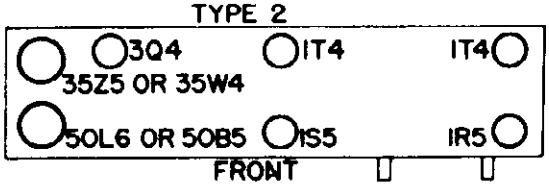
Remove plug from chassis and insert it in wall outlet. On d.c. if set does not operate, reverse line plug in wall outlet.



BATTERY INSTALLATION

NOTE: Plug with Red Lead Should be connected to "B" Battery at Side of Chassis.

TYPE 2



35Z5 AND 35W4 NOT INTERCHANGEABLE
50L6 AND 50B5 NOT INTERCHANGEABLE

BATTERIES USED IN THIS RECEIVER

TYPE	MANUFACTURER'S NUMBER
1½ Volt "A"	Standard "D" size (1 1/16" diameter) flashlight unit cell.
67½ Volt "B"	Eveready Minimax No. 467.

IMPORTANT: Remove batteries as soon as they are exhausted. The "A" battery will require more frequent replacement than the "B" battery.

TO REASSEMBLE THE CASE

1. Hold the chassis face down with the batteries in place *and the plastic door open.*
2. Note the two tongues at one end of the metal front. Place the plastic housing over the chassis so that these two tongues fit into the corresponding slots at one end of the plastic housing.
3. Press the other end of the housing so that it snaps into place.

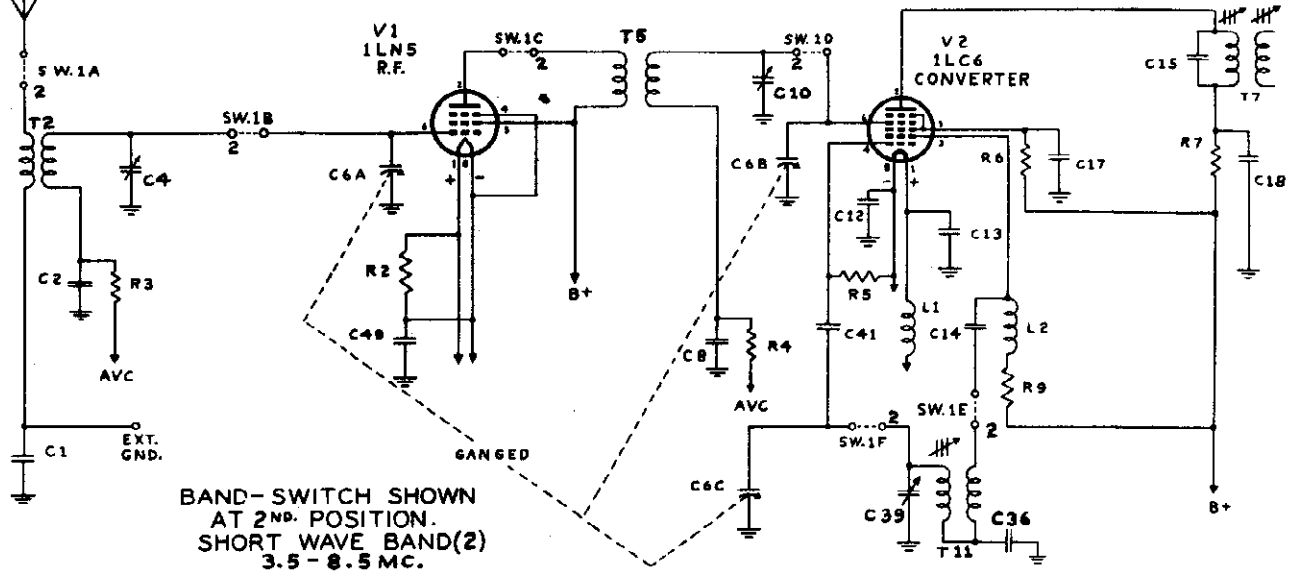
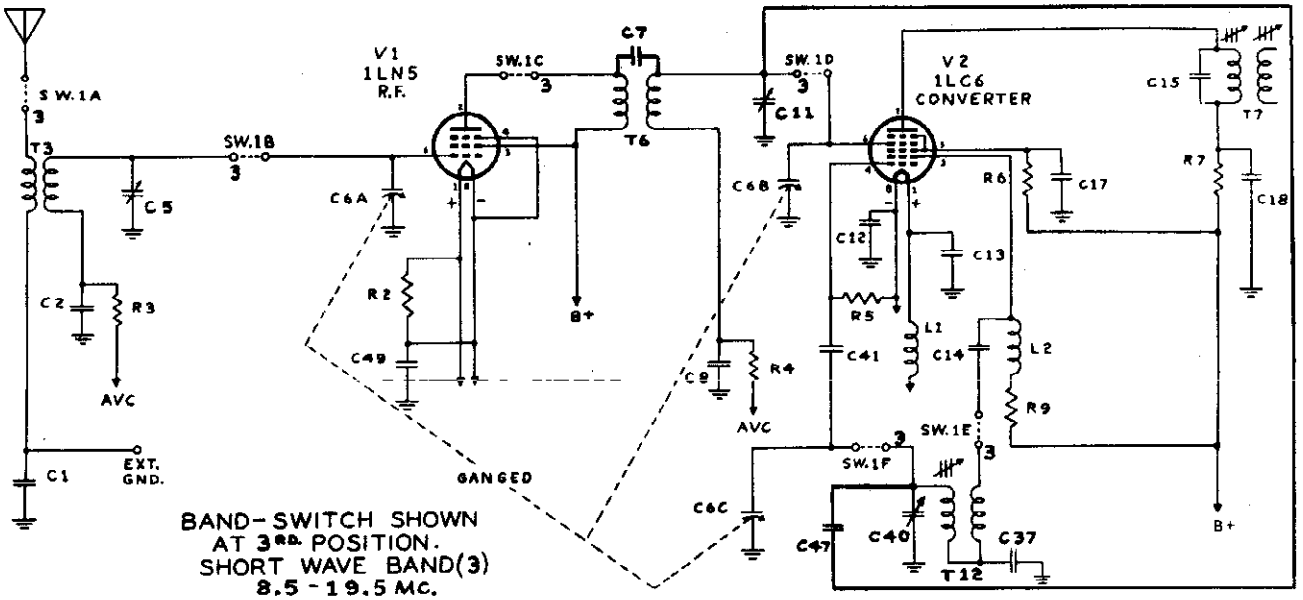
BAND-SWITCH SHOWN AT 1ST. POSITION.
BROADCAST BAND(1)
.54 - 1.7 MC.



BAND-SWITCH SHOWN AT 2ND. POSITION.
SHORT WAVE BAND(2)
3.5 - 8.5 MC.



BAND-SWITCH SHOWN AT 3RD. POSITION.
SHORT WAVE BAND(3)
8.5 - 19.5 MC.

The Espey Model #581 is an eight-tube superheterodyne designed to operate on:

(a) 105-125 Volts A.C., 60 cycle.
(b) 105-125 Volts D.C.
(c) Self contained batteries.

The instrument provides for commercial broadcast and short wave reception in the following frequency ranges:

(a) .54-1.7 M.C.
(b) 3.5-8.5 M.C.
(c) 8.5-19.5 M.C.

Electric Operation:

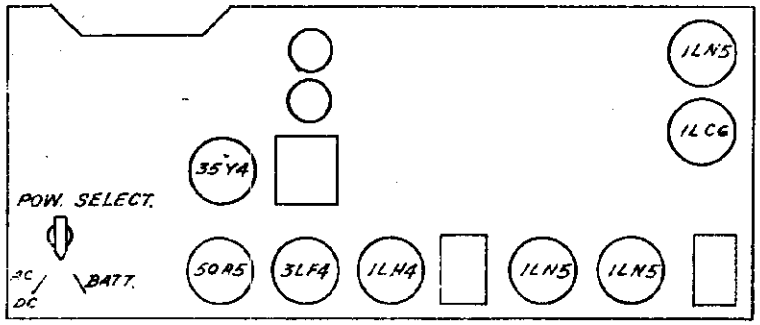
Set the power selector switch mounted on the rear left hand side of the chassis to "A.C.-D.C." for electric operation.

Battery Operation:

For battery operation, the power selector switch is set to the position marked "Batt". This switch is easily accessible through a door in the rear of the cabinet.

Two six (6) volt "A" batteries and two forty five (45) volt batteries are required for self-contained operation. These batteries are located under the chassis and may be inserted or replaced by removing the machine screw on either side of the cabinet holding the battery plate in place. The "A" batteries will provide approximately 30 hours of normal operation allowing the batteries to recuperate after several hours use. The "B" batteries will normally outlast two sets of "A" batteries. Batteries should be removed if radio set is to be stored for more than sixty (60) days.

Tube Location:



Batteries:

Suitable batteries for use with this Receiver are:

"A" Batteries: 6 Volt; Length, $3\frac{15}{16}$"; Width, $2\frac{3}{4}$"; Height, $5\frac{1}{2}$"; such as: Ever-Ready #718 or equivalent.

"B" Batteries: 45 Volt; Length, $4\frac{3}{16}$"; Width, $2\frac{19}{32}$"; Height, $5\frac{3}{8}$": such as: Ever-Ready #762-S, Burgess #5308, or equivalent.

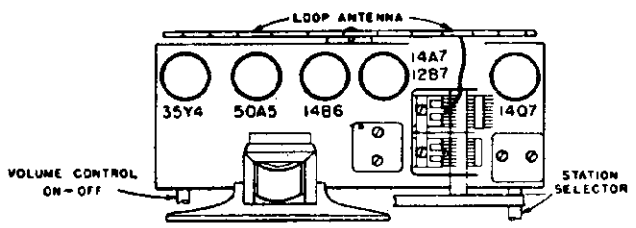
1 Type 14A7—I. F. Amplifier.
1 Type 14B6—Det. A.V.C. and Amp.
1 Type 50A5—Power Amp.
1 Type 35Y4—Rectifier.

Alignment Procedure:

Steps	Connect output of oscillator to	Tune osc. to	Tune radio dial to	Adjust the following for max. peak output
1.	Tuning condenser stator (ant.) in series with .01 mfd.	455	Quiet point at high frequency end of dial.	1st and 2nd I. F. Transformers
2.	Antenna term. of Ant. loop in series with 100 mmf.	1720	Full clockwise (out of mesh)	Osc. trimmer
3.	Antenna term. of Ant. loop in series with 100 mmf.	1500	1500	Ant. trimmer

Output meter is connected across voice coil. Receiver volume is turned to maximum.

Fig. 1—Tube and Trimmer locations:



NOTE: Trimmers may be located on either long or short side of variable condenser.

Nylon cord of the tuning and dial system may be replaced by following the diagram below

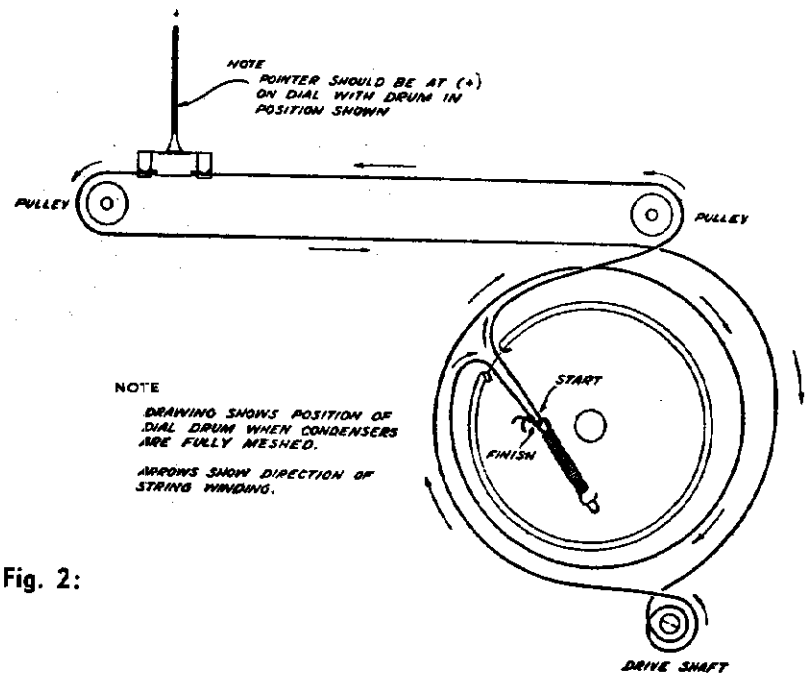


Fig. 2:

ALIGNMENT PROCEDURE

No attempt should be made to realign the various circuits until all other causes have been checked, unless the condition is so obvious as to indicate that realignment is necessary. Then proceed as follows:

Volume Control full on.

Low range A.C. meter connected across voice coil to indicate output.

Keep signal generator attenuated so as to maintain ½ scale reading on output meter.

Make certain that dial pointer is exactly on index line (top left side of dial plate) when variable condenser is fully meshed.

A Signal Generator calibrated at 455 Kc., 600 Kc., 1000 Kc., 1500 Kc., 15 Mc., 12.5 Mc., and 10 Mc and an output indicator are required to properly align this receiver. All adjustments should be mad with the volume control set for maximum, keeping the signal generator output as low as possible t prevent AVC action and incorrect adjustments.

Connect the low side of the Signal Generator to the chassis through a .1 Mfd. condenser. Con nect the high side to antenna lead at rear of set through dummy load of 100 MMF for Broadcast and 40 ohms for Shortwave.

The loop antenna should be placed in approximately the position relative to chassis as when chassi is installed in cabinet.

When aligning the Shortwave Oscillator, use the peak found farthest out from maximum capacit on the oscillator trimmer. Use the peak nearest maximum capacity on the loop trimmer.

STEPS	DUMMY ANTENNA	SET GENERATOR AT	SET GANG AT	ADJUST	LOCATED	TO OBTAIN
1	SET VOLUME CONTROL FOR MAXIMUM OUTPUT

NOTE: Models with R.F. trimmer on loop require removal of R. F. trimmer from gang capacitor having such trimmer. Late production gang capacitor 26239 (identified by red dot) with 19 plate oscillator section requires B.C. Oscillator Coil 38706 and S.W. Oscillator Coil 38709 (Marked with yellow dots).

The Service Department policy is to furnish ½ Watt 5% Carbon Resistors and 600 Volt Tub-

The parts shortage has resulted in the substitution of various types of tuning capacitors without change in part numbers stamped on them. In ordering replacement tuning capacitors for ET-060, 061, 063, 064, 065, 066, 069; EK-263, 264, and 265 the following suggestions should be observed:

Gang Capacitor with 21 plate oscillator section requires the removal of trimmer from R.F. section of gang if the loop antenna has a R. F. trimmer located on it. This capacitor uses B. C. oscillator coil No. 38483 and if a S. W. oscillator coil is used, requires S. W. oscillator coil No. 38549. Both of these coils have a white dot to indicate finish lug.

No. 23239 gang capacitor with 19 plate oscillator section (identified by red dot on rear) may require the removal of R. F. trimmer as explained above. This capacitor requires B. C. oscillator coil No. 38706 and S. W. oscillator coil (if used) No. 38709. These oscillator coils are marked with a yellow dot at the finish lug.

Prices subject to change without notice.

EQUIPMENT AND PROCEDURE FOR ALIGNMENT

To properly align this receiver, a signal generator calibrated at 455 Kc., 600 Kc., and 1500 Kc., and an output indicator are required. All adjustments should be made with the volume control set for maximum volume, keeping the signal generator output as low as possible to prevent A. V. C. action and incorrect alignment.

Connect the low side of the signal generator to one of the wires found at the rear of the set. The high side of the signal generator is connected to the other lead.

The loop should be spaced 3/4 inch from the chassis or the approximate position relative to the chassis as when installed in cabinet.

TABULATION FOR ALIGNMENT

Steps	Dummy Antenna	Set Generator At	Set Gang At	Adjust	Located	To Obtain
1	Set Volume Control For Maximum Output					
2	100 MMF	455 Kc.	Minimum Capacity	2nd. I.F. Trimmers	Top of I.F. Transformer	Maximum Output
3				1st. I. F. Trimmers

A Signal Generator calibrated at 455 Kc., 600 Kc. and 1500 Kc., and an output indicator are necessary to properly align this set. All adjustments should be made with the volume control set for maximum and the tone control for maximum treble, keeping the signal generator output as low as possible to prevent A.V.C. action and false settings.

The low side of the signal generator is connected to the chassis.

TABULATION FOR ALIGNMENT

Steps	Connect High Side of Generator to	Set Generator At	Set Gang At	Adjust	Located	To Obtain
1	Set Volume Control at Maximum and Tone Control at Maximum Treble					
2	Stator of Ant. Section of Gang with .1 Mf. In Series	455 Kc.	Minimum	2nd. I.F. Transformer	Top of 2nd. I.F. Transformer	Maximum Output
3				1st. I. F. Transformer	Top of 1st. I.F. Transformer	
4	Ant. Lead With 250 Mmf. In Series*	1500 Kc.	1500 Kc.	Osc. Trimmer	On Gang	
5		1500 Kc.	1500 Kc.	Ant. Trimmer	On Loop	
6	Check Pointer Calibration on 600 Kc.					

*Antenna wire protrudes from loop.

MODEL 4A2,
Commentator

THE FIRESTONE TIRE & RUBBER CO.

ALIGNMENT PROCEDURE

1. Remove the chassis and loop antenna from the cabinet at the same time. To accomplish this remove the two fasteners holding the top of the back to the cabinet and remove the two screws on the rear apron of the chassis.

2. Note that there are five calibrating lines stamped into the metal dial frame. When gang condenser is fully meshed, dial pointer should be in the position indicated by first line at the left. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.

3. Connect an output meter across the speaker voice coil or from plate of 35L6GT tube to B— through a .1 Mfd. condenser (see voltage chart for convenient B— connection).

4. Connect ground lead from signal generator to B— through a .25 Mfd. condenser.

5. Set volume control at maximum volume position and use a weak signal from the signal generator.

IMPORTANT—Align this receiver in exactly the order shown below.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF GENERATOR TO	SIGNAL GENERATOR FREQUENCY	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
.05 MFD. Paper Condenser	Control Grid of 12SA7	455 KC	Any point where it does not affect the signal.	E	2nd I.F.	Adjust for maximum output. Then repeat adjustment.
				C-D	1st I.F.	
100 MMFD. Mica Condenser	External Antenna Blue Lead on Loop	1720 KC	Set pointer to extreme right.	B	Oscillator	Adjust for maximum output.
100 MMFD Mica Condenser	External Antenna Blue Lead on Loop	1400 KC	Tune to 1400 KC generator signal.	A	Antenna	Adjust for maximum output.
100 MMFD. Mica Condenser	External Antenna Blue Lead on Loop	600 KC	Tune to 600 KC generator signal.	—	———	Check sensitivity.

POWER OUTPUT:

Undistorted — 1.0 watts
Maximum — 1.3 watts

MODEL 4A2C

ALIGNMENT PROCEDURE

Remove chassis and loop antenna from cabinet (do not remove loop of wire stapled to cabinet.) After chassis ha been removed, replace loop antenna in cabinet. Stand the chassis on one end and space it approximately same dis tance from loop as when installed in cabinet. Then reconnect all leads to loop antenna and to loop of wire stapled o cabinet.

Note that there are four calibrating lines stamped into the metal dial frame. When gang condenser is fully meshe dial pointer should be in the position indicated by first line at the left. If it is set incorrectly, release pointer clip o dial cord and reposition pointer.

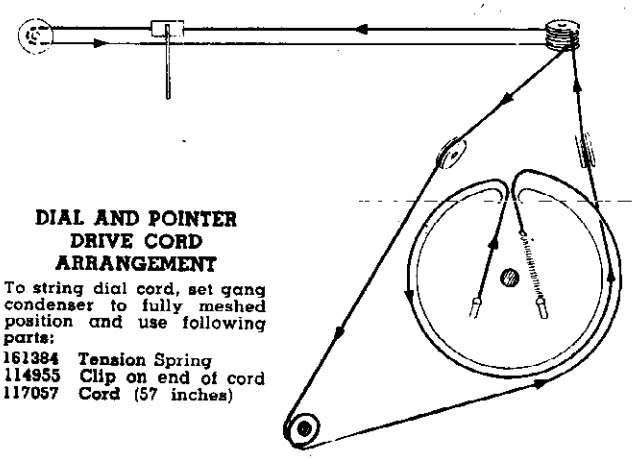
Connect an output meter across the speaker voice coil or from plate of 35L6GT tube to B— through a .1 Mfd. con denser (see voltage chart for convenient B— connection).

Connect ground lead from signal generator to B— through a .25 Mfd. condenser.

Set volume control at maximum volume position and use a weak signal from the signal generator.

IMPORTANT:—Align this receiver in exactly the order shown below. Broadcast band must be aligned before short wav band.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF GENERATOR TO	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
200 MMFD. Mica Condenser	Control Grid of 12SA7	455 KC	Broadcast	Any point where it does not affect the signal	1-2 3-4	2nd I.F. 1st I.F.	Adjust for maximum outpu Then repeat adjustment.
200 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1500 KC	Broadcast	Set pointer to 1500 KC reference line stamped into metal dial plate (first line at the right)	5	Broadcast Oscillator (Shunt)	Adjust for maximum outpu
200 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1500 KC	Broadcast	Tune to 1500 KC generator signal	6	Broadcast R.F.	Adjust for maximum outpu
200 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1500 KC	Broadcast	Tune to 1500 KC generator signal	7	Broadcast Antenna	Adjust for maximum outpu
400 OHM Resistor	External Antenna Clip on Loop Frame	12 MC	Short Wave	Set pointer to 12 MC. Reference line stamped into metal dial plate (second line from the right)	8	Short Wave Oscillator	Adjust to bring in signal. Chec to see if proper peak was ob tained by tuning in image c approx. 11.1 MC. If image doe not appear, realign at 12 MC with trimmer screw farther ou Recheck image.
400 OHM Resistor	External Antenna Clip on Loop Frame	12 MC	Short Wave	Tune to 12 MC generator signal	9	Short Wave Antenna	Adjust for maximum outpu Try to increase output by de tuning trimmer and retuning re ceiver dial until maximum ou put is obtained.



DIAL AND POINTER DRIVE CORD ARRANGEMENT

To string dial cord, set gang condenser to fully meshed position and use following parts:

161384 Tension Spring
114955 Clip on end of cord
117057 Cord (57 inches)

TOP VIEW OF CHASSIS

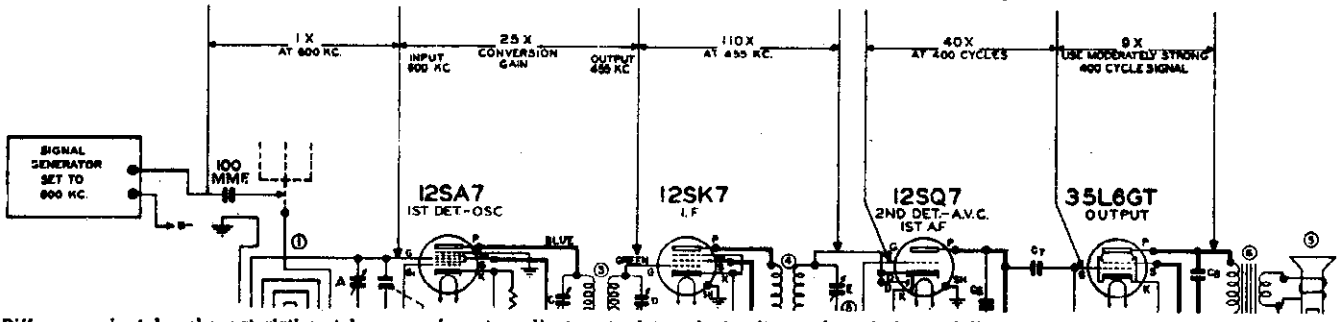
APPROXIMATE STAGE GAIN DATA MODEL 4A2

Be sure Ant. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe following precautions:

1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes).
2. For I.F. measurements connect negative terminal of a 3 volt battery (two 1½ volt cells in series) to A.V.C. lead and positive terminal to B—. This provides a definite operating point. IMPORTANT: Disconnect battery when measuring audio stage gains.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.
4. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

I.F. stage gains shown below are less than under normal operating conditions due to the use of 3 volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



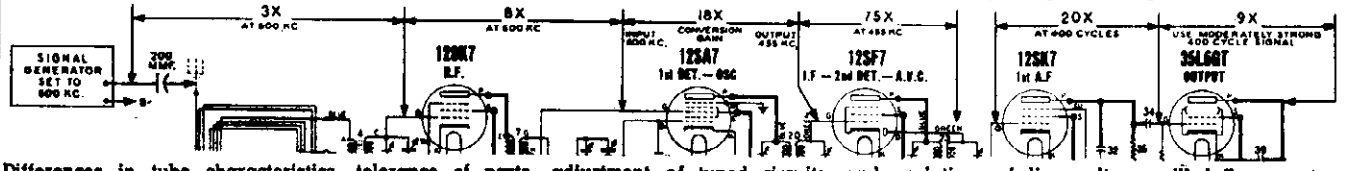
Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.

APPROXIMATE STAGE GAIN DATA- MODEL 4A20

Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe following precautions:

1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes.)
2. For R.F. and I.F. measurements connect negative terminal of a 3 volt battery (two 1½ volt cells in series) to A.V.C. lead and positive terminal to B—. This provides a definite operating point. IMPORTANT: Disconnect battery when measuring audio stage gains.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
4. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 3 volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.

AUDIO OSCILLATION

The audio system of this receiver utilizes a two stage type of inverse feed-back arrangement and, should it ever be necessary to replace the speaker or output transformer, it is important to maintain a definite phase relationship in the feed-back circuit. If the connections to the output transformer are reversed or if the feed-back connection is made to the wrong side of the output transformer secondary, the system will become regenerative instead of degenerative. Under those conditions audio oscillation may result. If that occurs, oscillation may be prevented by reversing the connections to the primary of the output transformer.

THE FIRESTONE TIRE & RUBBER CO.

ALIGNMENT PROCEDURE

1. Remove chassis and loop antenna from cabinet (do not remove loop of wire stapled to cabinet). After chassis has been removed, replace loop antenna in cabinet. Stand the chassis on one end and space it approximately same distance from loop as when installed in cabinet. Then reconnect all leads to loop antenna and to loop of wire stapled on cabinet.
2. Turn the tuning control knob clockwise as far as it will go (tuner mechanism is now in maximum open position with tuning slugs almost completely withdrawn from coils). Dial pointer should then point to 1600 KC mark on scale. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.
3. Connect output meter across speaker voice coil or from 6K6GT plate to chassis through a .1 Mfd. condenser.
4. Connect the ground lead of the signal generator to the receiver chassis.
5. Set volume control at maximum volume position and use a weak signal from the signal generator.
6. Push in the manual button and leave it in that position throughout the alignment procedure.

IMPORTANT:—Align this receiver in exactly the order shown below.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF SIGNAL GENERATOR TO	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
Set tuner mechanism to maximum open position by turning the tuning control knob clockwise as far as it will go (Dial pointer at 1600 KC). Then check whether the positions of the tuning slugs correspond to the positions shown in Fig. 2. If settings are incorrect, rotate the individual core and threaded stem until desired position is reached. Note that threaded stem is prevented from moving by a dab of speaker cement at top and this seal must be removed before stem can be rotated.

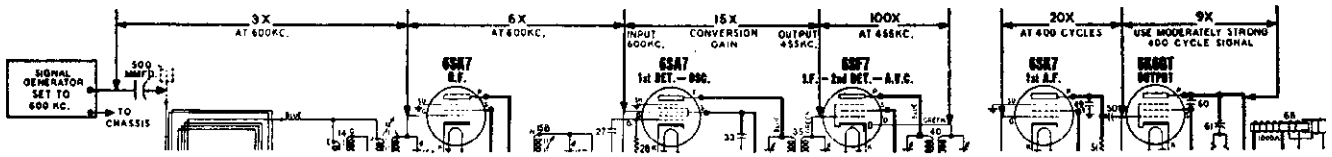
APPROXIMATE STAGE GAIN DATA

Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" typ instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurement Observe following precautions:

1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes.)
2. For R.F. and I.F. measurements connect negative terminal of a 3 volt battery (two 1½ volt cells in series) to A.V.C. lead at terminal "D" of S.W. Ant. coil. Then connect positive battery lead to receiver chassis. This provides a definite operating point. IMPORTANT: Disconnect battery when measuring audio stage gains.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
4. When using "channel" type i strument careful tune it for maximu output at desire frequency befor making measur ments.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 3 volts fixed bias order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence sta gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your te equipment. These factors may create considerable variation in gain measurements.

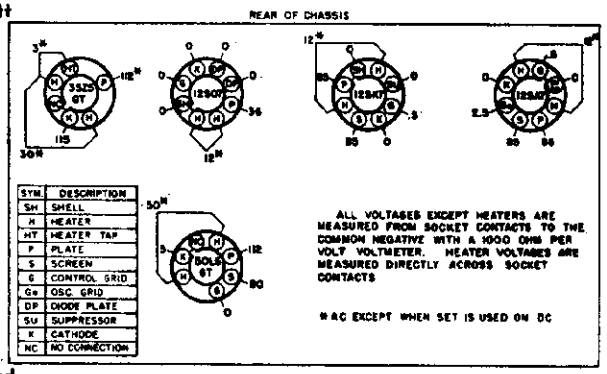
VOLTAGE READINGS AND PARTS LIST FOR MODEL 4 A 25



VOLTAGE TABLE
(BOTTOM VIEW OF CHASSIS)

SETTING-UP THE PUSH-BUTTONS MODELS 4A21 AND 4A22

1. Set band switch to "AM" position and allow set to operate 15 minutes before making adjustments.

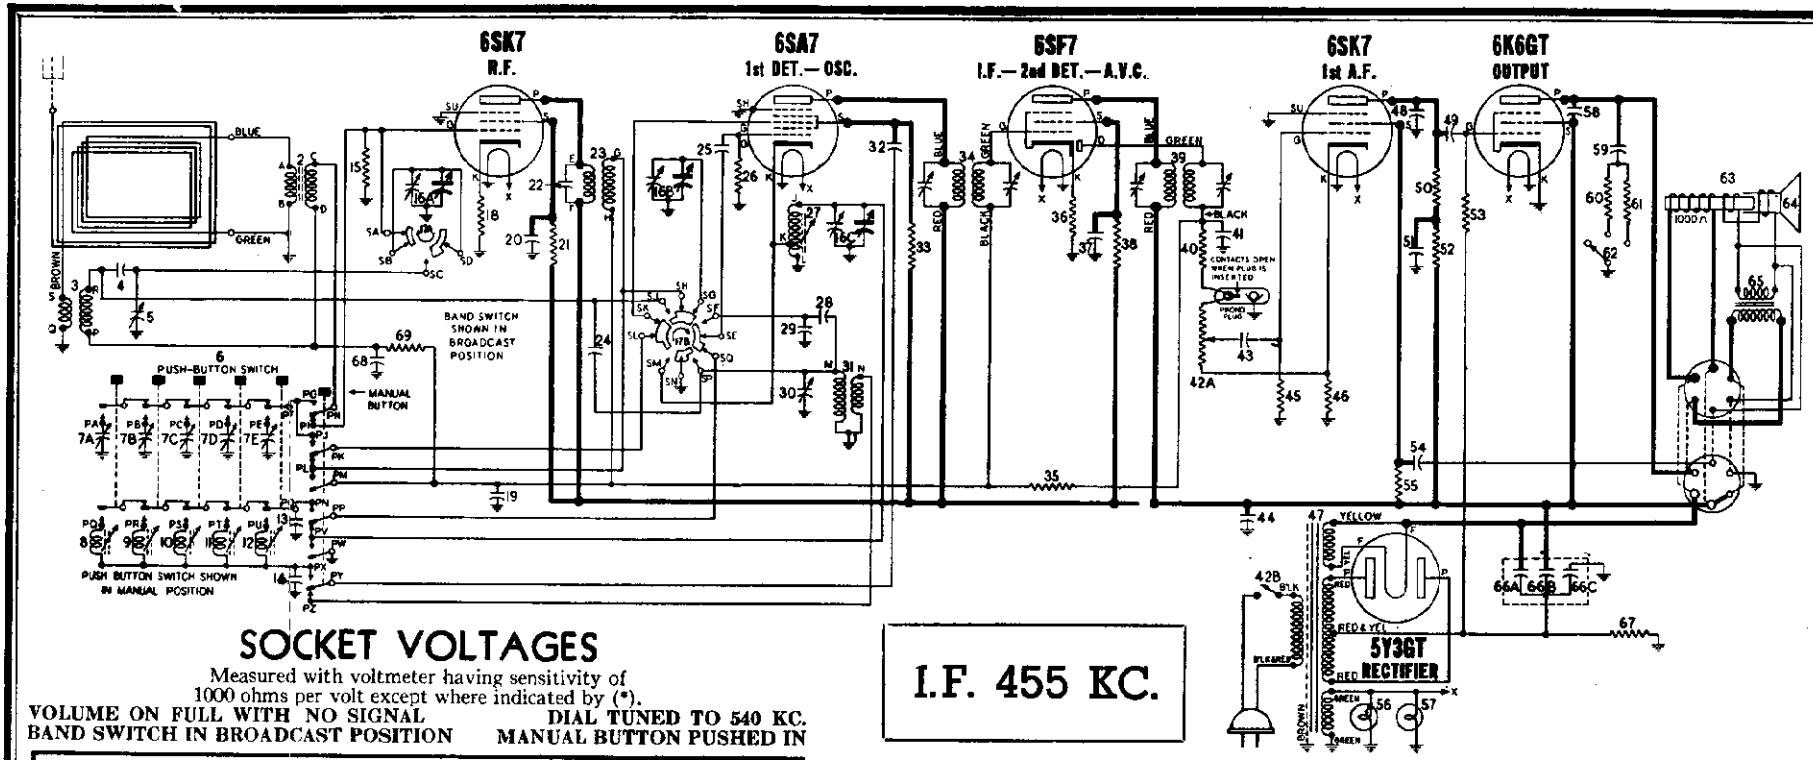
2. Note two rows of adjusting screws on back of radio chassis (visible and accessible through opening in cabinet back). Each vertical pair of adjusting screws is used to tune in a station for one of the push-buttons. A label under the row of screws specifies the frequency or tuning range that each screw will cover.

3. Select five powerful stations, each of which falls within the frequency range of the adjusting screw to be used to tune in that station.

4. Push in "MANUAL" button and listen to the program of the lowest frequency station you selected.

5. Now push in the first button on the left. Return to rear of radio and use vertical pair of adjusting screws on extreme right to tune in the same station. Adjust bottom screw first until desired station is heard. If station is not heard, change setting of top screw to a position where the slight static noise or rushing sound is the loudest. Then try adjusting bottom screw again; repeat this procedure until desired station is found. After locating station, carefully set bottom screw for deepest tone and top screw for maximum volume.

6. The set-up of the first push-button is now complete. Use a similar procedure to set-up the remaining buttons.



SOCKET VOLTAGES

THE FIRESTONE TIRE & RUBBER CO.

ALIGNMENT PROCEDURE

1. Remove chassis and loop antenna from cabinet (do not remove loop of wire stapled to cabinet). After chassis has been removed, replace loop antenna in cabinet. Stand the chassis on one end and space it approximately same distance from loop as when installed in cabinet. Then reconnect all leads to loop antenna and to loop of wire stapled on cabinet.

2. With the gang condenser fully meshed, dial pointer should be in the position indicated by the last division below 55 on the dial. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.

3. Connect output meter across speaker voice coil or from plate of 6K6GT tube to chassis through a .1 Mfd. condenser.

4. Connect the ground lead of the signal generator to the receiver chassis.

5. Set volume control at maximum volume position and use a weak signal from the signal generator.

6. Push in the manual button and leave it in that position throughout the alignment procedure.

IMPORTANT:—Align this receiver in exactly the order shown below. Broadcast band must be aligned before short wave band.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF SIGNAL GENERATOR TO	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
.1 MFD. Condenser	Trimmer on rear section of gang	455 KC	Broadcast (Clockwise)	Any point where it does not affect the signal.	1-2	2nd I.F.	Adjust for maximum output. Then repeat adjustment.
					3-4	1st I.F.	
500 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1500 KC	Broadcast (Clockwise)	1500 KC	5	Broadcast Oscillator (Shunt)	Adjust for maximum output.

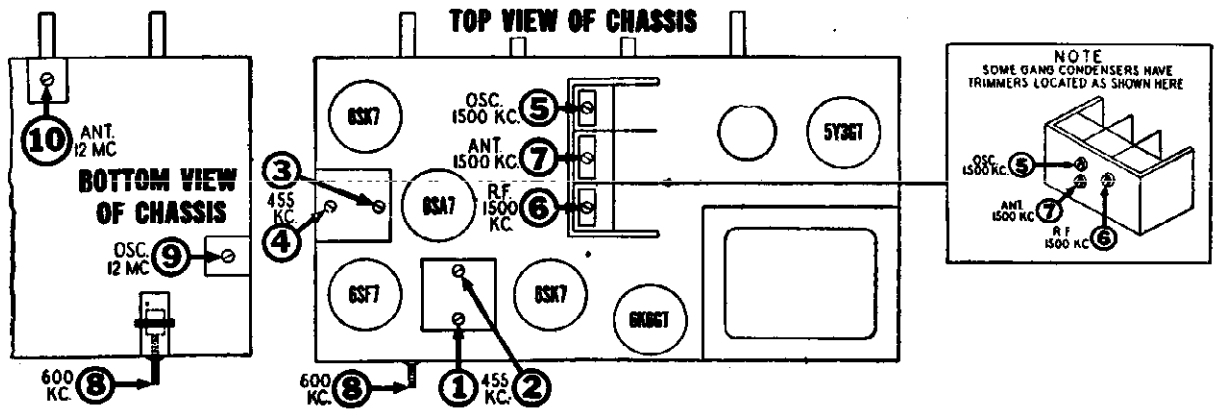
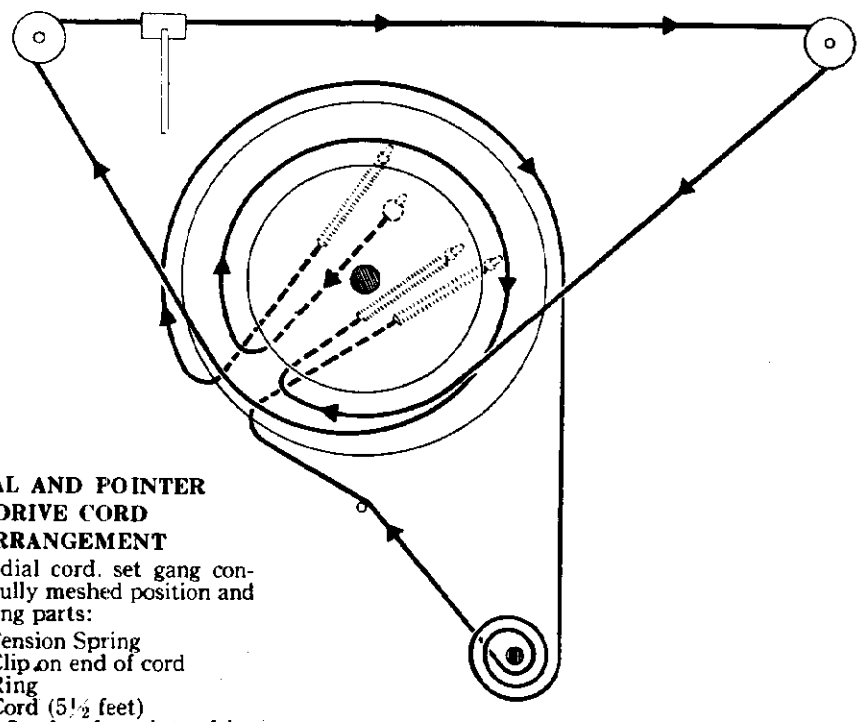
500 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1500 KC	Broadcast (Clockwise)	Tune to 1500 Kc. generator signal.	7	Broadcast Antenna	Adjust for maximum output.
500 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	600 KC	Broadcast (Clockwise)	Tune to 600 Kc. generator signal.	8	Adjustable core of Broadcast Oscillator Coil.	Adjust for maximum output. Try to increase output by rotating core in and out and retuning receiver dial until maximum output is obtained.
500 MFD. Mica Condenser	External Antenna Clip on Loop Frame	Repeat adjustment of trimmers 5, 6 and 7 at 1500 Kc. Then re-check adjustment of trimmer 8 at 600 Kc.					
400 OHM Carbon Resistor	External Antenna Clip on Loop Frame	12 MC	Short wave (Counter-Clockwise)	12 MC	9	S.W. Oscillator	Adjust for maximum output. Check to see if proper peak was obtained by tuning in image at approx. 11.1 MC. If image does not appear, realign at 12 MC, with trimmer screw farther out. Recheck image.
400 OHM Carbon Resistor	External Antenna Clip on Loop Frame	12 MC	Short wave (Counter-Clockwise)	Tune to 12 MC. generator signal.	10	S.W. Antenna	Adjust for maximum output. Try to increase output by detuning trimmer and retuning receiver dial until maximum output is obtained.





DIAL AND POINTER DRIVE CORD ARRANGEMENT

To string dial cord, set gang condenser to fully meshed position and use following parts:

113177 Tension Spring
114955 Clip on end of cord
119087 Ring
117057 Cord (5½ feet)
3 feet for pointer drive
2½ feet for tuning drive

POWER SUPPLY:

117 volts
50-60 cycles A.C.
55 watts

POWER OUTPUT:

Undistorted—2.3 watts
Maximum —3.5 watts

SPEAKER:

6 inch Electro-Dynamic
Voice coil impedance—3.5 ohms

BUILT-IN ANTENNA:

Noise reducing
low impedance loop

FREQUENCY RANGES:

Standard Broadcast Band	540-1725 KC.	Short Wave Band	9-12 MC.

PUSH-BUTTON RANGES:

Button No. 1 · —540-1000 KC.
Button No. 2 & 3—650-1300 KC.
Button No. 4 & 5—975-1600 KC.

SETTING-UP THE PUSH-BUTTONS

1. Set band switch to "AM" position and allow set to operate 15 minutes before making adjustments.

2. Note two rows of adjusting screws on back of radio chassis (visible and accessible through opening in cabinet back). Each **vertical pair** of adjusting screws is used to tune in a station for one of the push-buttons. A label under the row of screws specifies the frequency or tuning range that each screw will cover.

3. Select five powerful stations, each of which falls within the frequency range of the adjusting screw to be used to tune in that station.

4. Push in "MANUAL" button and listen to the program of the lowest frequency station you selected.

5. Now push in the first button **on the left,** Return to rear of radio and use vertical pair of adjusting screws **on extreme right** to tune in the same station. Adjust bottom screw first until desired station is heard. If station is not heard, change setting of top screw to a position where the slight static noise or rushing sound is the loudest. Then try adjusting bottom screw again; repeat this procedure until desired station is found. After locating station, carefully set bottom screw for deepest tone and top screw for maximum volume.

6. The set-up of the first push-button is now complete. Use a similar procedure to set-up the remaining buttons.

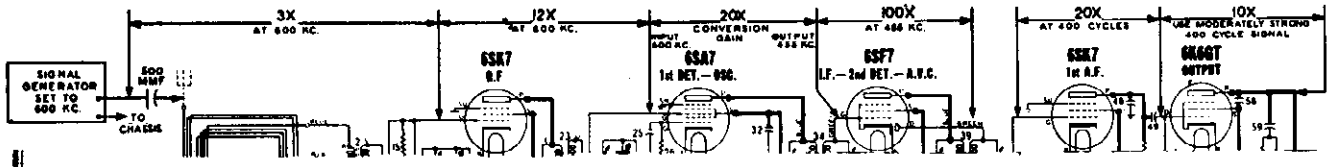
MODELS 4-A-21X, 4-A-22X

APPROXIMATE STAGE GAIN DATA

Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe following precautions:

1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes.)
2. For R.F. and I.F. measurements connect negative terminal of a 3 volt battery (two 1½ volt cells in series) to A.V.C. lead at terminal "P" of short wave antenna coil; then connect positive battery lead to chassis. This provides a definite operating point.
   IMPORTANT: Disconnect battery when measuring audio stage gains.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
4. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 3 volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



AUDIO OSCILLATION

The audio system of this receiver utilizes a two stage type of inverse feed-back arrangement and, should it ever be necessary to replace the speaker or output transformer, it is important to maintain a definite phase relationship in the feed-back circuit. If the connections to the output transformer are reversed or if the feed-back connection is made to the wrong side of the output transformer secondary, the system will become regenerative instead of degenerative. Under those conditions audio oscillation may result. If that occurs, oscillation may be prevented by reversing the connections to the primary of the output transformer.

NOTE:—The 6K6GT grid bias of —19 volts can be measured across resistor No. 72.
*—Measured with vacuum tube voltmeter.

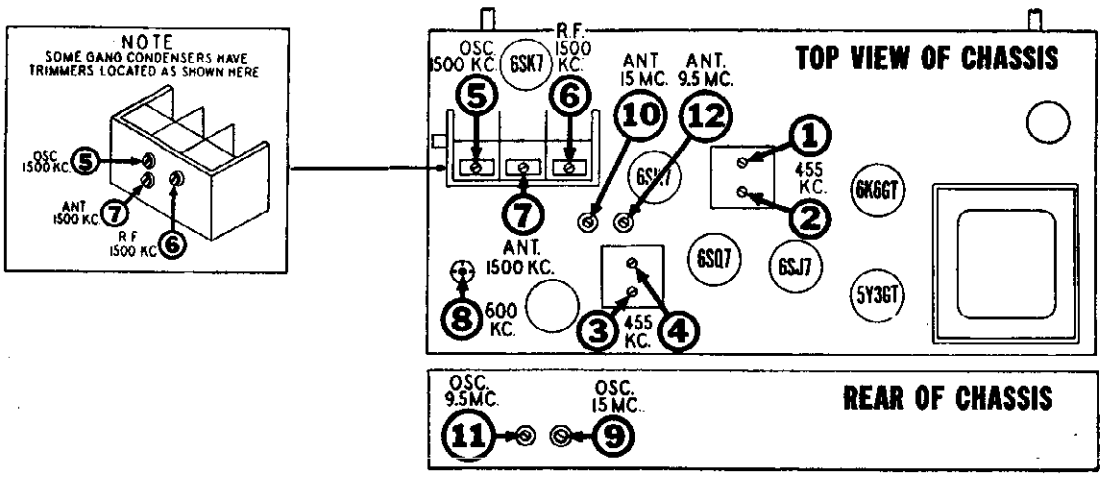
MODEL 4A23, Interceptor

THE FIRESTONE TIRE & RUBBER CO.

1. The chassis and loop antenna should remain in their normal position in the cabinet throughout the following procedure.
2. Check arrangement of leads to push-button switch as shown in illustration on following page.
3. With the gang condenser fully meshed, dial pointer should be in the position indicated by the last division below 55 on the dial. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.
4. Connect output meter across speaker voice coil.
5. Connect the ground lead of the signal generator to the receiver chassis.
6. Set volume control at maximum volume position and use a weak signal from the signal generator.
7. Push in the manual button and leave it in that position throughout the alignment procedure.

IMPORTANT:—Align this receiver in exactly the order shown below. Broadcast band must be aligned before short wave bands.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF SIGNAL GENERATOR TO	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
.1 MFD. Condenser	Trimmer on rear section of gang	455 KC	Broadcast (counter-clockwise)	Any point where it does not affect the signal.	1-2	2nd I.F.	Adjust for maximum output. Then repeat adjustment.
					3-4	1st I.F.	
.003 MFD. Condenser	External Antenna Clip on Loop Frame	1500 KC	Broadcast (counter-clockwise)	1500 KC	5	Broadcast Oscillator (Shunt)	Adjust for maximum output.
.003 MFD. Condenser	External Antenna Clip on Loop Frame	1500 KC	Broadcast (counter-clockwise)	Tune to 1500 KC Generator Signal	6	Broadcast R.F.	Adjust for maximum output.
.003 MFD. Condenser	External Antenna Clip on Loop Frame	1500 KC	Broadcast (counter-clockwise)	Tune to 1500 KC Generator Signal	7	Broadcast Antenna	Adjust for maximum output.
.003 MFD. Condenser	External Antenna Clip on Loop Frame	600 KC	Broadcast (counter-clockwise)	Tune to 600 KC Generator Signal	8	Adjustable core of Broadcast Oscillator Coil.	Adjust for maximum output. Try to increase output by rotating core in and out and retuning receiver dial until maximum output is obtained.
.003 MFD. Condenser	External Antenna Clip on Loop Frame	Repeat adjustments of trimmers 5, 6 and 7 at 1500 Kc. Then re-check adjustment of trimmer 8 at 600 Kc.					
400 OHM Carbon Resistor	External Antenna Clip on Loop Frame	15 MC	Short wave	15 MC	9	S.W. Oscillator	Adjust for maximum output. Check to see if proper peak was obtained by tuning in image at approx. 14.1 MC. If image does not appear, realign at 15 MC, with trimmer screw farther out. Recheck image.
400 OHM Carbon Resistor	External Antenna Clip on Loop Frame	15 MC	Short wave	Tune to 15 MC Generator Signal	10	S.W. Antenna	Adjust for maximum output. Try to increase output by detuning trimmer and retuning receiver dial until maximum output is obtained.
400 OHM Carbon Resistor	External Antenna Clip on Loop Frame	9.5 MC	31 M (Clockwise)	9.5 MC	11	31 M Oscillator	Adjust for maximum output. Check to see if proper peak was obtained by tuning in image at approx. 8.6 MC. If image does not appear, realign at 9.5 MC. with trimmer screw farther out. Recheck image.
400 OHM Carbon Resistor	External Antenna Clip on Loop Frame	9.5 MC	31 M (Clockwise)	Tune to 9.5 MC Generator Signal	12	31 M Antenna	Adjust for maximum output. Try to increase output by detuning trimmer and retuning receiver dial until maximum output is obtained.



AUDIO OSCILLATION

The audio system of this receiver utilizes a two stage type of inverse feed-back arrangement and should it ever be necessary to replace the speaker or output transformer it is important to maintain a definite phase relationship in the feedback circuit. If the connections to the output transformer are reversed or if the feed-back connection is made to the wrong side of the output transformer secondary, the system will become regenerative instead of degenerative. Under those conditions audio oscillation may result. If that occurs, oscillation may be prevented by reversing the connections to the primary of the output transformer.

THE FIRESTONE TIRE & RUBBER CO.

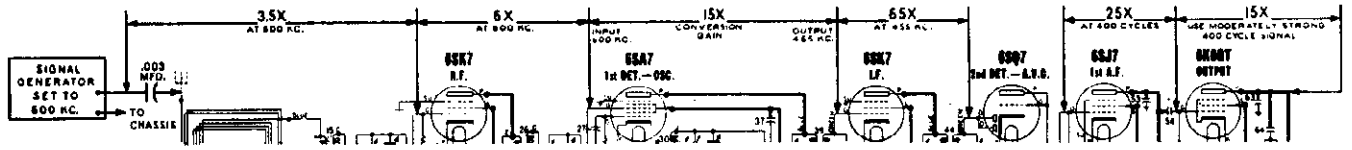
MODEL 4A23, Interceptor

APPROXIMATE STAGE GAIN DATA

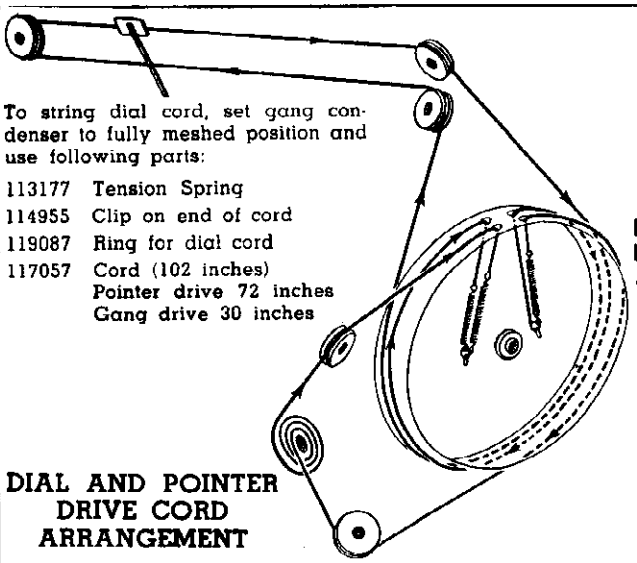
Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe following precautions:

1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes.)
2. For R.F. and I.F. measurements connect negative terminal of a 3 volt battery (two 1½ volt cells in series) to A.V.C. lead and positive terminal to chassis. This provides a definite operating point. IMPORTANT: Disconnect battery when measuring audio stage gains.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
4. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 3 volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



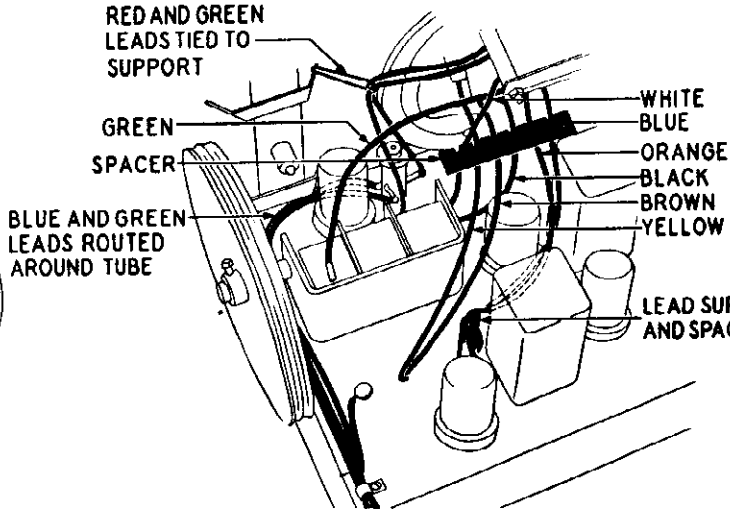
Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.



To string dial cord, set gang condenser to fully meshed position and use following parts:

113177	Tension Spring
114955	Clip on end of cord
119087	Ring for dial cord
117057	Cord (102 inches) Pointer drive 72 inches Gang drive 30 inches

DIAL AND POINTER DRIVE CORD ARRANGEMENT



IMPORTANCE OF MAINTAINING FIXED POSITIONS FOR LEADS AT TOP OF CHASSIS

The wires shown in the above illustration are associated with tuned circuits which carry radio frequency currents. Therefore, care must be exercised to insure that they are properly routed and spaced. Anchoring and fixing spacing of wires minimizes freedom of movement and is utilized to maintain a stable arrangement.

Since the relative positions of these wires may affect tuned circuits it is important to avoid any change in arrangement after the receiver has been aligned. If the position of the wires has been disturbed, it is advisable to re-check alignment

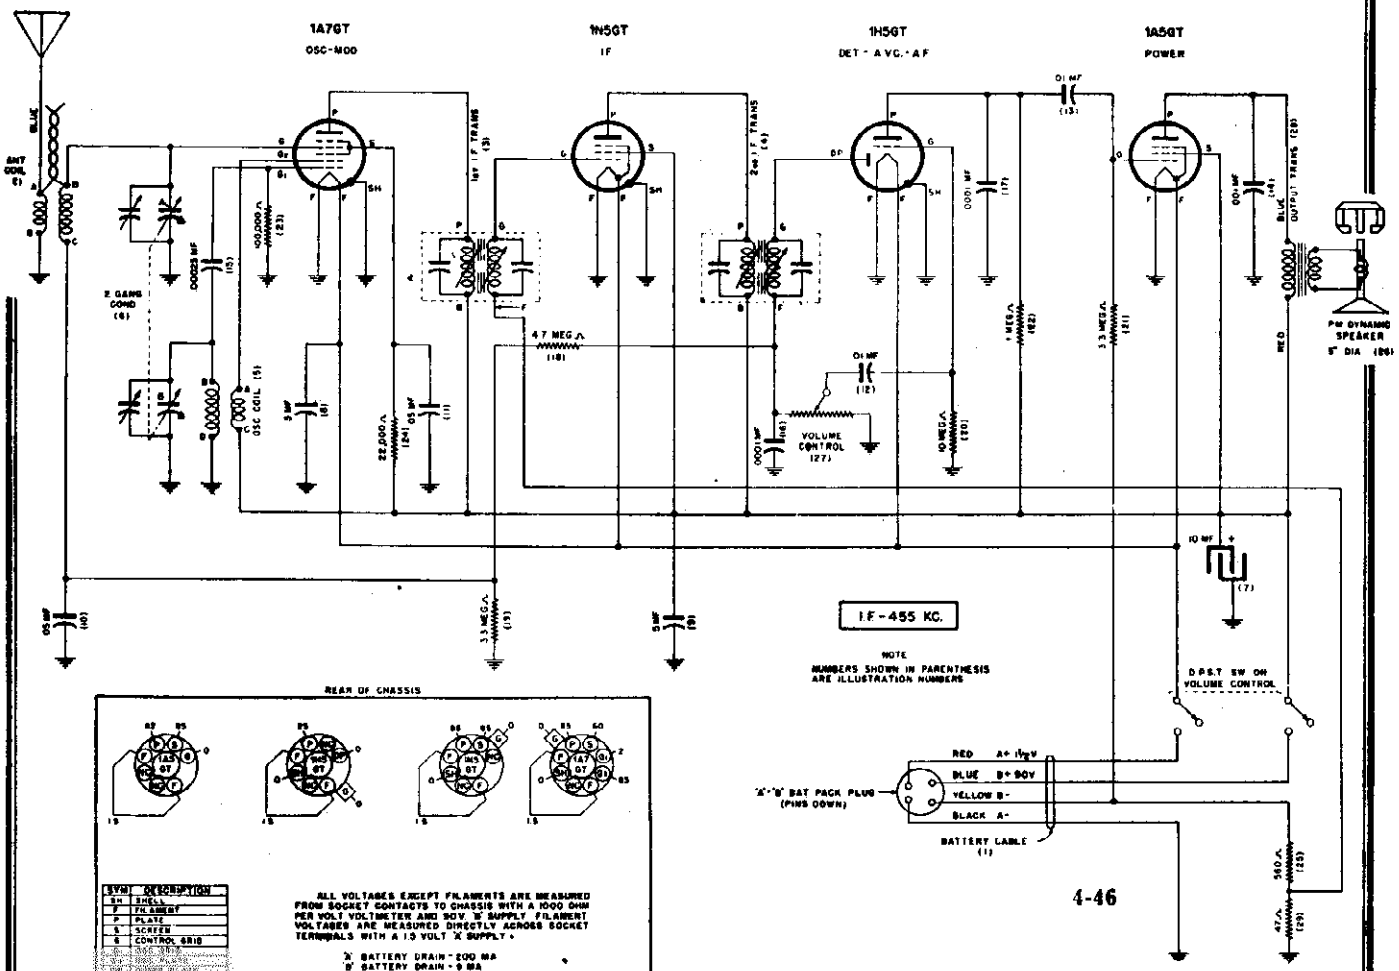
MODEL 4A24

THE FIRESTONE TIRE & RUBBER CO.



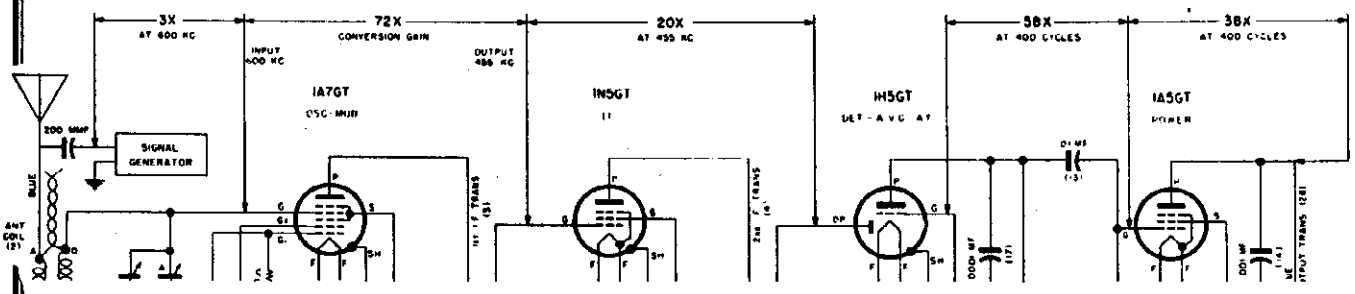
VOLTAGE TABLE
(BOTTOM VIEW OF CHASSIS)

PART NO 4-A-24

POWER OUTPUT Undistorted- 100 milliwatts
Maximum - 200 milliwatts

VOICE COIL IMPEDANCE 3.2 ohm at 400~

TUNING RANGE 528 to 1730 KC



Be sure R. F. and I. F. stages are accurately aligned before measuring gain. R. F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R. F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe the following precautions:

1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes.)
2. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
3. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

For Parts List, see P.15-17

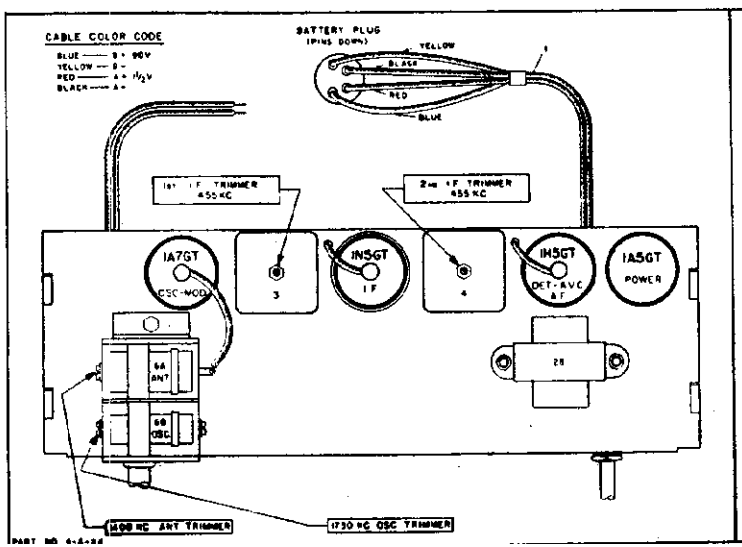
Be sure to follow procedure carefully and in the order given—otherwise the receiver will be insensitive and the dial calibration incorrect. For alignment procedure read tabulations from left to right. Make the adjustment marked (1) first, (2) next, etc.

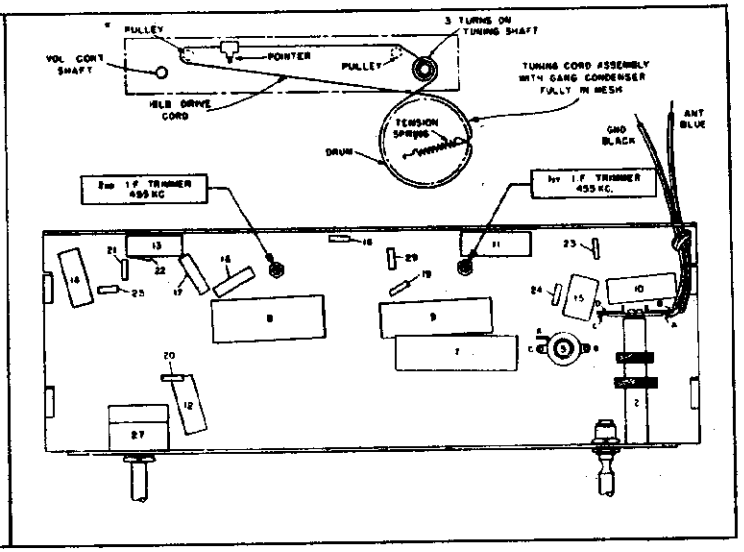
Before starting alignment:

(a) Check tuning dial adjustment by tuning gang condenser until plates touch maximum capacity stop (completely in mesh) at which point the dial needle must be exactly even with the last line at the low frequency end of the dial calibration. If dial needle does not point exactly to last line move to correct position.

(b) Use an accurately calibrated test oscillator with some type of output measuring device.

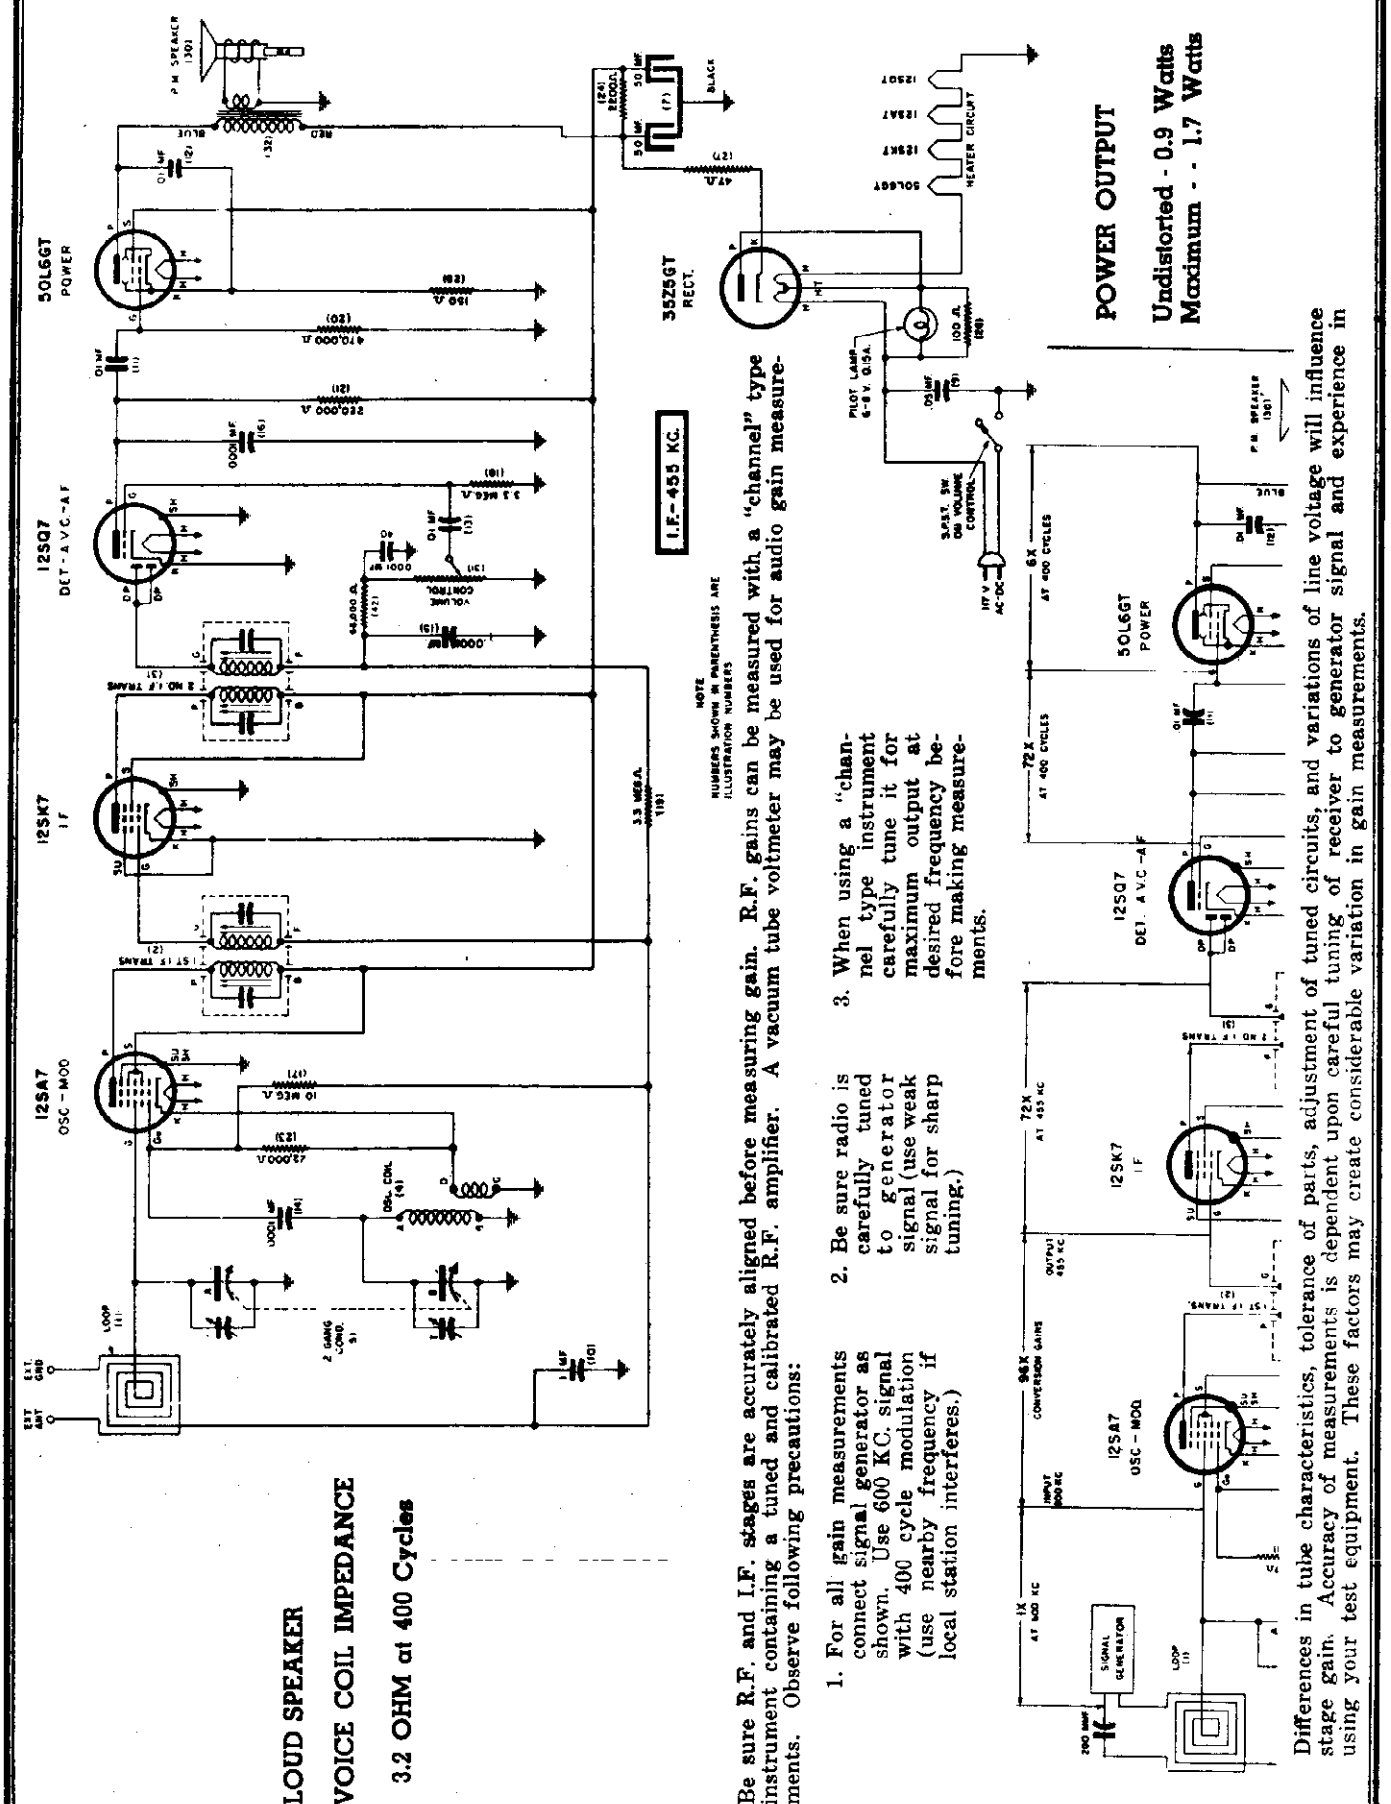
Steps	Set receiver dial to:	TEST OSCILLATOR: Adjust test oscillator frequency to:	TEST OSCILLATOR: Use dummy antenna in series with output of test oscillator consisting of:	TEST OSCILLATOR: Attach output of test oscillator to:	Refer to parts layout diagram for location of trimmers mentioned below:
1	I.F. Any point where no interference signal is received	455 K. C.	.02 MFD. condenser	High side to grid terminal of 1A7GT tube DO NOT REMOVE CAP. Low side to receiver black ground lead.	Adjust each of the second I.F. transformer trimmers for maximum output—then adjust each of the first I.F. trimmers for maximum output.
2	Exactly 1730 K. C.	Exactly 1730 K. C.	.00025 MFD. condenser	Receiver blue antenna lead Receiver black ground lead	Adjust 1730 K. C. oscillator trimmer for maximum output.
3	Exactly 1400 K. C.	Exactly 1400 K. C.	.00025 MFD. condenser	Receiver blue antenna lead Receiver black ground lead	While rocking gang condenser adjust 1400 K. C. antenna trimmer for maximum output.





MODEL 4A25

THE FIRESTONE TIRE & RUBBER CO.



Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe following precautions:

1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes.)
2. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
3. When using a "channel type instrument carefully tune it for maximum output at desired frequency before making measurements.

Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.

For Voltage and Parts List, see P.15-12

ALIGNMENT PROCEDURE

For alignment procedure read tabulations from left to right, and make the adjustment marked (1) first, (2) next, (3) third.

Before starting alignment:

(a) Check tuning dial adjustment by tuning gang condenser until plates touch maximum capacity stop (completely in mesh) at which point the dial needle must be exactly even with the last line at the low frequency end of the dial calibration. If dial needle does not point exactly to last line move to correct position.

(b) Use an accurately calibrated test oscillator with some type of output measuring device.

(c) PLACE LOOP ANTENNA IN THE SAME POSITION IT WILL BE IN WHEN THE SET IS IN THE CABINET.

Steps	Set receiver dial to:	TEST OSCILLATOR			Refer to parts layout diagram for location of trimmers mentioned below:
		Adjust test oscillator frequency to:	Use dummy antenna in series with output of test oscillator consisting of:	Attach output of test oscillator to:	
1	Any point where no interfering signal is received.	455 K. C.	.02 MFD. condenser	High side to front stator plates of tuning condenser. Low side to frame of condenser through a .02 Mfd. blocking condenser.	Adjust each of the second I. F. transformer trimmers for maximum output—then adjust each of the first I. F. trimmers for maximum output.
2	Exactly 1730 K. C.	Exactly 1730 K. C.	.00025 MFD. condenser	Receiver blue antenna lead Receiver black ground lead	Adjust 1730 K. C. oscillator trimmer for maximum output.
3	Approx. 1400 K. C.	Approx. 1400 K. C.	.00025 MFD. condenser	Receiver blue antenna lead Receiver black ground lead	While rocking gang condenser adjust 1400 K. C. antenna trimmer for maximum output.

EQUIPMENT AND PROCEDURE FOR ALIGNMENT

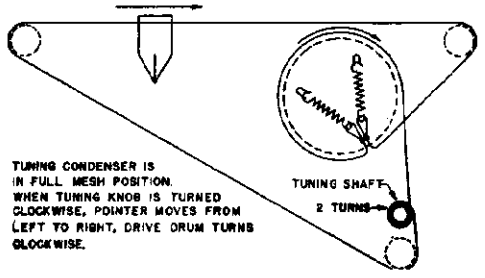
A Signal Generator calibrated at 455 Kc., 600 Kc. and 1500 Kc., and an output indicator are necessary to properly align this set. All adjustments should be made with the volume control set for maximum and the tone control for maximum treble, keeping the signal generator output as low as possible to prevent A.V.C. action and false settings.

The low side of the signal generator is connected to the chassis.

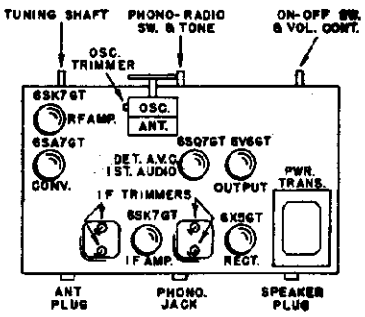
Steps	Connect High Side of Generator to	Set Generator At	Set Gang At	Adjust	Located	To Obtain
1	Set Volume Control at Maximum and Tone Control at Maximum Treble.					
2	Stator of Ant. Section of Gang with .1 Mf. In Series	455 Kc.	Minimum	2nd. I.F. Trimmers	Top of 2nd. I.F. Transformer	Maximum Output
3				1st. I.F. Trimmers	Top of 1st. I.F. Transformer	
4	Ant. Lead With 250 Mmf. In Series*	1500 Kc.	1500 Kc.	Osc. Trimmer	On Gang	
5		1500 Kc.	1500 Kc.	Ant. Trimmer	On Loop	
6	Check Pointer Calibration on 600 Kc.					

*Antenna wire protrudes from loop.

DIAL STRINGING

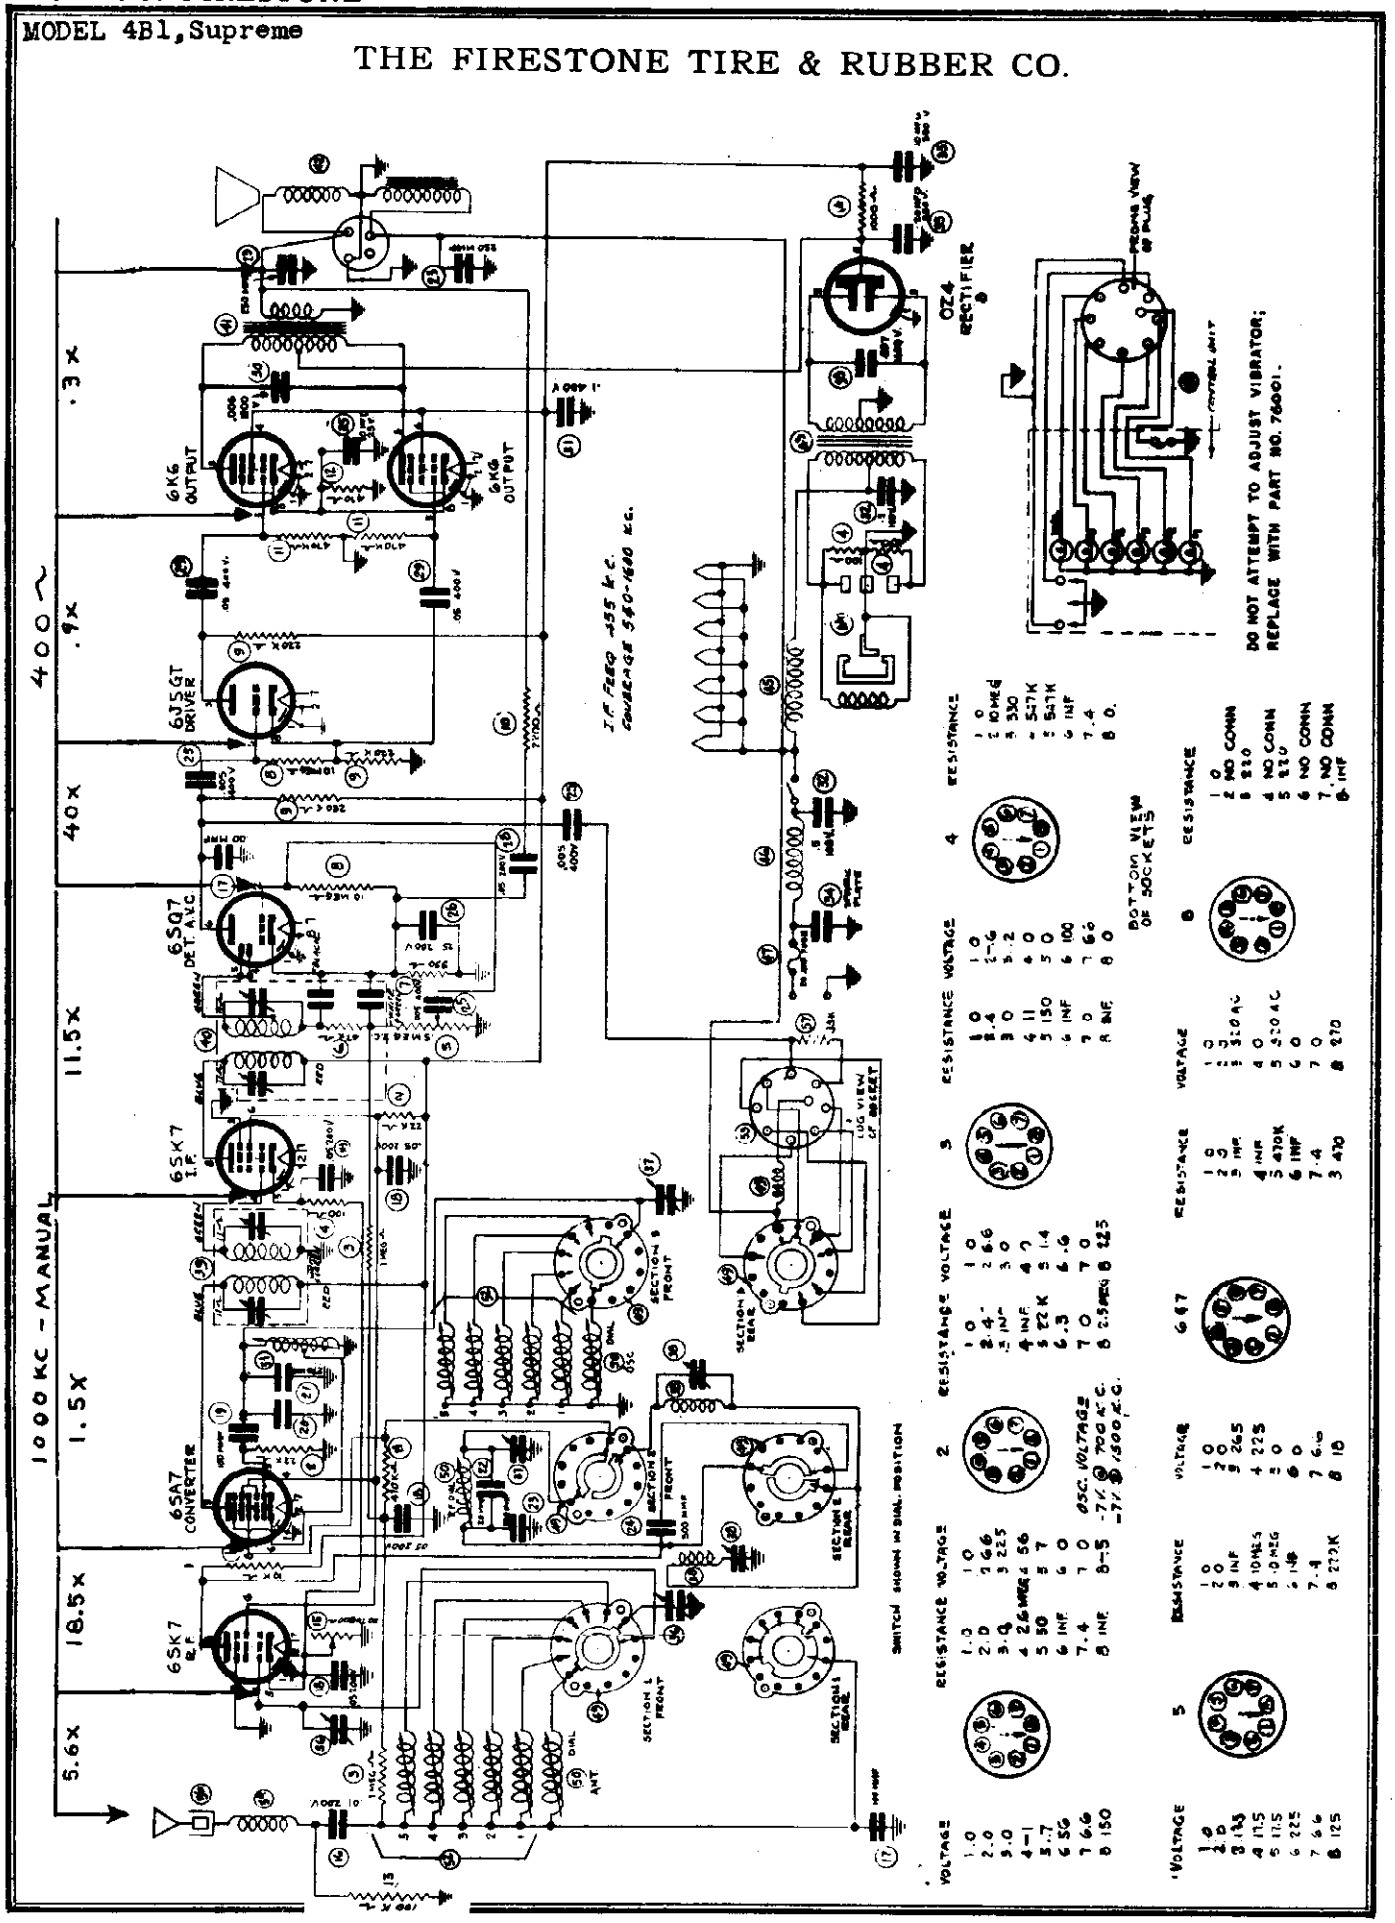


CHASSIS LAYOUT



MODEL 4B1, Supreme

THE FIRESTONE TIRE & RUBBER CO.



Although the set is relatively free of critical lead placement, when changing parts see that wires are in the same approximate position. If they are not, the set may oscillate or behave badly.

20. Tuning Control "Worm Reduction", Part No. 13538
21. Volume Control Shaft Bushing, Part No. 13537
22. Dial Drive Flexible Cable, Part No. 27298

All items except 13, 14, and 22 are packed with the receiver, other items are packed with the control kit.

PUSH BUTTON ADJUSTMENT

It is advisable to adjust the push buttons while set is still on the bench. With set operating and connected to the antenna, make a list of the five stations for which you desire Monomatic tuning. The stations chosen must be such that each will come within a different frequency range, as indicated by the following list. For example, it would not be possible to choose both a 550 kc station and a 600 kc station, since 600 kc does not come within the range of position #2. Arrange the station of lowest frequency will be #1; of next higher frequency, #2, next.

STATION	FREQUENCY RANGE
#1	540 to 920 kc
#2	680 to 1170 kc
#3	850 to 1450 kc
#4	850 to 1450 kc
#5	920 to 1570 kc

Operate the Monomatic button (marked Push) until the dial becomes illuminated, indicating that the receiver is adjusted for Dial Tuning. Then tune your #5 station, using the Station Selector knob. Operate the Monomatic button until the #5 station indicator (furthest right of the station indicators) becomes illuminated.

Turn the knob, located on the side of the set, which has the range 920-1570 kc indicated below it, until the desired station is heard at maximum volume.

After setting button #5, the antenna should be matched by adjusting the screw marked P. B. Antenna Trimmer in Figure 3, as #7. This screw is covered by a snap button. Slowly turn this screw until maximum volume is secured.

Return to Manual then tune in until your #1 indicator becomes illuminated. Then proceed to adjust the knob for this station until maximum signal is heard.

Assuming the lid is removed, place a 5/16 open end wrench on adjusting nut immediately ahead of heavy compression spring and adjust for further increase in signal, then readjust red knob for maximum signal. This is actually a tracking operation and will give optimum performance. This operating should be repeated for each button position.

After the car installation is made, it is recommended that all the red buttons be rechecked for maximum response.

After this re-check is completed, it is necessary to adjust the manual antenna trimmer, see #6. The adjusting screw for this is accessible after removing the snap button.

Return the set to dial tuning, turn the manual tuning control until a station near 1400 kc is heard, then adjust this screw for maximum volume. Now with set in car, depress monomatic button until #5 station is again illuminated. Check #7 trimmer for maximum signal.

ALIGNMENT PROCEDURE

1. Volume control full on, tone control on speech position. Keep generator input low except as noted by (*) below.
2. Connect output meter across voice coil of speaker.
3. Connect signal generator ground lead to receiver chassis.
4. Connect signal generator output lead to antenna.

Dial	*Generator Frequency*	*Dummy Antenna*	*Adjustments*
540 kc	455 kc	.1 Mfd.	1st & 2nd IF
*540 kc	455 kc	.1 Mfd.	IF Trap
Highest Frequency	1600 kc	.0001 Mfd.	Osc., RF, Antenna
600 kc	600 kc	.0001 Mfd.	600 kc Track

Repeat Alignment procedure to insure accuracy.

* Keep generator input low except as noted by (*).

DO NOT ATTEMPT TO ADJUST VIBRATOR; REPLACE WITH PART NO. 76001.

TUBE AND TRIMMER LOCATIONS

ALIGNMENT DATA AND SERVICING

Lack of sensitivity and poor tone quality may be due to any one or a combination of causes such as weak or defective tubes or speaker, open or grounded bias resistor, bypass condenser, etc. Never attempt to realign set until all other possible sources of trouble have been first thoroughly investigated and definitely proved not to be the cause.

NOTE: IT IS ABSOLUTELY NECESSARY THAT AN ACCURATELY CALIBRATED TEST OSCILLATOR WITH SOME TYPE OF OUTPUT MEASURING DEVICE BE USED WHEN ALIGNING THE RECEIVER AND THAT THE PROCEDURE BE CAREFULLY FOLLOWED, OTHERWISE THE RECEIVER WILL BE INSENSITIVE AND THE DIAL CALIBRATION WILL BE INCORRECT. THE TRIMMERS WILL BE REFERRED TO BY THEIR FUNCTION AS INDICATED ON THE PARTS DIAGRAM.

ALIGNMENT PROCEDURE

GENERAL DATA

The alignment of this receiver requires the use of a test oscillator that will cover the frequencies of 456, 600, 1400 and 1720 KC and an output meter to be connected across the primary and secondary of the output transformer. If possible, all alignments should be made with the volume control on maximum and the test oscillator output as low as possible to prevent the AVC from operating and giving false readings.

CORRECT ALIGNMENT PROCEDURE

The intermediate frequency (I. F.) stages should be aligned properly as the first step. After the I. F. transformers have been properly adjusted and peaked, the broadcast band should be adjusted.

I. F. ALIGNMENT

With the gang condenser set at minimum, adjust the test oscillator to 456 KC and connect the output to the grid of the first detector tube (12SA7) through a .05 or .1 mfd. condenser. The ground on the test oscillator should be connected to the ground bus, indicated in circuit diagram. Align all four I. F. trimmers to peak or maximum reading on the output meter.

BROADCAST BAND ALIGNMENT

Remove the chassis from the cabinet and set on a bench, taking care that no metal is near the loop. Do not make this setup on a metal bench. Connect the test oscillator to the antenna of the set through a 200 mmfd. (.0002) condenser. With the gang condenser set at minimum capacity, set the test oscillator at 1720 KC, and adjust the oscillator (or 1720 KC trimmer) on gang condenser. Next—set the test oscillator at 1400 KC, and tune in the signal on the gang condenser. Adjust the antenna trimmer (or 1400 KC trimmer) for maximum signal. Next set the test oscillator at 600 KC, and tune in signal on condenser to check alignment of coils.

Electrical and Mechanical Specifications

Frequency Range	540-1600 kc.	V.C. Impedance	3.5 ohms at 400 cycles
Intermediate Frequency	455 kc.	Power Output (Undistorted)	1 watt
Power Supply	105-125 volts, 60 cycle A.C.	Power Output (Maximum)	4 watts
Loudspeaker	Electrodynamic	Tuning Drive Ratio	4¾ to 1

TUBE COMPLEMENT

1—6SK7GT	RF Amplifier tube	1—6SQ7GT	Detector—AVC—1st Audio tube
1—6SA7GT	Converter tube	1—6K6GT	Power Output tube
1—6SK7GT	IF Amplifier tube	1—5Y3GT	Rectifier tube

NOTE: The above glass tubes are interchangeable with their metal equivalent.

ALIGNMENT PROCEDURE

The following equipment is necessary to properly align this chassis:

1. A signal generator which will provide an accurately calibrated signal at the frequencies listed.
2. An output meter.
3. A non-metallic screwdriver.
4. Dummy antenna: — .1 mfd. — RMA loop.

CONNECT GENERATOR TO	DUMMY ANTENNA	INPUT SIGNAL FREQUENCY	BAND	SET DIAL AT	TRIMMERS	PURPOSE
6SA7GT grid	.1 mfd	455 kc.	Broadcast	HF end	D E F G	Align IF

MODEL 6A1 (CHASSIS 6-5)

ALIGNMENT PROCEDURE

CHASSIS 5-1,5-2,5-3,6-1 and 6-5

Connect signal generator to control grid of first detector tube (6A7) through a .05 MF condenser, and to chassis. Do not remove grid cap. Also connect output meter across speaker voice coil. Turn band switch to "American Programs" position. Turn condenser gang completely out of mesh.

Set signal generator at 465 K.C. and carefully adjust the four I.F. trimmers (located in top of I.F. coil cans) to point showing highest reading on output meter.

Leave band switch in "American Programs" position. Connect signal generator to antenna and ground leads using a .0002 MF condenser in antenna lead.

Set signal generator and receiver dial both at 1700 K.C. Adjust B.C. OSC. trimmer until 1700 K.C. signal is heard.

Set signal generator at 1400 K.C. and turn condenser gang to the signal at 1400 K.C. Adjust antenna section and second section of preselector to point showing highest reading on output meter.

Set signal generator at 600 K.C. and rock pointer at 600 K.C. position on dial scale, while adjusting B.C. padder, until combination is found which gives highest output reading. (Note: If there is noise level at 600 K.C., padder can be adjusted to maximum noise without rocking gang and without use of signal generator. Use short wire for pick-up if necessary.)

Turn band switch to "Foreign Programs" position. Replace .0002 MF condenser in signal generator antenna lead with a 400 ohm carbon resistor.

Set signal generator and receiver dial both at 18.0 MC. Adjust SW OSC. trimmer until 18.0 MC signal is heard.

Set signal generator at 16.0 MC and turn condenser gang to the signal at 16.0 M.C. Adjust SW ANT. trimmer to point giving greatest output reading, while slightly rocking condenser gang.

SW padder is fixed (no adjustment necessary.)

NOTE: I.F. Sensitivity at 465 K.C. is 50 microvolts for 50 milliwatts output
Ant. Sensitivity at 600 K.C. is 30 microvolts for 50 milliwatts output (Chassis 5-1)
Ant. Sensitivity at 600 K.C. is 25 microvolts for 50 milliwatts output (Chassis 5-2 and 6-1)

MODELS 52T, 52Y (CHASSIS B5-1)

ALIGNMENT PROCEDURE (CHASSIS B5-1)

1. Connect signal generator to control grid of first detector tube (1C7G) through a .05 MF condenser and to chassis. Do not remove grid cap. Also connect output meter across speaker voice coil. Turn condenser gang completely out of mesh.
2. Set signal generator to 465 KC and carefully adjust the four I.F. trimmers (located in top of I.F. coil cans) to point showing highest reading on output meter.
3. Connect signal generator to antenna and ground leads using a .0002 MF condenser in antenna lead.
4. Set signal generator and receiver dial both at 1700 KC. Adjust osc. trimmer (on condenser gang) until 1700 KC signal is heard.
5. Set signal generator at 1400 KC and turn condenser gang to the signal at 1400 KC. Adjust antenna trimmer (under side of chassis) to point showing highest reading on output meter.

MODELS 56T, 56Y (CHASSIS B5-2)

NOTES ON SHORT WAVE ALIGNMENT

When aligning short-wave bands of Chassis B5-2, check to make sure you are aligning on a fundamental frequency and not on an image. This can be checked as follows: After aligning turn signal generator to maximum output and swing it to a point 930 KC (double the IF) above the alignment frequency, leaving the condenser gang set at the alignment frequency. If the alignment was correct, you will pick up an image signal at that point. If no image signal is heard, swing generator back to alignment frequency, decrease the capacity of the trimmers until another signal is heard, and repeat the alignment procedure. For example, after aligning a short-wave band at 5.8 MC, an image should be heard when the generator is swung to 6.73 MC. Likewise, after alignment at 18.7 MC, an image should be heard with the signal generator at 19.63 MC. Remember that while making this test, the condenser gang should not be moved with the signal generator, but should remain at the alignment frequency.

Circuit Diagram
Model T8
262 K. C.

ALIGNMENT OF THE I. F. TRANSFORMERS:

Models No. T8, No. D6, No. 75 and No. 100—Connect the feeder from the oscillator to the grid of the No. 77 autodyne tube. Remove the grid connection and connect a 500 M resistor from grid of the tube to ground.

Rotate the variable condensers to full open position.

Set the oscillator to a frequency of 262 K. C. adjust the I. F. and diode feeder trimmers to obtain maximum reading on the output meter.

ALIGNMENT OF VARIABLE CONDENSERS:

All Models—connect the feeder from a service oscillator to the antenna lead of the set and adjust the oscillator to 1540 K. C. Next, completely open the condenser, going to minimum capacity, and adjust the oscillator trimmer on the condenser gang for greatest reading on the output meter.

Now set the service oscillator to 1400 K. C. and rotate the variable condenser for a peak reading on the output meter of the signal from the oscillator. Then adjust the R. F. and antenna trimmers on the condenser gang for maximum reading of the output meter.

Next set the service oscillator to 600 K. C. Close the condenser gang until the signal is again tuned in and rotate the condensers back and forth while adjusting the oscillator padder condenser for highest reading on the output meter. The variable condensers should now track perfectly and coincide with the dial calibration.

GALVIN MFG. CORP.

ALIGNMENT PROCEDURE

Place the radio on the service bench with the front cover removed, but with the speaker and battery connected to it.

Turn the volume control to maximum position and leave it there throughout the alignment, reducing the signal generator output if necessary.

NOTE: Do not adjust the trimmer in the oscillator coil can that is covered with Scotch Tape. The original adjustment, made in the factory, should not be tampered with. (Fig. 7 below, shows all trimmer locations.)

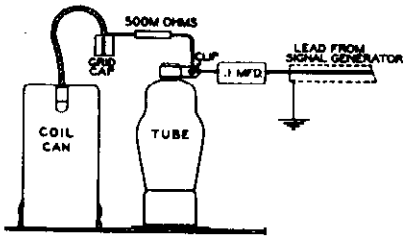
I.F. ALIGNMENT

1. Connect the signal generator to the control grid of the Osc.-Mod. tube (6A7) through a .1 MF condenser, having first removed the grid cap from the top of the tube. Connect a 500,000 ohm leak resistor from the grid of the tube to the grid cap just removed from the tube. (See Fig. 6.) Turn the condenser gang completely out of mesh. Connect an output meter across speaker voice coil.

2. Set the signal generator at 262 K.C. and carefully adjust the single trimmer in the Diode coil can to the point showing the highest reading on the output meter.

3. Adjust the two trimmers in the I.F. coil can to the point showing the highest output reading.

4. Repeat the I.F. and Diode adjustment several times for maximum accuracy.



SETTING THE RANGE

1. Connect the signal generator to the control grid of the R.F. tube (78) using the same .1 MF condenser and the same 500,000 ohm leak resistance.

2. Set the signal generator at 1560 K.C. and with the condenser gang completely out of mesh adjust the trimmer on the oscillator section of the condenser gang to the point showing the highest output reading.

3. Set the signal generator at 535 K.C. Turn the condenser gang completely in mesh and adjust the 600 K.C. trimmer in the Oscillator coil can for the highest output reading.

NOTE: The adjustments above set the range so the receiver will track with the calibrations in the control head.

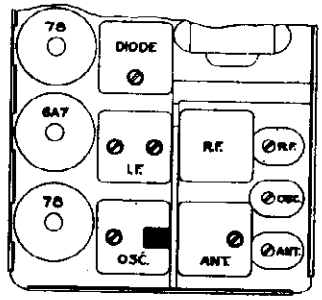
R.F. AND ANTENNA ALIGNMENT

1. Connect the signal generator to the antenna lead through a 40 MMF condenser and to chassis ground. Set the signal generator at 600 K.C. and turn the condenser gang until the signal is heard. Adjust the trimmer on the antenna coil can for the maximum output reading.

2. Set the signal generator at 1400 K.C. Turn the condenser gang until the signal is heard. Adjust the trimmer on the antenna section of the condenser gang for maximum output reading.

3. Adjust the trimmer on the R.F. section of the condenser gang for maximum output reading.

4. Recheck steps 1, 2, and 3, for accuracy.



TRIMMERS

SENSITIVITY AND STAGE GAIN MEASUREMENTS

These stage gain measurements will, if properly used, enable you to localize trouble quickly. They are intended for use with a signal generator that is accurately calibrated in microvolts.

Starting with the second detector - first audio stage, and working back step by step to I.F., Osc.-Mod., R.F. and finally to the antenna terminal, the circuit in which the trouble exists will quickly be determined by evidence of low gain, when signal generator attenuation readings are compared to the normal values as shown in the table.

All stage-gain measurements must be made with the volume control set for full volume. The shielded lead from the signal generator is connected to the top grid terminal of the tube through a .1 MF condenser, with a 500M Ohm resistor connected as a leak resistance between the grid of the tube and the grid cap which has been removed.

When measuring over-all sensitivity at the antenna terminal, use a 40 MMF condenser in place of the .1 MF. It must be remembered that the figures in the table are average and allowance must be made for variations between two sets of the same general type, due to difference of tube characteristics, etc.

Average Microvolt Input *	Generator Set at	Generator Feeder Connected to	Dummy Antenna Capacity	Leak Resistance	Output Meter Reading **
.25 Volts	400 Cycles	75 Grid	.1 MF	.5 Meg	2.2 Volts
25,000	262 K.C.	78 Grid (I.F.)	.1 MF	.5 Meg	2.2 Volts
700	262 K.C.	6A7 Grid	.1 MF	.5 Meg	2.2 Volts
800	600 K.C.	6A7 Grid	.1 MF	.5 Meg	2.2 Volts
45	600 K.C.	78 Grid (R.F.)	.1 MF	.5 Meg	2.2 Volts
3	600 K.C.	Ant. Lead	40 MMF	None	2.2 Volts

* For one watt output. V.C. Resistance - 5 ohms at 400 cycles.

** Meter connected across voice coil. 2.2 Volts equals 1 watt output.

APPROXIMATE VOLTAGE AND RESISTANCE READINGS:

INPUT TO TUNER: 24V (PUSH BUTTON DEPRESSED)
VOLTAGE ACROSS MOTOR: 18V (PUSH BUTTON DEPRESSED)
VOLTAGE ACROSS MAGNET: 6V (PUSH BUTTON DEPRESSED)
D.C. RESISTANCE OF MAGNETS: .78 Ω (COLD)
D.C. RESISTANCE OF MOTOR FIELD COIL: .675 Ω (COLD)
D.C. RESISTANCE OF MUTE WINDING (ON E-22-T & E-23-T ONLY): 23 Ω (COLD)

POINTS OF LUBRICATION:

ALL MOVING PARTS AND BEARINGS (EXCEPT MOTOR BEARINGS AND FIBRE DRIVE GEAR) ARE TO BE LIGHTLY LUBRICATED WITH 11M8930 MILK WHITE GREASE (KEYSTONE #78-6).

USE A LIGHT MOTOR OIL ON MOTOR BEARINGS

CAUTION ..... DO NOT OVER LUBRICATE!

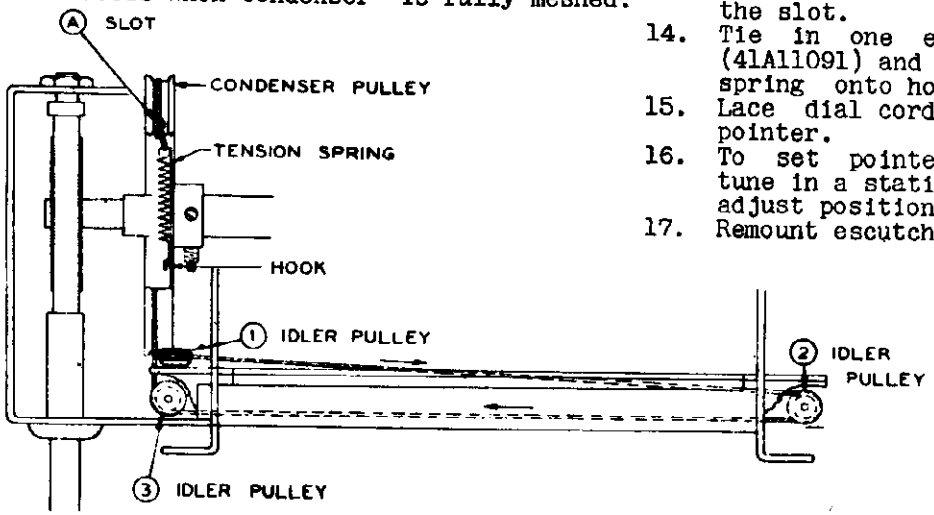
MODEL 39B-1
MODEL 39B-2

GALVIN MFG. CORP.

MODELS 39B-1 and 39B-2 POINTER CORD

1. Remove the chassis from housing.
2. Pull out the five push-buttons.
3. Remove the four screws which hold the escutcheon and remove same from front cover.
4. Remove broken cord.
5. Rotate condenser gang to fully meshed position.
6. Cut 28 inch length of 30 pound silk fish cord.
7. Thread one end of cord through slot (A). This is the slot nearest the front of chassis when condenser is fully meshed.
8. Run cord up and over rear idler pulley No. 1 in clockwise direction.
9. Continue cord across chassis to idler pulley No. 2 and around it in a clockwise direction.
10. Run cord back across chassis to front idler pulley No. 3 and around it in clockwise direction.
11. Run cord under brake shoe and around condenser pulley to slot (A).
12. Thread through slot (A).
13. Knot both ends of cord securely inside the slot.
14. Tie in one end of tension spring (41A11091) and hook other end of tension spring onto hook in condenser pulley.
15. Lace dial cord through hooks in dial pointer.
16. To set pointer to correct frequency, tune in a station of known frequency and adjust position of pointer on string.
17. Remount escutcheon plate.



SENSITIVITY AND STAGE GAIN MEASUREMENTS MODEL 39B-2

Volume Control Set at Maximum
* 1 Watt = 1.74 Volts
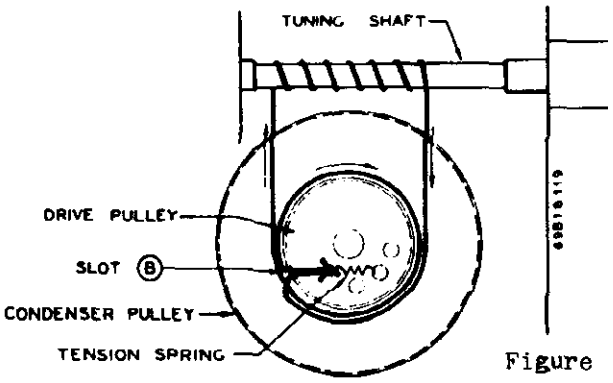
Tone Control Set At Voice
** Output meter connected across voice coil.
*** Use Special Dummy Part No.1X26767 or Booster Coil 24A26751 in series with a 35Mmf.Cond

GALVIN MFG. CORP.

MODELS 39B-1 and 39B-2 DIAL CORD INSTRUCTIONS

DIAL DRIVE CORD

Remove the chassis from the housing, and place on service bench with the tubes up.
Remove the broken string.
Turn the condenser gang to fully meshed position.
Cut a length of 30# silk fish cord 26 inches long.
Thread one end of cord through slot in drive pulley and with an ordinary paper clip fasten to tuning shaft bracket so the cord will stay in place.
In a counter clock-wise direction wind cord one full turn around drive pulley and up to tuning shaft.



Figure

Wind cord in clock-wise direction 7 turns around tuning shaft and down to drive pulley.
In a counter clock-wise direction, wind cord around drive pulley to slot (B).
Knot the two ends of cord together inside of drive pulley and fasten one end of spri (41A14759) to cord and the other end to hole in condenser pulley.

PRICES SUBJECT TO CHANGE WITHOUT NOTICE

This receiver is a 4 tube battery operated superheterodyne, covering the broadcast band from 538 to 1720 kc. The I.F. frequency is 455 kc.

POWER DRAIN:

'A' drain- .25 AMP. at 1.5 V.

'B' drain in 'L.D.' position- 8 MA. at 90 V.

'B' drain in 'H.P.' position- 12 MA. at 90 V.

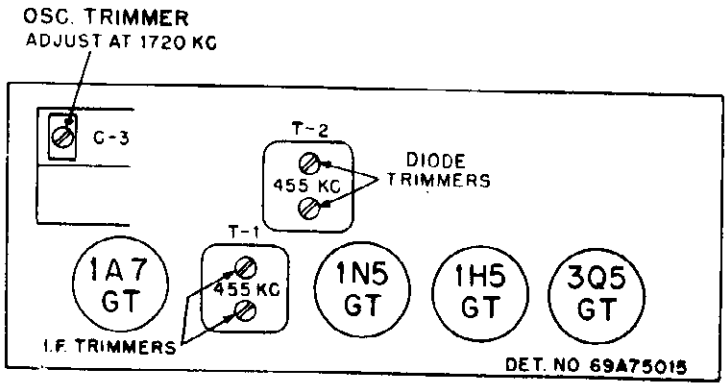
MODEL 45B12,Ch.HS-8

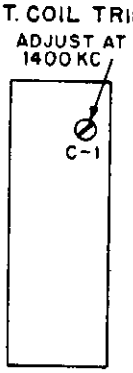
GALVIN MFG. CORP.

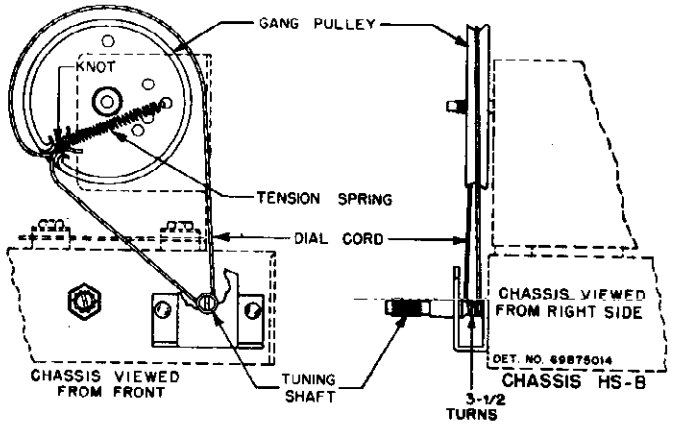
Turn Battery Saver Switch to 'H.P.' (high power) position.
Connect output meter across speaker voice coil (.38V = .05 watts).
Volume control set at maximum for all operations.
The adjusting screwdriver or alignment tool should be of the insulated type, such as Motorola Part No. 66A71008.

OPERATIONS IN ORDER	GANG CAPACITOR SET AT	DUMMY ANTENNA	GENERATOR CONNECTED TO	ADJUST TRIMMER NO.	GENERATOR SET AT (400~ 30% MODULATED)	AVERAGE INPUT FOR .38V OUTPUT
1. Adjust I.F.'s for maximum	Minimum Capacity	.1 mf	Osc.-Mod. grid	T-1 & T-2 (2 trimmers on each)	455 Kc	3750 microvolts to I.F. grid. 80 microvolts to Osc.-Mod. grid.
2. Set Oscillator trimmer	Minimum Capacity	.1 mf	Osc.-Mod. grid	Trimmer on C-3	1720 KC	100 microvolts
3. Adjust R.F. trimmer for maximum	1400 Kc.	200 mmf	Antenna Lead	C-1	1400 Kc	10 microvolts

4. Repeat above steps for maximum accuracy.





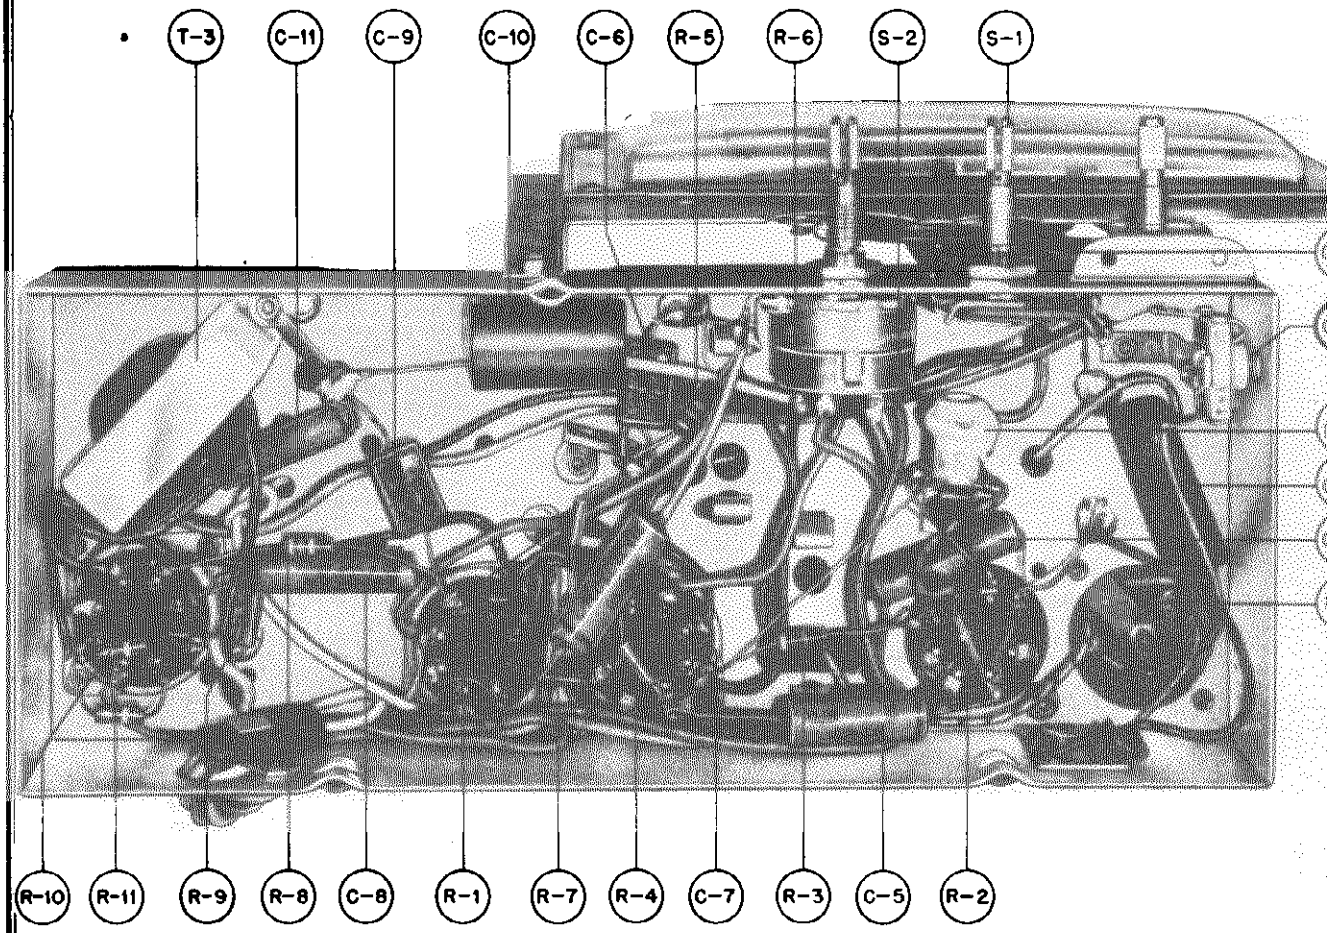


DIAL CORD LAYOUT

TO REPLACE DIAL CORD

1. Remove set from cabinet by pulling the knobs off and unscrewing the three chassis retaining screws from the bottom.
2. Remove the dial crystal by pushing out the four snap-in eyelets. Avoid damaging crystal and dial scale by pushing the eyelets out from the back. Do not remove the dial scale.
3. Remove the dial pointer by carefully pulling it off.
4. Next the dial plate is taken off by removing two screws.
5. Remove the old cord and replace with a new piece of 24 lb. fish line. See Figure 1. 2. 3. 4.
6. Secure the cord knot with a drop of cement.
7. Reassemble dial mechanism by working in reverse order. The pointer should be adjusted so that it is horizontal and pointing to the low frequency end when the gang capacitor is fully closed.

GALVIN MFG. CORP.



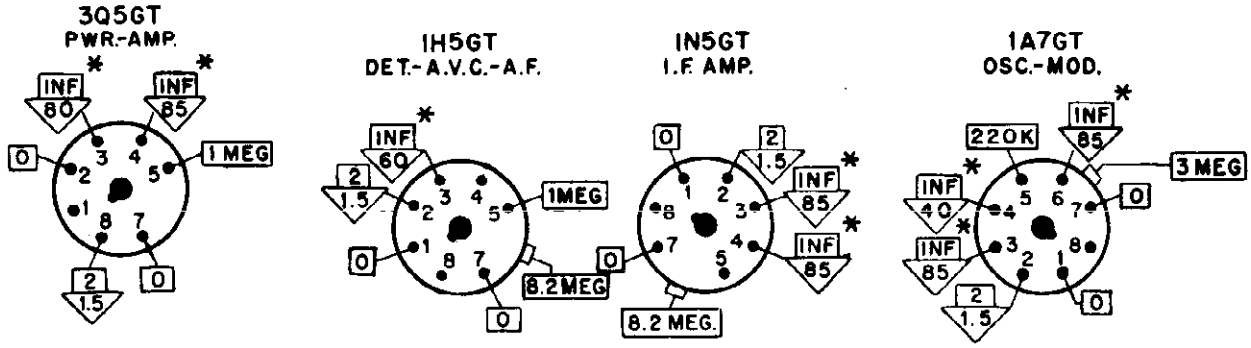
CHASSIS BOTTOM VIEW

VOLTAGES MEASURED ON A 20,000 Ω PER VOLT VOLTMETER TO CHASSIS WITH BATTERY SAVER SWITCH IN H.P. POSITION.

▽ = VOLTAGE MEASUREMENTS

▭ = RESISTANCE MEASUREMENTS.

* DISCONNECT ONE SIDE OF ELECTROLYTIC CAPACITOR C-10 WHEN MAKING RESISTANCE MEASURMENTS. CHECK ELECTROLYTIC CAPACITOR BY PUTTING POSITIVE OF CAPACITOR TO POSITIVE TERMINAL OF OHM-METER BATTERY. THE RESISTANCE SHOULD BE .5 MEG. OR SO.



BOTTOM VIEW OF CHASSIS

NOTE

'A' SOME EARLY PRODUCTION HS-1 CHASSIS WIRED AS SHOWN BY DOTTED LINES.

'B' LATER PRODUCTION HS-1 AND ALL HS-50 CHASSIS WIRED AS SHOWN BY DASHED LINES.

** C-11 USED ON HS-50; REPLACES TRIMMER ON ANTENNA SECTION OF GANG.

1. Remove the chassis from the cabinet.
2. Remove the broken cord.
3. Turn gang to full mesh position.
4. Cut a 31" length of 18 lb. silk fish cord.
5. Restring by placing cord around dial pulley, over shoulder rivets, and around gang pulley.
6. Tie cord to tension spring and fasten spring as shown in illustration.
7. Place a drop of shellac on cord knot.
8. Install and adjust pointer.
   a. Leave gang in full mesh position.
   b. Set pointer to "V" notch at low end of the dial.
   c. Clamp pointer to cord.
   d. Fix pointer to cord with a drop of shellac.
   e. The cord must not be too tight or bind, as too much tension will prevent the planetary drive (tuning shaft) from pulling the pointer. All elements of the pointer and string system must be free running.

ALIGNMENT CHART

Connect output meter across speaker voice coil (.38 V = .05 watt) Volume control set at maximum for all operations. The adjusting screwdriver or alignment tool should be of the insulated type, such as Motorola Part No. 66A71008

OPERATIONS IN ORDER	GANG CAPACITOR SET AT	DUMMY ANTENNA	GENERATOR CONNECTED TO	ADJUST TRIMMER TO	GENERATOR SET AT 400~ 30% MODULATED	AVERAGE MICROVOLT INPUT FOR .38V OUTPUT
1. Align I.F. and Diode for Maximum	Minimum	.1 mf	Osc. Mod.* Grid & B-	1-2-3-4	455 Kc	3000 Microvolts to I. F. Grid
2. Set Oscillator to dial scale	1620 Kc	.1 mf	Osc. Mod.* Grid & B-	5	1620 Kc	
3. Align R.F. for Maximum	1400 Kc	None	**Radiation	6	1400 Kc	45 Microvolts to Osc. Mod Grid thru .1 mf dummy .03 Volts at 400~ to 1st A.F.Grid

4. Repeat above steps for maximum accuracy.

* A convenient point for connection to B-, is the common terminal of the electrolytic capacitor, located in the middle of the chassis (bottom).

** Connect output of signal generator to a 5" diameter, 3 turn loop. With volume on full, and output meter connected across voice coil, bring loop close enough to receiver loop until output of 50 milliwatts is obtained (.38V on output meter) Vary distance between generator and receiver loops to maintain this output during alignment.

Prices Subject to Change Without Notice

1. Remove the chassis from the cabinet.
2. Remove the broken cord.
3. Turn gang to full mesh position.
4. Cut a 27" length of 18 lb. silk fish cord.
5. Replace new cord as follows:
   a. Tie one end of cord to tension spring on gang pulley.
   b. Make one complete turn around gang pulley in a counter-clockwise direction.
   c. Route the cord under and over shoulder rivets #1 and #2.
   d. Route the cord the length of dial scale, around the dial pulley, and over shoulder rivet #3.
   e. Make 3-1/2 turns around the tuning shaft in a counter-clockwise direction.
   f. Place cord over the bracket pulley and shoulder rivet #4 to the gang pulley.
   g. Place cord around the gang pulley counter-clockwise to the tension spring and tie.
6. Place a drop of shellac on the cord knots.
7. Install and adjust pointer.
   a. Leave gang in full mesh position.
   b. Set pointer to "V" notch at low end of the dial.
   c. Clamp pointer to cord.
   d. Fix pointer to cord with a drop of shellac or household cement.

6K6G	A. F.	X	6	145	150	0	....	0	12	.....
6Z7G	Output	X	6	160	0	0	160	0	0	.....

"X" indicates socket terminals used as dummy tie points.

All voltages measured from point indicated to chassis ground, using 1000 ohms per volt meter.

Battery voltage 6.

Battery drain 2.5 amps. at no signal.

Maximum power output 3 watts.

ALIGNMENT PROCEDURE Connect signal generator to control grid of first detector tube (6D8G) through a .05 MF condenser, and to chassis. Do not remove grid cap. Also connect output meter across speaker voice coil. Turn band switch to "American Programs" position. Turn condenser gang completely out of mesh.

Set signal generator at 465 K.C. and carefully adjust the four I.F. trimmers (located in top of I.F. coil cans) to point showing highest reading on output meter.

Leave band switch in "American Programs" position. Connect signal generator to antenna and ground terminals using a .0002 MF condenser in antenna lead.

Set signal generator and receiver dial both at 1700 K.C. Adjust B.C. OSC. trimmer until 1700 K.C. signal is heard.

Set signal generator at 1400 K.C. and turn condenser gang to the signal at 1400 K.C. Adjust antenna section and second section of preselector trimmers to point showing highest reading on output meter.

Set signal generator at 600 K.C. and rock pointer at 600 K.C. position on dial scale, while adjusting B.C. padder, until combination is found which gives highest output reading. (Note: If there is noise level at 600 K.C., padder can be adjusted to maximum noise without rocking gang and without use of signal generator. (Use short wire for pick-up if necessary.)

Turn band switch to "Police and Aircraft" position. Replace .0002 MF condenser in signal generator antenna lead with a 400 ohm carbon resistor.

Set signal generator and receiver dial both at 7.0 MC. Adjust POLICE OSC. trimmer until 7.0 MC signal is heard.

Set signal generator at 5.8 MC and turn condenser gang to signal at 5.8 MC. Adjust POLICE ANT. trimmer to point giving greatest output reading, while slightly rocking condenser gang.

Turn band switch to "Foreign Programs" position, still using 400 ohm carbon resistor in antenna lead to signal generator.

Set signal generator and receiver dial both at 22.0 MC. Adjust SW OSC. trimmer until 22.0 MC signal is heard.

Set signal generator at 18.7 MC. and turn condenser gang to signal at 18.7 MC. Adjust SW ANT. trimmer to point giving greatest output reading, while slightly rocking condenser gang.

INSTRUCTIONS FOR REMOVING CHASSIS FROM CABINET

Remove the line cord plug from 117 Volt outlet.
Remove the batteries.
Remove the dial plate hold-down screw in the upper left hand corner of the cabinet and the chassis retaining nut located beneath the front center of the chassis.
Slide the chassis and shelf out of the cabinet.

ALIGNMENT PROCEDURE

Connect output meter across speaker voice coil (.38 V = .05 watts).
Volume control set at maximum for all operations.
The adjusting screwdriver or alignment tool should be of the insulated type, such as Motorola Part No. 66A71008.
Chassis bottom plate must be in position on bottom of chassis.

OPERATIONS IN ORDER	GANG CAPACITOR SET AT	DUMMY ANTENNA	GENERATOR CONNECTED TO	GENERATOR SET AT (400~ 30% MODULATED)	ADJUST TRIMMER NO.	AVERAGE MICROVOLT INPUT FOR .38V OUTPUT
Align I.F.'s for maximum	Minimum Capacity	.1 mf.	Osc.-Mod. grid	455 Kc	T-1&T-2 (2 trimmers on each)	3700 microvolts to I.F. grid. 120 microvolts to Osc.-Mod. grid.
Set Oscillator trimmer	Minimum Capacity	None	Radiation Loop*	1620 Kc	C-3A	
Adjust R.F. trimmer for maximum	1400 Kc.	None	Radiation Loop*	1400 Kc	C-3B	135 microvolts to Osc.-Mod. Grid through .1 mf dummy.
Adjust Oscillator padder for maximum	600 Kc.	None	Radiation Loop*	600 Kc	C-4 (Rock gang capacitor for greatest output)	
Adjust antenna trimmer for maximum with set in cabinet	Approx. 1400 Kc.	None	Use weak station	---	C-3C	12 microvolts to R.F. grid through .1 mf dummy.

*Connect output of signal generator to a 5" diameter 3 turn loop. See Fig. 1. With volume control on full, bring loop close enough to receiver loop until an output of 50 milliwats is obtained (.38V on output meter). The distance between loops should never be less than 12". Vary distance between generator and receiver loops or adjust generator output to maintain .38V output during alignment.

NOTE:- ALL VOLTAGES ARE MEASURED BETWEEN B- (⏚) AND TUBE BASE PIN TERMINALS WITH A 1000 OHM PER VOLT VOLTMETER.
RESISTANCE MEASUREMENTS ARE MADE WITH ELECTROLYTIC CAPACITOR C-14 DISCONNECTED AT B- (⏚).
CHECK ELECTROLYTIC CAPACITOR BY PUTTING POSITIVE OF CAPACITOR TO POSITIVE TERMINAL OF OHMMETER. RESISTANCE SHOULD BE APPROX. 5 MEGOHM.

ALIGNMENT PROCEDURE

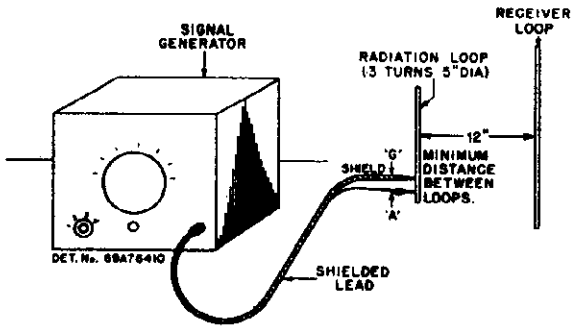
Connect output meter across speaker voice coil (.38V = .05 watt)
Volume control set at maximum for all operations.
The adjusting screwdriver or alignment tool should be of the insulated type, such as Motorola Part No. 66A71008

OPERATION IN ORDER	GANG CAPACITOR SET AT	DUMMY ANTENNA	GENERATOR CONNECTED TO	ADJUST TRIMMER NO.	GENERATOR SET AT (400 ~ 30% MODULATED)	AVERAGE MICROVOLT INPUT FOR .38V OUTPUT
1. Align I.F.'s for maximum	Minimum	.1 mf	Osc.-Mod. grid	T-1 & T-2 (2 trimmers on each)	455 Kc	4000 Microvolts to I. F. Grid
2. Adj. wave-trap for minimum response	Minimum	.1 mf	R.F. Grid	C-5	455 Kc	- - - - - - -
3. Set Oscillator to dial scale	Minimum	None	Radiation Loop*	C-3	1720 Kc	- - - - - - -
4. Align R.F. for maximum	1400 Kc	None	Radiation Loop*	C-1 (on loop) Should be adjusted with set in cabinet	1400 Kc	60 microvolts to Osc.-Mod. grid through .1 mf. dummy. 5.5 microvolts to R.F grid through .1 mf dummy
5. Repeat above steps for maximum accuracy.						.31 volt at 400~ to 1st A.F. grid.

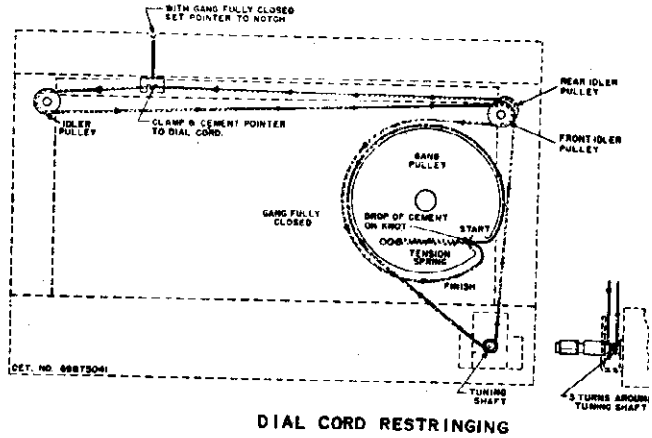
* *Connect output of signal generator to a 5" diameter 3 turn loop. See Fig. 2 . With volume control on full, bring loop close enough to receiver loop until an output of 50 milliwatts is obtained (.38V on output meter). The distance between loops should never be less than 12" Vary distance between generator and receiver loops or adjust generator output to maintain .38V output during alignment.*

TO REPLACE DIAL CORD:

1. Remove loop from cabinet (see instruction on loop back).
2. Remove chassis from cabinet by pulling the knobs off and unscrewing the three chassis retaining screws from the bottom.
3. Remove the old dial cord and replace with a new piece of 18 lb. cord. See Figure 1 for procedure.
4. With the gang fully closed, set pointer to left hand notch of dial background and clamp to cord. In clamping, be careful not to cut the cord.
5. Secure the pointer to cord and dial cord knot with a drop of cement.
6. Reassemble by working in reverse order.



METHOD OF RADIATING SIGNAL TO THE RECEIVER



DIAL CORD RESTRINGING

BOTTOM VIEW OF CHASSIS

This receiver is a 6 tube AC-DC superheterodyne, with a self contained loop antenna and a stage of R.F. amplification. The frequency range is 538 to 1720 kc and the I.F. frequency is 455 kc.

POWER INPUT: 117 V. AC-DC, 30 WATTS.

MODEL 550A

SENSITIVITY AND STAGE GAIN MEASUREMENTS

Average Microvolt Input *	Generator Set At	Generator Feeder Connected To	Dummy Antenna Capacity	Leak Resistance	Output Meter Reading **
12,000	262 K.C.	I.F. Grid	.1 Mfd.	.5 Meg.	1.74
300	262 K.C.	Mod. Grid	.1 Mfd.	.5 Meg.	1.74
350	600 K.C.	Mod. Grid	.1 Mfd.	.5 Meg.	1.74
12	600 K.C.	R.F. Grid	.1 Mfd.	.5 Meg.	1.74
6	600 K.C.	Antenna	***	None	1.74

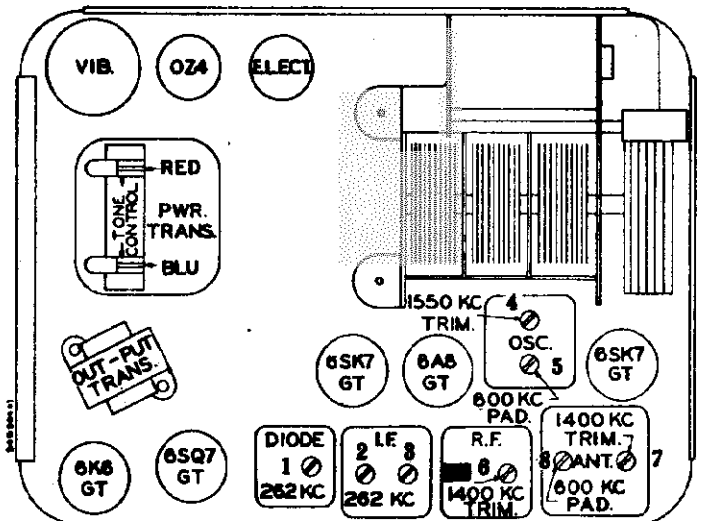
Volume Control Set At Maximum
* 1 Watt = 1.74 Volts

Tone Control Set At Music
** Output meter connected across voice coil.
*** Use Special Dummy Part No. 1X18018.

ALIGNMENT CHART

Operations In Order	Gang Condenser Set At	Dummy Antenna	Generator Connected To	Adjust Trimmers No.	Generator Set At
1	Minimum	.1 Mfd.	Osc.-Mod. Grid	1-2-3	262 K.C.
2	1550 K.C. (Min.)	.1 Mfd.	Osc.-Mod. Grid	4	1550 K.C.
3	535 K.C. (Max.)	.1 Mfd.	Osc.-Mod. Grid	5	535 K.C.
4	1400 K.C.	*	To Special Dummy	6	1400 K.C.
5	1400 K.C.	*	To Special Dummy	7	1400 K.C.
6	600 K.C.	*	To Special Dummy	8	600 K.C.

* Use Special Dummy Part No. 1X18018.



VOLTAGE CHART

POSITION	PLATE	SCREEN	CATHODE
R.F.	120	85	0
Osc-Mod.	120	75	0
I.F.	125	75	0
Det-AVC-AF	35	-----	1.5
Pwr.	140	125	0
Rect.	AC	-----	145

All measurements from chassis ground to socket terminal using 1000 ohms per volt meter.
Current Consumption—8.5 Amps. Battery Voltage 6.3
Maximum power output 4 Watts

GALVIN MFG. CORP.

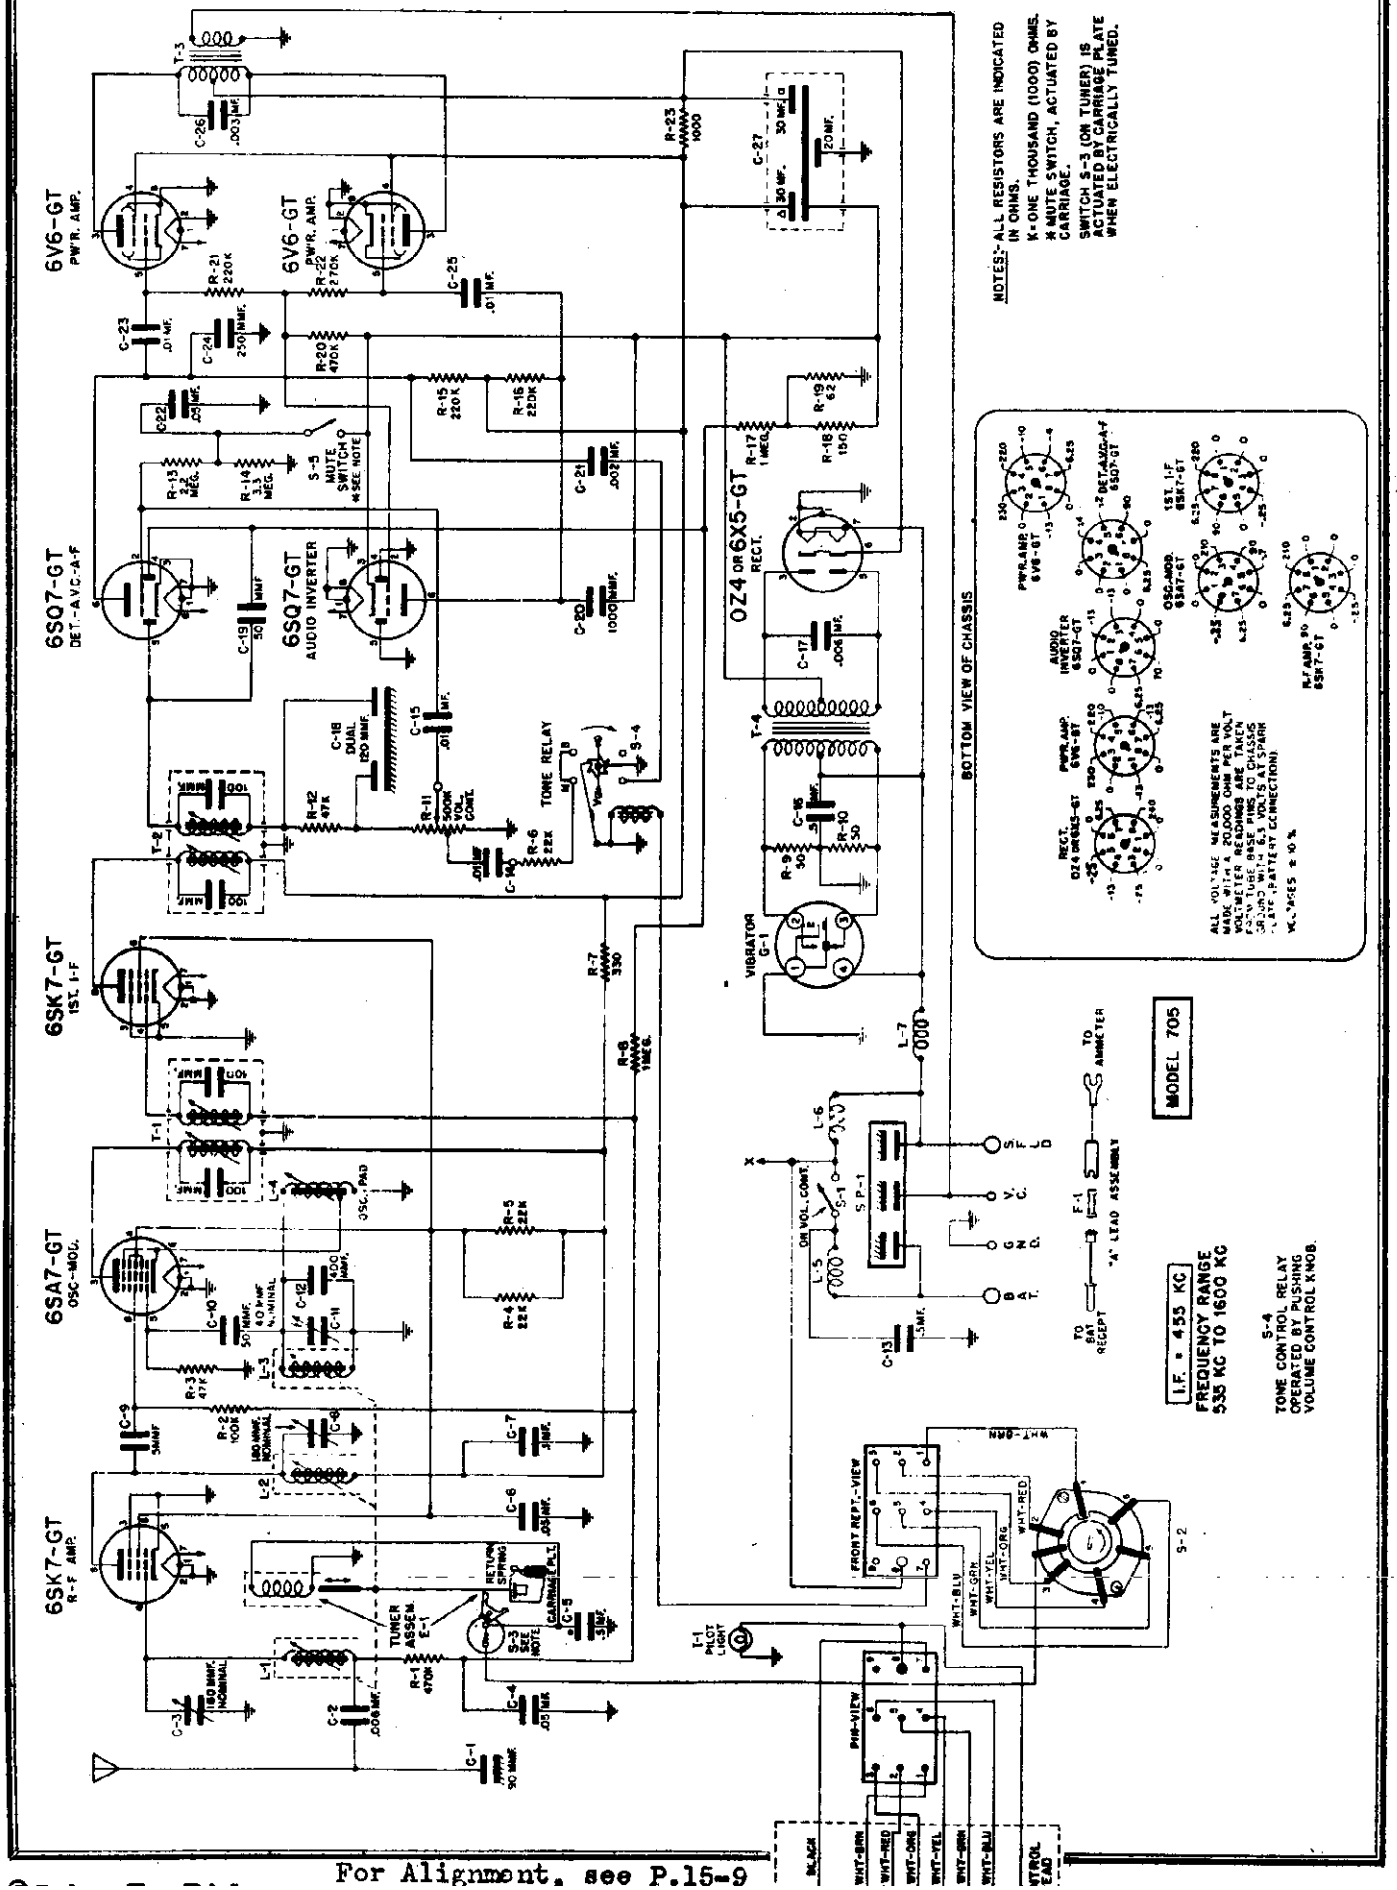
For Alignment see P.15

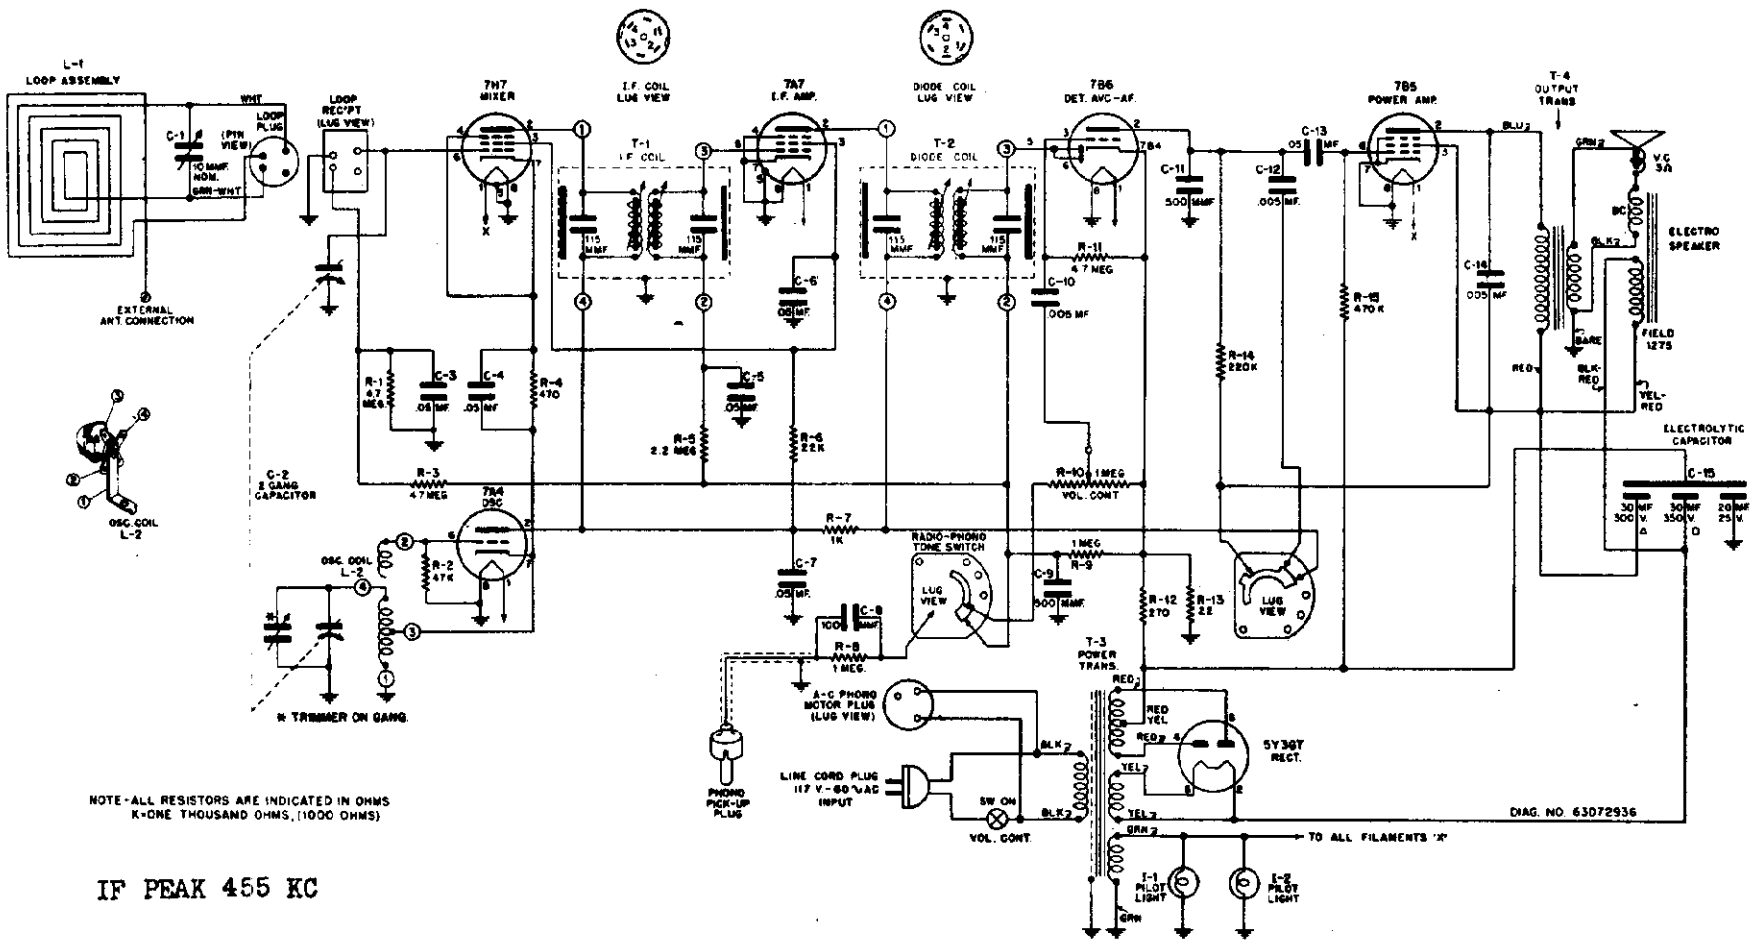
MODEL 705, Ch. AS-16

GALVIN MFG. CORP.



NOTES:- ALL RESISTORS ARE INDICATED IN OHMS.
K = ONE THOUSAND (1000) OHMS.
* MUTE SWITCH, ACTUATED BY CARRIAGE.
SWITCH S-3 (ON TUNER) IS ACTUATED BY CARRIAGE PLATE WHEN ELECTRICALLY TUNED.

For Alignment, see P.15-9



IF PEAK 455 KC

TO REMOVE CHASSIS FROM CABINET:

1. Remove the 3 control knobs.
2. Remove the 7 wood screws from bottom of cabinet.
3. The bottom board with chassis attached may now be removed from the cabinet.
4. The loop, phono pickup and phono motor cords all terminate in plugs. Do not attempt to unsolder them when freeing chassis from cabinet.
5. To expose bottom of chassis, remove the two screws that hold chassis to bottom board.

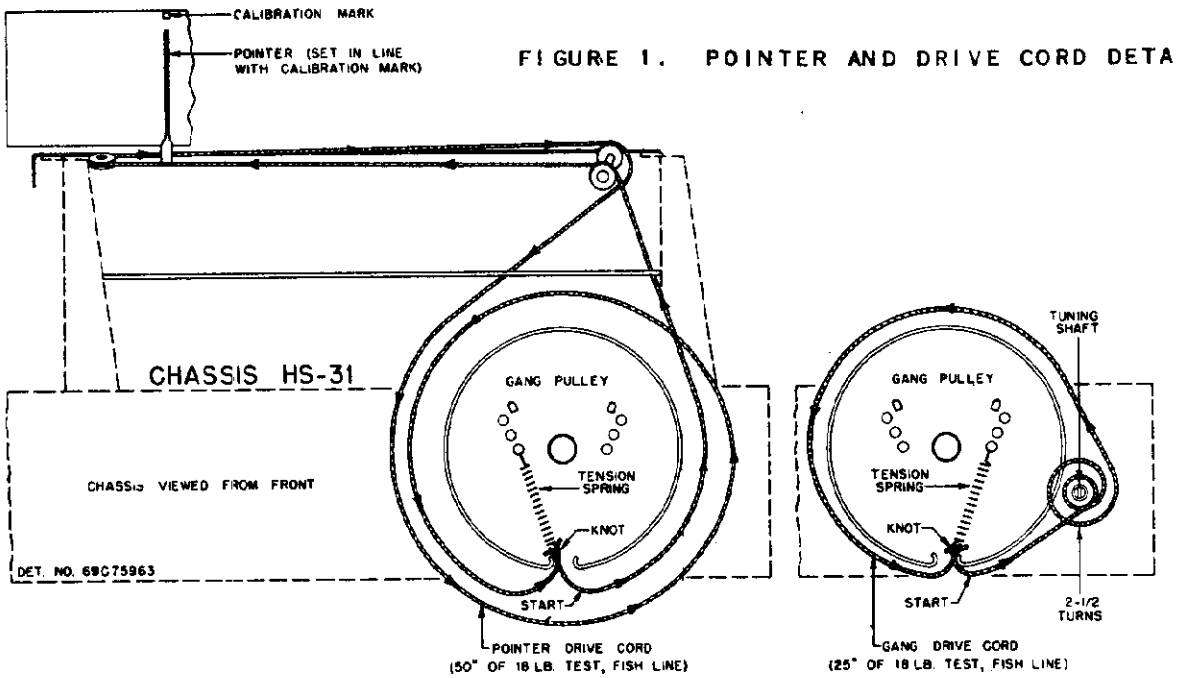


FIGURE 1. POINTER AND DRIVE CORD DETAIL

TO SERVICE POINTER AND DRIVE CORDS:

1. Remove chassis from cabinet as outlined under "TO REMOVE CHASSIS FROM CABINET."
2. All chassis are to be restrung as shown in Figure 1.
3. Secure all cord knots with a drop of household cement.
4. Secure pointer to cord with a drop of household cement.

NOTE:- ALL RESTRINGING IS PERFORMED WITH GANG FULLY CLOSED.

CHASSIS HS-31

NOTE - A VTVM WAS USED TO MAKE MEASUREMENTS. IF A 20,000 OHM PER VOLT METER IS USED ALL GRID & AVC VOLTAGES WILL READ LOWER.

MEASUREMENTS ARE MADE FROM TUBE BASE PIN TERMINALS TO CHASSIS.

PHONO-RADIO SWITCH IN RADIO POSITION.

VOLUME CONTROL ON FULL, DIAL SET TO L.F. END AND NO STATION TUNED IN.

VOLTAGE TOLERANCE ± 10%.

RESISTANCE TOLERANCE ± 20%.

▭ = RESISTANCE MEASUREMENTS.

◡ = VOLTAGE MEASUREMENTS.

BACK VIEW OF CHASSIS

GALVIN MFG. CORP.

Refer to Figure 3 for location of adjustment trimmers and cores. Connect output meter across speaker voice coil. (.38V = .05 watt). Volume control set at maximum for all operations. The PHONO-RADIO-TONE switch should be set to RADIO treble position. The adjusting screwdriver or alignment tool should be of the insulated type, such as Motorola Part No. 66A71008.

OPERATIONS IN ORDER	GANG CAPACITOR SET AT	DUMMY ANTENNA	GENERATOR CONNECTED TO	GENERATOR SET AT (400~ 30% MODULATED)	ADJUST TRIMMER OR CORE NO.	AVERAGE MICROVOLT INPUT FOR .38V OUTPUT
1. Align I. F. & diode for maximum	Minimum	.1 mf.	Mixer Grid	455 Kc.	1,2,3 & 4	6 microvolts
2. Set Oscillator trimmer	Minimum	.1 mf.	Mixer Grid	1620 Kc.	5	
3. Peak loop antenna	1400 Kc.	None	Radiation loop*	1400 Kc.	6 (should be repeaked after loop & set are installed in cabinet.)	

* Connect output of signal generator to a 5" diameter 3 turn loop. , See Figure 2. With volume control on full, bring loop close enough to receiver loop until an output of 50 milliwatts is obtained. (.38V on output meter). The distance between loops should never be less than 12". Vary distance between generator and receiver loops or adjust generator output to maintain .38V during alignment.

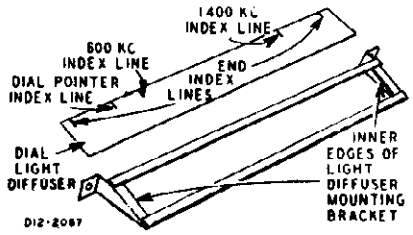
DIAL CALIBRATION

In order to align the receiver, the dial pointer must be positioned on the dial string correctly with reference to the dial. Index lines are provided on the dial light diffuser for this purpose.

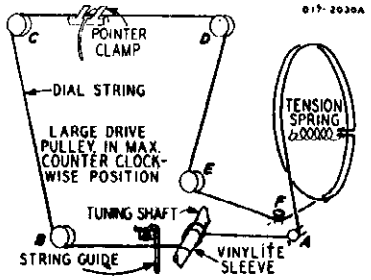
Before aligning the receiver (or when replacing the dial light diffuser) check the position of the diffuser strip, making certain that the two extreme index lines are aligned with the inner edges of the diffuser mounting bracket opening. The bracket should be crimped at one point to prevent movement of the diffuser strip. To position the dial pointer, turn the gang condenser to the fully closed position. The dial pointer should be directly over the dial pointer index line. (See illustration).

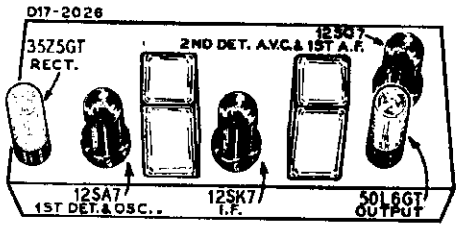
The 600 KC and 1400 KC index lines are for use when aligning the receiver.

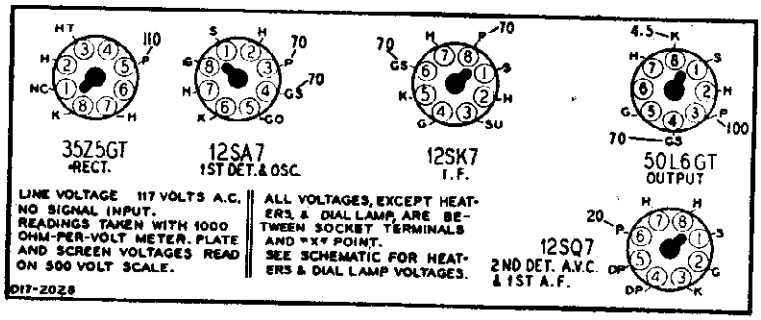


DRIVE CORD REPLACEMENT

Turn gang condenser to fully open position. Use a new drive cord and fasten one end to the tension spring. Fasten the other end of the tension spring to the hook on the drive pulley. Pass the drive cord through the slot in the drive pulley rim and continue over top of pulley (counterclockwise) one-half turn. Pass cord around idler stud A and wind two turns clockwise around tuning shaft, turns must progress away from chassis. Pass cord in front of string guide, around pulley B, over pulleys C, D, E and around idler stud F. Wind cord counterclockwise one and one-half turns around drive pulley in back of previous one-half turn. Pass cord through slot in pulley rim, stretch the tension spring and fasten free end of cord to spring. Refer to the Replacement Parts List for the number of the drive cord assembly for use with this radio.







ALIGNMENT PROCEDURE

Check dial pointer position, see DIAL CALIBRATION paragraph.

Volume Control—Maximum All Adjustments.

Allow Chassis and Signal Generator to "Heat Up" for several Minutes.

The equipment in column at right is required for aligning:

Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.

Output Indicating Meter: Non-Metallic Screwdriver.

Dummy Antennas—.1mf., 50 mmf.

25594	Transformer—Speaker Output (T6)

Reference Numbers such as (C4) are shown on circuit diagram.

Parts not listed above, may be ordered by part number as shown in the picture and by complete description, send a sketch if possible. Order parts from your local Gamble Store.

We cannot supply speaker cones. We can replace or repair a damaged speaker for a nominal price if it is returned to our factory, transportation charges prepaid.

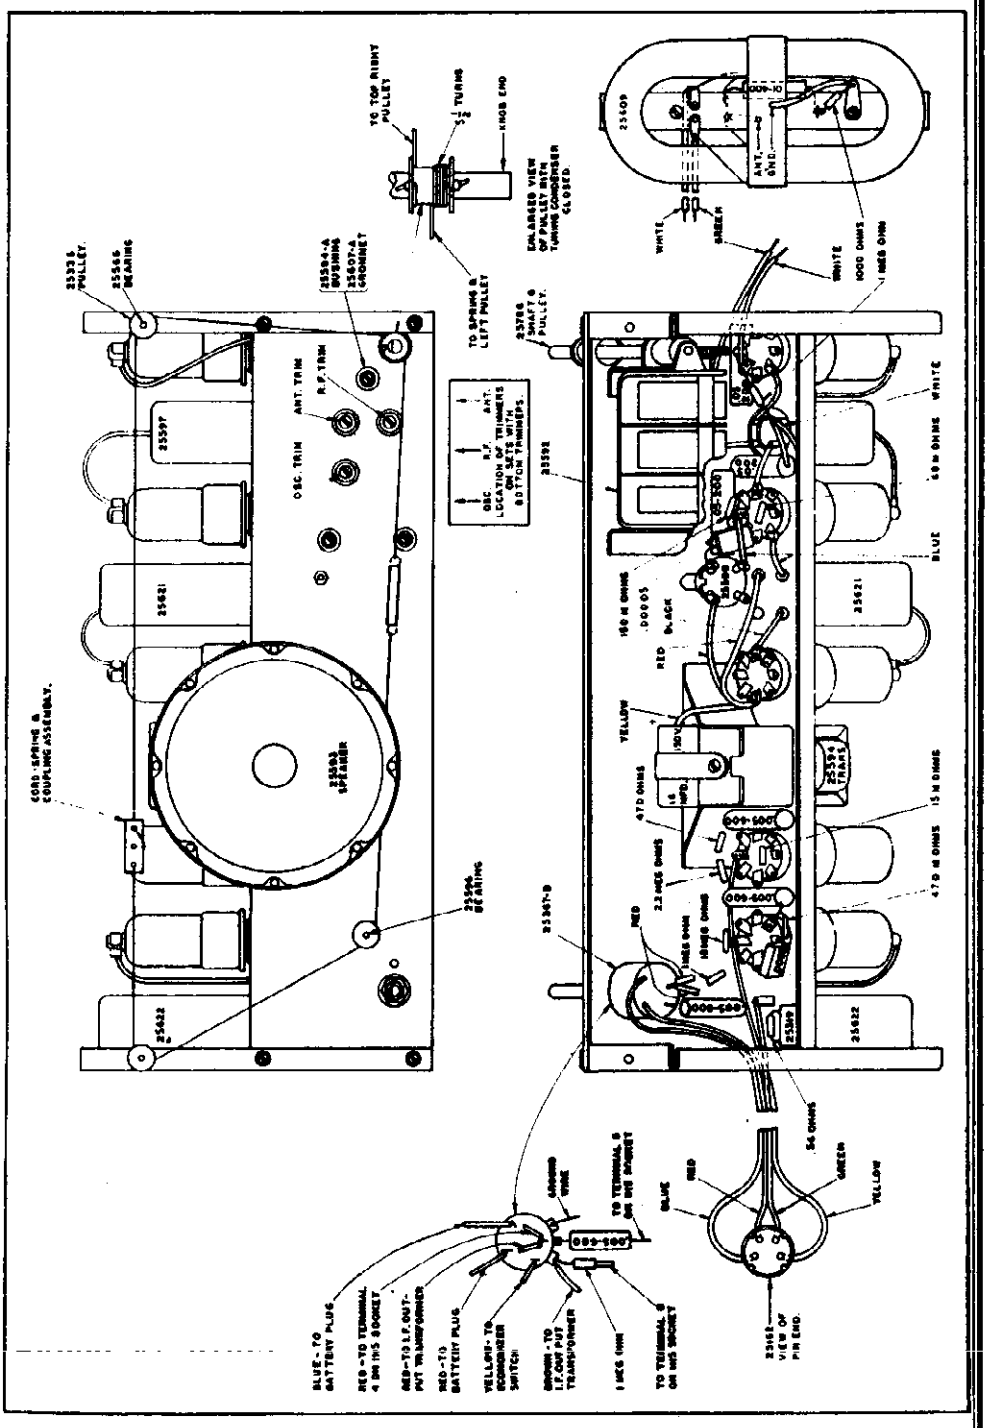
MODEL 43-6451

GAMBLE-SKOGMO INC.

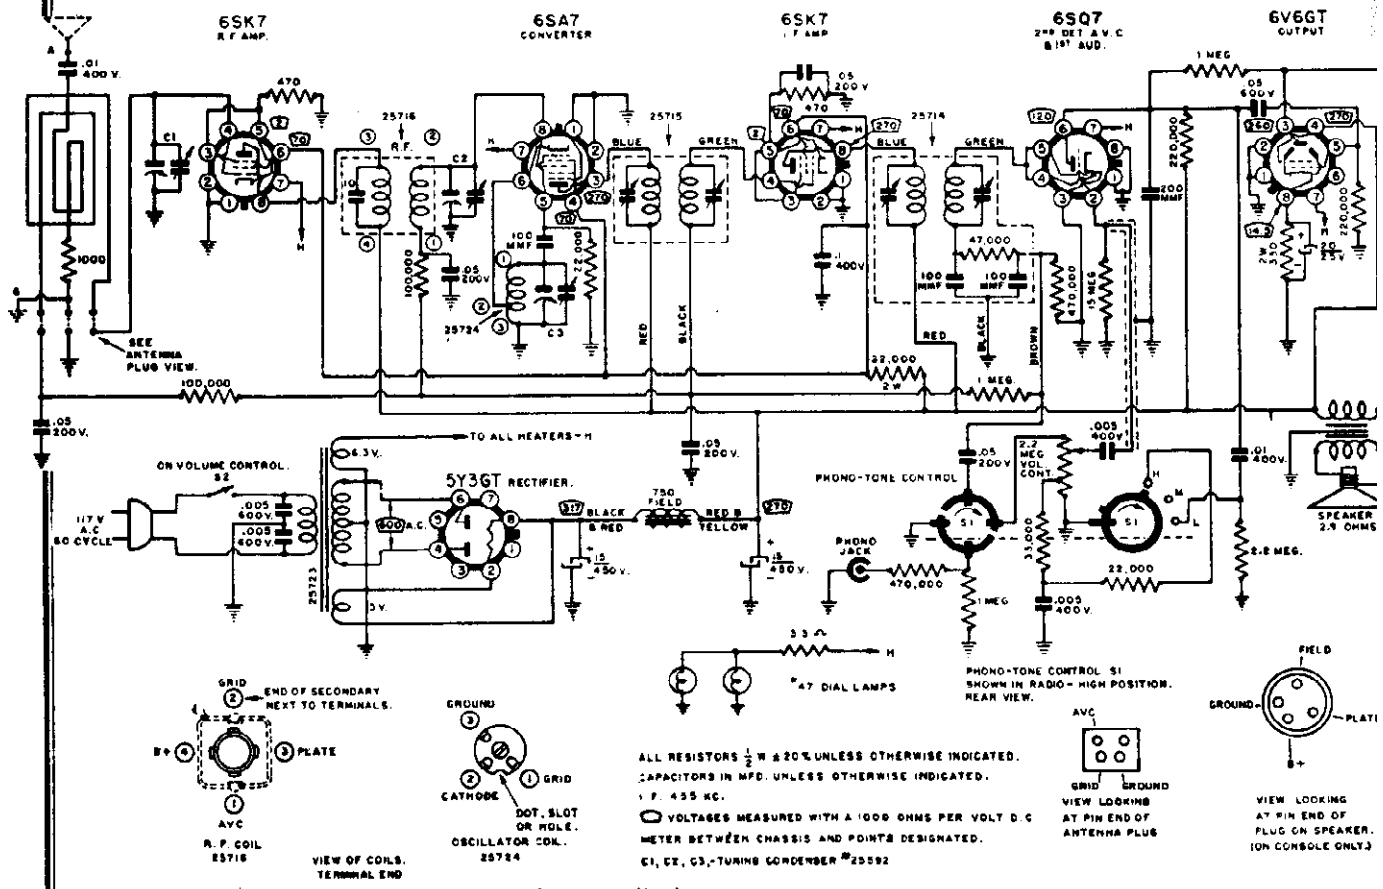
To Properly Align—Remove chassis from cabinet, and align I.F. Transformers in the conventional manner with a test oscillator adjusted to 455 KC, connected to the grid of the 1A7GT through a .1 Mfd condenser, with the tuning condenser set at minimum capacity. To align tuning condenser, connect test oscillator to antenna wire (green) through a .0001 Mfd. condenser. Adjust oscillator trimmer condenser (located on left top) to 1620 KC with tuning condenser at minimum capacity (completely out of mesh). The antenna and R. F. sections are trimmed at 1400 KC. Antenna trimmer is top right; R. F. trimmer is below at right. Dial pointer may be adjusted to scale by slipping bakelite pointer coupling on dial cord.

Battery Unit Voltages—Should be checked with receiver turned on—if B voltage is below 60 Volts, battery unit should be replaced.

Dial Cord Replacement—Is best accomplished by replacing complete cord assembly #25811, which is made up to correct length. In an emergency 30 lb. fish line may be used. See picture of chassis for correct installation.



GAMBLE-SKOGMO INC.



REMOVAL OF CHASSIS—Disconnect set from wall plug. Remove knobs by pulling straight out. Remove loop plug on back of chassis. Remove two screws under cabinet, chassis may be withdrawn from rear.

ALIGNMENT—Sets are properly aligned at the factory with precision equipment and the adjustments should not be disturbed unless a coil, tuning condenser or IF transformer has to be replaced or the set has been subject to damage or tampering. Alignment should only be done with the aid of an accurate signal generator and output indicating instrument.

TO PROPERLY ALIGN—Remove chassis from cabinet, and align I. F. Transformers in the conventional manner with a Signal Generator adjusted to 455 KC, connected to the grid of the 6SA7 through a .1 Mfd. condenser, with the tuning condenser set at minimum capacity. To align tuning condenser, carefully place loop in normal relation to chassis, connect Signal Generator to antenna clip through a .0001 Mfd. condenser. Adjust oscillator trimmer condenser (located on left top) to 1620 KC with tuning condenser at minimum capacity (complete out of mesh). The antenna and R. F. sections are trimmed at 1400 KC. Antenna trimmer is top right; R. F. trimmer is below at right. Dial pointer may be adjusted to scale by slipping pointer coupling on dial cord.

DIAL CORD REPLACEMENT—Is best accomplished by replacing complete cord assembly No. 25834 which is made up to correct length. In an emergency 30 lb. fish line may be used. See picture of chassis for correct installation.

DIAL SCALE REPLACEMENT—Remove chassis. Remove pointer track by removing the two wood screws holding it to the cabinet. Dial scale may now be lifted out from front of cabinet. When installing new scale—see that long screws in track bracket engage the notches in the ends of the scale.

DESCRIPTION

This radio is an AC operated superheterodyne set. It is designed for use on the usual home lighting service of 110 - 120 volts 50 - 60 cycles.

The set contains a built-in loop antenna (aerial) and will receive stations on the standard broadcast band 535 - 1620 kilocycles.

This radio combines many desirable features such as: Oversize eight inch Electro-dynamic speaker for excellent tone; Bass "boost" to give "rich" reproduction at normal volume; Three gang tuning condenser for better selectivity; High efficiency circuit for minimum cost of operation and maintenance.

INSTALLATION

TUBES—All the tubes are properly mounted in the sockets when the set is shipped. There is a possibility however, that the tubes have worked loose during shipment. Press each tube firmly into its socket.

POWER—Be sure that your home is supplied with current that is within the voltage and frequency rating given above.

SERVICE PARTS LIST

MODEL 43-8685

When ordering parts always mention complete factory model number, series and issue.

Part No.	Description
25692	Antenna—Loop
25596	Bearings—For Wood Pulleys
25572	Bracket—Tuning Condenser—Front
25573	Bracket—Tuning Condenser—Rear
25574	Bracket—Speaker
25765	Bracket—Pointer Track
25660	Cabinet
25597	Coil—R. F.
25724	Coil—Oscillator
25688	Condenser—Filter 15-450, 15-450, 20-25
25592	Condenser—Tuning C-1, C-2, C-3
25690	Control—Volume (with AC Switch S-2)
25068	Cord—AC and Plug
25834	Cord—Dial (includes Spring and Pointer Coupling)
25751	Dial Scale—Glass
25578	Dial Pointer
25829	Knob—Tone
25696	Knob—Volume and Tuning
25710	Phono—Pick-Up Socket
25693	Plug—For Loop

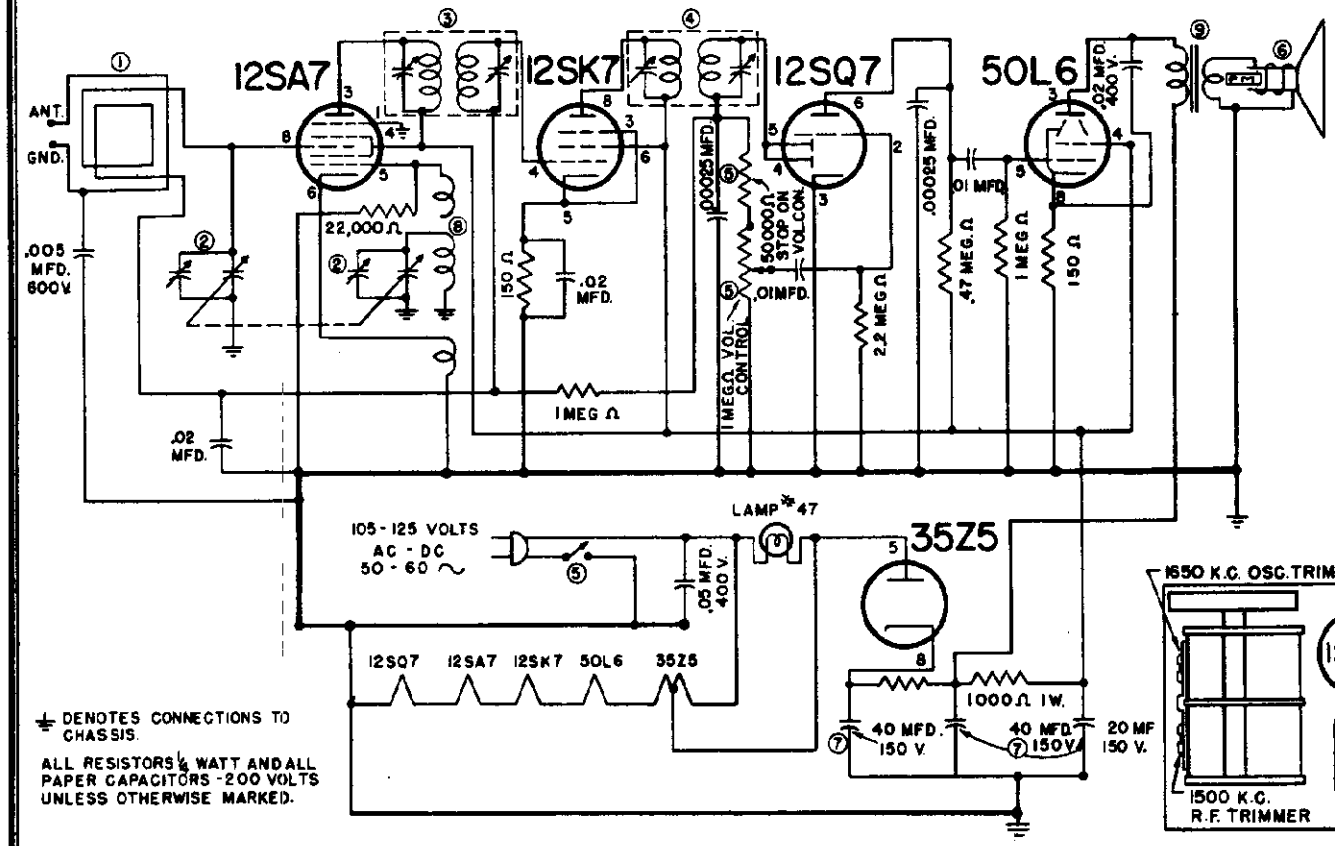
Part No.	Description
25336	Pulley—Wood—Small
25819	Pulley—Manual Drive With Shaft
25607	Rubber—Grommets
25774	Screw—Set For Worm Gear (Tuning Condenser)
25576	Socket—Dial Lamp
25620	Socket—Octal
25006	Socket—For Loop
25712	Speaker—With Transformer
25562	Switch—Tone S-1,
25711	Track—Pointer
25715	Transformer—I. F. Input
25714	Transformer—I. F. Output
25713	Transformer—Output—Speaker
25723	Transformer—Power 60 Cycles

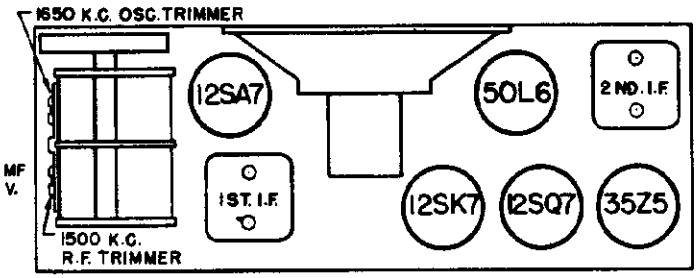
Note: Resistors and condensers not listed will be supplied on order- specify value.

We cannot supply speaker cones. We can replace or repair a damaged speaker for a nominal price if it is returned to our factory, transportation charges prepaid.

In ordering any part not listed give complete description and a sketch, if possible.

Order parts from your local Gamble Store.





TRIMMER AND TUBE LOCATION DIAGRAM

POWER CONSUMPTION: 30 Watts.

I.F. = 455 K.C.

① 1.403 LOOP ASSEMBLY
② 2.163 2GANG VARIABLE COND.
③ 1.259 1ST. I.F. TRANSFORMER
④ 1.409 2ND. I.F. TRANSFORMER
⑤ 8.200-1 VOLUME CONTROL & SWITCH
⑥ 30,300 P.M. 5" SPEAKER
⑦ 5.400-8 ELECTROLYTIC CAP. 40-40-20 MFD.
⑧⑧ 1.402 OSCILLATOR COIL
⑨ 9.200 OUTPUT TRANSFORMER

ALIGNMENT: Should it become necessary at any time to check the alignment of this receiver, proceed as follows:

(1) Set the Signal Generator to 455 KC and connect to the stator lug on the rear section of the Variable Capacitor. Connect the Signal Generator Ground lead to the chassis. Connect a suitable output meter across the Speaker Voice Coil Connections. Turn the Volume Control to the maximum position. Turn the Variable Capacitor to the extreme clockwise position.

(2) Adjust the trimmers located at the top of the first and second I. F. Transformers for maximum output as indicated on the Output Meter.

(3) Loosely couple the Signal Generator lead to the Loop and set to 1650 KC.

(4) With the Variable Capacitor set at the extreme clockwise position, tune in the 1650 KC signal by means of the Oscillator Trimmer on the Variable Capacitor (front section).

(5) Set the Signal Generator to 1500 KC and turn the Tuning Control so that this frequency is indicated on the dial. Adjust the Antenna Trimmer on the Variable Capacitor (rear section) for maximum output. No other adjustments are necessary.

K = KILOHMS

I. F. = 455 K C.

① 1-405 LOOP ANTENNA
② 2-203 2 GANG VARIABLE CONDENSER
③ 1-412 1ST I.F. TRANSFORMER
④ 1-413 2ND I.F. TRANSFORMER
⑤ 8.200-2 VOLUME CONTROL & SWITCH
⑥ 30-302 3½" P.M. SPEAKER
⑦ 5.400-3 ELECTROLYTIC CAP. 60-25-150 MFD.
⑧ 1-414 OSCILLATOR COIL
⑨ 11.200 ELECTRIC-BATTERY SWITCH

ALIGNMENT (Electric Operation) Receiver removed from cabinet. Should it become necessary at any time to check the alignment of this receiver, proceed as follows:

(1) Set the Signal Generator to 455 KC and connect to the stator lug (front section) of the Variable Capacitor. Extend Loop leads and connect to Loop contacts inside top of cabinet. Connect the Signal Generator ground lead to the chassis. Connect a suitable output meter across the Speaker Voice Coil Connections. Turn the Volume Control to the maximum position. Turn the Variable Capacitor to the extreme counter-clockwise position (minimum capacity).

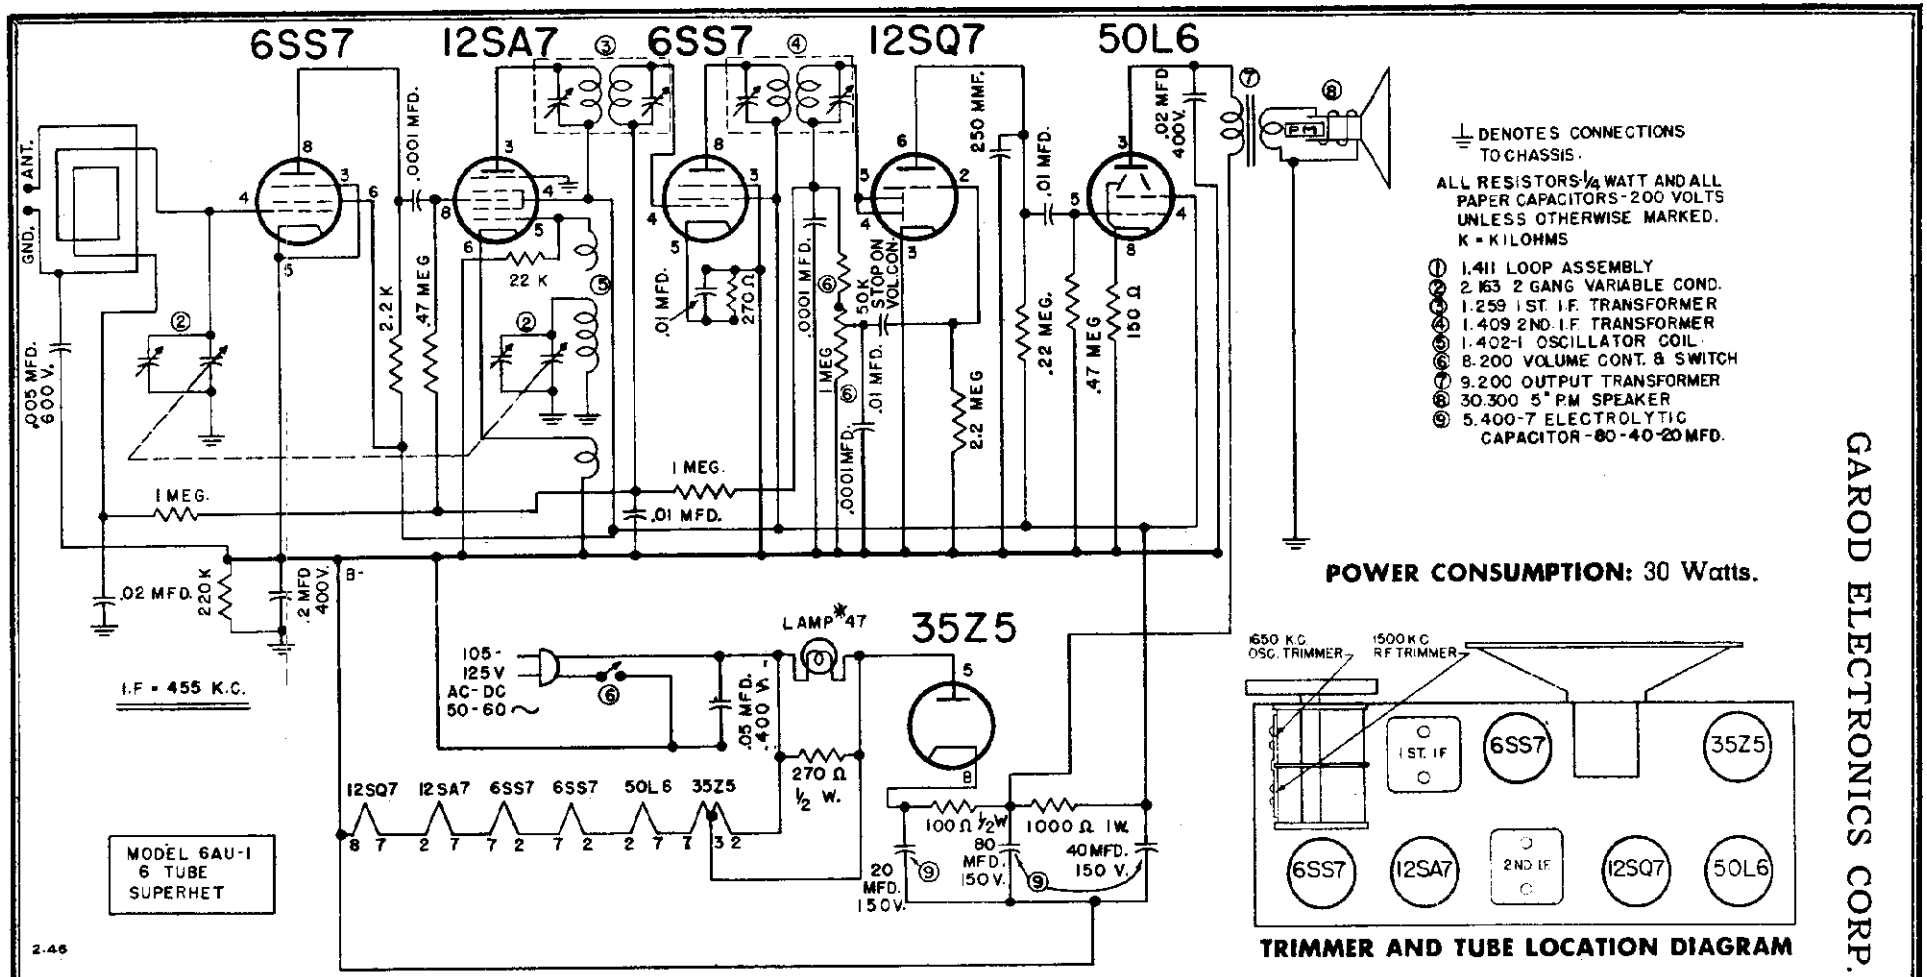
(2) Adjust the trimmers located at the top of the first and second I. F. Transformers for maximum output as indicated on the output meter.

(3) Loosely couple the Signal Generator lead to the Loop (open position) and set to 1650 KC.

(4) With the Variable Capacitor set at the extreme counter-clockwise position (minimum capacity), tune in the 1650 KC signal by means of the Oscillator Trimmer on the Variable Capacitor (rear section).

(5) Set the Signal Generator to 1500 KC and turn the Tuning Control so that this frequency is indicated on the dial. Adjust the Antenna Trimmer on the Variable Capacitor (front section) for maximum output.

(6) Install the chassis into the cabinet and check the dial calibration. If further adjustment is required, remove the two plug buttons on the side of the cabinet adjacent to the Variable Capacitor and adjust the Oscillator Trimmer as required for correct dial calibration. Readjust the Antenna Trimmer for maximum output and replace plug buttons.



GAROD ELECTRONICS CORP.

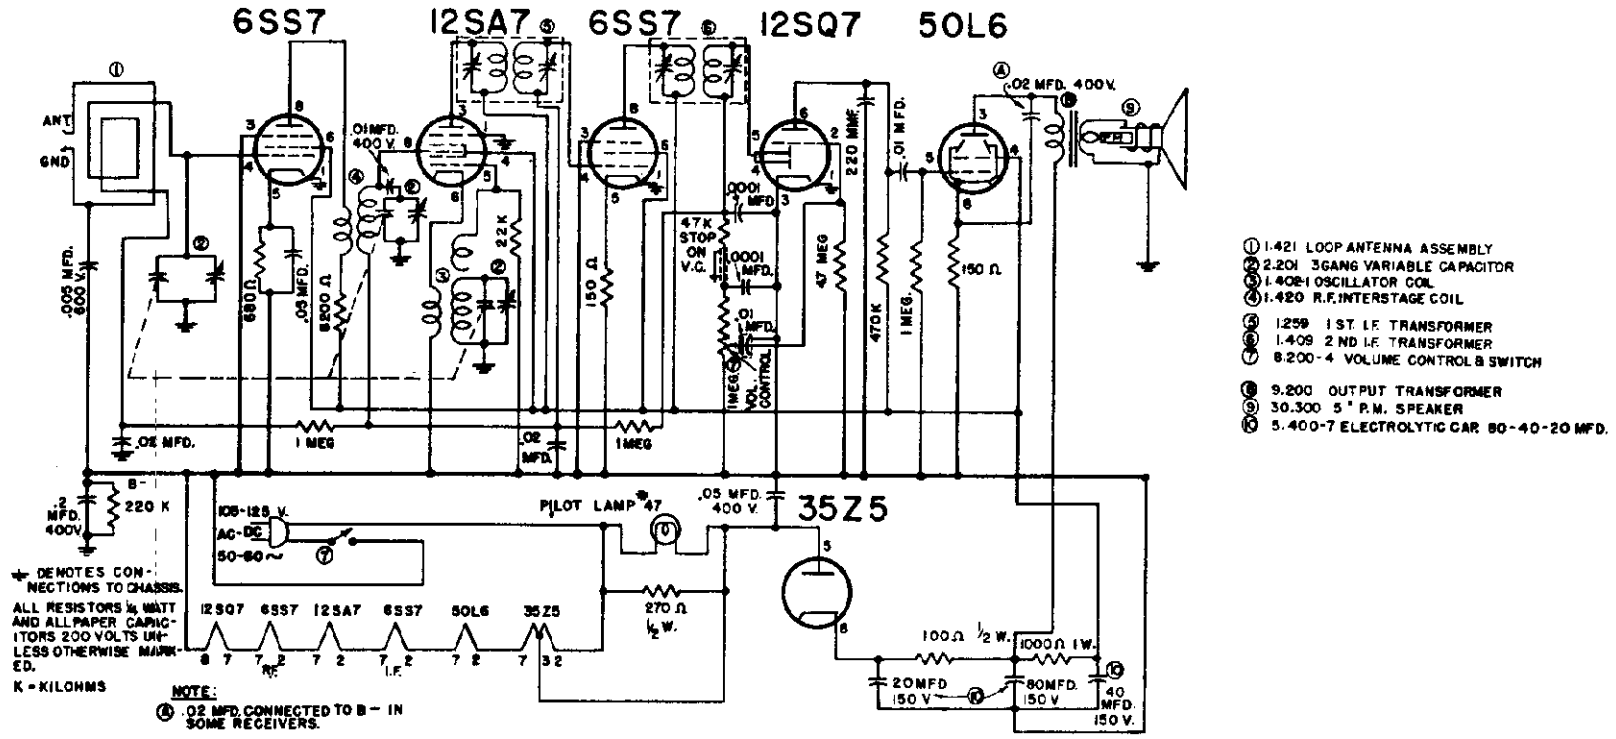
ALIGNMENT: Should it become necessary at any time to check the alignment of this receiver, proceed as follows:

Set the Signal Generator to 455 KC and connect to the grid of the 6SS7 R. F. Amplifier, or to the Stator Lug on the rear section of the Variable Capacitor. Connect the Signal Generator Ground Lead to a "–B" point underneath the chassis. Connect a suitable output meter across the Speaker Voice Coil Connections. First turn the Volume Control to the maximum position, Turn the Variable Capacitor to the extreme clockwise position.

Adjust the trimmers located at the top of the first and second I. F. Transformers for maximum output. Loosely couple the Signal Generator lead to the Loop and set to 1650 KC.

With the Variable Capacitor set at the extreme clockwise position, tune in the 1650 KC signal by means of the Oscillator Trimmer on the Variable Capacitor (front section).

Set the Signal Generator to 1500 KC and turn the Tuning Control so that this frequency is indicated on the dial. Adjust the Antenna Trimmer on the Variable Capacitor (rear section) for maximum output. No other adjustments are necessary.



① 1.421 LOOP ANTENNA ASSEMBLY
② 2.201 3GANG VARIABLE CAPACITOR
③ 1.402-1 OSCILLATOR COIL
④ 1.420 R.F. INTERSTAGE COIL
⑤ 1259 1 ST. I.F. TRANSFORMER
⑥ 1.409 2 ND I.F. TRANSFORMER
⑦ 8.200-4 VOLUME CONTROL & SWITCH
⑧ 9.200 OUTPUT TRANSFORMER
⑨ 30.300 5" P.M. SPEAKER
⑩ 5.400-7 ELECTROLYTIC CAP. 80-40-20 MFD.

(1) Set the Signal Generator to 455 KC and connect to the grid of the 6SS7 R. F. Amplifier, or to the Stator Lug on the rear section of the Variable Capacitor. Connect the Signal Generator Ground Lead to a "−B" point underneath the chassis. Connect a suitable output meter across the Speaker Voice Coil Connections. Turn the Volume Control to the maximum position. Turn the Variable Capacitor to the extreme clockwise position (minimum capacity).

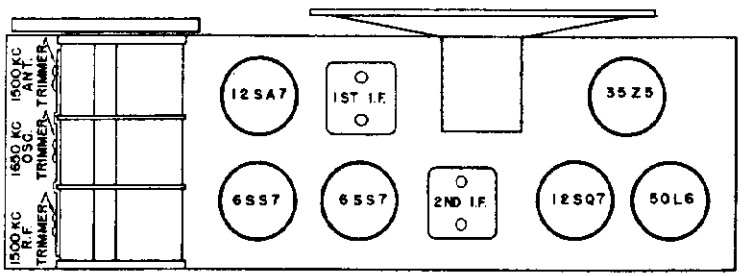
(2) Adjust the trimmers located at the top of the first and second I. F. Transformers for maximum output as indicated on the Output Meter.

(3) Loosely couple the Signal Generator lead to the Loop and set to 1650 KC.

(4) With the Variable Capacitor set at the extreme clockwise position, tune in the 1650 KC signal by means of the Oscillator Trimmer on the Variable Capacitor (middle section).

(5) Adjust the R. F. Trimmer (rear section) and the Antenna Trimmer (front section) on the Variable Capacitor for maximum output. No other adjustments are necessary.

POWER CONSUMPTION: 30 Watts. 8-46



TUNING RANGE: Broadcast: 540 to 1650 Kilocycles (180 to 555 meters).

MODELS 6DPS, 6DPS8

GAROD ELECTRONICS CORP.

Realignment of this receiver should not be attempted unless all other possible causes have been thoroughly investigated. An accurately calibrated signal generator, which will cover the necessary bands, and an output meter for indicating the effect of adjustments are required.

During the alignment procedure, all adjustments should be made under the following conditions (refer to Trimmer and Tube Location Diagram below for trimmer location):

(a) Line voltage as indicated on instruction sheet.
(b) Volume Control at maximum position.
(c) Tone Control at extreme left position (brilliant).
(d) Minimum input from signal generator. This procedure should be adhered to, otherwise adjustments will be broad, due to the action of the automatic volume control.

BROADCAST (*Band Switch in extreme left position*)

I. F. Adjustment:

(1) Set the signal generator to 455 KC and connect to the lower side of the Loop Antenna Trimmer through a .1 MFD capacitor. Connect the signal generator ground lead to the chassis. Connect a suitable output meter across the speaker voice coil connections. Turn the Variable Capacitor to the extreme clockwise position (minimum capacity).

(2) Adjust the trimmers located at the top of the first and second I. F. Transformers for maximum output as indicated on the output meter.

BC. R. F. Adjustment: It is desirable to align this band on the loop.

(1) Couple the signal generator to the receiver loop by means of a two or three turn loop.

(2) With the Variable Capacitor set at the extreme clockwise position (minimum capacity), tune in the 1650 KC signal by means of the broadcast oscillator trimmer (C2).

(3) Set the signal generator to 1500 KC and turn the Tuning Control so that this frequency is indicated on the dial. Adjust the Antenna Trimmer (C1) on the loop for maximum output.

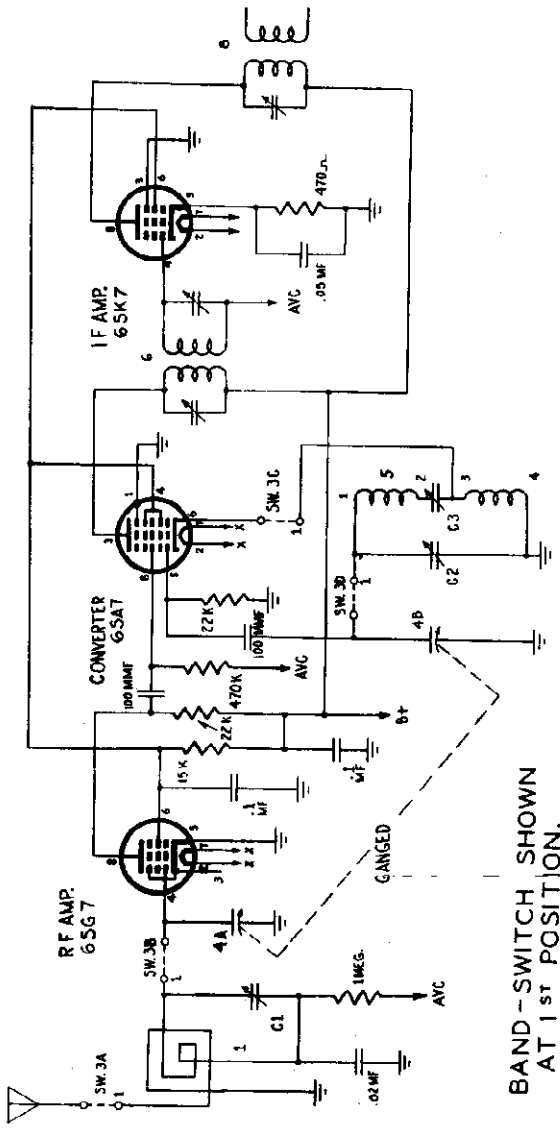
(4) Set the signal generator to 600 KC and turn the Tuning Control so that this frequency is indicated on the dial. Adjust the broadcast oscillator padder capacitor (C3) for maximum response while "rocking" the Variable Capacitor. Recheck the 1500 KC high frequency adjustment trimmer (C1).

SHORT WAVE (*Band Switch in the middle position*)

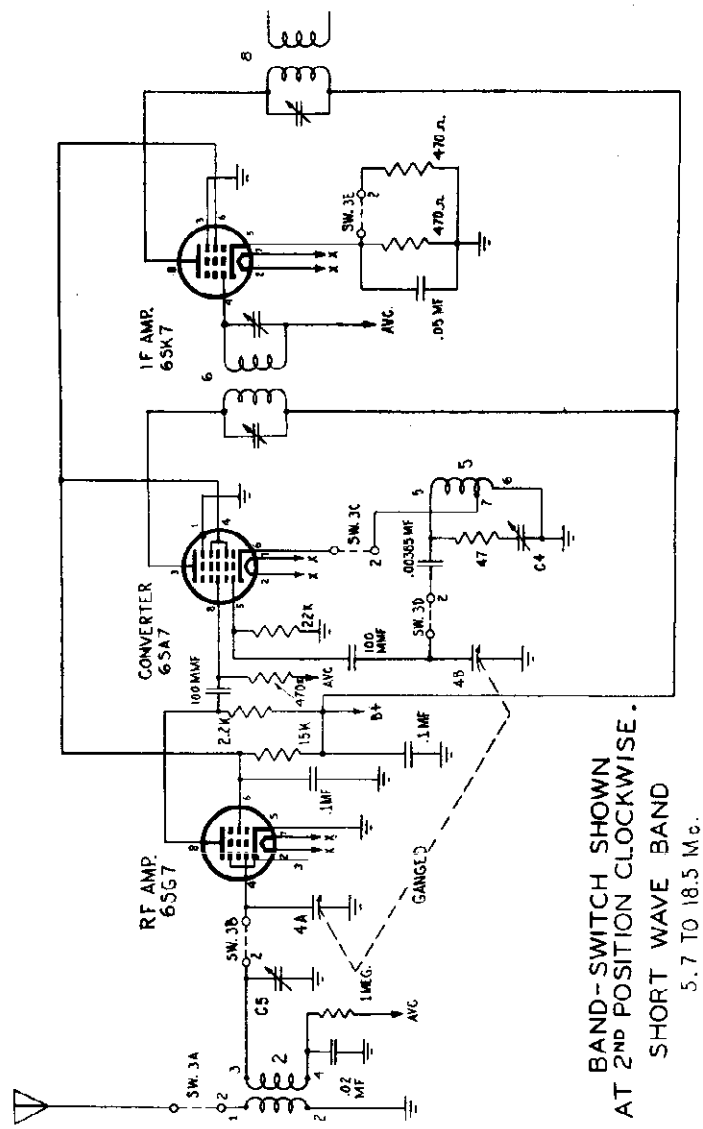
(1) Connect the signal generator through a standard short wave dummy antenna to the antenna (green wire) and the ground lead to the chassis of the receiver. Set the signal generator to 18.5 MC.

(2) With the Variable Capacitor set at the extreme clockwise position (minimum capacity), tune in the 18.5 MC signal by means of the S. W. oscillator trimmer (C4).

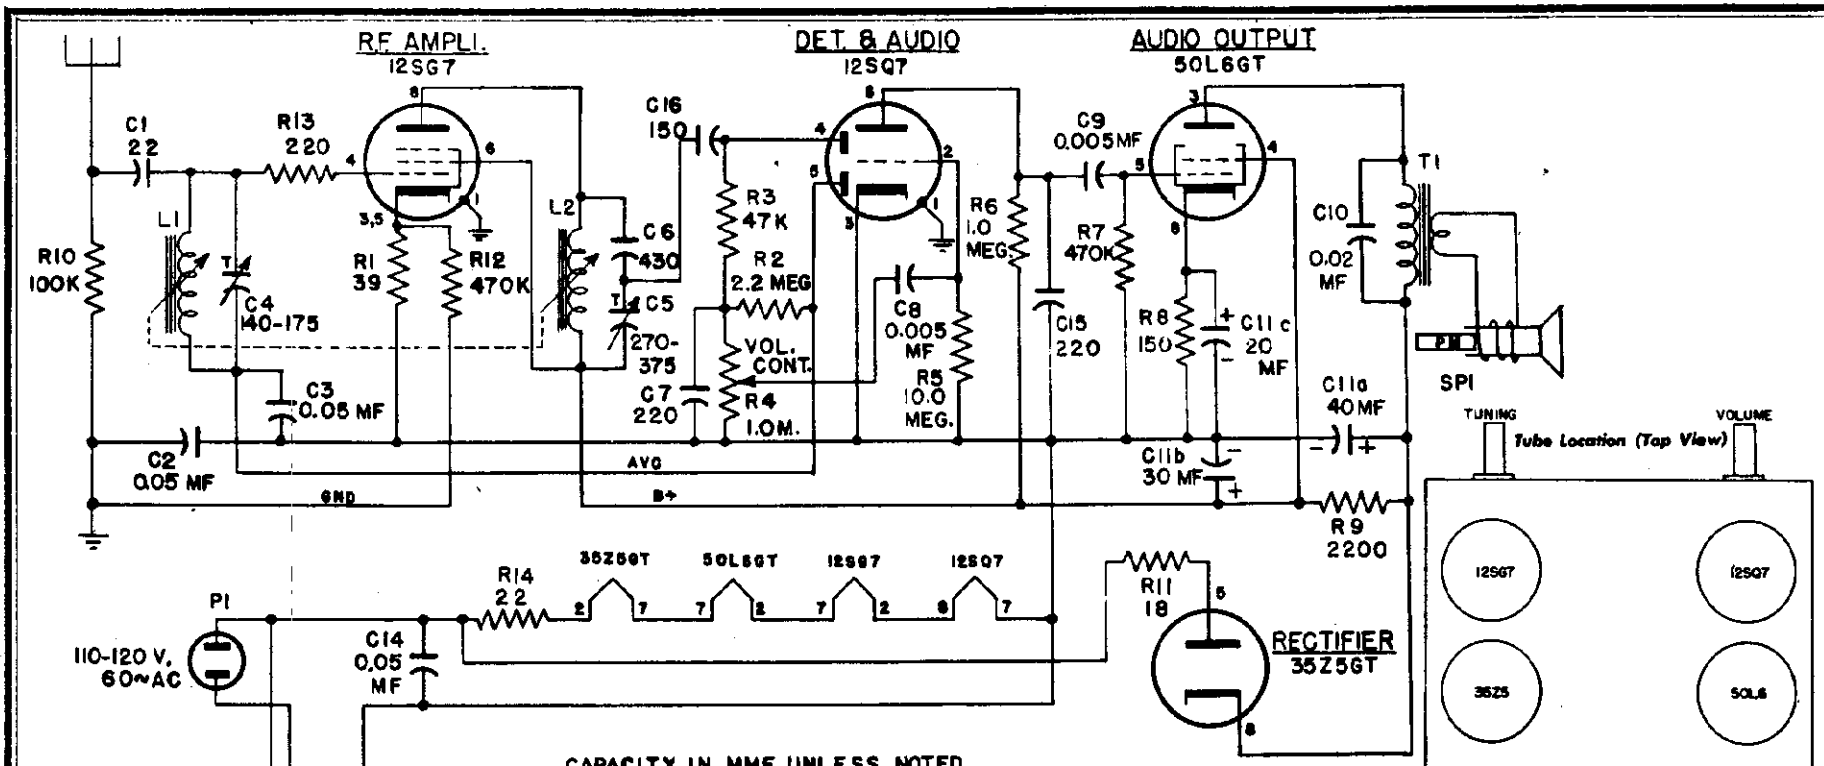
(3) Set the signal generator to 16 MC and turn the tuning control so that this frequency is indicated on the dial. Adjust the Antenna Trimmer (C5) on the short wave coil for maximum output while rocking the Variable Capacitor from left to right for maximum output. No other adjustments are necessary.



BAND-SWITCH SHOWN AT 1ST POSITION. BROADCAST BAND 540 TO 1650 KC

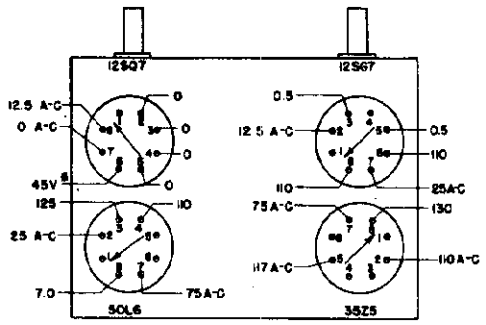


BAND-SWITCH SHOWN AT 2ND POSITION CLOCKWISE. SHORT WAVE BAND 5.7 TO 18.5 Mc.



CAPACITY IN MMF UNLESS NOTED

6-46



* *Measured with 20,000 ohm/volt meter*

Fig. 4. Socket Voltages

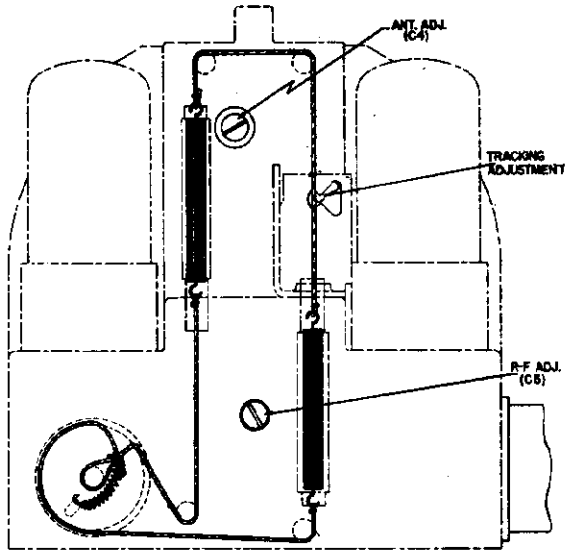
RADIO CIRCUIT ALIGNMENT

EQUIPMENT REQUIRED

1. Test oscillator with audio tone modulation.
2. A-C output meter, 1½ volts full scale.
3. 100 mmf. mica capacitor.
4. Insulated screwdriver.

PROCEDURE

1. Connect test oscillator through 100 mmf. to antenna lead; connect output meter across the loudspeaker voice coil leads.
2. Turn dial pointer as far clockwise as it will go.
3. Set test oscillator to 1620 kc with tone modulation. Keeping the radio volume control set for maximum and attenuating test oscillator so that the output meter reading never exceeds 1¼ volts, trim antenna (C4) and RF (C5) trimmers for maximum output.
4. Set test oscillator to 580 kc with tone modulation. While rocking tuning control in vicinity of this dial calibration, adjust tracking adjustment platform up or down to give maximum output meter reading.
5. Recheck 1620 calibration adjustment. If RF (C5) trimmer has to be changed appreciably for maximum output,



GENERAL ELECTRIC CO.

MODEL 50 ----- Mounting Screws.

To meet Underwriters requirements, the Model 50 chassis must be mounted in its cabinet with non-standard screws that cannot be removed with tools that are generally available to non-technical customers. We have been using spanner-head screws to meet this requirement.

Because our stock became exhausted due to the scarcity of these screws, we have temporarily used a standard Phillips-head screw to mount this radio in the cabinet, and then fill the screw head with solder. Radios mounted in this way may be easily removed from their cabinet by heating the screw head with a soldering iron until the solder becomes liquid enough to permit the insertion of a standard Phillips head screwdriver. CAUTION - Care should be exercised not to apply too much heat as it may damage the cabinet.

MODEL 50 ----- Rectifier 35W4 Substitution.

To overcome a shortage of 35Z5GT tubes, for a large portion of the Model 50 production we have had to substitute the miniature 35W4 rectifier tube. This tube has similar characteristics to the 35Z5GT, however it requires a miniature tube socket. This socket is adapted to the regular chassis hole by an adapter plate.

If it is desired to change a 35W4 for a 35Z5GT, it is only necessary to drill out the 35W4 socket adapter plate and substitute an octal base socket.

MODEL 50 ----- Time Set Incorrect.

Customer complaints of alarm set errors are usually brought about by their turning the Time Set shaft counterclockwise. This knob should only be turned clockwise. For alarm adjustment, refer to the Clock Service section

(Schematic Diagram):- The schematic diagram should be corrected to read:

1. Move the series resistor, R14, from its location between the power plug P1 and the 35Z5GT filament pin, to connect in series with the filament string between the 35Z5GT and 50L6GT filament pins.

2. The filament connections (pins 2 and 7) to the 35Z5GT tube are interchanged.

3. Remove R11 in series with the plate side of the 35Z5GT rectifier tube (pin 5) and connect it in series with the cathode side (pin 8) of the rectifier tube.

4. Late production receivers use a tapped primary on the output transformer, T1. The color code of the primary is: red - B+, white - tap; blue - plate. This tapped transformer replaces the early production transformer and is wired as follows:

(a) Break connection to filter resistor, R9, on the rectifier side of the resistor.

(b) Connect this broken side of R9 to the tap of the output transformer, T1.

The above connects the positive (+) side of C11a, the rectifier output and the red lead of the output transformer together; while the tap lead of T1 connects to R9.

5. In late production receivers, a miniature Type 35W4 tube is substituted in place of the 35Z5GT rectifier tube. This requires installation of a miniature socket and adapter plate in place of the octal socket. The corresponding pin connections are as follows:

	35Z5GT	35W4
Plate	Pin 5	- Pin 5
Cathode	Pin 8	- Pin 7
Filament	Pin 2	- Pin 4
Filament	Pin 7	- Pin 3

(Radio Replacement Parts List):- Add Part No. RTO-022, symbol T1, Transformer - output transformer. (This part is a direct replacement for late production radios and a replacement with modification for the early production transformer without tap.)

GENERAL ELECTRIC CO.

CLOCK SERVICE

Figure 6 shows clock parts referred to in the following paragraphs and the parts list.

CLOCK MOVEMENT DISASSEMBLY

1. Remove clock movement from case. When removing knobs, note that the Alarm-set knob is a left-hand thread, while Alarm-Radio is a pull-off knob.
2. Remove Bezel Window, Hands and Dial Face.
3. Remove two field screws (A) and break two soldered joints on Field. The Field and Rotor assembly (R) can now be removed. The Rotor is held by friction only to the Field.
4. Remove Switch Assembly (B) by removing two screws from base plate.
5. Remove Switch Shaft Assembly (C) and spacer.
6. Remove Alarm-set Shaft Assembly (D) and spacer.
7. Remove the three front plate assembly screws that are located under the Dial Face and then remove Front Plate.
8. Remove Alarm Gear Sleeve Assembly (E), Hour Gear Sleeve Assembly (F), Minute Gear Sleeve Assembly (G), and Sweep Second Gear Shaft Assembly (H).
9. Remove Alarm Cam Gear Assembly (I) and Spring Washer (J).
10. Remove Alarm-set Gear (K).
11. Remove Time-set Gear and Shaft Assembly (L).
12. Remove Switch Cam Lever (M).

CLOCK MOVEMENT REASSEMBLY

Reassemble in the reverse order of disassembly, observing the following precautions:

1. The spring washer (J) should curve upward when placed on the Alarm Cam Gear (I).
2. The Switch Cam Lever (M) fork must straddle the base plate post as shown in the illustration.
3. After reassembly of front plate, check the Sweep Second Gear (H) through hole in base plate to make sure it is free to turn.
4. Proceed with ALARM AND SWITCH ADJUSTMENTS as described below before installing hands.

ALARM AND SWITCH ADJUSTMENTS

1. Turn Alarm-Radio shaft to ALARM position.
2. Slowly rotate Time Set shaft clockwise until the contacts of the Switch Assembly (B) close.
3. Replace Dial Face, Alarm Dial, the Minute, Hour and Second Hands. Set all Hands and Dial so that they indicate 12 o'clock. Make sure all Hands and Alarm Dial are tight on their respective shafts.
4. With Alarm Set knob pulled out, continue to rotate Time Set shaft clockwise and note that the vibrator arm (N) drops against field core approximately 7-10 minutes later.
5. Set alarm at some other selected position and make sure mechanism actuates within limits (±1 minute).
6. Check alarm tone of vibrator. This can be adjusted by either bending vibrator arm nearer or farther away from field core. Bend arm near anchor point.

CLEANING AND LUBRICATION

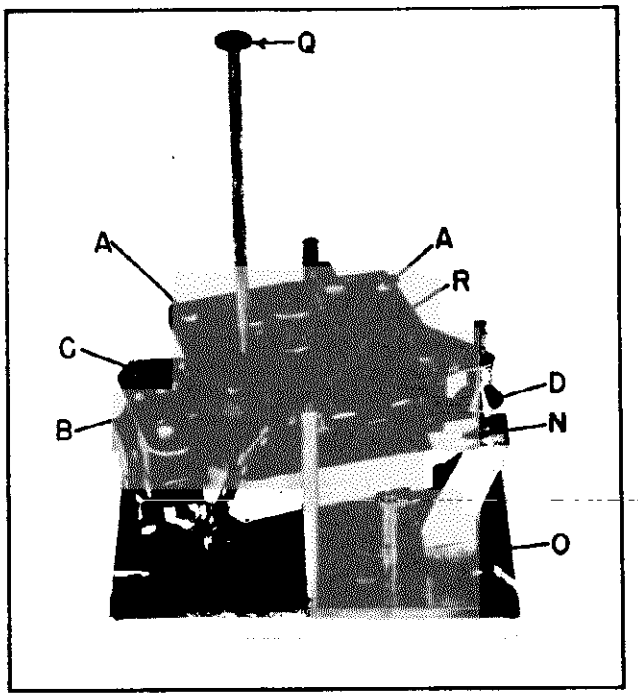
To clean, completely disassemble and clean all moving parts in carbon tetrachloride or some similar cleaner.

The inside of the sleeves and shaft surfaces may be cleaned of oxidized oil by rubbing with a fine grade of steel wool dampened in carbon tetrachloride.

Do not use too much oil and apply by means of a small wire (drop oiler). Too much oil collects dust and later oxidizes. Use only recommended clock oil, such as Nyes Celebrated Oil which may be purchased from Wm. F. Nye Co., Inc., New Bedford, or equivalent.

CLOCK TROUBLES

1. Clock will not operate—Defective field coil, defective rotor, binding of parts.
2. Clock loses time—Binding parts, too little friction on minute hand sleeve assembly, defective rotor. Clock time set shaft bent and rubs against hole in back cover. Radio pushed against wall so that knob (Q) rubs will cause loss of time.
3. Noisy Clock—Rotor defective, alarm armature improperly adjusted, loose parts, or binding of moving parts.



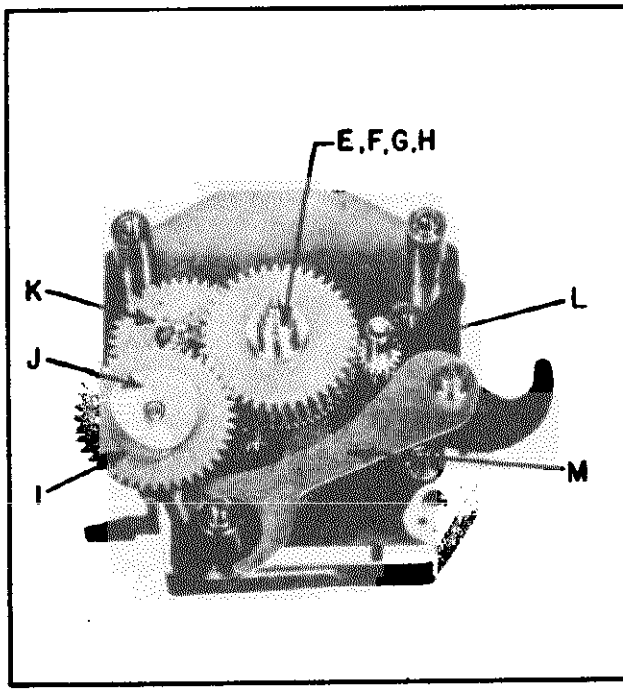


Fig. 6. Clock Part Identification

GENERAL ELECTRIC CO.

ELECTRICAL RATING (INPUT):

Voltage.....105-125 volts, a-c
Frequency.....60 cycles
Wattage.....30 watts

TUNING FREQUENCY (RADIO):

Broadcast Band.....540-1600 kc

POWER OUTPUT (117 VOLTS LINE):

Undistorted.....1.5 watts
Maximum.....2.2 watts

LOUDSPEAKER:

Type.....Alnico P.M.
Outside Cone Diameter.....4 inch
Voice Coil Impedance (400 Cycles) 3.5 ohms

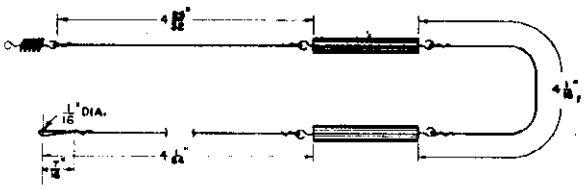

Fig. 2. Drive Cord Assembly

DRIVE CORD REPLACEMENT

When replacing the drive cord, it is essential that the measurements shown in Figure 2 be maintained very accurately, otherwise alignment and dial calibration difficulties will be experienced. Use a 1/32-inch diameter nylon jacketed cord, Part No. RDC-015, for replacement.

RADIO STAGE GAIN AND VOLTAGE CHECKS

Stage gain measurements by vacuum tube voltmeter or similar measuring devices may be used to check circuit performance and isolate trouble. The gain values listed may have tolerances of 20 per cent. Readings are taken with low signal input.

(1) R-F Stage Gains.

Antenna lead to 12SG7 grid.....8 at 1000 kc
12SG7 grid to 12SQ7 diode plate.....50 at 1000 kc

(2) Audio Gain.

0.06 volts at 400 cycles across volume control (R4) with control set at maximum will give approximately ½-watt output across speaker voice coil.

(3) Socket Pin Voltages.

Figure 4 shows voltages from all points to B—. Voltage readings much lower than those specified may help localize defective components or tubes.

Intermediate Frequency: ..... 455 kc

LOUDSPEAKER "ALNICO V" MAGNET DYNAMIC

Outside Cone Diameter ..... 4 in.
Voice Coil Impedance (400 cycles) ..... 3.5 ohm

ALIGNMENT PROCEDURE

ALIGNMENT FREQUENCIES

I.F. ..... 455 kc
R.F. ..... 1725 and 1500 kc
The location of all trimmers is shown in Fig. 1.

I.F. ALIGNMENT

Connect an output meter across the voice coil. Turn the volume control to maximum. Set test oscillator to 455 kc and keep the oscillator output as low as a readable meter reading will permit. Apply signal to the converter grid through a .05 mfd capacitor and align progressively the trimmers in the 2nd and 1st I.F. transformer cans.

R.F. ALIGNMENT

Apply the R.F. alignment signals through a standard I.R.E. dummy antenna to the receiver antenna post. With the gang condenser wide open, align the oscillator trimmer (C11) to 1725 kc. Change the generator signal to 1500 kc, tune the receiver to the signal and peak antenna trimmer (C9) for maximum output.

PRECAUTION

If the signal generator is a-c operated, use an isolating transformer between the power supply and the radio receiver power input. The use of an isolating capacitor is not recommended, as a-c through the capacitor will introduce hum modulation and/or create the possibility of a burned-out signal generator attenuator.

PRODUCTION CHANGES WERE MADE ON ALL MODELS 100,101,103,AND 105, HAVING SERIAL NUMBERS 5000 AND OVER. THE SERVICING DATA ON THE PRECEDING PAGES APPLY TO THE REVISED MODELS WITH THE FOLLOWING EXCEPTIONS:

(ELECTRICAL CIRCUIT ALIGNMENT)—Under the paragraph *PROCEDURE—GENERAL* the third sentence should read "If it doesn't, remove chassis and slip pointer on shaft until the pointer is under reference mark when chassis is bolted in place."

For receivers equipped with the Beam-A-Scope which forms a part of the back cover(Part Nos.RLL-009 and RLL-010), paragraph 4 should be changed to read, "Chassis must be removed from cabinet during i-f alignment. For r-f alignment,bolt chassis in cabinet securely; r-f and oscillator trimmers are then available through the hole in the back cover assembly".

(SCHEMATIC DIAGRAM)—A corrected schematic is printed below. Changes were made as follows:

(1) C18 connects between the output plate and screen instead of between plate and ground.

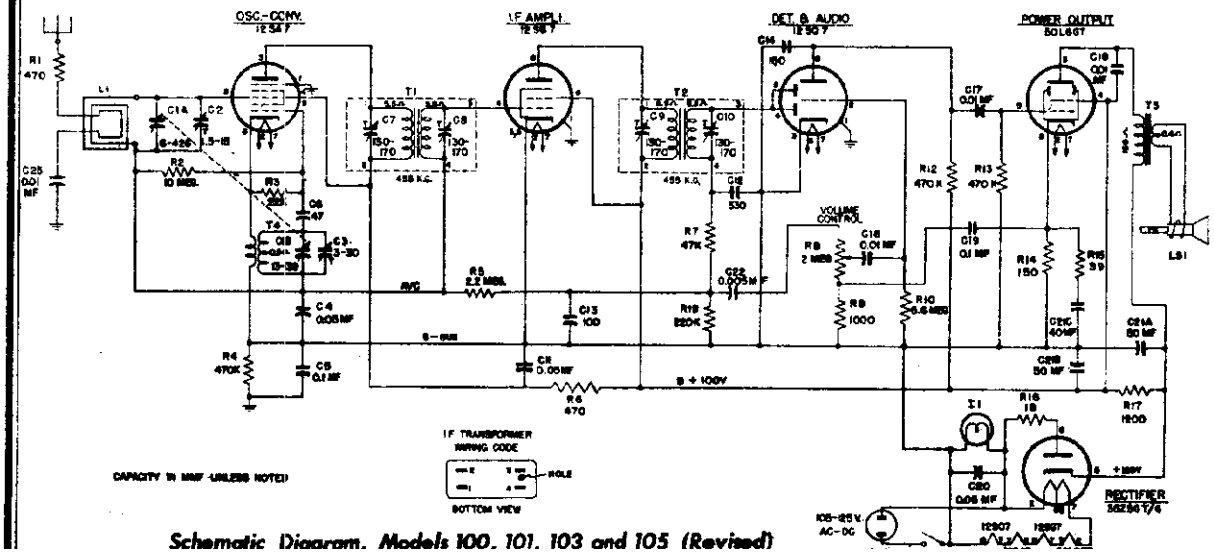
(2) The plate and screen filter (C11, R6) is moved from the IF amplifier circuit to the converter plate and screen circuit.

(3) The filament connections (Pins 2 and 7) to the 12SA7 converter tube are interchanged.

(4) The 10-megohm resistor,R2, is removed.

(Fig.4, Socket Voltages) At 12SA7 socket, pins 3 and 4 should be changed to read +92. At 12SG7 socket,pins 6 and 8 should be changed to read +97 volts.

(REPLACEMENT PARTS LIST)—Part Number UCC-013, Symbol C19, becomes Part Number RCC-013. Stock numbers RTS-001, RTS-003, and RTS-004 should be changed to read: RJS-001, RJS-003, and RJS-004, respectively.



Schematic Diagram, Models 100, 101, 103 and 105 (Revised)

(Parts List). Part No.RCE-001 changed to RCE-027. Delete Part Nos.RDF-001,RDF-003,RDX-001,and RMM-001. Part No.RWL-001 changed to RWL-004.Add Part No.RIT-006, Electrolytic cardboard cover.Add Part No.RLL-009,Beam-A-Scope loop ant. and back cover assembly,Models 103,105. Add Part No.RLL-010,Beam-A-Scope loop ant. and back cover assembly,Models 100, 101.Change Part No.ROP-005 to read Part No.UOP-525.

Beam-A-Scope Change. Two different type loop antenna assemblies were used uri Beam-A-Scope Change.--Two different type loop antenna assemblies were used during production. Part No.RLL-001 is secured to the chassis by two metal brackets and needs a separate cabinet back cover. The other type Beam-A-Scope is identified as it is a part of the back cover assembly. This new assembly is stocked as Part No. RLL-009 for Models 103 and 105,and as Part No.RLL-010 for Models 100 and 101. The Beam-A-Scopes are electrically interchangeable. The loop(RLL-009,RLL-010), which is a part of the back cover can be used without alteration to replace Part No.RLL-001. Part No. RLL-001 may replace Part No.RLL-009 or RLL-010,provided that brackets (Part No.RAD-001 and RAD-002) are added to the chassis to mount the new loop. When connecting the Beam-A-Scopes into the circuit, the inner turn of Part Nos.RLL-009 and RLL-010 must be connected to the converter grid(pin 8);while on Part No.RLL-001 loop, the turn nearest the back cover connects to the converter grid (pin 8).

REMOVAL OF PILOT LIGHT: In some cases, the glyptal cement used between the pilot light base and socket prevents removal of the light. Repeated applications of acetone or nail-polish remover between the lamp and socket will soften cement sufficiently to permit removal

TUBE COMPLEMENT

Oscillator-Converter	Type 12SA7
I. F. Amplifier	Type 12SG7
Detector-Audio	Type 12SQ7
Power Output	Type 50L6GT
Rectifier	Type 35Z5GT/G
Pilot Lamp	G-E, Type C7, 115-volt, 10-watt, clear, candelabra screw base.

ELECTRICAL CIRCUIT ALIGNMENT

ALIGNMENT FREQUENCIES

R-F	1500 kilocycles
I-F	455 kilocycles

EQUIPMENT REQUIRED

1. Test oscillator with audio tone modulation
2. A-C output meter, 1 ½ volts full scale
3. 0.05 mf. paper capacitor
4. 50 mmf. mica capacitor
5. Insulated screwdriver

PROCEDURE—GENERAL 1. Turn dial scale pointer as far counter-clockwise as possible. The pointer should coincide with the first marking at the left of the scale. If it doesn't, remove chassis and slip pointer drum on cord until pointer is under reference mark when chassis is bolted in place.

2. For i-f and r-f alignments, the output meter is connected across the loudspeaker voice coil terminals.

3. Keep radio volume control at maximum and attenuate test oscillator signal output so that the output meter reading never exceeds 1 ¼ volts.

4. The chassis must be removed from the cabinet during I-F alignment. For R-F alignment bolt the chassis in the cabinet securely, the rf and osc. trimmers are then available through the hole in the Beam-a-scope assembly when the back cover is removed.

5. Connect the capacitor as listed in column 2, between the output "High Side" of test oscillator and the point of input specified.

ALIGNMENT CHART

Step	Connect test oscillator to	Test osc. setting	Pointer setting on radio	Adjustment for maximum output
1	12SG7 grid in series with 0.05 mf. cap.	455 kc	1,500 kc	2nd I-F Trans. Trimmers
2	12SA7 grid in series with 0.05 mf. cap.	455 kc	1,500 kc	1st and 2nd I-F Trans. Trimmers
3	Ant. Post in series with 50 mmf.	1,500 kc	1,500 kc	C3 (Osc.)
4	Ant. Post in series with 50 mmf.	1,500 kc	1,500 kc	C2 (R-F)

STAGE GAIN AND VOLTAGE CHECKS

Stage gain measurements by vacuum tube voltmeter or similar measuring devices may be used to check circuit performance and isolate trouble. The gain values listed may have tolerances of 20%. Readings taken with low signal input so that AVC is not effective.

(1) R-F Stage Gains.
Antenna post to 12SA7 grid ..... 4 @ 1000 kc
12SA7 grid to 12SG7 grid ..... 30 @ 455 kc
12SG7 grid to 12SQ7 diode plate ..... 150 @ 455 kc

(2) Audio Gain.
0.06 volt at 400 cycles across volume control (R8) with control set at maximum will give approximately ½-watt output across speaker voice coil.

(3) Oscillator Grid Bias.
D-C voltage developed across the oscillator grid leak (R3). Averages 7.7 volts at 1000 kc.

(4) Socket Pin Voltages.
Figure 4 shows voltages from all tube pins to B– unless otherwise specified. Voltage readings much lower than those specified may help localize defective components or tubes

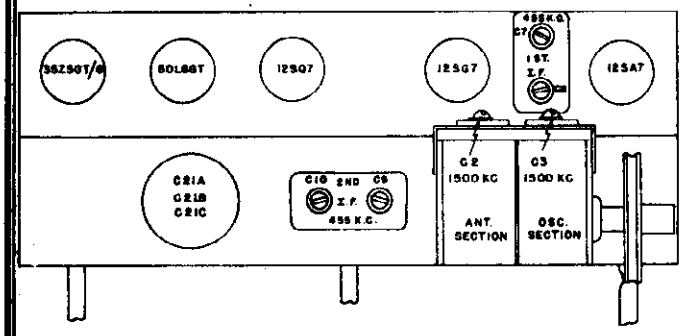

Fig. 1. Tube and Trimmer Location

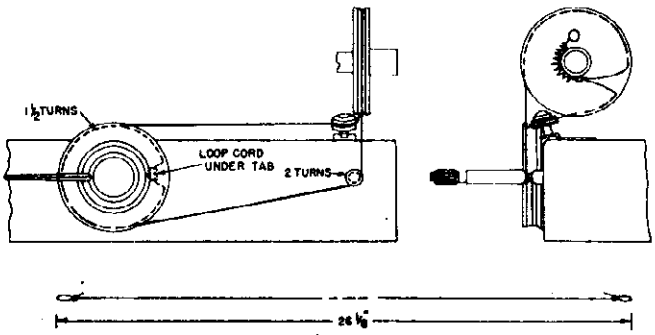

Fig. 2. Dial Stringing Diagram

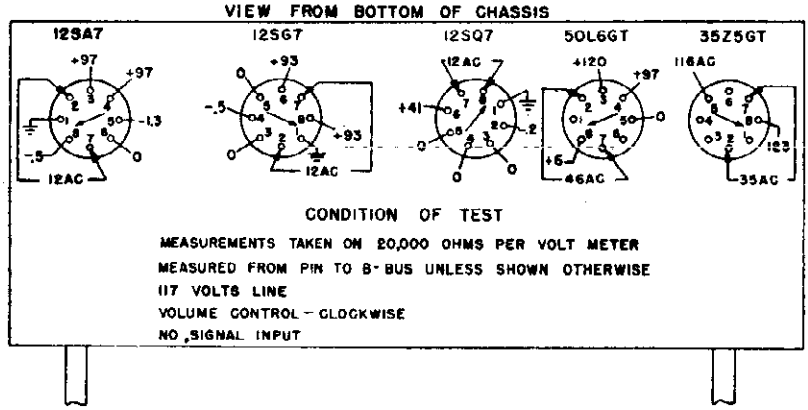

Fig. 4. Socket Voltages

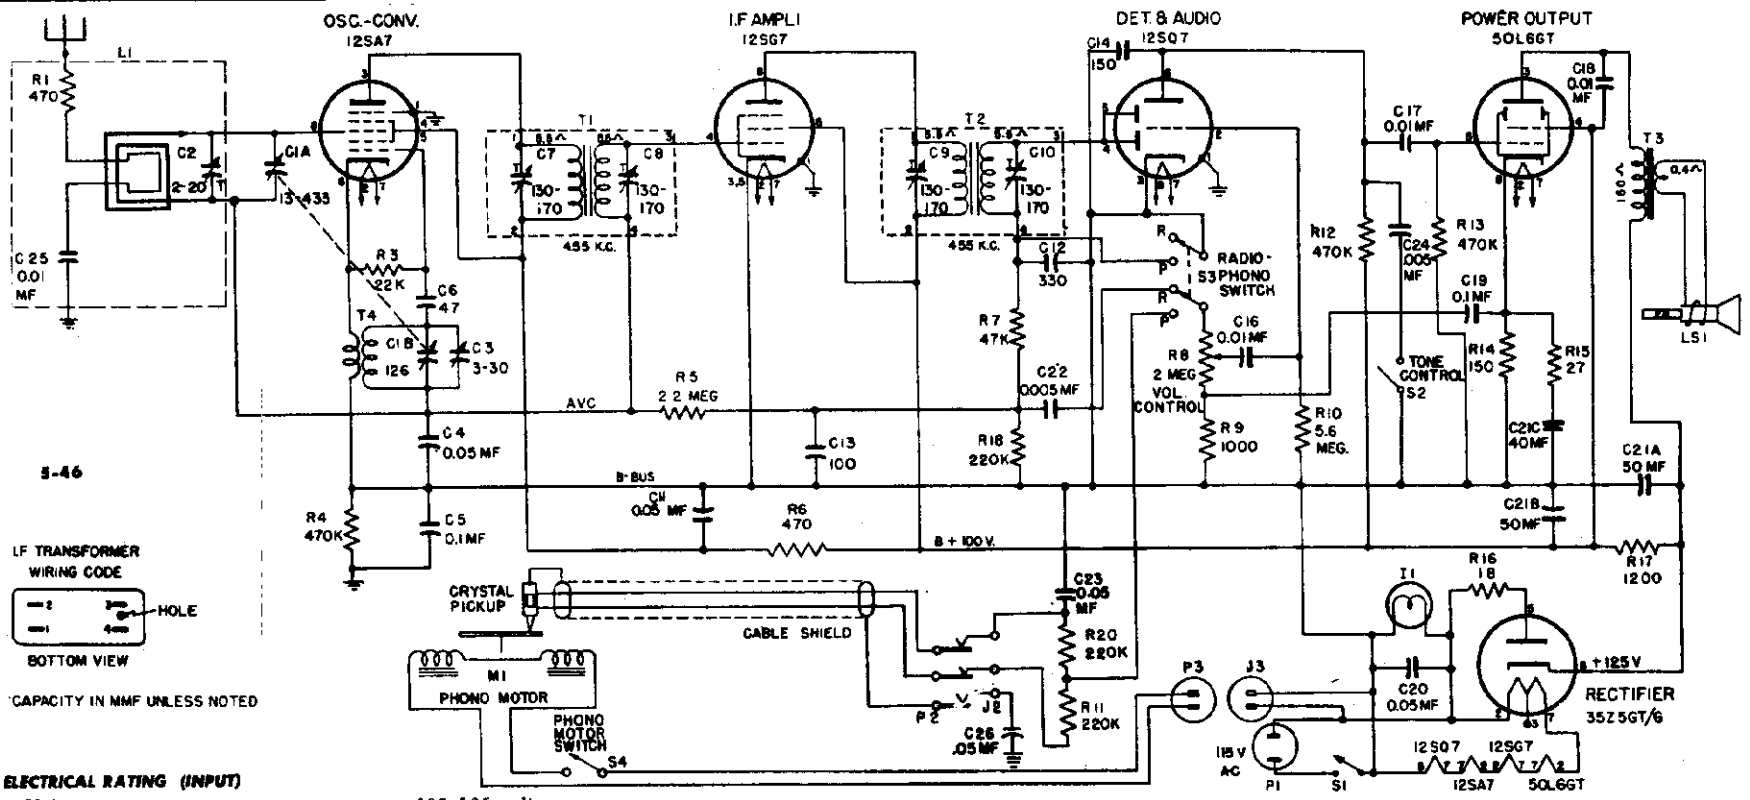


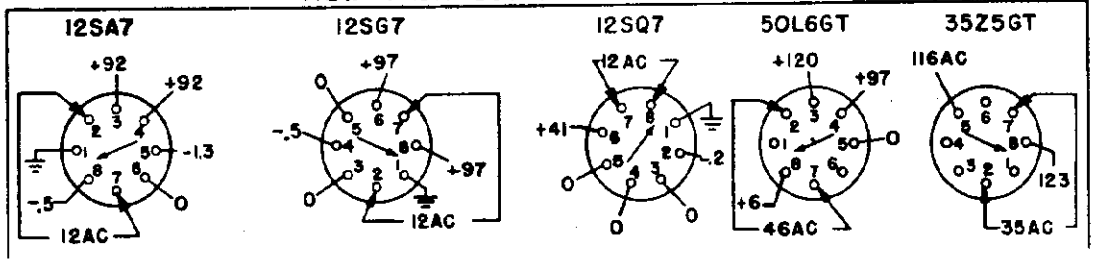
ELECTRICAL RATING (INPUT)

Voltage	105–125 volts a-c
Frequency	60 cycles
Wattage (Including Phonograph)	55 watts

OPERATING FREQUENCIES

Broadcast Band	540–1600 kilocycles
I-F Amplifier	455 kilocycles

VIEW FROM BOTTOM OF CHASSIS



CONDITION OF TEST

MEASUREMENTS TAKEN ON 20,000 OHMS PER VOLT · METER

MEASURED FROM PIN TO B- BUS UNLESS SHOWN OTHERWISE

VOLUME CONTROL – CLOCKWISE

NO SIGNAL INPUT

STAGE GAIN AND VOLTAGE CHECKS

Stage gain measurements by vacuum tube voltmeter or similar measuring devices may be used to check circuit performance and isolate trouble. The gain values listed may have tolerances of 20 per cent. Readings taken with low signal input so that AVC is not effective.

(1) R-f Stage Gains.

Antenna post to 12SA7 grid	4 @ 1000 kc
12SA7 grid to 12SG7 grid	30 @ 455 kc
12SG7 grid to 12SQ7 diode plate	150 @ 455 kc

(2) Audio Gain.

0.06 volts at 400 cycles across volume control (R8) with control set at maximum will give approximately ½ watt output across speaker voice coil.

(3) Oscillator Grid Bias.

D-c voltage developed across the oscillator grid leak (R3) averages 7.7 volts at 1000 kc.

(4) Socket Pin Voltages.

Fig. 4 shows voltages from all tube pins to B—unless otherwise specified. Voltage readings much lower than those specified may help localize defective components or tubes.

Voice Coil Impedance (400 cycles)	3.5 ohms

PHONOGRAPH MECHANISM

Type	Manual
Pick-up	Crystal
Needle	Permanent Type
Turntable Speed	78 rpm

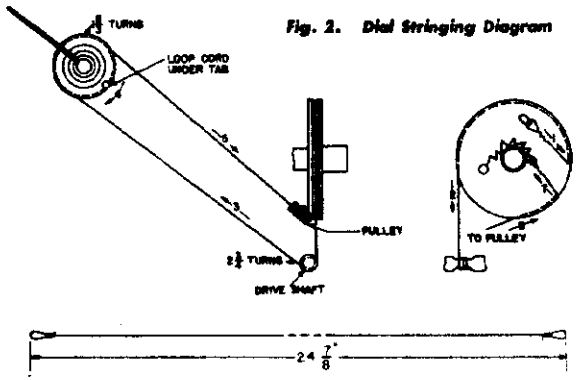

Fig. 2. Dial Stringing Diagram

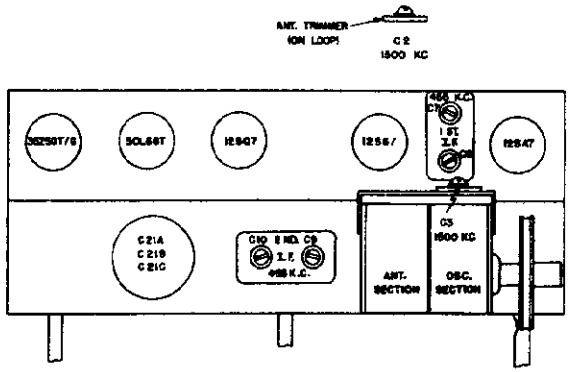

Fig. 1. Tube and Trimmer Location

ELECTRICAL CIRCUIT ALIGNMENT

EQUIPMENT REQUIRED

1. Test oscillator with audio tone modulation
2. A-c output meter, 1½ volts, full scale
3. 0.05 mf paper capacitor
4. 50 mmf mica capacitor
5. Insulated screwdriver

PROCEDURE—GENERAL 1. Turn dial scale pointer as far counterclockwise as possible. The pointer should coincide with the first marking at the left of the scale. If it doesn't, remove chassis and slip pointer on drum until pointer is under reference mark when chassis is bolted in place.

2. For i-f and r-f alignments, the output meter is connected across the loudspeaker voice coil terminals.
3. Keep radio volume control at maximum and attenuate test oscillator signal output so that the output meter reading never exceeds 1¼ volts.
4. The chassis must be removed from the cabinet during i-f alignment. For r-f alignment, bolt the chassis in the cabinet securely. The r-f trimmer is then available through the hole in the Beam-a-Scope assembly (back cover). The Osc. Trimmer can be reached when the back cover is tilted back.
5. Connect the capacitor as listed in column 2 between the output "High Side" of test oscillator and the point of input specified.

ALIGNMENT CHART

Step	Connect test oscillator to	Test osc. setting	Pointer setting on radio	Adjustment for maximum output

MODELS 110,111

GENERAL ELECTRIC CO.

ELECTRICAL RATING:

Voltage	105–125 v. a-c or d-c
Frequency on a-c	50/60 cycles
Wattage	30 watts

OPERATING FREQUENCIES:

Broadcast Band	540–1600 kc
I-F Amplifier	455 kc

POWER OUTPUT (120 VOLTS LINE):

Undistorted	0.8 watts
Maximum	1.6 watts

LOUDSPEAKER:

Type	Alnico P.M.
Outside Cone Diameter	4 inches
Voice Coil Impedance (400 cycles)	3.5 ohms

TUBE COMPLEMENT:

Oscillator-Converter	Type 12SA7
I-F Amplifier	Type 12SK7
Detector-Audio	Type 12SQ7
Power Output	Type 50L6GT
Rectifier	Type 35Z5GT/G
Pilot Lamp	GE No. 47

ELECTRICAL CIRCUIT ALIGNMENT

ALIGNMENT FREQUENCIES:

R-F	1500 kilocycles
I-F	455 kilocycles

EQUIPMENT REQUIRED:

1. Line isolation transformer.
2. A-c output meter, 1½ volts full scale.
3. Test oscillator with tone modulation.
4. 0.05 mf. paper capacitor.
5. 50 mmf. mica capacitor.
6. Insulated screwdriver.

PROCEDURE—GENERAL. *1.* Remove chassis from cabinet. Turn pointer as far counterclockwise as possible. The pointer should set horizontal. If it doesn't, remove the dial window and slip the pointer on its shaft until it is horizontal.

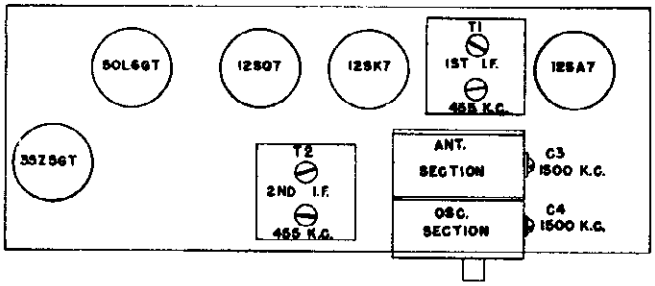

Fig. 2. Tube and Trimmer Location

2. Connect the line cord to the line through an isolation 1:1 ratio transformer.
3. Connect output meter across loudspeaker voice coil terminals.
4. Keep radio volume control at maximum and attenuate the test oscillator signal output so that the output meter reading never exceeds 1 volt.
5. For R-F alignment, the Beam-a-scope assembly should be connected and dressed in exactly the same location it would occupy if installed in the cabinet.
6. Connect the capacitor as listed in column 2, between the output "high side" of the test oscillator and the point of input specified.

ALIGNMENT CHART

Step	Connect Test Oscillator to	Test Oscillator Setting	Pointer Setting on Radio	Adjustment for Maximum Output

Detector-Audio Amplifier.....Type 12SQ7
Power Output.....Type 50L6GT
Rectifier.....Type 35Z5GT/G
Pilot Lamp.....GE No. 44, 6-8 volt

ELECTRICAL CIRCUIT ALIGNMENT

CAUTION—ONE SIDE OF THE POWER LINE IS CONNECTED TO THE CHASSIS. AVOID ANY GROUND CONNECTIONS TO THE RADIO UNLESS AN ISOLATING TRANSFORMER IS USED IN THE POWER LINE.

ALIGNMENT FREQUENCIES:

R-F.....1500 kc
I-F.....455 kc

EQUIPMENT REQUIRED:

1. Test oscillator with audio tone modulation.
2. A-C output meter, 1½ volts full scale.
3. 0.05 mf. paper capacitor.
4. 200 mmf. mica capacitor.
5. Insulated screwdriver.

PROCEDURE—GENERAL: 1. Turn the tuning knob to its extreme counterclockwise position. If the pointer does not coincide with the first marking at the left of the scale, slide it along the dial cord until it does.
2. Remove chassis from cabinet and connect output meter across speaker voice coil terminals. NOTE: For Models XB121 and XB221, use alignment strip in back of dial plate for pointer setting.
3. Keep radio volume control set at maximum and attenuate test oscillator signal output so that the output meter reading never exceeds 1¼ volts.
4. Connect the capacitor, listed in column 2 of Alignment Chart, between the "high side" of the test oscillator and the point of input specified. The ground terminal of the test oscillator may be connected to the chassis, providing an isolating transformer is used between the radio and the line input.

ALIGNMENT CHART

Step	Connect test oscillator to	Test oscillator setting	Pointer setting on radio	Adjustment for maximum output
1.	12SK7 grid (pin 4) in series with 0.05 mf.	455 kc	1500 kc	C12 and C13 (2nd i-f trans. trimmers)
2.	12SA7 grid (pin 8) in series with 0.05 mf.	455 kc	1500 kc	C10 and C11 (1st i-f trans. trimmers)
3.	Ant. post in series with 200 mmf.	1500 kc	1500 kc	C7 (osc.) on gang condenser.
4.	Ant. post in series with 200 mmf.	1500 kc	1500 kc	C5 (ant.) on gang condenser.

STAGE GAIN AND VOLTAGE CHECKS

Stage gain measurements by vacuum tube voltmeter or similar measuring devices may be used to check circuit performance and isolate trouble. The gain values listed may have tolerances of 20%. Readings taken with low signal input so that AVC is not effective.

(1) R-F Stage Gains.
Antenna Post to 12SA7 Grid.....4.0 @ 1000 kc
12SA7 Grid to 12SK7 Grid.....55 @ 455 kc
12SA7 Grid to 12SK7 Grid.....45 @ 1000 kc
12SK7 Grid to 12SQ7 Diode Plate.....50 @ 455 kc

(2) Audio Gain.
0.12 volts at 400 cycles across volume control (R4) with control set at maximum will give approximately ½-watt output across the speaker voice coil

(3) Oscillator Grid Bias.
D-C voltage developed across the oscillator grid leak (R3) averages 6.0 volts at 1000 kc.

(4) Socket Pin Voltages.
Figures 7 and 8 show voltages from all tube pins to B− unless otherwise specified. Voltage readings much lower than those specified may help localize defective components or tubes.

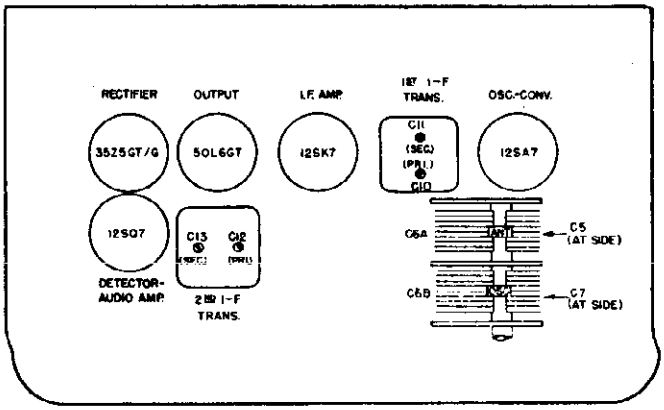

Fig. 1. Tube and Trimmer Location

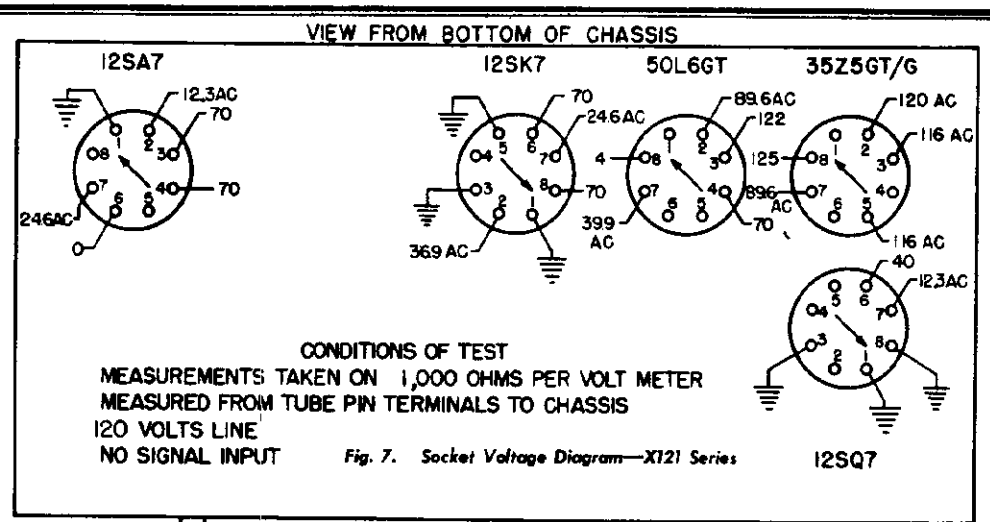

Fig. 7. Socket Voltage Diagram—X121 Series

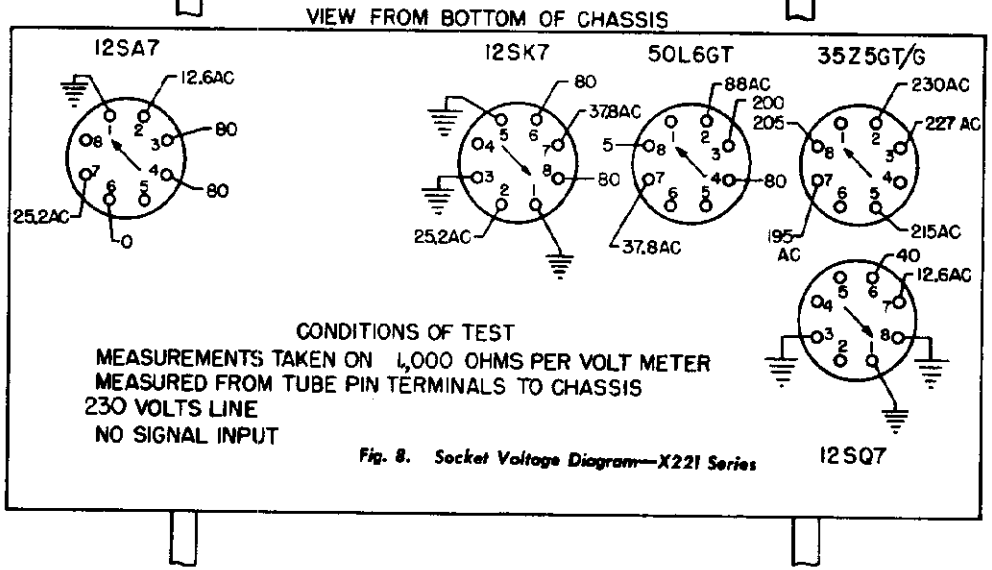

Fig. 8. Socket Voltage Diagram—X221 Series

Note that Part No. UCC-045 and RCC-045 appear to be the same condenser; however, the RCC-type is made with a higher melting point wax and is used in sections of the receiver where more heat is dissipated. The condensers are identical in size, but the RCC type is marked in red instead of black.

SHORT WAVE BAND #2
7.0 - 22 Mc.

MODELS X-153, X-153-A1, X-153-D2

GENERAL ELECTRIC CO.

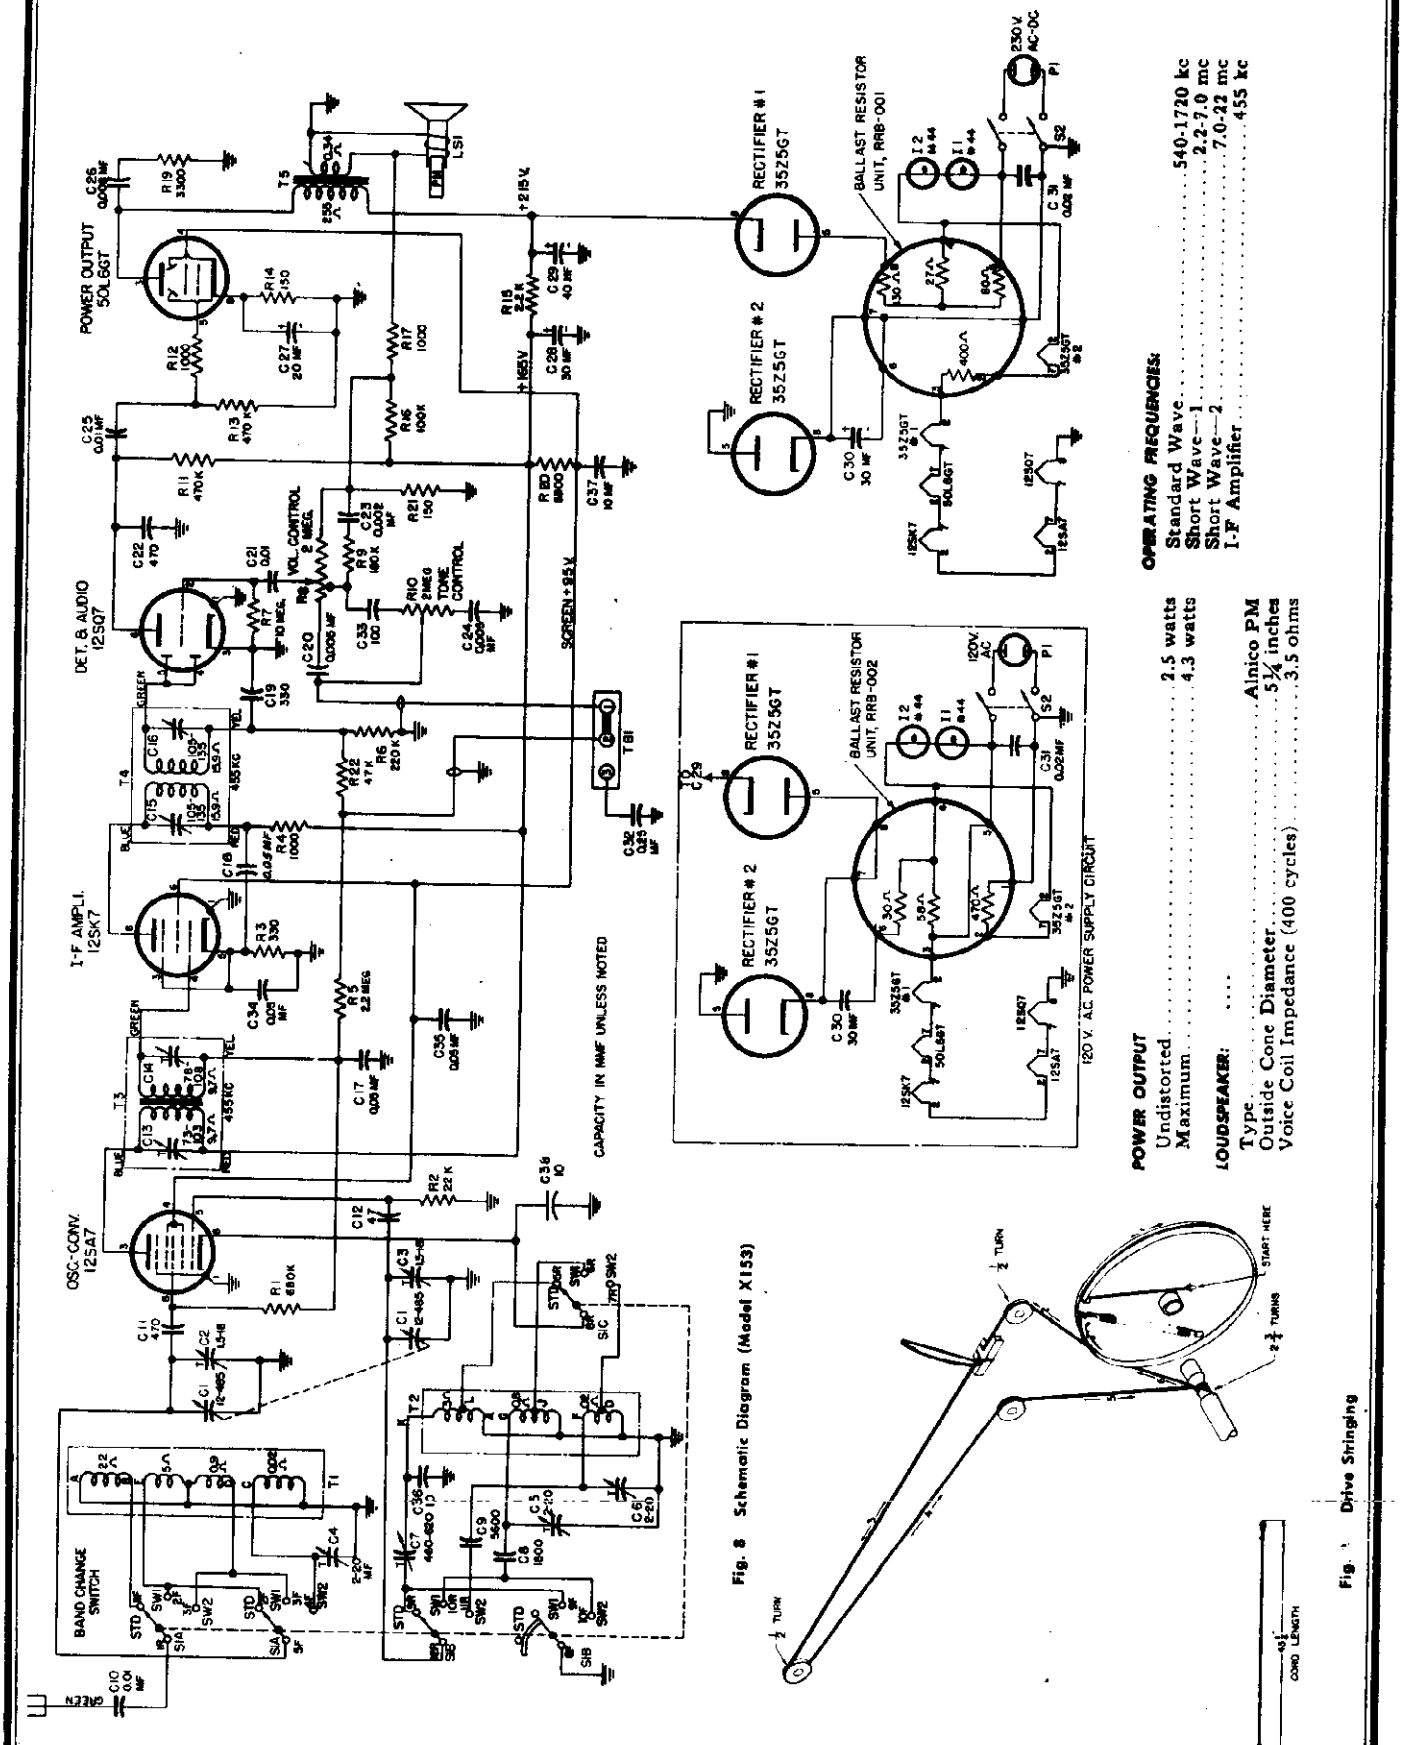

Fig. 8 Schematic Diagram (Model X153)

OPERATING FREQUENCIES:

Standard Wave	540-1720 kc
Short Wave—1	2.2-7.0 mc
Short Wave—2	7.0-22 mc
I-F Amplifier	455 kc

POWER OUTPUT

Undistorted	2.5 watts
Maximum	4.3 watts

LOUDSPEAKER:

Type	Alnico PM
Outside Cone Diameter	5¼ inches
Voice Coil Impedance (400 cycles)	3.5 ohms

Fig. Drive Stringing

MODELS X-153, X-153-A1, X-153-D2

ELECTRICAL CIRCUIT ALIGNMENT

ALIGNMENT FREQUENCIES:

R-F (Standard Wave) ..... 580 and 1500 kc
R-F (Short Wave 1) ..... 6 mc
R-F (Short Wave 2) ..... 18 mc
I-F ..... 455 kc

EQUIPMENT REQUIRED:

1. Test oscillator with audio tone modulation.
2. A-C output meter, 1½ volts full-scale.
3. 0.05 mf. paper capacitor.
4. 200 mmf mica capacitor.
5. Insulated screwdriver.

PROCEDURE—GENERAL:

1. The alignment procedure shown in table form should be followed with the chassis removed from the cabinet. Since the dial scale is not a part of the main chassis, it is necessary to use the special alignment scale fastened to the rear of the scale back plate assembly. With the gang condenser fully closed, set the left edge of the pointer to zero on the alignment scale. Then 147 on the alignment scale will correspond to 1500 kc (Standard Wave), approximately 149 to 6 mc (SW 1 band), and 141 to 18 mc (SW 2 band).

2. Connect output meter across speaker voice coil terminals. During alignment keep volume control set at maximum and attenuate test oscillator signal output so that the output meter reading never exceeds 1¼ volts.

3. Connect the capacitor listed in the chart between the "high side" of the test oscillator and the point of input specified. For Model X153, the ground terminal of the test-oscillator may be connected to the chassis, providing an isolating transformer is used between the radio and the line input.

4. After the chassis has been aligned and replaced into the cabinet, it may be necessary to reset the pointer. It should point to zero on the logging scale when the gang condenser is fully closed (pointer at extreme left of scale).

ALIGNMENT CHART

Step	Test-osc. Connection to	Test-osc. Setting	Pointer Setting	Adjust Trimmers for Max. Output
1	12SK7 or 6SK7 IF grid in series with .05 mfd.	455 kc	"STD" Band 550 kc	C15 and C16 (2nd IF trans. capacitors)
2	12SA7 or 6SA7 Conv. grid in series with .05 mfd.	455 kc	"STD" Band 550 kc	C13 and C14 (1st IF trans. capacitors)
3***	Ant. post in series with 200 mmf.	1500 kc	"STD" Band 1500 kc	C3 (osc.); C2 (ant.)
4	Ant. post in series with 200 mmf.	580 kc	"STD" Band 580 kc	C7**
5	Repeat Step No. 3			
6	Ant. post in series with 200 mmf.	6.0 mc	"SW1" Band 6.0 mc	C5 (osc.)**
7	Ant. post in series with 200 mmf.	18.0 mc	"SW2" Band 18 mc	C6 (osc.)* C4 (ant.)**

* Use minimum capacity peak.
** Rock gang condenser for optimum peak.
*** Note: C2 trimmer is not incorporated on some receivers. This requires that C3 be aligned while rocking the gang condenser.

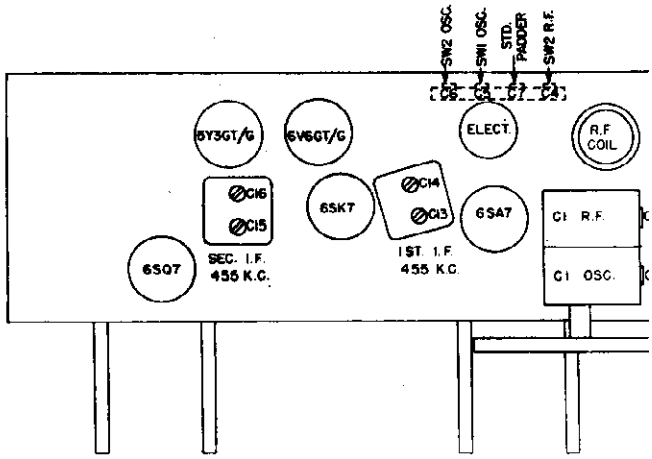

Fig. 1 Tube and Trimmer location (Model X150)

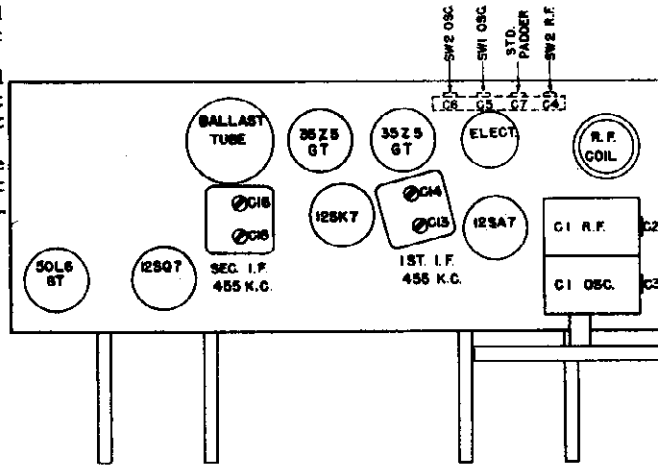

Fig. 2 Tube and Trimmer location (Model X153)

STAGE GAIN AND VOLTAGE CHECKS

Stage gain measurements by vacuum tube voltmeter similar measuring devices may be used to check circuit pe formance and isolate trouble. The gain values listed may ha tolerances of 20%. Readings taken with low signal input that AVC is not effective.

(1) R-F Stage Gains.
Antenna Post to 12SA7 Grid ..... 5.5 @ 1000
Antenna Post to 12SA7 Grid ..... 3.3 @ 4000
Antenna Post to 12SA7 Grid ..... 2.0 @ 12000
12SA7 Converter Grid to 12SK7 Grid ..... 65 @ 1000
12SA7 Converter Grid to 12SK7 Grid ..... 81 @ 455
12SK7 Grid to 12SQ7 Diode Plate ..... 62 @ 455

(2) Audio Gain.
0.06 volts for Model X150, or 0.03 volts for Model X15 at 400 cycles across volume control (R10) with control s at maximum will give approximately ½-watt output acr the speaker voice coil.

(3) Oscillator Grid Bias.
D-C voltage developed across the oscillator grid leak (R averages 7.3 volts at 1000 kc, 9.9 volts at 4000 kc, and volts at 12,000 kc.

(4) Socket Pin Voltages.
Figures 9, 10 and 11 show voltages from all tube pins to B unless otherwise specified. Voltage readings much lower th those specified may help localize defective components tubes.

ELECTRICAL RATING

Model	Rating	Power Supply			Power Consumption
		Nominal Voltage	Voltage Range	Frequency Cycles A-c	
X150	V	110 125 150 200 225 245	103-117 117-133 140-160 185-213 213-234 234-260	50-60	55
X150	C	110 125	103-117 117-133	25-60	55
X153	D2	230 Ac-Dc	210-250	40-60	60
X153	A1	120 Ac	105-130	40-60	60

CAUTION:

On the Model X153, one side of the power line is connected to the chassis. Use extreme caution when servicing this receiver unless an isolating transformer is used in the power line. Do not place a ground on the chassis unless an isolating transformer is used.

GENERAL INFORMATION

Power Supply Conversion—Model X150:

The Model X150 "V" rating receiver is equipped with a universal power transformer which permits practically instantaneous conversion for operation on any one of the six voltage ranges shown on the label. Merely loosen the set screw on the control at the top of the power transformer and turn the knob until the correct nominal voltage rating appears in the window. Tighten the set screw.

The Model X150 "C" rating makes use of a tapped transformer. To change voltage rating reconnect transformer primary to proper input color coded leads as shown on schematic.

Power Supply Conversion—Model X153:

The X153 Models with "D2" and "A1" ratings are identical except for the ballast tube that is used. The substitution of the appropriate ballast tube takes care of all the wiring changes necessary to convert from one line voltage range to the other. The "A1" rating may be converted for operation on a line of 230 volts a-c or d-c by removing the ballast resistor unit, Part No. RRB-002, and substituting the ballast resistance unit, Part No. RRB-001, in the same socket. When this is done the label should be changed so that it reads "D2" rating. The "D2" rating may be changed to "A1" rating in like manner—by substitution of Part No. RRB-002 ballast resistor for Part No. RRB-001.

Phonograph or FM Sound Connection:

Figure 4 shows a simple method for connecting a crystal or high impedance magnetic phono pick-up into the circuit of the Models X150 and X153. A double-pole, double-throw type phono switch with a phono motor power switch attached is recommended. This should be mounted close to the rear chassis terminal board on the radio. It is important that if the lead from the record player is shielded that the shield braid be connected to terminal 3, ***not to chassis ground. As a precaution when operating the Model X153, add spaghetti insulation to the full length of the shield braid so that the braid cannot accidentally touch the chassis. This will also avoid the possibility of the operator receiving a shock under certain conditions.***

When making this phono connection as a permanent installation, the link between terminals 1 and 2 must be removed.

An FM Translator may be connected in the same manner as for the record player. This permits the FM sound to be reproduced through the radio.

ELECTRICAL CIRCUIT ALIGNMENT

PROCEDURE: (1) Remove chassis during r-f alignment.

(2) Connect output meter across loudspeaker voice coil leads.

(3) Set radio volume control to its maximum position and attenuate the test oscillator signal output so that the output meter reading never exceeds 1 1/4 volts.

(4) Connect capacitor or capacitor and resistor listed in column 2 between the output "High Side" of test oscillator and the point of input specified.

ALIGNMENT

Equipment Needed.

Signal Generator, modulated 30% with 400 cycles.
One—60 mmf. capacitor
One—.05 mf. capacitor
One—400-ohm resistor
One—output meter
One—insulated screw driver.

General.

For a complete alignment, the i-f should be aligned before the r-f.

The i-f sections may be aligned with the chassis removed from the cabinet, but for the final r-f alignment the chassis should be in place, in the cabinet.

Fig. 3 identifies and locates all trimmers.

Be sure the radio has been "on" for at least 10 minutes before making any alignment adjustments.

In order to be sure of frequency stability in the signal generator, follow the manufacturer's recommended procedure for use.

When making connections to the signal generator, avoid any ground connections to the radio unless an isolation transformer is used in the power line.

I-F Alignment.

1. Remove chassis from cabinet.
2. Connect output meter across the speaker voice coil.
3. Set volume control for maximum.
4. Connect output terminal of signal generator through a .05 mf. capacitor to pin 4 of the 12SG7 (i-f amplifier) tube.
5. Set signal generator frequency to 455 kc.
6. Set dial pointer on radio to approximately 1500 kc.
7. Peak second i-f trimmers, C16 and C17, for maximum output.
8. It is important to keep the output reading under 1¼ volts by reducing the input or gain control so as to avoid spurious results due to a.v.c. action.
9. Disconnect signal generator from 12SG7 and connect (through .05 mf. capacitor) to pin eight of the 12SA7 converter.
10. Keeping output below 1¼ volts as before, peak the first i-f trimmers, C10 and C11, for maximum output.
11. Check second and first i-f trimmer adjustments.

Broadcast R-F Alignment.

When making the following alignment, the Beam-a-Scope (loop antenna) must be mounted to the chassis, and the chassis must be installed in the cabinet. All trimmer adjusting screws are available through the hole in the loop antenna frame.

1. Connect the output of the signal generator through a 60 mmf. capacitor, to the radio antenna post.
2. Set the signal generator and dial pointer to 1500 kc.
3. Adjust C14, C8, and C2 for maximum output. If two peaks are obtained when adjusting C14, the correct point is the one with the trimmer plates the furthest apart.

Shortwave R-F Alignment.

1. Set Band Change switch to SW position.
2. Set dial pointer and signal generator to 9.5 mc.
3. Remove chassis carefully, so as not to disturb the setting of the dial pointer.
4. Connect the output of the signal generator through a .05 mf. capacitor to pin eight of the 12SA7 converter tube.
5. Adjust C13 (under the chassis) for maximum output. Two points of maximum output may be obtained. The correct point is the one with the trimmer plates closest together.
6. Remove the signal generator connection, and connect its output through a 400-ohm resistor to the radio antenna post. Peak C7 for maximum output while rocking-in the main tuning condenser.
7. Replace the chassis in the cabinet, and check the setting of C7.

ANTENNA.

Broadcast Reception—Built in "Beam-a-Scope" loop antenna.

Shortwave Reception—Power cord used as antenna. An external antenna is recommended for improvement of long-distance reception.

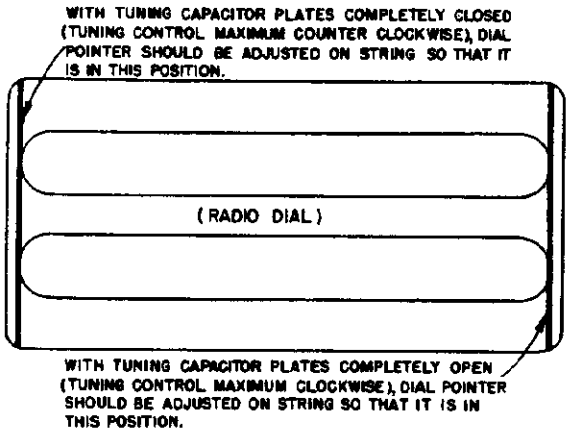

Fig. 1. Alignment of Dial Pointer on String

Alignment of Dial Pointer and String.

The extreme left and right positions of the dial pointer should be in accordance with Fig. 1. This adjustment should be checked before proceeding with the r-f alignment.

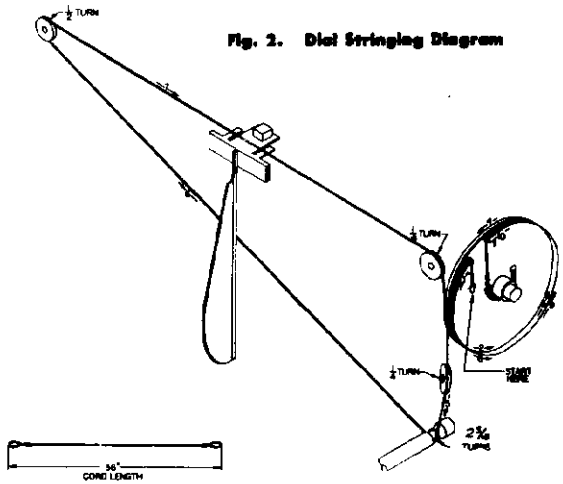

Fig. 2. Dial Stringing Diagram

GENERAL ELECTRIC CO.

STAGE GAINS AND VOLTAGE CHECKS

The following information will be useful to servicemen equipped with vacuum tube voltmeters or similar voltage measuring instruments. The stage gain values listed may have a tolerance of 20%.

Stage Gains.

(1) Antenna terminal* to pin 4 of **12SK7**.. 4 @ 1000 kc
(2) Pin 4 of **12SK7**† to pin 8 of **12SA7**..... 10 @ 1000 kc
(3) Pin 8 of **12SA7**† to pin 4 of **12SG7**..... 35 @ 455 kc
(4) Pin 4 of **12SG7**† to pins 4 or 5 of **12SQ7**.....100 @ 455 kc

* Connect to signal generator output through a 60 mmf. capacitor.
† Connect to signal generator output through a .05 mf. capacitor.

In all measurements, the readings should be kept as low as possible by reducing the signal generator gain control so as to avoid a.v.c. action.

Audio Gain.

0.06 volt at 400 cycles across the volume control (R10), with the control set at maximum, will give approximately 0.5 watt output (1.32 volts) across the speaker voice coil.

Oscillator Grid Voltage.

The d-c voltage developed across the grid leak R3 (22,000 ohms) averages 7.7 volts at 1000 kc. This should be measured with a vacuum tube voltmeter. (The grid current, measured with an ammeter in series with pin 6 of the 12SA7 tube, should be in the order of 350 microamps.)

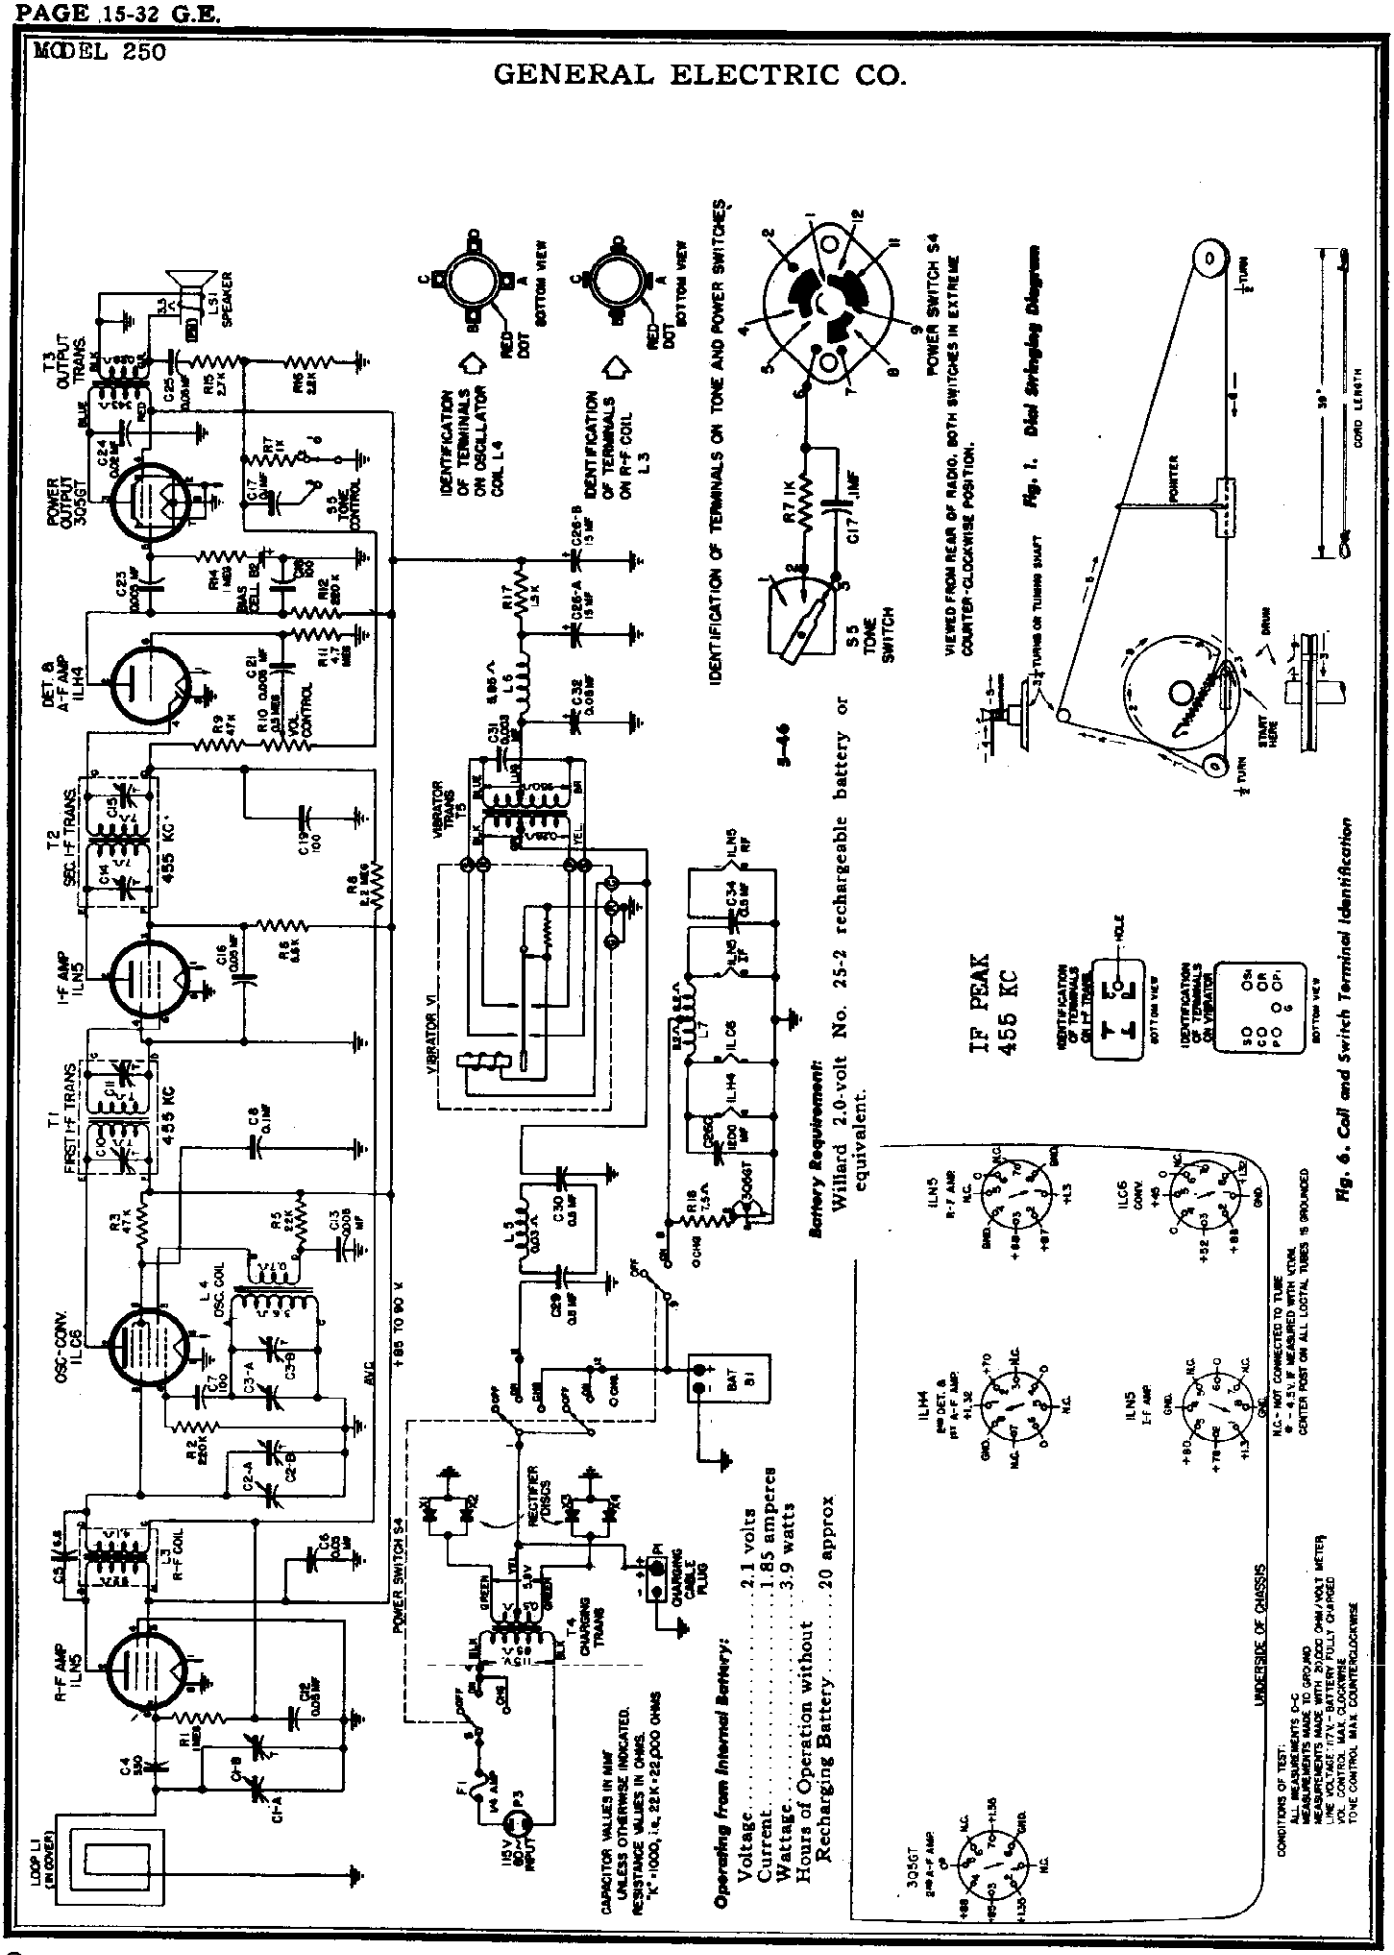
MODEL 250

GENERAL ELECTRIC CO.



GENERAL ELECTRIC CO.

MODEL 250 ----- Battery Filler Cap.

It is important that the battery filler cap be sufficiently tight so that the washer is compressed, otherwise battery acid will leak out and damage the radio. Make sure the washer is replaced when the cap is removed and that possible thread burrs do not prevent the cap from being tightened completely. Use a screwdriver to tighten the cap.

A quantity of Model 250 radios was shipped with the oscillator adjustment plug not locked after alignment. This causes the low frequency calibration to be considerably in error and reduces sensitivity at this end of the band.

Realign the oscillator adjustment (adjacent to 1st IF transformer), L4, then tighten down the lock nut.

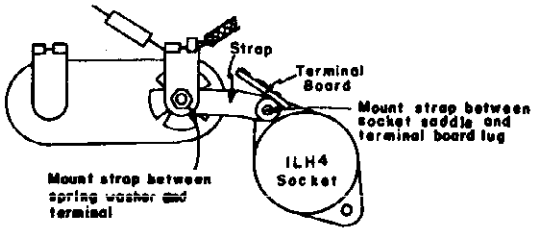
Failure of the vibrator unit REU-001 may be treated in the following manner:

1. The vibrator should be removed from the receiver and a resistance check made with an ohmmeter across terminals C and R.
2. If the resistance checks approximately six ohms and the vibrator will not start, it should be replaced with a new one.
3. If the resistance checks an infinite or high value, the vibrator should be opened up by unsoldering the base from the can. A resistance check should then be made across the terminals of the operating coil, and across the 220 ohm resistor. The operating coil should check approximately six ohms. If the coil is open, the vibrator must be replaced with a new one. If the resistor is open, the resistor should be replaced.
4. If the resistance across terminals C and R checks approximately 220 ohms, the starting contacts that short out the 220 ohm resistor do not make contact. This condition may be corrected by opening the vibrator and turning the small adjustment screw on the resistor side of the vibrator very slowly in the clockwise direction until the resistance across terminals C and R reads approximately six ohms. Care should be taken to see that this adjustment screw is not turned beyond the point where contact is made, and the 220 ohm resistor is shorted out.

A few radios were shipped that did not have the IF transformers peaked for maximum sensitivity. For sets with low sensitivity, realign the IF amplifier

When hum is experienced, the following checks should be made in the order of their listing:

1. Check the battery electrolyte level. It should be maintained at the recommended level.
2. A battery which is nearly discharged caused an excessive hum level.
3. A dirty or loose negative battery terminal contact causes excessive hum. Remove the battery and clean the terminals. Also, clean the negative prong located in the battery compartment, with fine emery; spread the battery spring contacts; and install a rubber insert, V61J551, up through the center of the split spring contacts. Early production radios did not have the rubber insert so that the normal handling causes these spring contacts to be compressed resulting in a high resistance connection. For those receivers not equipped, write your requirements to the Technical Service Section in Bridgeport and they will be forwarded immediately. When reinstalling the battery, spread a thin layer of petroleum jelly on the contacts.
4. Where the previous checks do not remedy the trouble, check the spring washer on the opposite end of the negative prong for a good chassis bond. This requires that the front part of receiver case be removed and then install a bonding strap as shown in the illustration. The factory is now installing an auxiliary copper strap made of 3/8" x .010" soft copper strip, fastened between the spring washer and the 1LH4 socket saddle hole as shown in the illustration. Drill out the rivet at the socket saddle and install a bolt and nut to hold it and the socket and terminal board.



In a few remote cases it has been found that the storage battery (25-2) terminals have loosened internally where they are swedged to the plate holder of the battery. This causes low voltage when under load and results in a "dead" or intermittent set. To remedy replace the battery.

GENERAL ELECTRIC CO.

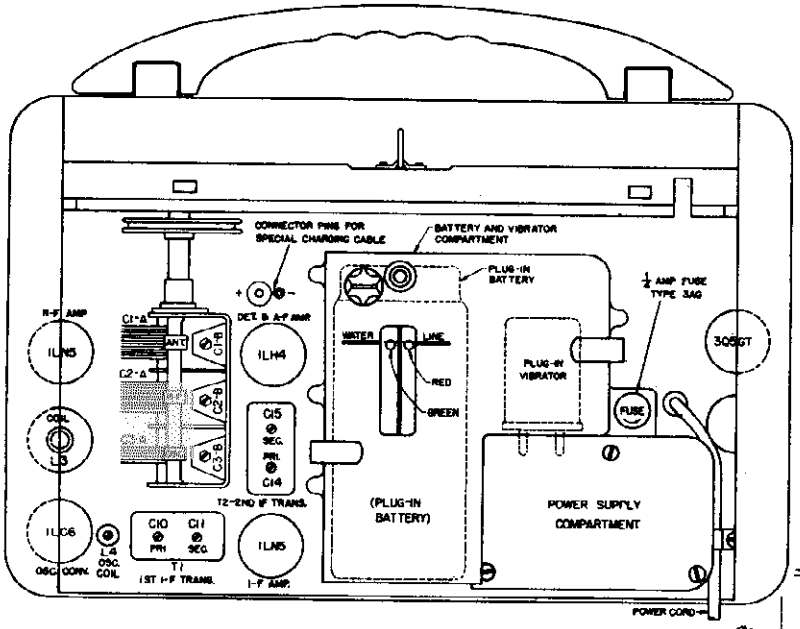


Fig. 3. Tube and Trimmer Location

ELECTRICAL CIRCUIT ALIGNMENT

1. EQUIPMENT REQUIRED.

1. Signal generator with audio tone modulation.
2. A-c output meter, 1 or 1½ volts full scale, 1000 ohms - volt.
3. Insulated screwdriver.

2. ALIGNMENT PROCEDURE.

1. *General.*—The alignment procedure is given in table form for convenience. Reference is made to Fig. 3 for the trimmer locations. The low side of the signal generator should be connected to the chassis of the receiver for i-f alignment; the high side should be connected as indicated in the Alignment Chart. A meter or some other suitable indicating device must be connected to the output of the receiver. Two methods for connecting an output meter are given in later paragraphs.

When aligning the receiver, the Volume Control on the receiver should be turned to its maximum position (clockwise), and the Tone Control should be turned to the position of maximum treble (extreme counterclockwise). The output signal of the signal generator should be kept as low as possible at all times; the reading of a meter connected across the voice coil leads of the receiver should be kept below ½ volt by changing the signal generator output. If the signal level is too high, the AVC becomes effective and alignment errors may result.

The following paragraphs give greater details regarding the connection of the output meter and the signal generator to the receiver during alignment.

2. *Connecting the Output Meter.*—In aligning the receiver, some means for indicating differences in the output voltage will be required. Either of the following methods is satisfactory. The first requires more disassembly of the receiver case than the second, but the second requires additional test equipment.

Method 1.—A satisfactory method for indicating differences in output is to connect a rectifier-type a-c meter of 1 or 1½ volts full scale deflection across the speaker voice coil terminals. To gain access to the speaker, remove the front panel from the radio as previously described. A short green lead will be found connected to one terminal of the speaker. This may be pushed through one of the holes in the chassis so that it will be accessible from the back of the radio. The front panel is reinstalled in place so that the stray capacities in the set will be the same as when the set is operating normally. Connect the meter between this lead and ground. A convenient ground connection is to remove the tone control knob and use a clip lead to the shaft.

Method 2.—The following is an alternate method which eliminates the necessity of removing the front panel of the set, but which requires additional test equipment. Make an indicating device by connecting a 4- to 6-inch diameter magnetic speaker or the high-impedance leads from the output transformer of a good p m dynamic speaker to the terminals of a rectifier-type microammeter with a full scale deflection of 100 microamperes or less. For convenience, the meter and speaker may be mounted in a small box in such a way that the meter will be visible when the speaker is placed in front of the speaker on the receiver being aligned.

To use this device, place its speaker in front of and about an inch away from the speaker of the receiver being aligned. The meter will then deflect in proportion to the intensity of the sound produced by the speaker, and therefore may be used as an output meter. The meter must not be moved during alignment.

3. *Connecting the Signal Generator.*—For aligning the i-f transformers, the output of the signal generator should be coupled through a 0.05 mf. capacitor to the grid (pin 6) of the 1LC6 oscillator-converter tube. This may be accomplished easily by connecting the capacitor to the stator of C2-A, the middle section of the tuning gang, as this stator is connected directly to the converter grid. The low side of the signal generator output should be connected to the chassis ground to complete the circuit.

For aligning the oscillator and r-f coils, the r-f signal should be inductively coupled by connecting a three- or four-turn, 6-inch diameter, loop of bell wire across the signal generator output terminals and then locate the loop about one foot from the radio cover, with cover open. To prevent possible errors in peak readings, the position of the loop with respect to the receiver should not be changed during any one set of adjustments.

ELECTRICAL RATING:

Charging from A-c Line:

Voltage.....105–125 volts, a-c only
Frequency.....50/60 cps
Wattage.....10 watts

Fuse:

G-E No. 2548, ¼-ampere rating.

OPERATING FREQUENCIES:

Broadcast Band.....540–1600 kc
I-F Amplifier.....455 kc

POWER OUTPUT:

Undistorted.....248 milliwatts
Maximum.....365 milliwatts

LOUDSPEAKER:

Type.....Alnico PM
Outside Cone Diameter.....5¼ inches
Voice Coil Impedance (400 cps)..3.2 ohms

ALIGNMENT CHART

† Use loop on output of signal generator.
* Adjust L3 and L4 alternately several times to obtain peak.
** Make all adjustments of C1B, C2B, and C3B with rear cover closed, through the three ports provided on cover. Remove snap buttons for access.

GENERAL ELECTRIC CO.

1. POWER SUPPLY

All power necessary for the operation of the receiver is supplied by the 2-volt built-in rechargeable battery. Power to the 1.4-volt tube filaments is supplied by the battery through suitable voltage dropping resistors. The high voltage for the screens and plates of the tubes is furnished by a synchronous vibrator used in conjunction with a step-up power transformer and its associated filter circuit. The synchronous vibrator operates directly from the battery voltage.

The receiver power is obtained from the battery at all times in the manner just described, whether the power cord is connected to a power source or not. When the power cord is connected to a receptacle supplying from 105 to 125 volts, 50 or 60 cps, a-c, and the power selector is in either the CHARGE or ON position, the power supplied from the line will be used to charge the battery. The CHARGE position on the three-position power selector switch allows the battery to be charged from the house current when the receiver is not operating. The ON position of the switch permits the radio to be operated at the same time that the battery is being charged. Under this condition, the battery floats in the circuit to keep the voltage at its proper voltage and, with high line voltage, the battery may be charged slowly while the radio is operating.

The battery-charging unit consists of a step-down transformer which converts the house current to approximately 5.8 volts center-tapped at 117 volts line, and a full-wave copper-oxide rectifier circuit which supplies the battery with d-c charging current.

A charging cable is available, which provides a convenient means of charging the radio battery from an automobile or 6-volt storage battery. The cable plug is inserted over the two pins provided, see Fig. 3, and the plug and socket on the other end of the cable are connected to a 6-volt supply. Complete installation instructions are provided with each cable.

2. CHARGER CHARACTERISTICS

Testing the operation of the rectifier unit.—A ¼-ampere fuse is used in series with the primary of the charger transformer. If the battery does not show any signs of becoming charged after a reasonable length of time, check the fuse. If it is necessary to replace the fuse, use a ¼-ampere, Type 3AG fuse.

If one or more of the copper-oxide discs of the rectifier unit are defective, the charger will not operate properly. To test the rectifier unit operation, remove the battery from the unit and reconnect it in series with a d-c ammeter capable of reading at least two amperes. Plug the power cord into a 105–125 volt, 50 or 60 cps, a-c supply, and turn the power selector switch to the CHARGE position. With the a-c line voltage at 117 volts, the average charging current should read about 1.8 amperes at 2.1 volts battery. Care must be exercised in making this test as the charging circuit is of extremely low resistance. *Very heavy* leads must be used, and the use of an ammeter having only 0.05 ohms resistance will introduce considerable error. If the line voltage is greater than 117, or the battery voltage is lower than 2.1 volts, the charging current will be greater. If the current is much less than 1.8 amperes at the rated line voltage of 117 volts, one or more of the copper-oxide discs may be defective.

Testing the individual rectifier discs. Two rectifier assemblies are used in the receiver, each assembly consisting of two rectifier discs held together by an eyelet. A cross section of a rectifier assembly is shown in Fig. 2. The center plate of the assembly is positive and is provided with a soldering tab. A copper-oxide rectifier disc is located on each side of the center plate. The rectifier disc conducts when the positive potential is applied to the copper-oxide surface. The copper oxide is a dark purple coating which has been plated with nickel to afford a good surface contact to the copper oxide. If either or both of the rectifier discs in an assembly become defective, the entire assembly should be replaced.

To check the rectifier assembly, the following tests are recommended. In the conducting direction, the rectifier assembly should pass 0.5 ampere or more when ½ volt is impressed across it. If a d-c ammeter is not available for measuring currents as high as 0.65 ampere, the circuit shown in Fig. 2 can be used for this check. The 2.00-ohm resistance should be fairly accurate. The voltage across the rectifier assembly should read 0.7 volt or less; if this voltage exceeds 0.7 volt, the assembly is defective and should be replaced.

The reverse current flow is as important as the above test and is made as follows: Reverse the battery polarity in the test circuit described for current check, disconnect the voltmeter, and place a milliammeter that will read 10 ma. in series with a lead to one of the battery terminals. A suitable meter fuse should be used in series with the milliammeter to prevent damage to the meter in case the assembly under test

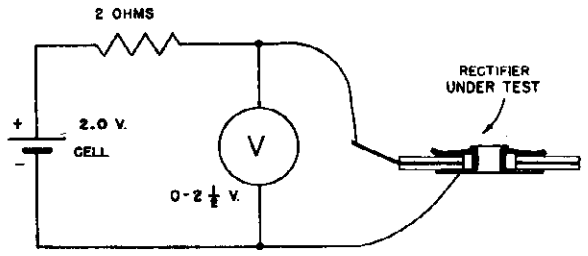

Fig. 2. Rectifier Test Circuit

is shorted. The reverse current should not exceed 10 ma. If the current is considerably above this value, the rectifier assembly should be discarded.

If a milliammeter is not available, a rough check may be made by measuring the resistance of the assembly in the nonconducting direction on the low-resistance range of an ohmmeter. The resistance should measure at least 300 ohms.

3. DISASSEMBLY OF THE RECEIVER

The following outlines should be of assistance in gaining access to the various compartments of the receiver and in dismantling it for replacement of panels.

To Gain Access to Power Supply Compartment.

1. Open the back cover and unsnap the battery compartment cover. Remove the cover by prying gently with a screwdriver.
2. Remove the three flat-head screws on the power supply compartment cover (see Fig. 3).
3. Pry the lid from the power supply compartment and lift it straight outward. All of the power supply components are attached to the lid and will come out with it as far as the connecting leads will permit. In replacing this cover, be careful not to short circuit the B+ lead.

To Gain Access to Underside of Radio Chassis.

1. Open the top cover and remove the four Phillips-head screws from the front edge of the escutcheon.
2. Unscrew the three flat-head screws from the bottom of the case, and remove the single sheet of metal which forms the front and bottom of the case. Disconnect the speaker plugs from the speaker to free the front panel from the chassis.

To Remove the Right End Panel.

1. Open the top cover and pull off the four knobs.
2. Remove the two cover stay-arms by unscrewing the screw which holds each to the cover. This allows the loop to fall to its extreme position. Care should be taken to see that the loop connection springs are not broken while the stay-arms are off.
3. Remove the eight Phillips-head screws which hold the escutcheon in place.
4. Bend the ends of the escutcheon inward slightly to free them from the end panels, and remove the escutcheon and dial assembly.
5. Remove the three speed-nuts which hold the end in place. Two of these are located in the top part of the case; the third one is in the bottom rear.
6. Pull off the end panel.

To Remove the Left End Panel.

1. Remove the escutcheon and dial assembly as outlined in steps one through four in the preceding paragraph.
2. Unscrew the three flat-head screws from the bottom of the case, and remove the single sheet of metal which forms the front and bottom of the case. Disconnect the speaker plugs from the speaker to free the front panel from the chassis.
3. Remove the three speed-nuts which hold the end in place. Two of these are located in the top part of the case; the third is in the bottom front.

To Remove Top and Rear Cover Assembly.

1. Open the back cover and unsolder the two antenna loop leads. To facilitate replacement, mark each of the metal strips with the color code of the wire which was unsoldered from it.
2. Remove the escutcheon and dial assembly as outlined in steps one through four of the preceding paragraph, "To Remove the Right End Panel."
3. Unscrew the three flat-head screws located near the ends of the hinge on the top of the chassis, and remove the entire top and rear cover assembly.
4. Pull out the hinge pin to separate the top and rear covers.

GENERAL ELECTRIC CO.

STAGE GAIN AND VOLTAGE CHECKS

Stage gain measurements may be made with a vacuum-tube voltmeter to check circuit performance and to locate stages which are not operating properly. The gain values listed may have a tolerance of 20%.

1. R-F Stage Gains.
   R-F Amplifier grid (1LN5, pin 6) to Osc.-Conv. grid (1LC6, pin 6).....25.0 at 1000 kc
   Osc.-Conv. grid (1LC6, pin 6) to I-F Amp. grid (1LN5, pin 6).....33 at 1000 kc
2. Audio Gain.
   The power output across the speaker voice coil should be approximately 50 milliwatts with a 400 cps signal of 0.07 volts applied across C19 (Volume Control max.—Tone Control CCW).
3. Oscillator Grid Bias.
   The d-c voltage developed across the oscillator grid leak (R2) averages 8.1 volts at 1000 kc.
4. Socket Pin Voltages.
   Fig. 4 shows typical tube pin voltages. All readings should be made from the pins to ground unless otherwise indicated.

BATTERY INFORMATION

The receiver uses a 2-volt Willard Radio Battery No. 25-2 or equivalent. It has a 25 ampere-hour capacity and should be cared for in the same manner as any other storage battery.

Charge Indicator

The degree of charge of the battery can be determined by raising the back cover of the radio and referring to the charge ball indicators visible through the hole in the metal battery case.

If the battery is fully charged, two indicator balls will be visible at the surface of the liquid in the battery. When the battery discharges, these ball indicators will sink and disappear in the following order:

1. Green indicator sinks when approximately 20 per cent of battery capacity has been discharged.
2. The red ball sinks when battery is 80 per cent discharged.

On charge, the balls rise or float in the reverse order and the charge is complete and may be stopped when both balls appear in the opening.

To Charge Battery

The battery is charged by merely plugging the receiver power cord in the rated a-c power outlet and turning the selector switch to CHARGE. Frequent check should be taken of the charge indicator and when both indicator balls are visible, the battery is fully charged. Charging the battery after all indicator balls are visible will not harm the battery except that it will evaporate the water faster. A completely discharged battery will be restored usually within 20 to 30 hours.

When operating the receiver from the a-c house current, the battery floats or is being charged at a slow rate. Thus, if you wish to operate the receiver at the same time that you are charging even a fully discharged battery, plug the power cord in the a-c receptacle and turn the power selector switch to the ON position. Prolonged and repeated operation on this position will assure that the battery is always maintained in a nearly fully charged condition.

Battery Operating Instructions

1. Add distilled or tap water in the filler cap at sufficiently frequent intervals to keep liquid level at indicator mark as viewed through opening in battery case. DO NOT OVERFILL as this impairs nonspill feature.

2. A fully charged battery will operate the radio in the ON position without being connected to a-c outlet for about 20 hours before recharging is required. Whenever possible, it is best not to allow the battery to become discharged to the extent that both indicators disappear.

However, if both indicators have sunk, the battery should be recharged immediately or within 24 hours.

3. A battery will continually discharge at a slow rate even when not in use. For this reason, monthly checks should be made of the charge condition and the battery placed on charge when necessary. This will prevent damage to the battery such as freezing during cold weather.

BATTERY INSTALLATION

The following instructions should be carefully followed in installing a battery:

1. Remove battery from packing carton.
2. If needed, add water to bring liquid level to indicator mark on battery container. ***Do not overfill.***
3. Raise back cover on radio, remove battery case cover. The latter is removed by unclipping the two catches. Pry off cover.
4. Unplug battery and replace with new battery.
5. Place battery on charge, if necessary, as described in a previous paragraph, until both indicators are showing in the opening in the case cover.

ELECTRICAL CIRCUIT ALIGNMENT

ALIGNMENT FREQUENCIES

R-F—1620, 1500, 1000 KC
I-F—455 KC

EQUIPMENT REQUIRED

1. Test Oscillator with Tone Modulation.
2. A-C Output Meter, 1½ volts full scale.
3. .05 Paper Condenser.
4. Insulated Screwdriver.
5. 200 μμf. Mica Condenser.

ALIGNMENT PROCEDURE—GENERAL

The alignment procedure is given in table form. All i-f and r-f alignments may be made with the chassis removed from the cabinet. All i-f and r-f adjustments are accessible from the bottom of the cabinet when the chassis is installed. The location of the i-f and r-f adjustments is shown in Figure 4. Adjustment of inductances L_2 and T_1 is accomplished by loosening the adjustment screws and sliding the inductance to the correct position using the chassis hole as a fulcrum. Retighten the adjustment screw after alignment.

For accurate calibration, the position of the pointer should be established prior to r-f alignment as follows. If no dial scale is available or if the chassis is removed from the cabinet, turn the tuning control knob fully counterclockwise (slugs fully in the coils) and secure the pointer to the dial string at some arbitrary position near the left end of the dial scale or pointer travel. Mark the pointer position on the backplate or note its position with reference to the number scale stamped on the backplate. Proceed with the alignment as indicated in the alignment chart and mark the pointer position for 1500 kc. The distance between the original reference mark and the 1500 kc mark should be 5.25 inches for accurate dial calibration. After installation of the chassis in the cabinet, the tuning control is turned extreme counterclockwise and the pointer slid and secured to the string at the extreme left rectangular dial calibration mark on the scale. The pointer is accessible through the hole in the backplate.

The output meter should be connected across the loudspeaker voice coil terminal. A voice coil terminal is accessible at an insulated rivet in the bottom of the chassis. The low side of the test oscillator output should be connected to the chassis ground; the high side of the test oscillator output should be connected as indicated in the alignment chart. During the entire alignment procedure, the volume control should be at its maximum position. The test oscillator output should be attenuated so that the output meter reading doesn't exceed 1¼ volts.

ALIGNMENT CHART

Step	Connect Test-Osc. To:	Test-Osc. Setting	Pointer Setting on Radio	Adj. for Max. Output
1	6SK7 pin No. 4 in series with .05 mf. paper capacitor	455 kc	1600 kc	2nd I-F Trans Trimmers C9-C10
2	6SB7Y pin No. 8 in series with .05 mf. paper capacitor	455 kc	1600 kc	1st and 2nd I-F Trans. C6, C7, C9, and C10
3	Antenna post in series with 200 mmf. capacitor. Shorting link removed.	1620 kc	Extreme Right	Osc. Trimmer C5
4	Antenna post in series with 200 mmf. capacitor. Shorting link removed.	1620 kc	Extreme Right	Ant. Trimmer C2
5	Antenna post in series with 200 mmf. capacitor. Shorting link removed.	1500 kc	*1500 kc	Oscillator Inductance L2
6	Antenna post in series with 200 mmf. capacitor. Shorting link removed.	1000 kc	1000 kc	Antenna Inductance T1
7	Recheck Steps 3, 4, 5, and 6.			
8	Replace shorting link unless installing for antenna operation.			

*1500 kc is 5.25 inches from extreme low frequency pointer position. (See alignment procedure.)

GENERAL ELECTRIC CO.

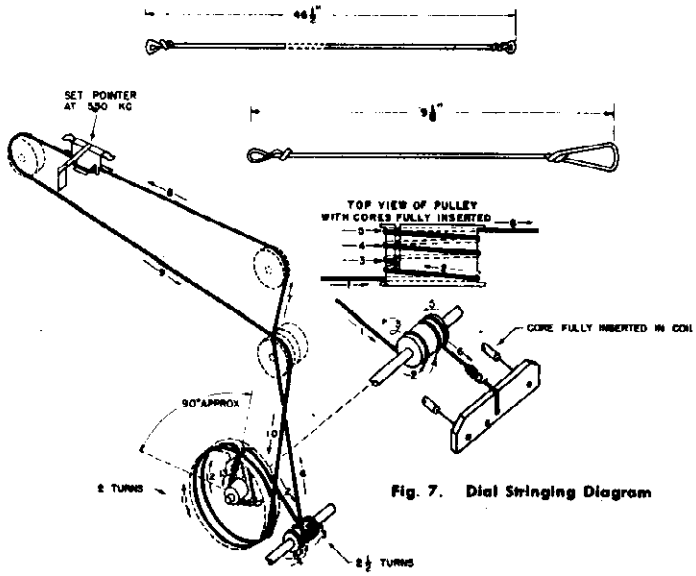

Fig. 7. Dial Stringing Diagram

STAGE GAIN AND VOLTAGE CHECKS

Stage gain measurements may be made with a vacuum tube voltmeter to check circuit performance and to locate stages which are not operating properly. The gain values listed may have a tolerance of 20%.

1. R-F Stage Gain.

   Antenna post to 6SB7Y grid . . . . . 3 at 1000 kc
   6SB7Y grid to 6SK7 grid . . . . . 70 at 455 kc
   6SK7 grid to 6SQ7 diode plate . . . . . 70 at 455 kc

2. Audio Gain.

   The power output across the speaker voice coil should be approximately ½ watt with .05 volts at 400 cps applied between the high side of the volume control and ground. Approximately .008 volts at 400 cps should be applied to the phonograph input for ½ watt output across the speaker voice coil.

3. Oscillator Grid Bias.

   The d-c voltage developed across the oscillator grid leak R2 should be approximately 6.6 volts at 1000 kc.

4. Socket Pin Voltages.

Socket pin voltages greatly different than those shown in Figure 1 indicate defective components or tubes. It should be noted that a considerable difference in voltage exists at some voltage check points depending on the position of the radio-phono switch. (See Fig. 1).

CAUTION

ONE SIDE OF THE POWER LINE IS CONNECTED TO THE CHASSIS. AVOID ANY GROUND CONNECTIONS TO THE RADIO UNLESS AN ISOLATING TRANSFORMER IS USED IN THE POWER LINE.

ELECTRICAL CIRCUIT ALIGNMENT

The following equipment is required: (1) test oscillator with tone modulation, (2) a-c output meter, 1 1/2 volts full scale, (3) 0.05 mf. paper capacitor, (4) 200 mmf. mica capacitor, (5) insulated screwdriver.

PROCEDURE:

(1) For i-f alignment, the chassis must be removed from the cabinet. For r-f alignment, the chassis should be firmly bolted in place in the cabinet.

(2) Connect output meter across loudspeaker voice coil leads.

(3) Set radio volume control to its maximum position and attenuate test oscillator signal output so that the output meter reading never exceeds 1 1/4 volts.

(4) Connect the capacitor as listed in column 2, between the output "High Side" of test oscillator and the point of input specified.

TUBE COMPLEMENT:

Converter-Oscillator..... Type 7Q7
I-F Amplifier..... Type 6SG7
Detector-Audio..... Type 6SQ7
Power Output..... Type 25L6GT/G
Rectifier..... Type 25Z6GT
Tuning Indicator..... Type 6U5
Pilot Lamp..... (2) GE #44

ELECTRICAL RATING:

"C" Voltage Rating
(Transformer RTP-012)... 103-133 v., 25-60 cycles
"D2" Voltage Rating
(Ballast RRB-003)..... 210-240 v., a-c or d-c
"V" Voltage Rating
(Transformer RTP-011)... 103-250 v., 50-60 cycles
Wattage ("C" and "V" Ratings)..... 60 watts
Wattage (D2 Rating)..... 100 watts

OPERATING FREQUENCIES:

Broadcast..... 540-1700 kc
Shortwave 1..... 2.2-6.8 mc
Shortwave 2..... 6.8-21.0 mc
31 Meters..... 9.36-9.8 mc

STAGE GAINS AND VOLTAGE CHECKS

Stage gain measurements by vacuum tube voltmeter or similar measuring devices may be used to check circuit performance and isolate trouble. The gain values listed may have tolerances of 20%. Readings taken with low signal input so that AVC is not effective.

(1) R-F Stage Gains.
Antenna Post to 12SK7 r-f grid..... 3 at 1000 kc
12SK7 r-f grid to 12SA7 grid.....13 at 1000 kc
12SA7 grid to 12SK7 i-f grid.....30 at 455 kc
12SK7 i-f grid to 12SQ7 diode plate..60 at 455 kc

(2) Audio Gain.
0.10 volts at 400 cycles across volume control (R17) with control set at maximum, will give approximately ½ watt speaker output.

(3) Oscillator Grid Bias.
D-c voltage developed across the oscillator grid leak (R4) averages 7.5 volts at 1000 kc.

(4) Socket Pin Voltages.
Fig. 5 shows voltages from all tube pins to B− unless otherwise specified. Voltage readings much lower than those specified may help localize defective components or tubes.

ALIGNMENT PROCEDURE

ALIGNMENT FREQUENCIES

R-F . . . . . 1500 kilocycles
I-F . . . . . 455 kilocycles

EQUIPMENT REQUIRED

1. Test oscillator with audio tone modulation
2. A-C output meter, 1½ volts full scale
3. 0.05 mf. paper capacitor
4. 50 mmf. mica capacitor
5. Insulated screwdriver

PROCEDURE—GENERAL

1. Turn dial control until pointer is as far to the left as it will go. The pointer should coincide with the first marking at the left of the scale. If it doesn't, remove chassis and slip pointer along drive cord until pointer is under reference mark when chassis is bolted in place.

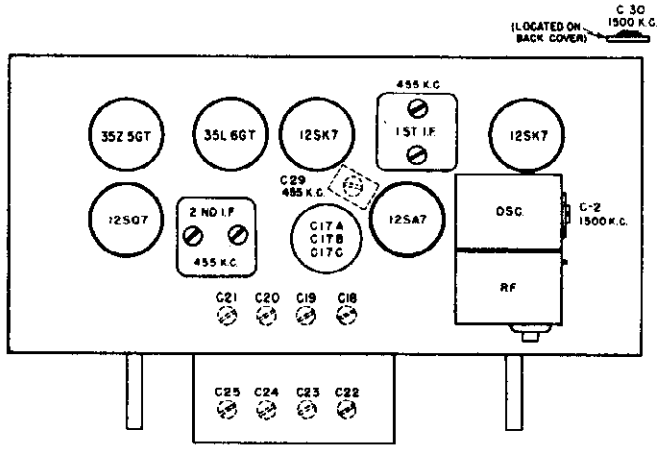

Fig. 4. Tube and Trimmer Location

ALIGNMENT CHART

Step	Connect Test Oscillator To	Test Osc. Setting	Pointer Setting on Radio	Adjustment For Maximum Output
*1	12SK7 i-f grid in series with 0.05 mf. capacitor.	455 kc	1500 kc	2nd i-f trans. trimmers
*2	12SA7 grid in series with 0.05 mf. capacitor.	455 kc	1500 kc	1st and 2nd i-f trans. trimmers
3	Ant. post in series with 50 mmf.	455 kc	1500 kc	C-29 (wavetrap) adjust for minimum output
4	Ant. post in series with 50 mmf.	1500 kc	1500 kc	C2 (Osc.)
5	Ant. post in series with 50 mmf.	1500 kc	1500 kc	C30 (r-f)

*Disconnect wavetrap (L3, C29) from circuit before making these alignments.

2. For i-f and r-f alignments, the output meter is cc nected across the loudspeaker voice coil terminals.

3. Keep radio volume control set at maximum and a tenuate test oscillator signal output so that the output met reading never exceeds 1¼ volts.

4. For i-f alignment, remove chassis from cabinet. F r-f alignment, the chassis should be bolted in the cabin Since the oscillator trimmer (C-2) is not accessible when t chassis is bolted in the cabinet, before C-2 adjustment, s pointer and test oscillator to 1500 kc and then remo chassis carefully from cabinet, so as not to disturb the setti of the dial pointer. Adjust oscillator trimmer (C-2) f maximum output and replace chassis in cabinet, then pr ceed with r-f trimmer (C-30) alignment.

5. Connect the capacitor as listed in column 2 betwe the "high side" of the test oscillator and the point of inp specified. The ground terminal of the test oscillator may connected to B— in the chassis providing an isolating tran former is used between the radio and the line input, otherwi use a suitable capacitor.

ELECTRICAL RATING (INPUT)

Voltage . . . . . 105-125 volts a-c d-c
Frequency (on a-c) . . . . . 25 to 60 cycles
Wattage . . . . . 40 watts

OPERATING FREQUENCIES:

Broadcast Band . . . . . 540-1600 kilocycles
I-F Amplifier . . . . . 455 kilocycles

POWER OUTPUT (117 volts line)

Undistorted . . . . . 1.2 watts
Maximum . . . . . 1.5 watts

LOUDSPEAKER:

Type . . . . . Alnico P.M.
Outside Cone Diameter . . . . . 5¼ inches
Voice Coil Impedance (400 cycles) . . . 3.5 ohms

STATION KEY ADJUSTMENTS—The station key adjustments are located on the bottom of the cabinet through the slots designated as "Osc." and "R-F." The extreme left trimmers in rows "Osc." and "R-F" are corresponding adjustments for the first or extreme left station key. The second set of adjustment trimmers is for the No. 2 or second key from the left correspondingly the remaining sets of trimmers are for the station keys No. 3 and No. 4. Turn power ON and allow radio to operate 15 minutes before making the following adjustments.

1. List the desired station on key, then depress the "Manual" key. Tune in the station desired for the key.
2. Push in station key to be set up, to its depressed position.
3. Adjust its corresponding "Osc." adjustment for the station signal which you tuned in step 1 and which is listed for the key. Peak the adjustment for the clearest program reception.
4. Adjust corresponding "R-F" adjustment for maximum signal strength.
5. Proceed in like manner for adjustment of the remaining keys.

Note: Clockwise rotation of adjustment screws lowers the frequency.

ELECTRICAL CIRCUIT ALIGNMENT

EQUIPMENT REQUIRED

1. Test oscillator with audio tone modulation.
2. A-C output meter, 1½ volts full scale.
3. Insulated screwdriver.

ALIGNMENT PROCEDURE

The alignment procedure is given in table form. All i-f alignments may be made with the chassis removed from the cabinet. However, the r-f alignments should be made with the chassis and loop antennas securely fastened in the cabinet, as the relative position of the loop antenna with respect to the chassis materially affects the alignment. All oscillator and r-f trimmers are accessible from the rear of the cabinet when the chassis is installed; the location of these trimmers is shown in Fig. 1.

The r-f signal should be capacity coupled by placing a two-foot wire on the output post (high side) of the test oscillator to act as an antenna. This antenna should be kept two feet or more away from the receiver loop to insure freedom from too much coupling. Metal objects such as meters and tools should not be placed on top of the receiver cabinet.

The output meter should be connected across the loud-speaker voice coil terminals. The low side of the test oscillator output should be connected to the chassis ground; the high side of the test oscillator output should be connected as indicated in the alignment chart. During the entire alignment procedure, the radio volume control should be in its maximum position. The test oscillator output signal should be attenuated so that the output meter reading never exceeds 1¼ volts.

ALIGNMENT CHART

Step	Connect Test Oscillator to	Test Oscillator Setting	Dial Settings	Adjust Trimmers
1	6SK7, pin 4, in series with 0.05 mf	455 kc	"BC" Band 550 kc	C6 and C7 for maximum
2	6SA7, pin 8, in series with 0.05 mf	455 kc	"BC" Band 550 kc	C4 and C5 for maximum
3	‡Capacity Coupled	1500 kc	"BC" Band 1500 kc	*C2 (Osc.) for maximum
4	‡Capacity Coupled	580 kc	"BC" Band 580 kc	*C22 (Osc) for maximum
5	‡Capacity Coupled	1500 kc	"BC" Band 1500 kc	*C2 (Osc) for maximum
6	‡Capacity Coupled	18 mc	"SW" Band 18 mc	**C23 (Osc.) to signal
7	‡Capacity Coupled	18 mc	"SW" Band 18 mc	*C24(Ant.) for maximum

‡ Use two-foot antenna on output of test oscillator.
* Rock gang condenser when making alignment.
** Use minimum capacity peak.

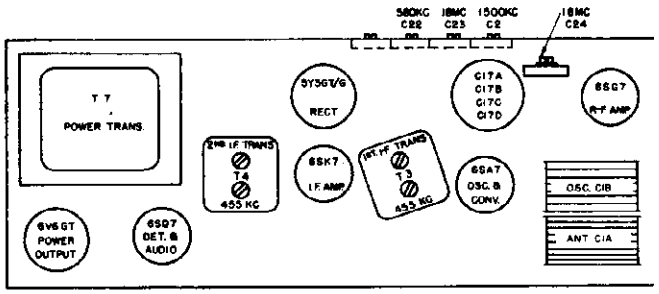

Fig. 1—Tube and Trimmer Location

STAGE GAIN AND VOLTAGE CHECKS

Stage gain measurements may be made with a vacuum tub voltmeter to check circuit performance and to locate stag which are not operating properly. The gain values listed ma have a tolerance of 20%. Readings should be taken with th AVC shorted out. This may be done conveniently by con necting the yellow Beam-a-Scope lead to ground.

1. R-F Stage Gains.
   Antenna to 6SG7 grid ..... 4 at 1000 kc
   6SG7 grid to 6SA7 grid ..... 14 at 1000 kc
   6SA7 grid to 6SK7 grid ..... 74 at 455 kc

   Audio Gain.
   The power output across the speaker voice coil should b approximately ½ watt with 0.06 volts at 400 cps applie between the high side of the volume control and ground.

3. Oscillator Grid Bias.
   The d-c voltage developed across the oscillator grid lea (R4) averages 5.7 volts at 1000 kc.

4. Socket Pin Voltages.
   Fig. 4 shows typical tube pin voltages. All readings shoul be made from the pins to ground unless otherwise ind cated.

GENERAL ELECTRIC CO.

ALIGNMENT PROCEDURE

ALIGNMENT FREQUENCIES

I.F. ..... 455 KC
R.F. ..... 1720 and 1500 KC

The location of all trimmers is shown in Fig. 1.

I. F. ALIGNMENT

Connect an output meter across the voice coil. Turn the volume control to maximum. Set test oscillator to 455 KC and keep the oscillator output as low as a readable meter reading will permit. Apply signal to the converter grid through a .05 mfd capacitor and align progressively the trimmers in the 2nd and 1st I.F. transformer cans.

R. F. ALIGNMENT

Apply the R.F. alignment signals through a standard I.R.E. dummy antenna to the receiver antenna post. With the gang condenser wide open, align the oscillator trimmer (C17B) to 1720 KC. Change the generator signal to 1500 KC, tune the receiver to the signal and peak the antenna trimmer (C17A) for maximum output.

PRECAUTION

If the signal generator is A-C operated, use an isolating transformer between the power supply and the radio receiver power input. The use of an isolating capacitor is not recommended, as A-C through the capacitor will introduce hum modulation and/or create the possibility of a burned-out signal generator attenuator.

OVERALL DIMENSIONS—

	YRB 82-1	YRB 67-1,
Height	8⅛"	8½"
Width	12½"	13"
Depth	7"	6⅞"

Rating: 105-125 volts DC
105-125 volts 40-60 cycles AC
28 watts at 117 volts

Tuning Frequency Range: ..... 540–1720 K

Intermediate Frequency: ..... 455 K

LOUDSPEAKER "ALNICO V" MAGNET DYNAMIC

Outside Cone Diameter 5½
Voice Coil Impedance (400 cyc) ..... 3.2 ohm

TUBES

Converter and Oscillator 12SA
I.F. Amplifier 12SK
Det. Audio, AVC 12SQ
Power Output 50L6G
Rectifier 35Z5G
Pilot Lamp ..... GE 5

GENERAL INFORMATION

Models YRB 67-1 and 67-2 are 5 tube (including rectifier) superheterodyne receivers in distinctively styled wood cabinets; Model YRB 82-1 is a rich brown plastic cabinet. These receivers incorporate built-in antenna, automatic volume control, oversize permanent magnet speaker and beam power output.

Color	Brown	Mahogany	Maple
Height	7 1/2 in.	8 1/4 in.	8 1/4 in.
Width	12 in.	13 in.	13 in.
Depth	7 1/2 in.	7 15/16 in.	7 15/16 in.

ELECTRICAL RATING (INPUT)

Voltage ..... 105-125 volts a-c or d-c
Frequency on a-c ..... 25 to 60 cycles
Wattage ..... 45 watts

OPERATING FREQUENCIES

Broadcast Band ..... 540-1600 kilocycles
I-F Amplifier ..... 455 kilocycles

POWER OUTPUT (117 VOLTS LINE)

Undistorted ..... 1.2 watts
Maximum ..... 1.5 watts

LOUDSPEAKER

Type ..... Alnico P.M.
Outside Cone Diameter ..... 5 1/4 in.
Voice Coil Impedance (400 cycles) ..... 3.5 ohms

TUBE COMPLEMENT

R.F. Amplifier ..... Type 12SG7
Oscillator-Converter ..... Type 12SA7
I.F. Amplifier ..... Type 12SK7
Detector-Audio ..... Type 12SQ7
Power Output ..... Type 35L6GT
Rectifier ..... Type 35Z5GT/G
Pilot Lamp ..... G-E, Type C7, 115-volt, 10-watt, clear, candelabra screw base

ELECTRICAL CIRCUIT ALIGNMENT

ALIGNMENT FREQUENCIES

R-F ..... 1500 kilocycles
I-F ..... 455 kilocycles

EQUIPMENT REQUIRED

1. Test oscillator with audio tone modulation
2. A.C. output meter, 1 1/2 volts full scale
3. 0.05 mf paper capacitor
4. 50 mmf mica capacitor
5. Insulated screwdriver

PROCEDURE—GENERAL

1. Turn dial scale pointer as far counterclockwise as possible. The pointer should coincide with the first marking at the left of the scale. If it doesn't, remove chassis and slip pointer on shaft until the pointer is under reference mark when chassis is bolted in place.

2. For i-f and r-f alignments, the output meter is connected across the loudspeaker voice coil terminals.

3. Keep radio volume control at maximum and attenuate test oscillator signal output so that the output meter reading never exceeds 1 1/4 volts.

4. The chassis must be removed from the cabinet during I-F alignment. For R-F alignment bolt the chassis in the cabinet securely.

5. Connect the capacitor as listed in column 2, between the output "High Side" of test oscillator and the point of input specified.

ALIGNMENT CHART

Step	Connect Test Oscillator to	Test Osc. Setting	Pointer Setting on Radio	Adjustment for Maximum Output
1	12SK7 grid in series with 0.05 mf cap.	455 kc	1500 kc	2nd I-F Trans. Trimmers
2	12SA7 grid in series with 0.05 mf cap.	455 kc	1500 kc	1st and 2nd I-F Trans. Trimmers
3	Ant. Post in series with 50 mmf	1500 kc	1500 kc	C3 (Osc.)
4	Ant. Post in series with 50 mmf	1500 kc	1500 kc	C2 (R-F)

STAGE GAIN AND VOLTAGE CHECKS

Stage gain measurements by vacuum tube voltmeter or similar measuring devices may be used to check circuit performance and isolate trouble. The gain values listed may have tolerances of 20 per cent. Readings taken with low signal input so that AVC is not effective.

(1) R-F Stage Gains.

Antenna post to 12SG7 grid ..... 4 at 1000 kc
12SG7 grid to 12SA7 grid ..... 8 at 1000 kc
12SA7 grid to 12SK7 grid ..... 30 at 455 kc
12SK7 grid to 12SQ7 diode plate ..... 57 at 455 kc

(2) Audio Gain.

0.12 volt at 400 cycles across volume control (R8) with control set at maximum will give approximately 1/2-watt output across speaker voice coil.

(3) Oscillator Grid Bias.

D-C voltage developed across the oscillator grid leak (R3). Averages 7.7 volts at 1000 kc.

(4) Socket Pin Voltages.

Figure 4 shows voltages from all tube pins to B- unless otherwise specified. Voltage readings much lower than those specified may help localize defective components or tubes.

ALIGNMENT

MODELS 1A5, 3A5, 5A5, 19A5

The chassis must be removed from the cabinet in order to align this receiver. Connect the output meter across the voice coil. Connect the signal generator to the Standard Hazeltine Model 1150 loop, and couple loosely to the receiver loop. Set the receiver volume control at maximum. The tuning condenser plates should be fully meshed when the dial pointer is at the index mark at the low frequency end of the dial. The signal generator output should at all times be just sufficient to obtain a minimum deflection on the output meter. Set the signal generator to 456 Kc. Adjust the i-f trimmers for maximum meter deflection in the following sequence: L4, L2, L3, L1. Set the generator and receiver to 1600 Kc and adjust oscillator trimmer C4 for maximum output. Set the generator and receiver to 1400 Kc and adjust loop trimmer C3 for maximum output.

MODELS 9A5, 15A5, 17A5

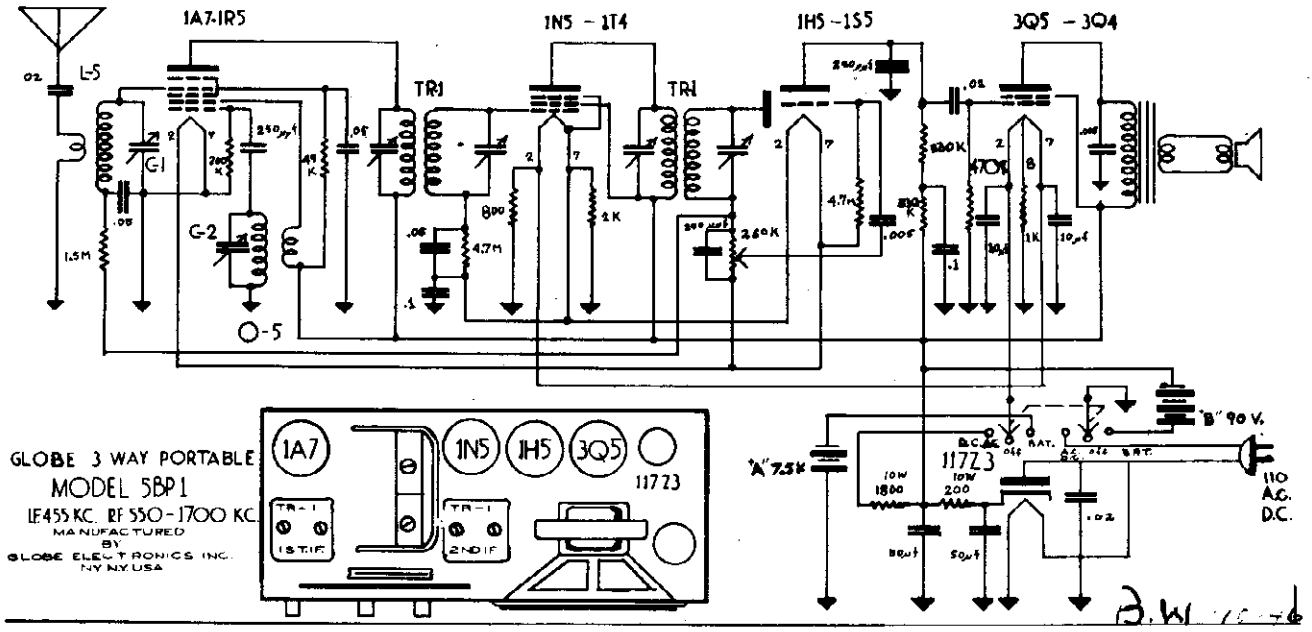
The chassis must be removed from the cabinet in order to align this receiver. Connect the output meter across the voice coil. Connect the signal generator to the standard Hazeltine Loop Model 1150, and couple loosely to the receiver loop. Set the receiver volume control at maximum. The tuning condenser plates should be fully meshed when the dial pointer is at the index mark at the low frequency end of the dial. The signal generator output should at all times be just sufficient to obtain a minimum deflection on the output meter. Set the signal generator to 456 Kc and adjust the i-f trimmers for maximum meter deflection in the following sequence: L4, L3, L2, L1. Set the generator and receiver to 1600 Kc and adjust the oscillator trimmer C4 for maximum output. Set the generator and receiver to 1400 Kc and adjust the loop trimmer C3 for maximum output.

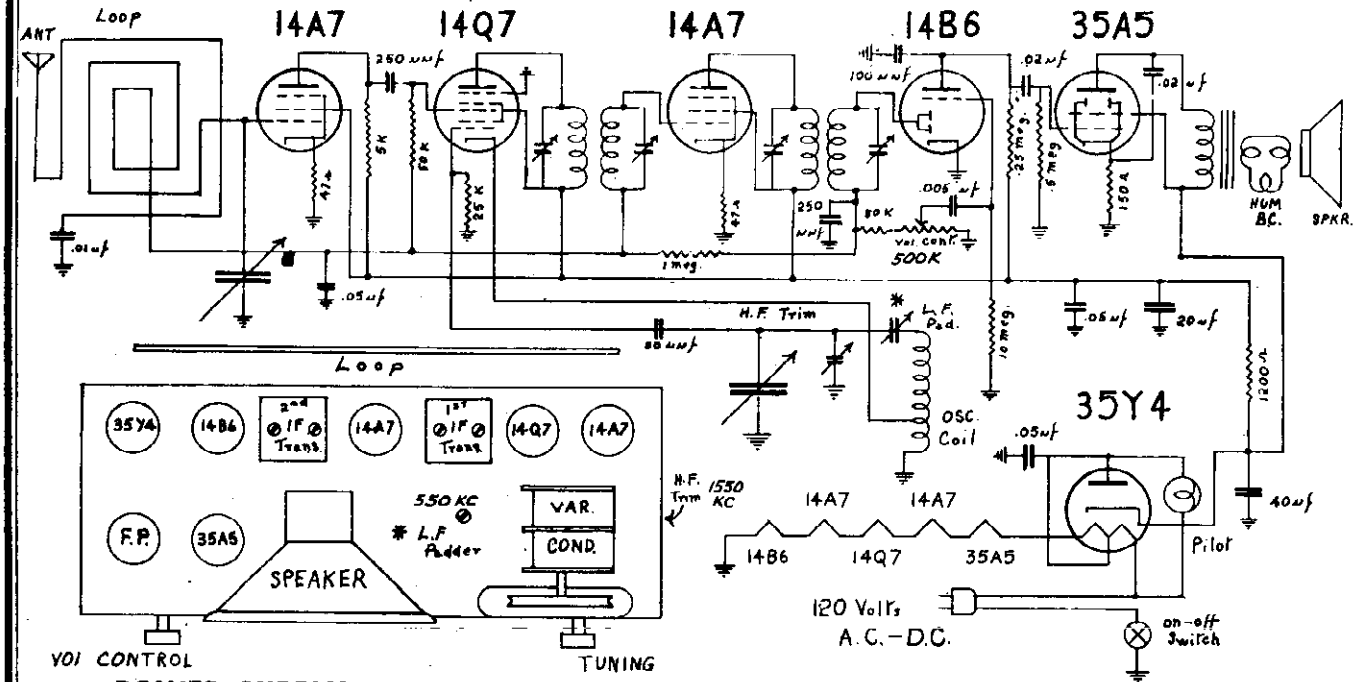
MODEL 14A4F

Alignment may be accomplished with the chassis in the cabinet if a small alignment screwdriver is used. Connect the output meter across the voice coil. Connect the high side of the signal generator to the antenna lead through a .01 mf condenser and the low side to the black ground wire. Set the receiver volume control at maximum. The tuning condenser plates should be fully meshed when the dial pointer is at the index mark at the low frequency end of the dial. The signal generator output should at all times be just sufficient to obtain a minimum deflection on the output meter. Set the signal generator to 455 Kc and adjust the i-f trimmers for maximum output in the following sequence: L5, L3, L4, L2. Set the generator and receiver to 1500 Kc and adjust the oscillator shunt trimmer C4 for maximum output. Set the generator and receiver to 1400 Kc and adjust the antenna trimmer C3 for maximum output. Set the generator and receiver to 600 Kc and adjust the antenna coil tuning slug L1 for maximum output. Repeat the high frequency adjustment of the antenna trimmer C3 at 1400 Kc.

GLOBE ELECTRONICS, INC.

MODEL 5BP1
MODELS 601, 6U1





POWER SUPPLY: A.C.-D.C. (105-125 volts).

RANGE: 540-1620 Kilocycles.

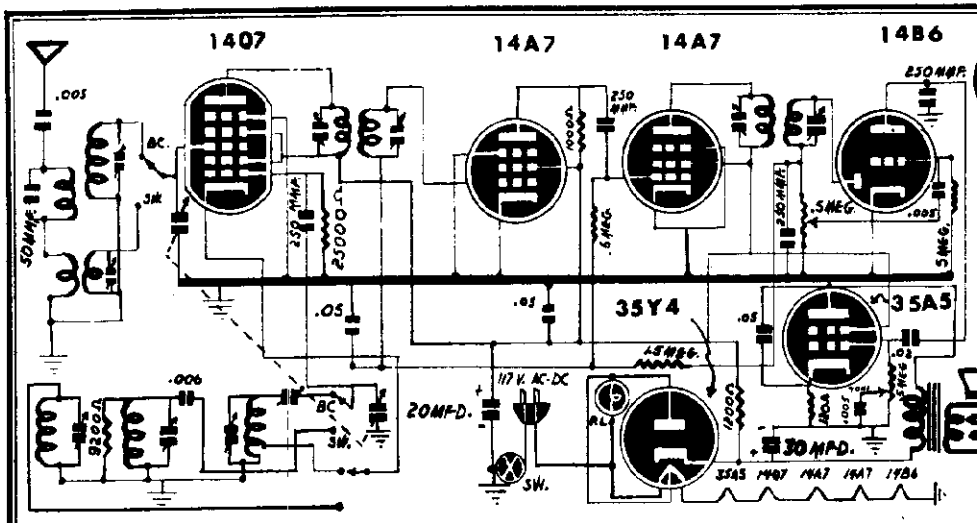
MODEL 601

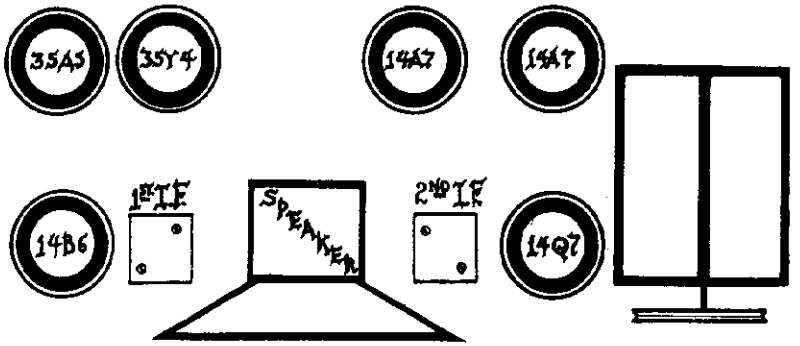
USE NO GROUND CONNECTIONS.

IF PEAK 455 KC

B. W. 9-25 46

NOTE: MODEL 6U1 is the same as MODEL 601 except that the frequency range is from 550 to 1700 KC and a cut-plate variable condenser replaces the L.F. padder.





ALIGNMENT: The Intermediate Frequency is 455 KC. To align the broadcast band, set the oscillator to 550 and 1650 KC, aligning the RF at 1500 KC. To align the SW, set the oscillator to 21 MC. Align the RF at 18.5 MC.

VOLTAGE DATA

All readings made between tube socket terminals and chassis. Voltages indicated have been obtained using a Vacuum Tube Voltmeter. A second voltage reading is shown made with a 1000 ohm-per-volt meter, when use of this instrument would result in appreciably lower readings. The voltages were measured using a fresh battery, volume control full on, dial at the high frequency end, and no signal.

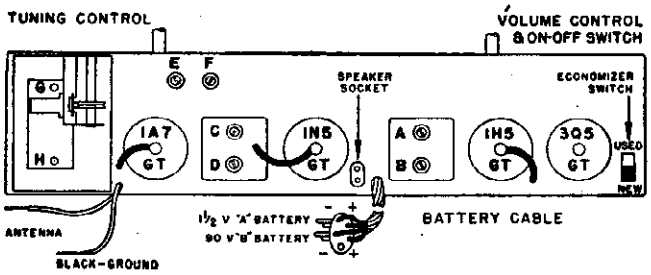
ALIGNMENT PROCEDURE

- IMPORTANT—Check to see that dial pointer reaches each end of dial scale when Station Selector Control is turned from one end to the other.
- Volume control—Maximum for all adjustments.
- Connect radio chassis to ground post of signal generator with a short heavy lead.
- Connect dummy antenna value in series with generator output lead, when needed (see below).
- Connect output meter across voice coil of speaker.
- Allow chassis and signal generator to warm up for several minutes.



- Use lowest Output setting of Signal Generator capable of producing adequate Output Meter indication and then proceed as indicated in the chart below.

Band	Signal Generator Frequency	Dummy Antenna	Connection to Radio	Receiver Dial Setting	Trimmers Adjusted (In Order Shown)	Trimmer Function	Type of Adjustment
I. F.	455 KC.	.1 MFD.	Grid of 1A7 (Cap)	High frequency end of dial	C-D—2nd I.F.	Output I.F.	Adjust to maximum output
	455 KC.	.1 MFD.	Grid of 1A7 (Cap)	High frequency end of dial	A-B—1st I.F.	Input I.F.	Adjust to maximum output
BROAD-CAST	1630 KC.	.0002 MFD.	Antenna Lead	High frequency end of dial	E—(See note below) F—(See note below)	Oscillator Antenna	Adjust to maximum output
	1300 KC.	.0002 MFD.	Antenna Lead	1300 KC.	G H	Oscillator Antenna	Adjust to maximum output

NOTE: Before adjusting trimmers "E" and "F", make sure that each iron core is 1⅜" or more outside of its coil form. If necessary, turn adjustments "G" and "H" to accomplish this.

MODEL R643-W

ALIGNMENT PROCEDURE

Be sure Radio Receiver and Signal Generator are thoroughly warmed up before starting alignment procedure.

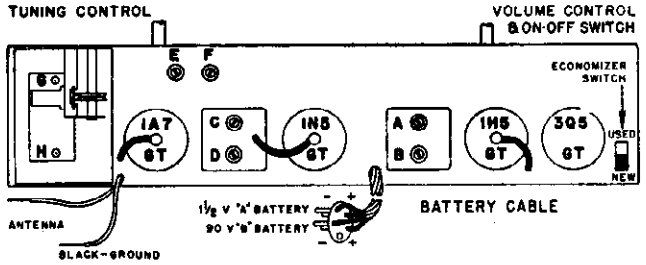
Check setting of Pointer Extremes and note correct 600 K.C. and 1400 K.C. positions on Dial Background. (See Dial Diagram on reverse side.)

Connect Output Meter across Voice Coil.

Turn Receiver Volume Control—full on.

Use lowest Output setting of Signal Generator capable of producing adequate Output Meter indication and then proceed in the following sequence.

Repeat adjustments to insure final overall maximum results.



Connect Signal Generator to—	Dummy Antenna Between Radio and Generator	Set Generator Frequency to—	Set Receiver Dial Frequency to—	Adjust Following Trimmers or Slugs	Type of Adjustmer
Grid of 1A7 (Cap)	.1 mfd. Condenser	455 Kc.	High frequency End of dial	A-B—1st I.F. C-D—2nd I.F.	Adjust to maximum Output
Antenna Lead	.0002 mfd. Condenser	1630 Kc.	High frequency End of dial	E—Osc. (Trimmer) F—Ant. (Trimmer)	Adjust to maximum Output
Antenna Lead	.0002 mfd. Condenser	1400 Kc.	Tune in Generator Signal	G—Osc. (iron core) H—Ant. (iron core)	Adjust to maximum Output

Tube Shields	87A8

B. F. GOODRICH CO.

ALIGNMENT PROCEDURE

1. Be sure both set and signal generator are thoroughly warmed up before starting alignment.
2. Make alignment, using a battery whenever possible.
3. Disconnect Loop Antenna leads from clips on set and remove chassis from cabinet.
4. Connect a 50,000 ohm carbon resistor across the two clips from which the Loop Antenna was removed.
5. Connect Output Meter across the Voice Coil.
6. Connect a fresh battery to the set.
7. Turn receiver Volume Control full on.

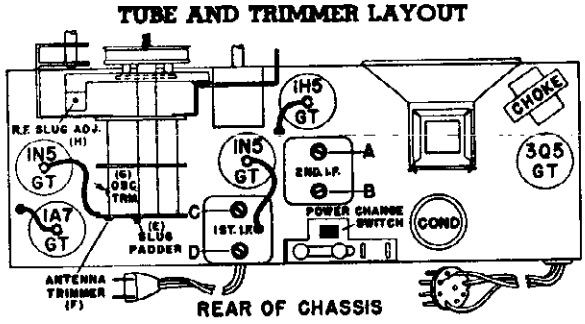
Step	Dummy Antenna Used in Series with Signal Generator	Connect High Side Signal Generator to	Signal Generator Frequency	Gang Condenser Setting	Trimmer Description and Designation	Type of Adjustment
1	.00025 Mfd. when using A.C. .1 Mfd. when using Battery	Grid Cap 1A7	455 K.C.	Any point where it does not affect Signal	2nd I.F. (A), (B). 1st I.F. (C), (D).	Maximum Deflection. Then repeat
2	.00025 Mfd. when using A.C. .1 Mfd. when using Battery	Grid Cap 1N5	1620 K.C.	Rotor full open (Plates out of mesh)	Oscillator Trimmer (G)	Maximum Deflection
3	.00025 Mfd. when using A.C. .1 Mfd. when using Battery	Grid Cap 1N5	1400 K.C.	Tune in Generator Signal	R.F. Slug (H)	Maximum Deflection
4	Replace Set in Cabinet					
5	.00025 Mfd.	Antenna and Ground Leads	1400 K.C.	Tune in Generator Signal	Antenna Trimmer (F)	Maximum Deflection
6	Disregard the next two steps if the set being aligned is a model with a fixed loop loading coil (L2).					
7	.00025 Mfd.	Antenna and Ground Leads	600 K.C.	Tune in Generator Signal	Loop Loading Coil Slug (E)	Maximum Deflection
8	.00025 Mfd.	Antenna and Ground Leads	1400 K.C.	Tune in Generator Signal	Reset Antenna Trimmer (F)	Maximum Deflection

Seal adjusting screw on the loop loading coil with any quick drying cement.

REPLACING R.F. TUNING SLUG

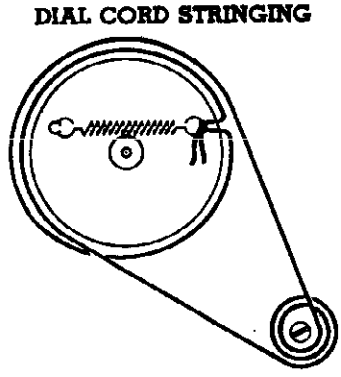
If the R.F. Tuning Slug has to be changed, use the following procedure. Set the gang condenser to the point where the plates are fully meshed. Screw the slug adjusting screw about halfway down. Place the slug in the coil in such a position that the top of the slug is flush with the top of the coil. Solder the slug wire to the adjusting screw. Be sure that the position of the slug does not change during the soldering and that the slug wire is straight. Proceed to re-align the set as shown in the chart.

TUBE AND TRIMMER LAYOUT



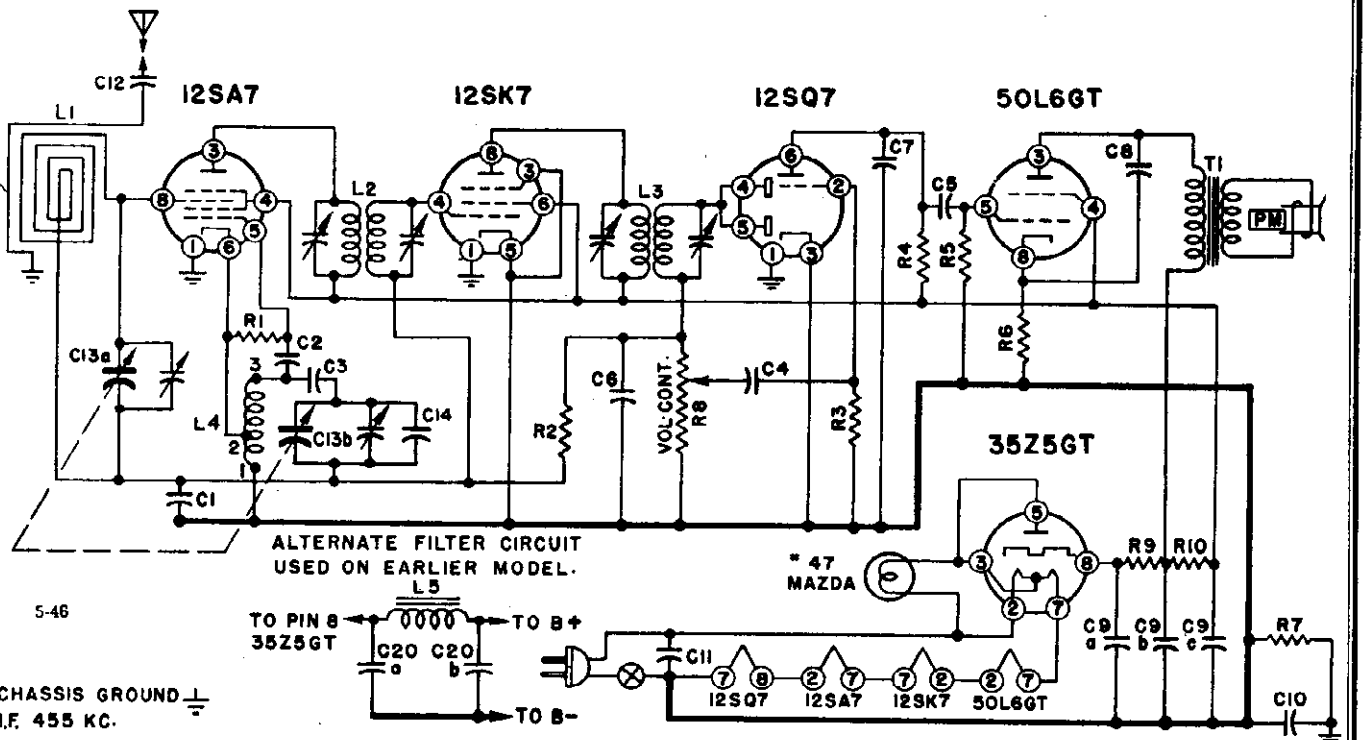
REAR OF CHASSIS

DIAL CORD STRINGING



MODELS R654-PM, R654-PV

B. F. GOODRICH CO.



NOTE: 1. In later production R9 and C9a are disconnected from pin No. 8 of the 35Z5 and a 33-ohm 1-watt resistor (R11) is connected between pin No. 8 and the junction of R9 and C9a.

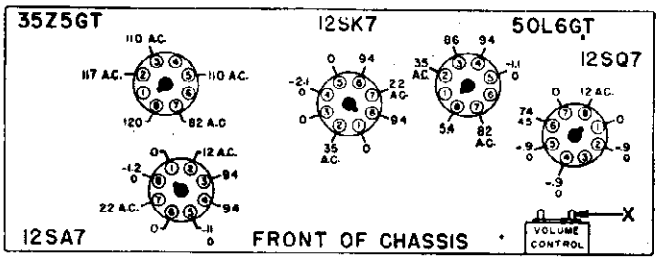
2. The jumper between pins 4 and 5 on the 12SQ7 is removed and one pin is connected to the secondary of the second I.F. (L3) and the other pin is connected directly to the junction point of R2 and the secondary of the 1st I.F. (2).

VOLTAGE DATA

All readings made between Tube Socket Terminals and Switch Lug on volume control (Point "X" on drawing).

Voltages indicated obtained on Vacuum Tube voltmeter.

A second voltage reading is shown made with a 1000 ohm-per-volt meter when use of this instrument would result in appreciably lower readings.



Bottom View

Measured on a 117 Volt A.C. line; volume control full on; dial tuned to low frequency end, no signal.

Frequency Range 540-1630 Kc.

POWER SUPPLY

This receiver is designed to operate from any AC (Alternating Current) power supply main of 110-120 volts, 50-60 cycles or DC (Direct Current) power supply main of 110-120 volts. If the receiver fails to operate on DC (Direct Current), reverse the power main plug.

On AC only the line plug should be tried both ways and left in the position that give minimum hum.

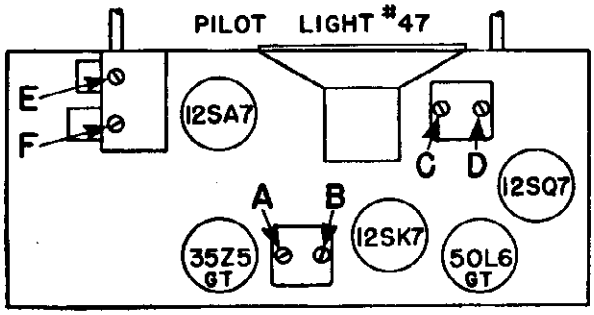
B. F. GOODRICH CO.

MODELS R654-PM, R654-P
MODEL R655-W

ALIGNMENT PROCEDURE

- Be sure Radio Receiver and Signal Generator are thoroughly warmed up before starting alignment procedure.
- Check setting of Pointer Extremes and note correct 600 K.C. and 1400 K.C. positions on Dial Background. (See Dial Diagram on reverse side.)
- Connect radio chassis to ground post of signal generator with a short heavy lead.
- Connect Output Meter across Voice Coil of Speaker.
- Turn Receiver Volume Control full on.
- Use lowest Output setting of Signal Generator capable of producing adequate Output Meter indication and then proceed as outlined in chart below.
- Repeat adjustments to insure final overall maximum results.

TOP VIEW — TUBE & TRIMMER LOCATION



BACK OF CHASSIS

Step	Dummy Antenna between Radio and Signal Generator	Connect Signal Generator to	Signal Generator Frequency	Gang Condenser Setting	Trimmers Adjusted for Maximum Output
1	250 mmfd. Condenser	Gang Condenser Antenna Stator	455 KC.	Rotor full open (Plates out of mesh)	C and D—2nd. I.F.
2	250 mmfd. Condenser	Gang Condenser Antenna Stator	455 KC.	Rotor full open (Plates out of mesh)	A and B—1st I.F.
3	250 mmfd. Condenser	Gang Condenser Antenna Stator	1630 KC.	Rotor full open (Plates out of mesh)	E—Oscillator
4	No actual connection between set and generator.	Loop radiator (or place pickup lead from generator close to loop of set to obtain adequate signal).	1400 KC.	Set Gang to tune in Generator Signal	F—Antenna (See Note)

NOTE: Antenna trimmer "F" must be aligned after chassis and loop are mounted in the cabinet. This adjustment can be made by lifting up the top cover and removing the plug button which is directly above trimmer "F".

ALIGNMENT PROCEDURE

1. Be sure both set and signal generator are thoroughly warmed up before starting alignment.
2. Make alignment, using a battery whenever possible.
3. Disconnect Loop Antenna leads from clips on set and remove chassis from cabinet.
4. Connect a 50,000 ohm carbon resistor across the two clips from which the Loop Antenna was removed.
5. Connect Output Meter across the Voice Coil.
6. Connect a fresh battery to the set.
7. Turn receiver Volume Control full on.

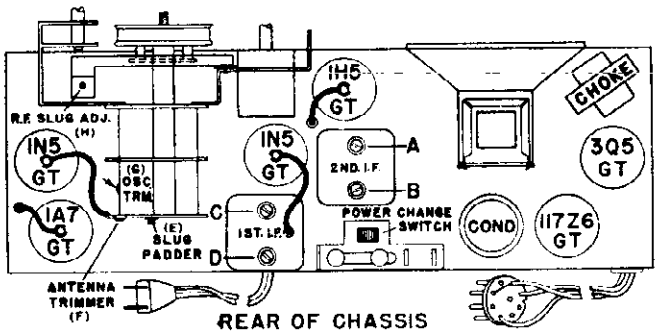
Step	Dummy Antenna Used in Series with Signal Generator	Connect High Side Signal Generator to	Signal Generator Frequency	Gang Condenser Setting	Trimmer Description and Designation	Type of Adjustment
1	.00025 Mfd. when using A.C. .1 Mfd. when using Battery	Grid Cap 1A7	455 K.C.	Any point where it does not affect Signal	2nd I.F. (A), (B). 1st I.F. (C), (D).	Maximum Deflection. Then repeat
2	.00025 Mfd. when using A.C. .1 Mfd. when using Battery	Grid Cap 1N5	1620 K.C.	Rotor full open (Plates out of mesh)	Oscillator Trimmer (G)	Maximum Deflection
3	.00025 Mfd. when using A.C. .1 Mfd. when using Battery	Grid Cap 1N5	1400 K.C.	Tune in Generator Signal	R.F. Slug (H)	Maximum Deflection
4	Replace Set in Cabinet					
5	.00025 Mfd.	Antenna and Ground Leads	1400 K.C.	Tune in Generator Signal	Antenna Trimmer (F)	Maximum Deflection
6	Disregard the next two steps if the set being aligned is a model with a fixed loop loading coil (L2).					
7	.00025 Mfd.	Antenna and Ground Leads	600 K.C.	Tune in Generator Signal	Loop Loading Coil Slug (E)	Maximum Deflection
8	.00025 Mfd.	Antenna and Ground Leads	1400 K.C.	Tune in Generator Signal	Reset Antenna Trimmer (F)	Maximum Deflection

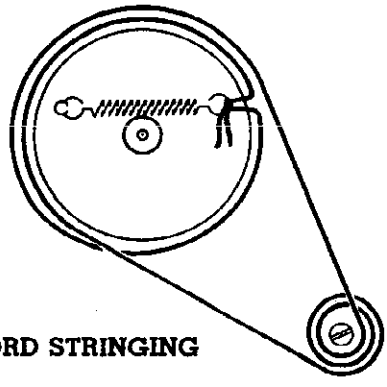
Seal adjusting screw on the loop loading coil with any quick drying cement.

REPLACING R.F. TUNING SLUG

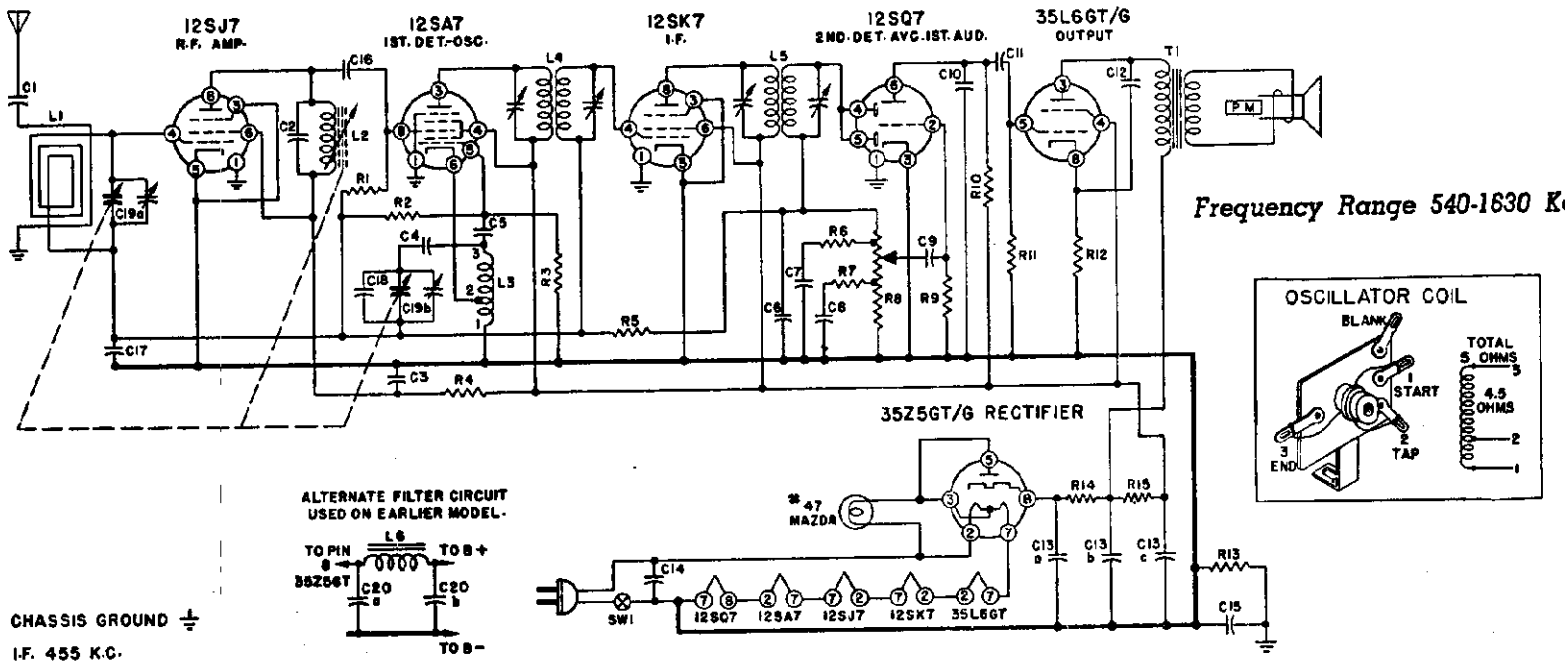
If the R.F. Tuning Slug has to be changed, use the following procedure. Set the gang condenser to the point where the plates are fully meshed. Screw the slug adjusting screw about halfway down. Place the slug in the coil in such a position that the top of the slug is flush with the top of the coil. Solder the slug wire to the adjusting screw. Be sure that the position of the slug does not change during the soldering and that the slug wire is straight. Proceed to re-align the set as shown in the chart.

TUBE AND TRIMMER LAYOUT





DIAL CORD STRINGING



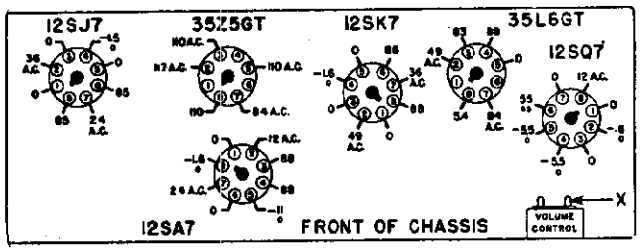
Frequency Range 540-1630 Kc.

NOTE: 1. In later production R14 and C13a are disconnected from pin #8 of the 35Z5 and a 33-ohm 1W resistor (R16) is connected from pin #8 to the junction of R14 and C13a.

2. The jumper between pins 4 and 5 on the 12SQ7 is removed and one pin is connected to the secondary of the second I.F. (L5) and the other pin is connected directly to the junction point of R5 and the secondary of the 1st I.F. (L4).

VOLTAGE DATA

All readings made between Tube Socket Terminals and Switch Lug on volume control (Point "X" on drawing). Voltages indicated were obtained with a vacuum tube voltmeter. However, when use of a 1000 ohm-per-volt meter results in an appreciably different reading, this reading is shown below that of the vacuum tube voltmeter reading. Voltages are measured using a 117 volt A.C. line with the volume control full on, the dial tuned to the low-frequency end and no signal.



Bottom View

DIAL STRINGING AND POINTER SETTINGS

L6 (325 ohms)	Choke, Filter

MODELS R664-PM, R664-PV, R664-W

B. F. GOODRICH CO.

DIAL DRUM POSITION

If the dial drum position is disturbed, it should be carefully re-positioned to insure correct tuning of the permeability tuned coil. With the gang fully meshed, the drum will be properly positioned if the center of the condenser shaft and the dial cable hole on the drum are in a straight line parallel to the chassis base. Note that the dial cable hole should be on the right side (looking at front) of the chassis.

TUNED SLUG POSITION.

If the tuned coil slug needs replacing or re-positioning, first see that the dial drum is in its proper position. Then with the gang condenser fully meshed and the threaded stud half-way through the bakelite, note that the top of the slug is flush with the top of coil form. Then re-align.

ALIGNMENT PROCEDURE

Be sure Radio Receiver and Signal Generator are thoroughly warmed up before starting alignment procedure.

Check setting of Pointer Extremes and note correct 600 K.C. and 1400 K.C. positions on Dial Background. (See Dial Diagram on reverse side.)

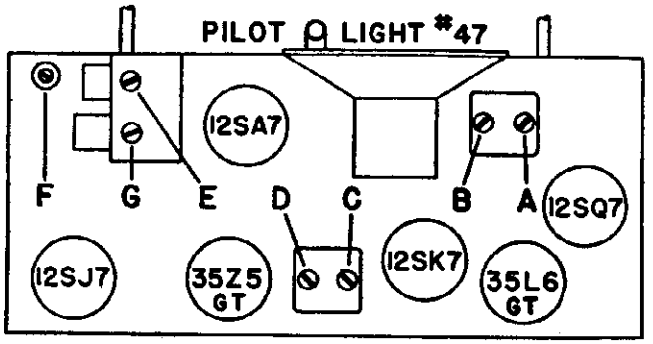
Connect Output Meter across Voice Coil.

Turn Receiver Volume Control full on.

Use lowest Output setting of Signal Generator capable of producing adequate Output Meter indication and then proceed as outlined in chart below.

Repeat adjustments to insure final overall maximum results.

TOP VIEW — TUBE & TRIMMER LOCATION



BACK OF CHASSIS

Connect Signal Generator To—	Dummy Antenna Between Radio and Generator	Set Generator Frequency To—	Set Receiver Dial Frequency To—	Adjust Following Trimmers	Type of Adjustment
12SA7 Control Grid	250 mmfd. Mica Condenser	455 KC.	High frequency end of Dial	A and B 2nd I. F. C and D 1st I. F.	Adjust to maximum Output
External Antenna Wire on Loop	250 mmfd. Mica Condenser	1630 KC.	High frequency end of Dial	E—Osc.	Adjust to maximum Output
External Antenna Wire on Loop	250 mmfd. Mica Condenser	1400 KC.	Tune in Generator signal	F—R. F. (Iron Core)	See Note Below
Loop radiator or place pickup lead from gen. close to set loop to obtain adequate signal.	No actual connection between set and generator.	1400 KC.	Tune in Generator signal	G—Ant.	Adjust to maximum Output

NOTE: Adjustment F is the threaded stud at the top end of the slug wire. Screw stud up or down in the bakelite for maximum output. Alignment is correct if the output is reduced when the position of the lever arm is changed slightly in either direction (up or down).

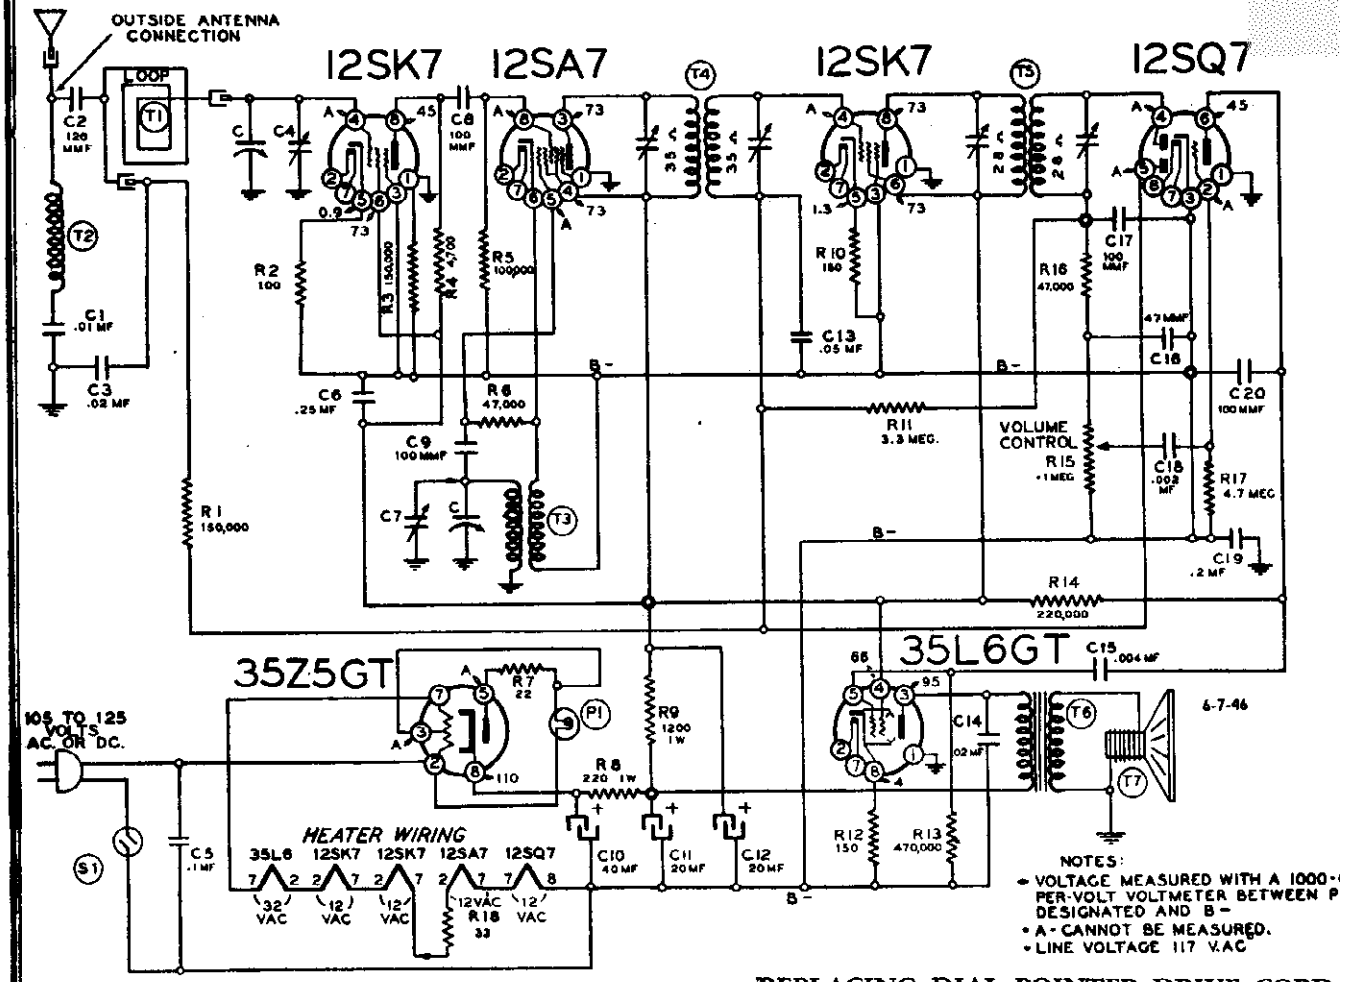
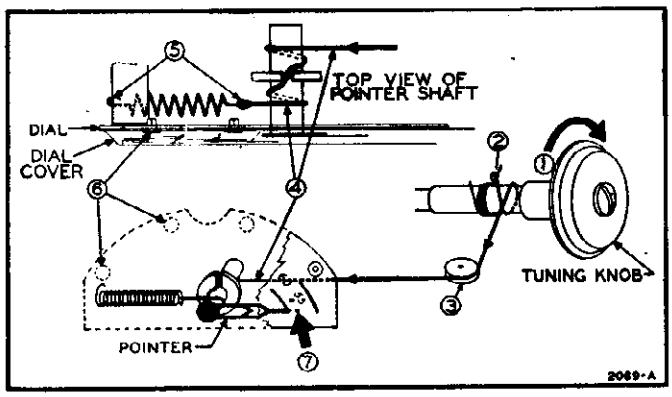
4A4-1	Washer, C (Tuning shaft)
4A6-3-C	Washer, Spring (Tuning Shaft)

W. T. GRANT CO.





REPLACING DIAL POINTER DRIVE CORD

Six inches of cord are required. Numbers below corresp to circled numbers in diagram.

1. Rotate tuning knob to extreme clockwise position.
2. Tie cord to loop in spring as shown.
3. Pass cord over idler pulley.
4. Pass cord OVER pointer shaft; wind it one turn aro shaft; pass it through key washer, then once more aro shaft.
5. Hook spring over end of dial support. Tie cord to spr IMPORTANT: Full contraction of spring must rotate poi shaft at least one half turn.
6. Remove dial crystal by removing snap-in rivets.
7. Make sure tuning knob is in extreme clockwise posit Then rotate pointer clockwise, against friction of shaft, u it is in a horizontal position, as shown.

POWER SUPPLY	105 to 125 volts, DC or 50-60 cycle AC, 35 watts. Also made for 25 cycles.
FREQUENCY RANGE	530 to 1650 kc.
INTERMEDIATE FREQ.	455 kc.
TUNING	Two-gang capacitor.
ANTENNA	Built-in loop. Also provisions for external antenna. No ground required.
SPEAKER	5-inch; P.M.; voice coil impedance 3.2 ohms.
POWER OUTPUT	1 watt undistorted. 1.5 watts maximum.
SENSITIVITY	10 microvolts average 50-milliwatt output.
SELECTIVITY	55 kc. broad at 1000 ti signal at 1000 kc.
TUBE COMPLEMENT	12SK7, R. F. amplifier 12SA7, converter 12SK7, I. F. amplifier 12SQ7, 2nd detector, A 1st audio 35L6GT, output amplifi 35Z5GT, rectifier

MODELS 605,606
Series A

W. T. GRANT CO.

DIAL LIGHT—If the dial lamp burns out the set should not be operated until a new lamp has been installed. Failure to heed this caution may result in a burned-out 35Z5GT tube. To replace the lamp, first remove the four buttons which hold the back to the cabinet. On the inside of the back unclip the green, black, and white wires clipped to the back. The Chassis View illustration shows the location of the dial lamp. *Pull* the lamp bracket toward the rear of the radio. The lamp can now be removed and replaced. Use a 6- to 8-volt lamp, type T-47. When replacing the back on the cabinet, connect the green wire to the green-painted clip, the black wire to the black-painted clip, and the white wire to the unpainted clip.

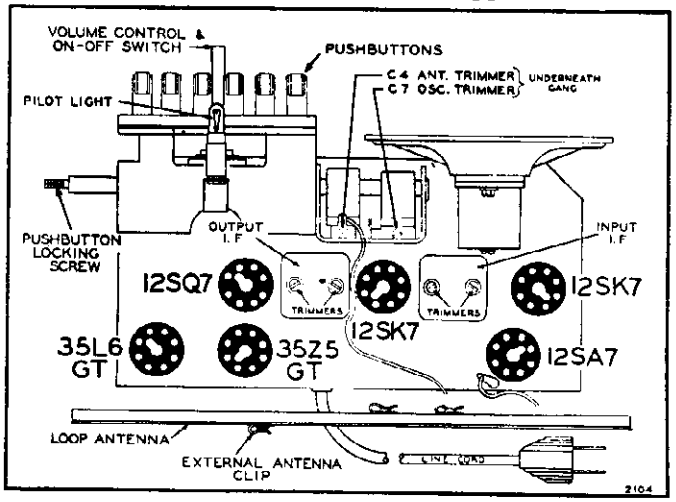
REMOVAL OF CHASSIS—If for any reason you wish to remove the radio chassis from the cabinet, proceed as follows: First be sure the line cord is disconnected from the house power receptacle. Then take off the back as described under "Dial Light" above. *Pull* the volume control knob off its shaft. Unscrew the locking screw in the center of the tuning knob and pull the knob off its shaft. Remove the four chassis mounting screws from the bottom of the cabinet. The chassis can now be slipped out.

After the chassis is replaced the automatic pushbuttons will probably have to be reset.

SETTING THE PUSHBUTTONS—The pushbuttons may be used, after proper adjustment, for the automatic tuning of any six stations on the standard broadcast band. They can be set up in any order.

1. Turn on the radio.

2. Push out the call letters of the six stations from the call-letter sheets supplied with this manual.



3. Insert one call-letter tab in the rectangular opening in the front of each pushbutton, in any order. Press an acetate tab (supplied in small envelope) into each of the pushbuttons.

4. With the screwdriver supplied, check to see that the locking screw in the center of the tuning knob (see front view) is loose. If it is not, turn it several turns to the left (counterclockwise).

5. Press the first pushbutton down *all the way*. With one hand hold the button down firmly and with the other carefully tune in the desired station. Release the pushbutton.

6. Follow this procedure for each of the five other buttons, setting each one for a different station.

7. Rotate the tuning knob on the side of the cabinet as far to the right as it will go. Tighten the locking screw in the center of the knob. IT IS IMPORTANT THAT THIS SCREW BE TIGHTENED VERY FIRMLY.

8. The pushbuttons are now properly set for automatic tuning.

Any of the six stations may be tuned in simply by pressing the proper button down as far as it will go. If you wish to reset any of the buttons for a new station, loosen the locking screw, set the pushbutton as described above, and re-tighten the locking screw.

ALIGNMENT PROCEDURE

(Refer to Chassis View for location of trimmers)

Output meter across 3.2-ohm output load.
Align for maximum output. Reduce input as needed to keep output near 0.4 volts.
Volume control at maximum for all adjustments.
Connect ground post of signal generator to B— of radio.

- Chassis must be removed from cabinet for proper alignment. Slight adjustments of the oscillator and antenna circuits can be made, without removing the chassis, through two holes provided on the bottom of the cabinet. The screws can be reached with a long screwdriver.

SIGNAL GENERATOR			*TUNER SETTING*	*ADJUST FOR MAXIMUM OUTPUT (in order shown)*
Frequency	*Dummy Antenna*	*Connection to Radio*		
455 kc	.1 mf	Grid (pin 8) of 12SA7	Plates out of mesh	Trimmers on output and input I.F. cans
1650 kc	.1 mf	Grid (pin 8) of 12SA7	Plates out of mesh	Oscillator trimmer C7 on bottom of gang
1400 kc	200 mmf	See note below	Set dial at 1400 kc	Antenna trimmer C4 on bottom of gang

Lay output lead of generator in back of loop antenna. Turn up generator output. Loop will pick up energy.

Can be used with f-m tuner
Can be used with f-m ac/dc tuner, in which case converter is isolated from tuner through condenser

89C200

Rear view of typical installation.

CONVERTER OSCILLATOR ADJUSTMENT

NOTE - A signal generator with a range of 84 MC to 111 MC will be necessary for oscillator and r-f adjustments.

HOW TO CONNECT SIGNAL GENERATOR TO CONVERTER

1. Connect signal generator "hot" lead to converter aerial. (green wire)
2. Connect signal generator ground lead to converter ground lead. (black wire)

WHERE TO SET RECEIVER TUNING DIAL

Set receiver tuning dial at 45 MC on FM dial scale for all of the three oscillator adjustments and use the following:

ADJUSTMENT PROCEDURE

NOTE - Always begin adjustments with converter range selector set at position 3.

Set converter frequency selector at position	Set sig. gen. at	Adjust following trimmer until signal is heard
3	105 MC	C - 5
2	96 MC	C - 4
1	87 MC	C - 3
Refer to photograph on schematic diagram for location of trimmers.		

CONVERTER R-F ADJUSTMENTS

NOTE - Signal generator remains connected the same as for oscillator adjustments. Use audio output meter for proper r-f alignment. The r-f alignment of the converter is performed only with the frequency range selector in positions 1 and 3.

With the frequency range selector in position 1-

1. Set the receiver at 48 MC on the FM dial scale.
2. Set the signal generator at 90 MC (Signal should be heard.
3. Peak secondary trimmer C-2 for maximum output on output meter.

With the converter frequency range selector at position 3-

1. Set the receiver at 42 MC on FM dial scale.
2. Set signal generator at 102 MC. (Signal should be heard.)
3. Peak aerial trimmer C-1 for maximum output on output meter.

NOTE - It may be necessary to readjust the converter on position 1 to insure maximum output.

A switch is provided on the converter for selecting three frequency ranges (84mc to 93mc, 93mc to 102mc, and 102mc to 111mc) and also for turning off the power to the converter and restoring the receiver for normal operation.

HOW TO INSTALL THE CONVERTER

The converter should be mounted inside of the receiver in such a way that the range selector switch will be easily accessible.

1. Determine suitable location for the converter inside of receiver cabinet on either side of receiver chassis.
2. Remove knob from converter shaft.
3. Place converter in a position such that the switch shaft will rest against inside front of cabinet in such a way as will permit the short side of mounting bracket to rest against inside surface of cabinet.
4. Mark spot on inside front of cabinet where hole is to be drilled and then remove the converter.
5. Drill small pilot hole and enlarge it from the front of the cabinet using a 3/8 inch carpenters drill.
6. Put extension shaft on converter switch shaft and tighten coupling.
7. Replace converter so that shaft extends out through front of cabinet and converter is located where desired.
8. Mark shaft, so when cut, it will extend at least 3/8 inches from front of cabinet and then remove converter from cabinet.
9. Saw off shaft where marked and file off any rough edges on end of shaft.
10. Replace converter in cabinet at desired position and fasten short end of bracket to mounting surface by means of the two wood screws supplied with kit.
11. Fasten frequency conversion chart label to front of receiver cabinet, put knob on shaft and fasten securely by tightening set screw.
12. Remove audio output tube from the receiver. (This will be either a 6V6, 6F6, 6K6 or 6L6 type tube.) In cases where there are two of the type, remove only one.
13. Insert the adapter plug into the audio output tube socket and insert the audio output tube, previously removed, into the adapter socket.
14. Disconnect the aerial from the receiver and connect it to the converter aerial lead. (green wire)
15. Connect inner conductor of shielded lead from the converter output to the aerial terminal on the receiver.
16. Connect shield of converter output lead from the converter to the ground terminal on the receiver.
17. Connect black lead of converter to a ground. (Water or radiator pipe or an external ground)

HOW TO USE THE CONVERTER

Consult frequency label chart for frequency conversions.

Turn converter frequency range switch to position 2. The range of reception on the receiver will now be 84 to 93 MC (megacycles).

Turn converter frequency range switch to position 3. The range of reception will now be 93 to 102 MC. (megacycles). Or

Turn converter frequency range switch to position 4. The range of reception on the receiver will now be 102 to 111 MC. (megacycles).

Turn converter frequency range switch to position 1 to restore receiver for normal operation.

A universal bracket is included for mounting the converter. Power is supplied to the converter tube through an adapter cable from the receiver with which the converter is to be used.

The converter will in no way interfere with the normal operation of the receiver. All tuning is accomplished by the main tuning dial on the receiver.

ALIGNMENT PROCEDURE FOR SKYRIDER "5-10" Model S21

Intermediate Frequency Alignment

Have the controls set as follows:

Broad-sharp switch to sharp position.
A.V.C. - B.F.O. switch in "OFF" position.
Set R. F. and A. F. gain controls at maximum.
Set band switch on Band #1.
Adjust main dial to minimum capacity or #24 on the Vernier scale.
Remove the 6L7 grid cap - connect the signal generator to this tube, through an .01 mfd condenser.
Now set the signal generator for 1600 KC output.
Adjust trimmers on T1, T2, T3 transformer for exact resonance which will be indicated by maximum output.

For adjustment of the Beat Frequency Oscillator turn the knob on the "pitch control" unit until the dot is straight up. Remove modulation from the 1600 KC signal being fed into the I. F. amplifier and then adjust T4 for zero beat.

R. F. Alignment

Replace the 0.1 mfd condenser in series with the generator to the receiver with a 400 ohm resistor. Connect the generator to the A1 terminal on the antenna terminal strip to be found on the rear apron of the chassis. Leave the jumper connected between A2 and G. There is only one pad adjustment on the "5-10" receiver and that is for the low frequency end of Band #1. This pad is adjusted from the top of the chassis.

Band #1

Place the band switch on Band #1. Set the generator and tuning dial to 28 mc and adjust pad C43 for maximum signal. Reset tuning dial and generator to 40 mc and set oscillator trimmer CA. Now recheck pad C43 and trimmer CA until no change in frequency calibration is noted. When this is accomplished adjust trimmers CB, CC for maximum gain. When making these latter adjustments it is advisable to "rock" the tuning control slightly until the point of exact resonance and maximum output is obtained.

Band #2

Set signal generator and tuning dial to 60 mc and adjust oscillator trimmer CD to signal. Then adjust CE, CF for maximum gain, slightly rocking the tuning gang while making the adjustment.

There is no pad on Band #2.

NOTE: Should the noise picked up by the receiver interfere seriously with the alignment, increase the signal generator output and reduce the R. F. gain. The noise limiter may also be left on during alignment.

The SKYRIDER "5-10" draws 74 watts at 117 volts 60 cycle A.C.

Band 1 - 27 MC to 42 MC
Band 2 - 40 MC to 68 MC

1852 - R. F. Amplifier
6L7 - First Detector
6J5 - High Frequency Oscillator
6K7 - 1st I. F. Amplifier
6P7G - 2nd I. F. Amplifier, B.F.O.
6Q7G - 2nd Detector, A.V.C., 1st Stage of Audio
6F6G - Audio Output tube
80 - Rectifier

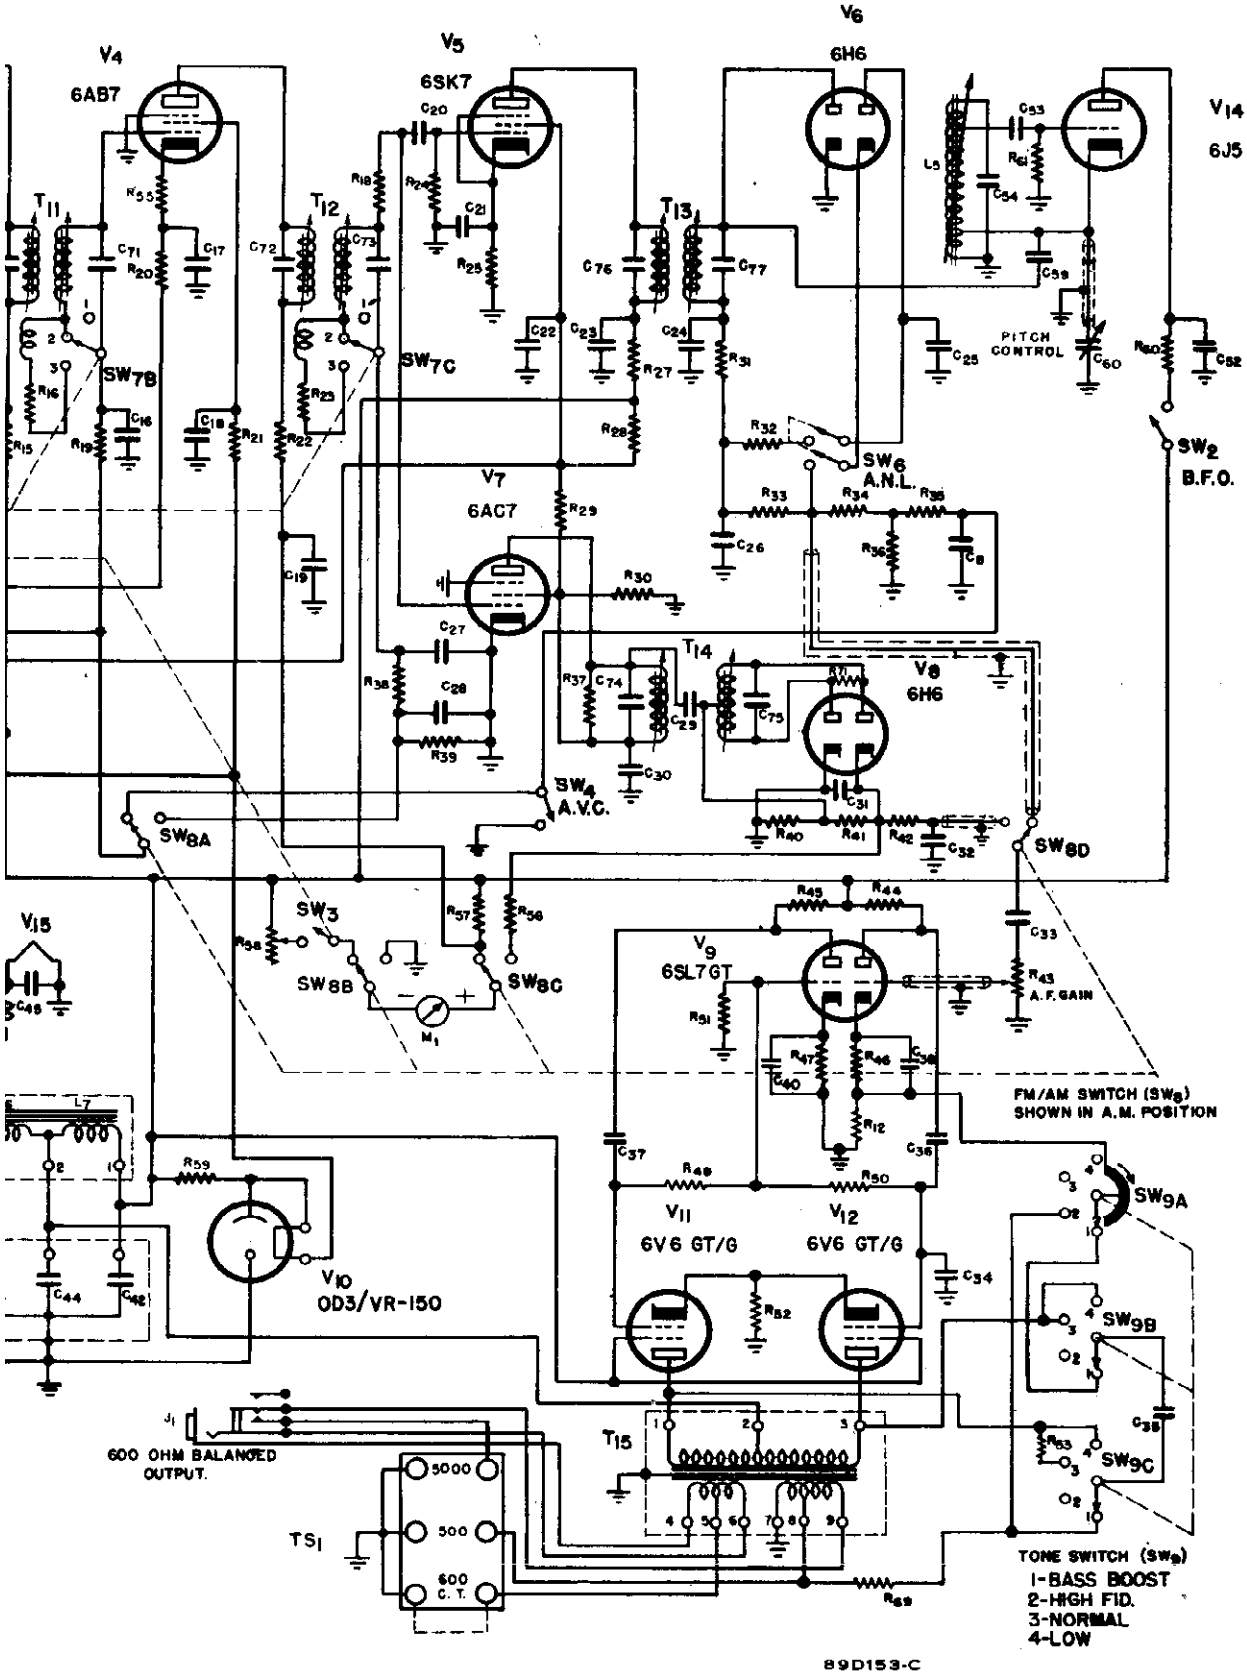
MODEL S-36A



re 7-7. Radio Receiver Model S-36A, schematic wiring diagram.

THE HALLICRAFTERS CO.

POWER REQUIREMENTS.

The receiver is designed to operate from either a 115-volt or 230-volt 50/60 cycle, single phase, a-c source or from a 6-volt storage battery and 270-volt "B" battery. The "B" batteries may be replaced by a suitable vibrator type power supply if it meets the following current requirements.

A-C Operation	* D-C Operation
Line voltage . . .115 volts, 230 volts	Filament voltage . . . . . 6.3 volts
Line current . . .1.0 amp., 0.5 amp.	Filament current . . . . . 4.5 amps.
Power consumption. . . . . 115 watts	"B" voltage. . . . . 270 volts
	"B" current . . . . . 145 ma.

* The 6-volt battery drain using a vibrator type supply for "B" voltage will run approximately 20 to 22 amperes.

Audio Output Connections.-A headset or loudspeaker may be used with the receiver.

(1) The headset jack marked PHONES, located on the front panel, provides a 600-ohm balanced output for headset reception. The center tap of the 600-ohm headset winding is grounded externally at the speaker output terminal board TS-1 by a jumper wire across the terminals marked 600 C.T. If it is desirable to operate with one side of the headset line grounded, disconnect the jumper on terminal board TS-1.

(2) The two sets of speaker terminals located on the rear chassis apron provide output impedances of 500 and 5000 ohms for loudspeaker reception. One side of each of the 500 and 5000-ohm output connections is grounded. This should be kept in mind if this receiver is to work in conjunction with other equipment. A speaker capable of handling 5 watts of audio power should be used with this equipment.

Remote Operation Facilities. - The receiver may be disabled remotely by disconnecting the jumper wire between pins #3 and #4 in the shorting plug PL-2, which is normally plugged into socket SO-1 during a-c operation, and connecting a remote switch or relay across these pins. The stand-by switch is connected in the "B" lead, hence, the remote stand-by switch must be insulated for approximately 270 volts to protect the operator. When using the remote control disabling switch, the SEND/REC switch on the receiver must be set at SEND.

> CAUTION - The external stand-by switch and its connections will be approximately 270 volts above ground hence must be well insulated throughout.

PREPARATION FOR USE.

A-C Operation. - The receiver may be operated from either a 115-volt or 230-volt, 50/60 cycle, single phase, a-c source of power. To change over from one line voltage to the other, it is merely necessary to throw the line voltage switch (SW-10) located on the top of the chassis near the power transformer. See Fig. 7-1. for location of the line voltage switch.

> CAUTION - Check the line voltage and position of the line voltage switch before connecting the receiver to a source of power. A receiver set for 230-volt operation will not be damaged when connected to a 115-volt line, but a receiver set for 115-volt operation will, in most cases, be damaged when plugged into a 230-volt outlet. When in doubt, set the line voltage switch for 230-volt operation. If the dial lamps light up dimly, indicating a 115-volt line voltage, switch over to the 115-volt position.

D-C Operation. - The receiver may be operated from a 6-volt d-c source, generally a storage battery, and a 270-volt d-c supply in the form of dry batteries or vibrator type power pack. Consult the chart on power requirements for d-c operation in Section I. and provide battery facilities capable of supplying these demands. The receiver is connected to the d-c supply as follows:

(1) Remove the octal "jumper plug" (PL-2) used for a-c operation from socket SO-1. Use No. 18 (AWG) wire leads for the 270-volt "B" supply connections to pins #3 and #5 and No. 12 (AWG) wire leads for the 6-volt "A" battery connections to pins #1, #8 and #7.

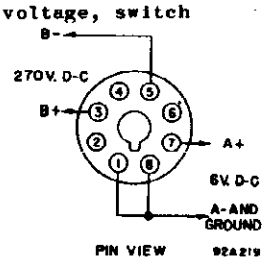


Fig. 2-1. Radio Receiver Model S-36A, wiring diagram for d-c power plug.

R.F. GAIN Control. - The radio frequency gain control regulates the sensitivity of the receiver. Turning the control to the right increases the sensitivity of the receiver. Ganged to this control is the "S" meter switch which connects the tuning meter into the circuit when the control is advanced all the way to the right.

SELECTIVITY Switch.--The selectivity switch serves a dual purpose. In position #1 it turns the receiver off when operating from an a-c source of power. (When operating from a d-c supply the power switch is part of the external supply, hence, the SELECTIVITY switch does not function in position #1). In positions #2 and #3 the selectivity switch controls the bandwidth of the i-f amplifier thereby affecting the selectivity of the receiver. In general, the switch is set at SHARP for amplitude modulated signals and at BROAD for frequency modulated signals.

"S" Meter or Tuning Meter.-- The tuning meter serves two functions in the receiver depending on the type of reception as follows:

(1) A.M. Reception. - When the receiver is adjusted to receive amplitude modulated signals, the tuning meter indicates the relative carrier strength of the received signal. To put the meter in operation, turn the R.F. GAIN control to the right until the switch connected to its shaft clicks, and set the A.V.C. switch at ON.

(2) F.M. Reception. - When the receiver is adjusted to receive frequency modulated signals, the tuning meter is used to indicate resonance with the station carrier. As the receiver is tuned through the f-m carrier the indicator will deflect to one side of zero, return to zero and deflect an equal distance to the opposite side of zero, and finally return to zero as the carrier is completely passed. The zero center position in the middle of the swing represents the correct setting of the receiver tuning dial and indicates resonance with the station carrier.

2. OPERATION.

Listed below are the receiver controls and their settings for the three types of reception provided by this receiver, namely, amplitude and frequency modulated telephone and c-w code reception.

a. A.M. (Amplitude Modulation) Telephone Reception - To receive amplitude modulated telephone signals set the front panel controls as follows:

SELECTIVITY switch	-	Set at A.C. OFF when the receiver is not in use. Set at SHARP for reception of amplitude modulated phone signals.
SEND/REC. switch	-	Set at REC. (Set at SEND to disable receiver for short stand-by periods.)
BAND SWITCH	-	Set at range number corresponding to band covering desired frequency.
A.M./F.M. switch	-	Set at A.M.
A.V.C.	-	Set at ON.
R.F. GAIN control	-	Turn to the right until tuning meter switch ganged to the control snaps on.
B.F.O. switch	-	Set at OFF.
PITCH CONTROL	-	Not used.
TUNING wheel	-	Set calibrated dial to frequency of desired signal, adjust for maximum tuning meter deflection.
ANTENNA trimmer	-	Adjust for maximum tuning meter deflection.
A.F. GAIN control	-	Adjust for desired volume at headset or loudspeaker.
TONE control	-	Set to please the listener. Generally set at HIGH FID. or BASS BOOST when signal to noise ratio is high or at NORMAL or LOW when signal to noise ratio is low.
A.N.L. switch	-	Normally set at OFF except when background noise is excessive.

MODEL S-36-A

THE HALLICRAFTERS CO.

b. F.M. (Frequency Modulation) Telephone Reception. - To receive frequency modulated telephone signals set the front panel controls as follows:

SELECTIVITY switch	-	Set at A.C. OFF when the receiver is not in use. Set at BROAD for reception of frequency modulated phone signals.
SEND/REC. switch	-	Set at REC. (Set at SEND to disable receiver for short stand-by periods.)
BAND SWITCH	-	Set at range number corresponding to band covering desired frequency.
A.M./F.M. switch	-	Set at F.M.
R.F. GAIN control	-	Turn all the way to the right. (The switch ganged to this control does not operate during f-m reception).
A.V.C. switch	-	Set at OFF.
B.F.O. switch	-	Set at OFF.
PITCH CONTROL	-	Not used.
A.N.L. switch	-	Set at OFF
TUNING wheel	-	Set calibrated dial to frequency of desired signal, adjust for "0" position of tuning meter marked for F-M tuning.
ANTENNA trimmer	-	Adjust for minimum background noise (Control will only be effective on very weak signals.)
A.F. GAIN control	-	Adjust for desired volume at headset or loudspeaker.
TONE control	-	Set at BASS BOOST or HIGH FID.

c. C-W Code Reception. - To receive continuous wave (c-w) code signals set the front panel controls as follows:

SELECTIVITY switch	-	Set at A.C. OFF when the receiver is not in use. Set at SHARP for reception of c-w code signals.
SEND/REC. switch	-	Set at REC. (Set at SEND to disable receiver for short stand-by periods.)
BAND SWITCH	-	Set at range number corresponding to band covering desired frequency.
A.M./F.M. switch	-	Set at A.M.
A.V.C. switch	-	Set at OFF.
B.F.O. switch	-	Set at ON.
PITCH CONTROL	-	Adjust to produce a 500 to 1000 cycle code signal.
TUNING wheel	-	Set calibrated dial to frequency of desired signal. Tune for maximum signal level at headset or loudspeaker.
R.F. GAIN control	-	Turn up as high as the signal strength of the code signal will allow. Too much gain will result in distortion of the signal.
ANTENNA trimmer	-	Adjust for maximum signal level at the headset or loudspeaker.
TONE control	-	Set at LOW or NORMAL.
A.N.L. switch	-	Set at OFF.
A.F. GAIN control	-	Adjust for desired volume at headset or speaker.

FUNCTIONING OF PARTS

1. GENERAL.

Figure 4-1. shows, in a very simple block form, the plan of the circuit of the Model S-36A receiver. Note that the circuit is that of the conventional superheterodyne receiver up to the second i-f amplifier stage. The output of the 2nd i-f amplifier is fed to two channels, namely, the F-M signal channel and the A-M signal channel. The F-M channel consists of the f-m limiter and discriminator and the A-M channel consists of an additional i-f amplifier stage and second detector stage. The demodulated signal from both channels then feeds the same audio amplifier, being selected by the A.M./F.M. switch.

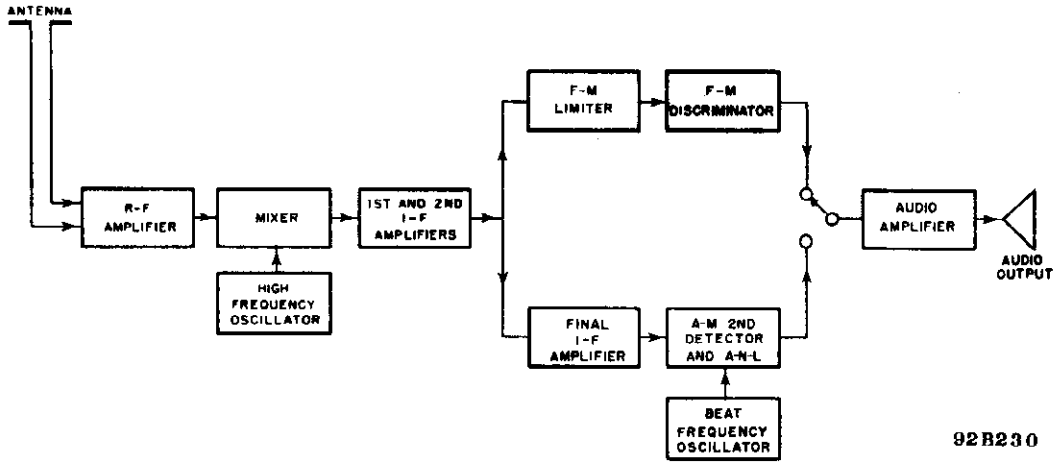

Fig. 4-1. Radio Receiver Model S-36A, block diagram.

2. DETAILED FUNCTIONING BY STAGES. (Refer to Fig. 7-7.)

Since the circuit functions of bands 1, 2 and 3 are essentially identical, this discussion will describe the circuit with BAND SWITCH (SW_{1A} to SW_{1G}) set at band 3 as shown in the schematic diagram.

a. R-F Amplifier. - The r-f amplifier stage employs a type 956 acorn type pentode tube in a conventional class A amplifier circuit. Signals present at the antenna are fed to the primary of transformer T-3 through terminals A_1 and A_2 of the antenna terminal strip TS-2. The secondary is tuned by the ganged tuning capacitor section C-1A and trimmer C-2. Trimmer capacitor C-2 is controlled from the front panel by the control marked ANTENNA to provide accurate alignment of the r-f stage with varying antenna load impedances. R-F signals selected by the parallel resonant circuit are applied to the grid of tube V-1 and appear in greater amplitude across the primary of transformer T-6. Parasitic resistor R-26 prevents unwanted oscillations in this stage and tends to stabilize the amplifier. Resistor R-1 by-passed by capacitor C-4 provides self-bias for the stage. Resistor R-2 and capacitor C-5 act as decoupling network for the screen of tube V-1 and resistor R-3 and R-4 and capacitors C-6 and C-78 act as decoupling networks for the plate circuit. The signal across the primary of transformer T-6 is coupled to the grid of tube V-2 inductively by transformer T-6 and capacitively by capacitor C-7. Capacitor C-7 provides a small amount of coupling to improve the response at the high frequency end of the band, thus equalizing the r-f signal amplitude over the tunable frequency range. The signal developed at the grid of tube V-2 then feeds the mixer stage of the receiver.

b. Mixer. - The mixer stage employs a type 954 acorn type pentode in a cathode coupled mixer circuit. The secondary of transformer T-6 is tuned by section C-1B of the ganged tuning capacitor and trimmer C-65. R-F signals selected by the parallel resonant circuit are applied to the grid of the mixer tube, V-2. A signal from the local oscillator 5.25 mc higher in frequency than the received signal on band #1 and 5.25 mc. lower in frequency than the received signal on bands #2 and #3 is fed to the mixer tube through the cathode and provides the difference frequency of 5.25 mc for the i-f amplifier stages.

c. **Oscillator.** - The oscillator circuit consists of a type 955 acorn type triode in a tuned-plate untuned grid type of oscillator circuit. The frequency of oscillation is determined by a resonant circuit consisting of the secondary of transformer T-9 and section C-1C of the main tuning capacitor connected in parallel. Capacitor C-11 is used to trim transformer T-9 (Band #3) only, although it remains in the circuit on bands #1 and #2. The r-f energy is fed from the plate of tube V-15 to the tuned circuit by the d-c blocking capacitor C-56. The decoupling network in the plate circuit of the oscillator tube consists of R-63, L-1, C-55 and R-62. Resistor R-66 (in band #3 only) and capacitor C-57 (in all bands) in series with the feed-back winding of transformer T-9 provide grid voltage across resistor R-64 for the oscillator tube. The oscillator voltage is supplied for the mixer stage by a third winding on transformer T-9 which is fed to the mixer tube (V-2) through capacitor C-9.

d. **First and 2nd I-F Amplifier.** - The 1st and 2nd i-f amplifier stages employ type 6AC7 and 6AB7 pentodes respectively. The i-f amplifier coupling transformers T-10, T-11, and T-12 for these two stages are tuned to 5.25 mc. by adjusting the powdered iron core slugs in both primary and secondary windings. The gain of the 1st and 2nd i-f amplifier stages is varied by the R.F. GAIN control (R-11), connected in series with the cathodes of both tubes, to provide sensitivity control for the receiver instead of the usual practice of varying the gain of the r-f amplifier stages. This method of control permits the r-f amplifier stages to operate at maximum gain, thereby providing a high signal to noise ratio at all sensitivity settings. The a-v-c grid voltage is applied to this section of the receiver through the decoupling networks C-12, R-10, C-16, and R-19. The a-v-c voltage is supplied by the 2nd detector tube (V-6) during a-m reception and a small amount of voltage is also supplied for a similar purpose, from the limiter tube (V-7) during f-m reception. Since the 1st and 2nd i-f amplifier stages are used for both a-m and f-m reception, the band width of the i-f amplifier channel is varied to provide a relatively sharp frequency response for a-m reception (SELECTIVITY switch set at SHARP) and a relatively broad frequency response for f-m reception. (SELECTIVITY switch set at BROAD). The selectivity of the i-f amplifier is controlled by switching in a third winding which varies the coupling between the primary and secondary windings. In SHARP position, the coupling winding is disconnected and only the coupling between primary and secondary windings determines the band width of the i-f amplifier. In BROAD position, the coupling winding is introduced to increase the coefficient of coupling between primary and secondary winding. The increase in coupling broadens the i-f amplifier frequency response to accept f-m signals. The signal voltage supplied by the 2nd i-f amplifier is fed to the limiter and discriminator for f-m reception and to the 3rd i-f amplifier stage and 2nd detector for a-m reception.

e. **Final I-F Amplifier.** - The last i-f amplifier stage, used for a-m reception, employs a type 6SK7 pentode connected in a conventional class A amplifier circuit. The stage is coupled by transformers T-12 and T-13 which are tuned by adjustable powdered iron core slugs. Resistor R-25 by-passed by capacitor C-21 provides self-bias for the stage. The gain of this stage is not varied as was the case for the 1st and 2nd i-f amplifier stages. The amplified signal voltage developed across the secondary of transformer T-13 is then fed to the 2nd detector for demodulation of a-m signals.

f. **A-M 2nd Detector and A-N-L.** - Both the second detector and automatic noise limiter stages employ a single type 6H6 duo-diode. One diode section of tube V-6 serves as detector for amplitude modulated signals by rectifying the modulated carrier. The r-f filter for this type of detection consists of resistor R-31 and capacitors C-24 and C-26 connected in a pi-section. Automatic volume control voltage and audio frequency voltage is obtained from the load and voltage divider resistors R-33, R-34, and R-36. Resistor R-35 and capacitor C-8 serve as a-v-c decoupling. The remaining diode section of tube V-6 serves as automatic noise limiter as follows: Capacitor C-25 becomes charged by the rectified carrier voltage and the time constant of this capacitor and the filter network associated with it is such that the audio frequency voltage variations do not alter this charge. During a severe noise pulse, however, the cathode of the diode plate connected to capacitor C-25 becomes more negatively charged than the charge held by capacitor C-25, hence, current flows shorting the audio voltage to ground through capacitor C-25 until the cathode voltage of the a-n-l diode again reaches a less negative potential than its plate and capacitor C-25 acquires its normal charge again. By shorting the audio voltage to ground during a noise pulse, the a-n-l circuit prevents the objectional noise pulses from reaching the audio amplifier stages.

g. **Beat Frequency Oscillator.** - The beat frequency oscillator employs a type 6J5 triode tube in a modified Hartley oscillator circuit. The oscillator frequency is adjusted by a moveable powdered iron core within the field of coil L-5. This iron core adjustment sets the oscillator's frequency at 5.25 mc. and is adjusted by a screw driver during alignment. The fine adjustment of the oscillator frequency re-

quired to provide control of the beat note frequency is controlled by variable capacitor C-60 (PITCH CONTROL) which tunes a small portion of the total oscillator coil (L-5). The B.F.O. switch controls the use of the oscillator by breaking the plate voltage lead to the tube. The decoupling network R-60 and C-52 prevents the oscillator signal from reaching the other stages through the "B" voltage supply.

h. **F-M Limiter and Discriminator.** - The frequency modulation detector consists of a limiter stage and a discriminator stage. The 6AC7 limiter tube (V-7) is fed by the second i-f transformer secondary winding along with the third i-f amplifier tube V-5 for a-m reception. The limiter stage operates as a saturated amplifier in which the output voltage remains constant over a large range of input voltage levels, thus eliminating variations in the amplitude of the carrier signal to be demodulated by the discriminator. When operating as an f-m receiver, automatic volume control action is obtained by applying a part of the voltage developed across resistor R-39 in the grid return of the limiter tube (V-7), to the control grids of the 1st and 2nd i-f amplifier tubes (V-3 and V-4) through section SW-8A of the A.M./F.M. switch. The constant level signal voltage from the limiter tube (V-7) is fed to the type 6H6 discriminator tube (V-8) through the discriminator transformer (T-14) and coupling capacitor C-29. The discriminator circuit, consisting of transformer T-14, tube V-9 and load resistors R-40 and R-41, converts the frequency variations of the f-m signal into amplitude variations or the audio signal. The de-emphasis network, consisting of resistor R-42 and capacitor C-32, attentuates the high frequency end of the audio range since these frequencies are emphasized as the f-m transmitter. From the de-emphasis network the audio signal is fed to the A.F. GAIN control (R-43) in the same way as the audio signal from the amplitude modulation detector tube (V-6).

i. **Audio Amplifier.** - The audio amplifier stages consists of a class A phase inverter amplifier employing a type 6SL7GT twin-triode driving a pair of 6V6GT/G pentodes in push-pull class A. The audio signal from either the a-m detector or the f-m discriminator is fed to the grid of the first triode section of the phase inverter tube (V-9) through the A.F. GAIN control (R-43). The amplified audio signal voltage from the first triode section of tube V-9 is fed to the grid of power amplifier tube V-12 and to the grid of the second triode section of tube V-9 through the voltage divider network consisting of resistors R-50 and R-51 which also serve as grid return for the power amplifier tube (V-12). The audio signal voltage developed across the plate load resistor (R-45) of the second triode section of tube V-9, which is now 180 degrees out of phase, is then fed to the remaining power amplifier tube (V-11) grid. The output of the power amplifier tubes is coupled to the load through transformer T-15, the secondary of which provides output impedances of 500 ohms and 5000 ohms to ground and 600 ohms balanced to ground. The network consisting of R-69, R-53 and C-35 supplies inverse feedback in various amounts to provide tone control ranging from bass boost to high frequency cutoff. The TONE switch SW-9 selects the required network combination.

j. **Tuning Meter.** - The tuning meter serves two circuits in the receiver depending upon the type of signals being received. It is switched from one circuit to the other by the A.M./F.M. switch (SW-8 sections B and C).

(1) **A-M Reception.** - When metering the reception of a-m signals, the tuning meter measures the plate current of the 2nd i-f amplifier tube (V-4) which varies with the strength of the signal carrier. Resistor R-58 sets the zero (no signal) position of the tuning meter by controlling that part of the plate current of tube V-4 flowing through the meter. The intermediate frequency signal voltage then drives the plate current of tube V-4 to a lower value depending upon the signal strength. The screen grid voltage of tube V-4 is regulated by the voltage regulator tube (V-10) to provide an accurate control over the zero signal plate current so that the meter adjustment resistor (R-58) need not be continually re-set for variations of the a-c line voltage.

(2) **F-M Reception.** - When metering reception of f-m signals the tuning meter measures the unbalanced current in resistors R-40 and R-41 obtained when the receiver is tuned to one side of the f-m carrier. When the receiver is tuned to the exact center of the f-m carrier the meter rests at zero indicating that the currents in the discriminator load resistors are equal. Resistor R-56 functions to limit the maximum current in the meter circuit to a safe value.

k. **Power Supply.** - The receiver has provisions for operation from either an a-c or d-c source.

(1) **A-C Operation.** - The receiver's power supply provides for operation from 115 or 230-volt a-c mains. The a-c current is fed through the line filter which is a low pass pi-section network connected in each side of the line. The network consists

of inductances L-2 and L-3 and capacitors C-48, C-49, C-50 and C-51. The line filter attenuates all the objectionable noise components coming into the receiver circuit through the a-c power source. The line voltage at which the receiver will operate is determined by the setting of the line voltage switch SW-10. This switch simply connects the two 115-volt primary windings of transformer T-16 in parallel for 115-volt operation or series for 230-volt operation. A type 5U4G (tube V-13) full wave rectifier is employed in a conventional full wave rectifier circuit. The high voltage from this rectifier is fed to the filter network through the "Shorting Plug" on the rear apron of the receiver chassis as is the filament current for the heaters of the tubes. The SEND/REC. switch is connected in series with the high voltage lead from the rectifier filament to the shorting plug socket to break the high voltage circuit to the receiver's filter sections, thereby, disabling the receiver but at the same time keeping the tube heaters hot, ready for instant use. The filter circuit consists of two low pass pi-section networks made up of inductances L-6 and L-7 and capacitors C-42, C-43, and C-44. In order to provide a constant "B" voltage for the oscillator, mixer, and screen grid of the 2nd i-f amplifier stages a voltage regulator tube type OD3/VR-150 is used. The voltage supplied to the screen of tube V-4 is regulated to provide accurate current control for the tuning meter connected in the plate circuit of this tube.

(2) **D-C Operation.** - External 6-volt storage battery and 270-volts of "B" batteries or storage battery and vibrator type supply provide for d-c operation. When operating from an external d-c supply the "Shorting Plug" on the rear apron of the receiver chassis is removed and a similar plug is wired to supply filament and plate current to the receiver circuits. The "B" voltage is fed to the input side of the filter sections used for a-c operation thereby insuring adequate filtering for vibrator type power supplies.

MAINTENANCE

CAUTION - Voltages at various points in this equipment are of sufficiently high potential to produce a severe shock. Locate the high-potential points on the VOLTAGE CHART before attempting to service circuits that are "hot". IT IS A GOOD RULE TO DISCONNECT THE POWER SOURCE BEFORE MAKING ADJUSTMENTS WHEN POSSIBLE. BE CAREFUL.

1. PREVENTIVE MAINTENANCE.

All components of the receiver should be given a thorough inspection at regular intervals. The time interval between inspections will be determined by the operating conditions of the individual installation. In general, keep the components clean and dry. Moisture, even in a completely tropicalized set may cause serious deterioration and produce general unsatisfactory operation. Dust and dirt materially effect both electrical and mechanical operation. Keep the various parts clean especially the tuning capacitors and associated gear drive. Dust should be blown out with dry air or brushed out carefully. Do not oil the gear teeth or the condenser wipers, as noisy reception will result from intermittant electrical contact at these points. Noisy reception may also be caused by dirty condenser wipers, faulty gain controls and switches, frayed cable connections, faulty tubes, etc. in the installation. Check accessible connections, switch contacts, etc. regularly, making sure that all are clean and tight and the tubes and cable connectors are held securely in their sockets.

2. REPLACING TUBES, LAMPS, and FUSES.

a. Replacing Tubes. - All tubes with exception of the three acorn types are accessible at the top of the chassis through the hinged cover of the cabinet. The three acorn type tubes are made accessible by removing the top cover of the r-f section which is held down by anchor clips. The acorn type tubes are inserted with the short end of the body in the socket. Acorn tubes are more fragile than the rest and must be handled accordingly. If the grid and plate clips on the connections to these tubes become loose replace or bend them to fit firmly. DO NOT ATTEMPT TO SOLDER DIRECTLY TO THE TUBE PIN as the heat generated by the soldering iron will crack the glass envelope. When replacing tubes, check the tube type carefully and replace with the correct tube type. Refer to the top view of the chassis to determine the location of the tubes and to the PARTS LIST for the type number and description of each.

b. Replacing Lamps. The receiver employs two lamps with bayonet type sockets to illuminate the calibrated tuning dial and the vernier dial. The lamps are to be replaced with a 6/8-volt, 250 ma. (blue bead) G.E. #44 or equivwlent. The color code referred to is the color of the glass bead above the glass stem inside the envelope of the lamp.

3. PERIODIC ADJUSTMENTS.

a. Tuning Meter Adjustment. -

(1) The tuning meter zero setting control is located behind its front panel button type cover, marked METER ADJ. Remove the button with a knife or screw driver blade.

(2) Disconnect the antenna and connect a jumper across terminals A_1, A_2, and GND. on terminal board TS-2.

(3) Set the front panel controls for amplitude modulation reception as follows:

(a) Set A.M./F.M. switch at A.M.

(b) Set A.V.C. switch at ON.

(c) Turn R.F. GAIN control to right until the switch on the control clicks.

(d) Set A.F. GAIN control for minimum gain. (All the way to the left.)

(e) Set A.N.L. switch at OFF.

(f) Set B.F.O. switch at OFF.

(g) Set SEND/REC. switch at REC.

(h) Set SELECTIVITY switch at SHARP.

(4) With a screw driver set the METER ADJ. control for the zero reading on the S-meter scale of the tuning meter.

(5) Remove the antenna terminal jumper and replace antenna leads and meter adjustment cover button, the adjustment is completed.

b. Receiver Alignment. - The receiver has been carefully aligned at the factory and should not require realignment until the receiver requires new tubes in the r-f and i-f amplifier stages, or shows signs of loss of sensitivity, off frequency calibration or requires service work on one or more of its r-f and i-f amplifier stages. Alignment should not be attempted by inexperienced personnel as maximum performance is obtained only by careful and intelligent alignment.

(1) Aligning Tools. -

(a) Signal generator capable of providing a 400-cycle modulated signal at 5.25 mc. and 27 to 145 mc. range. Recommended generators are the Ferris Instrument Corp. Model 18D or 18FS and the Measurements Corp. Model 75.

(b) A 50-ohm non-inductive dummy antenna resistor.

(c) Non-metallic screw driver. A bakelite screw driver with a short metal blade is very good.

(d) Audio output meter capable of handling 10 watts of audio power for either 500 or 5000-ohm loads.

(2) I-F Amplifier Alignment. -

(a) Disconnect the grid lead of the type 954 mixer tube (V-2) and connect the "hot" lead of the signal generator to the grid of the mixer tube using a small clip or flexible piece of wire to make the connection. Connect the ground wire of the generator to the receiver chassis.

> CAUTION - Do not attempt to solder to the tube terminal as the heat of the soldering iron is certain to crack the glass envelope.

(b) Connect the output meter across the speaker terminals. Set the range of the output meter for its highest range to prevent overloading the meter accidentally.

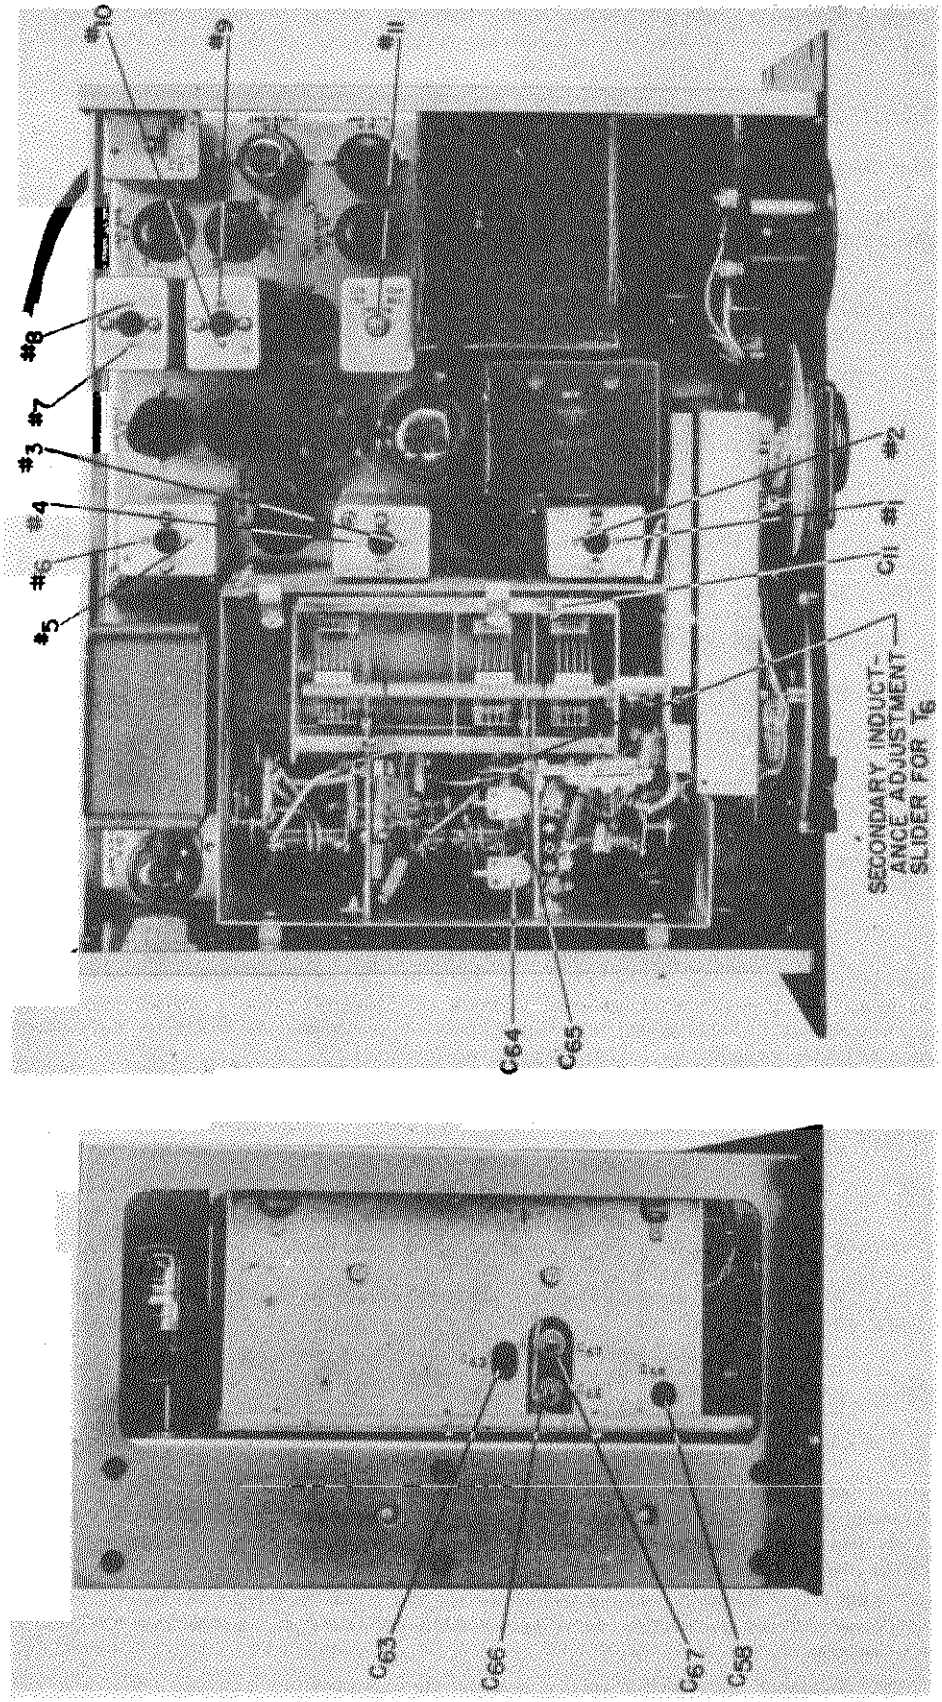

Figure 5-1. Radio Receiver Model S-36A, view showing alignment points.

(c) Let the receiver warm up for approximately half an hour, then set the receiver controls as follows:

R.F. GAIN control at maximum gain.

A.F. GAIN control at maximum gain. Work in a shielded room if possible.

SELECTIVITY switch at SHARP.

A.M./F.M. switch at A.M.
BAND SWITCH at band #2.

A.V.C. switch at OFF.

SEND/REC. switch at REC.

A.N.L. switch at OFF.

B.F.O. switch at OFF.

TONE control at HIGH FID.

(d) Set the signal generator frequency at 5.25 mc. and turn on the 400-cycle modulation.

(d) Adjust transformers T-10, T-11, T-12 and T-13 for maximum output meter reading using just enough signal generator output to provide a good resonant swing on the output meter. The signal level at the generator should not be more than 70 microvolts for a 500 milliwatt audio output level. Repeat the alignment procedure until assured of accurate alignment. Refer to figure 5-1. for the location of i-f transformer adjustment screws #1 through #8 inclusive on i-f transformers T-10, T-11, T-12, and T-13.

(3) Discriminator Transformer Alignment. -

(a) Set the A.M./F.M. switch at F.M. and the SELECTIVITY switch at BROAD.

(b) Leave the signal generator set at 5.25 mc. with 400-cycle modulation.

(c) Adjust the secondary slug (#10) of the discriminator transformer (T-14) for zero signal level at the output meter. Note that this adjustment is critical, therefore turn the adjustment screw slowly. Use sufficient signal generator output to provide a good null indication.

(d) Detune the adjustment made in par. (c) slightly so that the output meter gives a readable indication.

(e) Adjust the primary slug adjustment (#9) of the discriminator transformer for maximum response.

(f) Retune the secondary (slug #10) of the discriminator transformer for the null point as in par. (c).

(g) Detune the signal generator to a frequency lower than the i-f frequency until the maximum output point is reached. Note the output meter reading and the frequency deviation from the i-f frequency (5.25 mc.).

(h) Repeat the procedure for the frequency above the i-f frequency. The frequency deviation and maximum output should be the same for good balance. If they are not, then tune the signal generator to the lower of the two peaks and adjust the primary slug adjustment (#9) until the output rises an amount equal to about half the difference of the two peaks previously noted.

(i) Retest for balance as above readjusting the primary slug adjustment until both maximum readings are alike when the signal generator is detuned approximately the same amount on either side of resonance (5.25 mc.). If a balance cannot be obtained, it is an indication that the discriminator transformer secondary slug adjustment (#10) has been misadjusted and will require a very slight correction in either direction. The direction of adjustment that will cause the off-tune peaks to assume the same values is the correct one. Care must be taken in adjusting the discriminator secondary control as even a very slight misadjustment will result in distortion of frequency modulated signals.

(4) B.F.O. Adjustment. - Set up the receiver and signal generator as for i-f amplifier alignment and proceed as follows:

(a) Shut off the 400-cycle modulation of the signal generator.

(b) Set the PITCH CONTROL at "0" and set the B.F.O. switch at ON.

(c) Back off the A.F. GAIN control slightly and use just enough signal generator output to provide a clean beat note.

(d) Plug a headset into the PHONES jack.

(e) Adjust the slug screw (#11) of coil L-5 for zero beat.

(f) Check the adjustment by turning the PITCH CONTROL to the right and left of "0". A change in the pitch of the beat note should result. The frequency of the beat note will vary from zero at the "0" setting to a very high pitch at the #5 setting of the control.

(g) Disconnect the signal generator and reconnect the grid lead to the mixer tube, the alignment of the i-f amplifier stages is completed.

(5) R-F Amplifier Alignment.- The following sequence must be followed to properly align the r-f amplifier stages. Band 3 is aligned first since the adjustment of trimmer C-11 is made for band 3 alignment only and will slightly effect the alignment of bands 1 and 2 if band 3 is not aligned first.

(a) Connect the "hot" lead of the signal generator to terminal "A_1" of the antenna terminal board through a 50-ohm non-inductive resistor (carbon). Connect the ground lead of the generator to the receiver chassis. Leave the jumper connected between terminals "A_2" and "GND". Turn on the 400-cycle modulation.

(b) Let the receiver warm up for approximately half an hour, then set the receiver controls as follows:

R.F. GAIN control at maximum gain.

A.F. GAIN control at maximum gain.

SELECTIVITY switch at SHARP during alignment of band 1. and at BROAD during alignment of bands 2 and 3.

A.M./F.M. switch at A.M.

A.V.C. switch at OFF.

SEND/REC. switch at REC.

A.N.L. switch at OFF.

B.F.O. switch at OFF.

TONE control at HIGH FID.

NOTE For all alignment adjustments the signal generator output attentuator must be adjusted to provide a 500 milliwatt audio signal output at the speaker terminals of the receiver.

NOTE - During each of the following adjustments the ANTENNA control should be touched up to keep the antenna stage in alignment.

(c) Band 3. Alignment. - (BAND SWITCH at 3.)

1. Set the signal generator at 135 mc. and tune in its signal on the receiver. If the receiver's calibrated dial reads 135 mc. no adjustment of capacitor C-11 is necessary if not, adjust C-11 for maximum output with the receiver dial set at 135 mc.

2. Set the signal generator at 90 mc. and tune in its signal on the receiver. If the receiver dial reads 90 mc. no adjustment of the plate winding inductance of transformer T-9 is necessary - if not, loosen the setscrew at the frame of the main tuning condenser (C-1), holding the end of the plate coil, and adjust the inductance. Increase the inductance if the generator signal falls lower than the 90 mc. calibration point on the receiver dial and reduce the inductance if the signal

falls above the 90 mc. calibration point. Tighten down the set screw each time before checking the adjustment.

NOTE - If the plate coil inductance was altered it will be necessary to repeat step 1. again. Several adjustments of capacitor C-11 in step 1. and the plate coil inductance in step 2. may be required in cases of where a new transformer (T-9) had to be installed.

3. Set the signal generator and receiver at 135 mc. and adjust trimmer capacitor C-65 for maximum output. Rock the tuning control back and forth slightly to determine the best adjustment.

4. Ordinarily no adjustment of the secondary winding inductance of transformers T-3 and T-6 is necessary at 90 mc., however, if the sensitivity of the receiver falls off at this end of the range or if new transformers have just been installed it will be necessary to adjust the secondary winding inductance for maximum response at 90 mc. Transformer T-6 is provided with a soldered slider adjustment at the gang condenser frame, however, the ground side of the secondary of transformer T-3 must be unsoldered to be adjusted. The value of inductance that provides maximum audio signal at the output meter is the correct adjustment.

NOTE - If the secondary inductance was altered it will be necessary to repeat step 3. again. Several adjustments of capacitor C-65 in step 3. and inductance in step 4. may be necessary depending upon the condition of the coils.

(d) Band 2. Alignment. - (BAND SWITCH at 2.)

1. Set the signal generator at 80 mc. and tune in its signal on the receiver. If the receiver's calibrated dial reads 80 mc. no adjustment of capacitor C-67 is necessary - if not, adjust capacitor C-67 for maximum output with the receiver dial set at 80 mc.

2. Set the signal generator at 50 mc. and tune in its signal on the receiver. If the receiver dial reads 50 mc. no adjustment of the plate winding inductance of transformer T-8 is necessary - if not, it will be necessary to loosen the winding from the form with lacquer thinner and shift the individual turns until the signal peaks with the receiver dial set at 50 mc. Repeat step 1. above and recheck step 2. again before cementing the coil in place with Amphenol 912 cement.

NOTE - The presence of lacquer thinner may effect the winding inductance, hence, it is well to allow a few minutes for the lacquer thinner to evaporate before making inductance adjustments.

3. Set the signal generator and receiver at 80 mc. and adjust trimmer capacitor C-64 for maximum output. Rock the tuning control back and forth slightly to determine the best adjustment.

4. Ordinarily no adjustment of the secondary winding inductance of transformers T-2 and T-5 is necessary at 50 mc., however, if the sensitivity of the receiver falls off at this end of the range or if new transformers have just been installed it will be necessary to adjust the secondary winding inductance for maximum response at 50 mc. To adjust the secondary inductance it will be necessary to use lacquer thinner as in step 2. to loosen and shift turns until the signal peaks with the receiver dial set at 50 mc. Repeat step 3. above and recheck step 4. again before cementing the coils in place with Amphenol 912 cement.

(e) Band 1. Alignment. - (BAND SWITCH at 1.)

1. Set the signal generator at 45 mc. and tune in its signal on the receiver. If the receiver's calibrated dial reads 45 mc. no adjustment of capacitor C-66 is necessary - if not, adjust capacitor C-66 for maximum response with the receiver dial set at 45 mc.

2. Set the signal generator at 30 mc. and tune in its signal on the receiver. If the receiver dial reads 30 mc. no adjustment of the padder capacitor C-58 is necessary - if not, adjust capacitor C-58 for maximum output with the receiver dial set at 30 mc.

3. Set the signal generator and receiver at 45 mc. and adjust trimmer capacitor C-63 for maximum response. Rock the tuning control back and forth slightly to obtain the best adjustment.

4. Ordinarily no adjustment of the secondary winding inductance of transformers T-1 and T-4 is necessary at 30 mc., however, if the sensitivity of the receiver falls off at this end of the range or if new transformers have just been installed it will be necessary to adjust the secondary winding inductance for maximum response at 30 mc. To adjust the secondary inductance it will be necessary to use lacquer thinner as before to loosen and shift turns until the signal peaks with the receiver dial set at 30 mc. Repeat step 3. above and recheck step 4. again before cementing the coils in place with Amphenol 912 cement.

NOTE - After completing the above alignment procedure check the image frequency to determine whether the oscillator frequency is higher than the signal frequency on band 1. and lower than the signal frequency on bands 2 and 3. For example: Set the receiver dial at 100 mc., set the signal generator frequency at twice the i-f frequency lower than 100 mc. or 89.5 mc. and turn up the signal generator output to about 5000 times the normal alignment output. An image signal should be heard. If not, tune the signal generator to twice the i-f frequency higher than the signal frequency or 110.5 mc. and look for the image there. If the image shows up at 110.5 mc., the receiver's oscillator is operating above the signal frequency on this band and must be readjusted so that it falls below the signal frequency. Due to the construction of this receiver it is considered impossible to adjust the oscillator frequency so that it will fall on the wrong side of the signal frequency on any of the three bands, however, it is always well to check for the image after making any extensive alignment adjustments.

(f) When completely aligned the overall receiver sensitivity will usually run from 2 microvolts at 30 mc. to 10 microvolts at 130 mc. for 50 milliwatts audio output. If your receiver falls reasonably close to this sensitivity, consider your job finished.

4. LOCATING FAULTS WITH A VOLT-OHM METER.

a. Voltage Chart. - Refer to Fig. 5-2. for the tube socket terminal voltages. Voltages shown are those between the terminal and ground (chassis) unless otherwise specified. To identify the tube socket connections, refer to Fig. 7-6. The readings were taken with an RCA Volt-Ohmyist Junior analyzer using 20,000 ohm per volt sensitivity. To prepare the receiver for measurement, disconnect the antenna, connect a jumper between the antenna terminals A_1, A_2 and GND, disconnect the speaker and replace with a 5000-ohm 10-watt resistor across the 5000-ohm output terminals or a 500-ohm 10-watt resistor across the 500-ohm terminals, and set the controls as follows:

SELECTIVITY switch at SHARP

SEND/REC. switch at REC.

A.M./F.M. switch at A.M.

A.V.C., A.N.L., and B.F.O. switches at ON.

R.F. GAIN and A.F. GAIN controls at maximum gain position.

ANTENNA, TONE, TUNING, and PITCH CONTROL adjustments do not effect the readings.

b. Resistance Chart. - Refer to Fig. 5-3. for the tube socket terminal to ground (chassis) resistance measurements.

The readings were taken with an RCA Volt Ohmyst Junior analyzer. To prepare the receiver for measurement, disconnect the a-c line cord and set the controls as follows:

SELECTIVITY switch at SHARP.

SEND/REC. switch at REC.

A.M./F.M. switch at A.M.

A.V.C., A.N.L., and B.F.O. switches at ON.

R.F. GAIN and A.F. GAIN controls at maximum gain position.

TONE control set at BASS BOOST.

ANTENNA, TUNING and PITCH CONTROL adjustments do not effect the readings.

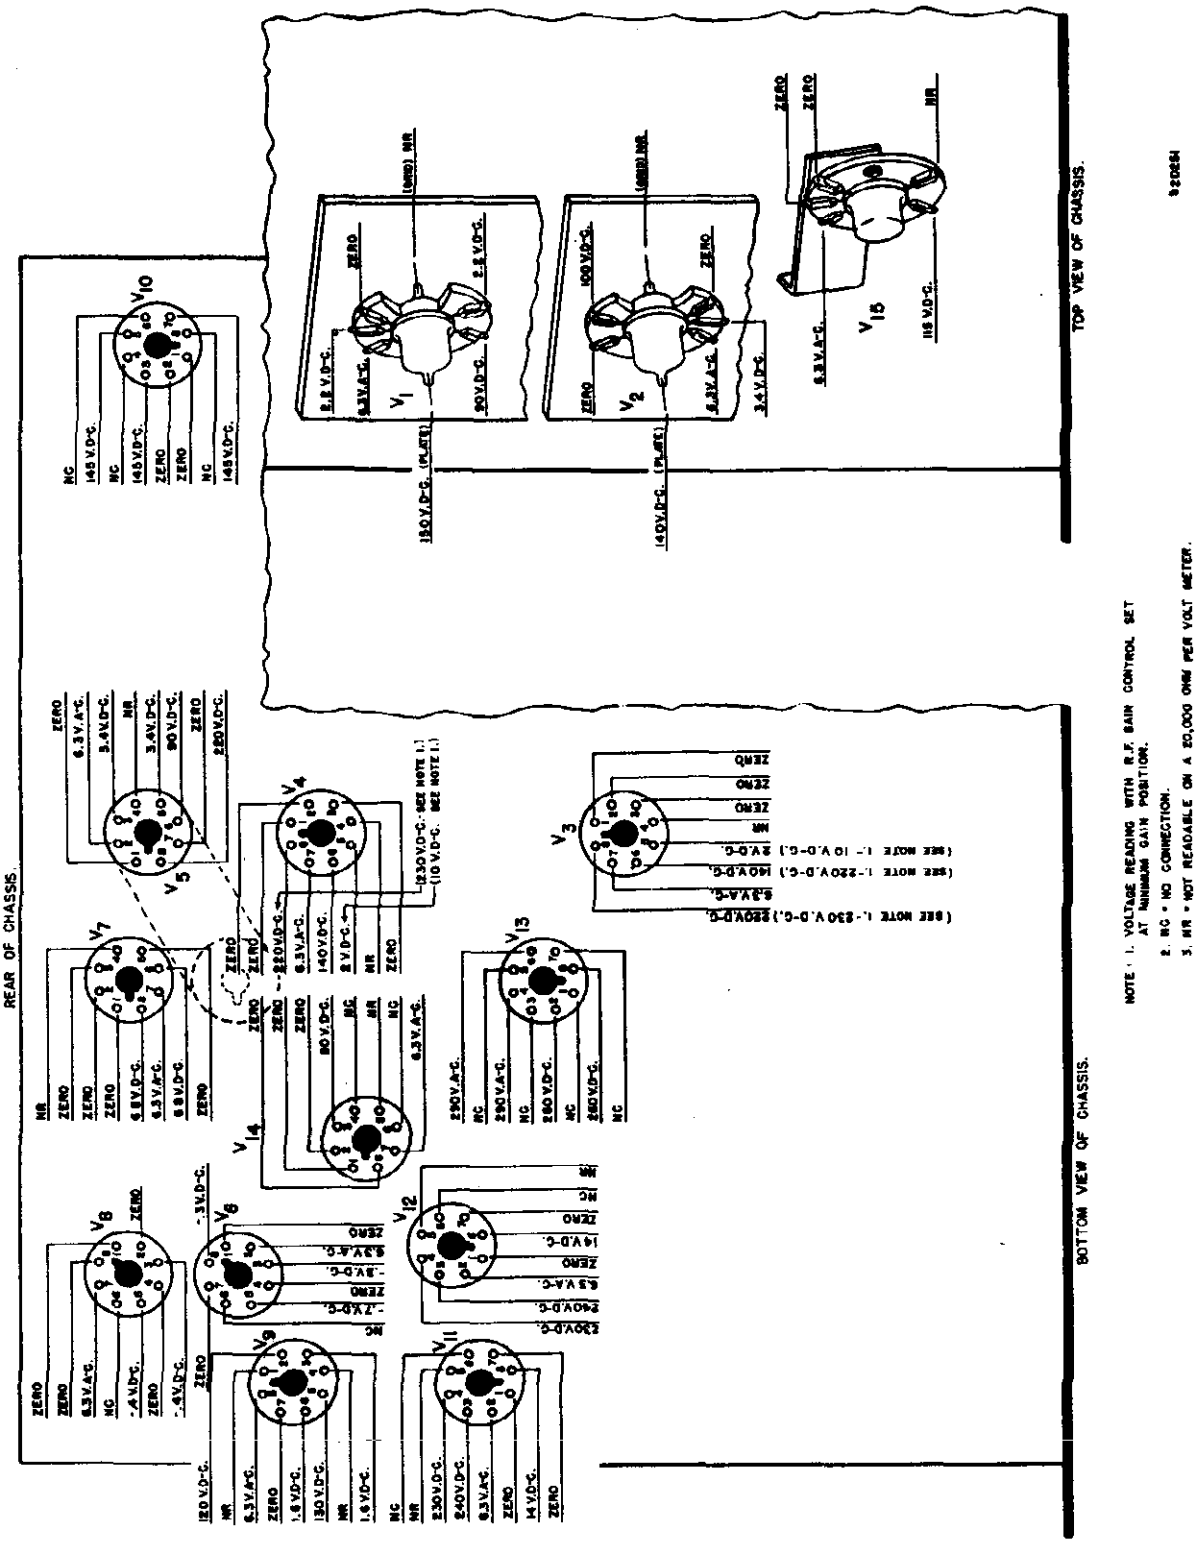

Figure 5-2. Radio Receiver Model S-36A, voltage chart.

MODEL S-56-A

THE HALLICRAFTERS CO.

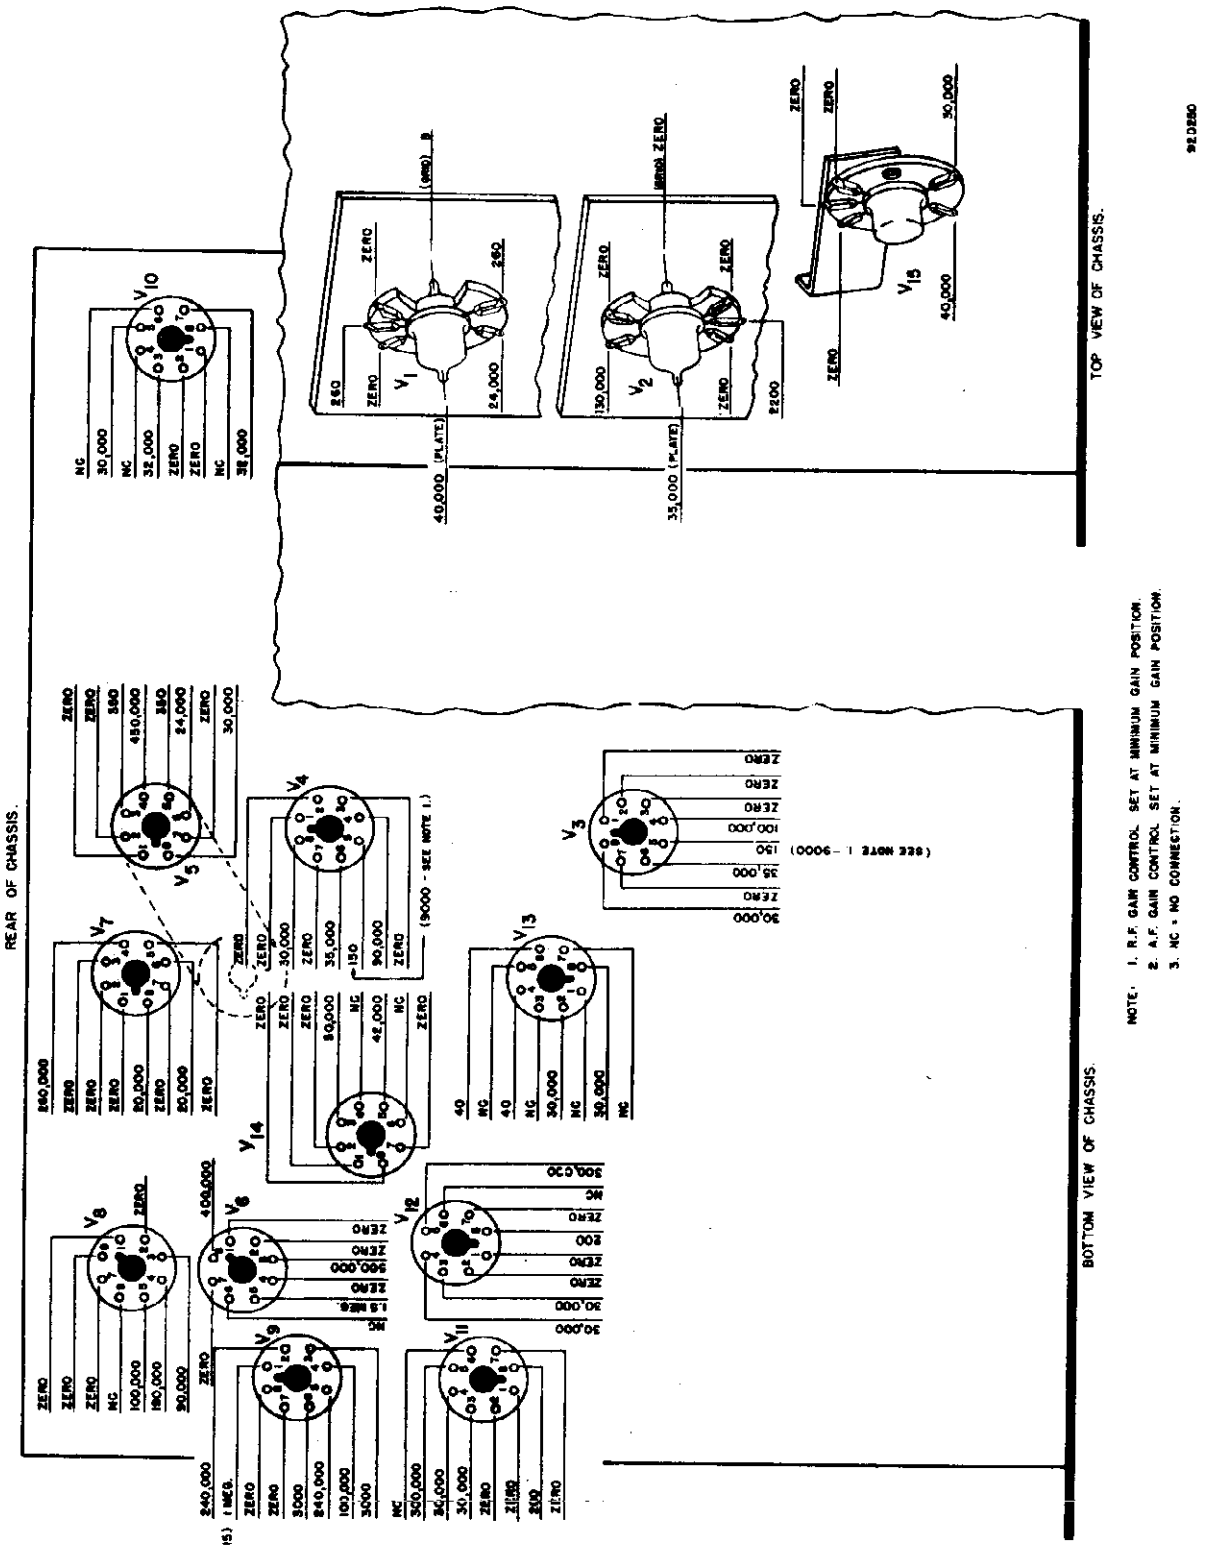

Figure 5-3. Radio Receiver Model S-36A, resistance chart.

c. Checking Transformer and Inductor Windings With an Ohm-meter. -

NOTE - One terminal of each winding measured must be disconnected from the circuit to avoid measuring circuit resistance instead of winding resistance alone as indicated in the chart.

Circuit Symbol	Name of Part	Winding	Winding Terminals	D-C Resistance (ohms)
T-15	TRANSFORMER, audio.	Primary	1 to 3	560
		½ primary	1 to 2/2 to 3	280
		600-ohm secondary	4 to 6	25
		½ 600-ohm secondary	4 to 5/5 to 6	12.5
		5000-ohm secondary	7 to 9	33
		500-ohm secondary	7 to 8	3
T-16	TRANSFORMER, power.	Primary #1	1 to 3	3.5
		Primary #2	2 to 4	3.5
		H.V. secondary	9 to 11	90
		½ H.V. secondary	8 to 10/10 to 11	45
		5.0-volt secondary	7 to 8	Zero
		6.3-volt secondary	5 to 6	Zero
L-6/L-7	Reactor, filter.	12-henry coil	1 to 2	215
		3-henry coil	2 to 3	85

SUPPLEMENTARY DATA

FREQUENCY RANGE.

27.8 mc. - 143 mc. (Covered in three bands).

AUDIO POWER OUTPUT.

Speaker operation - 3 watts with less than 5% distortion (500 or 5000 ohms).
Headset operation - 3 watts with less than 5% distortion (600 ohms).

SENSITIVITY.

At 30 mc. - 2.0 microvolts (For 50 milliwatt audio output).
At 135 mc. - 10.0 microvolts (For 50 milliwatt audio output).
(Signal generator modulated 30% at 400 cycles.)

AUDIO FIDELITY.

Audio response is flat within ± 3 db. from 40 to 10,000 cycles per second.

IMAGE RATIO.

Image ratio exceed 1000:1 at 30 mc., 300:1 at 58 mc.; 100:1 at 80 mc. and 60:1 at 100 mc.

SELECTIVITY.

I-F selectivity measured at the grid of the mixer tube is not less than 10kc. or more than 25 kc. with the SELECTIVITY switch at SHARP and not less than 65 kc. or more than 80 kc. with the SELECTIVITY switch at BROAD. at 6 db. down from resonance.

C_{53}	Capacitor, fixed: mica dielectric; 100 mmfd ± 20%; 500 V. D-C working; case 51/64" lg x 15/32" wd x 7/32" thk.	ASA	CM30A101M
C_{54}	Capacitor, fixed: ceramic dielectric; 200 mmfd ± 10%; 500 V. D-C working; zero temp. coeff; body 1.375" lg x 0.265" dia.	ER	47A026
C_{55}	Same as C_3	-	-
C_{56}	Capacitor, fixed: ceramic dielectric; 50 mmfd ± 2.5 mmfd; 500 V. D-C working; neg. 0.00075 mmfd/mmfd/deg. Cent.; body 7/16" lg x 7/32" dia.	ER type N750K	47A109
C_{57}	Capacitor, fixed: ceramic dielectric; 1000 mmfd ± 20%; 500 V. D-C working; body 11/16" lg x 3/16" dia.	MT type 20K1200	47A132
C_{58}	Capacitor, adjustable: mica dielectric; 400 mmfd ± 10%; bakelite mtg. insulation; 2 solder lug terminals to which are attached #18AWG tinned copper leads 1" long, both leads insulated from the frame; special L shaped mtg. frame 1"x 7/8" x 1"; octagon condenser frame 3/4" diam.	UE type 851A	44A050
C_{59}	Capacitor, fixed: twisted pair of leads to form 1 mmfd capacity.		
C_{60}	Capacitor, variable: air dielectric; min. cap. 3.5 mmfd, max. cap. 23 mmfd; ceramic insulation; 2 mtg. holes with 21/32" mtg. centers; one solder lug terminal (rotor plates); wire slot on stator plates mtg. posts; shaft 29/32" long x ¼" dia.; base 1-7/32" long x 15/16" wide; overall depth 2-3/8".	RC type 22-7	48A064
C_{61}	Same as C_4	-	-
C_{62}	Same as C_8	-	-
C_{63}	Capacitor, adjustable: mica dielectric; min. cap. 3 mmfd, max. cap. 50 mmfd; ceramic insulation; compression type adjustment; unit is 3/4" long x 5/8" wide x 11/16" deep including 2 solder lug terminals.	UE Special	44A049
C_{64}	Capacitor, adjustable: ceramic dielectric; 4 to 20 mmfd; 300 V. D-C working; screw driver adjustment; vertically mounted by a CRS special mtg bracket; same as C_{65}.	H Special	44A101
C_{65}	Same as C_{64}	-	-
C_{66}	Capacitor, adjustable: air dielectric; 1 to 12 mmfd; bakelite insulation; screw driver adjustment; 1-11/64" lg x 0.555" dia. overall excluding solder lug terminals; same as C_{67}.	MN type 22-5230 modified	44A140
C_{67}	Same as C_{66}	-	-
C_{68}	Capacitor, fixed: ceramic dielectric; 100 mmfd ± 3%; 500 V. D-C working; neg. 0.00005 mmfd temp. coeff.; body 3/4" lg x ¼" dia.; same as C_{69}, C_{70}, C_{71}, C_{72}, C_{73}, C_{76}, C_{77}.	ER Special	47A117

	FUSES		
FE_1	Fuse: 3 amperes @250 V.; 4AG; glass enclosed; 1-¼" long x 9/32" dia.; caps nickle plated copper alloy; carries 110% of rated current; vibration factor is 900.	LF type 1093	39A315
	JACKS		
J_1	Jack, phone: switching-one make, one break; steel frame; silver contacts; rubber and bakelite insulation; mounted by 3/8-32 brass bushing ¼" long; frame dimensions 1-19/32" x 27/32" x 3/4"; solder lug contacts; 1" from front of bushing to tip contact.	C type ST-687 modified	36B006
	INDUCTORS		
L_1	Inductor, R-F: 75 turns of #38SCE single layer winding; inductance 18.5 microhenries ± 10%; d-c resistance 4.20 ohms ± 3%; wound on molded bakelite coil form 15/16" long x 5/32" dia., coated with Chinese red lacquer; air core.	SWI type 561	53A008
L_2	Inductor, line filter: 57 turns of #22SCE universal winding; 46 microhenries inductance; winding ¼" ID x 1-1/16" OD x 9/32" lg; air core; coil form 1" lg x ¼" dia., tapped 6-32 at each end for mtg.	H 53A082	53A082
L_3	Same as L_2		
L_4	Inductor, R-F: 42 turns of #28SCE single layer winding; inductance 4.20 microhenries ± 10%; d-c resistance 0.25 ohms ± 70%; wound on molded bakelite coil form 7/8" long x 9/32" dia., coated with Chinese blue lacquer; air core.	SWI type 562	53A009
L_5	Inductor, beat frequency oscillator; 15-7/8 turns of #15/44 D cel. litz single layer winding tapped 3-1/8" turns and 10-7/8 turns from start of winding; coil wound on xx bakelite tube 1-5/8" long x ¼" O.D. x 0.409" I.D.; tuned by adjustable iron core; unit shielded; assembly includes resistor R_{61} and capacitors C_{53}, C_{54}, and C_{59}.	SWI type 3491	54C084

Ref. Symbol	Name of Part and Description	Mfr Code and Type No.	Hallicrafter's Part No.
L_6, L_7	Inductor assembly, filter: 2 section unit; section #1 inductance 2 henries - 10 + 30% @ 150 milliamperes; d-c resistance 85 ohms ± 10%; connected to solder lug terminals #2 and #3 (L_6); section #2 inductance 12 henries - 10 + 20%, @ 90 milliamperes; d-c resistance 215 ohms ± 10%; connected to solder lug terminals #1 and #2 (L_7); each section has a separate iron core; coils and cores located so no mutual coupling exists; hermetically sealed case 3-½" long x 2-9/16" deep x 5-½" high; unit mounts by 4 threaded lugs with 2-5/8" x 1-9/16" mtg. centers; breakdown between core and windings 2000 V. RMS; heat rise under rated load 40 deg. Cent. or less	ST type 16CU23	56C048
	LINE FILTERS		
LF_1	Line filter assembly: consists of inductors L_2 and L_3, and capacitors C_{48}, C_{49}, C_{50} and C_{51}, mounted in drawn aluminum can 4-15/32" high, x 1-3/8" wide x 1-13/16" deep with solder lug terminals and mounted by 4 spade lugs.	SWI type 3492	53A056
	LAMPS		
LM_1	Lamp: bayonet base 6 to 8 volts @ 250 milliamperes; glass bulb; same as LM_2	GE type 44	39A003
LM_2	Same as LM_1	-	-
	METERS		
M_1	Meter, "S" meter: calibrated in "S" units; 100-0-40 microamperes movement; body 2.82" dia. x 1.90" deep; round flush type mtg. plate 3.5 O.D., with 3 mtg. holes 120 degrees apart; includes 2 terminals 4-28-NF2 which project 0.66" from rear of meter.	H Special	88AD97
	PLUGS		
PL_1	Plug and line cord assembly: 2 conductor #18 type S-J all rubber covered cord 6 feet long with a spring type (Allied type 371) molded on plug at one end and stripped and tinned for 5/8" at the other end.	H type 1750	87A125
PL_2	Plug, octal: male, bakelite body 1-¢" O.D. x 7/16" thick; metal contact prongs 7/16" long; supplied with insulated jumpers between contacts 3 and 4, and contacts 6 and 7.	AP type CP-8	35A003
	RESISTORS		
R_1	Resistor, fixed: 270 ohms ± 10%; ½ watt; carbon; insulated; 0.249" O.D. x 0.655" long.	ASA	RC21AE271K
R_2	Resistor, fixed: 1000 ohms ± 10%; ½ watt; carbon; insulated; 0.249" O.D. x 0.655" long; same as R_3, R_6, R_{21}, R_{27}, R_{87}.	ASA	RC21AE102K
R_3	Same as R_2	-	-
R_4	Resistor, fixed: 10,000 ohms ± 20%; 2 watt; carbon; insulated; 0.342" O.D. x 1.78" long.	ASA	RC41AE103M
R_5	Resistor, fixed: 2200 ohms ± 10%; ½ watt; carbon; insulated: 0.249" O.D. x 0.655" long; same as R_{29}, R_{72}.	ASA	RC21AE222K

Ref. Symbol	Name of Part and Description	Mfr Code and Type No.	Hallicrafter's Part No.
R_6	Same as R_2	-	-
R_7	Resistor, fixed: 100,000 ohms ± 10%; ½ watt; carbon; insulated; 0.249" O.D. x 0.655" long; same as R_{33}, R_{40}, R_{41}, R_{61}.	ASA	RC21AE104K
R_8	Not used		
R_9	Resistor, fixed: 10 ohms ± 10%; ½ watt; carbon; insulated; 0.249" O.D. x 0.655" long; same as R_{16}, R_{25}, R_{26}.	ASA	RC21AE100K
R_{10}	Resistor, fixed: 100,000 ohms ± 10%; ½ watt; carbon; insulated; 0.170" diam x 0.400" long.	ASA	RC10AE104K
R_{11}	Resistor, variable: 10,000 ohms ± 20%; #8 reversed taper; shaft 1" long x ¼" dia.; 3 solder lug terminals with the variable contact located in the center and the fixed contacts 1-7/16" apart; no taps; includes a toggle action switch (SW_3) on rear which closes the circuit when the control is turned to the extreme right (clockwise).	CT type 135	28C058G
R_{12}	Resistor, fixed: 120 ohms ± 10%; ½ watt; carbon; insulated; 0.249" O.D. x 0.468" long.	ASA	RC20AE121K
R_{13}	Resistor, fixed: 120 ohms ± 10%; ½ watt; carbon; insulated; 0.249" O.D. x 0.655" long; same as R_{20}.	ASA	RC21AE121K
R_{14}	Resistor, fixed: 39,000 ohms ± 10%; ½ watt, carbon; insulated; 0.249" O.D. x 0.655" long.	ASA	RC21AE393K
R_{15}	Resistor, fixed: 330 ohms ± 10%; ½ watt; carbon; insulated; 0.249" O.D. x 0.655" long; same as R_{22}, R_{35}, R_{62}.	ASA	RC21AE331K

	SOCKETS		
SO_1	Socket, octal: female; high dielectric mica filled bakelite body 1-7/64" dia. x 31/64" thick; silver plated phosphor bronze solder lugs; molded on steel mtg. plate 1-9/32" wide x 0.031 thick having 2 mtg. holes of 5/32" dia. x 1-½" mtg. centers; pins are numbered on back of socket clockwise from locating pin.	AP type MIPSTH	6AB00
	SWITCHES		
SW_1	Switch, rotary selector: 3 position single pole, 7 section; non-shorting type contacts; ceramic wafers oval shaped 1-7/8" x 1-5/8" x 5/32" thick; 2 holes 0.144" dia. x 1-9/16" mtg. centers mount wafers individually; entire shaft 11-3/4" long x 0.249" dia. squared on opposite sides to 0.185" dia., with index plate 1-7/8" x 1-3/8" x 0.038" thick and having two 0.1875" stainless steel balls; 3 stops, each 60 degrees apart and position 1 symetrical to mtg. holes; minimum torque not less than 70 inch ounces.	OH type HC	60B181
SW_2	Switch, toggle: SPST; rated 3 amperes @ 250 V.; case 1" long threaded 15/32-32; solder lug contacts; same as SW_4, SW_5.	CH type 8280	60A178
SW_3	Switch, toggle action; SPST; part of resistor R_{58}	-	-
SW_4	Same as SW_2	-	-
SW_5	Same as SW_2	-	-
SW_6	Switch, toggle: DPST; rated 3 amperes @ 250 V.; case 1-3/32" long x 17/32" wide x 9/16" deep; mounted by bushing 15/32" long threaded 15/32-32; solder lug contact	CH type 9360 EX	60A183

Ref. Symbol	Name of Part and Description	Mfr Code and Type No.	Hallicrafter's Part No.
SW_{7A} SW_{7B} SW_{7C} SW_{7D} SW_{7E}	Switch, rotary selector: 3 section 3 position; 2 shields separate section #1 from rest of the assembly; a single pole A-C power switch is included at rear and is open at position #1, and closed in positions #2 and #3; all metal parts silver plated brass except for stainless steel index spring and ball; vacuum wax impregnated phenolic wafers; shorting type rotor contacts; frame 11" long including special mtg. bracket at rear of assembly; front of assembly mounts by 3/8-32 bushing $\frac{1}{2}$" long, shaft 1" long x $\frac{1}{4}$" dia.	CM type H	60B178
SW_{8A} SW_{8B} SW_{8C} SW_{8D}	Switch, rotary selector: single section 2 position; all metal parts silver plated brass except for stainless steel index spring and ball; vacuum wax impregnated phenolic wafer; non shorting teeth at contacts 5 and 9; frame 5/16" long, mounts by 3/8-32 bushing $\frac{1}{2}$" long; shaft 1" long x $\frac{1}{4}$" dia.	CM type QH	60A177
SW_9	Switch, rotary selector; 3 circuit; single section 4 position; metal parts brass, fungacide treated bakelite wafer; shorting type contacts; 1-3/8" lg x 1-7/16" wd x 1-5/8" h overall; shaft $\frac{1}{2}$" lg x $\frac{1}{4}$" dia.; mtg by 3/8-32 x $\frac{1}{2}$" lg brass bushing.	CM Special	60B212
SW_{10}	Switch, toggle, DPDT, rated 3 amperes @ 250 V., 1-3/4" long x 21/32" wide x 5/8" deep, mounted by bushing 13/32" long threaded 16/32-32, solder lug contacts.	HH	60A090

TRANSFORMERS

Ref. Symbol	Name of Part and Description	Mfr Code and Type No.	Hallicrafter's Part No.
T_1	Transformer, R-F: 27.8 to 47 megacycles; one primary and one secondary winding; primary 1-$\frac{1}{2}$ turns of #30SCE single layer winding with a Q of 85 at 44 megacycles with 95.8 micro-microfarads; secondary 5 turns of #22 D cel. single layer winding with a Q of 163 at 26 megacycles with 83.5 micro-microfarads; air cores; coils wound on a 3" bakelite tube 1-5/8" long x $\frac{1}{2}$" O.D. x 3/8" I.D.; solder lug terminals.	SWI type 651	51A265
T_2	Transformer, R-F: 46 to 82 megacycles; one primary and one secondary winding; primary 1-$\frac{1}{2}$ turns of #30SCE single layer winding with a Q of 67 at 45 megacycles with 105 micro-microfarads; secondary 1-7/8 turns of #18 D cel. braid single layer winding with a Q of 158 at 45 megacycles with 90 micro-microfarads; air cores; coils wound on a bakelite tube 1-5 8" long x $\frac{1}{2}$" O.D. x 3 8" I.D., solder lug terminals.	SWI type 654	51A268
T_3	Transformer, R-F: 82 to 143 megacycles; one primary and one secondary winding; primary 3-$\frac{1}{2}$ turns of #28 braided cel. single layer winding; secondary 1-$\frac{1}{2}$ turns of #14 solid copper single layer winding; air cores; coils wound on a solid form 3 4" long x $\frac{1}{4}$" dia.; extended coil winding leads for terminals.	SWI type 657	51A782
T_4	Transformer, R-F: 27.8 to 47 megacycles; one primary and one secondary winding; primary 28-$\frac{1}{2}$ turns of #34SCE single layer winding; secondary 6 turns of #22 D cel. braid; air cores; coils wound on a bakelite tube 1-5 8" long x $\frac{1}{4}$" O.D. x 3/8" I.D.; solder lug terminals.	SWI type 652	51H790
T_5	Transformer, R-F: 46 to 82 megacycles; one primary and one secondary winding; primary 11-$\frac{1}{2}$ turns of #34SCE single layer winding (wound counter-clockwise), secondar: 2-$\frac{1}{2}$ turns of #22 D cel. braid single layer winding (wound clockwise); air cores; coils wound on a bakelite tube 1-5/8" long x $\frac{1}{2}$" O.D. x 3/8" I.D.; solder lug terminals.	SWI type 655	51B794
T_6	Transformer, R-F: 82 to 143 megacycles; one secondary winding; primary 2-3/4 turns of #36SCE single layer winding; secondary 3/4 turns of #14 solid copper single layer winding; air cores; coils are wound on a solid bakelite form 7/8" long x $\frac{1}{2}$" dia.; extended coil winding leads for terminals.	SWI type 658	51A776
T_7	Transformer, R-F: 27.8 to 47 megacycles; one primary and two secondary windings; primary 1-3/4 turns of #34SCE; first secondary 4-1/8 turns of #22 D cel. braid; second secondary 2-$\frac{1}{2}$ turns of #30SCE; air cores; coils are wound on a bakelite tube 1-5/8" long x $\frac{1}{2}$" O.D.; solder lug terminals.	SWI type 653	51A267
T_8	Transformer, R-F: 46 to 82 megacycles; one primary and two secondary windings; primary 3/4 turn of #30S cel. braid; first secondary 2-$\frac{1}{2}$ turns of #18D cel. braid; second secondary $\frac{1}{2}$ turn of #28D cel. braid; air cores; coils are wound on a bakelite tube 1-5/8" long x $\frac{1}{2}$" O.D.; solder lug terminals.	SWI type 656	51A270
T_9	Transformer, R-F: 82 to 143 megacycles; one primary and two secondary windings; primary $\frac{1}{2}$ turn of #28 plain enamel; first secondary 1 turn of #14 bare copper wire; second secondary 1-$\frac{1}{2}$ turns of #28S cel. braid; air core; coils are wound on xx bakelite tube 1-5/8" long x 3/8" dia.; one solder lug and extended coil winding leads provide terminals.	SWI type 659	51B778
T_{10}	Transformer, intermediate-frequency: 5.25 megacycles; one primary and three secondary windings; primary 1½ turns single layer winding on adjustable polyiron core assembly; first secondary 1½ turns single layer winding on same form as primary; second secondary 21½ turns single layer winding on adjustable polyiron core assembly; third secondary 2½ turns wound on same form as second secondary; fixed trimmer capacitors (C_{9A}) and (C_{9B}), a fixed resistor (R_{10}) and a fixed capacitor (C_{12}) complete the assembly; aluminum shield can 4" high x 1-7 8" long x 1-7 16" wide with 4 spade lugs centered one on each side of shield; solder lug terminals at base numbered 1 thru 8 and a 7" insulated stranded wire lead brought out through a hole in the side of the shield provide connections.	EW Special	50C140
T_{11}	Transformer, intermediate-frequency: 5.25 megacycles; one primary and three secondary windings; primary 15½ turns single layer winding on adjustable polyiron core assembly; first secondary 1½ turn winding on same form as primary; second secondary 20 turns single layer winding on adjustable polyiron core assembly; third secondary 2½ turn winding on same form as second secondary; fixed trimmer capacitors (C_{7C}) and (C_{7A}), a fixed resistor (R_{19}) and a fixed capacitor (C_{16}) complete the assembly; aluminum shield can 4" high x 1-7 8" long x 1-7 16" wide with 4 spade lugs centered one on each side of shield mounted 9 32" from base; solder lug terminals at the base numbered 1 thru 8 provide connections.	EW Special	50C141

Ref. Symbol	Name of Part and Description	Mfr Code and Type No.	Hallicrafter's Part No.
T_{12}	Transformer, intermediate-frequency: 5.25 megacycles; one primary and three secondary windings; primary 106 turns single layer winding on adjustable polyiron core assembly; first secondary 1½ turn winding on same form as primary; second secondary 20½ turns single layer winding on adjustable polyiron core assembly; third secondary 2½ turn winding on same form as second secondary; fixed trimmer capacitors (C_{72}) and (C_{73}), complete the assembly; aluminum shield can 4" high x 1-7/8" long x 1-7/16" wide with 4 spade lugs centered one on each side of shield mounted @ 32" from base; solder lug terminals at base numbered 1 thru 8 provide connections.	EW Special	50C142
T_{13}	Transformer, intermediate-frequency: 5.25 megacycles; one primary and one secondary winding; primary 31½ turns single layer winding on adjustable polyiron core assembly; secondary 31½ turns single layer winding on adjustable polyiron core assembly; fixed trimmer capacitors (C_{76} and C_{77}) complete the assembly; aluminum shield can 4" high x 1-7/8" long x 1-7/16" wide with 4 spade lugs centered one on each side of shield mounted @ 32" from base; solder lug terminals at base numbered 1 thru 8 provide connections.	EW Special	50C143
T_{14}	Transformer, discriminator: 5.25 megacycles; one primary and one secondary winding; primary 33 turns single layer winding on adjustable polyiron core assembly; secondary 35 turns center tapped single layer winding on polyiron core assembly; fixed trimmer capacitors (C_{74} and C_{75}), and a fixed coupling capacitor (C_{29}) complete the assembly; aluminum shield can 4" high x 1-7/8" long x 1-7/16" wide with 4 spade lugs centered one on each side of shield mounted @ 32" from base; solder lug terminals at base numbered 1 thru 8 provide connections.	EW Special	50C144
T_{15}	Transformer, A-F: one primary and 2 secondary windings; primary to match a 12,000-ohm push-pull load @ 35 ma. for each tube; first secondary to match a load of 600 ohms, center tapped; second secondary to match a load of 5000 ohms; iron core; case hermetically sealed; vacuum impregnated; coil and core assemblies bolted to brackets spot welded to case, solder lugs terminals marked 1 through 8 at base of transformer, 4 mtg. lugs at base with 3-1 16" x 1-11/16" mtg. centers; breakdown between windings and core 1000 R.M.S. volts.	ST type 10A40	55C052
T_{16}	Transformer, power: primary, 2 section winding connected in parallel for 115 V. A-C, and connected in series for 230 V. A-C operation, 50/60 cycles, single phase; first secondary center tapped to provide 270 V. D-C @ 150 milliamperes across 10 mfd. capacitor and a 2 henry 65 ohm choke with a 5U4G rectifier tube; second secondary 6.4 V. A-C @ 4 amperes; third secondary 5 V. A-C @ 3 amperes; hermetically sealed case 4-15/16" long x 3-3/4" deep x 5-5/16" high spot welded at all joints; coil and core assemblies bolted to brackets spot welded to case; vacuum impregnated; mounted by 4 lugs at base with 3-5/8" x 2-3 8" mtg. centers; 4 terminals threaded 8-32 MC-2 connected to primary as follows: 1 and 3 to one section of primary, 2 and 4 to other section of primary; 7 solder lug terminals connected as follows; 5 and 6 connect to secondary #2 (6.4 V. A-C), 7 and 8 connect to secondary #3 (5 V. A-C), 9 and 11 connect to secondary #1 (540 V. A-C), 10 is center tap for secondary #1 and ground for transformer case and core, iron core; breakdown voltages as follows between windings and core and case; primary - 1500 V. RMS, secondary #1-2500 V. RMS, secondary #2-1500 V. RMS, secondary #3-2500 V. RMS.	ST type 10P51	52C084

1. GENERAL

Figure 4-1. shows, in very simple block form, the plan of the circuit of the Model S-37 receiver. Note that the circuit is that of the conventional superheterodyne receiver up to the second-i-f amplifier stage. The output of the 2nd i-f amplifier is fed to two channels, namely, the F-M signal channel and the A-M signal channel. The F-M channel consists of the f-m limiter and discriminator and the A-M channel consists of an additional i-f amplifier stage and second detector stage. The demodulated signal from both channels then feeds the same audio amplifier being selected by the AM/FM switch.

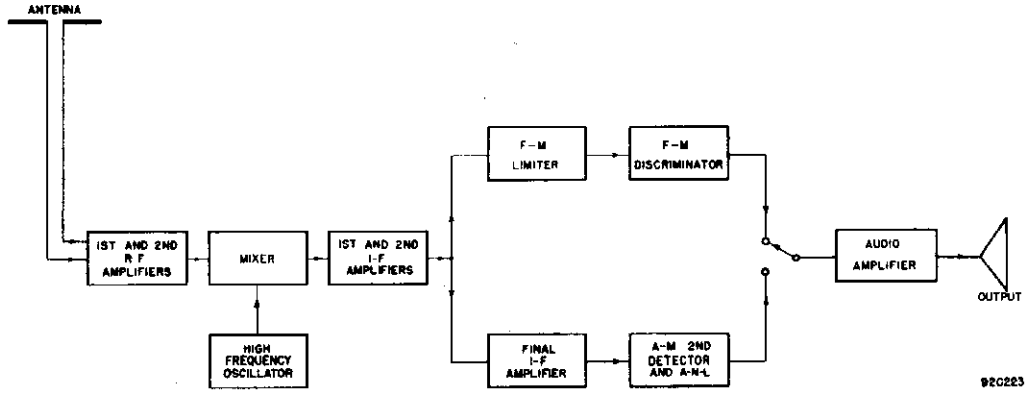

Fig. 4-1. Radio Receiver Model S-37, block diagram

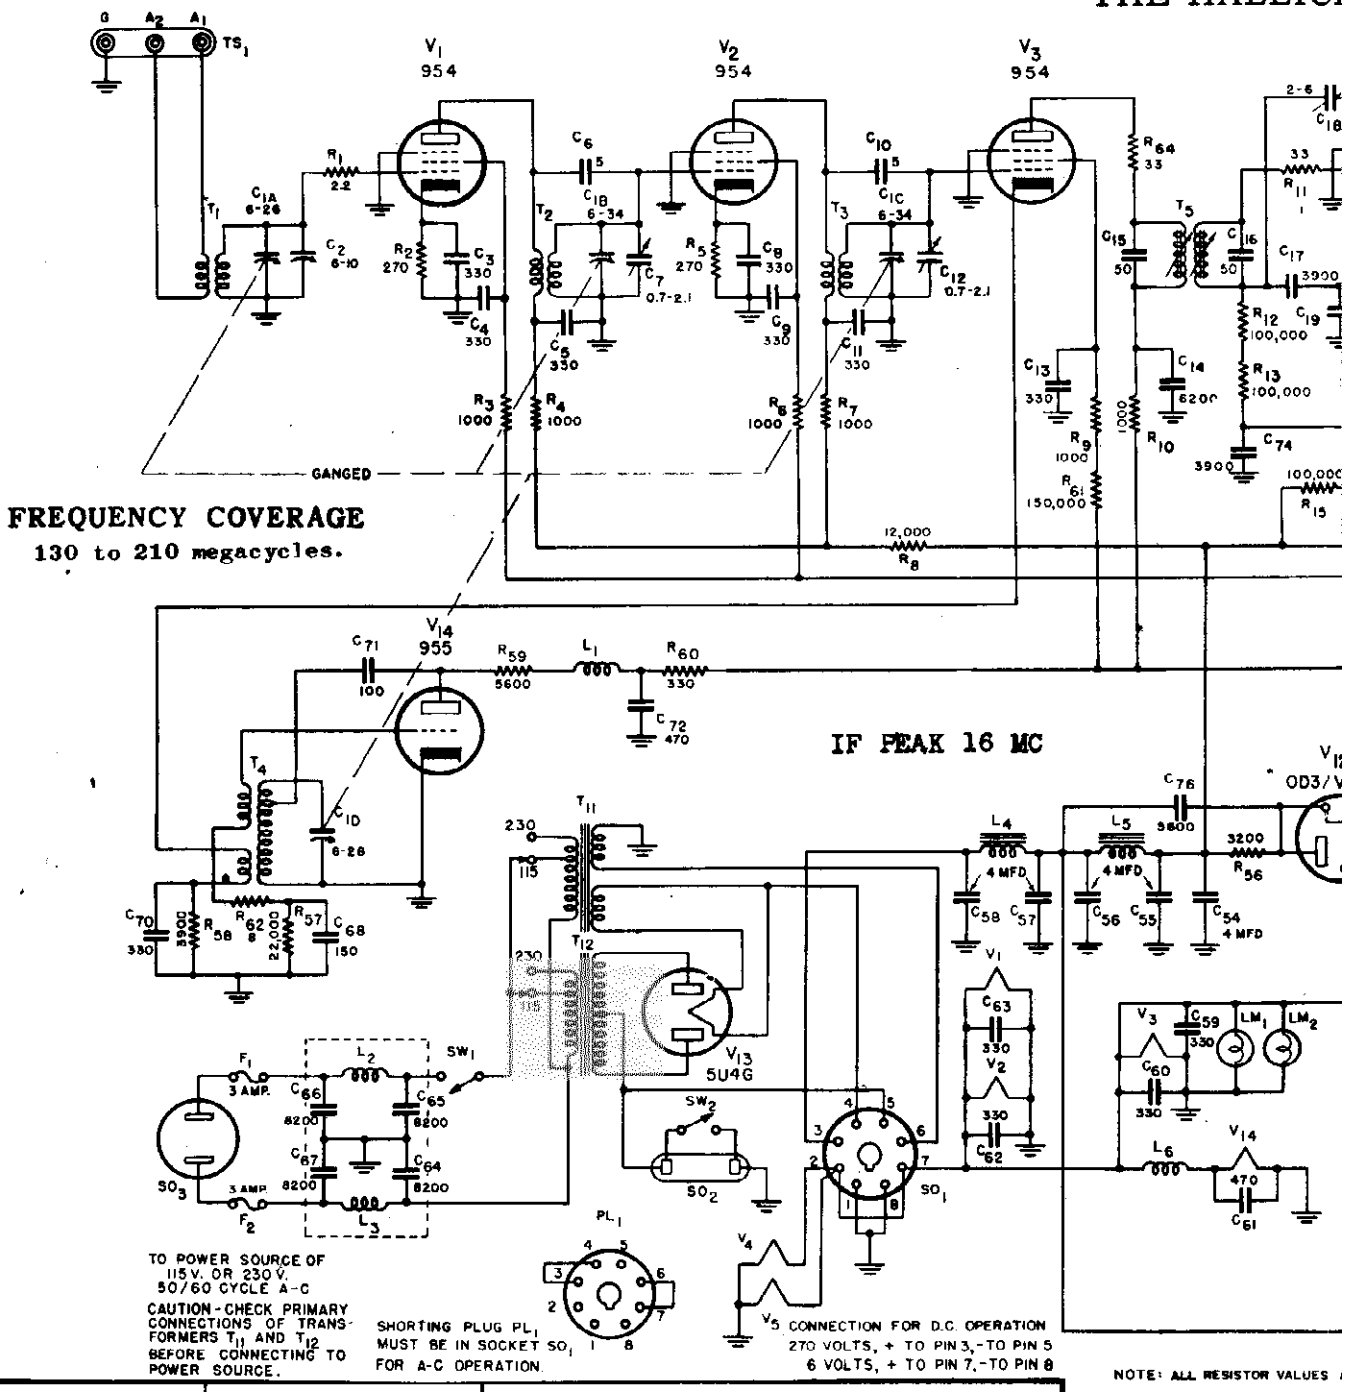
2. DETAILED FUNCTIONING BY STAGES. (Refer to Fig. 7-7.)

a. R-F Amplifier. - The two r-f amplifier stages employ type 954 acorn pentode tubes in a conventional two stage amplifier circuit. Signals present at the antenna are fed to the primary of transformer T-1 through terminals A_1 and A_2 of antenna terminal strip TS-1. The secondary is tuned by the ganged tuning capacitor section C-1A and trimmer C-2. Trimmer capacitor C-2 is controlled from the front panel by the control marked ANTENNA to provide accurate alignment of the r-f stage with varying antenna load impedances. R-F signals selected by the parallel resonant circuit are applied to the grid of tube V-1 and appear in greater amplitude across the primary of transformer T-2. Parasitic resistor R-1 prevents unwanted oscillations in this stage and tends to stabilize the amplifier. Resistor R-2 by-passed by capacitor C-3, provides self-bias for the stage. Resistors R-3 and R-4 and capacitors C-4 and C-5 act as decoupling networks for the screen and plate circuit of tube V-1. The signal across the primary of transformer T-2 is coupled to the grid of tube V-2 inductively by transformer T-2 and capacitively by capacitor C-6. Capacitor C-6 provides a small amount of coupling to improve response at the high-frequency end of the band, thus equalizing the r-f signal amplitude over the tunable frequency range. The secondary of transformer T-2 is tuned by section C-1B of the ganged tuning capacitor and trimmer C-7. R-F signals applied to the grid of tube V-2 by the secondary winding of transformer T-2, appear at the primary of transformer T-3 in greater amplitude as a result of the amplifying action of tube V-2. Resistor R-5 by-passed by capacitor C-8 provides self-bias for the stage. Resistors R-6 and R-7 and capacitors C-9 and C-11 act as decoupling networks for the screen and plate circuit of tube V-2. The signal developed at the primary winding of transformer T-3 then feeds the mixer stage of the receiver.

b. Mixer. - The mixer stage employs a type 954 acorn pentode in a cathode coupled mixer circuit. The signal across the primary of transformer T-3 is coupled to the grid of tube V-3 inductively by trasnformer T-3 and capacitively by capacitor C-10. Capacitor C-10 provides a small amount of coupling to improve response at the high-frequency end of the band, thus equalizing the r-f signal amplitude over the tunable frequency range. The secondary of transformer T-3 is tuned by section T-1D of the ganged tuning capacitor and trimmer C-12. R-F signals selected by the parallel resonant circuit are applied to the grid of the mixer tube V-3. A signal from the local oscillator 16 megacycles lower in frequency than the receiver tuning frequency, is fed to the mixer tube through the cathode and provides the difference frequency of 16 mc. for the i-f stages.

c. Oscillator. - The oscillator circuit consists of a type 955 acorn triode in a tuned-plate untuned-grid type of oscillator circuit. The frequency of oscillation is determined by a resonant circuit which consists of the secondary of transformer T-4 and section C-1D of the main tuning gang connected in parallel. The r-f energy is



Symbol	Tube Type	Function
V-1	954	1st r-f amplifier
V-2	954	2nd r-f amplifier
V-3	954	Mixer
V-4	6AC7	1st i-f amplifier
V-5	6AB7	2nd i-f amplifier
V-6	6SK7	3rd i-f amplifier
V-7	6H6	A-M detector and noise limiter
V-8	6AC7	F-M limiter
V-9	6H6	F-M discriminator
V-10	6SL7GT	Audio voltage amplifier
V-11	6V6GT/G	Audio power amplifier
V-12	OD3/VR-150	Voltage regulator
V-13	5U4G	Rectifier
V-14	955	High-frequency oscillator

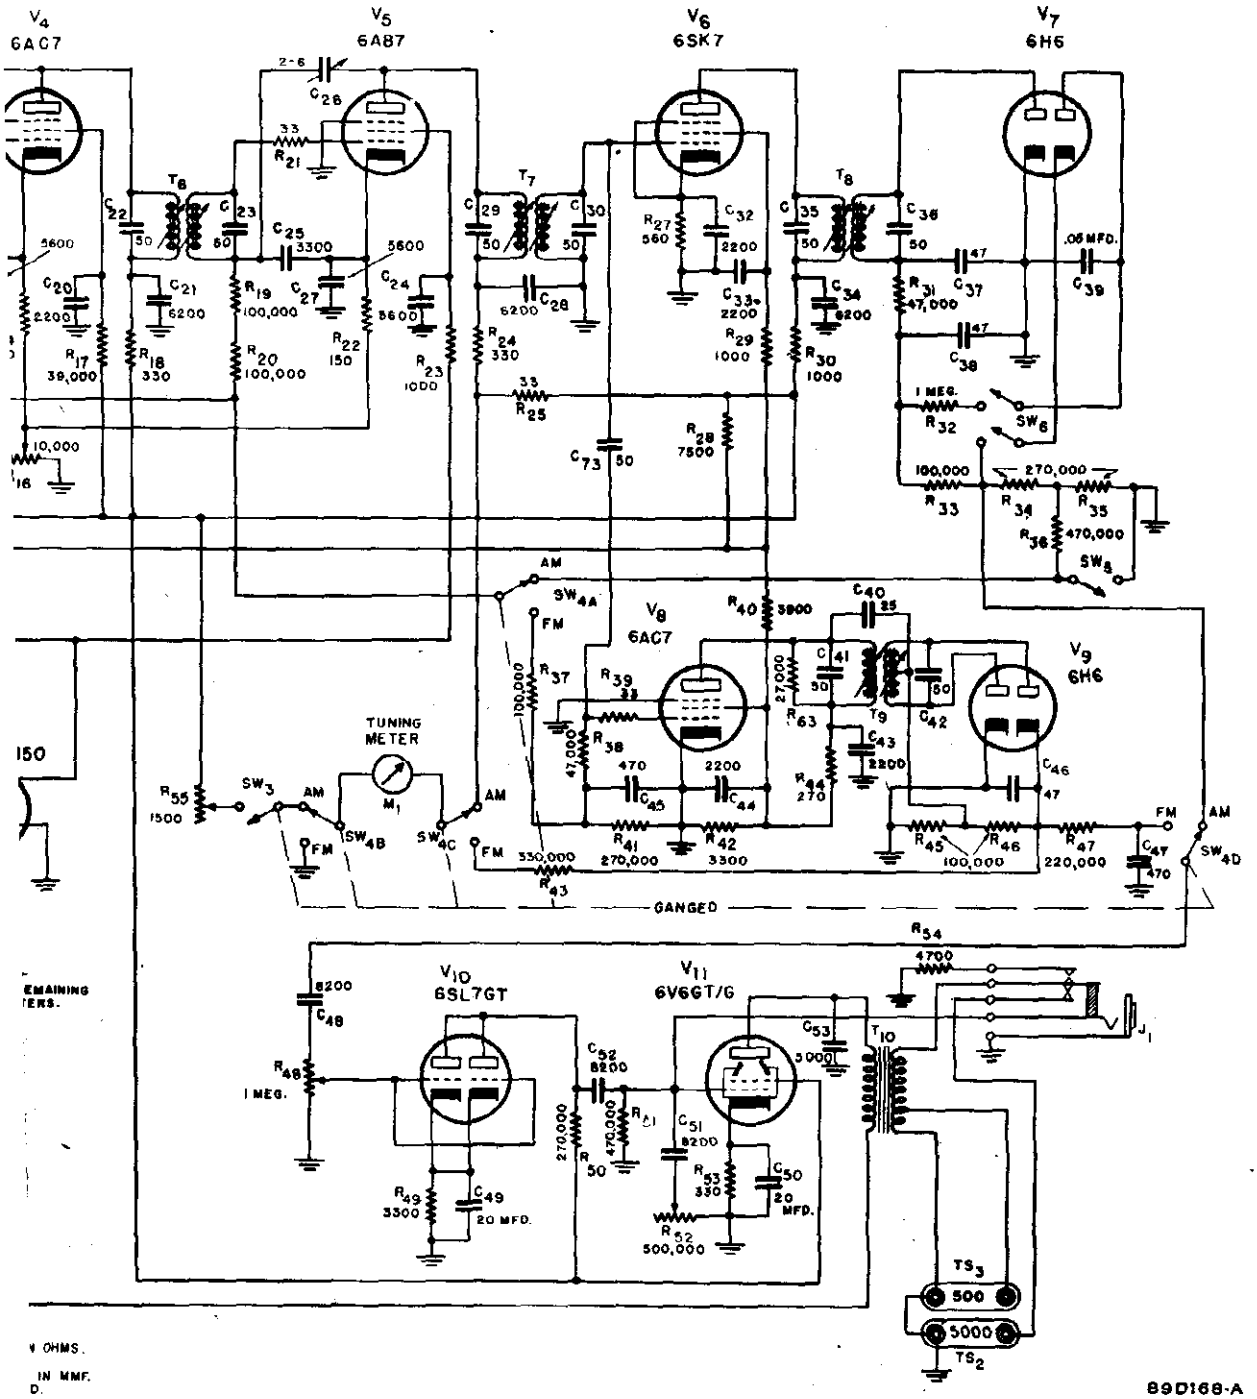


Figure 7-7. Radio Receiver Model S-37, schematic wiring diagram.

A-C Operation	* D-C Operation
e Voltage.....117 volts, 230 volts.	Filament voltage..... 6.3 volts.
e Current.....1.0 amp, 0.5 amp.	Filament current..... 3.6 amps.
er Consumption..110 watts.	"B" voltage..... 270 volts.
	"B" current..... 125 ma.

* The 6-volt battery drain using a vibrator type supply for "B" voltage will run approximately 18-20 amperes.

fed from the plate of tube V-14 to the tuned circuit by the d-c blocking capacitor C-71. The decoupling network in the plate circuit of the oscillator tube consists of R-59, L-1, C-72, and R-60. Resistor R-62 and R-57 by-passed by capacitor C-68 are connected in series with the feedback winding of transformer T-4 to provide equal oscillator voltage to the mixer stage over the entire tuning range. The mixer voltage is further compensated by the network R-58 and C-70, connected in series with the winding feeding the cathode of the mixer tube.

d. First and 2nd I-F Amplifier. - The 1st and 2nd i-f amplifier stages employ type 6AC7 and 6AB7 pentodes respectively. The i-f amplifier coupling transformers T-5, T-6 and T-7 for these two stages are tuned to 16 mc. by adjusting the powdered iron core slugs in both primary and secondary windings. Each stage is neutralized by capacitors C-18 for tube V-4 and C-26 for tube V-5, to provide stable amplification at this relatively high intermediate frequency. The gain of the 1st and 2nd i-f amplifier stages is varied by the R.F. GAIN control (R-16), connected in series with the cathodes of both tubes, to provide sensitivity control for the receiver instead of the usual practice of varying the gain of the r-f amplifier stages. This method of control permits the r-f amplifier stages to operate at maximum gain, thereby providing a high signal to noise ratio at all sensitivity settings. The a-v-c grid voltage is applied to this section of the receiver through the decoupling networks C-17, R-12, R-13, C-74, and R-19, R-20 and C-25. The a-v-c- voltage is supplied by the 2nd detector during a-m reception and a small amount of voltage is also supplied, for a similar purpose, from the limiter tube (V-8) during f-m reception.

e. Final I-F Amplifier. - The last i-f amplifier, used for a-m reception, employs a type 6SK7 pentode connected in a conventional circuit. The stage is coupled by transformers T-7 and T-8 which are tuned by adjustable iron core slugs. Resistor R-27 by-passed by capacitor C-32 provides self-bias for the stage. The gain of this stage is not varied as was the case for the 1st and 2nd i-f amplifier stages. The amplified voltage developed across the secondary of transformer T-8 is then fed to the 2nd detector for demodulation of a-m signals.

f. A-M 2nd. Detector and A-N-L. - Both the second detector and automatic noise limiter stages employ a single type 6H6 duo-diode. One diode section of tube V-7 serves as detector for amplitude modulated signals by rectifying the modulated carrier. The r-f filter for this type of detection consists of resistor R-31, and capacitors C-37 and C-38 connected in a pi-section. Automatic volume control voltage and audio frequency voltage is obtained from the load and voltage divider resistors R-33, R-34, R-35. Resistor R-36 serves as a-v-c decoupling. The remaining diode section of tube V-7 serves as automatic noise limiter as follows: Capacitor C-39 becomes charged by the rectified carrier voltage and the time constant of this capacitor and the filter network associated with it is such, that the audio frequency voltage variations do not alter this charge. During a severe noise pulse, however, the cathode of the diode plate connected to capacitor C-39 becomes more negative than the charge held by C-39, hence, current flows shorting the audio voltage to ground through capacitor C-39 until the cathode voltage of the a-n-l diode again reaches a less negative potential than its plate and capacitor C-39 acquires its normal charge again. By shorting the audio voltage to ground during a noise pulse, the a-n-l circuit prevents the objectional noise pulses from reaching the audio amplifier stages.

g. F-M Limiter and Discriminator. - The frequency modulation detector consists of a limiter stage and a discriminator stage. The type 6AC7 limiter tube (V-8) is fed by the second i-f transformer secondary winding along with the third i-f amplifier tube V-6 for a-m reception. The limiter stage operates as a saturated amplifier in which the output remains constant over a large range of input voltage levels, thus eliminating variations in the amplitude of the carrier signal to be demodulated by the discriminator. When operating as an f-m receiver, automatic volume control action is obtained by applying a part of the voltage developed across resistor R-41 in the grid return of the limiter tube (V-8), to the control grids of the 1st and 2nd i-f amplifier tubes (V-4 and V-5) through section SW-4A of the F.M./A.M. switch. The constant level signal out of the limiter tube (V-8) is fed to the discriminator tube (V-9) through the discriminator transformer (T-14) and coupling capacitor C-40. The discriminator circuit, consisting of transformer T-9, tube V-9 and load resistors R-45 and R-46, converts the frequency variations of the f-m signal into amplitude variations or the audio signals. The de-emphasis network, consisting of resistor R-47 and capacitor C-47, attentuates the high frequency end of the audio range since these frequencies are emphasized at the f-m transmitter. From the de-emphasis network the audio signal is fed to the A.F. GAIN control (R-48) in the same way as the signal from the amplitude modulation detector tube (V-7).

h. Audio Amplifier. - The audio amplifier consists of a conventional high-mu triode class A voltage amplifier driving a single beam power amplifier also operating class A.

(1) Voltage Amplifier. - The voltage amplifier stage employs a type 6SL7GT twin-triode tube with its elements connected in parallel. Self bias voltage obtained from resistor R-49 by-passed by capacitor C-49 provides grid bias voltage for class A operation. The stage operates into its plate load resistor R-50 from which grid voltage for the beam power stage is obtained as well as audio voltage for headset operation. Capacitor C-52 isolates the d-c plate voltage from the headset and beam power amplifier grid.

(2) Power Amplifier. - The power amplifier employs a type 6V6GT/G beam-power amplifier in a resistance capacity coupled single ended class A amplifier circuit. Grid bias is obtained from cathode resistor R-53 which is by-passed by capacitor C-50. The output of tube V-11 is coupled to the speaker load by transformer T-10 which provides proper matching for 5000 and 500 ohm loads. When the headset is plugged into the circuit, resistor R-54 is automatically connected across the 5000 - ohm winding to maintain proper load impedance for the beam power stage. If a speaker is connected to the 5000 ohm outlet, it will be automatically disabled when the headset is plugged in. The frequency response of the power amplifier stage is controlled by variable resistor R-52 and capacitor C-51 connected in series from the grid of tube V-11 to ground. As the resistance of R-52 is lowered, the higher audio frequencies are attenuated producing a bass boost effect in the output.

i. Tuning Meter. - The tuning meter is switched between two circuits depending upon the type of reception:

(1) A-M Reception. - When metering reception of a-m signals the tuning meter measures the plate current of the 2nd i-f amplifier stage which varies as the strength of the signal carrier. Resistor R-55 sets the zero (no signal) position by adjusting the plate current of tube V-5. A carrier then drives the plate current of tube V-5 to a lower value depending upon the signal strength. The screen grid voltage of tube V-5 is regulated by the voltage regulator tube to provide accurate control over the plate current.

(2) F-M Reception. - When metering reception of f-m signals the tuning meter measures the unbalanced current in resistors R-45 and R-46 obtained when the receiver is tuned to one side of the f-m carrier. When the receiver is tuned to the exact center of the f-m carrier the meter rests at zero indicating that the currents in the discriminator load resistors are equal. Resistor R-43 functions to limit the maximum current in the meter circuit to a safe value.

j. Power Supply. - The receiver has provisions for operation from either an a-c or d-c source.

(1) A-C Operation. - The internal power supply provides for operation from 115 or 230-volt a-c mains. The a-c current is fed through a line filter which is a low pass pi-section network connected in each side of the line. The networks consist of inductances L-2 and L-3 and capacitors C-64, C-65, C-66 and C-67. The line filter attentuates all the objectionable noise components coming into the receiver circuit through the a-c power source. The filament and high voltage supply transformers are separate units, each provided with a tapped primary for 115- or 230-volts operation. The taps must be wired accordingly each time the line potential is changed. A type 5U4G (tube V-13) full-wave rectifier is employed in a conventional rectifier circuit. The high voltage from this rectifier is fed to the filter network through the "Shorting Plug" on the rear apron of the receiver chassis as is the filament current for the heaters of the tubes. The SEND-REC. switch is connected in series with the center tap of the high voltage secondary of transformer T-12 and ground to break the high voltage circuit in order to disable the receiver and yet keep the tube heaters hot ready for instant use. The filter circuit consists of two low pass pi-section networks made up of inductances L-4 and L-5 and capacitors C-58, C-57, C-56, C-55 and C-54. In order to provide a constant plate voltage to the oscillator, mixer and screen of the second i-f stages a voltage regulator tube type OD3/VR-150 is used. The voltage supplied to the screen of tube V-5 is regulated to provide accurate current control for the tuning meter connected in the plate circuit of this tube.

(2) D-C Operation. - External storage battery and "B" batteries or storage battery and vibrator type supply provide for d-c operation. When operating from an external d-c supply the "Shorting Plug" on the rear apron of the receiver chassis is removed and a similar plug is wired to supply filament and plate current to the receiver circuits. The "B" voltage is supplied to the input side of the filter section used for a-c operation there by insuring adequate filtering for vibrator type supplies when used.

ANTENNA Control. - This control is used to compensate for misalignment of the receiver's antenna stage due to antenna impedance variations. Once set for a given antenna, its setting will hold for a wide range of frequencies.

R. F. GAIN Control. - The radio frequency gain control regulates the sensitivity of the receiver. Turning the control to the right increases the sensitivity of the receiver. Ganged to this control is the "S" meter switch which connects the tuning meter into the circuit when the control is advanced all the way to the right during automatic volume control operation.

S-METER ADJ. - This adjustment sets the signal level meter to its zero signal level position when the receiver is set for A.M. (amplitude modulation) reception. The adjustment is made with a screw driver and once set, it is seldom necessary to make further adjustments.

POWER Switch. - The power switch connects the a-c power to the receiver when operating from a-c mains only. When operating the receiver from a battery supply this control function must be handled by a power switch in the battery supply circuit.

> CAUTION - When operating the receiver from a d-c supply set the receiver's POWER switch at OFF and do not plug the a-c line cord into an a-c outlet.

"S" Meter or Tuning Meter. - The tuning meter serves two functions in the receiver depending on the type of reception as follows:

A.M. Reception. - When the receiver is adjusted to receive amplitude modulated signals, the tuning meter indicates the relative carrier strength of the received signal. To put the meter in operation, turn the R.F. GAIN control to the right until the switch connected to its shaft clicks, and set the A.V.C. switch at ON.

F.M. Reception. - When the receiver is adjusted to receive frequency modulated signals, the tuning meter is used to indicate resonance with the station carrier. As the receiver is tuned through the f-m carrier the meter pointer will first deflect to one side of zero, return to zero and deflect an equal distance on the opposite side of zero, and finally return to zero as the carrier is completely passed. The zero center position in the middle of the swing represents the current setting of the receiver tuning dial and indicates resonance with the station carrier.

OPERATION.

Listed below are the receiver controls and their settings for the two types of reception provided by this receiver, namely, amplitude modulation reception and frequency modulation reception.

a. A.M. (Amplitude Modulation) Reception. - To receive an amplitude modulated signal, set the panel controls as follows:

POWER switch	-	Set at ON when operating receiver on alternating current. To turn off receiver set switch at off. CAUTION - Leave switch set at OFF when operating receiver from external batteries.
SEND/REC. switch	-	Set at REC. (Set at SEND to disable receiver when desired.)
A.M./F.M. switch	-	Set at A.M.
A.V.C. switch	-	Set at ON.
R.F. GAIN control	-	Turn to right until switch on control clicks.
TUNING control	-	Set dial that is calibrated in megacycles to frequency of signal: adjust for maximum tuning meter reading.
ANTENNA control	-	Adjust for maximum tuning meter reading.
A.F. GAIN control	-	Adjust for desired signal level at headset or speaker.
TONE control	-	Set to please the listener.
A.N.L. switch	-	Normally set at OFF. Use only when background noise is excessive.

NOTE - The control settings listed above are those necessary for reception using automatic volume control and meter tuning. Should the operator wish to use manual control of the receiver's sensitivity set the A.V.C. switch at OFF and adjust the R.F. GAIN control for maximum required sensitivity. The tuning meter will not function when manual control of the receiver's sensitivity is employed.

F.M. (Frequency Modulation) Reception. - To receive a frequency modulated signal, set the panel controls as follows:

POWER switch	-	Set at ON when operating receiver on alternating current. To turn off receiver set switch at OFF. CAUTION - Leave switch set at OFF when operating receiver from external batteries.
SEND/REC. switch	-	Set at REC. (Set at SEND to disable receiver when desired.)
A.M./F.M. switch	-	Set at F.M.
A.V.C. switch	-	Set at OFF.
R.F. GAIN control	-	Turn all the way to the right. (It is not necessary to actuate the switch.)
TUNING control	-	Set dial that is calibrated in megacycles to frequency of signal; adjust for zero setting of tuning meter.
ANTENNA control	-	Adjust for maximum signal level in headset or speaker if control is effective. (Adjustment is generally needed only on very weak signals.)
A.F. GAIN control	-	Adjust for desired signal level at headset or speaker.
TONE control	-	Set to please the listener.
A.N.L. switch	-	Set at OFF. (not used)

CAUTION - Voltages at various points in this equipment are of sufficiently high potential to produce a severe shock. Locate the high potential points on the VOLTAGE-RESISTANCE DIAGRAM before attempting to service circuits that are "hot". IT'S A GOOD RULE TO DISCONNECT THE POWER SOURCE BEFORE MAKING ADJUSTMENTS WHEN POSSIBLE. BE CAREFUL.

1. PREVENTIVE MAINTENANCE

All components of the receiver should be given a thorough inspection at regular intervals. Keep the components clean and dry. Moisture, even in a completely tropicalized set may cause serious deterioration and produce general unsatisfactory operation. Dust and dirt materially effect both electrical and mechanical operation. Keep the various parts clean especially the tuning capacitor and associated gear drive. Dust should be blown out with dry air or brushed out carefully. Do not oil the gear teeth or the condenser wipers as noisy reception will result from intermittant electrical contact at these points. Noisy reception may also be caused by dirty condenser wipers, faulty gain controls, and switches, frayed cable connections, faulty tubes, etc. in the installation. Check accessible connections, switch contacts, etc. regularly making sure that all are clean and tight and the tubes and cable connectors are held securely in their sockets.

2. REPLACING TUBES, LAMPS, AND FUSES

a. Replacing Tubes. - All tubes with the exception of the four acorn types are accessible at the top of the chassis through the hinged cover of the cabinet. The four acorn type tubes are made accessible by removing the top cover of the r-f section which is held down by thumb screws. The acorn tubes should be inserted with the short end of the body in the socket. Acorn tubes are more fragile than the rest and should be handled accordingly. If the grid and plate clips on the connections to these tubes become loose replace or bend to fit. DO NOT ATTEMPT TO SOLDER DIRECTLY TO THE TUBE PIN as the heat generated by the soldering iron will crack the glass envelope. When replacing tubes, check the tube type carefully and replace with the correct tube type. Refer to the top view of the chassis to determine the location of the tubes and to the PARTS LIST for the type number and description of each.

b. Replacing Lamps. - The receiver employs two lamps with bayonet type sockets to illuminate the vernier dial and the tuning meter. The lamps illuminating the vernier dial scale and tuning meter are to be replaced by a 6/8-volt, 150 ma. (Brown bead) G.E. 47 or equivalent. The color code referred to, is the color of the glass bead above the glass stem inside the envelope of the lamp. The lamp illuminating the meter scale is removed by pulling the lamp socket from the rubber grommet in the meter case. When reinserting the lamp, do not push the socket assembly too far into the meter case as a hot spot of light will appear on the meter scale instead of even area of illumination.

c. Replacing Fuses. - Two fuses are used, one in each side of the a-c line. The fuse holders are located on the rear apron of the chassis and require a screw driver to remove the fuse. Replace burned out fuses with 3-ampere 250-volt, Little Fuse type 3AG or equivalent.

CAUTION - The fuses protect your equipment, don't take chances using fuses rated for a heavier current drain than 3 amperes.

3. PERIODIC ADJUSTMENTS

a. Tuning Meter Adjustment.

(1) The tuning meter zero setting control is located behind its front panel button type cover marked S-METER ADJ. Remove the button with a knife or screw driver blade.

(2) Disconnect the antenna and connect a jumper across terminals A_1, A_2, and GND.

(3) Set the front panel controls for amplitude modulation reception as follows:

(a) Set A.M./F.M. switch at A.M.

(b) Set A.V.C. switch at ON.

(c) Turn R.F. GAIN control to right until the switch on the control clicks.

(d) Set A.F. GAIN control for minimum gain. (All the way to the left).

(e) Set A.N.L. switch at OFF.

(f) Set SEND-REC. switch at REC.

(4) With a screw driver set the S-METER ADJ. control for the zero reading on the S-meter scale of the tuning meter.

(5) Remove the antenna terminal jumper and replace antenna leads and meter adjustment cover button, the adjustment is completed.

b. Receiver Alignment. - The receiver has been carefully aligned at the factory and should not require realignment until the receiver requires new tubes in the r-f and i-f stages or shows signs of loss of sensitivity, off frequency calibration or requires service work on one or more of its r-f and i-f stages. Alignment should not be attempted by inexperienced personnel as maximum performance is obtained only by careful and intelligent alignment.

(1) Aligning Tools. -

(a) Signal generator capable of providing a 400-cycle modulated signal at 16 mc. and 130 to 210 mc. range. Recommended generators are the Ferris Instrument Corp. Model 18D or 18FS and the Measurements Corp. Model 75.

(b) A 50-ohm non-inductive dummy antenna resistor.

(c) Non-metallic screw driver. A bakelite screw driver with a short metal blade is very good.

(d) Audio output meter capable of handling 5 watts of audio power for either 500 or 5000-ohm loads.

(2) I-F Amplifier Alignment.

(a) Disconnect the grid lead of the type 954 mixer tube (V-3) and connect the signal generator to the grid of the mixer tube, using a small clip or flexible piece of wire to make the connection. Connect the ground wire of the generator to the receiver chassis.

CAUTION - Do not attempt to solder to the tube terminal as the heat of the soldering iron is certain to crack the glass envelope.

(b) Connect the output meter across the speaker terminals. Set the range of the output meter for its highest range to prevent overloading the meter accidently.

(c) Let the receiver warm up for approximately half an hour then set the receiver controls as follows:

R.F. GAIN control at maximum gain.

A.F. GAIN control at maximum gain permitted by local noise level. Work in a shielded room if possible.

A.M./F.M. switch at A.M.

A.V.C. switch at OFF.

A.N.L. switch at OFF.

SEND/REC. switch at REC.

(d) Set the signal generator frequency at 16 megacycles and turn on the 400-cycle modulation.

(e) Adjust i-f transformers T-5, T-6, T-7, and T-8 for maximum response by tuning for maximum signal level at the output meter using just enough signal generator output to provide a good resonant swing on the output meter. The signal level at the generator should run not more than 70 microvolts for a 500 milliwatt audio output level. Repeat the alignment procedure until assured of accurate alignment. Refer to

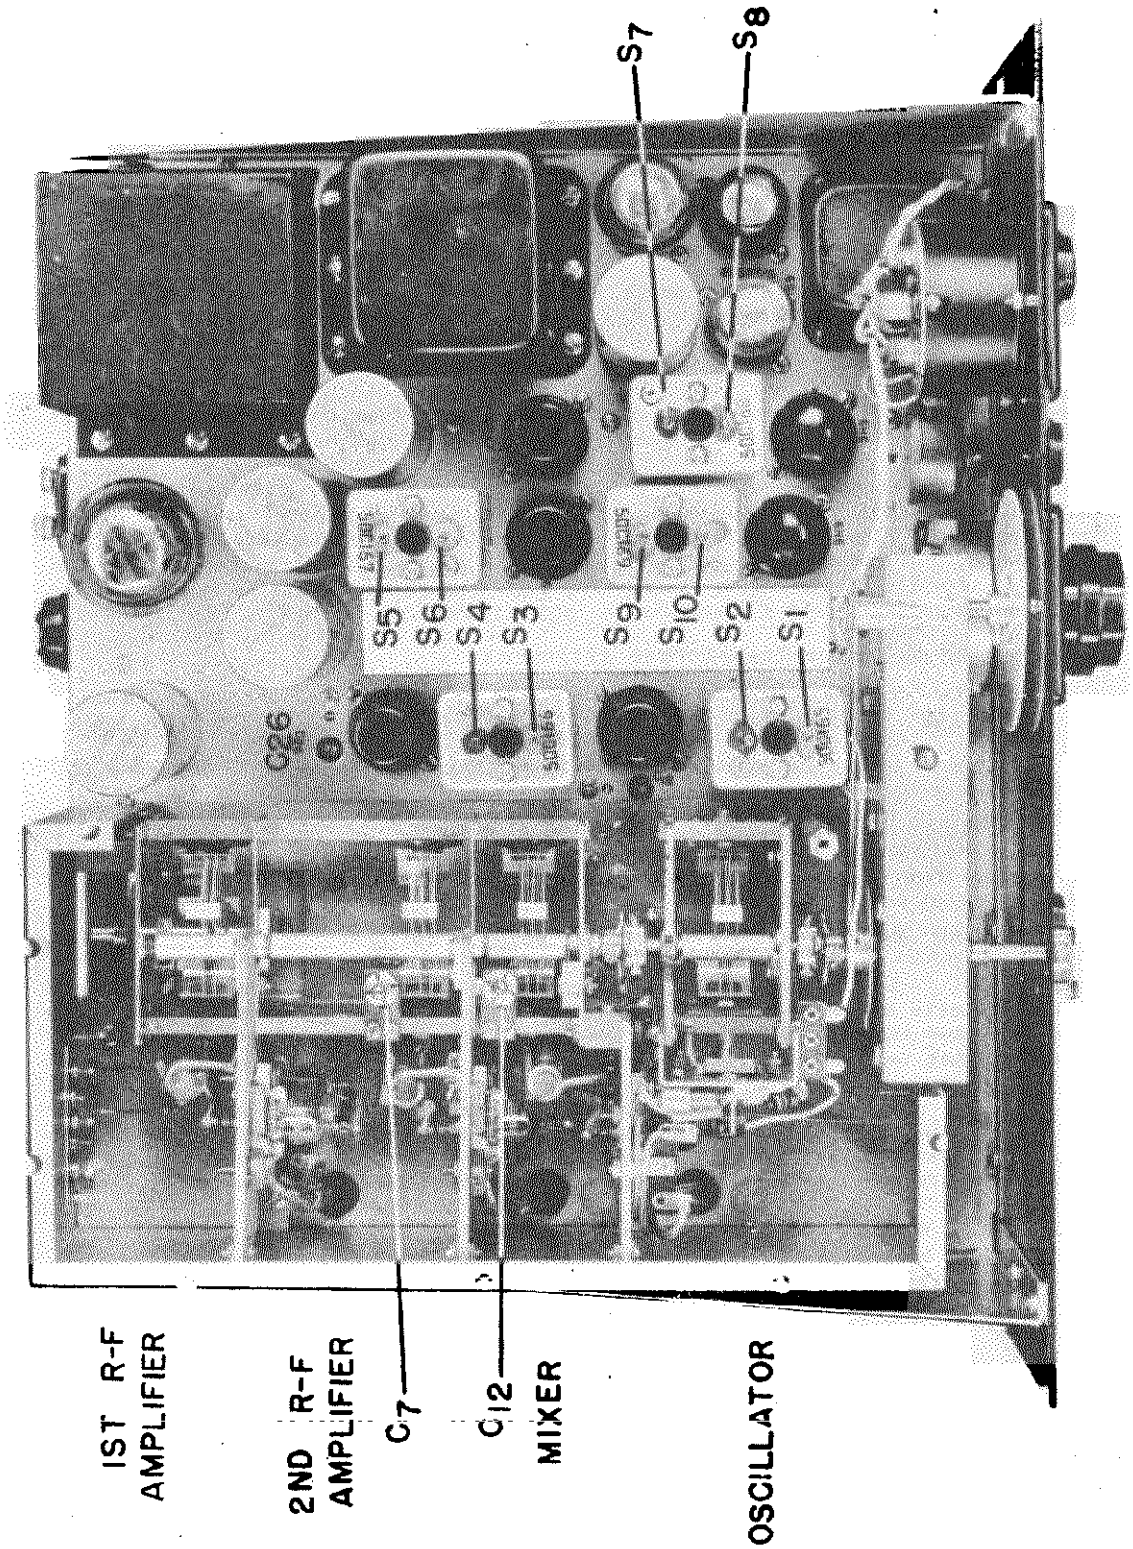

Figure 5-1. Radio Receiver Model S-37, top view showing alignment points.

figure 5-1 for the location of i-f transformer adjustment screws S_1 through S_8 inclusive on i-f transformers T-5, T-6, T-7, and T-8.

(f) Disconnect the filament lead of the 1st i-f amplifier tube (V-4) at pin #2 of the d-c power input socket (SO-1) on the rear apron of the chassis. Refer to Fig. 7-7. Allow the filament of tube V-4 about one minute to cool off before proceding.

(g) Increase the output of the signal generator until a readable signal level is indicated by the output meter and adjust neutralizing capacitor C-18 for minimum output. While adjusting capacitor C-18, adjust slug adjustment S_3 on transformer T-6 for maximum output to compensate for detuning caused by adjusting C-18. Repeat the procedure until satisfied that the best possible settings have been obtained.

(h) Reconnect the filament lead of tube V-4 and disconnect the filament lead of the 2nd i-f amplifier tube V-5 at the d-c power input socket. Allow a minute for the tube to cool as before.

(i) Adjust neutralizing capacitor C-26 and slug adjustment S_5 on transformer T-7 for their optimum settings as for the 1st i-f amplifier stage. Reconnect the filament lead again before proceeding.

(j) Detune transformers T-6 (Slugs S_3 and S_4) and T-8 (Slugs S_7 and S_8) until a fairly high signal generator output is required to produce a readable output meter reading. First adjust transformers T-5 and T-7 for maximum output, then adjust transformer T-8 and finally transformer T-6. Do not readjust transformers T-5 and T-7 when adjusting T-8 and T-6. Reduce the signal generator output as required while bringing these last two i-f transformers into alignment.

(3) Discrimator Transformer Alignment. -

(a) Set the A.M./F.M. switch at F.M.

(b) Leave the signal generator set at 16 mc. with 400 cycle modulation.

(c) Adjust the secondary slug (S_{10}) of the discriminator transformer (T_9) for zero signal level at the output meter. Note that this adjustment is critical, therefore turn the screw slowly.

(d) Detune the signal generator from the 16 mc i-f frequency until a readable indication is obtained at the output meter and adjust the primary slug (S-9) for maximum output meter reading.

(e) Balance up the discriminator stage as follows:

1. Detune the signal generator to either side of the 16 mc resonant point and note the maximum output meter readings obtained. If they are equal, the discriminator stage is functioning properly, if not, proceed with the balancing adjustment that follows.

2. To balance up an unbalanced condition, tune the signal generator to the resonant point of the weaker peak and tune the primary slug (S_9) until the output rises about one-half the difference of the unbalanced readings obtained in step 1. Recheck for balance and repeat the balancing procedure if necessary.

NOTE - If a balance cannot be obtained by adjusting the primary slug (S_9), the discriminator's secondary slug (S_{10}) has been misadjusted slightly and will require a very slight readjustment in either direction. The direction of adjustment that will cause the off-tune peaks to assume the same values is the correct one. Note that the quality of the f-m signal will depend materially upon the degree of balance obtained, hence, a little care will be well repaid in performance.

(f) Disconnect the signal generator and reconnect the grid lead to the mixer tube, the alignment of the i-f amplifier stages is completed.

(4) R-F Amplifier Alignment. -

(a) Connect the signal generator to the "A_1" antenna terminal through a 50-ohm resistor and connect the ground wire of the signal generator to terminal "A_2". Disconnect the jumper wire between "A_2" and "GND" as the generator should not be grounded to the receiver's chassis for the following adjustments.

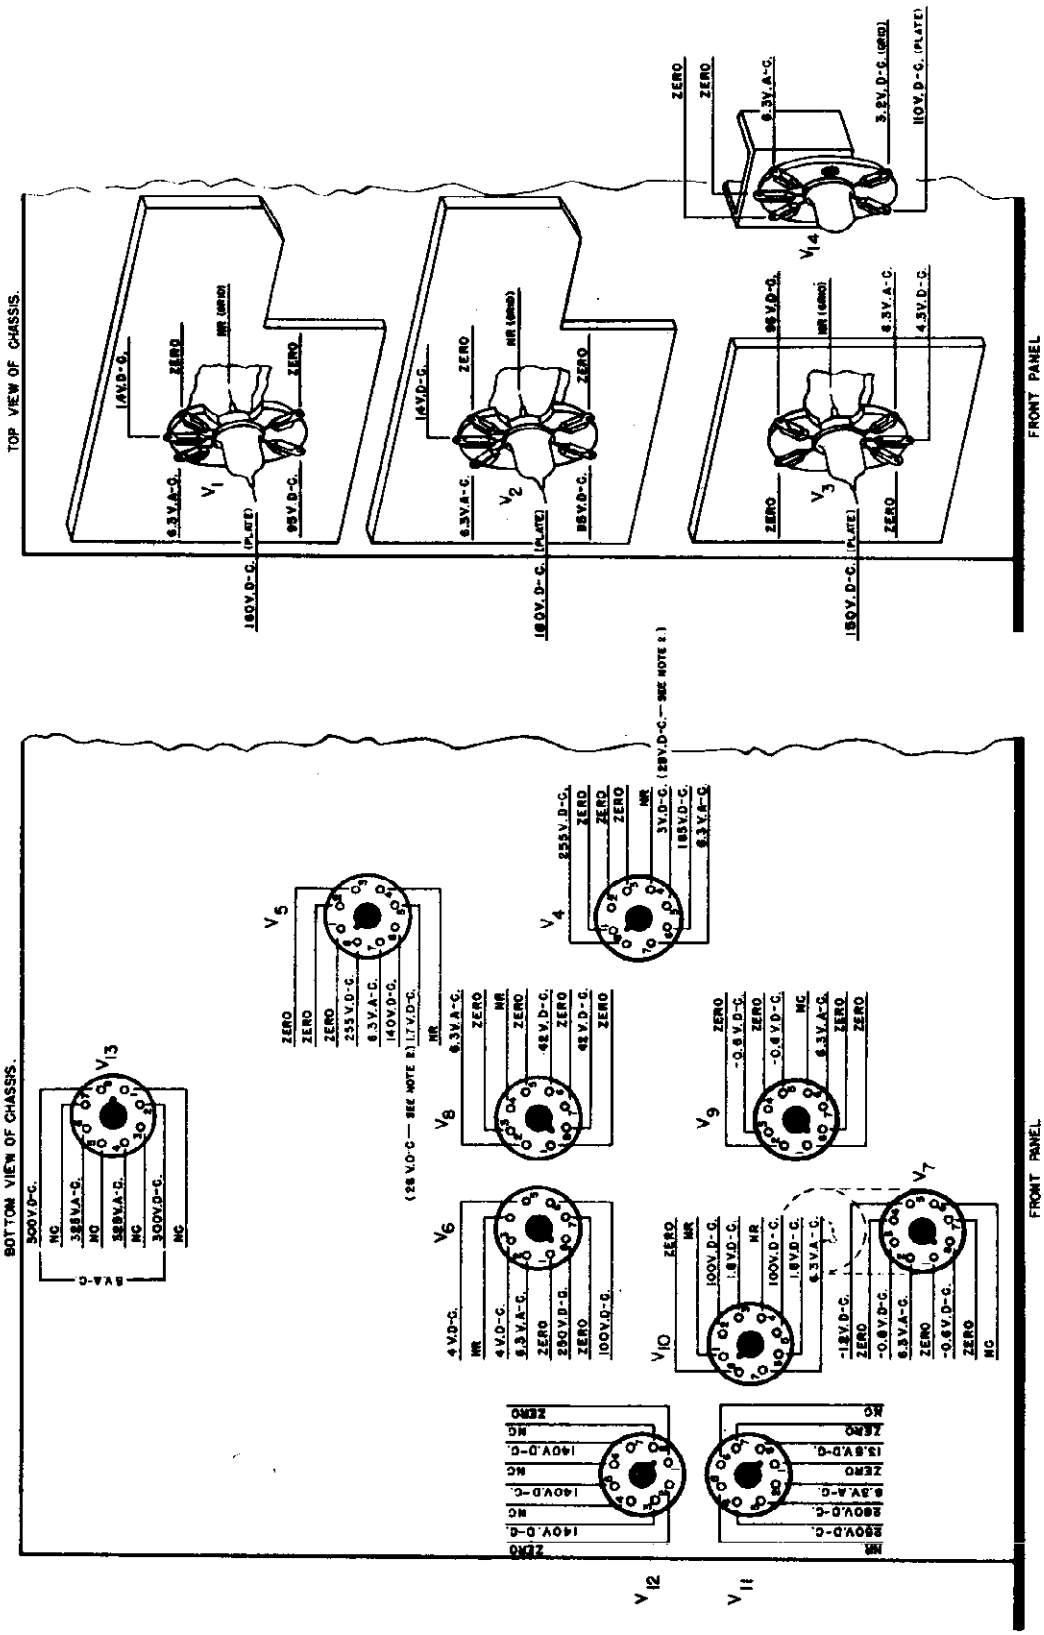

Figure 5-2. Radio Receiver Model S-37, voltage chart.

(b) Set the receiver controls as for i-f amplifier alignment. Refer to paragraph 3. b. (2) (c) this section.

(c) Set the signal generator at 210 mc. and turn on 400 cycle modulation.

Note - if your signal generator will not reach 210 mc. use the harmonic of the generator signal.

(d) Set the receiver's TUNING dial at 210 mc. and set the ANTENNA control for maximum output, then adjust capacitors C-7 and C-12 for maximum output while "rocking" the TUNING dial control back and forth across the generator signal. Use just enough signal generator output to provide a readable resonance point at the output meter.

NOTE - Should it be necessary to adjust the frequency of the oscillator to make the receiver's dial reading fall on 210 mc exactly, loosen and shift the heavy wire primary winding (oscillator transformer T-4 primary) nearest to the front panel and the heavy wire coupling loop on the opposite side of the heavy tubing secondary winding. Take care that the coupling between the primary winding and the secondary is not reduced below that necessary to maintain adequate feed back for the oscillator over the entire band. Having obtained proper adjustment recement the winding in place with Amphenol "912" or an equivalent low loss cement. After adjusting the oscillator frequency realign capacitors C-7 and C-12 as described above.

(e) Set the signal generator at 130 mc, tune in the signal on the receiver and check to see that the receiver's main tuning dial reads 130 mc. If not, the secondary (heavy tubular winding) inductance of transformers T-1, T-2, T-3, and T-4 must be adjusted by loosening the clamps and set screws which hold them in place and sliding the transformers back and forth. Tighten all set screws after adjustment.

NOTE - If it is necessary to adjust the inductance of the windings at 130 mc. the adjustments in paragraph (d) must be repeated at 210 mc to bring the high frequency end of the range into alignment again.

(f) Repeat steps (d) and (e) until the receiver alignment and calibration are satisfactory then make the following check to see that the oscillator frequency falls below the signal frequency as it should. For example: Set the receiver dial at 165 mc., turn up the signal generator output to about 5000 times normal, and set the signal generator frequency at twice the i-f frequency lower than 165 mc. or 133 mc. An image signal should be heard. If not, tune the signal generator to twice the i-f frequency higher than the signal frequency or 197 mc. and look for the image there. If the image shows up at the 197 mc. the receiver's oscillator is operating above the signal frequency and must be readjusted so that it falls below the signal frequency. Due to the construction of this receiver it is considered impossible to adjust the oscillator frequency so that it will fall above the signal frequency, however, it is always well to check for the image after making any extensive alignment adjustments.

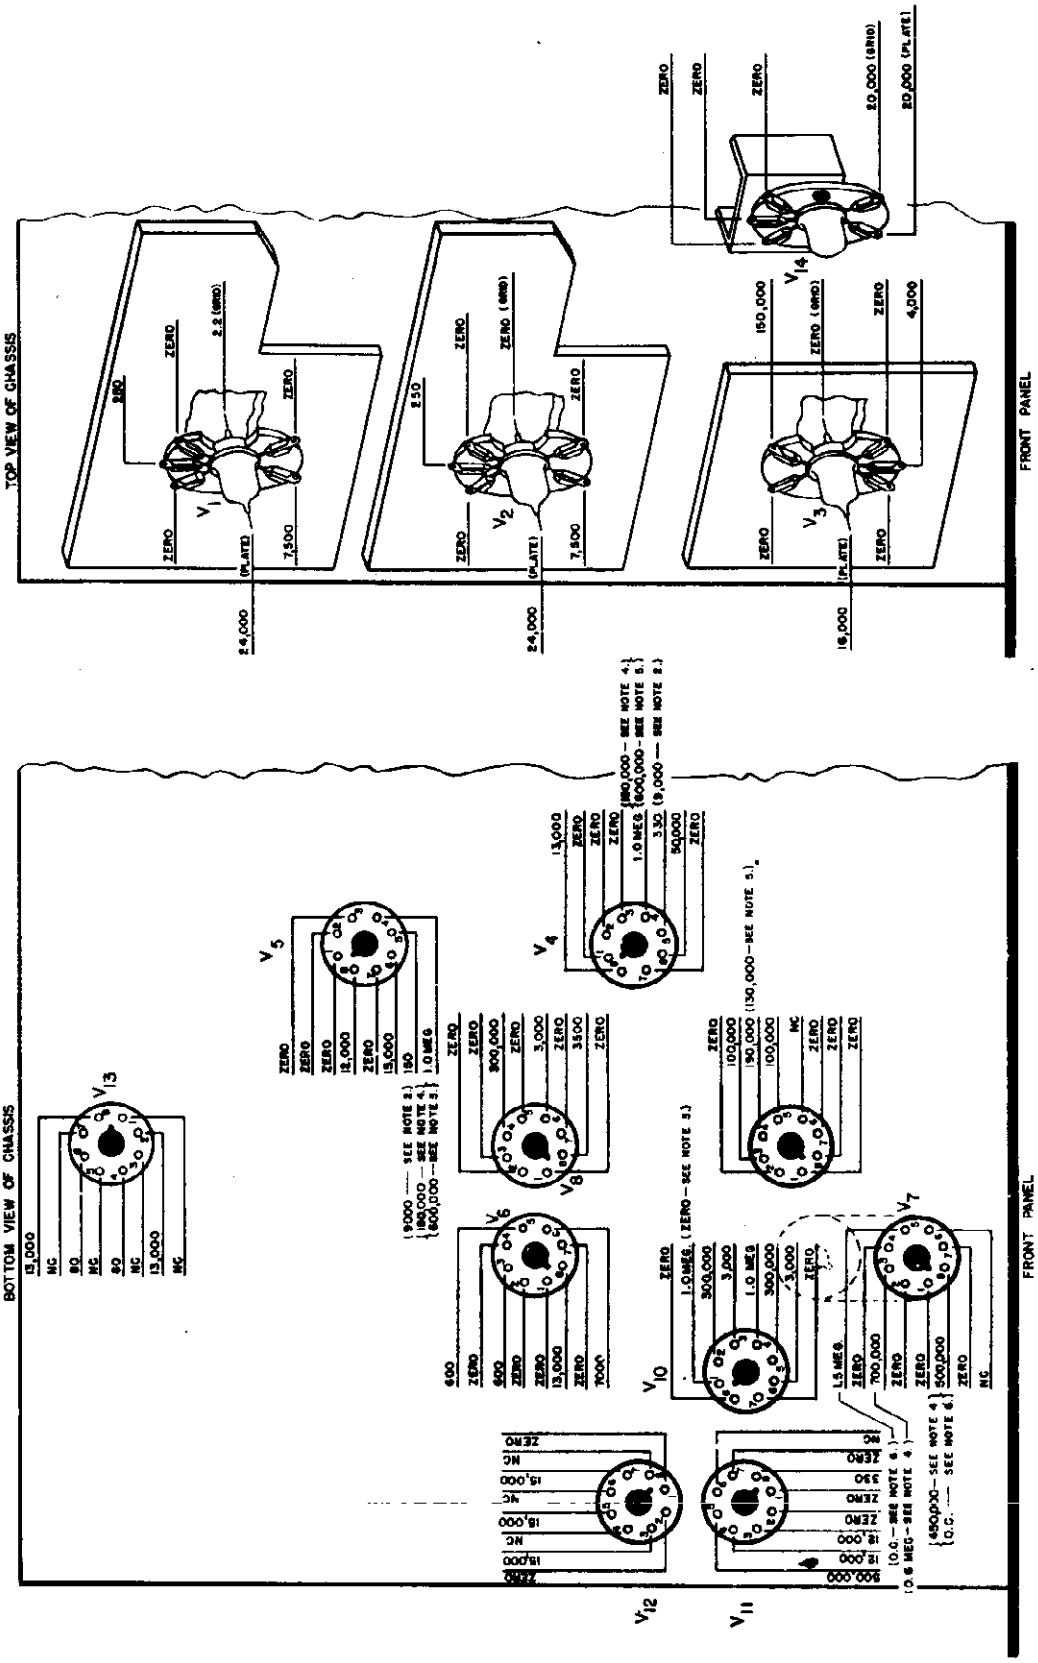
(g) When completely aligned the overall receiver sensitivity will usually run between 10 to 15 microvolts for 500 milliwatts audio output. If your receiver falls reasonably close to this sensitivity, consider your alignment adjustments satisfactory.

4. LOCATING FAULTS WITH A VOLT-OHM METER

a. Voltage Chart. - Refer to Fig. 5-2. for the tube socket terminal voltages. Voltages shown are those between the terminal and ground (chassis) unless otherwise specified. To identify the tube socket connections, refer to Fig. 7-6. The readings were taken with an RCA Volt Ohmyst Junior analyzer using 20,000 ohm per volt sensitivity. To prepare the receiver for measurement, disconnect the antenna, connect a jumper between the antenna terminals A_1, A_2, and GND., disconnect the speaker and replace with a 5000-ohm 10-watt resistor across the 5000-ohm output terminals or a 500-ohm 10-watt resistor across the 500-ohm terminals, and set the controls as follows:

POWER, A.V.C. and A.N.L. switches at ON.

SEND/REC. switch at REC.



9RD237

Figure 5-3. Radio Receiver Model S-37, resistance chart.

A.M./F.M. switch at A.M.

R.F. GAIN and A.F. GAIN controls at maximum gain position.

ANTENNA TUNING and TONE controls do not effect readings.

b. **Resistance Chart.** - Refer to Fig. 5-3. for the tube socket terminal to ground (chassis) resistance measurements. To identify tube socket connections, refer to Fig. 7-6. The readings were taken with an RCA Volt Ohmyst Junior analyzer. To prepare the receiver for measurement, disconnect the a-c line cord and set the controls as follows:

POWER, A.V.C. and A.N.L. switches at ON.

SEND/REC. switch at REC.

A.M./F.M. switch at A.M.

R.F. GAIN and A.F. GAIN controls at maximum gain position.

TONE control at maximum clock-wise position.

ANTENNA and TUNING controls do not effect readings.

CAUTION - The receiver's line cord, if operating from an a-c outlet, or the battery supply cord, if operating from a d-c supply, must be disconnected before making resistance measurements.

c. **Checking Transformer and Inductor Windings With an Ohm-meter.** -

NOTE - One terminal of each winding measured must be disconnected from the circuit to avoid measuring circuit resistances instead of winding resistance alone as indicated in the chart.

Circuit symbol	Name of part	Winding	Winding terminals	D-C resistance (ohms)
T-10	TRANSFORMER, audio.	Primary.	1 to 2	300
		5000-ohm secondary.	3 to 6	250

SWI Special	53A065
L_3	Same as L_2.	-	-
L_4	Coil, filter: input; 2 henries ± 15%; rated d-c current 150 ma; d-c resistance 85 ohms ± 10%; iron core; 1850 turns of #31 enameled copper wire; metal case 2-5/8" h x 3-3/16" wd x 2-11/16" lg; mtg flange has six mtg holes, 3 on each side, of 3/16" diam, spaced 3/4" apart, on 2-3/8" mtg centers; two lug terminals on top of case, each terminal 3/16" diam, spaced 5/8" apart; coil is vacuum wax impregnated; voltage breakdown 2400 volts A.M.S. between coil and core or coil and case.	CTC type 7466	56B011
L_5	Coil, filter: output; 12 henries; rated d-c current 90 ma; d-c resistance 290 ohms at 75°C; test voltage 2400 volt r.m.s. between coil and core or coil and case; hermetically sealed in metal case 3-1/16" h x 2-3/8" wd x 2-½" lg; four #8-32 NC thread mtg studs on 1-½" x 1-3/8" mtg centers; hardware included; two lug terminals on top spaced 23-32" apart.	CTC type 7865	56B012

Ref. Symbol	Name of Part and Description	Mfr Code and Type No.	Hallicrafter's Part No.
L_6	Coil, r-f: 4.2 uh ± 10%; distributed capacity 1 mmf ± 20%; d-c resistance 0.25 ohms ± 10%; "Q" with 100 mmf capacitor 100 ± 20%; 42 turns #28 ESCC copper wire on molded natural bakelite form 7/8" lg x 9/32" diam; Chinese blue lacquer coated; two copper wire leads 1-½" lg.	SWI Special	53A009
LM_1	Lamp, incandescent: pilot; 6-8 volt, 0.15 amp; bayonet type base.	GE type 47	39A004
LM_2	Same as LM_1.	-	
PL_1	Connector, male contact: octal; molded bakelite body, 1" lg x 1-½" diam overall; prongs are numbered from 1 to 8 on both sides; includes insulated jumper between 3 and 4 and one between 6 and 7.	AP type CP-8	35A003
M_1	Meter, micro ammeter: range 100-0-40 microamperes; accuracy ± 20% of full scale length 1.65" covered in 90° of pointer swing; approx resistance 1250 ohms d-c; damping factor 8 (full scale length); metal case 1-3/16 d x 2-½" diam; std by metal flange 3-½" diam having 3 mtg holes 1-8" diam spaced 120° apart on 1-3/16" radius; two stud terminals at rear ½" long x #10-32 thread; flange is part of case.	B Special	82A036
R_1	Resistor, fixed: 2.2 ohm ± 10%; ½ watt; composition; insulated; 7/16" lg x 0.215" diam; two #18 AWG leads 1-½" lg; part of transformer T_1.	ER type 504	23A016
R_2	Resistor, fixed: 270 ohm ± 10%; ½ watt; composition; humidity resistant; insulated; 0.655" lg x 0.249 diam; two #21 AWG wire leads 1-½" lg; same as R_3, R_{44}.	ASA	RC21AE271K
R_3	Resistor, fixed: 1000 ohm ± 20%; ½ watt; composition; humidity resistant; insulated; 0.655" lg x 0.249" diam; two #21 AWG wire leads 1-½" lg; same as R_4, R_6, R_7, R_9, R_{10}, R_{23}, R_{26}.	ASA	RC21AE102M
R_4	Same as R_3.	-	-
R_5	Same as R_2.	-	-
R_6	Same as R_3.	-	-
R_7	Same as R_3.	-	-
R_8	Resistor, fixed: 12,000 ohms ± 10%; 2 watt; composition; insulated; humidity resistant; 1.78" lg x 0.342" diam; two #19 AWG wire leads 1-1/2" lg.	ASA	RC41AE123K
R_9	Same as R_3.	-	-
R_{10}	Same as R_3.	-	-
R_{11}	Resistor, fixed: 33 ohm ± 10%; ½ watt; composition; insulated; humidity resistant; 0.655" lg x 0.249" diam; two #21 AWG wire leads 1-½" lg; same as R_{21}, R_{25}, R_{39}, R_{64}.	ASA	RC21AE330K
R_{12}	Resistor, fixed: 100,000 ohm ± 10%; ½ watt; composition; insulated; humidity resistant; 0.468" lg x 0.249" diam; two #21 AWG wire leads 1-½" lg; part of transformer T_5. Same as R_{19}, R_{45}, R_{48}.	ASA	RC20AE104K

Ref. Symbol	Name of Part and Description	Mfr Code and Type No.	Hallicrafter's Part No.
R_{13}	Resistor, fixed: 100,000 ohm ± 10%; ½ watt; composition; insulated; humidity resistant; 0.655" lg x 0.249" diam; two #21 AWG wire leads 1-½" lg; same as R_{15}, R_{33}.	ASA	RC21AE104K
R_{14}	Resistor, fixed: 330 ohm ± 10%; ½ watt; composition; insulated; humidity resistant; 0.655" lg x 0.249" diam; two #21 AWG wire leads 1-½" lg; same as R_{24}, R_{53}, R_{60}.	ASA	RC21AE331K
R_{15}	Same as R_{13}.	-	-
R_{16}	Resistor, variable: 10,000 ohm ± 20%; carbon; #8 reversed taper; shaft 1" long x ¼" diam; 3 solder lug terminals; center lug is variable contact; includes switch SW_3.	CT type 136	26C054
R_{17}	Resistor, fixed: 30,000 ohm ± 10%; ½ watt; composition; insulated; humidity resistant; 0.655" lg x 0.249" diam; two #21 AWG wire leads 1-½" lg.	ASA	RC21AE303K
R_{18}	Resistor, variable: 330 ohm ± 20%; ½ watt; composition; insulated; humidity resistant; 0.655" lg x 0.249" diam; two #21 AWG wire leads 1-½" lg.	ASA	RC21AE331M
R_{19}	Same as R_{12}; part of transformer T_6.	-	-
R_{20}	Resistor, fixed: 100,000 ohm ± 20%; ½ watt; composition; insulated; humidity resistant; 0.655" lg x 0.249" diam; two #21 AWG wire leads 1-½" lg; same as R_{37}, R_{55}, R_{66}.	ASA	RC21AE104M
R_{21}	Same as R_{11}.	-	-
R_{22}	Resistor, fixed: 150 ohm ± 10%; ½ watt; composition; insulated; humidity resistant; 0.655" lg x 0.249" diam; two #21 AWG wire leads 1-½" lg.	ASA	RC21AE151K
R_{23}	Same as R_3.	-	-
R_{24}	Same as R_{14}.	-	-
R_{25}	Same as R_{11}.	-	-
R_{26}	Not used		
R_{27}	Resistor, fixed: 560 ohm ± 10%; ½ watt; composition; insulated; humidity resistant; 0.655" lg x 0.249" diam; two #21 AWG wire leads 1-½" lg.	ASA	RC21AE561K
R_{28}	Resistor, fixed: 7500 ohm ± 10%; 10 watt; wire wound; vitreous baked enameled coated; 1-3 4" lg x 3 8" max diam; two #18 AWG wire leads 1-3 8" lg.	V type CC	24B0752E
R_{29}	Same as R_3.	-	-
R_{30}	Resistor, fixed: 1000 ohm ± 10%; ½ watt; composition; insulated, humidity resistant; 0.655" lg x 0.249" diam; two #21 AWG wire leads 1-½" lg.	ASA	RC21AE102K
R_{31}	Resistor, fixed: 47,000 ohm ± 10%; ½ watt; composition; insulated; humidity resistant; 0.655" lg x 0.249" diam; two #21 AWG wire leads 1-½" lg; same as R_{38}.	ASA	RC21AE473K
R_{32}	Resistor, fixed: 1 megohm ± 20%; ½ watt; composition; insulated; humidity resistant; 0.655" lg x 0.249" diam; two #21 AWG wire leads 1-½" lg.	ASA	RC21AE105M
R_{33}	Same as R_{13}.		

Ref. Symbol	Name of Part and Description	Mfr Code and Type No.	Hallicrafter's Part No.
R_{34}	Resistor, fixed: 270,000 ohm ± 10%; ½ watt; composition; insulated; humidity resistant; 0.656" lg x 0.249" diam; two #21 AWG wire leads 1-½" lg; same as R_{35}, R_{41}, R_{50}.	ASA	RC21AE274K
R_{35}	Same as R_{34}.	-	-
R_{36}	Resistor, fixed: 470,000 ohm ± 20%; ½ watt; composition; insulated; humidity resistant; 0.656" lg x 0.249" diam; two #21 AWG wire leads 1-½" lg.	ASA	RC21AE474M
R_{37}	Same as R_{20}.	-	-
R_{38}	Same as R_{31}.	-	-
R_{39}	Same as R_{11}.	-	-
R_{40}	Resistor, fixed: 3,900 ohm ± 10%; 2 watt; composition; insulated; humidity resistant; 1.78" lg x 0.343" diam; two #18 AWG wire leads 1-½" lg.	ASA	RC41AE392K
R_{41}	Same as R_{34}.	-	-
R_{42}	Resistor, fixed: 3300 ohm ± 10%; 1 watt; composition; insulated; humidity resistant; 1.28" lg x 0.310" diam; two #20 AWG wire leads 1-½" lg.	ASA	RC31AE332K
R_{43}	Resistor, fixed: 330,000 ohm ± 10%; ½ watt; composition; insulated; humidity resistant; 0.656" lg x 0.249" diam; two #21 AWG wire leads.	ASA	RC21AE334K
R_{44}	Same as R_2.	-	-
R_{45}	Same as R_{12}; part of transformer T_9.	-	-
R_{46}	Same as R_{12}; part of transformer T_9.	-	-
R_{47}	Resistor, fixed: 220,000 ohm ± 20%; ½ watt; composition; insulated; humidity resistant; 0.656" lg x 0.249" diam; two #21 AWG wire leads 1-½" lg.	ASA	RC21AE224M
R_{48}	Resistor, variable: 1 megohm ± 20%; carbon; #6 taper; shaft 1" long x ¼" diam; 3 solder lug terminals with variable contact located in the center and fixed contacts 1-7/16" apart; no taps.	CRL type 1-010	25C069
R_{49}	Resistor, fixed: 3300 ohm ± 10%; ½ watt; composition; insulated; humidity resistant; 0.656" lg x 0.249" diam; two #21 AWG wire leads 1-½" long.	ASA	RC21AE332K
R_{50}	Same as R_{34}.	-	-
R_{51}	Resistor, fixed: 470,000 ohm ± 10%; ½ watt; composition; insulated; humidity resistant; 0.656" lg x 0.249" diam; two #21 AWG wire leads 1-½" lg.	ASA	RC21AE474K
R_{52}	Resistor, variable: 500,000 ohm ± 20%; carbon; #6 taper; shaft 1" lg x ¼" diam; 3 solder lug terminals with variable contact between the outer lug terminals; terminals 1-7/16" apart; no taps.	CT type 31	25C065
R_{53}	Same as R_{14}.	-	-
R_{54}	Resistor, fixed: 4700 ohm ± 20%; 1 watt; composition; insulated; humidity resistant; 1.28" lg x 0.310" diam; two #20 AWG wire leads 1-½" lg.	ASA	RC31AE472M

Ref. Symbol	Name of Part and Description	Mfr Code and Type No.	Hallicrafter's Part No.
R_{55}	Resistor, variable: 1500 ohm ± 20%; wire wound; at line taper; shaft 3/8" long x ¼" diam, slotted 1/16" x 1/16"; 3 solder lug terminals with variable contact located in the center and fixed contacts 1-7/16" apart; no taps.	CT type 125	25C060
R_{56}	Resistor, fixed: 3,200 ohm ± 10%; 10 watt; wire wound; vitreous enamel coated; 1-3/4" lg x 3/8" max diam; two #18 AWG wire leads 1-3/8" long.	U type CC	24RG32EK
R_{57}	Resistor, fixed: 22,000 ohm ± 20%; ½ watt; composition; insulated; humidity resistant; 0.656" lg x 0.249" diam; two #21 AWG wire leads 1-½" lg.	ASA	RC21AE223M
R_{58}	Resistor, fixed: 3900 ohm ± 10%; ½ watt; composition; insulated; humidity resistant; 0.656" lg x 0.249" diam; two #21 AWG wire leads 1-½" lg.	ASA	RC21AE392K
R_{59}	Resistor, fixed: 5,600 ohm ± 10%; ½ watt; composition; insulated; humidity resistant; 0.656" lg x 0.249" diam; two #21 AWG wire leads 1-½" lg.	ASA	RC21AE562K
R_{60}	Same as R_{14}.	-	-
R_{61}	Resistor, fixed: 150,000 ohm ± 20%; ½ watt; composition; insulated; humidity resistant; 0.656" lg x 0.249" diam; two #21 AWG wire leads 1-½" lg.	ASA	RC21AE154M
R_{62}	Resistor, fixed: 8 ohm ± 10%; ½ watt; composition; insulated; humidity resistant; 7/16" lg x 0.215" diam; two #21 AWG wire leads.	IRC type 504	23A019
R_{63}	Resistor, fixed: 27,000 ohm ± 10%; ½ watt; composition; insulated; humidity resistant; 0.468" lg x 0.249" diam; two #21 AWG leads 1-½" lg. Part of transformer T_9.	ASA	RC20AE273K
R_{64}	Same as R_{11}.	-	-
SO_1	Connector, female contact: octal; high dielectric mica filled bakelite body, 1-7/64" diam x 31/64" thick; silver plated phosphor bronze solder lugs; molded on steel mtg plate 1-9/32" wd x 0.061" thk having 2 mtg holes of 5/32" diam x 1-½" mtg centers; pins are numbered on back of socket clockwise from locating pin.	AP type NIP8TM	8A200
SO_2	Connector, female contact: two terminal; bakelite body, 11/16" wd x 3/8" h x 23/32" d + thickness of mtg plate; mounted by cad plated steel plate having 2 mtg holes with 1-1/8" mtg centers; 2 solder lug terminals 5/16" lg x ¼" wd, rated 10 amp at 250 volts, 15 amp at 125 volts.	AL type 4002-T	10A015
SO_3	Connector, male contact: recessed; two brass prongs; screw type terminals; 1-3/4" x 1-5/8" x 1-¼" overall; molded bakelite body recessed in metal cup 1-3/8" diam with flange type mtg having 1-3/4" mtg centers, mtg holes 0.144" diam.	AP type 80M-10	10A047
SW_1	Switch, toggle; SPST; power; rated 3 amp at 250-volt; black enamel steel case 13/16" h x 15/32" d x ¼" wd; 2 solder lug terminals; mounts by brass bushing 15/32" - 32 to fit a 3/8" hole; mechanism in brass; lugs separated by fibre piece; same as SW_2, SW_5.	HH type 20094	60A116
SW_2	Same as SW_1.	-	-

Ref. Symbol	Name of Part and Description	Mfr Code and Type No.	Hallicrafter's Part No.
SW_3	Switch, toggle: SPST; mounts on back of R.F. GAIN control and closes when the R.F. GAIN control is turned all the way to the right (clockwise); part of R.F. GAIN control.	-	-
SW_{4A} SW_{4B} SW_{4C} SW_{4D}	Switch, rotary: single section; 2 position; all metal parts silver plated brass except for stainless steel index spring and ball; vacuum wax impregnated phenolic wafer; non shorting teeth of contacts 5 and 8; frame 5/16" lg; mts by 3/8-32 bushing ½" lg, shaft 1" lg x ¼" diam.	OH type SW	60A177
SW_5	Same as SW_4.	-	-
SW_6	Switch, toggle: DPST; rated 1 amp at 250-volts, 3 amp at 125-volts; metal case, 1-9/16" x 19/32" overall diam; includes fibre separators in assembly; 4 brass lug terminals; mts by brass bushing 15/32-32 x 13/32".	MH	60A117
T_1	Transformer, r-f: sec, 2 turns of 1/8" O.D. x 1/16" I.D. copper tubing, silver plated; pri, 1-½ turns of #26 tinned & single braided colanese wire strung thru hollow sec; grid lead, stranded voice coil wire 3/4" lg; spacing between sec turns not less than 1/32"; coil wound on polystyrene form 1-13/16" lg x 3/8" diam; includes resistor R_{21}, mounted thru center of form ½" from top end; one lead of resistor soldered to sec about 1-3/4 turns from winding start; the other lead is cut short and the grid lead with acorn tube clip is attached; the start end of the sec extends 27/32" from the center of the coil form and is flatted 3/16" from the end; the finish end of the secondary extends 13/16" from the center of the coil form; the primary terminal are two solder lug terminals which are mounted on a ceramic terminal 5/8" wd x 3/4" h x 5/32" thk which is mtd near the bottom of the coil form by a ½" nickel plated brass screw; start and finish leads of sec extend from coil at a 90 degree angle.	EW Special	51A350
T_2	Transformer, r-f: pri, 2-½ turns of #32 enameled single silk covered wire; spaced one wire diam; sec, 2 turns of silver plated copper tubing 1/8" O.D. x 1/16" I.D.; grid lead is voice coil wire 1-½" lg with acorn tube clip and soldered on sec 2 turns from winding start; spacing between sec turns not less than 1/32"; the start end of the sec extends 3/4" from center of coil form and flatted 3/16" from end; the finish end extends 15/16" from center of coil form; coils are wound on polystyrene from 1-7/16" lg x 3/8" diam at one end and 5/16" diam at other end; secondary leads terminate as two solder lug terminals which are mtd on a ceramic terminal 5/8" wd x 3/4" h x 5/32" thk which mounts to coil form by a ½" nickel plated brass screw; grid lead insulated by 2 Amphenol "912" beads #73-1; start and finish leads of sec extend from coil at a 90 degree angle.	EW Special	51A351
T_3	Transformer, r-f: pri, 3-3/4" turns of #32 enameled single silk covered wire spaced not less than 1/32" between turns; sec, 1-½ turns of silver plated copper tubing, 1/8" O.D. x 1/16" I.D.; grid lead is voice coil wire 1-3/4" lg with acorn tube clip at one end, other end soldered to sec 1 turn from start end; start end of sec extends 1-1/32" from center of coil and is flatted 3/16" from end; finish end of sec extends 13/16" from center of coil; start and finish end of coil extend at a 90 degree angle; pri leads terminate at two solder lug terminals which are mounted on a ceramic terminal 5/8" wd x 3/4" h x 5/32" thk mounted on coil form by a 1/2" nickel plated brass screw; grid lead is insulated by 3 amphenol "912" beads #73-1.	EW Special	51A352
T_4	Transformer, r-f: pri, 1-½ turns of #16 tinned copper wire; sec, 1-½ turns of silver plated copper tubing 1/8" O.D. x 1/16" I.D.; sec winding spaced 1/32"; sec leads are 1-½" and 1-3/32" lg respectively; pri leads are 1-3/4" wd 1-½" lg respectively and extending from the coil at a 90 degree angle; capacitor C_{71} is soldered 1 turn from longest lead of sec; coils are wound on polystyrene from 1-½" lg x 3/8" diam; pri is slightly sealed to coil form for shipping, seal may easily be broken for adjustment.	EW Special	51A353
T_5	Transformer, IF: 16 megacycles; input stage; shielded; shield can 1-7/8" lg x 1-7/16" wd x 4" h; powdered iron core; tuned primary and secondary; adjustable iron core tuning; spade lug mtg on 1-7/8" x 1-7/16" mtg centers; 8 solder lug terminals at base; includes capacitors C_{15} and C_{16} and resistor R_{12}.	EW Special	60C165
T_6	Transformer, IF: 16 megacycles; interstage; shielded; shield can 1-7/8" lg x 1-7/16" wd x 4" h; powdered iron core; tuned primary and secondary; adjustable iron core tuning; spade lug mtg on 1-7/8" x 1-7/16" mtg centers; 8 solder lug terminals at base; includes capacitors C_{28} and C_{29}, and resistor R_{19}.	EW Special	60C166
T_7	Transformer, IF: 16 megacycles; interstage; shielded; shield can 1-7/8" lg x 1-7/16" wd x 4" h; powdered iron core; tuned primary and secondary; adjustable iron core tuning; spade lug mtg on 1-7/8" x 1-7/16" mtg centers; 8 solder lug terminals at base; includes capacitors C_{29}, C_{30}, and C_{72}.	EW Special	60C167
T_8	Transformer, IF: 16 megacycles; diode; shielded; shield can 1-7/8" lg x 1-7/16" wd x 4" h; powdered iron core; tuned primary and secondary; adjustable iron core tuning; spade lug mtg on 1-7/8" x 1-7/16" mtg centers; 8 solder lug terminals at base; includes capacitors C_{35} and C_{36}.	EW Special	60C168
T_9	Transformer, IF: 16 megacycles; discriminator; shielded; shield can 1-7/8" lg x 1-7/16" wd x 4" h; powdered iron core; tuned primary and secondary; adjustable iron core tuning spade lug mtg on 1-7/8" x 1-7/16" mtg centers; 8 solder lug terminals at base; includes capacitors C_{40}, C_{41} and C_{42}, and resistors R_{45}, R_{46} and R_{53}.	EW Special	60C169
T_{10}	Transformer, AF: audio output; two windings; primary to match output of tube V_{13} (6V6GT), secondary to match 5000 ohm load; tapped to match 500 ohm load; enclosed in metal case.	H Special	55B012
T_{11}	Transformer, power: filament; primary for 220 volts, 50 cycles with tap for 115-volts; #1-secondary 2 amp 5 volts; #2 secondary 4 amp 6.3 volts; coil and core potted and sealed in metal case 3-15/16" x 2-1/4" x 4" overall, 2 mtg flanges each having 3 mtg holes 7/32" diam spaced 1-1/8" apart, 2 sets of mtg holes have 3-½" x 2-½" mtg centers.	H Special	52A044

Ref. Symbol	Name of Part and Description	Mfr Code and Type No.	Hallicrafter's Part No.
T_{12}	Transformer, power: plate; primary 230 volts, 50 cycles with tap for 115 volts; secondary 280 volts each side of center tap, 150 ma using 5U4G full wave rectifier and 10 mfd filter capacity; coil and core potted and sealed in metal case, 4-3/8" h x 3-21/32" wd x 3-21/32" d; 2 mtg flanges each having 3 mtg holes 7/32" diam spaced 1-3/8" apart, mtg centers 3-7/8" x 2-3/4".	H Special	52A043
TS_1	Board, terminal: mounts three brass, cadmium plated binding posts and nuts, and has two brass cadmium plated mtg inserts; base of black BM120 or 262 high impact bakelite; base 2-3/8" lg x 7/8" wd x 3/16" thk; mtg inserts centered on 3/4" x ½ mtg centers, have 0.144" clearance ID.	H Special	11B163
TS_2	Board, terminal: mounts two brass, cadmium plated binding posts and nuts, and has two brass cadmium plated mtg inserts; base of black BM120 or 262 high impact bakelite; base 1-5/8" lg x 7/8" wd x 3/16" thk; mtg inserts centered on ½" mtg centers have 0.144" clearance ID, same as TS_3.	H Special	11B162
TS_3	Same as TS_2.	-	-
V_1	Tube, detector amplifier pentode (acorn type); same as V_2, V_3.	RCA type 954	90X954
V_2	Same as V_1.	-	-
V_3	Same as V_1.	-	-
V_4	Tube, television amplifier pentode, same as V_8.	RCA type 6AC7	90X6AC7
V_5	Tube, television amplifier pentode.	RCA type 6AB7	90X6AB7
V_6	Tube, triple-grid super-control amplifier.	RCA type 6SK7	90X6SK7
V_7	Tube, twin diode; same as V_9.	RCA type 6H6	90X6H6
V_8	Same as V_4.	-	-
V_9	Same as V_7.	-	-
V_{10}	Tube, twin-triode amplifier.	RCA type 6SL7GT	90X6SL7GT
V_{11}	Tube, beam power amplifier.	RCA type 6V6 GT/G	90X6V6GT/G
V_{12}	Tube, voltage regulator (Glow discharge type).	RCA type OD3/VR-150	90XVR150
V_{13}	Tube, full-wave high-vacuum rectifier.	RCA type 5U4G	90X5U4G
V_{14}	Tube, detector, amplifier, oscillator (acorn type).	RCA type 955	90X955

SUPPLEMENTARY DATA

AUDIO POWER OUTPUT.

Speaker operation - 2 watts with less than 5% distortion
Headset operation - High impedance.

SENSITIVITY.

At 130 mc. - 15 microvolts. (For 500 milliwatt audio output.)
At 200 mc. - 7 microvolts, (For 500 milliwatt audio output.)

SIGNAL TO NOISE RATIO.

Not less than 5 to 1 when measured with a 3.5 microvolt, 400-cycle 30% modulated signal.

AUDIO FIDELITY.

Audio response is flat within ± 4 db. from 100 to 10,000 cycles per second.

IMAGE RATIO.

Not less than 60 db. between 130 mc. and 210 mc.

SELECTIVITY.

I-F selectivity measured at the grid of the mixer tube is not less than 140 kc. or more than 180 kc. at 6 db down from resonance. The receiver will be more selective when measured from the antenna terminals.

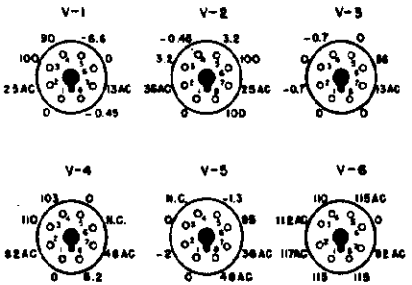
VOLTAGES AT TUBE TERMINALS

ALL VOLTAGES ARE DC UNLESS OTHERWISE SPECIFIED



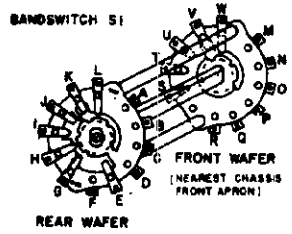
"N.C." MEANS NO CONNECTION.

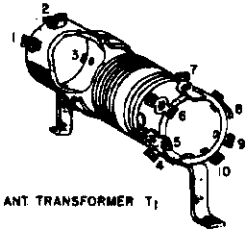
VOLTAGES LISTED WERE TAKEN WITH AN ELECTRONIC VOLT METER; AT 117 V. A-C LINE VOLTAGE; NO SIGNAL BEING RECEIVED. CONTROLS SET AS FOLLOWS:

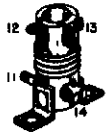
VOLUME	MAX. CLOCKWISE
TUNING	SET AT 550 KC
BANDSPREAD	SET AT 100
A.M./C.W.	SET AT "C.W."
RECEIVE/STANDBY	SET AT "RECEIVE"
NOISE LIMITER	SET AT "OFF"
BAND SELECTOR	SET AT "1"
SPEAKER/PHONES	SET AT "SPEAKER"

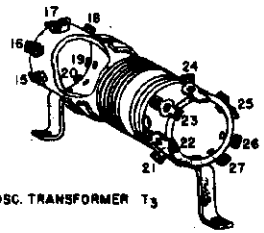
NOTE:
RESISTANCE VALUES ARE IN OHMS; MICA CAPACITOR VALUES ARE IN MMF.; PAPER CAPACITOR VALUES ARE IN DECIMAL EQUIVALENTS OF MFD; ELECTROLYTIC CAPACITOR VALUES ARE IN MFD.

IF PEAK 455 KC









August 1946

NOTE: DIMENSIONS & PROPORTIONS SHOWN IN PICTORIAL VIEWS HAVE BEEN EXAGGERATED FOR CLARITY OF TERMINAL LUG LOCATION.

DENOTES ELECTRICAL SHIELD.
DENOTES UNSHIELDED UNIT ASSEMBLY.
DENOTES MECHANICAL GANGING.

LETTERS AT BANDSWITCH (S_1) AND NUMERALS AT ANTENNA AND OSCILLATOR TRANSFORMERS (T_1-T_2 & T_3) IDENTIFY CORRESPONDING TERMINAL LUGS ON PICTORIAL VIEWS.

GENERAL: Model S-38 is a 6 tube AC/DC superheterodyne table model, radio receiver, incorporating 4 bands of AM/CW reception, as follows: band #1, 540 kc to 1650 kc; band #2, 1650 kc to 5.0 mc; band #3, 5.0 mc to 14.5 mc; band #4,

POWER SUPPLY DATA: 105 to 125 volts AC/DC line voltage. Power drain is 30 watts

IF FREQUENCY	IF SELECTIVITY	IMAGE RATIO	SENSITIVITY	AUDIO OUTPUT
455 kc	7 kc wide at 6 db down 65 kc wide at 60 db down (for 50 milliwatt output)	2.7:1 at 30 mc 6:1 at 14 mc 10:1 at 5 mc 35:1 at 1500 kc	12 microvolt at 600 kc 12 microvolt at 5 mc 11 microvolt at 14 mc 23 microvolt at 30 mc (for 50 milliwatt output)	675 milliwatt with less than 10% distortion at 400 cycles

EQUIPMENT:

1. Signal Generator capable of the ranges indicated in the Alignment Chart, including a 400 cycle audio modulator.
2. Output meter capable of handling 1 watt of audio power.
3. Standard RMA dummy consisting of a 200 mmf condenser in series with a 20uh r-f choke which is shunted by a 400 mmf condenser in series with a 400 ohm carbon resistor.
4. Non-metallic screw driver.

CONNECTIONS: Connect the Sig. Gen. "cold" lead to "G" on the antenna strip; the "hot" lead is connected as indicated in the Chart.

Connect the output meter across the terminals of socket SO-1 and remove the speaker plug from the socket and adjust the meter for 3 ohms impedance.
Caution: Set the meter at a sufficiently high range to prevent possible damage from overload.

CONTROL SETTINGS: After allowing about a ten minute warm up period, set the receiver's control as follows:

SPEAKER/PHONES switch at "SPEAKER."
VOLUME control at full clockwise (maximum).
CW/AM switch at "AM" (except for BFO adjustment).
NOISE LIMITER switch at "OFF."
BANDSPREAD TUNING control at "0," (min. cap.).
STANDBY/RECEIVE switch at "RECEIVE."

HOW TO RESTRING DIAL CORDS

To restring the main tuning dial cord, cut a 14" length of 30 lb. test dial cord and tie one end to the tension spring of the main tuning capacitor drive pulley at position "1" on the diagram. Following the numbers 1 through 15, wind the cord on the pulley and knob drive shaft. At position "15", stretch the tension spring and tie the cord securely. Cut off the excess cord. Note that two complete turns are wound on the knob drive shaft.

To restring the bandspread tuning dial cord, cut a 16" length of dial cord and follow the procedure as explained above, except start at position "A" on the diagram and proceed through position "S". Note that the knob drive shaft has two complete turns.

NOTES: 1. ALL RESISTOR VALUES ARE SHOWN IN OHMS.
2. ALL CAPACITOR VALUES ARE SHOWN IN MICROMICROFARADS UNLESS OTHERWISE SPECIFIED.

FREQUENCY COVERAGE.

The Model S-40 Radio Receiver provides continuous coverage over the frequency range from 550 kilocycles (kc) to 44 megacycles (mc) in four bands. Each band is provided with sufficient overlap to insure continuity of coverage over the entire tuning range. The frequencies covered per band are as follows:

Figure

Band	Coverage
1	550 kc. to 1700 kc.
2	1680 kc. to 5.4 mc.
3	5.3 mc. to 15.8 mc.
4	15.3 mc. to 44 mc.

POWER REQUIREMENTS.

The receiver is designed to operate from a 117-volt, 50/60 cycle single phase, (25/60 cycle if receiver has universal power transformer) a-c source or from a 6-volt storage battery and 260-volts of "B" battery. The "B" batteries may be replaced by a suitable vibrator type power supply if it meets the following current requirements:

A-C Operation	* D-C Operation
Line voltage . . . . . 117 volts	Filament voltage. . . . . 6.3 volts
Line current . . . . . 0.76 amp.	Filament current. . . . . 5 amps.
Power consumption. . . . . 75 watts	"B" voltage . . . . . 260 volts
	"B" current . . . . . 70 ma.

* The 6-volt battery drain using a vibrator type supply for "B" voltage will run approximately 10 amperes.

Audio Output Connections. - The headset jack marked PHONES, located on the front panel, provides output for headset reception. The circuit is such, that the speaker circuit is opened when the headset cord plug is inserted into the PHONE jack. The output of the first audio stage is then capacitively coupled to the PHONE jack.

Remote Operation Facilities. - The receiver may be disabled remotely by disconnecting the jumper wire between pins #3 and #4 on the shorting plug (PL-2), which is normally plugged into socket SO-1 during a-c operation, and connecting a remote switch or relay across these pins. The stand-by switch is connected in the "B" lead. When using the remote control disabling switch, the STANDBY/RECEIVE switch on the receiver must be set at STANDBY.

PREPARATION FOR USE.

A-C Operation. - The receiver may be operated from a 117-volt, 50/60 cycle, (25/60 cycle if universal power transformer is used) single phase a-c source of power. In the event that the receiver has a universal power transformer, check the line voltage and set the line voltage switch, located on top of the transformer, before connecting the receiver to a source of power. If the receiver power transformer is set for a higher line voltage than the source, it will not be damaged when connected to a line of lower voltage, but a receiver set for a lower line voltage will, in most cases, be damaged when plugged into an outlet having a higher line voltage.

D-C Operation. - The receiver may be operated from a 6-volt d-c source, generally a storage battery, and a 260-volt d-c supply in the form of dry batteries or vibrator type power pack. Consult the chart on power requirements for d-c operation in Section I, and provide battery facilities capable of supplying these demands. The receiver is connected to the d-c supply as follows:

(1) Remove the octal "jumper plug" (PL-2) used for a-c operation from socket SO-1. Use #18 (AWG) wire leads for the 260-volt "B" supply connections to pins #3 and #5, and #12 (AWG) wire leads for the 6-volt "A" battery connections to pins #1, #8 and #7.

CAUTION - Check your wiring carefully before connecting up to the battery supply.

OPERATION.

Listed below are the receiver controls and their settings for the two types of reception provided by this receiver, namely, phone and c-w code reception. Refer to Figure 1-1 or the front panel of the receiver.

a. **PHONE RECEPTION.** - To receive phone signals set the front panel controls as follows:

STANDBY/RECEIVE switch	- Set at RECEIVE. (Set at STANDBY to disable receiver for short standby periods.
BAND SELECTOR switch	- Set at range number corresponding to band covering desired frequency.
AM-CW switch	- Set at AM.
A.V.C. switch	- Set at ON.
NOISE LIMITER switch	- Normally set at OFF.

MODEL S-40

THE HALLICRAFTERS CO.

SENSITIVITY control	- Turn the control all the way clockwise to maximum.
VOLUME control	- Adjust for desired volume at headset or loudspeaker.
PITCH CONTROL	- Not used.
TONE control	- Set to please listener. Set at HIGH for normal reception. Generally set at LOW or MED. when noise level is high.
TUNING control	- Set calibrated dial to frequency of desired signal and adjust for maximum tuning meter deflection (if a tuning meter is used.) Dial frequency calibrations are true only with BANDSPREAD tuning dial set at zero.
BANDSPREAD Tuning control	- Use this control in conjunction with the TUNING control as described in the paragraph on bandspread tuning in this section. This control is used for finer tuning.

b. C-W Code Reception. - To receive continuous wave (c-w) code signals, set the front panel controls as follows:

BAND SELECTOR switch	- Set at range number corresponding to band covering desired frequency.
A.V.C. switch	- Set at OFF.
AM-CW switch	- Set at CW.
NOISE LIMITER switch	- Set at OFF.
TUNING control	- Set calibrated dial at frequency of desired signal. Tune for maximum signal level at headset or loudspeaker. Dial frequency calibrations are true only with the BANDSPREAD tuning dial set at zero.
SENSITIVITY control	- Turn up as high as the signal strength of the code signal will permit. Too much gain will result in distortion of the signal.
TONE control	- Set at LOW or MED.
VOLUME control	- Turn up to full clockwise.
BANDSPREAD tuning control	- Use this control in conjunction with the MAIN tuning control as described in the paragraph in bandspread tuning in this section. This control is used for finer tuning.
PITCH CONTROL	- Set at desired pitch of code signal by turning to the right or left.
STANDBY-RECEIVE	- Set at RECEIVE (Set at STANDBY to disable receiver for short standby periods.

GENERAL: Model S-40 is a 9 tube commercial superheterodyne table model, radio receiver, incorporating 4 bands of AM/CW reception, as follows: band #1, 540 kc to 1700 kc; band #2, 1.7 mc to 5.35 mc; band #3, 5.35 mc to 15.7 mc; band #4, 15.7 mc to 43 mc. Provision for variable sensitivity control; optional AVC, noise limiting, BFO pitch, tone, headset reception, and use of an external "S" meter; standby operation; and bandspreading are provided.

REAR PANEL CONNECTIONS: Consist of AC line cord with plug, antenna and ground connector strip, dc power input socket and external "S" meter connector socket.

POWER SUPPLY DATA: AC operation—117 volt, 50/60 single phase source. (Also, 110/130/150/220/250 volt, 25 cycles single phase source with special power transformer available, Hallicrafter's part #52CO27.) Power drain is 75 watts.

DC operation—filament 6.3 volt @ 3.5 amp; "B" supply 260 volt @ 70 ma. (The 6 volt battery drain for vibrator type supply for "B" voltage will run about 10 amp.)

FUNCTIONING OF PARTS

1. GENERAL.

Figure 4-1. shows, in a very simple block form, the plan of the circuit of the Model S-40 radio receiver. Note that the circuit is that of the conventional superheterodyne receiver. A signal received at the antenna is fed through an r-f amplifier stage to a combined mixer-oscillator stage where a local signal is generated and mixed with the incoming signal. An intermediate frequency signal selected at the output of the mixer stage is fed through two i-f amplifier stages to a combined detector audio amplifier stage where it is demodulated, amplified and fed through an audio power amplifier stage to a loud speaker. Provision is made for headset reception. A combined a-v-c and a-n-l stage is also included to provide improved reception. A beat frequency oscillator is incorporated for the reception of continuous wave (c-w) signals. Provision is also made for bandspread operation. An external tuning meter may be used with the receiver, provision being made at the rear of the receiver for connections.

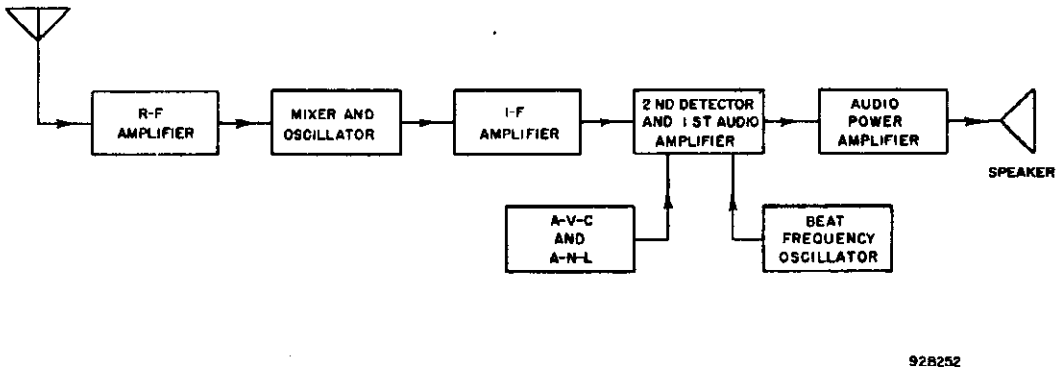

Figure 4-1. Radio Receiver Model S-40, block diagram.

2. DETAILED FUNCTIONING BY STAGES. (Refer to Fig. 7-7.)

Since the circuit functions of bands 1, 2, 3 and 4 are essentially identical, this discussion will describe the circuit with BAND SELECTOR switch (S-1A through S-1F) set at band 4 as shown in the schematic diagram.

a. R.F. Amplifier. - The r-f amplifier stage employs a type 6SG7 pentode tube in a conventional class A amplifier circuit. Signals present at the antenna are fed to the primary of transformer T-1 through terminals A-1 and A-2 of the antenna terminal strip TS-1. The secondary of transformer T-1 is tuned by the ganged tuning capacitor section C-6A and trimmer C-1. Ganged tuning capacitor section C-7A acts as a bandspread for the secondary of transformer T-1. R-f signals selected by the parallel resonant circuit are applied to the grid of tube V-1 and appear in greater amplitude across the primary of transformer T-5. Resistor R-1 and capacitor C-5 provide decoupling for the a-v-c voltage applied to the control grid. Parasitic resistors R-4 and R-31 prevents unwanted oscillations in this stage and tends to stabilize the amplifier. Resistor R-2, by-passed by capacitor C-8, provides self-bias for the stage. Resistor R-3 (SENSITIVITY control) regulates the bias to the grid. Resistor R-5 and capacitor C-9 act as a decoupling network for the screen of tube V-1. The signal voltage developed across the primary of transformer T-5 is then coupled to the grid of tube V-2 inductively through transformer T-5 and capacitively through capacitor C-10. Capacitor C-10 provides a small amount of coupling to improve the response at the high frequency end of the band, thus equalizing the r-f signal amplitude over the tunable frequency range.

b. Mixer-Oscillator. - The mixer-oscillator stage employs a type 6SA7 converter tube. The tube functions both as oscillator and mixer. The secondary of r-f transformer T-5 is tuned by section C-6B of the ganged tuning capacitor and trimmer C-12. Ganged tuning capacitor section C-7B acts as bandspread tuning for the secondary of transformer T-5. Ganged tuning capacitor section C-6C, trimmed by capacitor C-19, tunes the secondary of transformer T-9 which is part of the oscillator circuit. Ganged tuning capacitor section C-7C acts as bandspread tuning for the secondary of transformer T-9. A signal generated by the local oscillator, 455 kc. higher in frequency than the received signal on bands #1, #2, #3 and 455 kc. lower in frequency than the received signal on band #4, is mixed electronically in the mixer tube since the oscillator tube elements are included as part of the mixer tube V-2 in the same tube envelope. The frequency of oscillation is determined by a resonant circuit consisting of the secondary of transformer T-9 and section C-6C of the main tuning capacitor and trimmer capacitor C-19 connected in parallel. Section C-7C of the variable ganged bandspread capacitor is connected in parallel with section 6-6C of the main tuning capacitor for the purpose of effectively spreading or broadening the frequency range. Capacitor C-26 is an additional fixed trimmer across the resonant circuit. Capacitor C-18 provides increased gain for the oscillator on this band. Variable capacitors C-23, C-24, and C-25 are padders for bands #3, #2, and #1 respectively. Resistor R-7 is a grid return for the oscillator grid in tube V-2. Capacitor C-16 is the oscillator grid coupling capacitor while capacitor C-17 provides coupling and d-c blocking for the oscillator plate circuit. Resistor R-30 suppresses parasitic oscillations. Plate voltage for the screen grid of tube V-2, which also acts as oscillator plate, is applied through resistor R-8. The difference frequency of the oscillator and incoming signal frequencies is applied to the first i-f transformer T-13 primary which is tuned by capacitor C-29. Capacitor C-29 is a by-pass for the mixer plate.

c. First and 2nd I-F Amplifier. - The first and 2nd i-f amplifier stages employ type 6SK7 pentode tubes. I-f amplifier coupling transformer T-13, T-14, and T-15 for these two stages are tuned to 455 kc by adjusting the trimmer capacitors across each transformer primary and secondary. The gain of the 1st and 2nd i-f amplifier stages is varied by the SENSITIVITY control (R-3), connected in series with the cathodes of both tubes, to provide sensitivity control for the receiver. The a-v-c grid voltage is applied to this section of the receiver through resistor R-12 when A.V.C. switch S-2 is at OFFor in the open position. C-31 is an a-v-c by-pass for the control grid of 1st i-f amplifier tube V-3. Resistor R-9, by-passed by capacitor C-32, provides fixed bias for tube V-3. Resistor R-11 by-passed by capacitor C-35 provides fixed bias for 2nd i-f amplifier tube V-4. Capacitor C-39 is a plate by-pass for tube V-4. The signal voltage developed across the transformer T-15 primary is fed inductively to the 2nd detector.

d. 2nd Detector and 1st Audio. - Both the second detector and first audio amplifier stages employ a single type 6SQ7 duo diode-triode. The diode section of tube V-5 serves as a detector by rectifying the modulated carrier. The r-f filter for this type of detection consists of resistor R-14 and capacitors C-41 and C-42 connected in a pi-section. Automatic volume control and audio frequency voltage is obtained from a voltage divider consisting of resistors R-19, R-17 and R-15. Capacitor C-43 couples the 2nd detector to the VOLUME control, resistor (R-20). Resistor R-16 is bias for the first audio stage, part of tube V-5. Resistor R-22 is the plate load for the triode part of tube V-5. Capacitor C-44 acts as r-f filter at the plate. The audio frequency voltage is then fed through coupling capacitor C-45 to the grid of the output audio amplifier tube V-6.

e. Power Audio Amplifier. - The power audio amplifier stage is a class A amplifier employing a type 6F6-G pentode. Resistor R-23 is a grid return for the control grid of tube V-6. Resistor R-24, by-passed by capacitor C-46, supplies bias to the control grid. Resistor R-25 and capacitors C-47 and C-48 serve as a tone control circuit. Capacitor C-49 serves as by-pass for the screen grid. The audio signal is then fed through socket SO-3 and plug PL-3 to the primary of output transformer T-16 whence it is coupled inductively to the secondary and fed to the speaker LS-1 voice coil. An audio frequency signal is also fed from the grid of tube V-6 to PHONE jack J-1. Voltage is fed to the plate of tube V-6 through the primary of transformer T-16.

f. A.V.C. and NOISE LIMITER. - Both the automatic volume control and automatic noise limiter stages employ a single type 6H6 duo-diode. One diode of tube V-7 serves as the automatic volume control rectifier. The remaining diode section of tube V-7 serves as an automatic limiter as follows: Capacitor C-40 becomes charged by the rectified carrier voltage and the time constant of this capacitor and filter network associated with it is such that the audio frequency voltage variations do not alter this charge. During a severe noise pulse, however, the cathode of the diode plate connected to capacitor C-40 becomes more negatively charged than the charge held by capacitor

C-40 until the cathode voltage of the a-n-l diode again reaches a less negative potential than its plate and capacitor C-40 acquires its normal charge. By shorting the audio voltage to ground during a noise pulse, the a-n-l circuit prevents the objectionable noise pulses from reaching the audio amplifier stages.

g. **Beat Frequency Oscillator.** - The beat frequency oscillator employs a type 6J5 triode tube in a tuned-grid, untuned plate oscillator circuit. The oscillator frequency is adjusted by a moveable powdered iron core in the field of transformer T-17. This iron core adjustment sets the oscillator frequency at 455 kc. and is adjusted by a screw driver during alignment. The fine adjustment of the oscillator frequency required to provide control of the beat note frequency is controlled by a knob (PITCH CONTROL) from the front panel. The AM-CW switch controls the use of the oscillator by opening or closing the plate voltage lead to the tube. Resistor R-28 provides a load for the plate of tube V-8. Resistor R-29 is the oscillator tube V-8 grid return while capacitor C-55 provides grid coupling from the oscillator tank circuit. Capacitor C-54, across part of transformer T-17, resonates the tank circuit. Capacitor C-53 forms part of a series impedance circuit with part of transformer T-17. The beat frequency signal is coupled to the 2nd detector through capacitor C-38.

h. **Power Supply.** - The receiver has provisions for operation from either an a-c or d-c source.

(1) **A-C Operation.** - The receiver's power supply provides for operation from a 117-volt source. The a-c current is fed to the primary of power transformer T-18 through the line cord. A type 80 (tube V-9) full wave rectifier is employed in a conventional full wave rectifier circuit. The high voltage from this rectifier is fed to a filter network through the "Shorting Plug" on the rear apron of the receiver chassis as is the filament current for the heaters of the tubes. The STANDBY/RECEIVE switch is connected in series with the transformer T-18 center tap lead to ground (chassis), thereby disabling the receiver but at the same time keeping the tube heaters hot and ready for instant use. The filter circuit consists of a pi network made up of the speaker field coil and capacitors C-50 and C-51. Resistors R-26 and R-27 are part of a voltage divider and capacitor C-52 is a by-pass.

(2) **D-C Operation.** - External 6-volt storage battery and 260-volts of "B" batteries or storage battery and vibrator type supply provide for d-c operation. When operating from an external d-c supply the "Shorting Plug" on the rear apron of the receiver chassis is removed and a similar plug is wired to supply filament and plate current to the receiver circuits. The "B" voltage is fed to the input side of the filter sections used for a-c operation thereby insuring adequate filtering for vibrator type power supplies.

i. **Tuning Meter.** - The tuning meter "S METER" is not supplied with the receiver, but can be purchased on request from the company. Provision has been made on the rear apron of the receiver for the external connection of the "S" meter. A five prong plug is wired to the meter as indicated in figure 4-2 and should be plugged into socket SO-2. When metering reception, the meter measures a voltage drop across resistor R-27 e.i. a change in screen current of first and second i-f amplifier tubes V-4 and V-3.

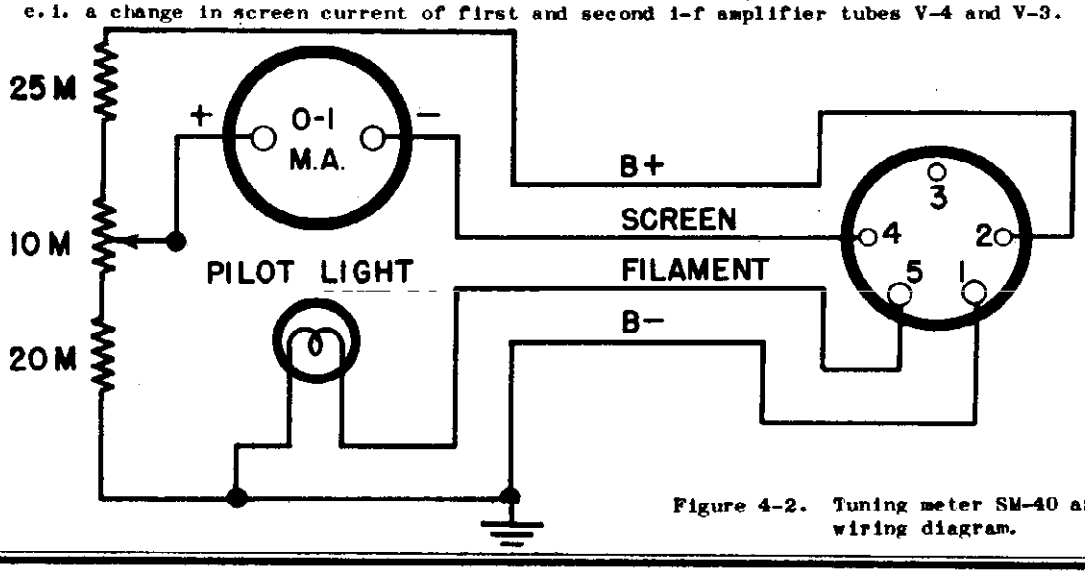

Figure 4-2. Tuning meter SM-40 and schematic wiring diagram.

MAINTENANCE

CAUTION. - Voltages at various points in this equipment are of sufficiently high potential to produce a severe shock. Locate the high - potential points on the VOLTAGE CHART before attempting to service circuits that are "hot". IT IS A GOOD RULE TO DISCONNECT THE POWER SOURCE BEFORE MAKING ADJUSTMENTS WHEN POSSIBLE. BE CAREFUL.

1. PREVENTIVE MAINTENANCE.

All components of the receiver should be given a thorough inspection at regular intervals. The time interval between inspections will be determined by the operating conditions of the individual installation. In general, keep the components clean and dry. Moisture, even in a completely tropicalized set may cause serious deterioration and produce general unsatisfactory operation. Dust and dirt materially effect both electrical and mechanical operation. Keep the various parts clean, especially the tuning capacitors. Dust should be blown out with dry air or brushed out carefully without bending the gang plates in the slightest. Noisey reception may also be caused by dirty condenser wipers, faulty gain controls and switches, frayed cable connections, faulty tubes, etc. in the installation. Check accessible connections, switch contacts, etc. regularly, making sure that all are clean and tight and the tubes and cable connectors are held securely in their sockets.

2. REPLACING TUBES, LAMPS, and FUSES.

a. Replacing Tubes. - All tubes are accessible at the top of the chassis through the hinged cover of the cabinet. When replacing tubes, check the tube type carefully and replace with the correct type. Refer to the top view of the chassis to determine the location of the tubes and to the PARTS LIST for the type number and description of each.

b. Replacing Lamps. - The receiver employes two lamps with bayonet type sockets to illuminate the calibrated tuning dial and the bandspread tuning dial. The lamps are to be replaced with a 6/8-volt, 250 ma. (blue bead) G.E. #44 or equivalent. The color code referred to, is the color of the glass bead above the glass stem inside the envelope of the lamps.

3. PERIODIC ADJUSTMENTS.

a. Receiver Alignment. - The receiver has been carefully aligned at the factory and should not require realignment until the receiver requires new tubes in the r-f and i-f amplifier stages, or shows signs of loss of sensitivity, off frequency calibration or requires service work on one or more of its r-f and i-f amplifier stages. Alignment should not be attempted by inexperienced persons as maximum performance is obtained only by careful and intelligent alignment.

(1) Aligning Tools. -

(a) Signal generator capable of providing a 400 cycle modulated signal at 455 kc, and 550 kc. to 44 mc. range.

(b) A 390 ± 20% ohm non-inductive carbon dummy antenna resistor.

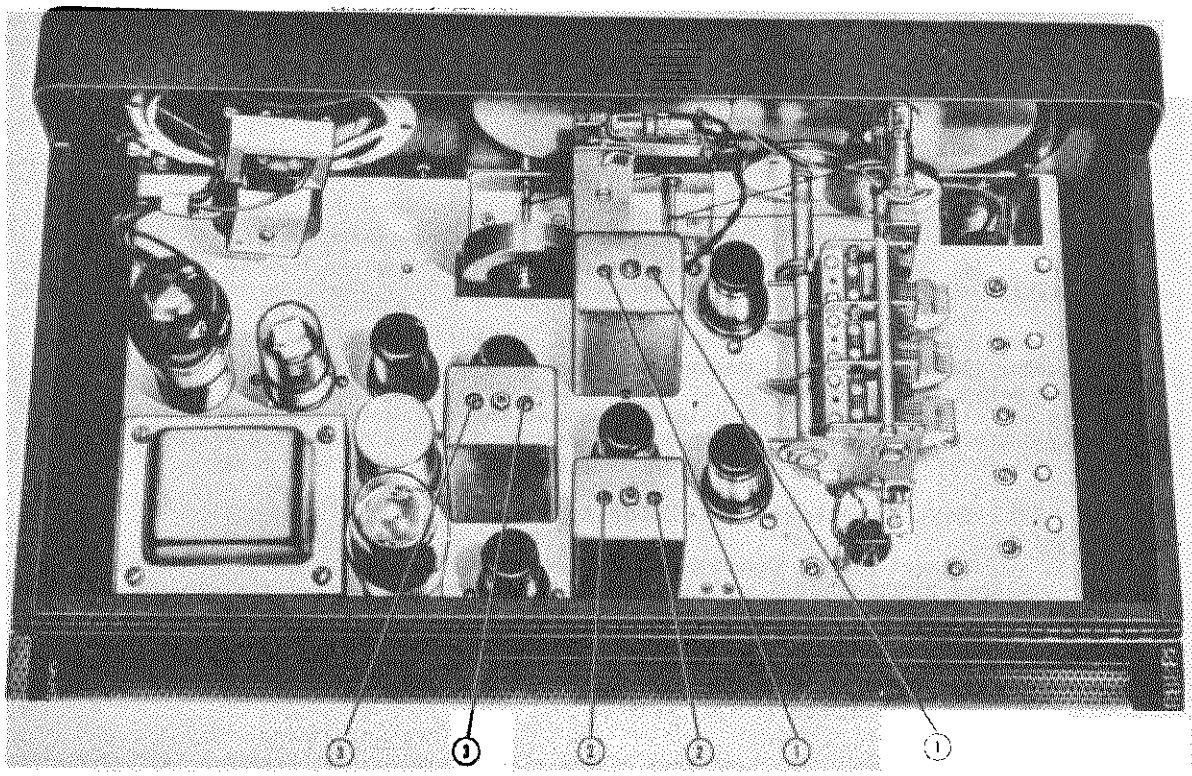
(c) Non-metallic screw driver. A bakelite screw driver with a short metal blade is very good.

(d) Audio output meter capable of handling 1.5 watts of audio power for speaker load.

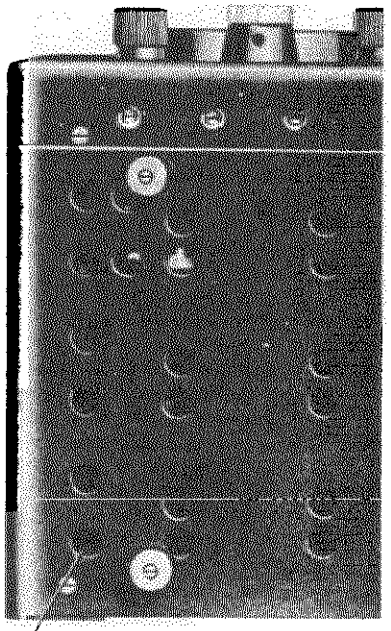
(2) I-F Amplifier Alignment. - (See Fig. 5-1)

(a) Connect the "hot" lead of the generator directly to the stator plates of the center section of the main tuning capacitor gang (the solder lug on top of that section). Connect the ground wire of the generator to the receiver chassis. Set main tuning capacitor at minimum capacity (open).

(b) Connect the output meter across the speaker voice coil and set the meter range switch for its highest range to prevent overloading the meter accidentally.



① I-F Adjustments for 1st I-F Transformer T-13
② I-F Adjustments for 2nd I-F Transformer T-14
③ I-F Adjustments for 3rd I-F Transformer T-15



R-F and oscillator adjustment holes

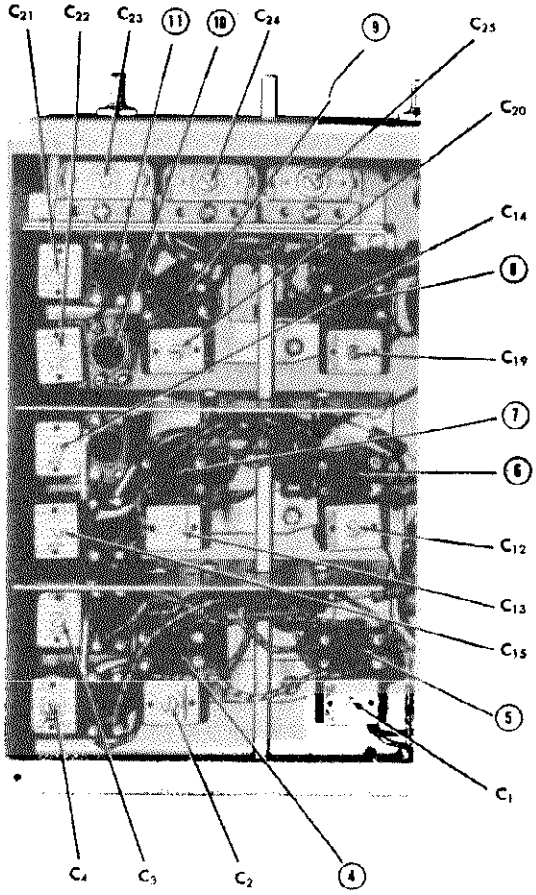


Figure 5-1. Radio Receiver Model S-40, view showing aligning points.

(c) Let the receiver warm up for approximately ten minutes, then set the receiver controls as follows:

SENSITIVITY control at maximum sensitivity (full clockwise).
VOLUME control at maximum volume (full clockwise).
A.V.C. switch at OFF.
NOISE LIMITER switch at OFF.
CW-AM switch at AM.
TONE control at HIGH.
STANDBY/RECEIVE switch at RECEIVE.

(d) Set the signal generator frequency at 455 kc, and turn on the 400-cycle modulation.

(e) Adjust transformers T-13, T-14, and T-15 for maximum output meter reading using just enough signal generator output to provide a good resonant swing on the output meter. The signal level at the generator should be approximately 52 microvolts for a 500 milliwatt audio output level. Repeat the alignment procedure until assured of accurate alignment. Refer to figure 5-1 for the location of i-f transformer adjustment screws #1 through #3 inclusive on transformers T-13, T-14, and T-15.

(3) Beat Frequency Oscillator Adjustment. -

Connect signal generator as in paragraph (2). Turn 400-cycle modulation off. Remove PITCH CONTROL knob with an Allen wrench and adjust the slotted screw shaft for zero beat. Replace knob so that red mark is on top.

(4) R-F Amplifier Alignment. -

†See note at end of this section.

(a) Connect the "hot" lead of the signal generator to terminal "A1" of the antenna terminal board through a 390 ± 20% ohm non-inductive carbon resistor. Connect the ground lead of the generator to the receiver chassis. Leave the jumper connected between terminals "A2" and "GND". Turn on the 400-cycle modulation.

(b) Let the receiver warm up for approximately ten minutes, then set the receiver controls as follows:

SENSITIVITY control at maximum sensitivity (full clockwise).
VOLUME control at maximum volume (full clockwise).
A.V.C. switch at OFF.
NOISE LIMITER switch at OFF.
CW-AM switch at AM.
TONE control at HIGH.
STANDBY/RECEIVE switch at RECEIVE.

NOTE - For all alignment adjustments, the signal generator output attenuator must be adjusted to provide a 500 milliwatt audio signal output at the speaker socket of the receiver on the output meter.

NOTE - Refer to figure 5-1 for all r-f alignment points.

(c) Band 4. Alignment. -

(1) Set the signal generator at 36 mc. and tune in its signal on the receiver. If the receiver's calibrated dial reads 36 mc. no adjustment is necessary - if not, adjust oscillator trimmer capacitor C-19 for maximum output with the receiver dial set at 36 mc.

(2) Set the signal generator at 18 mc. and tune in its signal on the receiver. If the receiver's calibrated dial reads 18 mc. no adjustment is necessary - if not, adjust slug #8 on transformer T-9 for maximum output with the receiver dial set at 18 mc.

NOTE - If slug #8 has been adjusted it will be necessary to repeat step (1) again. Several adjustments of capacitor C-19 in step (1) and slug #8 in step (2) may be required in cases where the transformer has been greatly detuned or a new transformer has been installed.

(3) Set signal generator and receiver at 36 mc. and adjust trimmers C-1 and C-12 for maximum output.

(4) Set signal generator and receiver at 18 mc. and adjust slugs #5 and #6 for maximum output.

NOTE - If slugs #5 and #6 have been adjusted, it will be necessary to repeat step (3) again. Several adjustments of capacitors C-1 and C-12 and slugs #5 and #6 may be required in cases where the transformer has been greatly detuned or a new transformer has been installed.

(d) Band 3. Alignment. -

(1) Set the signal generator at 14 mc. and tune in its signal on the receiver. If the receiver's calibrated dial reads 14 mc. no adjustment is necessary - if not, adjust oscillator trimmer capacitor C-20 for maximum output with the receiver dial set at 14 mc.

(2) Set the signal generator at 7 mc. and tune in its signal on the receiver. If the receiver's calibrated dial reads 7 mc. no adjustment is necessary - if not, adjust oscillator padder capacitor C-23 for maximum output with the receiver dial set at 7 mc.

NOTE - If capacitor C-20 has been adjusted it will be necessary to repeat step (1) again. Several adjustments of capacitor C-20 in step (1) and capacitor C-23 in step (2) may be required in cases where the transformer has been greatly detuned or a new transformer has been installed.

(3) Set the signal generator at 10 mc. and tune in its signal on the receiver. If the receiver's calibrated dial reads 10 mc. no adjustment is necessary - if not, adjust slug #9 on transformer T-10 for maximum output with the receiver dial set at 10 mc.

(4). If slug #9 has been adjusted, repeat steps (1) and (2).

(5) Set the signal generator and receiver at 14 mc. and adjust trimmers C-2 and C-13 for maximum output.

(6) Set signal generator and receiver at 7 mc. and adjust slugs #4 and #7 for maximum output.

NOTE - If slugs #4 and #7 have been adjusted, it will be necessary to repeat step (3) again. Several adjustments of capacitors C-2 and C-13 and slugs #4 and #7 may be required in cases where the transformer has been greatly detuned or a new transformer has been installed.

(e) Band 2. Alignment. -

(1) Set the signal generator at 5 mc. and tune in its signal on the receiver. If the receiver's calibrated dial reads 5 mc. no adjustment is necessary - if not, adjust oscillator trimmer capacitor C-21 for maximum output.

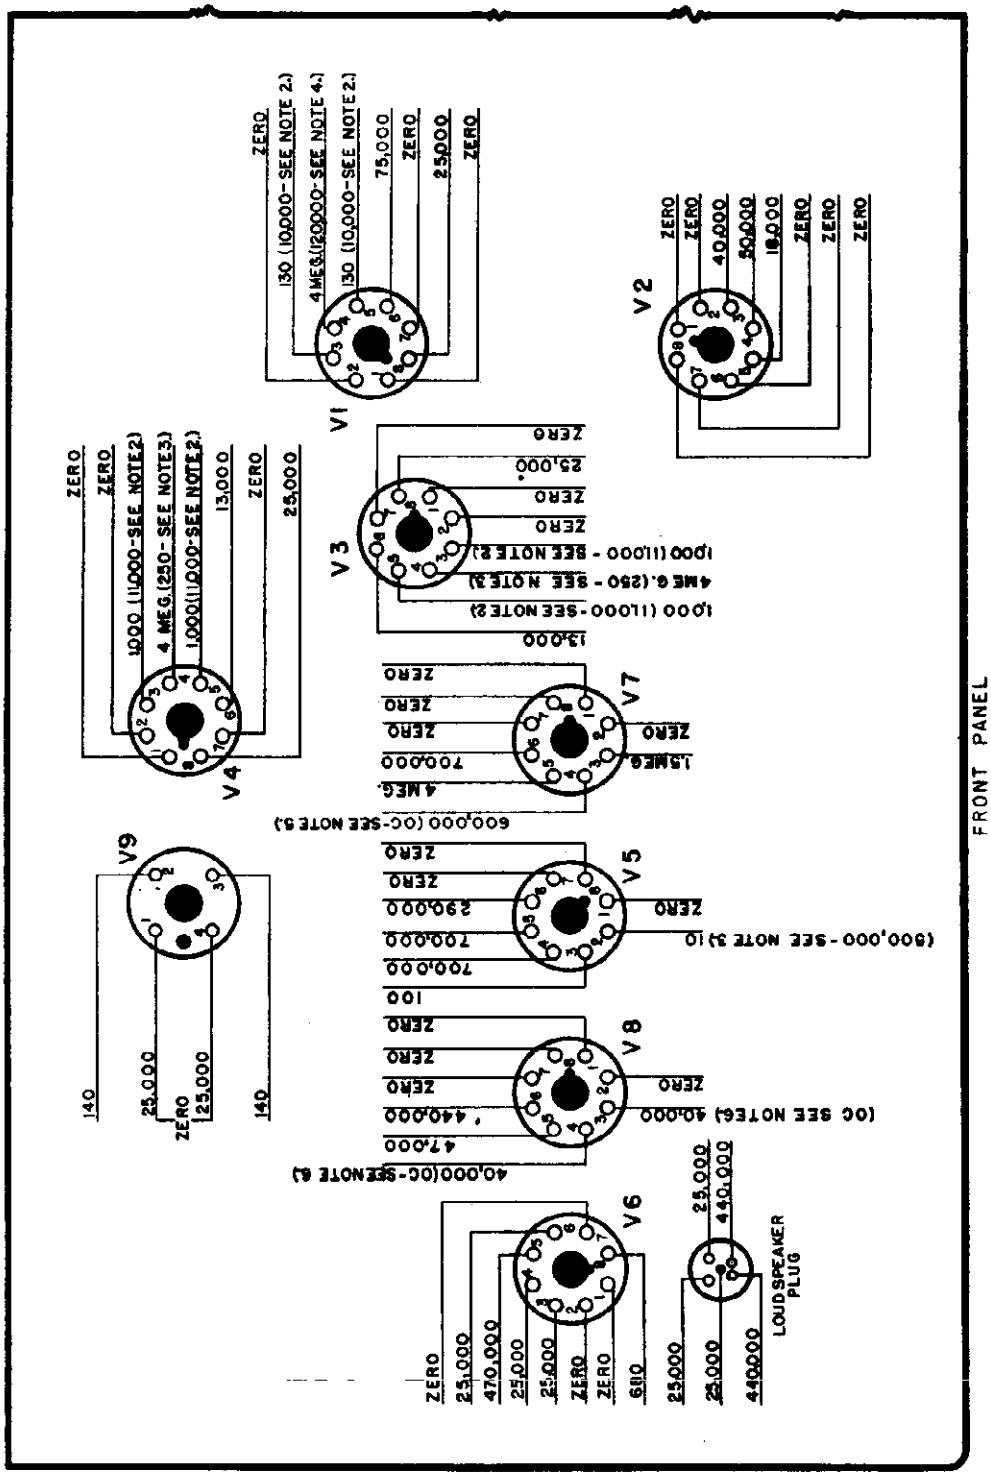
(2) Set the signal generator at 1.8 mc. and tune in its signal on the receiver. If the receiver's calibrated dial reads 1.8 mc. no adjustment is necessary - if not, adjust oscillator padder capacitor C-24 for maximum output with the receiver dial set at 1.8 mc.

NOTE - If capacitor C-21 has been adjusted it will be necessary to repeat step (1) again. Several adjustments of capacitor C-21 in step (1) and capacitor C-24 in step (2) may be required in cases where the transformer has been greatly detuned or a new transformer has been installed.

(3) Set the signal generator at 3 mc. and tune in its signal on the receiver. If the receiver's calibrated dial reads 3 mc. no adjustment is necessary - if not, adjust slug #11 on transformer T-11 for maximum output with the receiver dial set at 3 mc.

MODEL S-40

THE HALLICRAFTERS CO.



NOTES:
1. CIRCUIT RESISTANCES LESS THAN ONE OHM ARE SHOWN AS "ZERO".
2. RESISTANCE READING WITH "SENSITIVITY" CONTROL SET AT MINIMUM SENSITIVITY.
3. RESISTANCE READING WITH "VOLUME" CONTROL SET AT MINIMUM VOLUME.
4. RESISTANCE READING WITH "A.V.C." SWITCH SET AT "OFF."
5. RESISTANCE READING WITH "NOISE LIMITER" SWITCH SET AT "OFF."
6. RESISTANCE READING WITH "C.W.-A.M." SWITCH SET AT "A.M."
7. O.C. - OPEN CIRCUIT.

Figure 5-3. Radio Receiver Model S-40, resistance chart.

(4) If slug #11 has been adjusted repeat steps (1) and (2).

(5) Set the signal generator and receiver at 5 mc. and adjust trimmers C-3 and C-14 for maximum output.

(f) Band 1. Alignment. -

(1) Set the signal generator at 1500 mc. and tune in its signal on the receiver. If the receiver's calibrated dial reads 1500 kc. no adjustment is necessary - if not, adjust oscillator trimmer capacitor C-22 for maximum output with the receiver dial set at 1500 kc.

(2) Set the signal generator at 600 kc. and tune in its signal on the receiver. If the receiver's calibrated dial reads 600 kc. no adjustment is necessary - if not, adjust oscillator padder capacitor C-25 for maximum output with the receiver dial set at 600 kc.

NOTE - If capacitor C-22 has been adjusted it will be necessary to repeat step (1) again. Several adjustments of capacitor C-22 in step (1) and capacitor C-25 in step (2) may be required in cases where the transformer has been greatly detuned or a new transformer has been installed.

(3) Set the signal generator and receiver at 1000 kc. and tune in its signal on the receiver. If the receiver's calibrated dial reads 1000 kc. no adjustment is necessary - if not, adjust slug #10 on transformer T-12 for maximum output with the receiver dial set at 1000 kc.

(4) If slug #10 has been adjusted repeat steps (1) and (2).

(5) Set the signal generator and receiver at 1500 kc. and adjust trimmers C-4 and C-15 for maximum output.

NOTE - After completing the above r-f alignment procedure check the image frequency to determine whether the oscillator frequency is higher than the signal frequency on bands 1, 2 and 3, and lower than the signal frequency on band 4.

(g) When completely aligned the overall receiver sensitivity will usually run from 7.2 microvolts at 600 kc. to 5 microvolts at 36 mc. for 500 milliwatts audio output. If your receiver falls reasonably close to this sensitivity, consider your job finished.

4. LOCATING FAULTS WITH A VOLT-OHM METER.

a. Voltage Chart. Refer to schematic for the tube socket terminal voltages. Voltages shown are those between the terminal and ground (chassis) unless otherwise specified. The readings were taken with a Weston Model 772 Analyzer using 20,000 ohm per volt sensitivity. To prepare the receiver for measurement, disconnect the antenna, connect a jumper between the antenna terminals A1, A2, and G, and set the controls as follows:

STANDBY/RECEIVE switch at RECEIVE.
A.V.C., NOISE LIMITER at ON and AM-CW switch at CW.
SENSITIVITY and VOLUME controls full clockwise.
TUNING, and PITCH CONTROL adjustments do not effect the reading.
TONE control at any one of the three tone positions.

b. Resistance Chart. - Refer to Fig. 5-3. for the tube socket terminal to ground (chassis) resistance measurements. To identify tube socket connections, refer to Fig. 7-6. The readings were taken with a Weston Model 772 Analyzer. To prepare the receiver for measurement, disconnect the a-c line cord and set the controls as follows:

STANDBY/RECEIVE switch at RECEIVE.
A.V.C., NOISE LIMITER at ON and AM-CW switch at CW.
SENSITIVITY and VOLUME controls full clockwise position.
TONE control at any one of the three tone positions.
TUNING and PITCH control adjustments do not effect the readings.

c. Checking Transformer and Inductor Windings With an Ohm-meter. -

NOTE - One terminal of each winding measured must be disconnected from the circuit to avoid measuring circuit resistance instead of winding resistance alone as indicated in the chart.

Circuit Symbol	Name of Part	Winding	Winding Terminals	D-C Resistance (Ohms)
T-16	TRANSFORMER, audio	Primary	Primary	400
		Secondary	Secondary	* 5
SPKR FIELD	Speaker field	-	-	1500
T-18	TRANSFORMER, power	Primary	1 to 3	6
		H.V. secondary	6 to 10	280
		½ H.V. secondary	6 to 8	140
			8 to 10	140
		6.3-volt secondary	2 to 4	ZERO
		5.0-volt secondary	7 to 9	ZERO

* With speaker plug in socket.

†Note Rock main tuning gang capacitor when making r-f adjustments on bands 3 and 4.

TUBE COMPLEMENT.

Symbol	Tube Type	Function
V-1	6SG7	R-F amplifier
V-2	6SA7	Mixer and local oscillator.

CONTROL SETTINGS FOR PRELIMINARY TEST OPERATION (Broadcast Band)

REF. NO. (in Fig. 1)	NAME	FUNCTION	SETTING
1	SENSITIVITY	RF gain control	Maximum clockwise
2	BAND SELECTOR	Operating band selector	Counter clockwise to "1"
3	VOLUME	Audio gain control	Half clockwise; adj. as necessary
4	AVC	Automatic volume control	AT "ON"
5	TUNING	Main tuning control	To local station freq. on main dial scale
6	CW/AM	BFO on/off switch	At "AM"
7	NOISE LIMITER	Noise peak limiting	At "OFF"
8	BAND SPREAD	Short wave band spreading	To "0" on small dial scale
9	TONE	Receiver on/off switch and tone control	Clockwise to "MED"
10	PITCH CONTROL	CW beat note pitch selector	Any position (not in use)
11	PHONES jack	Headset connection	Not used
12	STANDBY RECEIVE	Receiver temporary standby	At "RECEIVE"

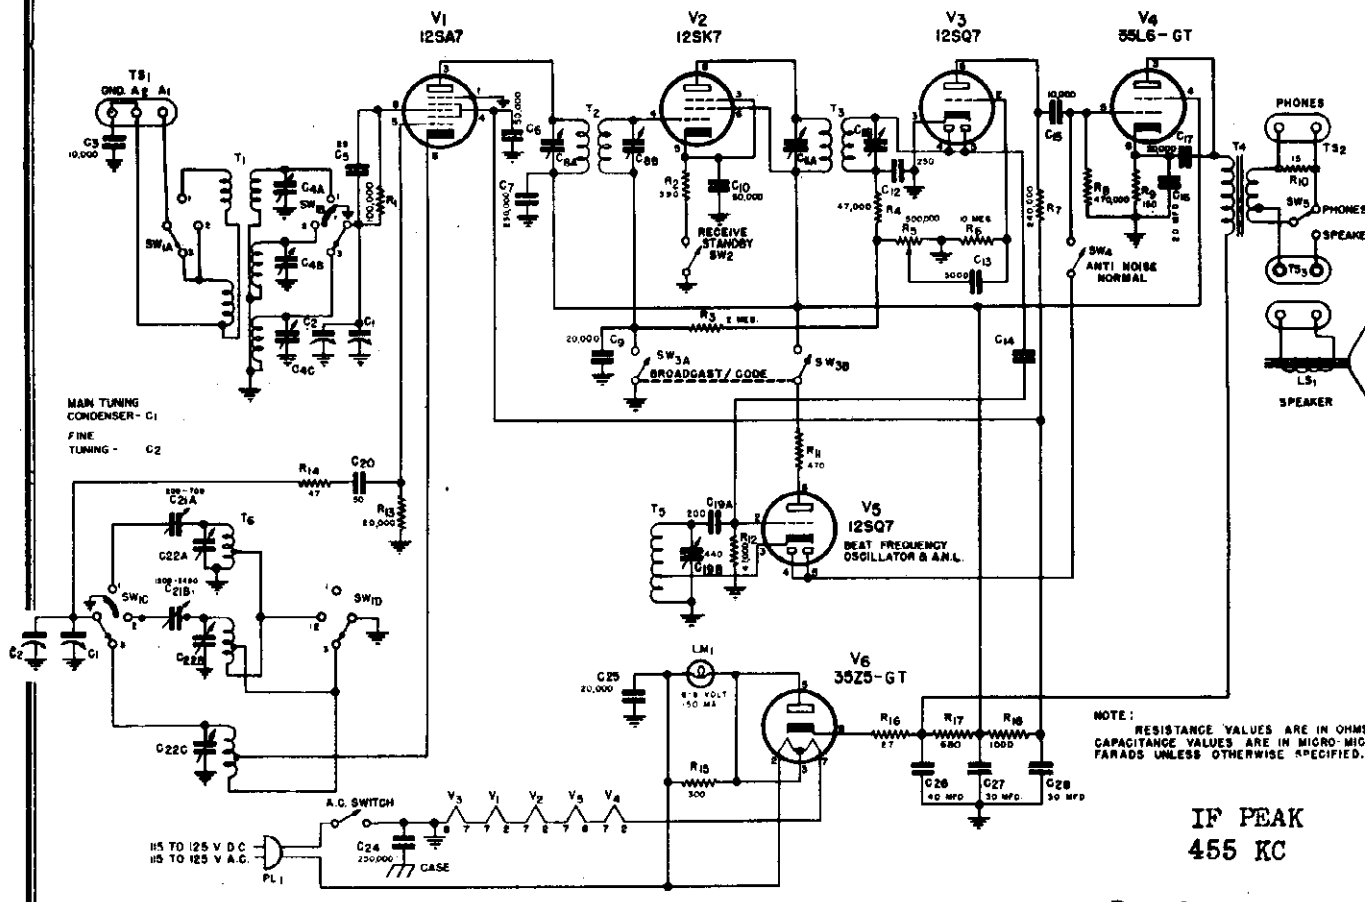
THE HALLICRAFTERS CO. MODELS S-41C, S-41



December 1945

Foreign and Domestic Broadcast Reception. - To receive broadcast stations set the control as follows:

VOLUME control	- Set at OFF when the receiver is not in use. Turn to the right until desired volume is obtained after tuning in the station.
BAND SELECTOR switch	- Set at band number corresponding to the range covering desired frequency of reception.
BROADCAST-CODE switch	- Set at Broadcast. This switch may be set at CODE to help tune in weak phone signals by tuning for zero beat and then switching back to BROADCAST.
PHONES/SPEAKER switch	- Set at PHONES for headset reception; set at SPEAKER for loud speaker reception.
RECEIVE-STANDBY switch	- Set at RECEIVE when listening, set at STANDBY during short standby periods.
FINE TUNING control	- Set at zero when tuning in stations with the MAIN TUNING control. Tuning dial calibrations are true only when the FINE TUNING pointer is set at zero. Use the FINE TUNING control for amateur band reception or for vernier tuning in the short wave bands.
MAIN TUNING control	- Set main tuning pointer at frequency of desired station. FINE TUNING pointer must be set at zero for true calibration.
ANTI NOISE-NORMAL switch	- Set at NORMAL unless background noise is excessive.

Foreign and Domestic Code Reception. - To receive code stations set the BROADCAST-CODE switch at CODE. All other controls are to be handled as for foreign and domestic broadcast.

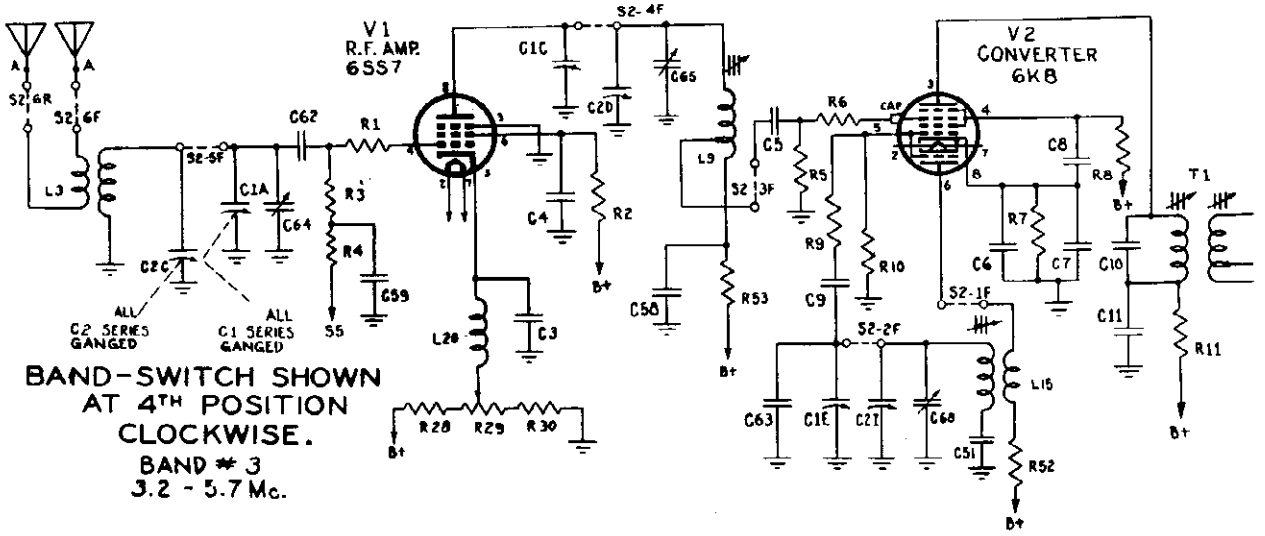
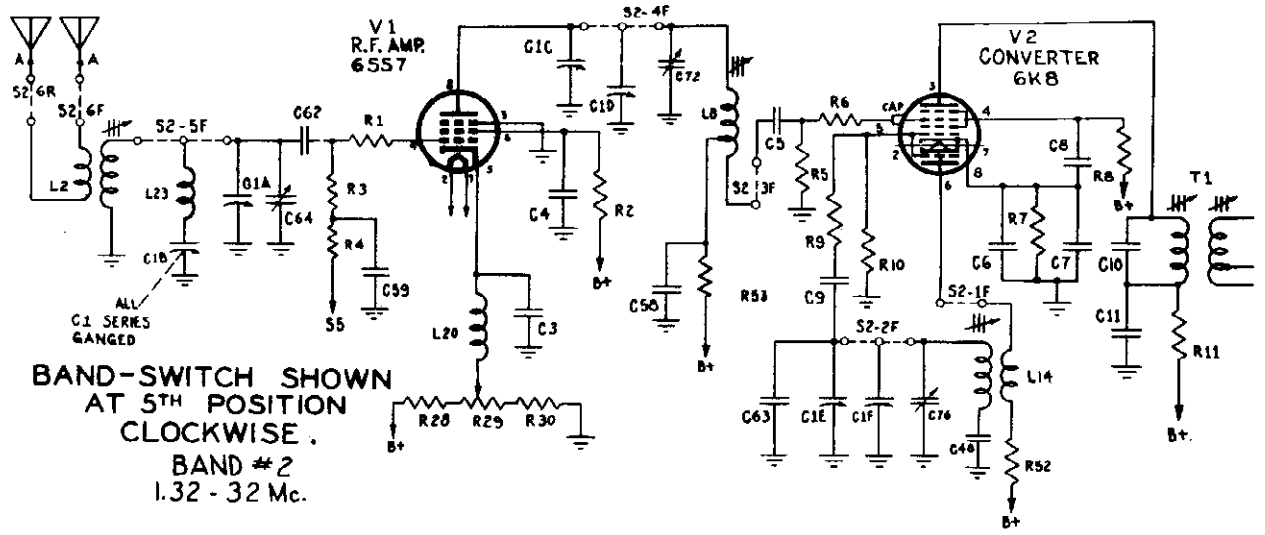
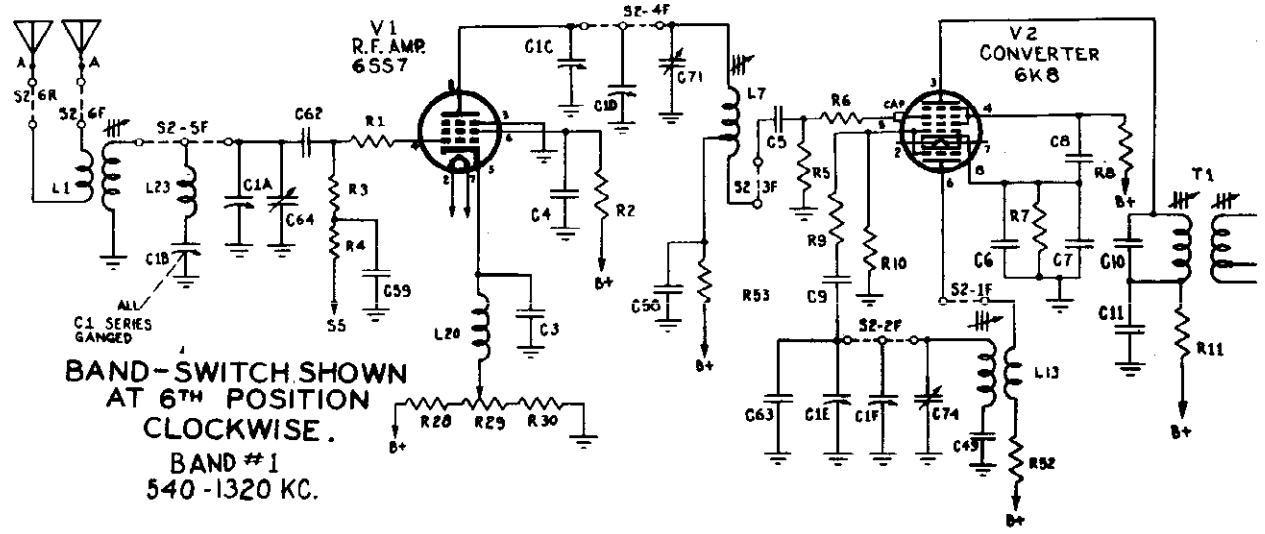
MODEL HQ-129-X

HAMMARLUND MFG. CO. INC.







TECHNICAL DESCRIPTION

This receiver is sensitive enough to pick up extremely weak signals and has the selectivity to separate signals in the more crowded bands. It covers a continuous range of frequencies from 540 KC. to 31 MC, or from 555 meters to 9.7 meters, in six bands. Band spread tuning is supplied on the four higher frequency bands, with actual calibration in the 80, 40, 20 and 10 meter amateur bands.

DESIGN

PRE-SELECTION

The pre-selection or tuned R.F. stage for each band of this receiver is designed for high performance. Entirely individual tuning coils are used for each band. These along with the multi-section variable condenser permit the proper LC ratio for best performance to be used with each band. Both grid and plate circuits are tuned. A compensating condenser, adjustable from the front of the panel, provides perfectly aligned input circuits with any given antenna system.

These features of design provide high selectivity and high gain and afford maximum signal-to-noise ratio and maximum image signal rejection.

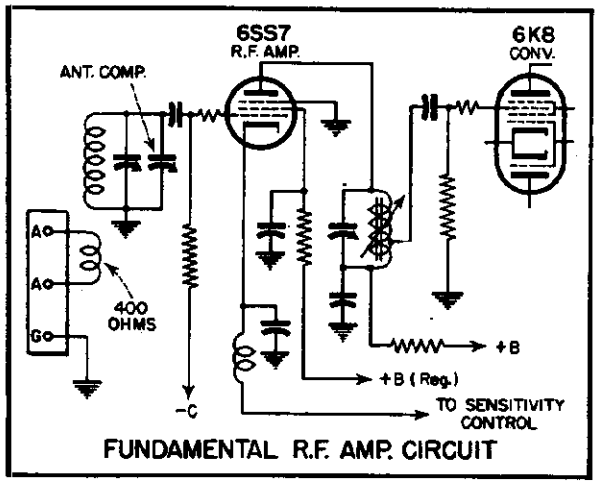


Fig. 2—Tuned R.F. amplifier and converter. Careful circuit design improves signal-to-noise ratio.

TUNING RANGES

Band	*Frequency*	*Meters Wave Length*
1	540 —1320 KC	555 —227
2	1.32—3.2 MC	227 —93.7
3	3.2 —5.7 MC	93.7—52.6
4	5.7 —10 MC	52.6—30.0
5	10 —18 MC	30 —16.7
6	18 —31 MC	16.7—9.7

TUBE LINE-UP

Symbol		*Type*	*Function*
V-1	6SS7	Triple-Grid Super Control Amplifier, Single Ended	R.F. Amplifier
V-2	6K8	Triode-Hexode Converter	Converter or 1st Detector and Oscillator
V-3	6SS7	See Above	1st I.F. Amplifier
V-4	6SS7	See Above	2nd I.F. Amplifier
V-5	6SS7	See Above	3rd I.F. Amplifier
V-6	6H6	Twin Diode	Detector and Noise Limiter
V-7	6SN7GT/G	Twin Triode Amplifier	1st Audio Amplifier and "S" Meter Tube
V-8	6V6GT/G	Beam Power Amplifier	Audio Power Amplifier and output Tube
V-9	6SJ7	Triple Grid Tube	Beat Frequency Oscillator
V-10	5U4G	Full Wave Rectifier	Rectifier
V11	0C3/VR105	Voltage Regulator	Voltage Regulator

BAND SPREAD

An exceptionally wide band spread of 310 degrees supplied by a special 9 section condenser, is provided on the 4 higher frequency ranges. The band spread dial has 5 scales. Four of these are directly calibrated for the 80, 40, 20 and 10 meter amateur bands. The fifth

scale is an arbitrary 0-200 division scale, provided for making up calibration charts for other bands, such as the short wave international broadcast bands. It is also of use in logging stations.

The following table shows the approximate frequency range that can be covered by the band spread dial at different points on each of the 4 higher frequency bands.

Band	*Low End*	*Middle*	*High End*
3.2 MC— 5.7 MC	.4 MC	.7 MC	1.25 MC
5.7 MC— 10 MC	.2 MC	.5 MC	.9 MC
10 MC— 18 MC	.2 MC	.5 MC	.9 MC
18 MC— 31 MC	.6 MC	1.2 MC	2.2 MC

It should be noted that the Main Tuning dial has been calibrated with the Band Spread dial set at 200 which corresponds to minimum band spread capacity included in the circuit. To use band spread tuning, the Main Tuning dial should be set at the high frequency end of the desired band with the Band Spread dial set at 200. Lower frequencies such as those in the above table will then be obtained as the Band Spread dial setting is decreased.

CONVERTER STAGE

This converter stage uses the triode-hexode 6K8 tube which becomes more efficient as the frequency increases. The design of this converter stage is such that the over-all RF gain is relatively constant and uniform over the whole range of the receiver. This provides uniform operation and provides a true indication of signal strength, as shown on the "S" meter, over all the bands.

The stability of the oscillator is insured by a drift compensator, by low loss tube sockets, and by a ceramic oscillator switch section. It is further insured by its operation from a controlled voltage circuit which uses the OC3/VR-105 Voltage Regulator tube to keep the voltages constant regardless of line voltage fluctuation.

All these factors aid in maintaining the accuracy of the calibration of the receiver.

CRYSTAL FILTER AND PHASING CIRCUIT

The patented crystal filter included in the HQ-129-X Receiver is an outstanding Hammarlund development. Five degrees of selectivity, selected by a six-position panel control, are provided for reducing interference. Steps 1, 2, and 3, varying from broad to fairly sharp, may normally be used for phone reception, depending upon the degree of fidelity desired. Steps 4 and 5, giving sharper selectivity, may be used for CW code reception. The "OFF" position of the control cuts out the crystal filter when broadest selectivity or highest fidelity is desired. The curves of Fig. 5, indicate the degrees of broadness or sharpness that may be obtained.

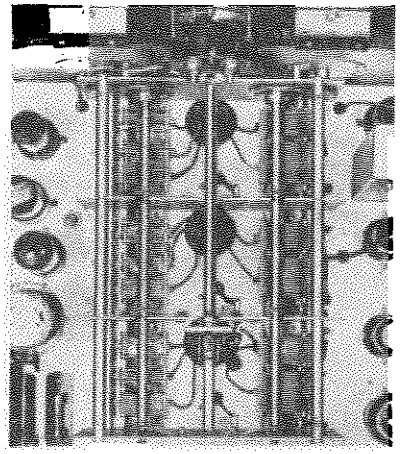

Fig. 3—Precision H.F. tuning assembly.

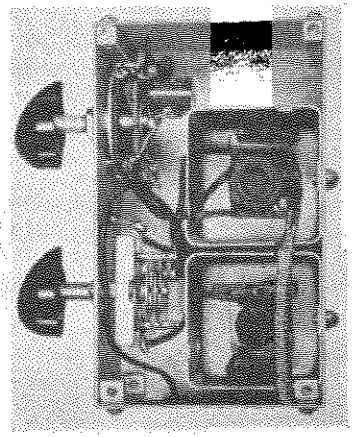

Fig. 4—Crystal Filter unit.

Along with the crystal filter, a phasing control is provided to eliminate interfering heterodynes, within limits. Fig. 5, is a schematic diagram of the filter and phasing circuit. The complete unit is shown in Fig. 4.

The over-all gain of the receiver is not noticeably affected by the changes in selectivity of the filter nor is the reading of the "S" Meter appreciably affected.

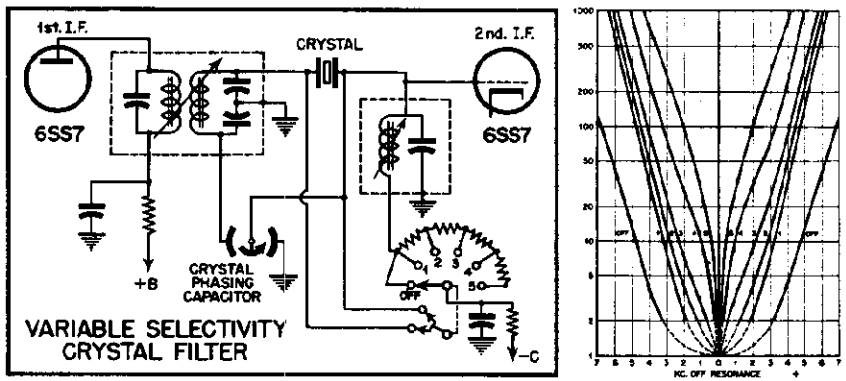

Fig. 5—Selectivity curve and crystal filter circuit.

I. F. AMPLIFIER

Three stages of I.F. amplification are provided. The gain per stage is purposely made low, in order to maintain stability. Iron core permeability-tuned transformers are used for improved performance and for ease of adjusting. Silvered mica condensers are used in each transformer circuit to improve its stability. The intermediate frequency is 455 KC—the R.M.A. standard frequency.

Over-all selectivity curves for this amplifier and the crystal filter are shown in Fig. 5.

A.V.C. SYSTEM

The automatic volume control system in the HQ-129-X gives remarkably smooth operation. The RF stage and the first two I.F. stages are automatically controlled. A switch is provided for shifting from AVC to manual control, when so desired.

SECOND DETECTOR

One section of a 6H6 tube is used for the second detector and for the A.V.C. system. This system is well designed and produces a minimum of distortion.

NOISE LIMITER

The other section of the 6H6 tube is employed as a noise limiter. It is designed to reduce automobile ignition interferences and other similar disturbances to a negligible amount. Its operation does not affect the intelligibility of the received signals, and it may be switched off when so desired.

"S" METER

The signal strength "S" meter which is operated from one section of the 6SN7 Tube shows the relative signal strength of the received signal. The dial is calibrated in units of 1 to 9. Each division represents a doubled signal strength over the previous division. For example, if division 6 corresponds to approximately 6.25 microvolts at the antenna terminals, division 7 represents approximately 12.5 microvolts, 8 represents 25 microvolts, and 9 represents 50. Each division therefore represents a 6 DB step. This relative sensitivity of the meter can be adjusted. In production it is arbitrarily adjusted to a reading of 9 for an input of approximately 50 microvolts. Should this not correspond with your previous experience with a strength 9 signal, readjust the slotted shaft, located near the 6V6 and the 6SN7 tubes, as shown on the chart in Fig. 8.

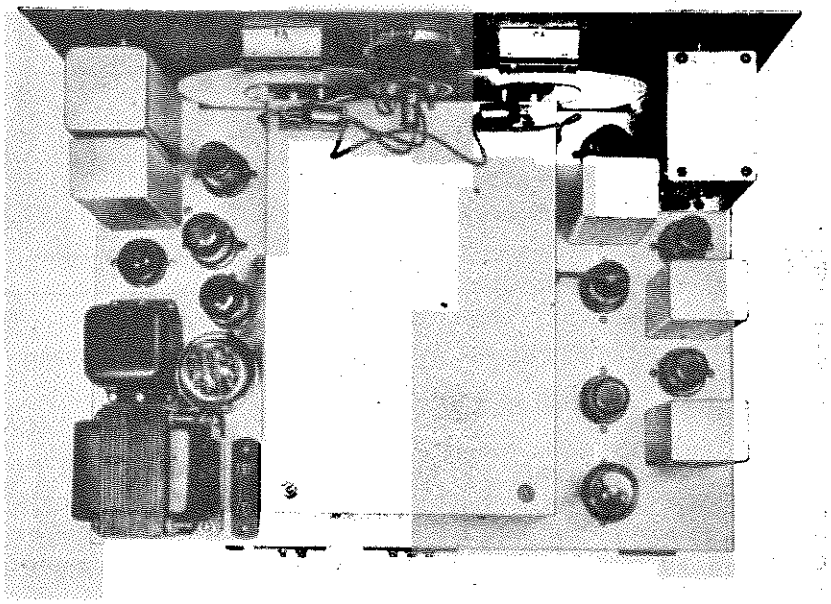

Fig. 6—Top view showing chassis layout.

BEAT FREQUENCY OSCILLATOR

The Beat Frequency Oscillator is designed for the reception of CW or unmodulated code signals. The control on the front panel provides a wide selection of beat frequencies for the best tone to cut through any interfering signals. The oscillator is of the electron coupled type, has excellent stability, and is designed to have no material affect on the operation of the I.F. Amplifier. A switch is provided for turning this oscillator on or off at will.

AUDIO AMPLIFIER

The first stage of the audio amplifier is a resistance coupled triode voltage amplifier using one section of the twin triode 6SN7 tube. The final stage uses a 6V6 Beam Power amplifier Tube and supplies an undistorted power output of approximately 3 watts. An output transformer with an output impedance of 6 ohms is used to connect directly to the voice coil of a suitable permanent magnet type dynamic speaker. A phone jack is connected across the same output and disconnects the speaker when headphones are plugged in. A manual gain control is provided.

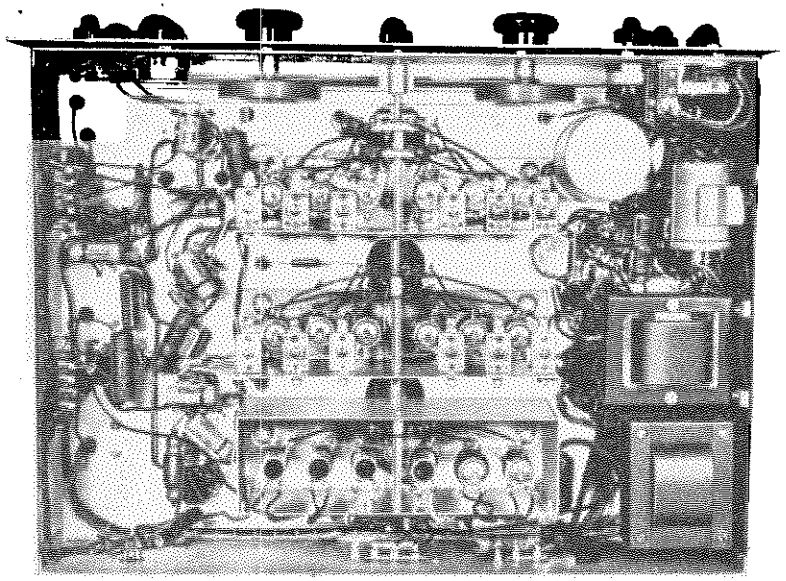

Fig. 7—Bottom view showing placement of parts.

POWER SUPPLY

All components of the power supply have a very large safety factor in order to insure satisfactory operation over a long period of time. A two-section filter is employed with a total inductance of 40 henries and a total capacitance of 30 microfarads. This heavy duty filter provides humless operation.

ANTENNA SUGGESTIONS

Because of the high sensitivity of the HQ-129-X receiver, the antenna is usually not critical. Often an indoor wire 20 to 50 feet long, strung along the base board or along the ceiling molding of a room will give surprisingly good reception. A long single wire outdoor antenna, such as shown in Fig. 9, will generally give entirely satisfactory reception. This wire may be 50 to 75 feet long. The more isolated this antenna is from neighboring objects the better the reception will be.

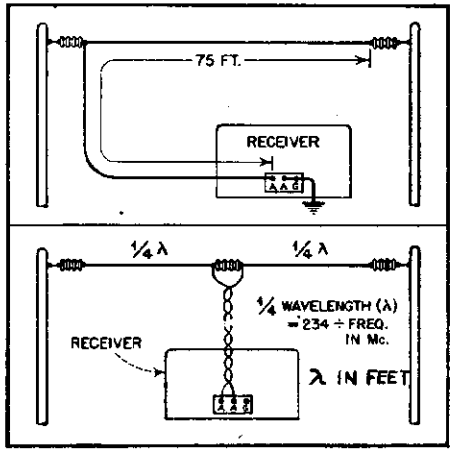

Fig. 9—Antenna suggestions.

REALIGNMENT PROCEDURE—I.F. AMPLIFIER

Tuning of the intermediate-frequency transformers is accomplished by the use of iron-core permeability-tuned coils together with fixed silvered-mica capacitors, resulting in a very high degree of stability. This, together with the mechanical arrangement provided, precludes the possibility of any appreciable drift or change of setting. Therefore, re-alignment should not be necessary, except when parts are re-

placed which would affect tuning of the I.F. circuits (like I.F. transformer or crystal).

Alignment of the I.F. channel should not be attempted unless suitable equipment is on hand. Proper alignment is accomplished by the visual method employing a cathode-ray oscilloscope used in conjunction with a frequency-modulated (swept) signal generator, having a fairly constant output. The oscilloscope should be externally synchronized by the signal generator.

The transformers must be tuned for symmetry and proper coincidence of the visible curves, as well as for amplitude. This requires a stage-by-stage alignment, starting with the Diode Input Link Transformer (T5) and continuing back through the First I.F. Transformer (T1). The procedure is as follows:

1) Set the Main Tuning capacitor to .54 M.C. and the band-switch to .54-1.32 M.C., the Send-Receive switch to Receive, the Limiter "off", the MAN-AVC-BFO switch to MAN position and the Crystal Selectivity switch to "off" position.

2) Now, with the generator set at 455 K.C. and applying the signal to the grid (pin #4) of the Third I.F. tube (V5), adjust the plate inductor (L27) of the I.F. Output Link (T4) and the Diode Input inductor (L29) of the Diode Input Link (T5), alternately, to obtain maximum amplitude, symmetry and pattern coincidence on the oscilloscope.

3) Apply the signal input lead to the grid (pin #4) of the 2nd I.F. tube (V4). Turn the two adjustment screws of the 3rd I.F. Transformer to obtain symmetrical, coinciding curve with as much amplitude as possible without disturbing the pattern.

4) Switch the signal input lead to the grid (pin #4) of the 1st I.F. tube (V3), and adjust the lower (plate) inductor (L25) of the Crystal Filter (T2) for maximum amplitude at center of curve.

5) Apply the signal input to the grid cap of 6K8 mixer tube (V2). Adjust screws of 1st I.F. Transformer (T1) as in (3). This should result in a tall selectivity curve with a slightly flattened peak.

6) Turn Crystal Selectivity switch to position #1, set Crystal Phasing pointer on arrow, and adjust the upper (grid) inductor (L19) of the Crystal Filter (T2) for maximum amplitude and symmetry. Adjust signal input or receiver Sensitivity control to prevent overloading.

7) Switch Crystal Selectivity to position #2 and adjust Phasing control slightly from the arrow position, if necessary, to obtain identical images.

Adjust the signal generator frequency to obtain coincidence of the images, and if complete coincidence is not obtained, alternately make slight adjustments of the phasing control and the signal generator frequency, until images coincide.

These last steps have determined the exact frequency of the quartz crystal and the frequency setting of the signal generator should be left undisturbed.

8) Repeat carefully the complete I.F. alignment procedure (steps 1 through 7) for the crystal frequency.

R.F. AND H.F: OSCILLATOR

As in the case of the I.F. amplifier, the R.F. stage and the H.F oscillator were accurately aligned at the factory with the aid of calibrated oscillators that are frequencly compared with standard frequency crystals. These circuits are designed to insure permanence of adjustment and should not be disturbed unless it is positive that readjustment is necessary.

The front row of adjustments, shown on the chart (Fig. 8), control the H.F. Oscillator circuits and consequently the dial calibration. To check these adjustments the band spread dial must be at 200, since that is the setting at which the main dial was calibrated. An accurate test oscillator is necessary. Connect the test oscillator to the antenna terminals and set it and the MAIN TUNING dial at the frequency indicated on the chart. The inductance is adjusted at a low frequency and the trimmer at a high frequency in each band, each being adjusted for maximum response. Generally a small fraction of a turn will suffice. These adjustments mutually affect each other. Therefore, if much damage is made at one end of a band, the other end of the same band must be readjusted. This procedure must be repeated until further readjustment at either end is unnecessary.

cuits. To adjust these, set the oscillator to the frequency indicated on the chart and tune it in on the receiver. Employing an output meter, make the adjustments for peak meter readings. At 30 mc. there is a certain amount of interlocking between the detector and H.F. oscillator making it necessary to rock the tuning capacitor back and forth while adjusting the trimmer capacitor, in order to avoid a false setting.

The chart below, Fig. 10, gives the values of the voltages between the tube socket terminals and ground or B- negative side of the circuit. The meter scale that should be used for making the check is shown in parenthesis below the voltage. A meter having a resistance of 1000 ohms per volt should be used. Small variations in voltages do not indicate trouble. With the aid of this chart and the circuit diagram (Fig. 8) the ailing capacitor or resistor can be found.

OCTAL BASE

(BOTTOM VIEW)

Tube socket terminals.

Voltage readings are based on an a-c line voltage exactly equal to the primary tap on the power transformer - higher or lower line voltage should result in corresponding variations in these readings.

All d-c readings are based on the use of a meter having a resistance of 1000 ohms per volt, and are taken between socket terminals and chassis.

INSTALLATION

Connection to Power Supply—Connect Receiver to Power Supply as follows:

(1) Remove the sheet-metal covers from terminal strip (E4, FIG. 3) on rear of Receiver and from terminal strip (E1, FIG. 3) on Power Supply. See that all ten screws on each strip are unscrewed at least three turns. Then attach one end of the connector cable to each terminal strip *exactly* as shown in FIG. 3 and tighten all screws securely. Make certain that each slotted spade lug on the cable strips makes contact with its respective screw terminal *only*, since a lug jammed between *two* screws could cause considerable trouble. Immediately replace both metal covers and do not remove them while the Power Supply is connected to the a-c power line.

(2) The spacing of spade lugs on cable terminal strips is exactly the same as the spacing of screws on Receiver and Power Supply. If the two fail to go together easily, DON'T USE FORCE. Be sure *all* screws are unscrewed far enough. If a spade lug has been bent or pushed out of place by rough handling, straighten it and try again. Spade lugs should slip under screws from the top.

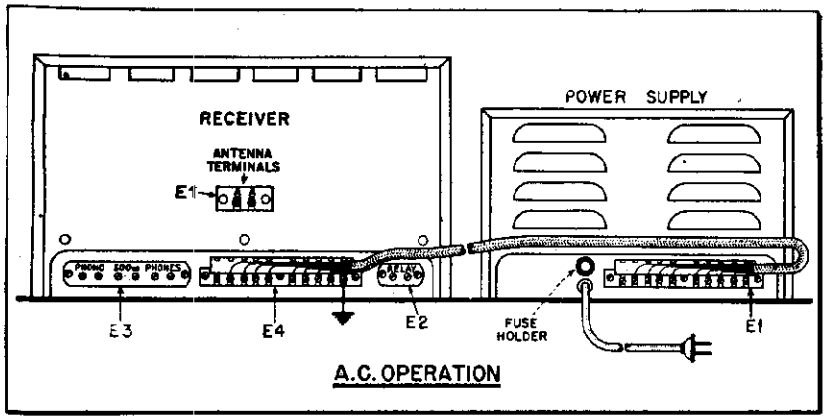

FIG. 3—Connections for power cable—A.C. operation.

Connection for Battery Operation—A cable for use in battery operation is available on special order. This cable (W2 in Parts List) has only one terminal strip. The other end of the cable is made up of eight loose wires. Connect this cable according to FIG. 4 (note the color code for the eight loose wires), or make up connections to serve the purpose. Connect the battery cable to the Receiver *first* and replace the terminal cover *before* making connections to the batteries. When discontinuing battery operation, disconnect the battery cable from the receiver. All operations of the Receiver are the same with either the Power Supply or the battery set-up.

Chassis Ground: It is not usually necessary to ground the Receiver chassis, but this can be done by connecting the ground lead to the left-hand PHONO or to the left-hand PHONES terminal (located on terminal strip E3, FIG. 3). These two terminals are grounded to the inside of the chassis.

Earphones: Plug a headset into the PHONES jack (J1, FIG. 2), or connect it to screw terminals marked PHONES on rear of chassis. No matching transformer is necessary

Loudspeaker: The permanent magnet dynamic loudspeaker supplied with the Receiver has a transformer mounted on its housing. This transformer matches the voice coil of the loudspeaker to the 500-ohm output terminals (on terminal strip E3, FIG. 3) located at the rear of the chassis (marked 500 ohms). For loudspeaker operation, connect the two-wire lead attached to the terminals of the loudspeaker transformer to the 500-ohm terminals on the Receiver. Disconnecting the loudspeaker will not impair the operation of the Receiver.

Power Transformer Primary Tap: Before plugging the power cord into the a-c line, remove bottom plate from Power Supply to see that power cord is properly connected for the a-c voltage of the power line being used. One wire of the power cord is permanently connected to the fuse-holder (E3, FIG. 5); the other wire is connected at the factory to one of the screw terminals on terminal strip E2 (FIG. 5). These screw terminals are marked 105, 115 and 125, and are connected to primary taps on the power transformer. See that the power cord wire is connected to the screw terminal most closely agreeing with the available a-c line voltage and replace the bottom cover plate.

POWER SOURCES

A-C Operation . . .
105-125 Volts, 50-60 cps
180 watts average power consumption

Battery Operation . . .
6-volt storage battery, drain 6.25 amperes for heaters.
Five 45-volt "B" batteries, drain 117 milliamperes at 225 volts; 4.5 milliamperes at 90 volts.
One 45-volt "C" battery, drain 10 milliamperes.

OPERATION

a. *Radiophone Reception:* Set the front panel controls (FIG. 2) as follows:

CONTROL	POSITION
CRYSTAL SELECTIVITY	OFF
PHASING	on arrow
BAND WIDTH	3
LIMITER	Off
AVC-MANUAL	AVC
SENSITIVITY	10
BAND SPREAD	100
SIGNAL-MOD-CW	MOD
AUDIO GAIN	6
SEND-REC	REC
BEAT OSCILLATOR	0

(1) Throw OFF-ON power switch in center of panel to ON. This puts Receiver in operation.

(2) Adjust band switch (S1, FIG. 2) to a band which is likely to be very active. This will facilitate the process of getting familiar with the various adjustments. If interference is not serious, BAND WIDTH control can be adjusted to a wider band width (higher number), depending upon the degree of fidelity desired. In general, adjust this control to band width giving best tone with least interference.

(3) Do all tuning, with or without the meter with BAND WIDTH control set at 3. Other settings give wider bands, making exact tuning difficult. Make band width adjustments *after* signal is tuned properly.

(4) LIMITER-OFF-ON control turns noise limiter on and off. The noise limiter will be most valuable on the higher frequencies, where interference from automobile ignition system is most bothersome.

b. *Code Reception:* Flip AVC-MANUAL switch to MANUAL and turn down SENSITIVITY control to provide proper sensitivity.

(1) On strong signals, do not turn SENSITIVITY control all the way on, because it will cause overloading. If the AUDIO GAIN control is set at about 7, it is possible to regulate volume by using only the sensitivity control.

(2) To turn on the beat oscillator, set SIGNAL-MOD-CW switch to CW. The BEAT OSCILLATOR control varies the pitch of the beat between oscillator and incoming signal. Use beat oscillator for code reception and for locating weak modulated signals.

(3) Fading signals can be improved by returning AVC-MANUAL switch to AVC.

c. *Crystal Filter:* First three positions of CRYSTAL SELECTIVITY control are generally used for radiophone reception and will serve for code reception where interference is not serious. Last two positions are intended for code reception *only* since they provide so narrow a band that "phone" signals are usually unintelligible. After adjusting CRYSTAL SELECTIVITY control for desired degree of selectivity, use PHASING control to eliminate or reduce any heterodyne interference or "whistle" which may be present.

d. *Receiver Silencing:* Receiver can be silenced by flipping the SEND-REC switch (S6, FIG. 2) to SEND. This operation opens the "B" supply to the R-F and 1st detector tubes (V1, V2 and V3). The Receiver then remains ready for instant service during transmission periods. Note also that instead of using the SEND-REC switch, a relay may be connected to the RELAY terminals (E2, FIG. 3) at rear of Receiver and silencing controlled by relay action, actuated, for example, by the associated transmitter. When using a relay for silencing, flip SEND-REC switch to SEND (open) and *leave* it there. While the transmitter is operating, the relay should remain *open*; when the transmitter is "off the air," the relay contacts should *close* to restore Receiver operation.

e. *Phono Operation:* Leads from a phonograph pickup may be connected to the PHONO terminals (on terminal strip E3, FIG. 3) at the rear of the Receiver. (Note that the left-hand terminal of this pair is grounded to chassis.) Use the SEND-REC switch (S6) as a "phono-radio" switch by flipping it to the SEND position, thus eliminating radio intereference and making it unnecessary to hunt for a "dead spot" on the tuning dial.

f. *Tuning:* All tuning *can* be done with the MAIN TUNING control. In this case, leave the band spread dial at 100. BAND SPREAD control spreads out a narrow band of frequencies *below* the frequency to which the main dial is set. This control operates continuously throughout the entire tuning range of the Receiver, and signals can be spread out in any one of the five bands.

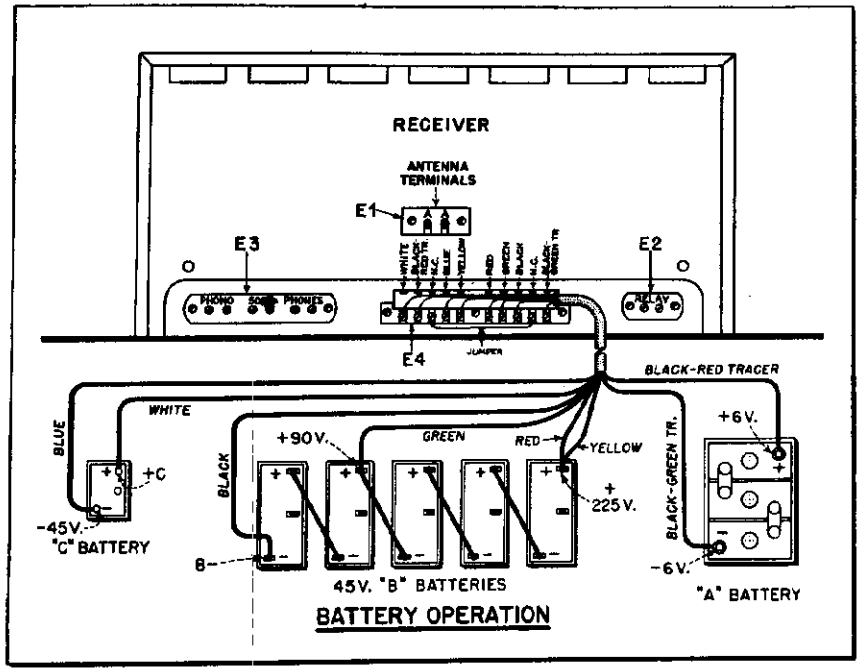

FIG. 4—Connections for power cable—battery operation.

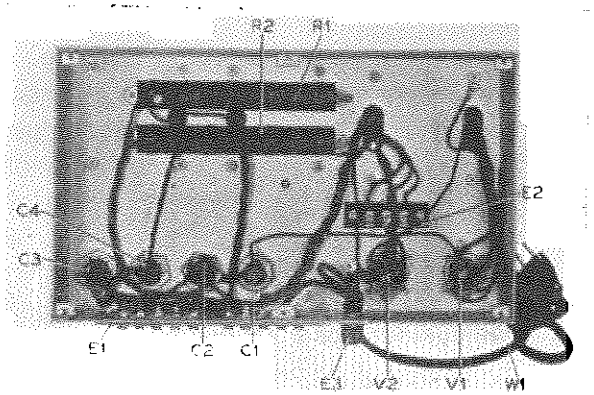

FIG. 5—Bottom view of power supply.

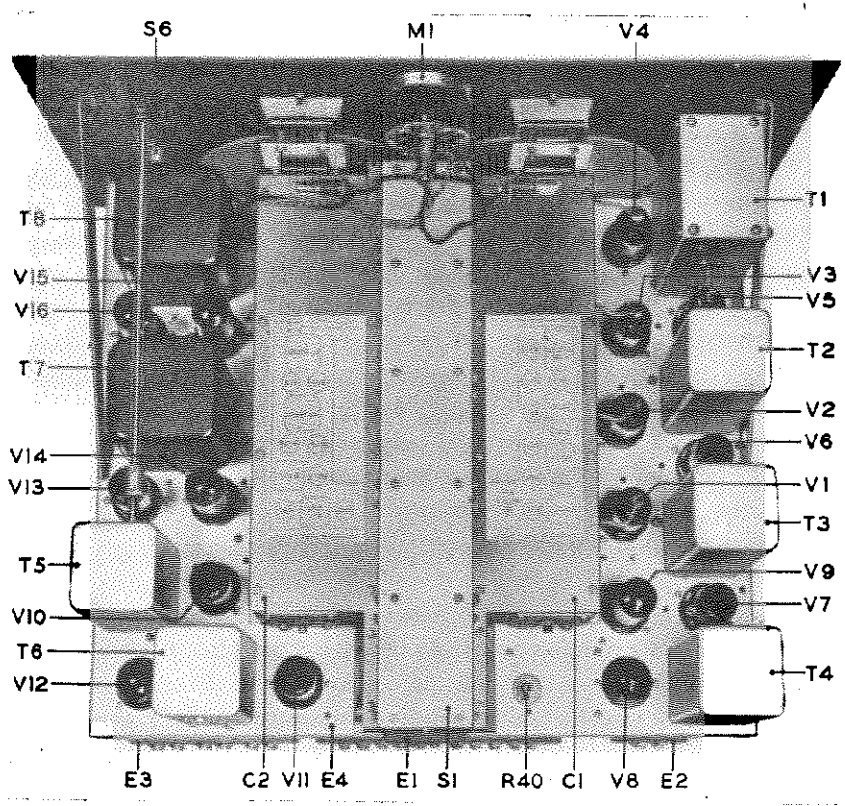

FIG. 7—Top chassis view showing arrangement of components.

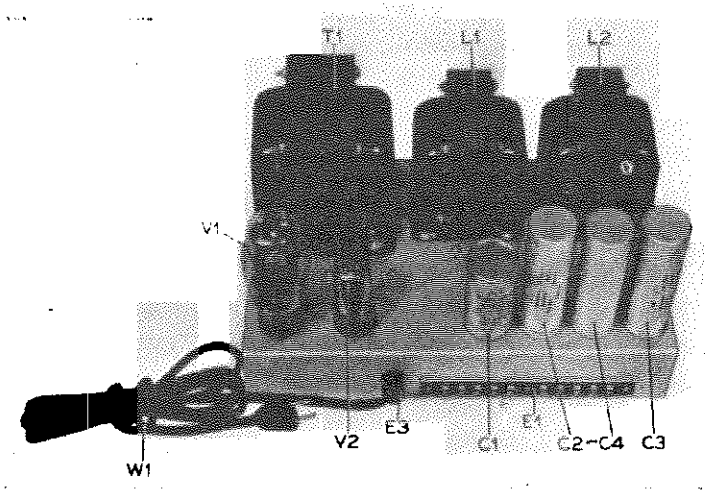
FIG. 6—Top view of power supply.



g. *Earphone Operation:* For earphone operation, plug earphones into the PHONES jack (J1, FIG. 2) provided for them on the front panel, or connect them to the PHONES terminals on the rear of the Receiver chassis. These terminals are connected in parallel with the jack on the front panel.

h. *S-Meter Tuning:* The S-meter (M1, FIG. 2), a tuning guide, operates only when the Receiver is set for AVC. Its reading increases as the Receiver approaches resonance with the incoming signal. Exact resonance is shown by the greatest reading of the meter. BAND WIDTH control must be set at 3 for accurate tuning by means of the meter. A screwdriver adjustment (R40, FIG. 7) at the rear of the chassis varies the resistance in shunt with the meter. By means of this adjustment, an "S9" reading may be obtained on any input between approximately 10 and 10,000 microvolts. The normal factory adjustment is made on an input of 50 microvolts, and when so adjusted each "S" number represents a change in signal input of approximately 6 decibels, or a ratio of two-to-one.

CIRCUIT ARRANGEMENT

RF AMPLIFIER

a. *Antenna Circuit:* The antenna is coupled to the grid of the 1st RF amplifier (V1) through an input transformer having an untuned primary and tuned secondary. The terminals of the primary coils are ungrounded, and are connected through a double-pole section (S1A) of the band switch to the "A," "A" terminals (E1) on the rear of the tuning unit. This symmetrical arrangement of the antenna primary coils permits full advantage to to be taken of the noise-reducing properties of a balanced transmission line lead-in. The impedance of the input circuit averages approximately 100 ohms throughout the tuning range of the Receiver.

b. *Amplifier Stages:* There are two stages of RF amplification preceding the first detector or mixer. These stages are coupled by means of RF transformers having tuned secondaries and low inductance untuned primaries. The plates of the two RF amplifier tubes (V1, V2) are shunt fed through RF chokes L35, L36 and are coupled to their respective tuned circuits through fixed capacitors C26, C30. This shunt feed keeps plate voltage off the tuned RF amplifier circuits. Two stages of RF amplification, in the frequency range covered by the 540-1240 kc band, normally provide more selectivity than is desirable for the reception of high-fidelity programs. To prevent loss of audio quality resulting from RF side-band cutting, resistors (R4, R8) have been placed in series with the secondaries of RF transformers L14, L19, to broaden their pass band.

CRYSTAL FILTER

a. *Controls:* The Quartz Crystal Filter (T1) couples the 1st detector (V3) to the 1st IF amplifier (V5). Its selectivity can be varied in definite steps by the CRYSTAL SELECTIVITY switch (S2) controlled from the front panel by knob and pointer. In addition, its selectivity characteristic can be greatly sharpened *on one side* or the other (to avoid heterodyne "whistle") by adjusting the PHASING capacitor (C46), also controlled by a knob on the front panel.

b. *Variable Selectivity:* Curves A and B, FIG. 8, show Receiver selectivity curves which indicate certain effects of the Crystal Filter. When the CRYSTAL SELECTIVITY switch is set at OFF, the quartz crystal is short-circuited and signal voltages present in the secondary of the 1st detector plate coil (L26) are impressed directly on the control grid of the first IF amplifier tube (V5). At any other setting (1 to 5), the quartz crystal is in use and acts as an extremely high "Q," high impedance, series tuned circuit interposed between the secondary of plate coil L26 and the 1st IF grid circuit (L27, C48), which constitutes the load into which the crystal works. Selectivity is varied by altering the impedance of this parallel tuned circuit (L27, C48), which is accomplished by adding resistance. (R17, R18, R19, R20) in series with coil L27 and capacitor C48.

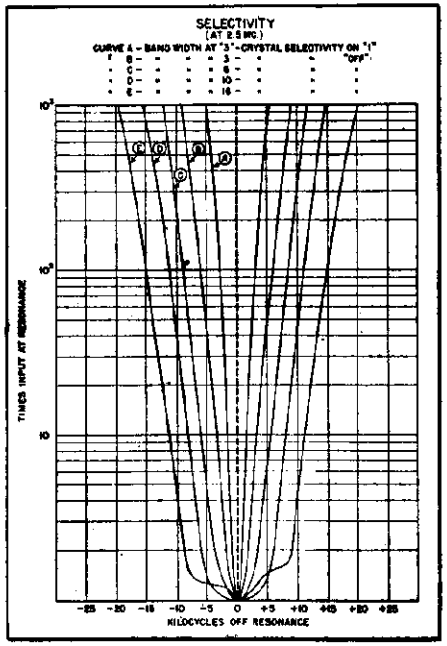


FIG. 8—Selectivity curves.

HF OSCILLATOR

The HF oscillator operates at a frequency 455 kc. (the frequency for which the IF amplifier is adjusted) *higher* than that of the incoming signal. The oscillator section of the variable tuning capacitor (C1D) has the same capacitance and plate shape as the RF sections (C1A, C1B, C1C). The constant 455 kc. frequency difference is maintained by means of a padding capacitor in series with the variable, together with appropriate values of oscillator inductance and parallel trimmer capacitance.

FIRST DETECTOR

The 1st detector employs a 6L7 pentagrid mixer (V3). Its injection grid (grid No. 3) is coupled to the HF oscillator cathode, and its signal grid (grid cap) is coupled to the plate of the second RF amplifier tube (V2) by means of the second RF transformer.

I-F AMPLIFIER

The intermediate-frequency amplifier has three stages consisting of three coupling transformers (T2, T3 and T4) and three pentode amplifier tubes (V5, V6 and V7) of the remote cutoff or super-control type. The first two transformers (T2, T3) are identical, and have tuned primaries as well as tuned secondaries. The secondary coils are fixed in position, while the primary coils are mounted on slide rods permitting them to move back and forth with respect to the secondaries, thus changing the degree of inductive coupling between them. When the coils are farthest apart the coupling is at its lowest value and the transformers exhibit their maximum selectivity or minimum band width. Conversely, when the coils are pushed close together the coupling is greatly increased and minimum selectivity or maximum band width results. At any adjustment between these two extremes, an intermediate degree of selectivity is obtained.

SECOND DETECTOR

The 2nd detector (V8) is a twin diode operated with both plates and both cathodes connected in parallel. Its IF input is obtained from the untuned secondary of coil L32 in transformer T4 in the plate circuit of the 3rd IF amplifier (V7). To facilitate operation of the limiter tube (V9) the diode load resistance is divided into two approximately equal parts. One part, R33, is placed between the paralleled cathodes and ground and is by-passed (for IF) by a small capacitor (C66). The other part is between the low-potential end of the secondary and ground, and is made up of R29, R30 and R31. Resistor R29 and two small capacitors (C64, C63) constitute a filter to prevent IF voltages from reaching resistor R31 and the AUDIO GAIN control (R48).

NOISE LIMITER

The noise limiter tube (V9) is a 6N7 class B twin triode with its two grids and its two plates connected in parallel in order to secure the lowest possible impedance. The circuit is designed to limit interferences of very short pulse duration such as caused by auto ignition and other similar disturbances. It is designed to work with or without the AVC system and will automatically follow widely different signal levels. Some distortion results at higher modulation percentages but this is unavoidable if effective noise limiting is to be obtained. An "on-off" switch is provided.

"S" METER

The "S" or Signal Strength Meter (M1) is connected for use when the AVC-MANUAL switch (S5) is thrown to AV. This meter shows the relative strength of the received signal. The centrally located dial is calibrated in units of 1 to 9. A variable control (R40) on the rear of the chassis allows the meter to be adjusted to read "S-9" on any signal from 10 to 10,000 microvolts. The normal factory adjustment for "S-9" is approximately 50 microvolts. Each division represents a ratio of approximately 2 to 1 over the previous division. Thus each division represents a 6db step. The sensitivity control (R46) must be set at maximum (position 10) for maximum "S" meter accuracy. This "S" meter can also be used as a tuning meter since it will show maximum reading at resonance. In this case, to obtain a relatively sharp resonance indication, the BAND WIDTH control should be set at position 3.

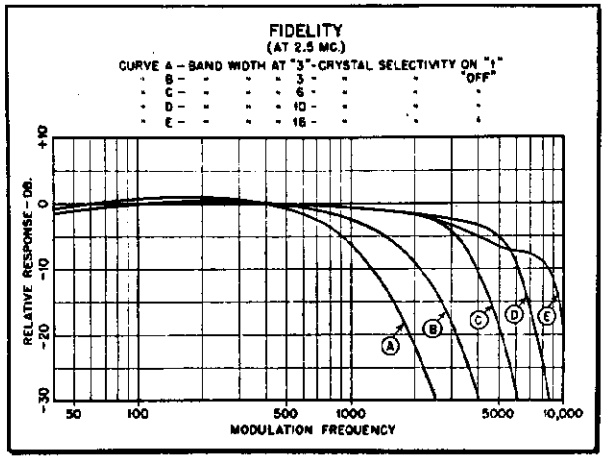

FIG. 9—Audio fidelity curves.

AVC AMPLIFIER AND RECTIFIER

Special amplifier and rectifier stages are employed in order to give most satisfactory AVC action. AVC voltages are applied to the two RF stages and to the first two IF stages and compensate for variations in signal strength due to fading. A different rate of compensation is required for voice modulated signals than for code signals. This is automatically adjusted when the beat frequency oscillator is turned on or off.

BEAT OSCILLATOR

The beat oscillator tube (V10) and associated oscillator circuit (T5) provide a voltage at approximately the intermediate frequency. This voltage, when introduced into the input circuit of the 2nd detector (V8) by means of a small coupling capacitor (C60), mixes with the I-F signal being delivered to the detector by the 3rd I-F amplifier (V7). The mixture of these two similar frequencies results in a "beat" or difference frequency in the output of the 2nd detector. The beat oscillator frequency is adjusted so that the pitch of this difference frequency falls within the audio-frequency range. Fine adjustment of the beat frequency pitch is accomplished by means of the BEAT OSCILLATOR control on the front panel which turns a small variable capacitor (C69) in transformer T5. The beat oscillator is turned on by throwing the SIGNAL-MOD-CW switch (S4) to CW. In addition to being necessary for proper reception of CW signals, the beat oscillator is useful for locating weak signals of any kind.

AF AMPLIFIER

a. *Circuits:* The AF amplifier has three stages, using one 6J5 triode (V13) and three 6F6 pentodes (V14, V15, V16). The grid of the first tube (V13) is connected to the moving arm of the AUDIO GAIN control (R48) through a blocking capacitor (C82). Its plate is coupled to the grid of the second AF amplifier by means of capacitor C83, plate resistor R53 and grid leak R54. The second amplifier tube (V14), while a pentode, is operated as a triode by connecting its plate and screen together. It drives the output tubes (V15, V16) through a push-pull input transformer (T7). The output tubes (V15, V16) are also triode-connected pentodes and are operated as class AB_2 amplifiers.

b. *Output Transformer:* The output transformer (T8) has two secondary windings; a 500-ohm secondary (4-5) for power output, and a secondary for earphones (6-7) designed to deliver about 3% of the ondary is connected to a matching load such as the loudspeaker

The turns ratio and resistance of the earphone winding are such that the power delivered to any load between 8000 ohms and 80 ohms varies less than 6 db, and the power input to a 250-ohm load is but 2 db greater than that to a 4000-ohm load. FIG. 16 shows curves of overall audio fidelity with different settings of the CRYSTAL SELECTIVITY and BAND WIDTH controls.

POWER SUPPLY

The Power Supply furnishes "A," "B" and "C" voltages for the Receiver. The "A," or heater voltage, is 6.3 volts AC obtained from a separate secondary winding (1-2) on the power transformer (T1, FIG. 10). "B" voltage is obtained from the center-tapped high-voltage secondary (7-8-10) connected to the plates of the "B" rectifier tube (V1). After this voltage is rectified, it is filtered by the combined action of the first filter choke (L1) and the two filter capacitors C1 and C2. This provides 380 volts DC for the plates of the power output tubes in the Receiver. Further filtering by the second filter choke (L2) and the first two sections of capacitor C3 provides 250 volts DC for the plates of the remaining tubes in the Receiver. Approximately 100 volts DC for the screen grids of the Receiver tubes is obtained from the tap on the bleeder resistor (R1), which is by-passed by the remaining section of capacitor C3. Negative "C" voltage is obtained from a tap (9) on the high-voltage secondary connected to the filament of the "C" rectifier tube (V2). The rectified output from the plates of tube V2 is filtered by the three sections of resistor R2 and the three sections of filter capacitor C4. When connected to the Receiver, the voltage at the end of this filter is approximately minus 50.

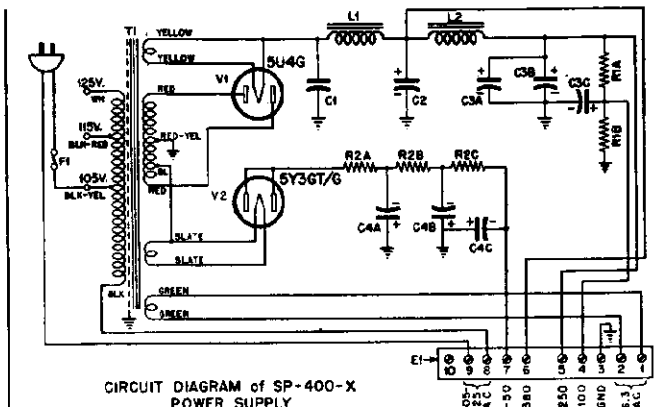

FIG. 10—Power supply diagram.

CONTINUITY TESTS

If the Receiver is inoperative, it may have a shorted filter or by-pass capacitor or an open resistor. Remove the cabinet or bottom cover plate to get at all parts. Measure socket voltages and compare them with TABLE 2. (Consult FIG. 11 and TABLE 1 for key to tube base pin connections.) If this measurement does not reveal the trouble, start checking socket terminal resistance values against TABLE 3 (Receiver) or TABLE 4 (Power Supply). Obtain values of resistors and capacitors by locating the reference number on the proper circuit diagram and looking it up in the Table of Parts, Section V. In checking these resistance values be sure to set the "variable" controls to the positions specified in the table.

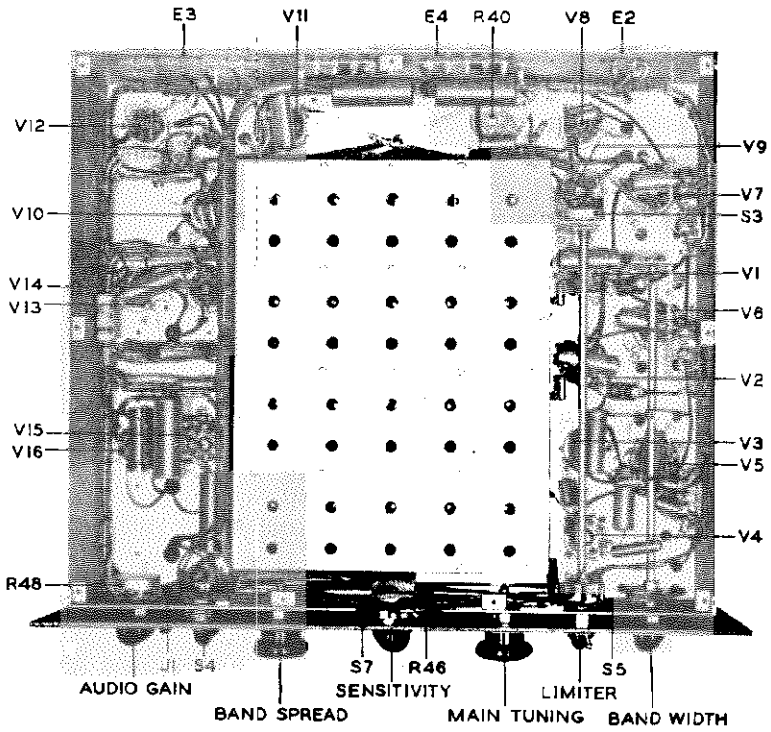

FIG. 12—Bottom view of chassis.

ALIGNMENT—GENERAL

When either selectivity or sensitivity or both appear to be below normal and *all tubes have been tested*, check the alignment. Remove the dust cover or cabinet and bottom cover plate of the Receiver to get at all parts for making adjustments. CAUTION: ANY CHANGES FROM ORIGINAL SETTINGS WILL BE SMALL SO USE GREAT CARE WHEN CHECKNG ADJUSTMENTS. This is especially true of the HF oscillator circuits, which should NOT be disturbed unless the MAIN TUNING dial is definitely known to be off calibration.

a. *Signal Generator:* This should be an accurately calibrated instrument producing amplitude-modulated radio-frequency signals. In addition to 455 kc. (the IF), the frequency range required of the signal generator depends on the tuning range of the receiver to be aligned. The RF alignment frequencies required for the Series 400-X Super-Pro are shown in FIG. 13. The second harmonic can generally be used when the fundamental frequency is not available. For example, a signal generator covering all frequencies from 455 kc to 15 mc could be used to check the highest frequency band by using the second harmonic of 15 mc to provide the 30 mc called for in FIG. 13. The signal generator should have an output of approximately 100 microvolts and an output impedance of approximately 100 ohms for best results when aligning the RF and HF Oscillator circuits. For IF alignment these values are not critical. The frequency calibration of the signal generator is extremely important *if* the Receiver dial calibration is to be correct.

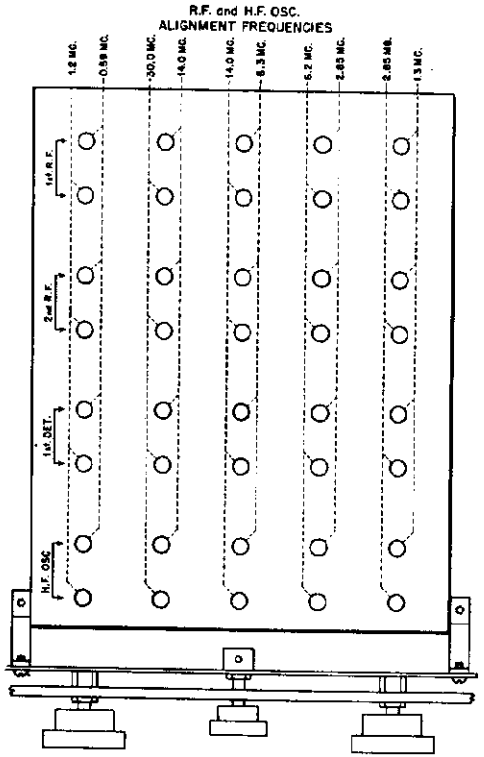

FIG. 13—R.F. and H.F. osc. alignment frequencies and location of adjustments.

b. *Output Meter:* The output meter should respond to the modulation frequency of the signal generator, preferably 400 cps, and should provide at least half-scale deflection for 10 volts. Its resistance should be greater than 500 ohms.

c. *Tools:* An insulated screwdriver 9/64" wide and .025" thick at the bit, is required for alignment of the Receiver.

d. *Preliminary Procedure:* Throw the OFF-ON switch to ON and permit the Receiver to warm up for about an hour before beginning adjustments. Connect the output meter to the 500-ohm terminals located at the rear of the Receiver chassis

ALIGNMENT PROCEDURE

a. *Preliminary Setup:* Adjust the signal generator to approximately 455 kc and connect its output to the control grid cap of the 1st detector tube (V3) through a fixed capacitor (anything larger than 100 mmf will do). Set the front panel controls as follows:

SENSITIVITY	0
AVC-MANUAL	MANUAL
SIGNAL-MOD-CW	MOD
SEND-REC	REC
BAND SWITCH	2.85-6.3 mc
AUDIO GAIN	10
CRYSTAL SELECTIVITY	OFF
PHASING	on arrow
BAND WIDTH	3
BAND SPREAD DIAL	100

b. *IF Alignment Check:*

(1) Set the MAIN TUNING dial near 2.85 mc, but be careful not to tune in a powerful local signal. Set the CRYSTAL SELECTIVITY switch on 3, the AVC-MANUAL switch on AVC, and advance the SENSITIVITY to 10. Turn off the modulation of the signal generator and adjust its frequency slightly to produce maximum deflection of the "S" meter. The adjustment of the signal generator in this manner is necessary in order to get exact agreement with the natural period of the particular quartz crystal in the Receiver being checked. After reducing SENSITIVITY to 0, the modulation may be switched on, but the tuning adjustment of the signal generator must not be altered until the alignment check has been completed. Return the CRYSTAL SELECTIVITY and AVC-MANUAL controls to their original settings of OFF and MANUAL and advance the SENSITIVITY control until a suitable output meter reading is obtained. A half-scale reading in the region of 5 to 10 volts will be satisfactory.

(2) Now check the alignment of both upper (grid) and lower (plate) air trimmer capacitors in IF transformers T2 and T3 and the single trimmer in T4 for peak reading of the output meter. If one or more of these adjustments results in a sizeable increase in output, reduce the SENSITIVITY control enough to bring the meter reading back to half-scale. Alignment of the plate circuit of the crystal filter (T1) can be tested in the same way by means of the lower adjusting screw on the side of the unit. This screw varies the position of the powdered iron core in coil L26. Do not change the setting of the upper adjusting screw which tunes grid coil L27, as this circuit cannot be adjusted properly with the output meter. It can, however, be generator and cathode-ray oscilloscope. If this equipment is available, proceed as follows:

(3) Connect the input of the vertical amplifier of the oscilloscope to the PHONO connections on Terminal strip E3 (FIG. 7) on the rear skirt of the Receiver chassis. The "high" terminal is the second one from the edge of the strip; the first screw is connected to the chassis. Set the frequency-modulated signal generator to approximately 455 kc and connect its output to the control grid cap of the 1st detector (V3) through a fixed capacitor (100 mmf or larger). With the CRYSTAL SELECTIVITY switch at OFF, readjust the signal generator frequency to produce the conventional single-peaked resonance curve on the screen of the oscilloscope. Then turn the CRYSTAL SELECTIVITY switch to position 1. If the grid coil (L27) is correctly tuned the image on the oscilloscope screen will remain symmetrical but will be only about two-thirds as wide as before, indicating an increase in selectivity. The oscilloscope image is also affected by the PHASING control, maximum symmetry occurring at or very near the arrow on its scale. Therefore, when tuning L27, rock the PHASING control back and forth at the same time to secure the best adjustment.

c. *AVC Alignment Check:* Leaving all other controls as in PAR. 26a, and without changing the signal generator frequency, reduce AUDIO GAIN to 0, switch to AVC and increase SENSITIVITY to 10. Increase AUDIO GAIN to restore half-scale reading on the output meter and adjust the single trimmer capacitor in T6 for *minimum* output meter reading. The "S" meter reading should "peak" at the same time the output meter reading "dips."

d. *Beat Oscillator Alignment Check:* Continuing with controls as above switch off the output meter and plug in a pair of earphones, or replace the meter with a suitable loudspeaker. Turn the SIGNAL-MOD-CW switch to CW and see that the BEAT OSCILLATOR control is exactly on 0 (zero). If tone in earphones or speaker is not very low in pitch, readjust the trimmer capacitor near the bottom of T5 until it is. If the beat oscillator is in perfect alignment when this test is made, no sound will be heard since the signal generator and the beat oscillator will be oscillating at the same frequency and there will be no audible difference or "beat." Check this by turning the BEAT OSCILLATOR control knob slightly off 0 (zero) toward one side or the other. If this results in a tone rising in pitch as the pointer is turned away from 0 (zero) to either side, the beat frequency oscillator is perfectly aligned. If no audible tone can be obtained within the range of the BEAT OSCILLATOR control, adjust the trimmer capacitor near the bottom of T5 until an approximate "zero beat" occurs at 0 (zero) setting of the BEAT OSCILLATOR

e. *HF Oscillator Calibration Check:* The accuracy of the MAIN DIAL calibration depends solely on the HF oscillator frequency, which in this Receiver is 455 kc. (the IF) *higher* than the signal frequency. Although the frequency of the HF oscillator can be measured directly if accurate frequency-measuring equipment is on hand, it is far simpler to check it by tuning in signals of known frequency and noting the MAIN DIAL readings. CAUTION: BE SURE THE BAND SPREAD DIAL IS SET AT 100 WHEN MAKING THIS TEST.

(1) To correct dial calibration, refer to alignment chart (FIG. 13) for location of HF oscillator adjustments as well as signal frequencies at which settings should be made. The output of the signal generator should be unmodulated and SIGNAL-MOD-CW switch on Receiver turned to CW. Set BEAT OSCILLATOR at 0, AUDIO GAIN at 10, AVC-MANUAL on MANUAL, BAND WIDTH at 16. Disconnect output meter and use earphones or loudspeaker to make necessary adjustments by "zero beat" method. Connect signal generator to antenna terminals for this test.

(2) If the 2.85-6.3 mc band is to be corrected, tune signal generator accurately to 6.3 mc. Tune in signal generator signal at 6.3 mc end of Receiver dial to zero beat. Notice approximate dial error. Turn main dial slightly toward 6.3 mc calibration line until beat note rises to a high pitch. Do not turn dial far enough to raise beat so high it cannot be heard. With alignment screwdriver adjust trimmer capacitor marked HF OSC 6.3 mc (FIG. 13) until beat is again zero. Turn main dial still farther toward 6.3 mc line and make a further adjustment of trimmer capacitor to return to zero beat. Repeat this process as often as necessary to bring dial to exactly 6.3 mc. (The main dial could be set at once on exactly 6.3 mc and trimmer turned enough at one time to produce zero beat, but the step-by-step method is recommended.) Now retune signal generator to exactly 2.85 mc and tune in signal-generator signal at low-frequency end of main dial and correct the calibration step-by-step as before, using inductance trimming adjustment HF OSC 2.85 mc (FIG. 13). When 6.3 mc signal from signal generator is again tuned in at other end of dial, it will be found that inductance adjustment at 2.85 mc has changed correction previously made at 6.3 mc. This is normal. Go back and forth several times from 2.85 to 6.3 mc in order to bring both ends of dial scale into exact agreement with the signal frequency. CAUTION: DURING THIS ADJUSTMENT BE VERY CAREFUL TO ADJUST THE SENSITIVITY CONTROL TO AVOID OVERLOADING.

f. *RF and 1st Detector Alignment Check:* Although alignment of these three circuits (1st and 2nd RF and 1st Det) can be checked at the same time as the HF oscillator, it is simpler to consider each check as a separate operation. Efficient weak-signal reception, with low receiver noise level and high image rejection ratios, depends on the relative alignment of these three circuits with respect to the HF oscillator and without regard to calibration accuracy.

(1) Accurate calibration of the signal generator is not required to check these adjustments. Modulation of the signal generator, while convenient, is not strictly necessary. Input to antenna terminals should be through 100 ohms (approximate) including output resistance of signal generator. If signal generator is modulated, Receiver controls should be set as for IF alignment; if unmodulated, set BEAT OSCILLATOR to 2 (either side) and SIGNAL-MOD-CW to CW. Adjust SENSITIVITY for half-scale reading on output meter when signals are exactly in tune.

(2) Starting with 2.85-6.3 mc band, set main dial at 6.3 mc (BAND SPREAD at 100) and adjust frequency of signal generator for peak deflection of output meter. Then check setting of trimmer marked 1st DET 6.3 mc (FIG. 13). Repeat this procedure on trimmers designated as 2nd RF and 1st RF in same row. If readjustments on one of these settings greatly increases output meter reading, alter SENSITIVITY slightly to reduce reading to half-scale. After each adjustment check tuning of Receiver to make sure test signal is still accurately tuned. BAND SPREAD may be used as a vernier for this purpose.

CAUTION: THIS TUNING CHECK IS EXTREMELY IMPORTANT AT HIGH END OF 6.3-14.0 MC AND 13.4-30.0 MC BANDS WHERE THERE IS SOME SLIGHT INTERACTION BETWEEN 1ST DET AND HF OSC CIRCUITS. After checking the three trimmers at high end of this band, turn main dial to 2.85 mc and retune signal generator to suit. Then check the three inductance adjuster settings marked 2.85 mc (FIG. 13) in the same row. Since adjustments at one end of a band also affect the other end of the band (as described under HF OSC alignment), repeat above procedure until no further improvement can be secured. The number of repetitions necessary depends on how much mistuning existed initially. Other bands may be checked in the same manner.

(3) For best possible efficiency with a particular antenna arrangement, the 1st RF circuits may be adjusted with the antenna connected. This can be done by loosely coupling output of signal generator to antenna system instead of directly to antenna terminals through a 100-ohm resistor. Make sure that signal from signal generator actually reaches Receiver by way of antenna rather than by some form of direct coupling.

(4) In all the foregoing tests using output meter readings for circuit adjustment it is recommended that earphones (or speaker) be used to monitor the signal. This will avoid false adjustments caused by overloading or freakish responses.

MODEL SP-400-SX

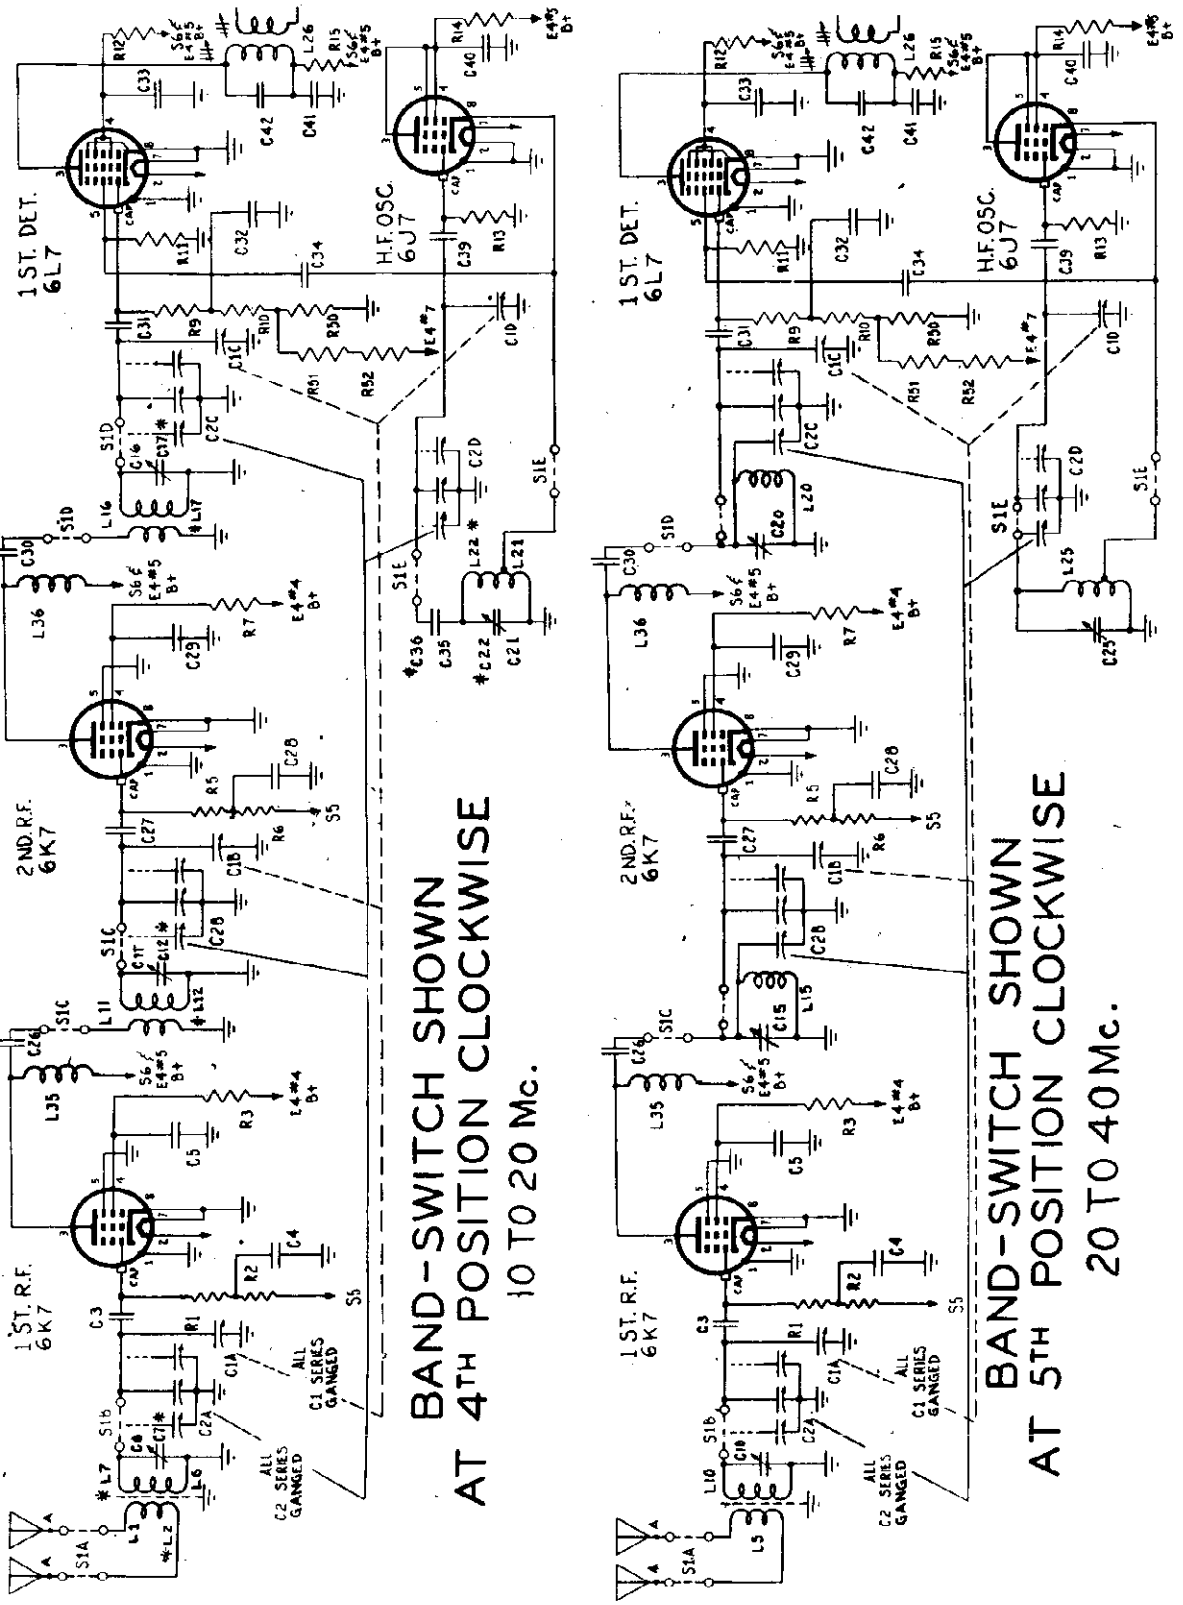
HAMMARLUND MFG. CO. INC.



ALIGNMENT - GENERAL

When either selectivity or sensitivity or both appear to be below normal and *all tubes have been tested*, check the alignment. Remove the cabinet or dust cover and bottom cover plate of the Receiver to get at all parts for making adjustments. CAUTION: ANY CHANGES FROM ORIGINAL SETTINGS WILL BE SMALL SO USE GREAT CARE WHEN CHECKING ADJUSTMENTS. This is especially true of the H-F oscillator circuits, which should NOT be disturbed unless the MAIN TUNING dial is definitely known to be off calibration.

a. *Signal Generator* - This should be an accurately calibrated instrument producing amplitude-modulated radio-frequency signals. In addition to 465 kc (the I.F.), the frequency range required of the signal generator depends on the tuning range of the receiver to be aligned. The R-F alignment frequencies required for the Series 400-SX Super-Pro are shown in Fig. 13. The second harmonic can generally be used when the fundamental frequency is not available. For example: a signal generator covering all frequencies from 465 kc to 20 mc could be used to check the highest frequency band by using the second harmonic of 20 mc to provide the 40 mc called for in Fig. 13. The signal generator should have an output of approximately 100 microvolts and an output impedance of approximately 100 ohms for best results when aligning the R-F and H-F-Oscillator circuits. For I-F alignment these values are not critical. The frequency calibration of the signal generator is extremely important if the Receiver dial calibration is to be correct.

b. *Output Meter* - The output meter should respond to the modulation frequency of the signal generator, preferably 400 cps, and should provide at least half-scale deflection for 10 volts. Its resistance should be greater than 500 ohms.

c. *Tools* - An insulated screwdriver 9/64" wide and .025" thick at the bit, is required for alignment of the Receiver.

d. *Preliminary Procedure* - Throw the OFF-ON switch to ON and let the Receiver warm up for about an hour before beginning adjustments. Connect the output meter to the 500-ohm terminals located at the rear of the Receiver chassis.

ALIGNMENT PROCEDURE

a. *Preliminary Setup* - Adjust the signal generator to approximately 465 kc and connect its output to the control grid cap of the 1st detector tube (V3) through a fixed capacitor (anything larger than 100 mmf will do). Set the front panel controls as follows:

SENSITIVITY	0
AVC-MANUAL	MANUAL
SIGNAL-MOD-CW	MOD
SEND-REC	REC
BAND SWITCH	2.5-5.0 mc
AUDIO GAIN	10
CRYSTAL SELECTIVITY	OFF
PHASING	on arrow
BAND WIDTH	3
BAND SPREAD DIAL	100

b. *I-F Alignment Check* -

(1) Set the MAIN TUNING dial near 2.5 mc, but be careful not to tune in a powerful local signal. Set the CRYSTAL SELECTIVITY switch on 3, the AVC-MANUAL switch on AVC, and advance the SENSITIVITY to 10. Turn off the modulation of the signal generator and adjust its frequency slightly to produce maximum deflection of the "S" meter. The adjustment of the signal generator in this manner is necessary in order to get exact agreement with the natural period of the particular quartz crystal in the Receiver being checked. After reducing SENSITIVITY to 0, the modulation may be switched on, but the tuning adjustment of the signal generator must not be altered until the alignment check has been completed. Return the CRYSTAL SELECTIVITY and AVC-MANUAL controls to their original settings of OFF and advance the SENSITIVITY control until a suitable output meter reading is obtained. A half-scale reading in the region of 5 to 10 volts will be satisfactory.

(2) Now check the alignment of both upper (grid) and lower (plate) air trimmer capacitors in I-F transformers T2 and T3 and the single trimmer in T4 for peak reading of the output meter. If one or more of these adjustments results in a sizeable increase in output, reduce the SENSITIVITY control enough to bring the meter reading back to half-scale. Alignment of the plate circuit of the crystal filter (T1) can be tested in the same way by means of the lower adjusting screw on the side of the unit. This screw varies the position of the powdered iron core in coil L26. Do not change the setting of the upper adjusting screw which tunes grid coil L27, as this circuit cannot be adjusted properly with the output meter. It can, however, be aligned by the "visual" method using a frequency-modulated signal generator and cathode-ray oscilloscope. If this equipment is available, proceed as follows:

(3) Connect the input of the vertical amplifier of the oscilloscope to the PHONO connections on terminal strip E3 (Fig. 6) on the rear skirt of the Receiver chassis. The "high" terminal is the second one from the edge of the strip; the first screw is connected to the chassis. Set the frequency-modulated signal generator to approximately 465 kc and connect its output to the control grid cap of the 1st detector (V3) through a fixed capacitor (100 mmf or larger). With the CRYSTAL SELECTIVITY switch at OFF, readjust the signal generator frequency to produce the conventional single-peaked resonance curve on the screen of the oscilloscope. Then turn the CRYSTAL SELECTIVITY switch to position 1. If the grid coil (L27) is correctly tuned the image on the oscilloscope screen will remain symmetrical but will be only about two-thirds as wide as before, indicating an increase in selectivity. The oscilloscope image is also affected by the PHASING control, maximum symmetry occurring at or very near the arrow on its scale. Therefore, when tuning L27, rock the PHASING control back and forth at the same time to secure the best adjustment.

c. *AVC Alignment Check* - Leaving all other controls as in PAR. 26a, and without changing the signal generator frequency, reduce AUDIO GAIN to 0, switch to AVC and increase SENSITIVITY to 10. Increase AUDIO GAIN to restore half-scale reading on the output meter and adjust the single trimmer capacitor in T6 for *minimum* output meter reading. The "S" meter reading should "peak" at the same time the output meter reading "dips".

d. *Beat Oscillator Alignment Check* - Continuing with controls as above (PAR. 26c), switch off the output meter and plug in a pair of earphones, or replace the meter with a suitable loudspeaker. Turn the SIGNAL-MOD-CW switch to CW and see that the BEAT OSCILLATOR control is exactly on 0 (zero). If tone in earphones or speaker is not very low in pitch, readjust the trimmer capacitor near the bottom of T5 until it is. If the beat oscillator is in perfect alignment when this test is made, no sound will be heard since the signal generator and the beat oscillator will be oscillating at the same frequency and there will be no audible difference of "beat". Check this by turning the BEAT OSCILLATOR control knob slightly off 0 (zero) toward one side or the other. If this results in a tone rising in pitch as the pointer is turned away from 0 (zero) to either side, the beat frequency oscillator is perfectly aligned. If no audible tone can be obtained within the range of the BEAT OSCILLATOR control, adjust the trimmer capacitor near the bottom of T5 until an approximate "zero beat" occurs at 0 (zero) setting of the BEAT OSCILLATOR control.

e. *H-F Oscillator Calibration Check* - The accuracy of the MAIN DIAL calibration depends solely on the H-F oscillator frequency, which in this Receiver is 465 kc (the IF) *higher* than the signal frequency except in the 20-40 mc band, where the H-F oscillator is 465 kc lower than the signal frequency. Although the frequency of the H-F oscillator can be measured directly if accurate frequency-measuring equipment is on hand, it is far simpler to check it by tuning in signals of known frequency and noting the MAIN DIAL readings. CAUTION: BE SURE THE BAND SPREAD DIAL IS SET AT 100 WHEN MAKING THIS TEST.

(1) To correct dial calibration, refer to alignment chart (Fig. 13) for location of H-F oscillator adjustments as well as signal frequencies at which settings should be made. If the 2.5-5.0 mc band is to be corrected, the signal generator may be set accurately to 2.5 mc and its second harmonic (if strong enough) used for the 5.0 mc end of the band. The output of the signal generator should be unmodulated and SIGNAL-MOD-CW switch on Receiver turned to CW. Set BEAT OSCILLATOR at 0, AUDIO GAIN at 10, AVC-MANUAL on MANUAL, BAND WIDTH at 16. Disconnect output meter and use earphones or loudspeaker to make necessary adjustments by "zero beat" method. Connect signal generator to antenna terminals for this test.

(2) Tune in second harmonic at 5.0 mc end of dial to zero beat. Notice approximate dial error. Turn main dial slightly toward 5.0 mc calibration line until beat note rises to a high pitch. Do not turn dial far enough to

raise beat so high it cannot be heard. With alignment screwdriver adjust trimmer capacitor marked HF OSC 5.0 mc (Fig. 13) until beat is again zero. Turn main dial still farther toward 5.0 mc line and make a further adjustment of trimmer capacitor to return to zero beat. Repeat this process as often as necessary to bring dial to exactly 5.0 mc. (The main dial could be set at once on exactly 5.0 mc and trimmer turned enough at one time to produce zero beat, but the step-by-step method is recommended.) Now tune in 2.5 mc fundamental at low-frequency end of main dial and correct the calibration step-by-step as before, using inductance trimming adjustment HF OSC 2.5 mc (Fig. 13). When second harmonic is again tuned in at other end of dial, it will be found that inductance adjustment at 2.5 mc has changed correction previously made at 5.0 mc. This is normal. Go back and forth several times from 2.5 to 5.0 mc in order to bring both ends of dial scale into exact agreement with the signal frequency. CAUTION: DURING THIS ADJUSTMENT BE VERY CAREFUL TO ADJUST THE SENSITIVITY CONTROL TO AVOID OVERLOADING.

f. *R-F and 1st Detector Alignment Check* - Although alignment of these three circuits (1st and 2nd RF and 1st Det) can be checked at the same time as the H-F oscillator, it is simpler to consider each check as a separate operation. Efficient weak-signal reception, with low receiver noise level and high image rejection ratios, depends on the relative alignment of these three circuits with respect to the H-F oscillator and without regard to calibration accuracy.

(1) Accurate calibration of the signal generator is not required to check these adjustments. Modulation of the signal generator, while convenient, is not strictly necessary. Input to antenna terminals should be through 100 ohms (approximate) including output resistance of signal generator. If signal generator is modulated, Receiver controls should be set as for I-F alignment; if unmodulated, set BEAT OSCILLATOR to 2 (either side) and SIGNAL-MOD-CW to CW. Adjust SENSITIVITY for half-scale reading on output meter when signals are exactly in tune.

(2) Starting with 2.5-5.0 mc band, set main dial at 5.0 mc (BAND SPREAD at 100) and adjust frequency of signal generator for peak deflection of output meter. Then check setting of trimmer marked 1st DET 5.0 mc (Fig. 13). Repeat this procedure on trimmers designated as 2nd RF and 1st RF in same row. If readjustments on one of these settings greatly increases output meter reading, alter SENSITIVITY slightly to reduce reading to half-scale. After each adjustment check tuning of Receiver to make sure test signal is still accurately tuned. BAND SPREAD may be used as a vernier for this purpose. CAUTION: THIS TUNING CHECK IS EXTREMELY IMPORTANT AT HIGH END OF 10-20 MC AND 20-40 MC BANDS WHERE THERE IS SOME SLIGHT INTERACTION BETWEEN 1ST DET AND H-F OSC CIRCUITS. After checking the three trimmers at high end of this band, turn main dial to 2.5 mc and retune signal generator to suit. Then check the three inductance adjuster settings marked 2.5 mc (Fig. 13) in the same row. Since adjustments at one end of a band also affect the other end of the band (as described under H-F OSC alignment), repeat above procedure until no further improvement can be secured. The number of repetitions necessary depends on how much mistuning existed initially. Other bands may be checked in the same manner.

(3) For best possible efficiency with a particular antenna arrangement, the 1st RF circuits may be adjusted with the antenna connected. This can be done by loosely coupling output of signal generator to antenna system instead of directly to antenna terminals through a 100-ohm resistor. Make sure that signal from signal generator actually reaches Receiver by way of antenna rather than by some form of direct coupling.

(4) In all the foregoing tests using output meter readings for circuit adjustment it is recommended that earphones (or speaker) be used to monitor the signal. This will avoid false adjustments caused by overloading or freakish responses.

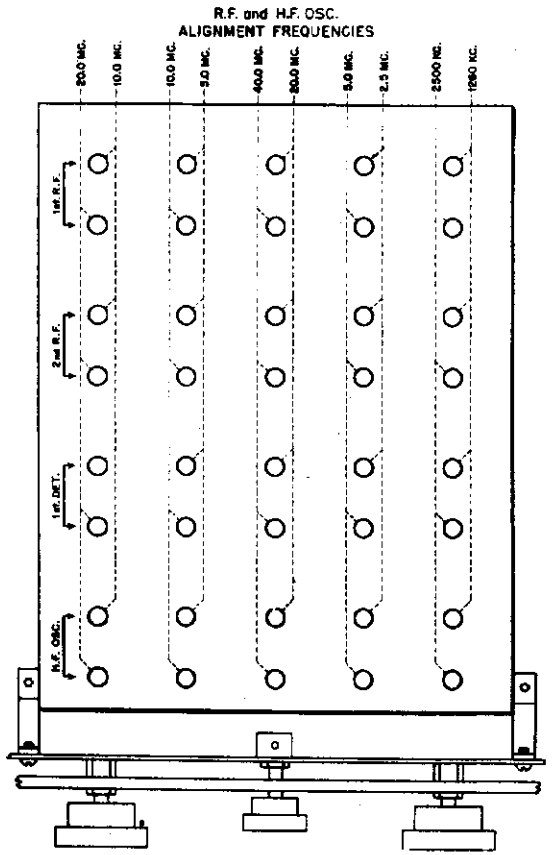


Fig. 13. ALIGNMENT CHART. Shows location of screwdriver adjustments and corresponding test frequencies.

D.C. voltages measured with 20,000 ohm/volt meter
A.C. voltages measured with 1,000 ohm/volt meter
All voltages measured with reference to B-

* Means tie point

NOTE: The above readings are obtained with no signal input to receiver.

No alignment adjustments should be attempted without first thoroughly checking over all other possible causes of trouble such as defective tubes, resistors, and condensers. In order to align the receiver properly, remove the chassis from the cabinet and proceed as follows.

EQUIPMENT REQUIRED:

1. Signal Generator.
2. Output Meter with 2.5 Volt Scale.
3. .1 Mfd. Condenser.

I.F. ALIGNMENT:

1. Connect output meter across speaker voice coil; set meter on 2.5 volt scale.
2. Connect output of signal generator directly to antenna post on loop; connect ground side of generator to chassis of receiver through .1 Mfd. condenser. Set signal generator on 455 Kc (modulated).
3. Adjust I.F. trimmers (first T4 and then T3) for maximum reading on output meter.

Note: Keep signal level low, just enough to keep maximum reading on lower half of meter scale. Tuning condenser plates should be all the way out; volume control should be on full.

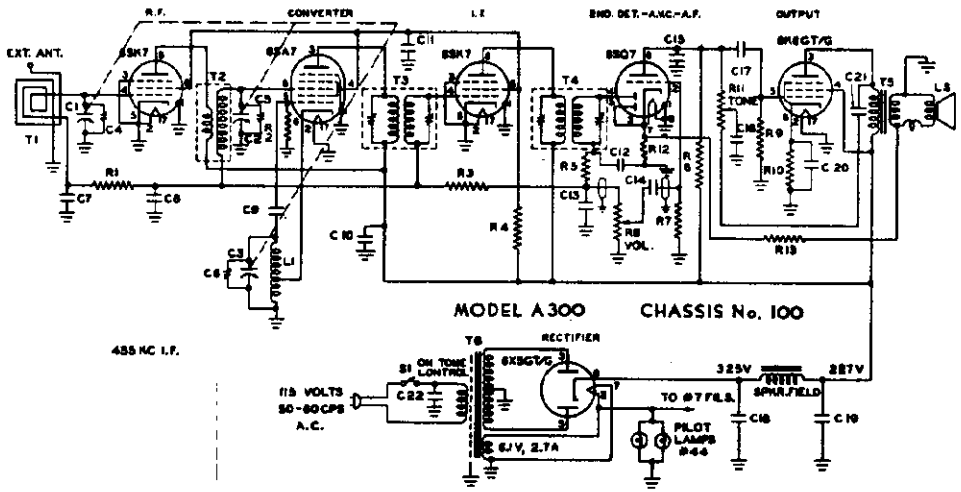
R.F. ALIGNMENT:

1. Set tuning condenser with plates completely out.
2. Set signal generator at 1650 Kc (modulated) and feed its output into a loop of wire about 6" in diameter. Place this loop about one foot away from and parallel to the receiver loop antenna.
3. Tune in signal by adjusting oscillator trimmer (C4).
4. Adjust output of signal generator to obtain deflection on lower half of meter scale.
5. Adjust oscillator trimmer for maximum output.
6. Set signal generator at 1400 Kc and tune in signal with tuning condenser.
7. Adjust antenna trimmer (C3) while rocking gang condenser for maximum reading on output meter. Feed only enough signal from generator to keep maximum reading on lower half of meter scale.

DIAL ADJUSTMENT:

To set the dial on calibration, pick up a station of known frequency near the center of the dial and move the pointer by hand as required.

Power Consumption .....26 Watts
Undistorted Audio Output .....1.0 Watt
Maximum Audio Output .....1.5 Watts
Loudspeaker .....5-inch round P.M.



Hoffman Model A300 with Chassis number 100S is electrically identical with Chassis number 100 except for the following:

1. Five-inch P.M. speaker, part number 9003, has been substituted for 4 x 6 inch oval dynamic speaker, part number 9000.
2. A 1500-ohm resistor, part number 4701, has been connected in the filter circuit in place of the 1500-ohm speaker field.

These changes have been incorporated in the schematic diagram shown below.

Hoffman Model A300 is a 6-tube broadcast band AC operated superheterodyne table model receiver incorporating such features as built-in loop antenna, a stage of r-f amplification preceding the converter tube, and a variable tone control. An additional feature, usually not found in receivers of this type, is an inverse feedback network to reduce audio distortion.

SPECIFICATIONS

Tuning Range	535 Kc to 1640 Kc
Intermediate Frequency	455 Kc
Power Supply	115 V A.C., 50-60 C.P.S.
Power Consumption	55 Watts
Audio Output	1.25 Watts

NORMAL OPERATING CURRENTS

6X5GT/G	Cathode Current	65 Ma
6K6GT/G	Cathode Current	24.5 Ma

ALIGNMENT PROCEDURE

CAUTION:

No alignment adjustments should be attempted without first thoroughly checking over all other possible causes of trouble such as defective tubes, resistors, and condensers. In order to align the receiver properly, remove the chassis from the cabinet and proceed as follows:

EQUIPMENT REQUIRED:

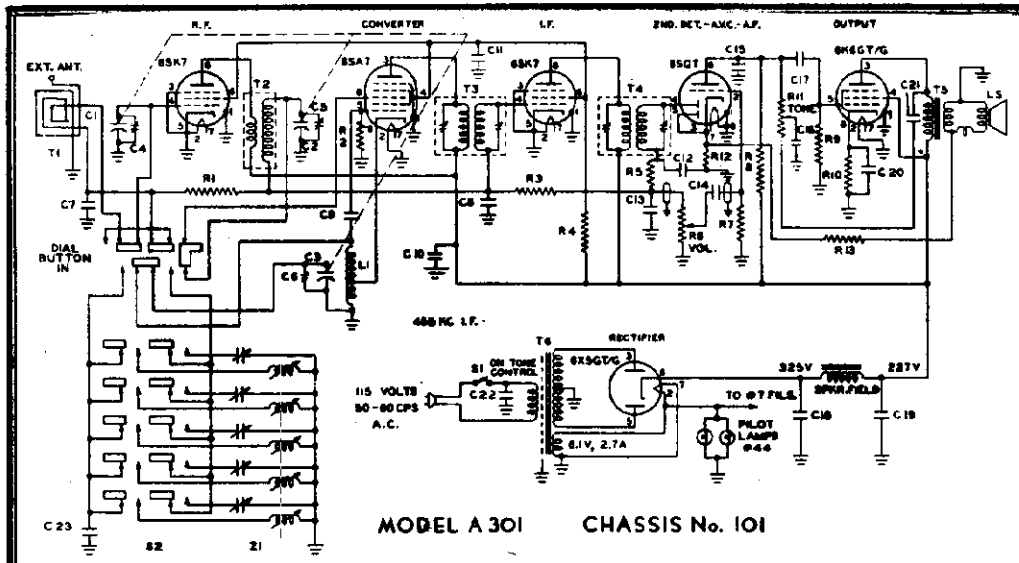
1. Signal Generator
2. Output Meter with 2.5 Volt Scale.
3. .1 Mfd. Condenser

I.F. ALIGNMENT:

1. Connect output meter across speaker voice coil; set meter on 2.5 Volt Scale.
2. Connect output of signal generator to stator of C2 (see schematic) through a .1 Mfd. condenser; connect ground side of generator directly to chassis of receiver. Set signal generator on 455 Kc (modulated).
3. Adjust I.F. trimmers (first T4 and then T3) for maximum reading on output meter. (Note: Keep signal level low, just enough to keep maximum reading on lower half of meter scale.) The tuning condenser plates should be all the way out; volume and tone controls should be in extreme clockwise position.

R.F. ALIGNMENT:

1. Set tuning condenser with plates completely out.
2. Set signal generator at 1650 Kc (modulated) and feed its output into a loop of wire about 6 inches in diameter. Place this loop about one foot away from and parallel to the receiver loop antenna.
3. Tune in signal by adjusting oscillator trimmer (C6).
4. Adjust output of signal generator to obtain deflection on lower half of meter scale.
5. Adjust oscillator trimmer for maximum output.
6. Set signal generator at 1400 Kc and tune in signal with tuning condenser.
7. Adjust antenna and RF trimmers (C4 and C5) while rocking gang condenser for maximum reading on output meter. Feed only enough signal from generator to keep maximum reading on lower half of meter scale.



Hoffman Model A301 with Chassis 101S is electrically identical with Chassis 101 except for the following:

1. Five-inch P.M. speaker, part number 9003, has been substituted for 4 x 6-inch oval dynamic speaker, part number 9000.
2. A 1500-ohm resistor, part number 4701, has been connected in the filter circuit in place of the 1500-ohm speaker field.

These changes have been incorporated in the schematic diagram shown below.

PUSHBUTTON ADJUSTMENTS

The frequency ranges for the pushbuttons are given in figure 3. A layout of the pushbutton adjustments is shown in figure 4. Note that in this figure pushbutton number 1 is now to the extreme right, since the pushbutton assembly is being viewed from the rear. To make pushbutton adjustments, proceed as follows:

1. Turn the receiver on and let it warm up for fifteen minutes or longer in order to minimize drift effects.
2. Depress the DIAL pushbutton and tune in the station which is to be set on pushbutton number 1.
3. Now depress pushbutton number 1 and adjust tuning slug 1a and trimmer 1b (figure 4) until the station is accurately tuned in again.
4. Repeat the above procedure for the remaining pushbuttons.

NOTE: When making oscillator coil pushbutton adjustments, it is desirable that this adjustment be made from the high-frequency end (slug all the way out). The proper oscillator coil slug setting will then be reached before there is any possibility of tuning the oscillator to the low-frequency side of the carrier.

PUSHBUTTON NO.	1	2	3	4	5

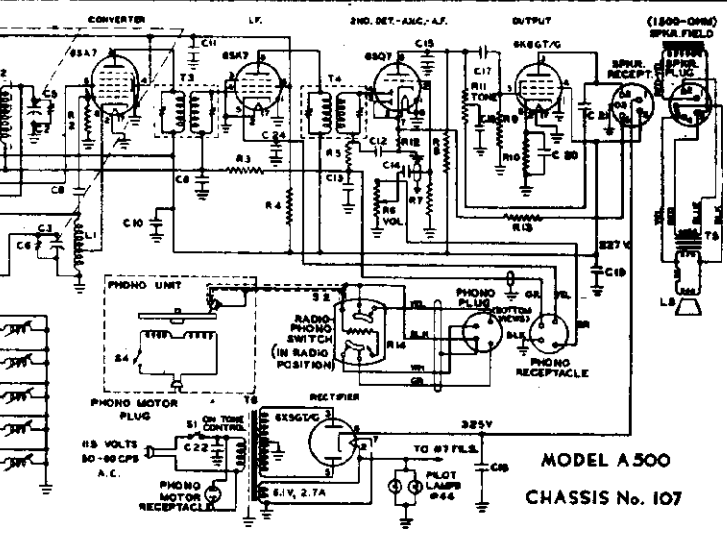
MAY, 1946



MODEL A500 CHASSIS No. 107

Hoffman Model A500 with Chassis 107S is electrically identical with Chassis 107 except for the following:

1. Ten-inch P.M. speaker, part number 9010, has been substituted for ten-inch electrodynamic speaker, part number 9012.
2. A 1500-ohm resistor, part number 4701, has been connected in the filter circuit in place of the 1500-ohm speaker field.

These changes have been incorporated in the schematic diagram shown below.

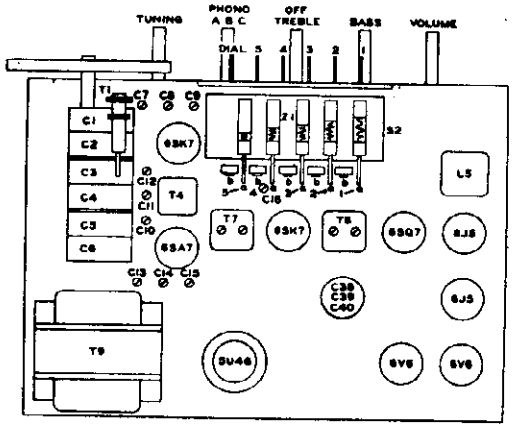
OPERATIONS IN ORDER	SIGNAL GENERATOR		RECEIVER		TRIMMER ADJ. IN ORDER
	CONNECTIONS TO REC.	FREQUENCY	CONTROL SETTINGS	DIAL SETTING	
1	To stator of C-6 through .1 mfd. cond.	455 Kc	Vol. Max. Range Sw. on "A" Band	Minimum Capacity	T-8 and T-7
2	To Ant. Term. through a 400-ohm resistor.	18 Mc	Vol. Max. Range Sw. on "C" Band	18 Mc	C-12, C-15, C-9
3	To Ant. Term. through a 400-ohm resistor	10 Mc	Vol. Max. Range Sw. on "B" Band	10 Mc	C-11, C-13, C-8
4	To Ant. Term. through 200 mmf. condenser	1400 Kc	Vol. Max. Range Sw. on "A" Band	1400 Kc	C-10, C-13, C-7
5	To Ant. Term. through 200 mmf. condenser	600 Kc	Vol. Max.. Range Sw. on "A" Band	600 Kc	C-16, T-1 tuning slug
6	To Ant. Term. through 200 mmf. condenser	1400 Kc	Vol. Max. Range Sw. on "A" Band	1400 Kc	C-10, C-13, C-7

NOTE: Rocking the condenser gang on the higher frequencies (bands "B" and "C") is necessary in order to avoid a false point of alignment due to "pulling action" between r-f and oscillator circuits.

NOTE: Be sure that the image frequency is not picked up during this adjustment. Note that the signal may be readily heard at two points as C-11 is adjusted. The correct setting for C-11 is with the trimmer in its looser position (adjusting screw further out).

NOTE: It is necessary to align the "C" band first so that "B" band and broadcast band alignment will not be adversely affected by subsequent "C" band adjustment.

Alignment of "C" Band:



NORMAL OPERATING VOLTAGES

The following table lists the normal operating voltages to be expected at the various tube socket terminals.

PIN NO.	1	2	3	4	5	6	7	8
6SK7 (R.F.)	0	0	0	−.1	0	+95	6.2 AC	+290

D.C. voltages measured with 20,000 ohm/volt meter.
A.C. voltages measured with 1,000 ohm/volt meter.
Line voltage 117.

measured at junction of R13 and R16.

□ measured at junction of R15 and R17.

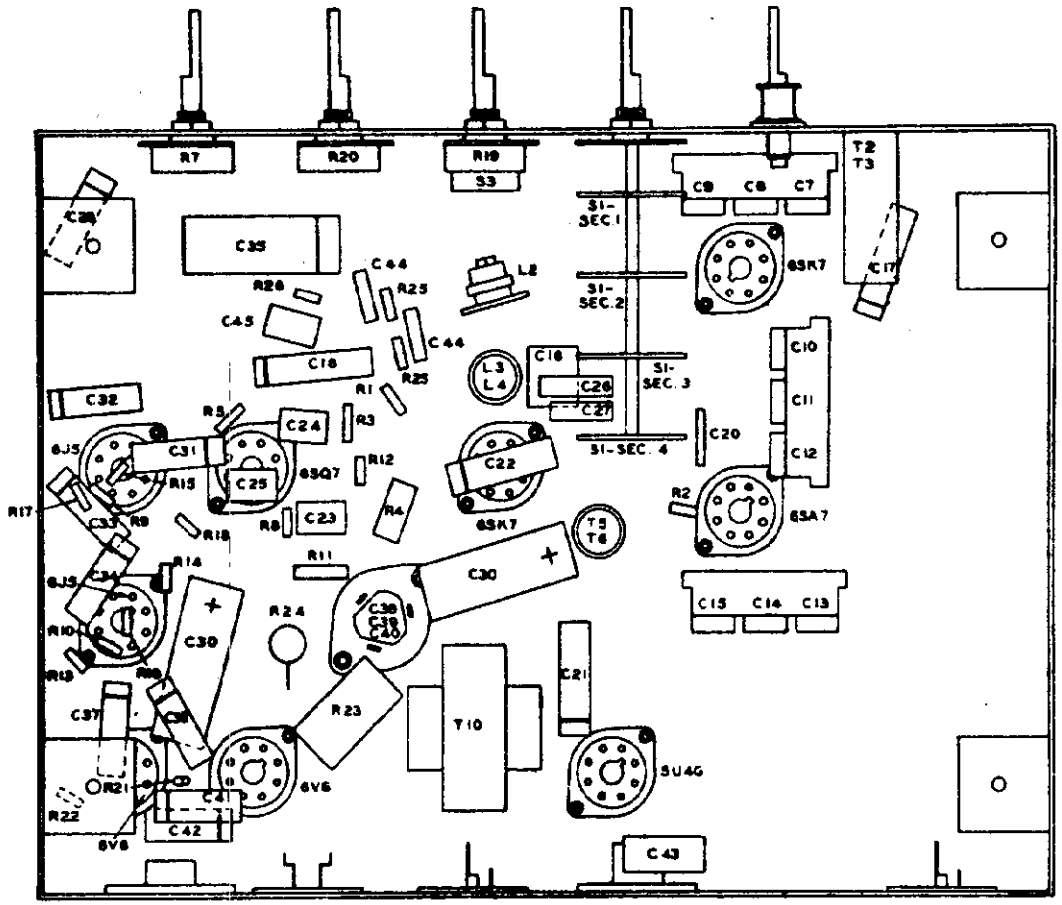
All voltages measured with reference to chassis except as follows:

* measured between pins 2 and 8; not to chassis.

NOTE The above readings are obtained with no signal input to receiver and band switch in position "A".

NORMAL OPERATING CURRENTS

5U4G	Cathode Current	115 Ma.
6V6	Cathode Current (both tubes)	70 Ma.



TUNING RANGES:

Band "A"	540 Kc to 1600 Kc.
Band "B"	5.6 Mc to 10.4 Mc
Band "C"	9.4 Mc to 19.4 Mc
Intermediate Frequency	455 Kc
Power Supply	115V A.C., 50-60 C.P.S.
Power Consumption (incl. phono)	125 Watts
Undistorted Audio Output	12 Watts

Model A501 with Chassis 108S is electrically identical with Chassis 108ST, except for: Output transformer, Part No.5110 substituted for Part No.5107.

These are electrically identical.

A 10-mf, 450-volt electrolytic condenser, Part No.4203, has been added from screen to ground on the 6SK7 r-f and i-f tubes to eliminate a hum modulation. It is suggested that this condenser be added on all Model A501 receivers not having it.

CONSUMPTION 30 WATTS

POWER OUTPUT - (MAX.) 1.25W UPO .5 W. TUNING RANGE = 540-1600 KC

SOCKET VOLTAGE READINGS:

All voltages taken from the back of the AC switch to the socket contacts with a 20,000 ohm per volt D.C. meter and the line voltage fixed at 117 volts A.C.

TUBE	FUNCTION	CATH-ODE	SCR. GRID	PLATE	OSC. PLATE
12SA7	Mixer		92	92	92
12SK7	I.F.Amp.	3	92	92	
12SQ7	Det.			44	
50L6GT	Output	5.8	92	85	

ALIGNMENT INFORMATION

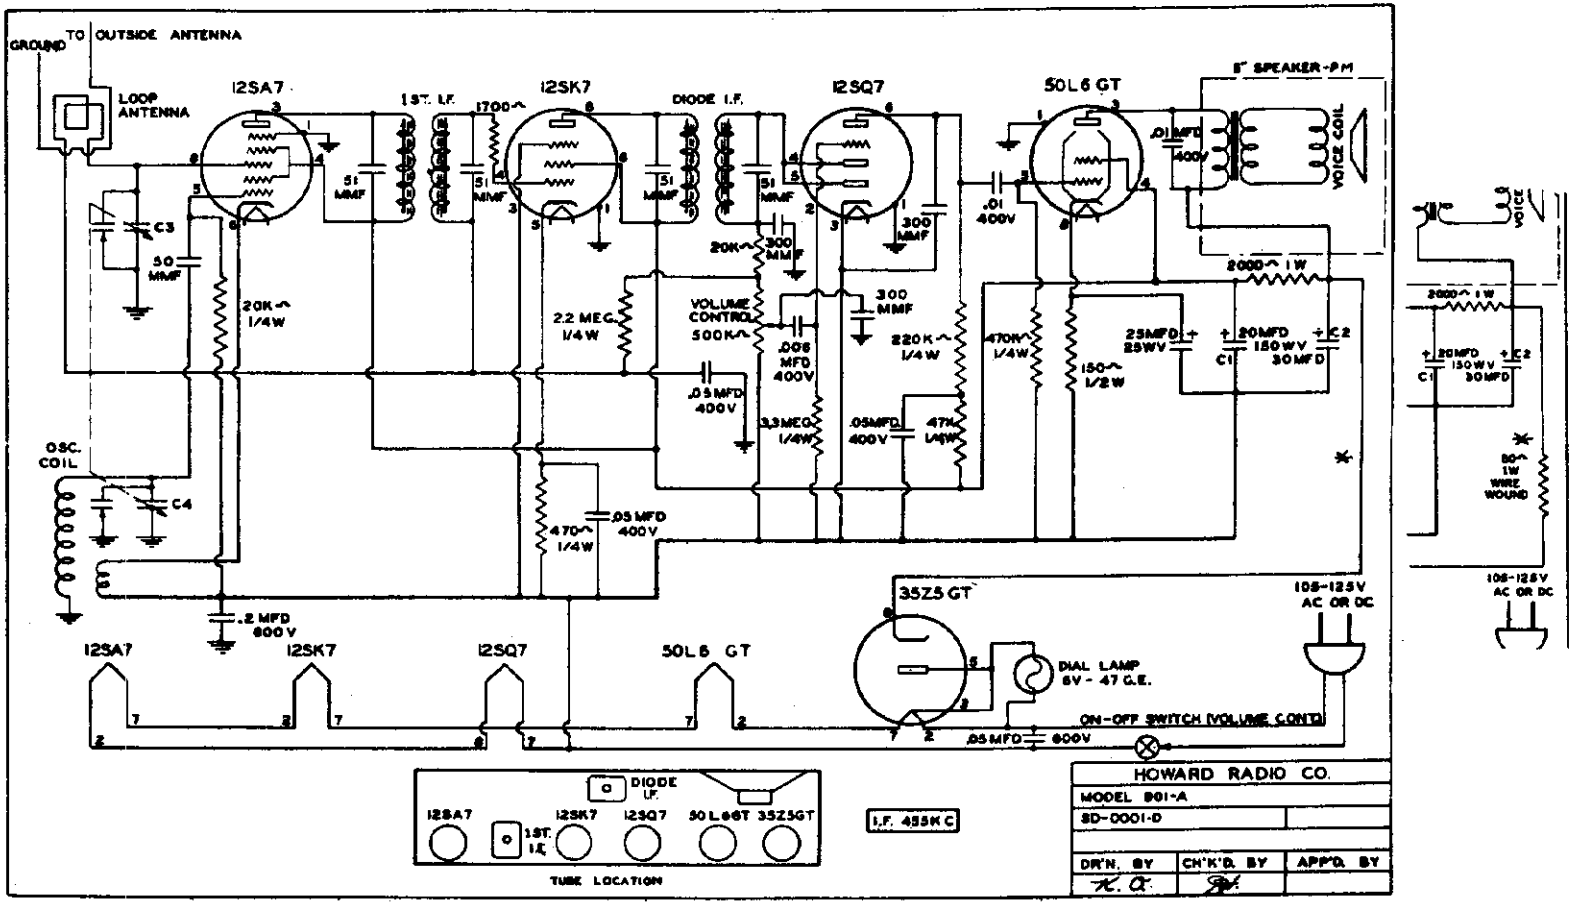
Each 455 KC I. F. coil has an Iron Core adjustment protruding from the top and the bottom of the I. F. can. Look beneath the chassis to reach the lower I. F. adjustments. Repeat the I. F. alignment operation several times to insure accuracy of adjustment.

Add or remove resistance in the cathode circuit of the 12SK7 tube as the I. F. gain indicates.

The wire lead running from the loop aerial between the I. F. coils and the condenser gang is important in its placement. Dress this wire tightly to the chassis.

Set dial at 1400 KC. and adjust oscillator trimmer which is located on back section of variable condenser, then peak antenna stage trimmer on front section of variable condenser to 1400 KC. No adjustment is required at the low frequency end of the dial

The filter condenser has a common negative, but note it does not return to ground and is insulated from the chassis.



CONSUMPTION -- 30 Watts ---- See label on back of chassis.

ANTENNA SYSTEM = Built-in Loop. Available connections for aerial and ground.

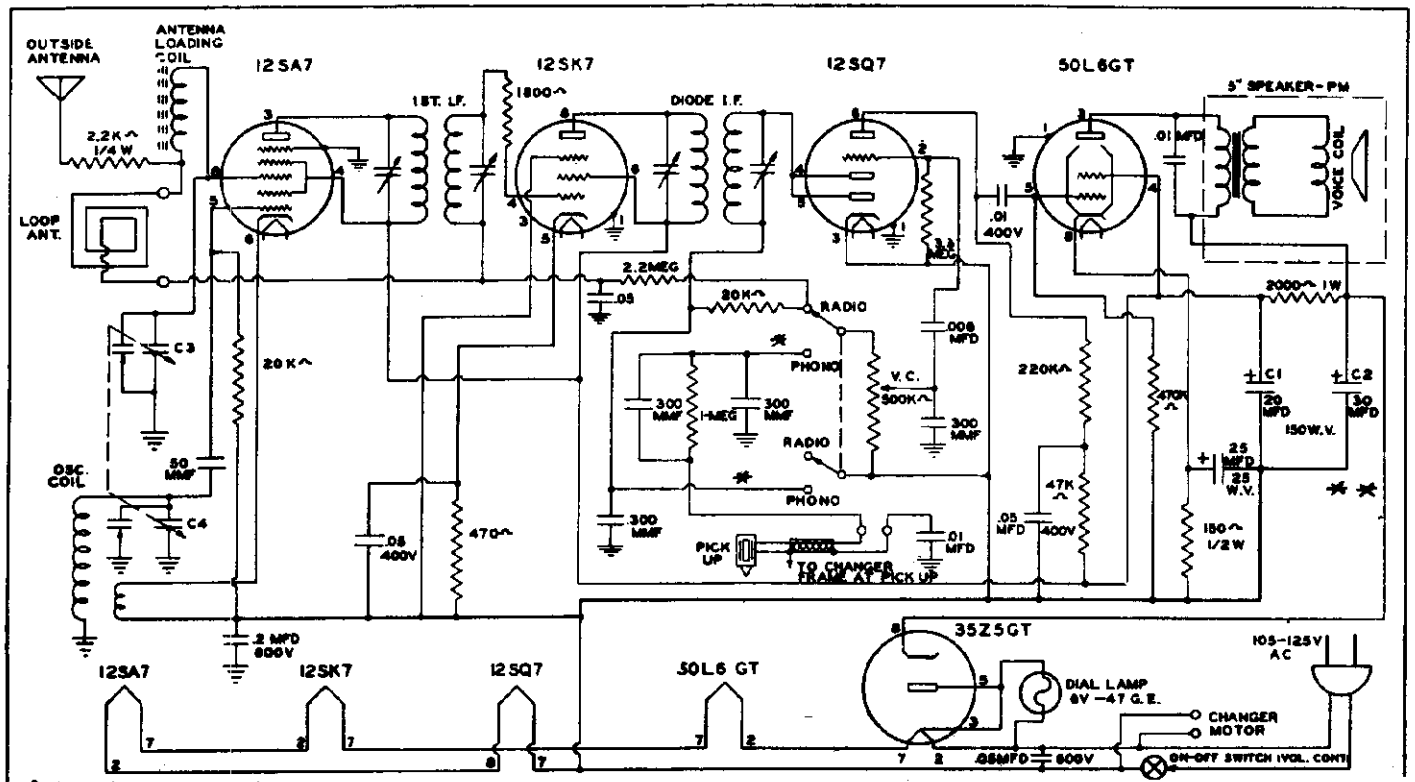
TUNING RANGE = 540-1600 KC -- String Drive -- Full Vision Airplane Dial.

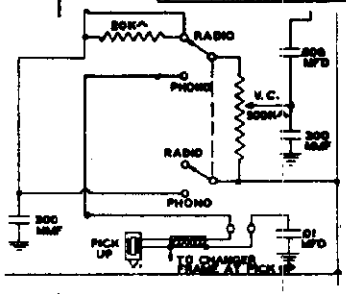
SPEAKER = Permo Mag. Dynamic -- SIZE = 5" -- V.C.IMP. (400CPS) 3.2 Ohms.

POWER OUTPUT = (MAX.) 1.5 W. -- UPO 1.W.

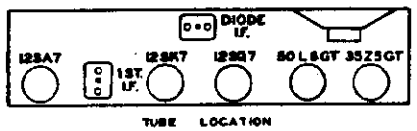
I.F. = 455KC - 26 Ohms Resistance Primary and Secondary.

* Circuit change for plastic cabinets Serial Nos. 31, 321 to 50,000 and wood cabinets above Serial No. 70,380



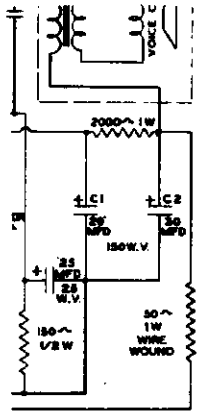


*Circuit Change above Serial No. 4200



I.F. 455 KC

NOTE: ALL RESISTORS 1/4 W UNLESS OTHERWISE SHOWN



** Circuit change above Serial No. 4200

ALIGNMENT PROCEDURE

The following equipment is necessary to properly align this chassis:

1. A signal generator which will provide an accurately calibrated signal at the frequencies listed.
2. An output meter.
3. A non-metallic screwdriver.
4. Dummy antenna: — .1 mfd. — RMA loop.

CONNECT GENERATOR TO	DUMMY ANTENNA	INPUT SIGNAL FREQUENCY	BAND	SET DIAL AT	TRIMMERS	PURPOSE
6SA7GT grid	.1 mfd	455 kc.	Broadcast	HF end	D E F G	Align IF
6SK7GT RF grid	.1 mfd	1620 kc.	Broadcast	HF end	C	Set limit of band
6SK7GT RF grid	.1 mfd	1400 kc.	Broadcast	1400 kc.	B	Align RF
RMA loop	Through loop	1400 kc.	Broadcast	1400 kc.	A	Align antenna

Parts Layout
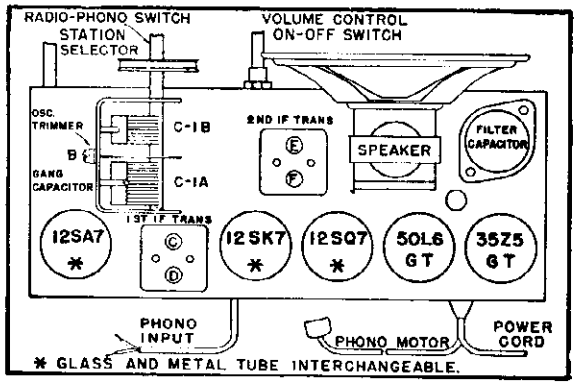
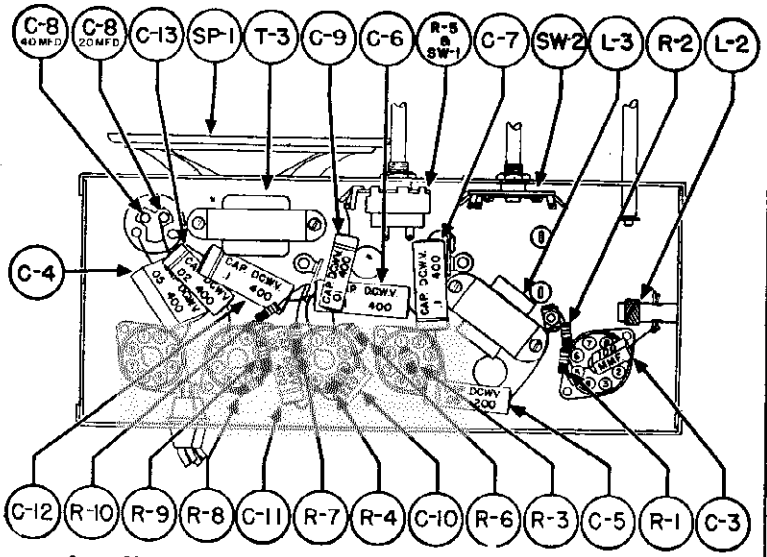
Chassis Model 558





The following equipment is necessary to properly align this chassis:

A signal generator which will provide an accurately calibrated signal at the frequencies listed.
An output meter.
A non-metallic screwdriver.
Dummy antenna: — .1 mfd. — RMA loop.

NOTE: Intermediate Frequency and Oscillator adjustments may be made with the loop disconnected provided a resistor of 10,000 to 50,000 ohms is substituted to close the 12SA7GT grid circuit. The loop alignment must be done with the loop and chassis mounted in operating position in the cabinet. A single turn loosely coupled to loop may be substituted for RMA loop.

GENERATOR	CONNECTION AT RADIO	DUMMY ANTENNA	DIAL	TO TUNE TRIMMERS	REMARKS
IF 455 kc.	12SA7GT grid	.1 mfd.	HF end	IF trimmers C D E F	Tune to max.
1620 kc.	12SA7GT grid	RMA loop	HF end	Osc. trimmer B	Set limit of band
1400 kc.	Through loop*	RMA loop	1400 kc.	Ant. trimmer A	Tune to max.

* Loop trimmer accessible through bottom of cabinet.

NOTE: All DC voltages measured with a 1000 ohm-per-volt meter from ON-OFF switch (—B) to socket contact indicated. All AC voltages are measured from ON-OFF switch (—B) to socket contact indicated.
All voltages are positive DC unless otherwise marked.
Volume Control full on. No signal.
Line voltage 117 volts AC.

Dial Mechanism

The following equipment is necessary to properly align this chassis:

A signal generator which will provide an accurately calibrated signal at the frequencies listed.
An output meter.
A non-metallic screwdriver.
Dummy antenna: .1 mfd. — RMA loop.

Intermediate Frequency and Oscillator adjustments may be made with the loop disconnected provided a resistor of 10,000 to 50,000 ohms is substituted to close the 12SK7GT grid circuit. The loop alignment must be done with the loop and chassis mounted in operating position in the cabinet. A single turn loosely coupled to loop may be substituted for RMA loop.

1. DESCRIPTION

1.1 GENERAL: The Kaar Engineering Company Model KE-23AT is a nine-tube general purpose communications receiver covering a frequency range from 500 KC to 42 MC, the most commonly used radio communications bands. This receiver provides a high degree of selectivity and sensitivity which should provide reception under the most difficult conditions.

1.2 POWER SUPPLY: The KE-23AT receiver is designed for operation from AC power from its built-in AC power supply. An auxiliary 24" power cable terminating in a miniature 5 prong plug provides operation from a 6 volt battery through an external power pack.

1.21 The built-in power supply provides operation from 40 - 60 cycle AC power at 100, 120, 150, 210 and 230 volts. A switch is provided for selecting any one of these voltages as necessary. The receiver will also operate satisfactorily under substantial overvoltage or undervoltage conditions, and satisfactory operation can be expected on any voltage between 90 and 250 volts.

1.22 Operation from a 6 volt battery is provided by removing the power plug from its socket and inserting it into an external power supply capable of furnishing 460 volts at 65 Ma and 6 V. DC for the heaters. By making a minor circuit change underneath the chassis, the high voltage power requirement can be reduced to 230 - 250 volts at 65 Ma.

1.3 SPEAKER: The 8" PM model 23ST loud speaker as furnished with this receiver is recommended for general use. Much larger speakers to provide better tone quality or very small speakers for monitoring purposes may be used satisfactorily. A 4 ohm output is provided for direct loud speaker operation. 500 ohms is also provided for feeding the output into a 500 ohm line.

1.4 DIMENSIONS: The KE-23AT receiver is mounted on a 8 3/4" x 19", 16 gage steel panel of relay rack mounting dimensions. It is housed in an 18 gage steel cabinet, with hinged lid in the top, 19" long, 9" high and 11" deep.

The model 23ST speaker cabinet is 9" high (excluding handle), 10" wide and 6" deep.

Both the receiver and speaker are finished in gray, baked enamel wrinkle with black trim and knobs.

1.5 FREQUENCY COVERAGE: The tuning range of the receiver is covered in four bands:

Band A	500 KC to 1600 KC
Band B	1600 KC to 5000 KC
Band C	5 MC to 16 MC
Band D	16 MC to 42 MC

The frequencies are calibrated directly on the main dial. The VERNIER dial in the center provides a means for fine tuning adjustments and accurate logging. One complete rotation of this dial covers one division on the 0 - 50 logging scale on the main dial. The tuning ratio is approximately 100 to 1.

1.6 TUBE COMPLEMENTS:

V-1	6SK7GT	Tuned R.F. Amplifier.	
V-2	6K8	First Det. Osc.	
V-3	6SK7GT	455 KC I.F. Amplifier	
V-4	6H6	Automatic Noise Limiter.	
V-5	6SQ7GT	Second Det. and Squelch Control.	
V-6	6SQ7GT	First Audio Amplifier.	
V-7	6SK7GT	Beat Frequency Oscillator.	
V-8	6V6GT	Power Output Tube.	
V-9	5Y3GT	Rectifier.	

Glass "GT" tubes or even "G" tubes can be used if the metal tubes indicated above are not available. Metal tubes can be substituted in all cases where glass tubes are indicated. However, if such substitutions are made for V-1, V-2 or V-3, it is quite probable that the receiver would have to be re-aligned, particularly on the higher frequency bands.

1.7 CIRCUIT:

1.71 The circuit is a standard superheterodyne with a high degree of stability. Permeability tuned intermediate frequency transformers and ceramic trimming condensers across the R.F. coils are incorporated to assure permanancy of adjustment.

1.72 A special feature of the KE-23AT is the NO-SIGNAL SQUELCH CIRCUIT. This SQUELCH (or "Q") CIRCUIT may be used in two-way communication work where "standby" operation is desirable and where the background noise with the station off would be objectionable. The SQUELCH CIRCUIT automatically silences the receiver except when a station is actually being received. This feature can also be used as a between-station quieting device preventing the rear of static between stations when tuning from one to another.

1.73 There is also provided an AUTOMATIC NOISE SILENCER which limits the noise produced by gasoline engine ignition systems or other electrical equipment, including ordinary static, that may exceed the level of the signal being received.

1.74 A BEAT FREQUENCY OSCILLATOR is provided for receiving CW (code) signals.

1.8 PERFORMANCE: For a receiver built as simply as the KE-23AT with as few tubes and component parts, the general performance is excellent.

1.81 SENSITIVITY: When measured with a standard dummy antenna input, the sensitivity of the receiver will be approximately between 1 and 5 microvolts over the range 500 KC to 16 MC, and between 3 and 15 microvolts in the 16 to 42 MC range.

1.82 SELECTIVITY: The average selectivity is approximately as follows:

Ratio: Input Voltage off Resonance to Voltage at Resonance	Kilocycles off Resonance
10 (20 DB)	7 KC
100 (40 DB)	14 KC
1000 (60 DB)	25 KC

1.83 AUDIO RESPONSE: The audio frequency response is essentially flat between 100 and 3500 cycles. The power output is approximately 3 watts with a total harmonic distortion of not over 10%.

2. INSTALLATION

2.1 A radio receiver is only as good as its installation. Reception obviously will not be as good with a poor, fluctuating or noisy power source; or a make-shift antenna; as it would be under proper conditions. Generally speaking the KE-23AT receiver should be installed according to good and acceptable practice. A filter is provided in the AC line to help minimize noise from that source. The automatic noise limiter will help reduce noise entering by way of the antenna. Two voltage regulating neon lamps are in the oscillator voltage supply circuit to minimize the effect of voltage fluctuations. The receiver has been moisture-proofed and the parts on the under side of the chassis have been sprayed with fungus resisting lacquer as an aid to operation in damp and humid climates.

2.3 ANTENNA AND GROUND: The importance of a good antenna cannot be ever stressed. It is essential for satisfactory reception of weak signals.

2.21 The antenna input circuit of the KE-23AT provides for the use of a Marconi or doublet antenna. The Marconi type is usually recommended for ordinary reception and should prove satisfactory in most instances. It consists of an ordinary antenna wire of approximately #12 or 14 B&S gage strung between insulators as high as possible. The over-all length is not critical and may be some 50 to 100 feet long including the lead-in to the set. When using this type of antenna, the terminals on the rear of the set, "F" and "G", must be connected together and the antenna lead-in connected to "A".

2.22 The receiver will usually work fairly satisfactorily without a ground connection but a good ground connection is to be highly recommended. In many instances it will increase the signal strength and reduce noise. A six-foot rod driven in moist earth will make a satisfactory ground, or as an alternate, a cold water pipe. The lead-in from the ground should be of heavy wire, at least #12 or 14, and should be connected to "G" at the rear of the receiver.

2.23 Under special conditions when a doublet antenna may be used, the 400 ohm transmission line will then be connected between "A" and "D" with the ground connected to "G". In this case "D" and "G" are not connected together. The doublet antenna performs excellently in a direction at right angles to its length but only on the rather narrow group of frequencies for which it was designed.

2.3 SETTING UP THE RECEIVER FOR AC OPERATION:

2.31 Unpack the KE-23AT receiver and loud speaker from the shipping case and examine for possible damage. There are no loose accessories other than the instruction book.

2.32 Make sure that the tubes are firmly seated in their sockets and the grid cap is in place on the 6K8 tube.

2.33 Make sure that the power plug, P-3, on the end of the 24" power cable is firmly inserted in the power socket, P-2, at the rear of the chassis for AC operation.

2.34 Attach the 23ST speaker to the two terminals marked "4-8 Ω" at the rear of the receiver.

Ordinarily the loud speaker will be placed at the side of the receiver. It is not desirable to place it on top of the cabinet since vibration from it might possibly introduce microphonic noises which would not otherwise be noticeable.

2.35 Connect the antenna lead-in or antenna transmission line in accordance with instructions in Paragraph 2.2.

2.36 Determine the voltage of the AC source which is to operate the receiver by measurement with a voltmeter. Then set the voltage selector switch, SW-10, to the nearest voltage indicated. This switch is located just behind the tuning meter, M-1. It will be necessary to loosen the set screw with a small screw driver in order to turn the switch.

CAUTION: Never turn the voltage selector switch with the receiver turned "ON". An accidental wrong setting may damage the receiver and accidental contact with the terminals at the rear of the tuning meter may cause shock.

If no voltmeter is available to test the line voltage, in cases of emergency the voltage selector switch can be turned first to the 230 volt position, the brilliancy of the pilot lamps observed, and then the switch tried in the consecutively lower positions until the brilliancy of the pilot lamps appears to be about normal. Care should be exercised in operating the receiver with this estimated setting, and at the first opportunity it should be checked with a voltmeter. Also, at the correct setting when the receiver is turned off and then on again, the two neon lamps located just in front of the 6K8, V-2, should ignite.

2.4 BATTERY OPERATION: The KE-23AT may be operated from a 6 volt storage battery with a proper vibrator power supply. It can be operated from other battery sources if the proper voltages are applied to the correct prongs of the power plug, P-3.

To set up and operate the receiver from the vibrator power supply, proceed as follows:

2.41 Proceed as directed in Paragraphs 2.31 - 2.35. Be sure the AC line cord is not plugged into an AC outlet, (in case AC power should accidentally be applied).

2.42 Remove the power plug, P-3, in the end of the 24" power cable from the power socket, P-2, at the rear of the chassis. If operation is to be from a type of vibrator power supply furnishing approximately 460 volts at 65 MA from the same type of 5 prong power socket with the correct connections, simply plug P-3 into the socket.

Although the high voltage required for the receiver is only 250 volts, a dropping resistor, R-35 (3500 ohms, 25 watts), is installed in the receiver in order to drop the 460 volts to the correct value.

2.43 If operation is to be from other power supplies, make sure that the proper voltages are applied to the proper pins on P-3 as shown in the schematic diagram. The easiest way to do this is to connect the output terminals or leads from the power supply unit used to a 5 prong female cable socket such as an Amphenol Type MPF5L. If the output is approximately 240 - 250 volts at 65 MA, such as would be obtained from the Kaar Type 647X Vibrator Power Supply, then the resistor, R-35, should be shorted out by soldering a piece of wire around its terminals. (This resistor is located under the chassis at the rear near the fuse extractor post.) For power supplies furnishing voltages between 250 and 460 volts, a 10 watt resistor of the proper resistance value as calculated, or determined by experiment, may be connected across the terminals of R-35. The correct value should provide approximately 250 volts at the low potential end of the resistor when the receiver is operating.

2.44 Connect the heavy battery leads from the power supply to the 6 volt battery, the RED lead to the positive (+) and the BLACK lead to the negative (-) terminal.

2.45 When operating from a battery power source, the operation of the receiver is the same as before except that the switch, S-1, on the Volume Control does not now turn the receiver off and on. To turn the receiver off, it will be necessary to remove one of the battery leads from the storage battery. A special high current, low resistance switch may be installed in one of the battery leads if desired.

2.5 BREAK-IN CONNECTION: The KE-23AT may be used with a transmitter to form a two-way radio communication system. When the transmitter has break-in facilities, it is only necessary to run wires to the two BREAK-IN terminals on the rear of the chassis. When the STANDBY-RECEIVE switch is in the "STANDBY" position, every time the transmitter is turned off the receiver will automatically be turned on, and the receiver will be silenced while transmitting. This system will only work when the receiver is operated from its internal AC power supply. When operating from batteries with an external power supply, these BREAK-IN CONNECTIONS can not be used, and if break-in operation is desired, it will be necessary to provide for breaking the high voltage supply lead by other means, such as by a special relay operated by the transmitter.

3. OPERATING INSTRUCTIONS

3.1 The various controls for operating the KE-23AT receiver are located across the bottom of the panel and are appropriately marked. The main tuning knob is located in the center of the panel just underneath the Vernier dial. To put the KE-23AT receiver into operation, proceed as follows:

3.11 Plug the line cord into a source of AC power as outlined in Paragraph 2.3 or connect for battery operation with an external power supply as per Paragraph 2.4.

3.12 If operating from an AC source, the receiver is turned on by rotating the VOLUME control from its "OFF" position to the right. A click will be felt and heard. As the switch connected to this control closes, the dials should light up. It will take 30 seconds or so for the tubes to heat up. If operating from a 6 volt storage battery, the receiver is turned off and on by disconnecting one of the battery leads as described in Paragraph 2.45.

3.13 Set the SELECTOR switch on position "A" for receiving broadcast stations, as they are usually the easiest to receive initially and will enable one to become accustomed to the operation of the set. In remote locations it may be that there are no near-by stations on Band A, in which case the SELECTOR switch should be set on position "C" and short wave broadcast stations tuned in instead.

3.14 The R.F. GAIN control should be turned completely to the right (clockwise) as far as it will go to position "10".

3.15 The SQUELCH control should be turned off by rotating it as far as it will go to the right (clockwise) until the switch snaps in the "OFF" position.

3.16 The AUTOMATIC NOISE LIMITER, A.N.L., and BEAT FREQUENCY OSCILLATOR, B.F.O. should be "OFF"; and the AUTOMATIC VOLUME CONTROL, A.V.C., switch "ON". Put the STANDBY-RECEIVE switch in the "RECEIVE" position.

3.17 Advance the VOLUME control to the right to a point where background noise is heard. In quiet locations it may be desirable to turn the VOLUME control full on, and when a station is turned to too loudly, reduce it to the desired volume level.

3.18 Rotate the main tuning knob until a fairly strong station is heard. The operator should then familiarize himself with the operation of each of the various controls in turn. Tune for maximum reading on Tuning Meter.

3.2 The function of each of the controls is herewith explained.

3.21 R.F. GAIN CONTROL: This control adjusts the sensitivity of the receiver and is used when the signal strength of a powerful nearby station is too great and reception is distorted. Normally, however, with the AUTOMATIC VOLUME CONTROL (A.V.C.) "ON", there will be very little use for this control when receiving voice and it is usually left turned completely to the right to position "10". The A.V.C. switch should be turned "OFF" when listening to code with the BEAT FREQUENCY OSCILLATOR (B.F.O.) "ON". With the A.V.C. "OFF", even medium powerful stations will overload the receiver and it will be necessary to reduce the sensitivity with the R.F. GAIN CONTROL for best results. The Tuning Meter operates only when the A.V.C. is turned on.

3.22 SELECTOR SWITCH: The SELECTOR switch, or "BAND CHANGE" switch as it is sometimes called, allows selection of the various frequency ranges, "A", "B" "C" or "D", as desired. Simply turn the pointer knob to the desired range.

3.23 SQUELCH CONTROL: The SQUELCH CONTROL (or "Q" control) can be used to silence the receiver except when a signal is actually being received. Its use is particularly adapted to two-way communication work where the KE-23AT may be standing by and where a considerable amount of background noise would be present when no station is being received. The squelch circuit allows the receiver to be actually inoperative until the station to which it is tuned comes on the air, when it is automatically turned on. By adjusting the SQUELCH knob, the receiver can be made to operate only on signals of a definite minimum volume. As the control is turned to the left (counter-clockwise) it takes a stronger and stronger signal to trip the squelch circuit. For instance, in position "8" a reasonably strong signal will operate the receiver, while in position "2" it would take a powerful transmitter located just a few blocks away to operate it and any weaker station on the same frequency would not then come in.

To properly set the SQUELCH for a given condition, tune in the station it is desired to receive in the ordinary manner while it is transmitting. Then when it goes off the air, turn the SQUELCH control knob to the left until the background and static noises just disappear. Then check and see if, when the transmitter again comes on the air, it can be heard.

Another way would be to turn the control knob to the left when the transmitter is on the air until it just disappears; then advance the knob slightly to the right until the station just sounds normal, but no further. This latter method is satisfactory for close-by stations, but for more distant stations which are subject to fading, it is possible that at some other time of day the signal would become weaker than it was when the control was set and then might not trip the SQUELCH circuit.

To use the SQUELCH control for a between-station quieting device, it is only necessary to set the knob at the position where average static noise just disappears when not tuned to a station. Then, when the set is tuned across the dial, only the stations stronger than the static noises will come in. This use of the control does not work too satisfactorily on the short wave bands, as the short wave stations are usually subject to so much fading that it is possible to tune right by them as they are fading and consequently miss them altogether.

3.24 VOLUME CONTROL: The main receiver "On-Off" switch is combined with the VOLUME control. To turn the receiver "On", turn the control to the right, and to turn it "Off", turn it to the left until the switch clicks and the dial lights go out. The VOLUME control is used to adjust the volume level of the received signals. When operating the receiver with the A.V.C. "OFF", best results will be obtained by advancing the VOLUME control a little further than normal and then reducing the volume to the desired level by turning the R.F. GAIN control to the left.

3.25 TONE CONTROL: The TONE control serves to reduce the intensity of the higher audio-frequencies which some listeners find desirable in assisting to reduce static or to make the tone quality "bassy". In the "HIGH" position, the receiver operates normally as there is no attenuation of the high frequencies and music, and especially voice, will be most natural. For the greatest

intelligibility of the speaking voice, this control should always be in the "HIGH" position. When in the "LOW" position, most of the treble tones are lost. Since electrical and atmospheric noises are more or less of a high pitch, there will be a marked reduction in background noise when the TONE control is in the "LOW" position, but often this advantage is lost as the excessive "drummy" or "boomy" tone of the voice is not clear and crisp. The center point provides a position half way between the high and low settings.

3.26 PITCH CONTROL AND BEAT FREQUENCY OSCILLATOR: The BEAT FREQUENCY OSCILLATOR (B.F.O.) is turned on by snapping the "B.F.O." switch to "ON". The Beat Frequency Oscillator is a miniature radio transmitter built into the receiver for producing a signal which will "beat" with the received carrier to create an audible tone or whistle. CW (code) signals are produced by virtually turning a transmitter off and on to make the dots and dashes. If it were not for the Beat Frequency Oscillator, nothing could be heard but some thumping sounds as the transmitter went off and on. By beating this oscillator with the transmitter, a tone is produced which can be read as code. The pitch of the beat note should be adjusted by the PITCH CONTROL Ordinarily the receiver is properly tuned when, with the PITCH CONTROL in the center "O" position, the tone is so low that it is inaudible. Then the control may be turned to the right or left until a tone of the desired pitch results. The pitch selected will depend upon the listener's preference, the background noises present, etc.

When listening to code signals with the B.F.O. on, the A.V.C. switch should be "OFF" and the volume controlled by turning the R.F. GAIN control to the left. The regular volume control can be left set at a comfortable listening level.

3.27 AUTOMATIC NOISE LIMITER: The AUTOMATIC NOISE LIMITER (A.N.L.) is a device for short-circuiting noises and interference which are stronger than the signal being received. It works best on noises of short duration such as spark discharge noises and the like. It is operative when the A.N.L. switch is "ON". Since the device removes a portion of the sounds coming through the receiver, there will be a certain amount of distortion, which is of much less consequence than heavy background noise when receiving a weak signal. However, when listening to stronger stations not requiring this feature, the A.N.L. should be turned "OFF" as the speech and music will then tend to be clearer.

3.28 STANDBY-RECEIVE SWITCH: Located at the center of the designation plate is the STANDBY-RECEIVE switch. This switch must always be in the "RECEIVE" position in order for the receiver to operate. When the receiver is used in conjunction with a transmitter, it is desirable to turn the receiver off while transmitting, leaving the tubes still lit in order that it can be instantly turned on without the usual delay in waiting for the tubes to warm up. This switch is used for that purpose.

At the rear of the receiver is a BREAK-IN connection which parallels this front panel switch. In using a transmitter with break-in facilities, it is only necessary to run wires from these two BREAK-IN terminals to the proper terminals on the transmitter. Then the STANDBY-RECEIVE switch should be left in the "STANDBY" position, and every time the transmitter is turned off the receiver will automatically be turned on. Complete Two-Way Radiotelephone communication can be carried on in this fashion very easily.

3.29 PHONES: A phone jack is located on the front panel for using headphones when desired. Ordinary high impedance crystal or magnetic phones can be used.

3.210 OUTPUT TERMINALS: There are two output circuits in the KE-23AT receiver, 4 Ohms and 500 Ohms. When using the Model 23ST speaker, connections should be made to the "4 Ω" terminals. For 500 Ohm output, connections should be made to the "500 Ω" terminals.

4. MAINTENANCE

4.1 The parts used in the KE-23AT Receiver are of more than adequate rating and the maintenance required ordinarily will be limited to the occasional checking of the tubes.

4.2 If the receiver is used in extremely dirty and dusty locations, it will be advisable to blow out the dust, preferably with compressed air, every few weeks. If compressed air is not available, a soft paint brush may be used although care should be exercised in dusting around the various adjusting screws in order that their settings will not be altered.

4.3 It may be desirable every few months to oil the gear train mechanism. A drop of light machine oil on the end of a tooth pick may be applied to the various bearings.

CAUTION: Do not use too much oil. One small drop only should be applied at each point.

It also may be desirable to apply vaseline or other light grease to the gears themselves. However, in very dirty locations this may not be desirable as the grease would collect abrasive dust and cause premature wear.

4.4 Should the failure of some part occur, regular servicing technique by one familiar with this work is suggested. If parts replacement be required, standard parts of any reputable manufacturer, of the same value and voltage rating as the originals, may be used without adversely affecting the performance of the equipment.

5. ALIGNMENT PROCEDURE

5.1 GENERAL: Due to continual temperature changes, ageing of the parts and tubes, etc., it may be necessary to align the KE-23AT from time to time. Even under severe operating conditions this should seldom be necessary more than once a year. It is suggested that only someone entirely familiar with the theory of alignment of superhetrodyne receivers be permitted to make these adjustments.

Ordinarily the alignment will need only to be "touched up", and no more than a very small fraction of a turn of any of the adjusting screws should be required. This procedure is not particularly difficult. However, if certain coils and condensers are replaced, or through tampering the receiver should get badly out of alignment, trouble may be experienced in getting it correctly aligned again unless one is very thoroughly familiar with the correct procedure, as a number of apparent settings, images and the like may prove to be confusing, particularly on the higher frequency bands "C" and "D".

NOTE: Since individual receivers may vary slightly one from the other, the dial calibration may not be exact in all cases, and alignment should not be attempted merely for making the dial calibration exact as performance may be sacrificed. Under no conditions bend the plates of the tuning condenser C-1.

To properly align the KE-23AT Receiver, certain apparatus will be required.

A very accurately calibrated source of HF signals is necessary. This may be an ordinary Test Oscillator for aligning the I.F. Amplifier, provided that 455 KC has been accurately calibrated by recent comparison with a secondary frequency standard. For properly aligning the R.F. section on the various bands, a regular laboratory type Standard Signal Generator is recommended. The frequencies that will be required will be: 455, 550, 1,400, 1,800 and 4,400 KC; and 5.5, 14, 16 and 38 MC. It is also desirable, but not essential, to have a series of frequencies lying near the mid-point of each band, such as 900 and 3,000 KC and 9 and 25 MC. It is also desirable to have provision for modulating the signal with a 400 or 1,000 cycle tone.

In order to visually observe the correct alignment, an Electronic Voltmeter or a regular rectifier type AC Voltmeter is used. If neither of these is available, then the regular tuning meter, M-1, may be used, but the small scale will make accurate adjustment difficult.

If the Electronic Voltmeter is used, connect the positive (+) lead to the chassis and insert the negative (-) lead-prong in the "ALIGNMENT JACK", the red tip-jack on the rear of the chassis. If the AC Voltmeter is used, it is connected as an output meter across the "500Ω" terminals at the rear of the receiver. When aligning the receiver, the "A.V.C." switch should be On when using the Electronic Voltmeter or the Tuning Meter of the receiver, and Off when using the AC Voltmeter as an output meter.

It is preferable to use an insulated screw driver for adjusting the various trimmers. The receiver may be left in or removed from the cabinet when aligning the R. F. section, but it must be removed when aligning the I. F. Amplifier.

5.2 ALIGNMENT OF THE I. F. AMPLIFIER: Correct alignment of the Intermediate Frequency Amplifier is perhaps most important, as all signals being received are converted to the 455 KC I.F. frequency. If the Amplifier is incorrectly aligned, it may cause the dial calibration to be excessively off or cause mis-tracking.

To align the I. F. Amplifier, proceed as follows:

5.21 To gain access to the adjusting screws, it will be necessary to remove the receiver from the cabinet. This is done by removing the four screws in the panel and then pulling the receiver forward out of the cabinet.

5.22 Connect the loud speaker. If the Electronic Voltmeter is used, turn the A.V.C. switch On. If the AC Voltmeter is used, turn the A.V.C. switch Off. The R.F. GAIN control should be turned completely On to the right, the A.N.L. switch Off, and the STANDBY-RECEIVE switch in the "RECEIVE" position. The VOLUME control may be turned about 1/3 way on just so the signal can be comfortably heard in order to give an aural indication, partly for convenience and also so that one can get the "feel" of the receiver. The B.F.O. switch should be turned off.

5.23 Remove the grid cap of the 6K8 mixer tube, V-2, and connect the Test Oscillator output to the 6K8 grid and the chassis. It may be most convenient to clip the grounded side to the variable condenser frame.

5.24 Turn on the receiver and the Test Oscillator and allow several minutes for the equipment to warm up and become stable. Since it is best to align the receiver at its normal operating temperature, in extremely cold climates it is recommended to let it run for an hour or two before proceeding with the alignment.

5.25 Apply the 455 KC signal to the 6K8 tube. If the I.F. Amplifier is considerably out of alignment, such as might be the case if a new transformer had been installed, then a fairly strong signal will have to be used in order to force it through the system. Otherwise, set the level of the Test Oscillator until some two or three volts are read on the Electronic Voltmeter, or five volts with the Volume Control turned full On on the AC Voltmeter.

5.26 Then, with a screw driver, adjust the four screws on the rear side of the I.F. transformers, T-13 and T-14, one at a time, until maximum reading on the meter is obtained. If the alignment is occasioned by the replacement of one of the transformers, then adjust the two screws on this one first and follow up with the minor adjustment of the transformer that was not replaced.

After the adjustment appears to be completed and the meter reading is at a maximum, then go back over the adjusting screws in reverse order trying for a slightly higher reading. As the meter reading increases appreciably, reduce the output of the Test Oscillator as necessary.

5.3 ALIGNMENT OF THE BEAT FREQUENCY OSCILLATOR: The Beat Frequency Oscillator oscillates at the same frequency to which the I.F. Amplifier is tuned. Its adjustment is correct if, when a station is accurately tuned in, "zero beat" occurs when the B.F.O. pitch control is at zero or mid-point. Should it be required to adjust for this condition, proceed as follows:

5.31 If the I.F. Amplifier has just been aligned, leave the setup intact. Otherwise, set up in the same manner as described above, and apply the 455 KC signal. It is preferable that the modulation be removed from the signal.

5.32 With the B.F.O. PITCH control set at the mid-point, "0", with a screw driver turn the adjusting screw of T-15 until the beat-note between the Beat Frequency Oscillator and the Test Oscillator becomes lower and lower in pitch and finally zero beats.

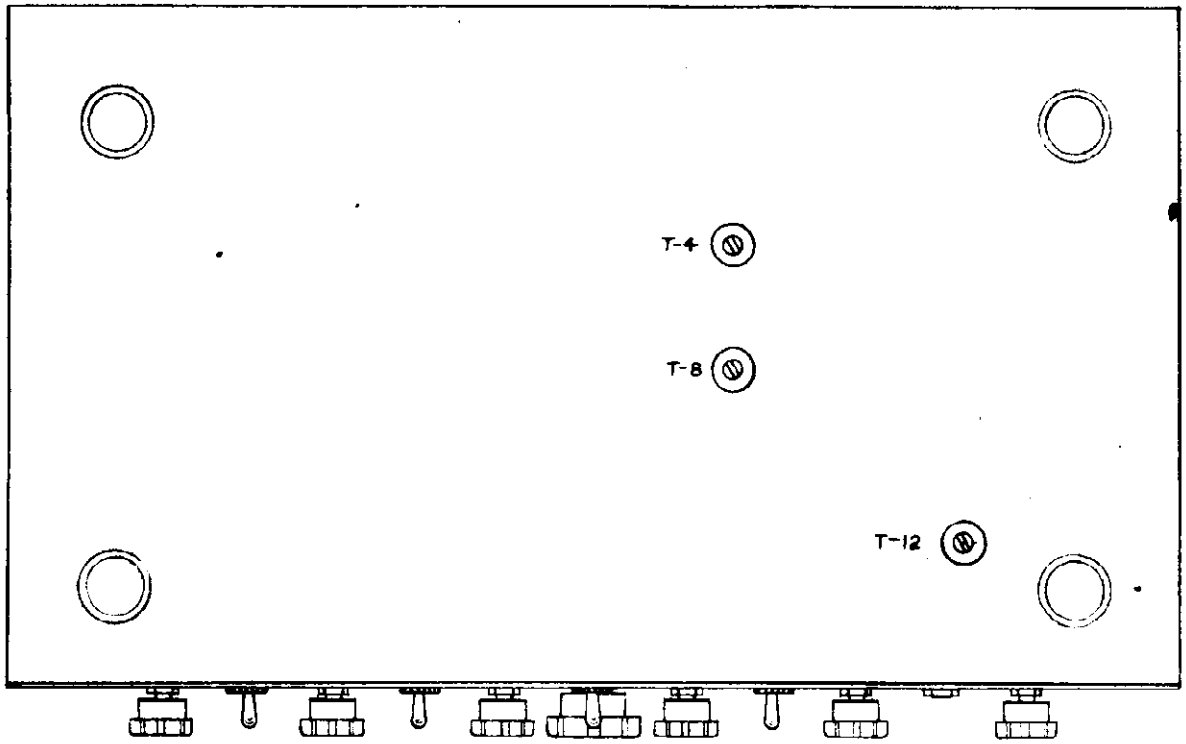
5.33 Check the adjustment by turning the B.F.O. pitch control to the right or left and see that the pitch increases as the control is turned either way.

5.34 Remove the leads and replace the grid cap on the 6K8 tube.

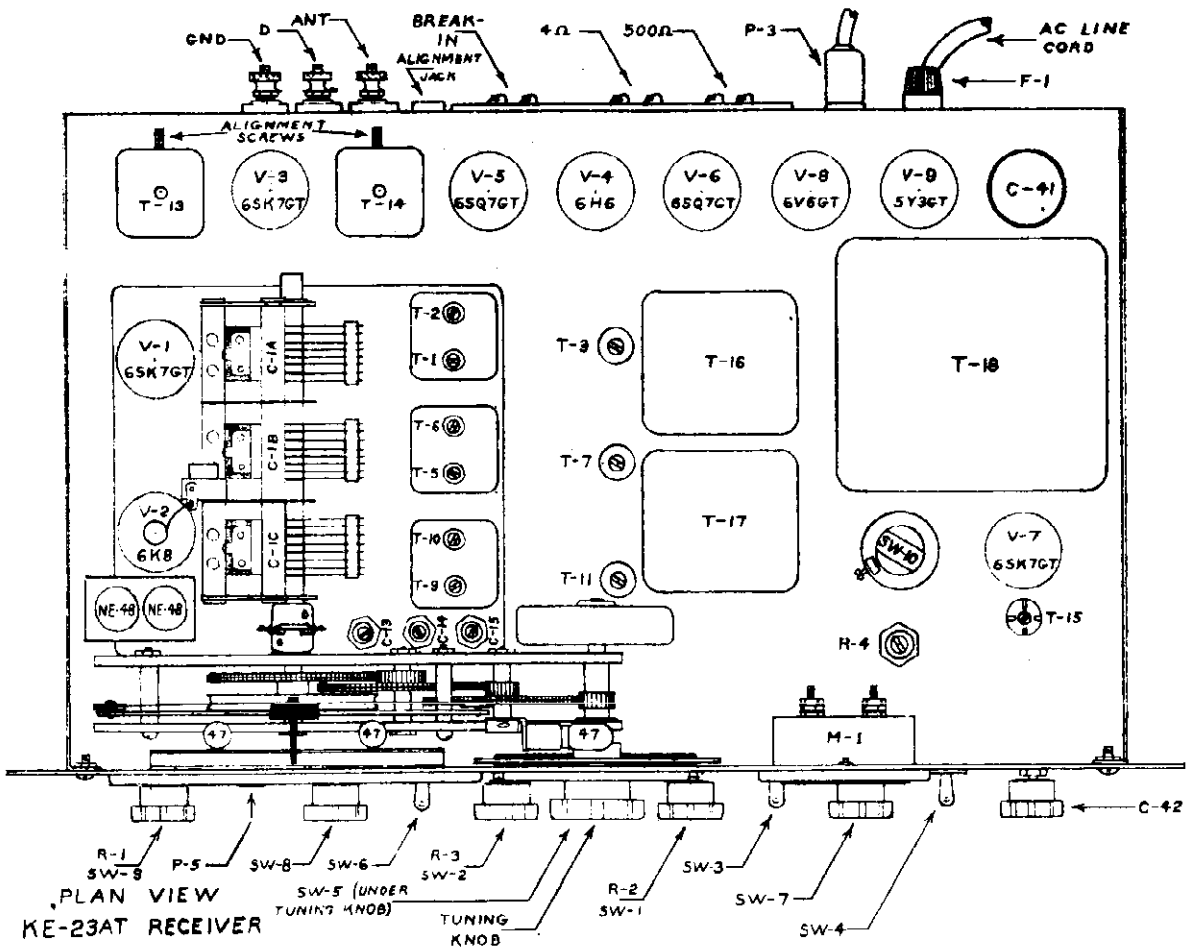
5.4 ALIGNMENT OF THE RADIO FREQUENCY SECTION: This procedure is much more difficult than that of aligning the I.F. Amplifier. It is suggested that care be exercised if only "touching up" the trimmers not to get the receiver too far out of alignment, as difficulty may be experienced in getting it realigned correctly, particularly on Bands "C" and "D". The positions of the various trimming and padding adjusting screws are shown in the Plan View and Bottom View diagrams.

5.41 Connect the Signal Generator through a standard dummy antenna to the input terminals, A and D, (be sure D and G are connected together). If a dummy antenna is not available, a 400 Ohm resistor can be connected between the hot side of the output of the Signal Generator and the antenna terminal, A.

KAAR ENGINEERING CO.



BOTTOM VIEW
KE-23AT RECEIVER



PLAN VIEW
KE-23AT RECEIVER

5.42 Set the various switches and controls in the same position as outlined in Paragraph No. 5.22.

5.43 To align the A Band, 500 - 1,600 KC, proceed in the following order:

(1) Turn the SELECTOR switch to "A".

(2) Apply the 1,400 KC signal and tune the dial to approximately 1,400 KC. In other words, tune in the signal to be sure it is getting through. If the set is badly out of alignment, then a very strong signal may have to be used and T-9 turned to locate it.

(3) If the dial does not read exactly 1,400, then turn it so that it does. VERY CAREFULLY "trim" by turning the trimmer T-9 until the signal is again heard. Do not attempt to too accurately tune by means of the trimmer alone, instead slightly rotate the tuning dial for the maximum reading on the meter after T-9 has been approximately set. This movement should be so slight that the pointer will still point to 1,400.

(4) Trim further by adjusting T-5 and T-1 for maximum reading on the output meter, reducing the output from the Signal Generator if necessary.

(5) Apply a signal of 550 KC and tune it in on the dial.

(6) Proceed to "pad" by adjusting the padding condenser, C-13, and the dial in connection with each other. There is somewhat of a "trick" to doing this properly and one who is inexperienced in padding a superhetrodyne may find it difficult.

To properly pad, VERY CAREFULLY turn the adjusting screw of the padding condenser, C-13, to the right, clockwise, 1/8 or 1/4 turn. This should detune the receiver slightly. Then retune with the dial and observe the reading on the output meter.

If the meter reading is higher, it shows the procedure is in the right direction. Then give C-13 another 1/8 or 1/4 turn and observe the reading again. Continue until the meter ceases to read higher. If one too many fractional turns is made and the meter starts to read lower, then go back 1/8 or 1/4 turn as necessary.

If, instead of the output meter reading higher when C-13 is turned 1/8 or 1/4 of a turn it reads lower, then, instead, turn it 1/8 or 1/4 turn to the left, counter-clockwise, and proceed as above until the maximum meter reading is reached.

(7) The receiver is now correctly padded on Band A and if the intention was to "touch up" the adjustments only, no further alignment on Band A will be necessary.
However, if the receiver was considerably out of line, then it may be that the dial will not read 550 when a 550 KC signal is applied. If such is the case the pointer may be bent slightly until it reads correctly. This may make the pointer read incorrectly at 1,400 KC, and if so, it will be necessary to trim over again as outlined in (3) and (4) above.

(8) If Band A has required more adjustment than merely a "touch up" of the trimmers, then, regardless of whether the dial reads 550 at 550 KC or not, the padding procedure may have been enough to throw the trimmers out of alignment. This can be checked by returning to 1,400 KC, and see if the dial still reads 1,400. If it does not, repeat (3). Even if it does, check the adjustments T-5 and T-1 again. If T-9 requires further adjustment then repeat the entire trimming procedure, then repad again, retrim again and repad as necessary until the result of further adjustment in both cases is indiscernable.

(9) In cases of extreme misalignment it is possible to inadvertently turn T-9 an excessive amount to such a position that would cause the oscillator to oscillate at a frequency 455 KC lower than the signal frequency, 1,400 KC, instead of higher. If this happens, the apparent performance of the receiver at and around 1,400 KC will seem to be the same as with the oscillator adjusted correctly, and the receiver will pad just as it should. However, if this mistake is made, the set will not perform satisfactorily in the middle of the band, appearing insensitive or dead, and it may even whistle when tuning in stations.

A quick check for this is to attach a fairly long outside antenna to the antenna terminal, A, instead of the Signal Generator, and tune the dial from 1,400 to 550 KC. The noise in the center of the band around 900 KC should be somewhat higher than at 550 KC and possibly a little lower than at 1,400 KC, but the set should sound definitely live in the center of the band. This can also be checked with the Signal Generator, and the output should read as good as or better at 900 KC as at 550.

Should it be found that the set is dead in the middle of a band, then apply 1,400 KC to the input as before and tune in the signal, then turn the trimmer of T-9 approximately 1/4 to 3/4 turn in either direction until the signal is tuned in again with a new adjustment. Then trim and pad several times as described above and again check the performance at the center of the band.

5.44 To align the B Band, 1,600 - 5,000 KC.

(1) Turn the SELECTOR switch to position "B". The Signal Generator and output meter are left connected as before.

(2) Proceed in the same manner as outlined in Paragraph 5.43 (3) to (9) above, but trimming at 4,400 KC and padding at 1,800.

On this higher frequency range it will be found that the trimming of T-10 is somewhat more critical than T-9 was on Band A, but the padding with C-14 is less critical.

(3) It will be noted that by properly trimming T-10, the dial can be made to read correctly at 4,400 KC, and T-6 and T-2 can be easily adjusted. However, the dial reading at 1,800 KC is dependent upon the coils which are not adjustable, and it is possible that when the receiver is correctly padded on Band B that the dial will not read exactly 1,800. If such should be the case the pointer may be bent slightly to "split the difference", so to speak, between the 550 KC reading of Band A and the 1,800 KC reading of Band B. Sometimes one may wish to "split the difference" between the correct padding position and the correct dial reading, in which case the receiver may be purposely mis-padded slightly in order that the dial may read more correctly. If this is done, some performance will naturally be sacrificed.

5.45 To align the C Band, 5 - 14 MC.

(1) Turn the SELECTOR switch to "C" and proceed as before, using 14 Megacycles for trimming and 5.5 Megacycles for padding.

(2) On this higher frequency band it is extremely easy to incorrectly adjust the trimming condenser of T-11 in such a manner that the oscilletor is lower in frequency than the signal, as the two settings of the trimmers fall so close together, and sometimes in merely "touching up" the adjustments, the wrong oscillator frequency may result. Therefore, it is most important when aligning the C Band to check the performance in the center of the band, around 8 - 9 MC.

NOTE: Because of an inherent characteristic of the receiver the sensitivity between 9.5 and 10 MC is somewhat less than over the rest of the range. This slightly "dead" spot is rather sharply defined and should not be confused with a general lack of sensitivity over the middle portion of the band which would be due to the trimmers being incorrectly set.

It will be found that the padding adjustment of C-15 will not be critical.

5.46 To align the D Band, 16 - 42 MC.

(1) Turn the SELECTOR switch to "D".

(2) It is to be noted that on the D Band only, the oscillator frequency is 455 KC Lower than the signal frequency, and the method of determining the correct setting is different from that used on the other bands.

(3) Apply a 38 MC signal to the receiver, adjust the trimming condenser of T-12 and obtain the correct dial reading as before. Adjust T-8 and T-4 for maximum reading on the meter. It will be noted in this case that all the adjustments are very, very critical. In adjusting T-12 it may be necessary to turn the trimmer a very small amount to an estimated setting, and then find the signal by tuning the dial, this adjustment is so critical.

(4) After T-12, T-8 and T-4 are adjusted, then check to see if the oscillator frequency is lower than the signal frequency. To do this, find the image by tuning the dial to approximately 39 MC where the signal should again be heard a little weaker than before. If the signal is heard on 39 MC the adjustment of T-12 is correct. However, if it should be heard on 37 MC and not on 39, the adjustment is incorrect and T-12 should be completely reset.

(5) It must be pointed out that in trimming the D Band it is possible to get false settings. At a false setting all of the adjustments seem to proceed normally except that the receiver lacks sensitivity generally and the performance is very poor. If this condition is suspected, the 38 MC signal should again be applied only possibly stronger, and T-12 and T-8 and T-4 arbitrarily readjusted until the 38 MC signal can be located with an entirely different set of adjustments. Then proceed to carry through the trimming procedure from the beginning.

(6) There is no padding adjustment for the D Band. Instead, the turns on the oscillator coil are moved back and forth to change the inductance, which accomplishes the same result.

It is suggested that no attempt be made to pad the D Band under a touch-up procedure. Only if one of the D Band coils has been replaced should this adjustment be attempted. The results of padding will vary from set to set but, in general, if one of the coils has been replaced it is suggested that an attempt be made to move the turns on it only, leaving the other two alone.

(7) The general padding procedure is much the same as that used with a padding condenser. A 16 MC signal is applied, the output meter reading observed as before, and one of the turns of heavy wire on T-12 moved backwards or forwards by pushing with a screw driver. Follow the signal by retuning the dial and observing if the output has gone up or gone down, repeating or reversing the procedure as necessary. After the correct point has been found, it will be necessary to retrim, much more so in this case than when aligning Bands A, B or C. Then, repad and retrim, repad and retrim as many times as necessary until the performance seems satisfactory. It is not uncommon to have to repeat as many as ten times before satisfactory performance is achieved.

(8) When the best padding seems to have been obtained, then heavy wire of the secondary of T-4 may be moved back and forth to try and better the results. It will seldom be necessary to adjust T-8.

The final check may be made at 25 MC in the center of the band. Ordinarily the sensitivity of the set at 25 MC will be greater than at 38 or 16 MC.

(9) Apply a little Duco Cement, or equivalent, to the turns of wire that have been moved in order to secure them in place.

5.47 Remove the meter and Signal Generator and replace the set in the cabinet.

PARTS LIST

KAAR TYPE KE-23AR COMMUNICATIONS RECEIVER

Circuit Symbol	Function	Description	Type	Mfgr.
C-T	Trimming condensers, 12 units mounted across secondaries of T-1 to T-12.	7-45 mmf. variable ceramic.	CTS-2	TEL
C-1A	Antenna coil secondary tuning.	Rear section, 3 gang variable air condenser. 442 mmf. (Effective capacity.)	23	RC
C-1B	R.F. coil secondary tuning.	Center section, 3 gang variable air condenser. 442 mmf. (Effective capacity.)		
C-1C	Oscillator grid coil tuning.	Front section, 3 gang variable air condenser. 442 mmf. (Effective capacity.)		
C-2	High frequency coupling for T-7.	5 mmf. ceramic, 400 V. DC.	N-750K-5	E
		or		
		Two 10 mmf. mica in series.	5R5Q1	CD
C-3	Compensating capacitance for secondary of T-4.	25 mmf. ceramic, 400V. DC.	N-750K-25	E
C-4	Compensating capacitance for secondary of T-6.	Same as C-3.		
C-5	High frequency coupling for T-8.	50 mmf. ceramic, 400 V. DC.	N-750K-50	E
C-6	Tuning condenser for compensating coil of T-4.	Same as C-5.		
C-7	V-2 oscillator grid.	100 mmf. ceramic, 400 V. DC.	N-750L-100	E
C-8	V-5 diode, R.F. filter.	Same as C-7.		
C-9	Tuning condenser for T-15.	Same as C-7.		
C-10	V-7 grid.	Same as C-7.		
C-11	V-5 diode, R.F. by-pass.	250 mmf. ceramic, 400 V. DC.	N-750M-250	E
C-12	Low frequency tickler tuning of T-12.	150 mmf. mica, 500 V. DC.	F0	MC
C-13	A Band oscillator padding condenser.	250 - 525 mmf., mica compression.	HC-41	SI
C-14	B Band oscillator padding condenser.	850 - 1500 mmf., mica compression.	HC-71	SI
C-15	C Band oscillator padding condenser.	Same as C-14.		
C-16	C Band oscillator padding condenser. Fixed portion.	.001 mfd. mica, 500 V. DC.	1-W5D1	CD
C-17	V-2 oscillator plate coupling.	.002 mfd. mica, 500 V. DC.	1-W5D2	CD
C-18	V-1 cathode by-pass.	.1 mfd. 200 V. DC., moulded paper.	MPW-5157	SOL

V-1	R.F. Amplifier.	Vacuum tube.	6SK7GT	TS
V-2	Oscillator and First Detector-Mixer.	Vacuum tube.	6X8	RCA
V-3	I.F. Amplifier.	Vacuum tube.	6SK7GT	TS
V-4	Automatic Noise Limiter.	Vacuum tube.	6H6	RCA
V-5	Diode Second Detector and Squelch Control.	Vacuum tube.	6SQ7GT	HY
V-6	First Audio Amplifier.	Vacuum tube.	6SQ7GT	HY
V-7	Beat Frequency Oscillator.	Vacuum tube.	6SK7GT	TS
V-8	Audio Output Amplifier.	Vacuum tube.	6V6GT	RCA
V-9	Rectifier.	Vacuum tube.	5Y3GT	TS
2 #NE-48	Voltage regulator for V-2.	Two neon lamps in series.	NE-48	GE
3 #47	Illumination of dials.	Three bayonet base miniature pilot lamps.	47	GE
M-1	Signal strength meter.	0 - 1 MA 3-1/2 inch milliammeter.	DW-51	GE
F-1	Fuse.	2 amp. small glass.	3AG	BS
P-1	External connection to A.V.C. for receiver alignment.	Single contact tip jack.	889R	ICA
P-2	AC supply for heaters.	5 prong miniature socket.	8SS	AMP
P-3	Plate and heater input for DC operation.	5 prong miniature cable plug.	MPM5S	AMP
P-4	Input from AC line.	Rubber AC, spring action line plug.	102	ALL
P-5	Output connection for phones.	Open circuit phone jack.	IJ-101	U

OTHER PARTS AND ACCESSORIES

Description of Part	Type	Mfgr.
Ceramic octal tube sockets for V-1 to V-9.	25-8437	UC
Miniature bayonet pilot lamp sockets.	3171	CI
2 contact neon lamp sockets.	1012 (Sockets ONLY)	GC
Fuse extractor post for 3AG fuse.	HKM	BS
Ceramic thru panel insulators for antenna and ground connections, A, D, and G.	86	EFJ
Terminal strip for 500 Ohm and 4 Ohm output connections and break-in, 6 terminals.	Special 5C	J
Small pointer knobs.	S-3C8-3P	KK
Large tuning knob.	S-3C9-3	KK
Round Vernier dial assembly.	VS-23T-2	KE
Main tuning dial scale.	TS-23T	KE
Gear-train tuning mechanism.	GT-23T	GR

The KAAR ENGINEERING COMPANY reserves the right to make parts substitutions as necessary, changes or improvements on its products from time to time without incurring obligation to install the same on equipment previously sold.

40E1	Pilot Lamp	6-8 Volt .150 Amp. Type 47 Lamp

For alignment procedure read tabulations from left to right, and make the adjustment marked (1) first, (2) next, (3) third.

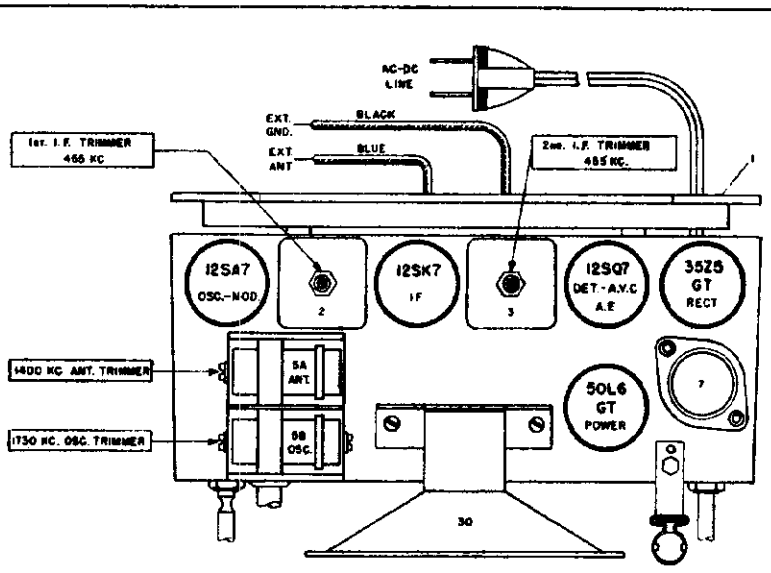
Before starting alignment:

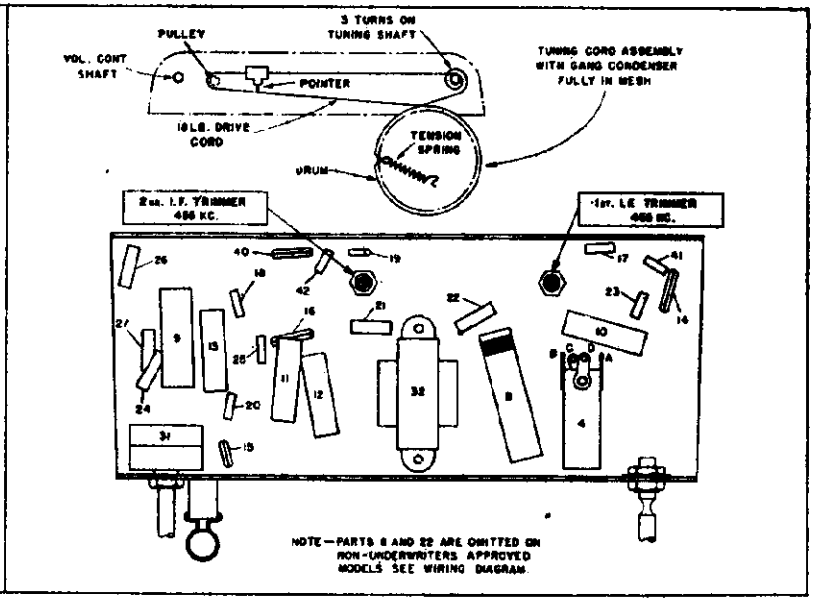
(a) Check tuning dial adjustment by tuning gang condenser until plates touch maximum capacity stop (completely in mesh) at which point the dial needle must be exactly even with the last line at the low frequency end of the dial calibration. If dial needle does not point exactly to last line move to correct position.

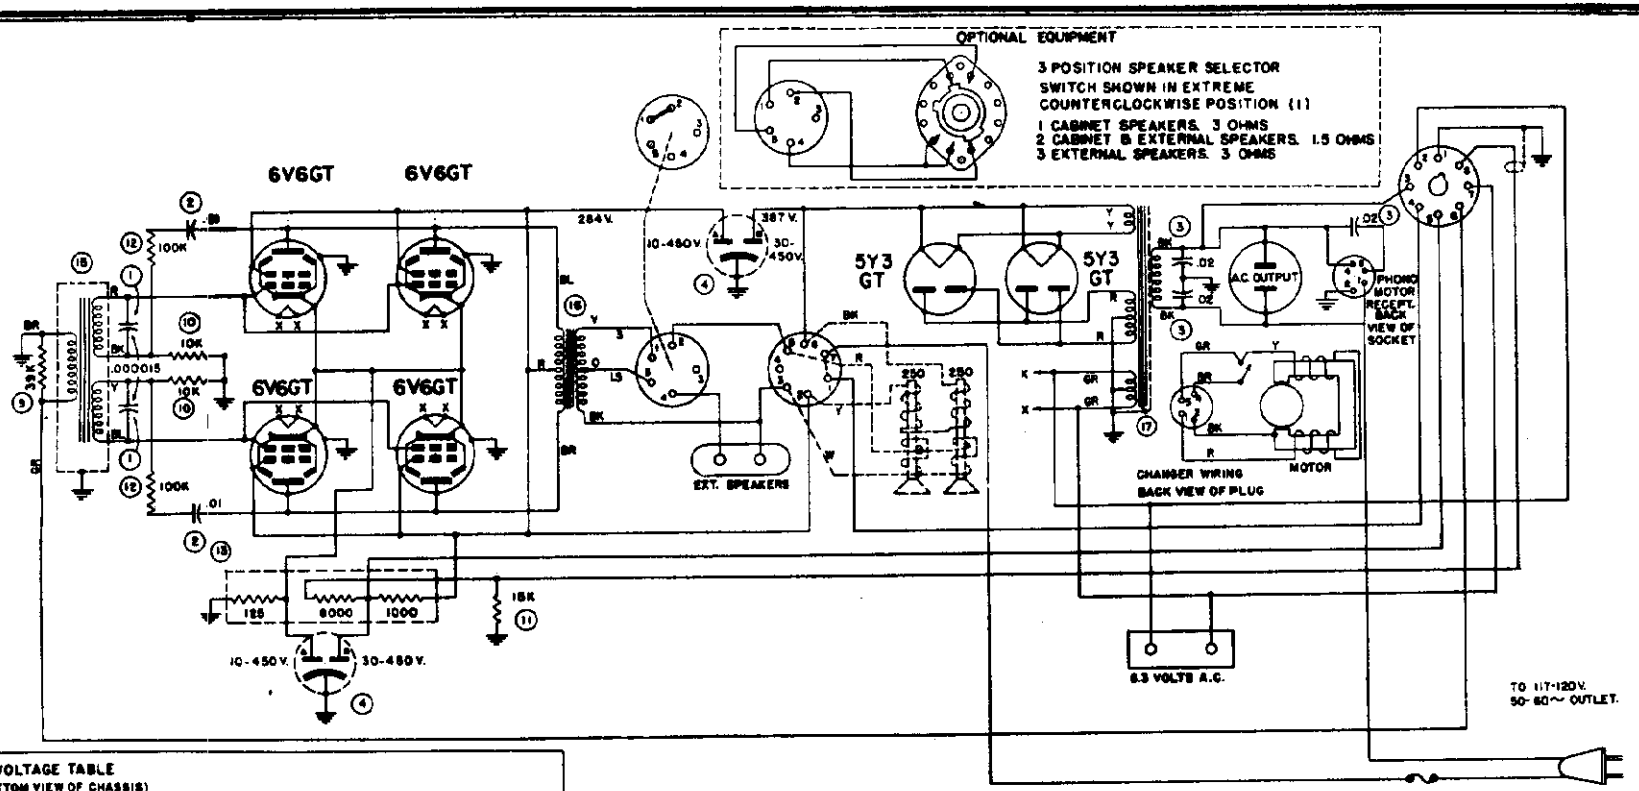
(b) Use an accurately calibrated test oscillator with some type of output measuring device.

(c) PLACE LOOP ANTENNA IN THE SAME POSITION IT WILL BE IN WHEN THE SET IS IN THE CABINET.

Steps	Set receiver dial to:	TEST OSCILLATOR: Adjust test oscillator frequency to:	TEST OSCILLATOR: Use dummy antenna in series with output of test oscillator consisting of:	TEST OSCILLATOR: Attach output of test oscillator to:	Refer to parts layout diagram for location of trimmers mentioned below:
1	Any point where no interfering signal is received.	455 K. C.	.02 MFD. condenser	High side to rear stator plates of tuning condenser. Low side to frame of condenser through a .02 Mfd. blocking condenser.	Adjust each of the second I. F. transformer trimmers for maximum output—then adjust each of the first I. F. trimmers for maximum output.
2	Exactly 1730 K. C.	Exactly 1730 K. C.	.00025 MFD. condenser	Receiver blue antenna lead Receiver black ground lead	Adjust 1730 K. C. oscillator trimmer for maximum output.
3	Approx. 1400 K. C.	Exactly 1400 K. C.	.00025 MFD. condenser	Receiver blue antenna lead Receiver black ground lead	While rocking gang condenser adjust 1400 K. C. antenna trimmer for maximum output.



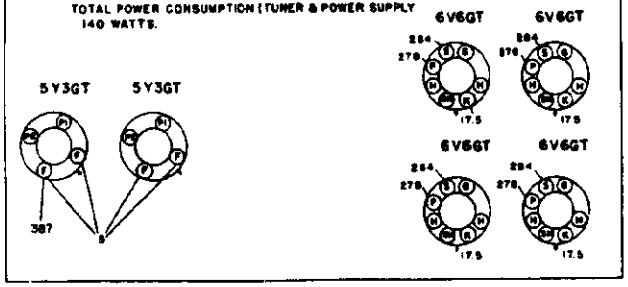




VOLTAGE TABLE
(BOTTOM VIEW OF CHASSIS)

NOTE: MEASURE HEATER AND FILAMENT VOLTAGES DIRECTLY ACROSS SOCKET TERMINALS.

ALL OTHER VOLTAGES MEASURED FROM SOCKET TERMINALS TO GROUND WITH A 1000 OHM/VOLT VOLTMETER WITH BANDSWITCH IN SHORT WAVE POSITION.
(H) HEATERS 6.3 VOLTS A.C.
MEASURE CATHODES ON 30V. SCALE. ALL OTHERS ON 600 V. SCALE.
LINE VOLTAGE 117 V. A.C.
TOTAL POWER CONSUMPTION (TUNER & POWER SUPPLY 140 WATTS.



Power supply	117 volts 50/60 cycles AC
Power consumption	*140 watts
Power output	20 watts
Output impedance	2.5/1.7 ohms

Speakers:

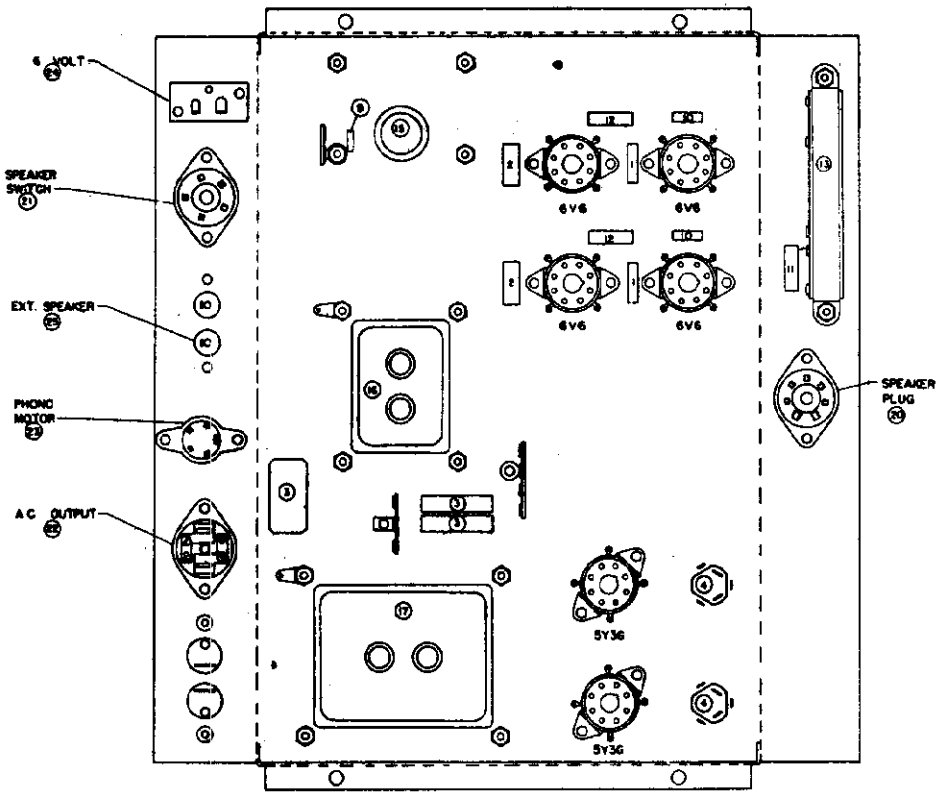
	No. 582815	No. 582869
Field coil resistance	250 ohms	250 ohms
Voice coil impedance (400 cycles)	5.0 ohms	5.0 ohms

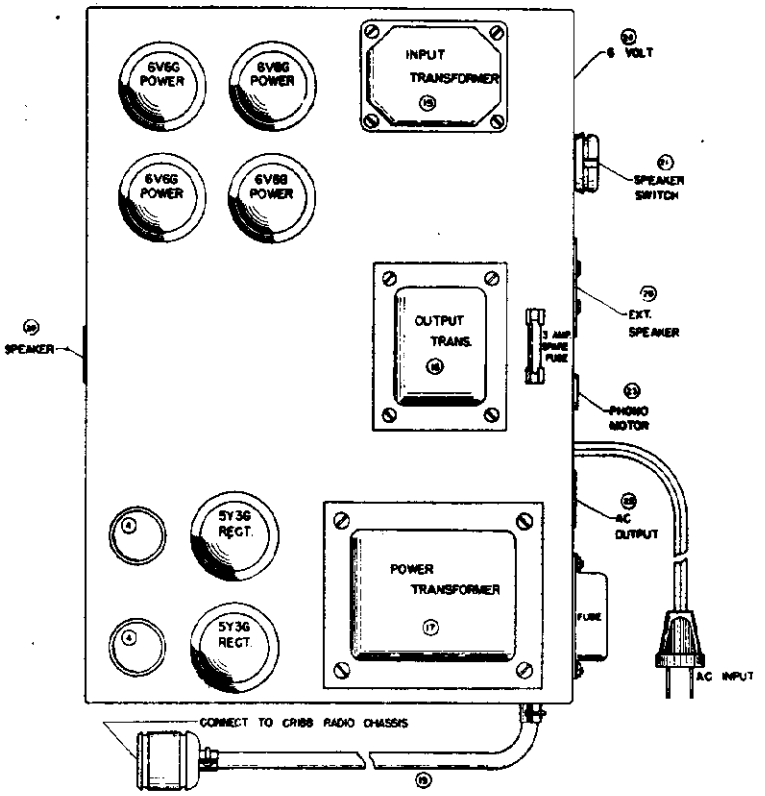
*Power consumption is for amplifier and CR-188 radio chassis.

METHOD FOR REMOVING CHASSIS FROM CABINET

JUNE, 1946

To remove the chassis, first remove all plugs and cables from the receptacles and the connector from is mounted to the cabinet shelf with four screws and nuts; after they have been removed, the amplifier





ACCESSORIES

SPEAKER SELECTOR SWITCH—Provision is made in this amplifier for connecting extension speakers and a speaker selector switch. By means of this switch, the cabinet and extension speakers may be operated separately or together while maintaining the proper load on the amplifier. This is accomplished by means of a rotary switch with a connecting plug that may be purchased from any authorized Magnavox dealer. When shipped from the factory, a shorting plug is inserted in the amplifier receptacle stamped SPEAKER SWITCH. This plug must not be removed unless the speaker selector switch is added. Then the shorting plug is replaced with a plug that is supplied as a part of the selector switch assembly.

EXTENSION SPEAKER—Two screw terminals are provided on the rear of the amplifier chassis for the connection of an extension speaker line. High-fidelity permanent-magnet extension speakers are available through all authorized Magnavox dealers.

THE MAGNAVOX CO.

Instructions for removing the CR-143 or CR-163 chassis from the Sheraton Console, American Modern, Chippendale, Hepplewhite and Berkeley cabinets.

1. Remove the plugs from the bottom of the chassis.
2. Remove the antenna-ground terminal strip from the side of the cabinet
3. Pull the control knobs and the push button knobs from their shafts.
4. Remove the four machine screws that secure the two chassis brackets to the cabinet, and lower the chassis from the cabinet.

ALIGNMENT PROCEDURE

ALIGNING THE I-F AT 455 KILOCYCLES

1. Connect the ground lead of the signal generator to the chassis or radio ground lead. Connect the other lead of the signal generator to the oscillator grid of the 12SA7 tube through a .00025 mfd. series condenser.
2. Set the signal generator to EXACTLY 455 kilocycles and turn the receiver volume to maximum setting.
3. Peak each of the second i f transformer trimmer condensers.
4. Peak each of the first i-f transformer trimmer condensers.

To insure most accurate trimmer setting, repeat the above adjustment several times, always using the lowest possible signal generator output consistent with readable output meter scale deflection.

ALIGNING THE 535-1730 KILOCYCLE BAND

1. Remove the signal generator lead from the grid of the 12SA7 tube. Connect it to the receiver antenna lead (blue) through a .00025 mfd. series condenser.
2. Check the tuning dial adjustment by turning the gang condenser until the plates are completely meshed, at which point the dial pointer must be exactly even with the last line at the low frequency end of the dial calibration.
3. Adjust the band selector switch for operation on the 545-1730 kilocycle BROADCAST band.
4. Set the signal generator frequency and receiver dial to EXACTLY 1400 kilocycles. Adjust the BROADCAST oscillator trimmer and the antenna trimmer to bring in the 1400 kilocycle signal generator signal to maximum output.
5. Set the signal generator and receiver frequency to 600 kilocycles. While rocking the gang condenser slightly to the right and to the left, adjust the 600 kilocycle oscillator padder to maximum output.

ALIGNING THE 5.7-18.1 MC BAND

1. Substitute a 400 ohm resistor for the .00025 mfd. condenser in series with the signal generator output feeding the antenna lead.
2. Adjust the band selector switch to the 5.7-18.1 megacycle short wave band, tune the receiver and signal oscillator frequency to EXACTLY 15 megacycles and adjust the short wave oscillator trimmer and antenna trimmer for maximum output as indicated on the output meter.

While adjusting the oscillator trimmer, two peaks may be noticed, in which case, care must be taken so that the proper peak is used for aligning the receiver at 15 megacycles. Always screw in the trimmer to maximum capacity, then back off the trimmer until the second peak (if more than one is noticed), which is the correct one, is tuned in.

NOTE: To assure most accurate trimmer setting, repeat all of the above adjustments several times, always using the lowest possible test oscillator output consistent with readable output meter scale deflection.

10 KC FILTER ADJUSTMENT

With the tone control set for maximum treble response, tune the receiver to a point between two stations of about the same signal strength on adjacent channels. If a 10,000 cycle heterodyne is heard as the beat note between the two carriers, it may be eliminated by tuning the 10 kc output filter by means of the 10 kc trimmer condenser, located at the rear of the chassis.

SPECIFICATIONS

Primary voltage . 117 V. 50-60 cycle AC or DC;
Power consumption . . . . . 85 watts;
Power output . . . . . 6 watts;
Speaker: Field Coil . . . . . *1800 ohms;
Transformer . . . . . **3000 ohms;
Intermediate frequency . . . . . 455 kc;
Tuning frequency range . . . . . 535-1730 kc;
5.7-18.1 mc;

Circuit: Superheterodyne with two-gang tuning condenser, six-station condenser-type push button tuner, two tuning ranges, treble control, automatic volume control, bass compensation in volume control for phonograph pickup, teleye tuning indicator (CR-143 and CR-163 only).

* DC resistance. ** Primary impedance.

Models CR-143, CR-145, CR-163 and CR-164 are basically alike. Minor circuit differences are indicated on Figure 36.

The phonograph input circuit in CR-143 and CR-145 is designed for use with a 3 oz. pressure crystal pickup; CR-163 and CR-164 phonograph input circuit accommodates the 1 oz. pressure crystal pickup.

Instructions for removing the CR-145 or CR-164 chassis from the Concerto Combination, Sheraton Table and Modern Table cabinets.

1. Remove the back from the cabinet.
2. Pull the control knobs and push button knobs from their shafts.
3. Remove the plugs from the rear of the chassis and disconnect the antenna and ground connections.
4. Completely mesh the tuning condenser plates by turning the station selector knob until the dial pointer is in the lowest frequency setting on the dial.
5. Remove the four machine screws, located on the bottom of the cabinet, that secure the chassis.
6. Slide to the rear of the cabinet, lifting the rear of the chassis to permit the dial assembly to clear the rear opening.

Instructions for removing the CR-143 or CR-163 chassis from the Chairside cabinet.

1. Set the cabinet on end so that the speaker is facing upward.
2. Remove the plugs from the rear of the chassis.
3. Remove the antenna-ground terminal strip from the side of the cabinet.
4. Pull the control knobs and the push button knobs from their shafts.
5. Remove the four Phillips-head wood screws securing the radio panel, and lift the panel from the cabinet.
6. Remove the four machine screws that secure the chassis to the cabinet. Two of these screws are accessible in the phonograph compartment and the other two are beneath the motorboard.
7. Slide the chassis out the top opening of the cabinet.

NOTE: If it is necessary to remove the speaker, the four mounting nuts on the speaker should be removed and the speaker taken through the bottom opening of the cabinet.

MODEL A-205C

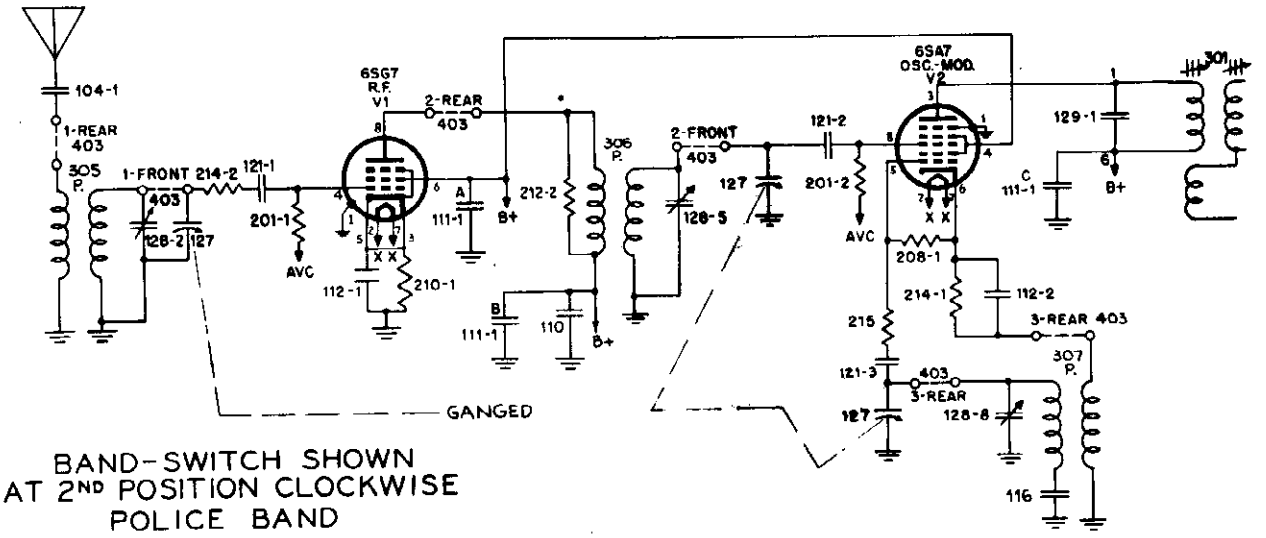
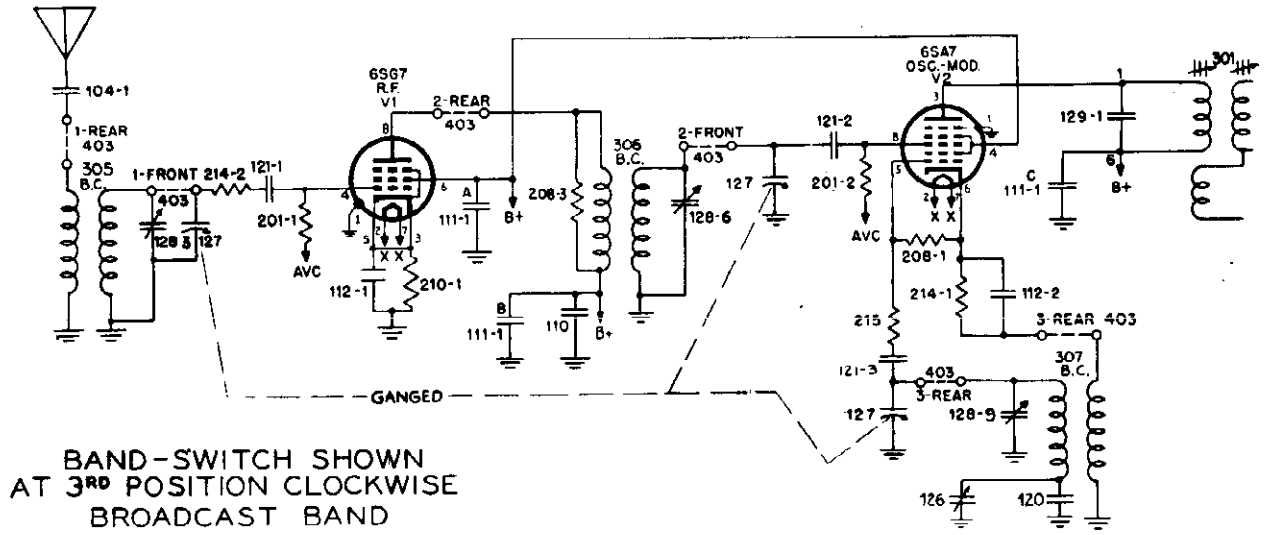
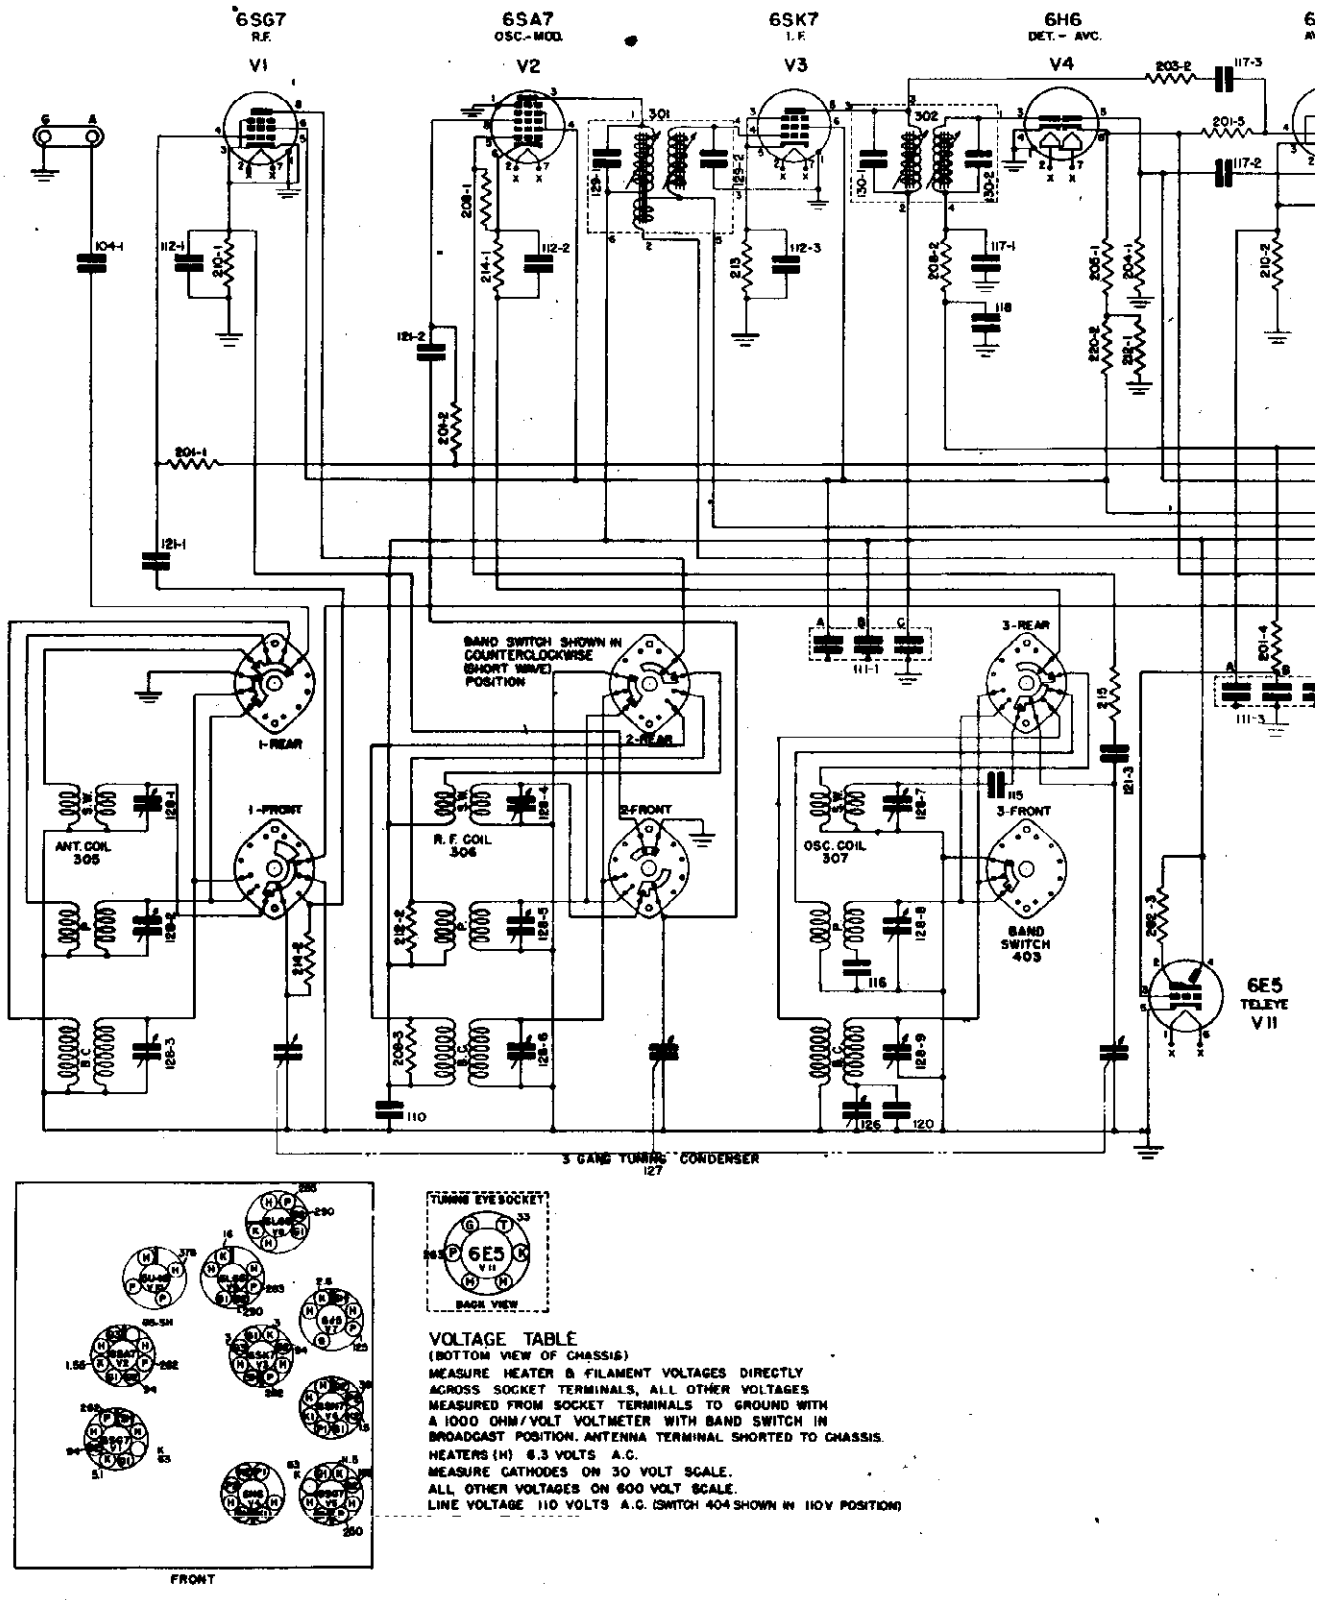
BAND-SWITCH SHOWN
AT 1ST POSITION.
SHORT WAVE BAND



BAND-SWITCH SHOWN
AT 2ND POSITION CLOCKWISE
POLICE BAND

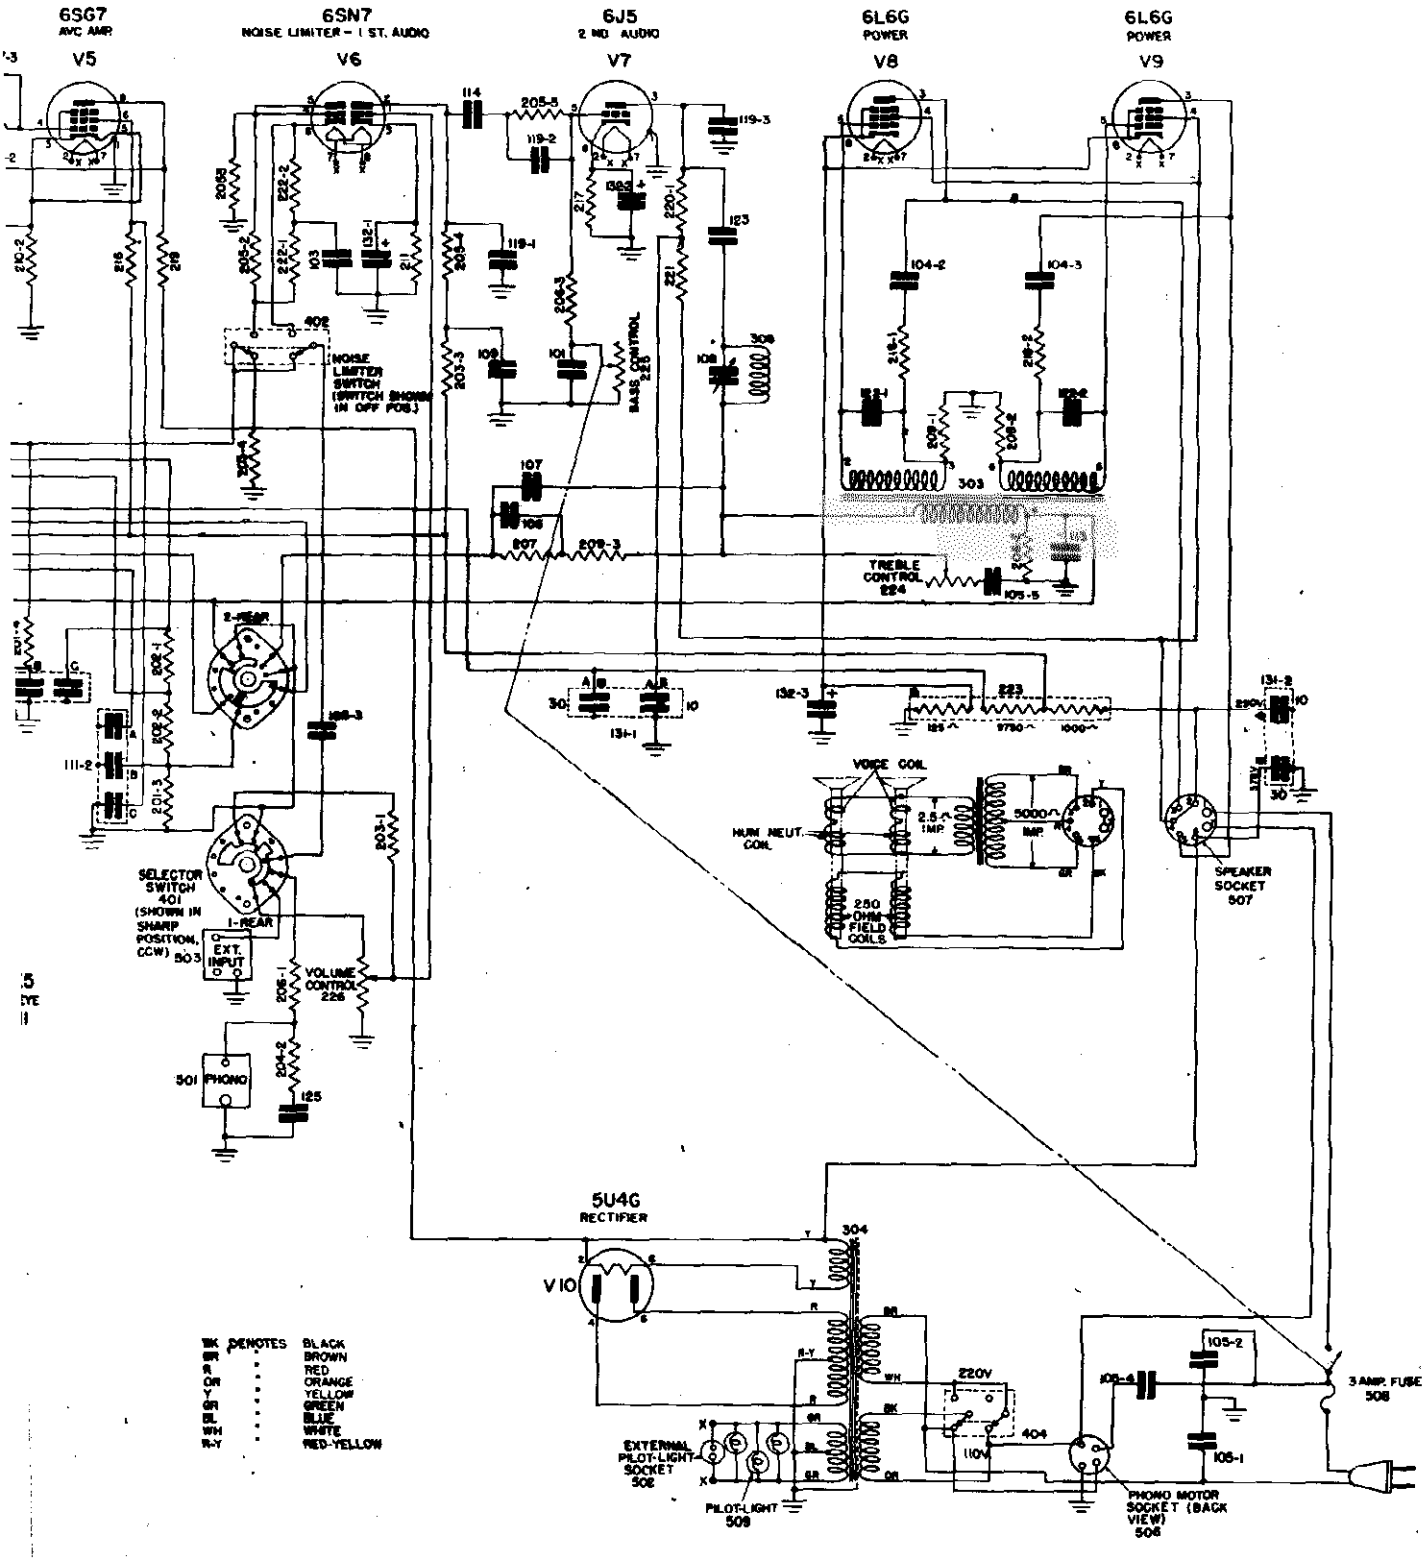


BAND-SWITCH SHOWN
AT 3RD POSITION CLOCKWISE
BROADCAST BAND



Model CR-183 and CR-185 radio chassis built by Magnavox for the U. S. Navy Department, were incorporated in Navy Radio-Phonograph combinations. The CR-183 chassis was used in instruments identified Models RCT, RCU and RCU-1. In combinations designated Model RCU-2, a CR-185 chassis was incorporated.

MAGNAVOX CO.



The differences between the CR-183 and the CR-185 are not extensive and the alignment procedure that follows applies to both receivers, although separate schematic diagrams are shown. Electrical values are not shown on the schematics; the reference number shown next to each part identifies the items shown in the parts list where electrical values and ratings are given.

THE MAGNAVOX CO.
CR-183, CR-185

SHORT WAVE BAND ALIGNMENT

1. With the 400 ohm resistor in series with the test oscillator lead to the antenna of the radio receiver, set the band selector switch to SHORT WAVE.
2. Set the test oscillator frequency and receiver dial to EXACTLY 15 megacycles. Adjust the short wave oscillator trimmer, r-f trimmer and antenna trimmer for maximum deflection on the output meter.

While adjusting the oscillator trimmer, two peaks may be noticed, in which case care must be taken so that the proper peak is used for aligning the receiver at 15 megacycles. Always turn the trimmer screw clockwise to maximum capacity; then back off the trimmer until the second peak (if more than one is noticed) is reached.

NOTE: To assure most accurate trimmer setting, repeat all of the above adjustments several times, always using the lowest possible test oscillator signal, consistent with readable output meter scale deflection.

10 KC FILTER ADJUSTMENT

1. Turn the tone control to the right as far as possible for maximum treble response and the selectivity switch to the BROAD position.
2. Tune the receiver to a point between two station of about the same signal strength, located on adjacent channels 10 kc apart.
3. If a 10,000 cycle heterodyne is heard as a beat note between the two carriers, adjust the 10 kc trimmer until this beat note can no longer be heard. The 10 kc trimmer is located on the top of the radio chassis between the two 6L6G output tubes.
4. The preferred method for making this adjustment is to connect the output of an audio oscillator set at EXACTLY 10,000 cycles, to the phonograph input socket and set the 10 kc trimmer for minimum signal.

ALIGNMENT PROCEDURE

An accurate calibrated r-f test oscillator, an output indicator and a screw driver are required to align the radio receiver. The output meter should be connected across the voice coil terminals, and the test oscillator output should be kept to such a value that the reading on the output meter does not exceed one volt. Be sure that the selectivity switch is set in the SHARP position when aligning the set. This is important!

INTERMEDIATE-FREQUENCY STAGE ALIGNMENT

1. Connect the ground lead of the test oscillator to the chassis or to the ground terminal on the rear of the chassis. Connect the "high" side of the oscillator to the control grid of the oscillator section of the 6SA7 tube (pin #5), through a .00025 mfd. series capacitor.
2. Set the test oscillator to EXACTLY 455 kc and turn the receiver volume control to its maximum setting.
3. Adjust both second i-f transformer trimmers for maximum deflection on the output meter. One trimmer is accessible from the top of the i-f transformer; the other from the bottom.
4. Adjust both first i-f transformer trimmers for maximum signal as indicated on the output meter.

To assure most accurate trimmer setting, repeat the above adjustment several times, always using the lowest possible test oscillator output consistent with readable output meter scale deflection.

BROADCAST BAND ALIGNMENT

1. Check the tuning dial adjustment by turning the gang condenser until the condenser plates are completely meshed, at which point the dial pointer must coincide with the last line at the low frequency end of the dial scale. If the pointer is not in this position, remove the dial scale, loosen the screw that holds the pointer in place and set to the proper position.
2. Remove the test oscillator lead from the grid of the 6SA7 tube and connect it to the antenna terminal on the rear of the chassis through a .00025 mfd. series capacitor.
3. Set the band selector switch to BROADCAST
4. Set the test oscillator frequency and receiver dial to EXACTLY 1400 kilocycles. Adjust the broadcast oscillator trimmer, r-f trimmer and antenna trimmer for maximum deflection on the output meter.
5. Set the test oscillator and receiver frequency to 600 kilocycles. While rocking the condenser gang slightly to the right and to the left, adjust the 600 kilocycle oscillator padder for maximum output. The 600 kc padder is located on the side of the chassis below the three-band oscillator coil. If this padder requires considerable adjustment, repeat operation given in step 4.

POLICE BAND ALIGNMENT

1. Replace the .00025 mfd. test oscillator antenna series capacitor with a 400 ohm resistor.
2. Set the band selector switch to POLICE.
3. Set the test oscillator frequency and receiver dial to EXACTLY 5000 kilocycles. Adjust the police oscillator trimmer, r-f trimmer and antenna trimmer for maximum deflection on the output meter.

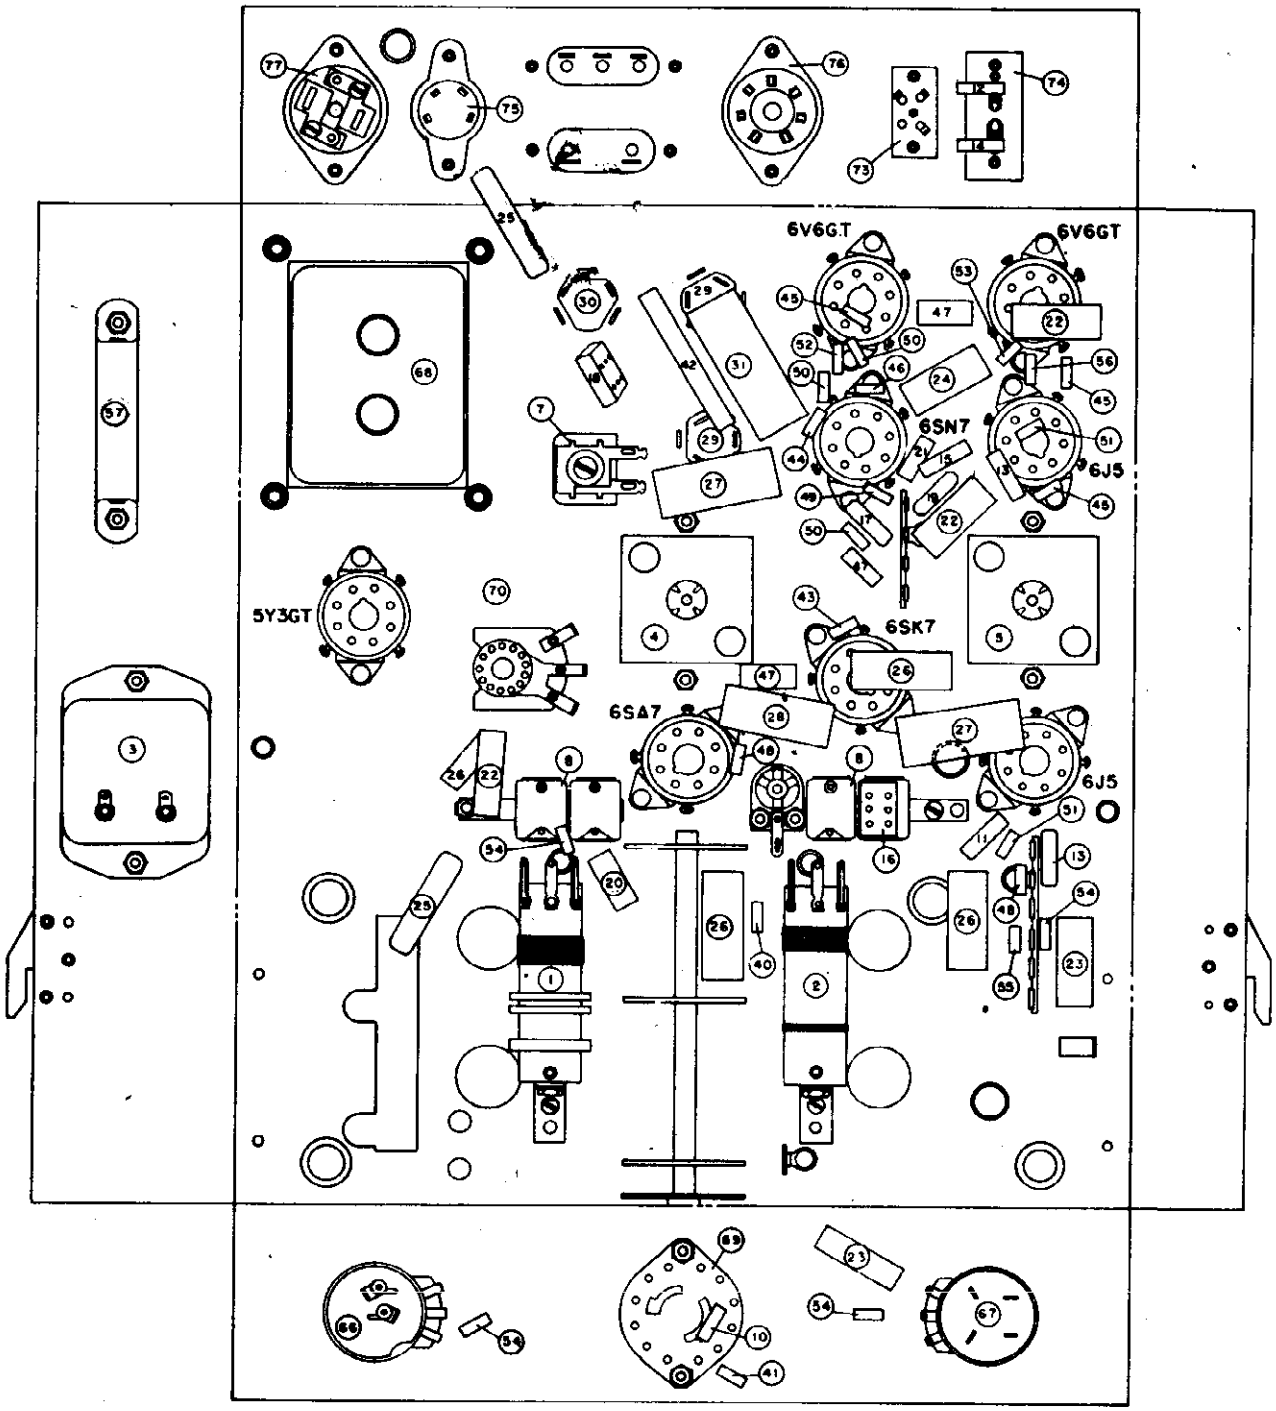

FIGURE 5

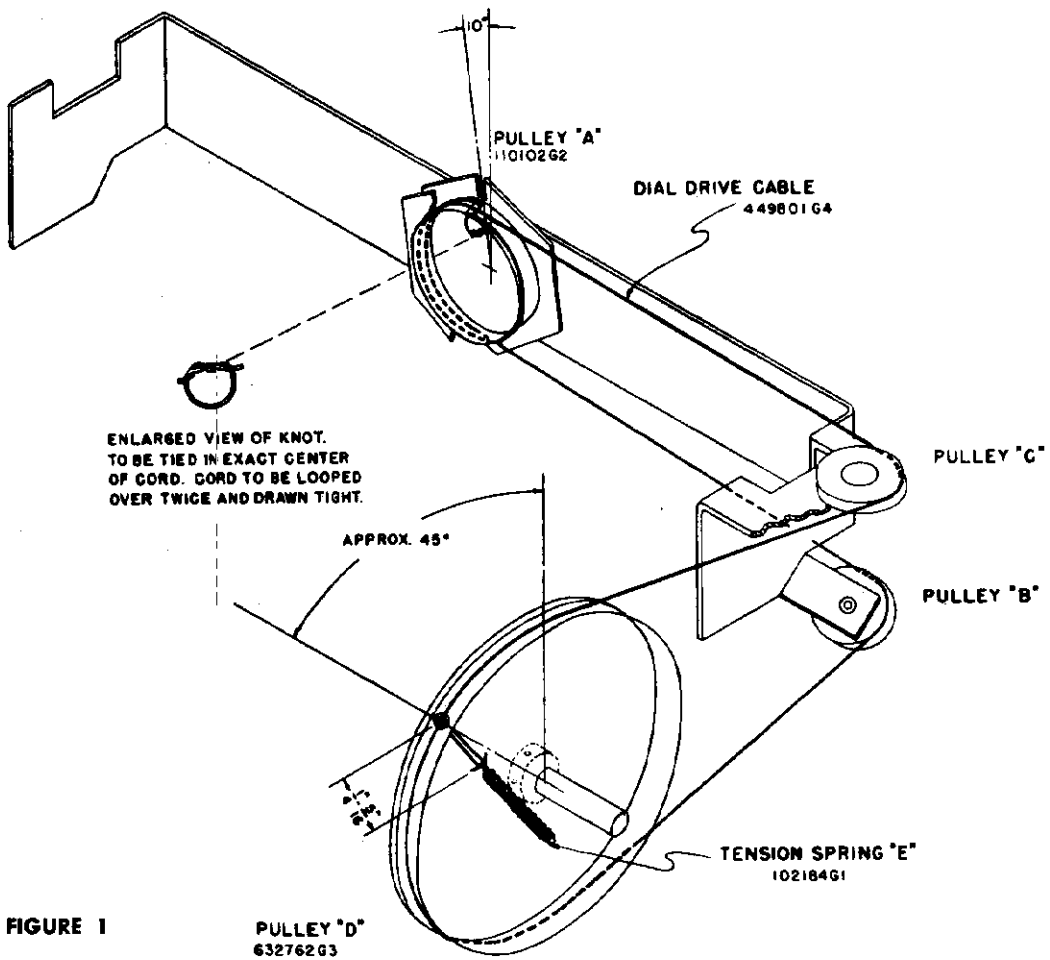

FIGURE 1

DIAL CORD REPLACEMENT

Rotate the brass pulley designated "A" in Figure 1 until the dial pointer strikes the stop at the high frequency end of the dial calibration. In this condition the slot in pulley "A" should be approximately ten degrees to the left of being vertical—see Figure 1. If the slot in the pulley is in some other position under the above mentioned conditions, the pointer set screw is probably loose and has allowed the pointer to slip. To correct this condition, first remove the glass dial and loosen the pointer screw. Then while holding pulley "A" so that its slot is approximately ten degrees to the left of vertical (when viewed from the rear) adjust the pointer until it is resting against the stop at the high frequency end of its travel. Then tighten the pointer set screw securely and replace the glass dial.

Completely unmesh the condenser gang and check the location of the hole or slot in pulley "D." If this hole is not approximately 45 degrees back from vertical as shown on Figure 1, loosen the two No. 6 Allen set screws in the hub of pulley "D" and slip the pulley on its shaft (while holding the condenser gang unmeshed) until the specified adjustment is obtained; then tighten one of the set screws securely. It will be shown later that this is a temporary setting. Next, tie a double knot in the exact center of a 25-inch length of dial cable and fold the cable back on itself so that the knot is at one end. The correct method for tying this knot is shown as an inset on Figure 1. Grasp the cable near the knotted end and slide it into the pulley slot so that the knot is against the inside rim of the pulley as shown in the sketch. The piece of cable nearest the dial frame should be wound in the direction shown for one-half turn; then over the lower pulley "B," around the bottom of the large pulley "D" and into the hole. Pull the cable taut and wrap the end around the small hook on pulley "D" temporarily.

The remaining piece of cable should be wound around pulley "A" in the direction shown, for one complete turn, over the upper pulley "C," and over the top of pulley "D." Thread the end through the small hole in pulley "D" and pull both ends of the cable taut. With one end of tension spring "E" fastened to the hook on pulley "D" lace the two free ends of the cable through the opposite end of the spring and tie a knot at a point that will allow ¼" to 5/16" of cable between the spring and the inside rim of pulley "D." Be sure to tie the knot around one coil of the spring in the manner shown.

Now with the condenser gang completely meshed, check the position of the dial pointer. If it is not in line with the last calibration mark at the low frequency end of the dial, loosen the set screw in pulley "D" and turn it until the pointer is in the specified position. Be sure that the condenser gang does not move during this adjustment. Then tighten the two screws in pulley "D" securely completing the operation.

THE MAGNAVOX CO.

CONDENSER GANG DRIVE ADJUSTMENTS

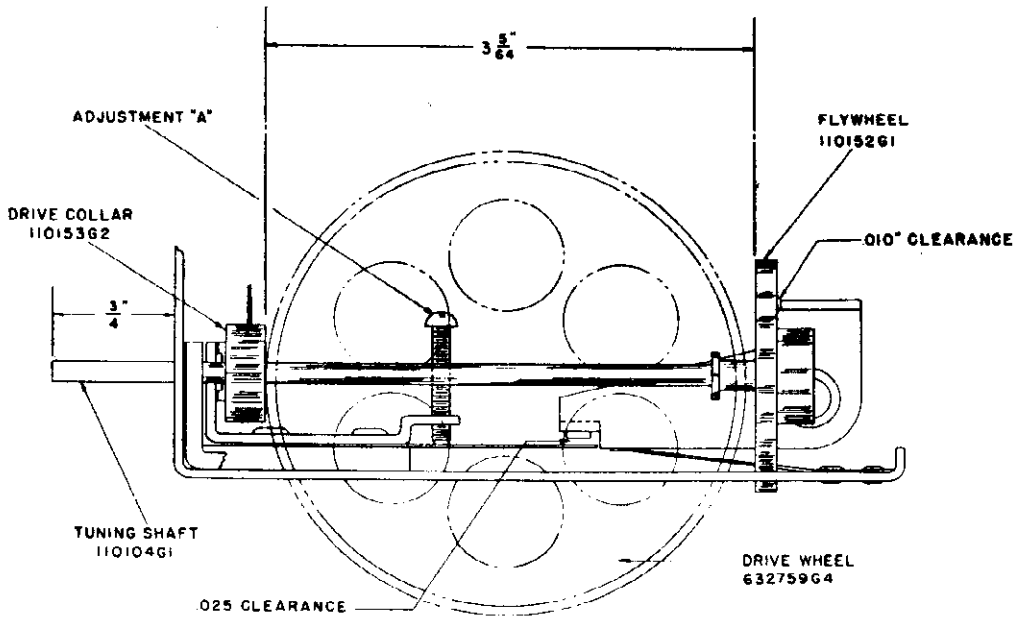

FIGURE 2

Whenever any of the mechanical parts in the condenser gang drive assembly require replacement due to rough handling or for any other reason, it is extremely important that clearances and adjustments shown on Figures 2 and 3 are affected; otherwise the tuning mechanism will be sluggish or it may slip during operation.

In reassembling the mechanism after any part was replaced, follow the procedure outlined below:

1. Assemble the Tuning Shaft, Drive Collar, Compression Spring, Spring Retainer and Flywheel in the manner shown on Figure 3. The Tuning Shaft must extend ¾" from the front of the assembly and that the spacing between the rear of the Drive Collar and the front of the Flywheel must be 3-5/64" as specified on Figure 2. Any excess length in the Tuning Shaft may extend beyond the rear of the Flywheel.

2. The distance between the rubber-tired Drive Wheel and the smaller diameter section of the Spring Retainer must be 1/32" to 1/16". This adjustment is effected by loosening the two No. 6 Allen set screws in the Drive Wheel hub and sliding the wheel on its shaft until the required clearance is obtained. When the adjustment is completed, tighten the two screws in the hub of the Drive Wheel. See Figure 3.

3. While pressing down on the Treadle Bar at the location shown on Figure 3, adjust the Thrust Bracket until the clearance between the rest of the Flywheel and the projection on the Thrust Bracket is .010" as shown on the diagram. To make this adjustment, loosen the two No. 6 Allen set screws (use No. 6 Allen Wrench –Magnavox Part No. 800044G2) in the hub of Thrust Bracket and rotate the bracket until the specified clearance is obtained when the push buttons are NOT actuated. Tighten the two screws securely when the adjustment is completed. Press each push button and check that the Drive Collar is pushed away from the rubber-tired Drive Wheel.

4. Next, adjust the clearance in the muting switch contacts by turning the Phillips-head screw designated Adjustment "A" on Figure 2, until the specified clearance of .025" is obtained (when the push buttons are NOT actuated.)

5. While pressing any one of the push buttons in as far as possible, turn the screw designated Adjustment "B" (Figure 3) until a minimum clearance of .015" is obtained between the front surface of the Drive Collar and the switch spring directly in front of it. This setting should also cause a minimum clearance of .010" between the switch contacts actuated

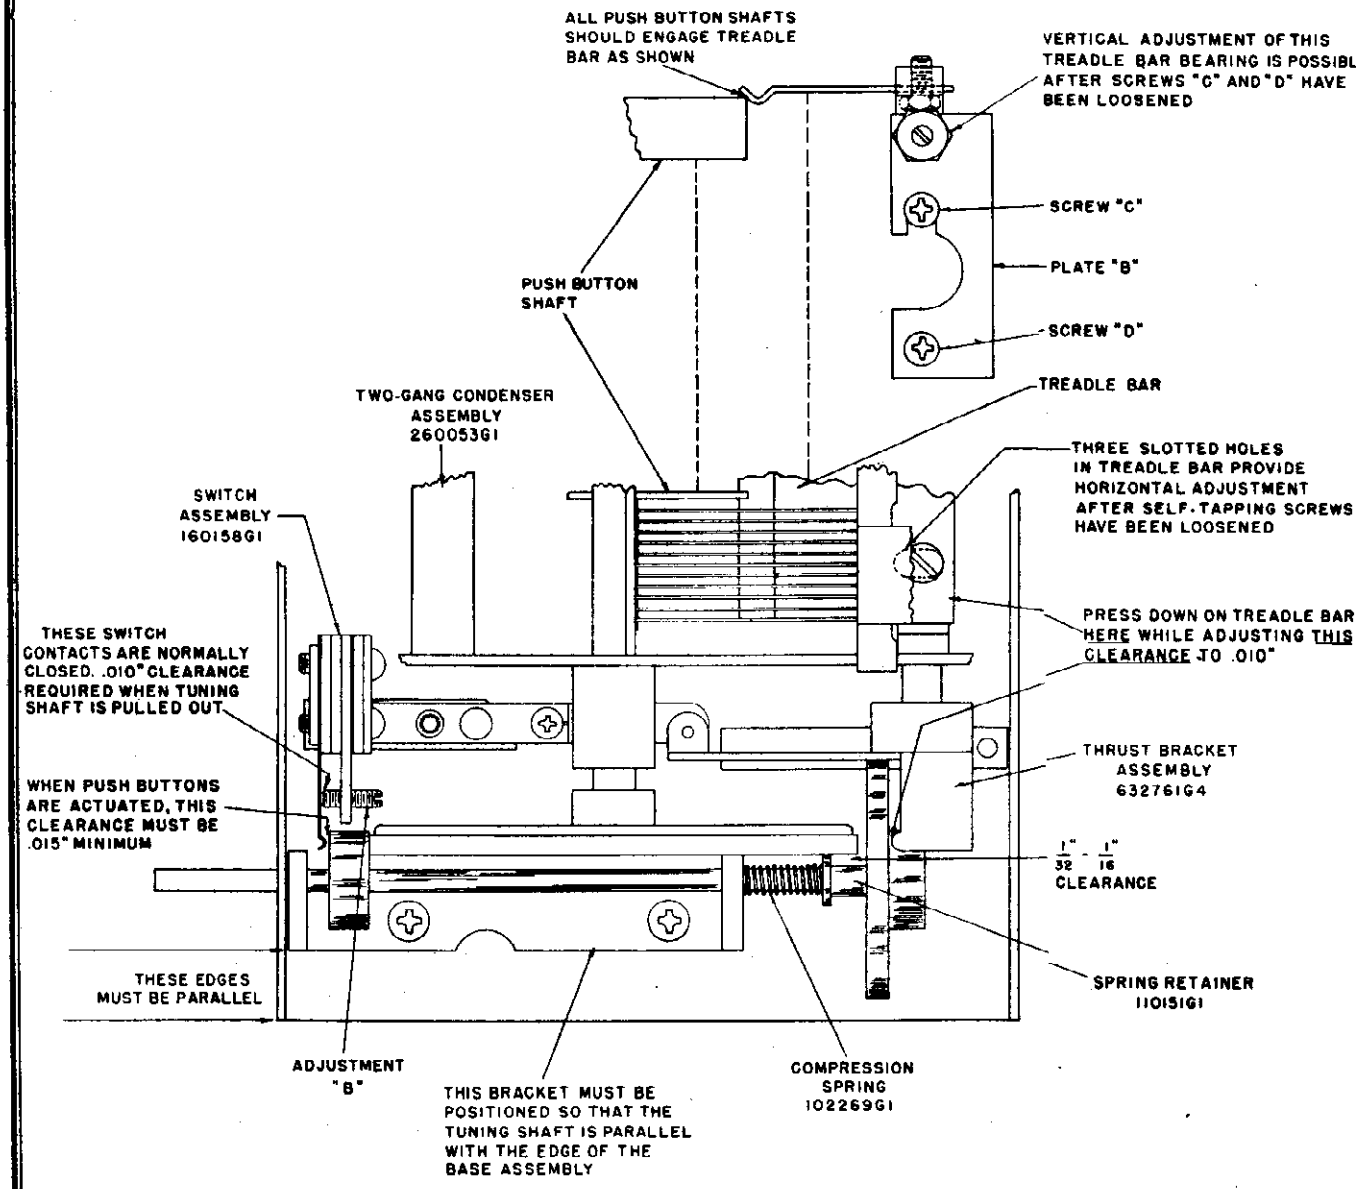

FIGURE 3

by pressure of the front surface of the Drive Collar, when the Tuning Shaft is pulled out. The function of this switch is to open the muting circuit when setting up the push buttons. As its contacts are wired in series with the large muting switch (contacts are shorted by pressing any push button), pulling out on the Tuning Shaft causes the small switch contacts to open the muting circuit so that a station can be heard while the push button is held in and tightened. On rare occasions it may be necessary to adjust the relation between the push button bars and the Treadle Bar. Such adjustment might be required if when pushing any of the push buttons, sufficient motion is not transmitted to the Treadle Bar to cause a disengagement between the Drive Collar and the Drive wheel.

This can usually be accomplished by loosening the two screws designated "C" and "D" on Figure 3, and moving plate "B" in the direction required to correct this condition.

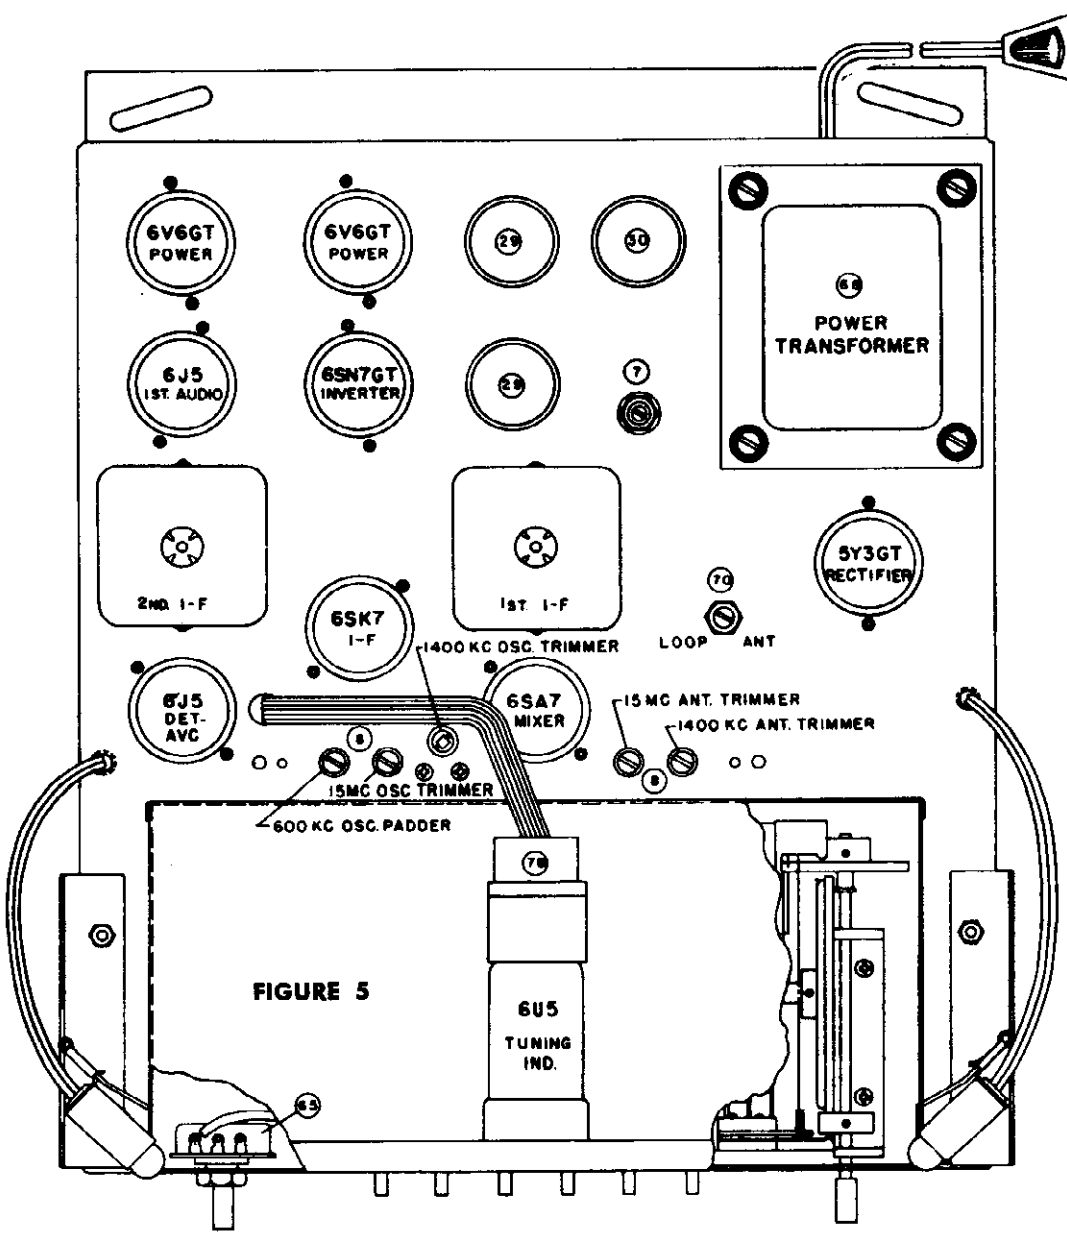

FIGURE 5

Method for Removing Chassis from Cabinet

Model CR-187 radio chassis is designed for easy removal from the cabinet in which it is installed. As the radio panel is permanently fastened to the chassis, the control knobs need not be removed when the chassis is taken out of the cabinet for service. To remove the chassis, first remove the antenna leads from their terminals and all plugs from the receptacles on the rear of the chassis. Then remove the two Phillips-head screws from the angular slots in the flange at the rear of the chassis. Lift the rear of the chassis about one inch and pull it straight back. Never remove the chassis tray from the cabinet—it has been properly positioned to bring the radio panel in place when the chassis is replaced. In replacing the chassis, slide it so that the small hooks near the front, ride inside the flanges on the sides of the chassis tray. Push the chassis forward as far as it will go and the hook should then engage the slots in the chassis tray. Replace the two Phillips-head screws and nuts and tighten securely. Replace all plugs in their receptacles and the antenna leads on their correct terminals. The antenna terminal board for the loop antenna connections is designated S-L-H. The end of the short wave antenna that is fastened to the inside of the cabinet connects to S. Always disconnect this antenna from terminal S when an outdoor antenna is used as it may pick up noise. The two terminals on the loop are designated L and H. The leads connected to these terminals should be wired to the corresponding terminals (L and H) on the chassis.

The alignment of this receiver requires the use of an accurately calibrated r-f signal generator and an output meter. All trimmer condenser locations are shown on the chassis layout diagram, Figure 5. The radio volume control should be turned to maximum and the signal generator output kept as low as possible during alignment to prevent the AVC from operating and giving false readings. *Always set the Selectivity Switch to SHARP TUNE before aligning the i-f stages.* This is done by turning the Treble Control counter-clockwise as far as possible.

I-F ALIGNMENT

1. Connect the output of the signal generator to the oscillator grid (pin No. 5) of the 6SA7 tube through a .00025 mfd. capacitor. The ground on the signal generator should be connected to the radio chassis ground.

2. Turn the condenser gang until it is completely meshed, (low-frequency end of dial calibration) and set the band selector switch to BDCST as for broadcast band reception.

3. Adjust the signal generator to EXACTLY 455 kc. and peak the second i-f transformer and the first i-f transformer trimmers in that order.

On early models of the CR-187 chassis, the two i-f trimmers are located in the top of the respective i-f transformers. In later production, one trimmer is accessible from the top and the other from the bottom of each transformer as shown in the layout diagram, Figure 5.

BROADCAST BAND ALIGNMENT

1. Remove the signal generator lead from the 6SA7 grid and connect it to the radio antenna terminal through the .00025 mfd. capacitor. The ANT-LOOP switch (70) must be in the ANT. setting.
2. Check the tuning-dial pointer adjustment. When the plates of the tuning condenser are completely meshed, the dial pointer must be in line with the last calibration mark at the low frequency end of the dial. If it is not, loosen the set screws in the hub of pulley "D" shown on Figure 1 and make the necessary adjustment.
3. With the band selector still set for broadcast band reception, adjust the signal generator and the radio receiver to 600 kc. While rocking the gang condenser a few degrees to the right and to the left, adjust the 600 kc. oscillator padder for maximum indication on the output meter.
4. Set the signal generator and the radio receiver to 1400 kc.; adjust the 1400 kc. oscillator trimmer and the 1400 kc. antenna trimmer for maximum output. If considerable adjustment was necessary, recheck the 600 kc. padder setting.
5. If the loop antenna trimmer is out of adjustment it should be set after the radio chassis is in the cabinet. Set the ANT-LOOP switch (70) to the LOOP position. Adjust the signal generator to 1400 kilocycles and connect its output to a loop containing approximately five turns of wire eight inches in diameter placed eighteen inches from the receiver loop and in the same plane.
6. Set the receiver to 1400 kc. and adjust the trimmer on the receiver loop for maximum output.

SHORT WAVE BAND ALIGNMENT

1. Set the band selector switch to SW as for short wave reception and substitute a 400 ohm resistor for the capacitor in series with the signal generator lead connected to the antenna terminal on the receiver.
2. Set the signal generator and the radio receiver to 15 mc.; then adjust the 15 mc. oscillator trimmer and the 15 mc. antenna trimmer for maximum output. While adjusting the 15 mc. oscillator trimmer two peaks may be observed; only one is the correct peak for 15 mc. alignment. Screw in the trimmer to maximum capacity—then decrease the capacity until the first peak is observed. This is the correct one.

10 KC FILTER ADJUSTMENT

This chassis incorporates a 10 kc. filter circuit to eliminate the beat note heard as a whistle between stations on the broadcast band. If the trimmer is out of adjustment, the following procedure should be observed.

1. Set the Selectivity Switch to FULL RANGE by turning the Treble Control knob clockwise as far as possible.
2. Connect the output of an audio oscillator to the phonograph pickup socket on the radio chassis and adjust the oscillator to EXACTLY 10,000 cycles.
3. Set the band selector to PHONO and adjust the 10 kc. trimmer (7) for minimum output.
4. If an audio oscillator is not available for making this adjustment, set the band selector to BDCST connect an antenna to the receiver and set the gang condenser to a point between two stations on adjacent channels having approximately the same power. If the 10 kc. trimmer is out of adjustment, whistle will be heard. Adjust the trimmer until the whistle is eliminated.

Due to the fact that a change was made in the mechanical construction of the dial assembly after the first CR-187 radio chassis production run, it is important that you follow the procedure outlined below in ordering replacement glass dials.

If the glass dial for which a replacement is required is marked 150260, order a 150276 dial glass assembly. If the glass is marked 150281, order a 150283 dial glass assembly. These assemblies include the rubber strips cemented in their correct positions.

*The part number of the loop antenna assembly changes with different cabinets. It is therefore important that you specify the Style Number of the instrument when ordering a replacement loop antenna assembly.

I-F on Converter Grid to I-F Grid at:
- 455 kc. 59

I-F Grid to Detector Plate at:
- 455 kc. 68

AUDIO GAIN

Voltage required across Volume Control to produce .05 watt speaker output** at 400 cycles is .014 volt with Band Selector Switch in BDCST setting.

OSCILLATOR OUTPUT VOLTAGE

The DC voltage developed across Oscillator Grid Resistor (40) at:
- 600 kc. 5.8
- 6 mc. 6.6

* Variations of ±20% are permissible. All readings made with sufficient input signal to provide .05 watt speaker output.

** .05 watt speaker output at 400 cycles is equivalent to a reading of 0.35 volts as measured by a high resistance AC voltmeter across the voice coil of either speaker.

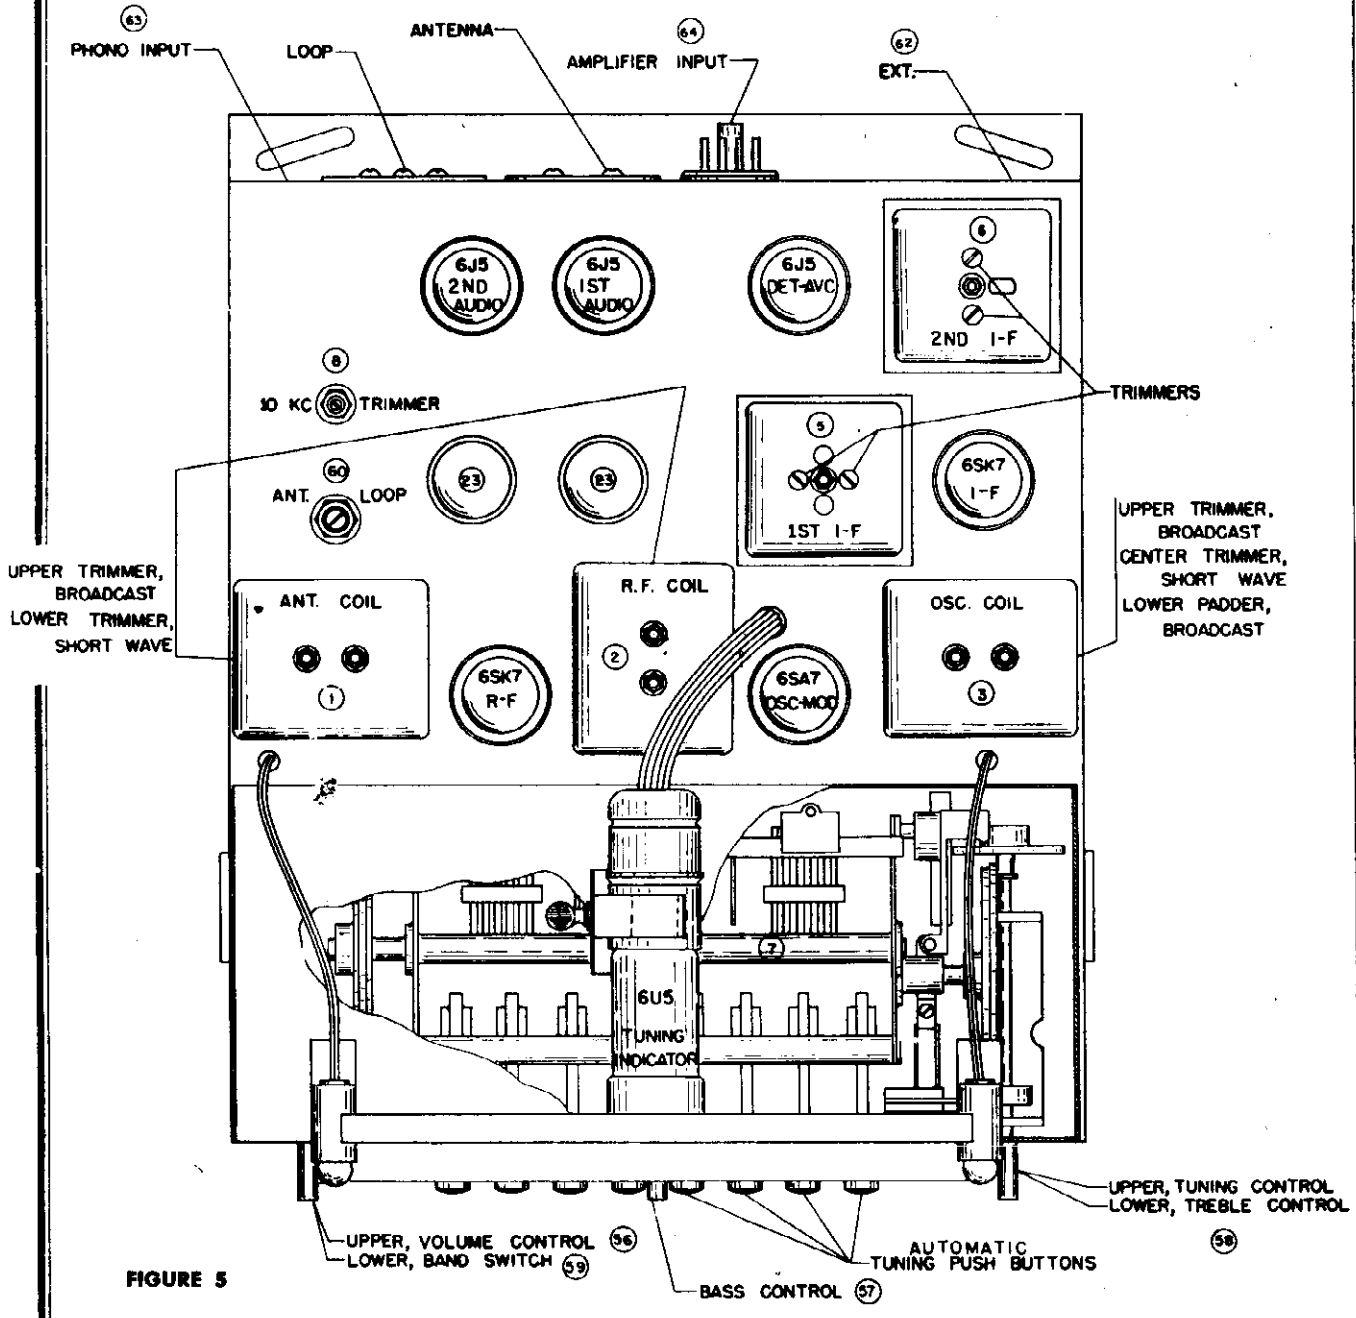

FIGURE 5

Model CR-188 radio chassis is designed for easy removal from the cabinet in which it is installed. As the radio panel is permanently fastened to the chassis, the control knobs need not be removed when the chassis is taken out of the cabinet for service. To remove the chassis, first remove the antenna leads from their terminals and all plugs from the receptacles on the rear of the chassis. Then remove the two Phillips-head screws from the angular slots in the flange at the rear of the chassis. Lift the rear of the chassis about one inch and pull it straight back. Never remove the chassis tray from the cabinet—it has been properly positioned to bring the radio panel in place when the chassis is replaced. In replacing the chassis, slide it so that the small hooks near the front, ride inside the flanges on the sides of the chassis tray. Push the chassis forward as far as it will go and the hooks should then engage the slots in the chassis tray. Replace the two Phillips-head screws and nuts and tighten securely. Replace all plugs in their receptacles and the antenna leads on their correct terminals. The antenna terminal board for the loop antenna connections is designated S-L-H. The end of the short wave antenna that is fastened to the inside of the cabinet connects to S. Always disconnect this antenna from terminal S when an outdoor antenna is used as it may pick up noise. The two terminals on the loop are designated L and H. The leads connected to these terminals should be wired to the corresponding terminals (L and H) on the chassis.

ALIGNMENT PROCEDURE

The alignment of this receiver requires the use of an accurately calibrated r-f signal generator and an output meter. All trimmer condenser locations are shown on the chassis layout diagram, Figure 5. The radio volume control should be turned to maximum and the signal generator output kept as low as possible during alignment to prevent the AVC from operating and giving false readings. *Always set the Treble Control to SHARP TUNE before aligning the i-f stages.* This is done by turning the Treble Control Knob to the No. 1 position.

I-F ALIGNMENT

1. Connect the output of the signal generator to the oscillator grid (pin No. 5) of the 6SA7 tube through a .00025 mfd. capacitor. The ground on the signal generator should be connected to the radio chassis ground.
2. Turn the condenser gang until it is completely meshed, (low-frequency end of dial calibration) and set the band selector switch to BDCST as for broadcast band reception.
3. Adjust the signal generator to EXACTLY 455 kc. and peak the second i-f transformer and the first i-f transformer trimmers in that order.

On early models of the CR-188 chassis, the two i-f trimmers are located in the top of the respective i-f transformers as shown in the layout diagram Figure 5. In later production, one trimmer is accessible from the top and the other from the bottom of each transformer.

BROADCAST BAND ALIGNMENT

1. Remove the signal generator lead from the 6SA7 grid and connect it to the radio antenna terminal through the .00025 mfd. capacitor. The ANT-LOOP switch (60) must be in the ANT. setting.
2. Check the tuning dial pointer adjustment. When the plates of the tuning condenser are completely meshed, the dial pointer must be in line with the last calibration mark at the low frequency end of the dial. If it is not, loosen the set screws in the hub of pulley "D" shown on Figure 1 and make the necessary adjustment.
3. With the band selector still set for broadcast band reception, adjust the signal generator and the radio receiver to 600 kc. While rocking the gang condenser a few degrees to the right and to the left, adjust the 600 kc. oscillator padder for maximum indication on the output meter.
4. Set the signal generator and the radio receiver to 1400 kc.; adjust the 1400 kc. oscillator trimmer and the 1400 kc. antenna trimmer for maximum output. If considerable adjustment was necessary, recheck the 600 kc. padder setting.
5. If the loop antenna trimmer is out of adjustment it should be set after the radio chassis is in the cabinet. Set the ANT-LOOP switch (60) to the LOOP position. Adjust the signal generator to 1400 kilocycles and connect its output to a loop containing approximately five turns of wire eight inches in diameter placed eighteen inches from the receiver loop and in the same plane.
6. Set the receiver to 1400 kc. and adjust the trimmer on the receiver loop for maximum output.

SHORT WAVE BAND ALIGNMENT

1. Set the band selector switch to SW as for short wave reception and substitute a 400 ohm resistor for the capacitor in series with the signal generator lead connected to the antenna terminal on the receiver.
2. Set the signal generator and the radio receiver to 15 mc.; then adjust the 15 mc. oscillator trimmer and the 15 mc. antenna trimmer for maximum output. While adjusting the 15 mc. oscillator trimmer two peaks may be observed; only one is the correct peak for 15 mc. alignment. Screw in the trimmer to maximum capacity—then decrease the capacity until the first peak is observed. This is the correct one.

10 KC FILTER ADJUSTMENT

This chassis incorporates a 10 kc. filter circuit to eliminate the beat note heard as a whistle between stations on the broadcast band. If the trimmer is out of adjustment, the following procedure should be observed.

1. Turn the Treble Control to FULL RANGE (No. 4 position).
2. Connect the output of an audio oscillator to the phonograph pickup socket on the radio chassis and adjust the oscillator to EXACTLY 10,000 cycles.
3. Set the band selector to PHONO and adjust the 10 kc. trimmer (8) for minimum output.
4. If an audio oscillator is not available for making this adjustment, set the band selector to BDCST, connect an antenna to the receiver and set the gang condenser to a point between two stations on adjacent channels having approximately the same power. If the 10 kc. trimmer is out of adjustment, a whistle will be heard. Adjust the trimmer until the whistle is eliminated.

MODEL CR-188

THE MAGNAVOX CO.

Model CR-188 radio chassis is a two-band tuner that must be used in conjunction with a power amplifier, such as the Model AMP-101 for speaker operation. Heater and plate voltages for the CR-188 radio chassis are supplied from the amplifier chassis; it is therefore essential that the radio and amplifier chassis be interconnected during alignment or for other electrical service operations.

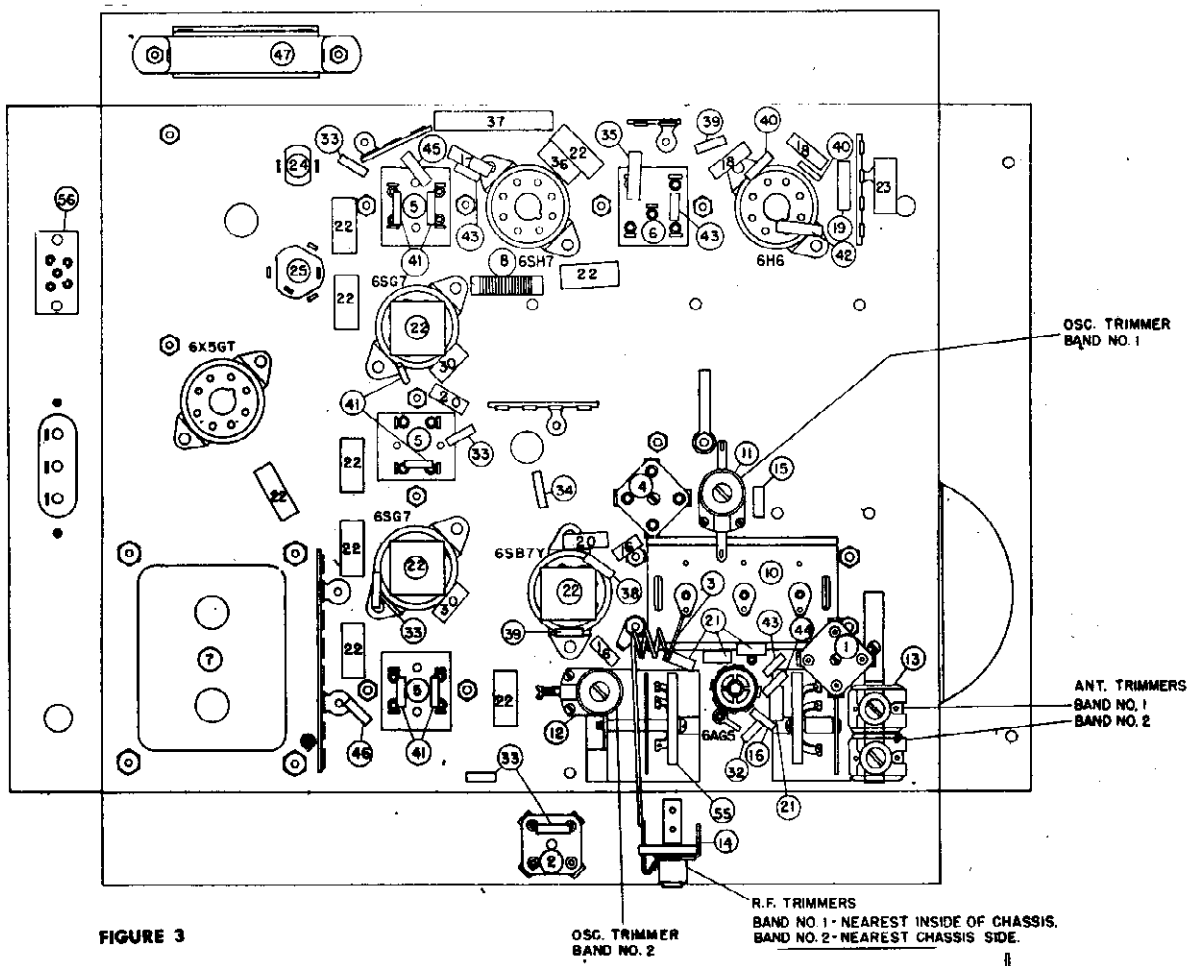

FIGURE 3

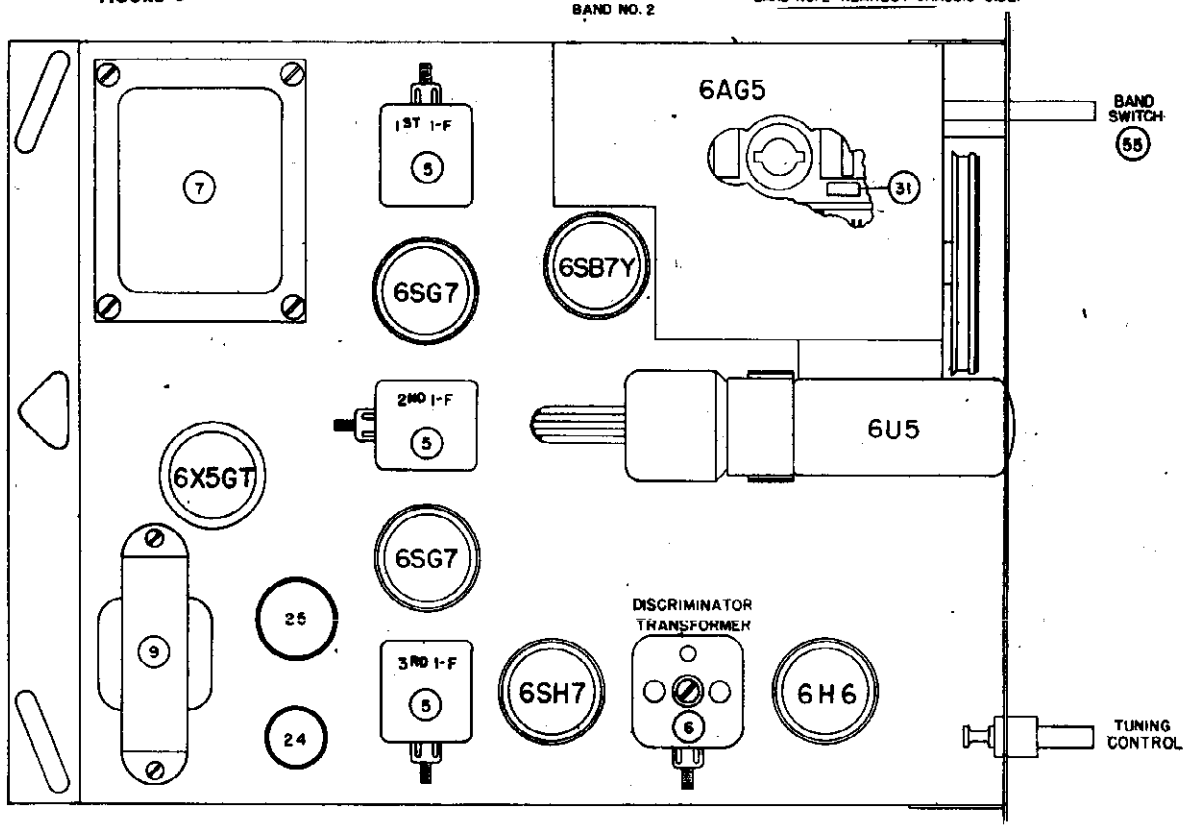

METHOD FOR REMOVING CHASSIS FROM CABINET

As the control panel is permanently fastened to the tuner in all models except those mounted in the Regency Symphony combination, it is not necessary to remove the control knobs from the cabinet. The instructions immediately following are for all combinations except the Regency Symphony. Separate instructions for removing the CR-189A chassis from that instrument are shown in this manual.

Before removing the chassis, disconnect the antenna and ground leads from their terminals, and the output and the power cables from their receptacles. While holding the rear of the chassis in place with one hand, remove the two Phillips-head screws from the angular slots in the flange at the rear of the chassis. Then while lowering the chassis, pull back on it to disengage the hooks from the slots in the tray to which the chassis is mounted, and withdraw the chassis from the cabinet.

In replacing the chassis, slide it in so that the small hooks near the front ride inside the flanges on the sides of the chassis tray. Push the chassis forward as far as it will go so that the hooks engage the slots in the chassis tray; then lift up the rear of the chassis until the guide pin in the chassis tray projects through the triangular opening the flange on the rear of the F-M chassis. Now pull back on the chassis. A ledge on the guide pin referred to above, will hold the chassis in place while the mounting screws are started into the captivated nuts on the top of the chassis tray. These nuts are accessible through the angular slots in the chassis flange and the Phillips-head screws should be turned in to within a few turns of being tight. Now slide the chassis forward until its panel is flush with the panel of the A-M radio chassis and tighten the two Phillips-head screws securely, completing the replacement operation.

REGENCY SYMPHONY. To remove the CR-189A chassis from the Regency Symphony first remove the antenna and ground leads from their terminals and the output and power cables from their receptacles. Then pull the control knobs from their shafts and remove the two fancy-head screws from the front panel. Next, remove the two Phillips-head screws from the angular slots in the flange at the rear of the chassis and pull the chassis out of the rear of the cabinet.

In replacing the chassis, the reverse order of the above instructions should be followed.

ALIGNMENT PROCEDURE

The alignment of this F-M tuner is made in three major steps namely, I-F alignment, Discriminator alignment and R-F alignment. An F-M generator is not required in aligning this F-M tuner. Any *accurately calibrated* signal generator covering a range in the vicinity of 10.7 megacycles may be used in aligning the I-F and the Discriminator stages. For R-F alignment, the generator must cover the tuning range of the tuner or approximately 42 to 110 megacycles. If such a signal generator is not available, this alignment may be made by using an F-M radio station as a frequency standard.

I-F ALIGNMENT

1. Connect the "high" side of the signal generator to Grid 3 (pin #8) of the 6SB7Y converter tube and the "low" side of the generator to the radio chassis.
2. If a vacuum tube voltmeter is available, connect it across the 220,000 ohm resistor in the grid circuit of the 6SH7 limiter tube at points designated "A" and "X" on the schematic diagram (Figure 2) to measure the limiter grid bias voltage. Set the signal generator to exactly 10.7 megacycles and adjust the third, the second and the first i-f transformer trimmers in that order for maximum reading on the meter. A reading of 2 to 8 volts should be considered normal.
3. If a vacuum tube voltmeter is not available, connect a 0-50 or 0-200 microammeter in series with the "ground" end of the 220,000 ohm resistor in the grid circuit of the 6SH7 limiter tube at point "X" on the schematic diagram. Set the signal generator to exactly 10.7 megacycles and adjust the third, the second and the first i-f transformer trimmers in that order for maximum meter readings. A normal reading will be in the range of 10 to 35 microamperes. At the completion of these adjustments, remove the microammeter and ground the 220,000 ohm resistor to the point where it was originally connected.

DISCRIMINATOR ALIGNMENT

The accurate alignment of the discriminator transformer cannot be overemphasized. Incorrect alignment will result in badly distorted reception. The following steps should be followed in the order given:

1. A DC vacuum tube voltmeter is connected to the output circuit by connecting it from ground to point "B" on the schematic diagram. This measures the detector output voltage. Adjust the signal generator frequency to exactly 10.775 megacycles and adjust both trimmers on the discriminator transformer for maximum reading. If the indicated voltage is less than 3 volts readjust the output of the generator until the meter indicates 3 volts or more. Now adjust the signal generator frequency to 10.7 megacycles and turn the trimmer screw on the top of the discriminator until the voltage is zero. *This is an extremely important adjustment.* Reset the generator frequency to 10.775 and record the meter reading.
2. Reverse the meter connections and set the signal generator frequency to 10.625 megacycles. The meter reading now obtained must be within 10% of the reading recorded in the previous operation—if it is not, the discriminator alignment was not done accurately and must be repeated.
3. The discriminator may also be aligned using a 0-50 or 0-200 microammeter if a vacuum tube voltmeter is not available. In this case, the detector output current is measured. Connect the microammeter to the same points specified in paragraph 1 and proceed in the manner outlined in paragraphs 1 and 2 of this section. In the operation described in paragraph 1, the meter reading should be at least 20 microamperes when the trimmers are peaked at 10.775 megacycles; if not, the generator should be adjusted until that value is obtained.

BAND NO. 1 R-F ALIGNMENT

It is essential that Band No. 1—the high frequency band, is aligned prior to the alignment of Band No. 2. If this is not done, Band No. 1 alignment will be incorrect.

1. Set the Band Selector switch to Band No. 1 and check that the dial pointer is in line with the last mark at the low frequency end of the dial calibration when the condenser gang is fully meshed. If it is not, slide the pointer on its string to the correct position, and crimp the lugs (on the rear of the pointer) tightly around the string and apply a drop of cement to hold the pointer in adjustment.
2. Connect the vacuum tube voltmeter to points "A" and "X" on the schematic diagram or connect a 0-50 or 0-200 microammeter in series with the "ground" end of the 220,000 ohm resistor in the grid circuit of the 6SH7 limiter tube at point "X" on the schematic diagram.
3. An extremely accurate signal generator is a necessity in making the following adjustments and it should be connected to the antenna post through a 300 ohm resistor. If such a generator is not available, connect an F-M antenna to the antenna terminal (A) and use an F-M transmitter for a frequency standard. It is preferable that this station be located in the high frequency end of the band—102 to 108 megacycles.
4. Set the signal generator (if one is used) and the F-M tuner to exactly 108 megacycles—if an F-M station is used as a frequency standard accurately set the tuner to the frequency of the F-M station and adjust the Band No. 1 oscillator trimmer for a maximum reading on the meter. Then adjust the Band No. 1 antenna trimmer and the r-f trimmer for a maximum meter indication. If too much signal is fed to the tuner, it might appear at several settings of the tuning dial and confuse the adjustment. When the adjustments are completed, the second harmonic of the oscillator frequency will be 10.7 megacycles lower than the signal frequency.

BAND NO. 2 R-F ALIGNMENT

1. With the meter still connected to the tuner, set the Band Selector switch to Band No. 2. Set the signal generator and the F-M tuner to exactly 48 megacycles. If an F-M station is used as a frequency standard (this station should be in the high frequency end of the band) accurately set the tuner to the frequency of the F-M station. Adjust the Band No. 2 oscillator trimmer for a maximum reading on the meter. Then adjust the Band No. 2 antenna trimmer and the r-f trimmer for the highest meter reading. On Band No. 2, the oscillator frequency will be 10.7 megacycles lower than the signal frequency. This completes the alignment—remove the meter from the circuit and if the ground circuit of the 220,000 ohm resistor in the grid circuit of the 6SH7 limiter tube was opened for the connection of a microammeter, ground the resistor to restore the circuit to normal.

MODEL CR-192A,
CR-192B

THE MAGNAVOX CO.

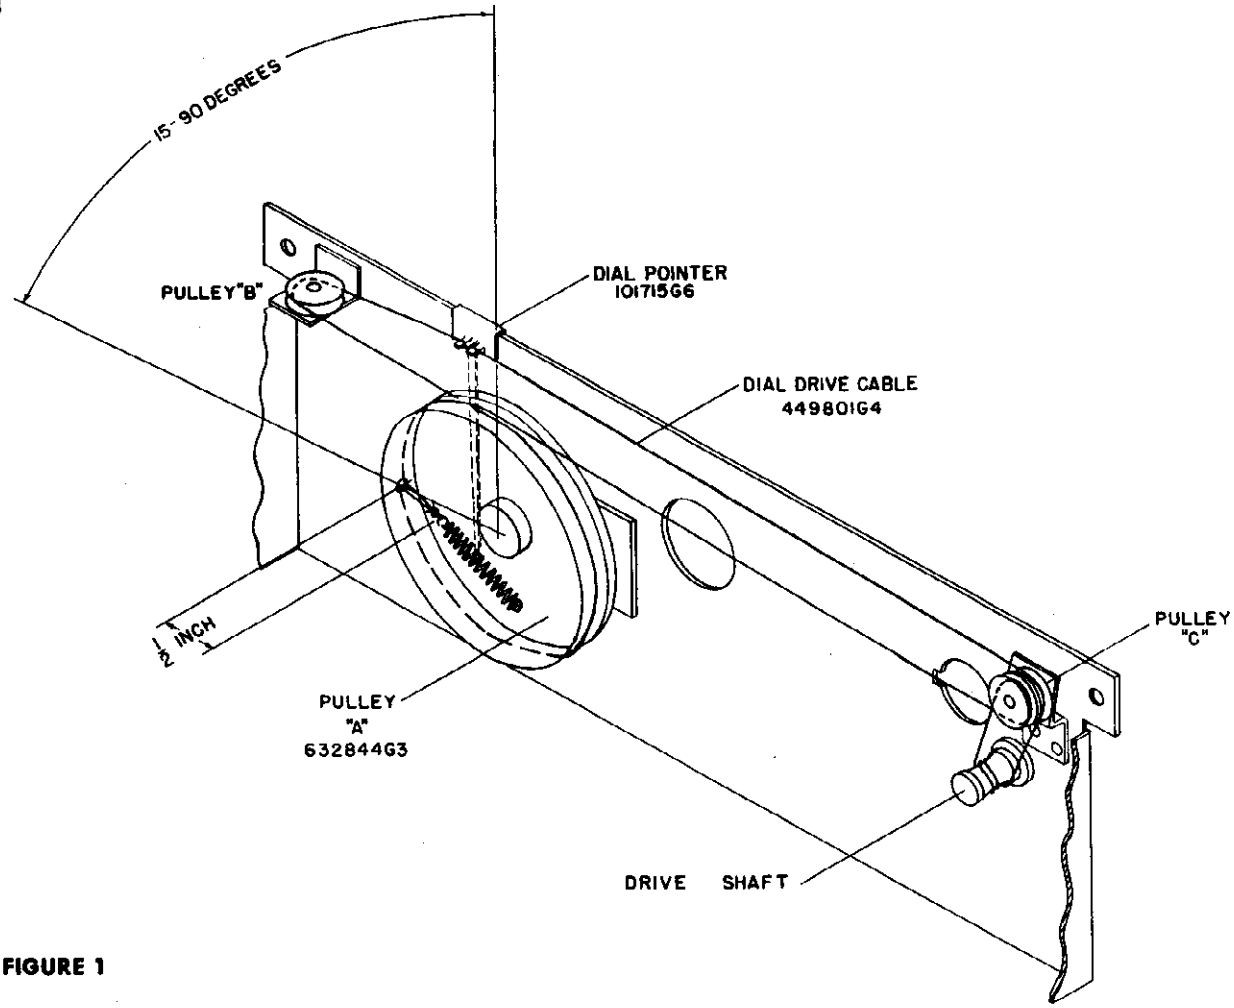

FIGURE 1

DIAL CORD REPLACEMENT

A single cable transmits motion from the dial tuning knob to rotate the condenser gang and to move the dial pointer. A 30-inch length of string is required to restring this assembly. After the broken cable is removed, turn pulley "A" (see Figure 1) until the condenser gang plates are completely meshed. In this condition, the small hole in the rim of pulley "A" should be within the limits of 15 to 90 degrees to the left of being vertical as shown in Figure 1. If this hole is at a different position from the condition specified, loosen the two screws in the coupling to the condenser gang and turn pulley "A" while holding the condenser plates meshed. Tighten the two set screws after the adjustment has been made.

Lace one end of the new length of cable through the hole in pulley "A" and temporarily fasten it to the hook to which the spring is normally fastened. Make a complete turn around pulley "A" in a counterclockwise direction, lace it around pulley "B," then across the rear of the dial scale and over the top of the front groove in pulley "C." Proceed down around the tuning shaft for 2½ turns in a clockwise direction and wrapping the cable over pulley "D" from front to back. Continue up over the rear groove of pulley "C" in a clockwise direction for one turn and extend the cable to the left so that the loose end is to the rear of the section of cable that it crosses. The loose end of the cable should now be wound over the top of pulley "A" so that it is nearest the dial frame and into the hole in the pulley groove. Remove the other end of the cable from the hook and while holding both ends taut, insert one end of the spring on the hook in pulley "A." Lace the two free ends of the cable through the opposite end of the spring and pull the cable until the spring is stretched to within ½-inch of the rim on the pulley. Tie a double knot so that the knot is around one coil of the spring, while maintaining tension on the cable.

Turn the tuning control shaft until the condenser gang is completely meshed and slide the dial pointer on its track until it is in line with the last calibration mark at the low frequency end of the dial. Press the crimping lugs on the dial pointer together over the cable. After checking to see that the condenser gang is still completely meshed and the dial pointer is in the position specified previously, apply a few drops of cement to the cable where it is crimped by the pointer. This completes the operation.

DIAL CORD REPLACEMENT

As mentioned previously in this Service Bulletin, two types of drive mechanisms are used to transmit the motion from the dial tuning knob to the large pulley that is coupled to the condenser gang. These two arrangements are shown on Figures 1 and 2. The cable used to drive the dial pointer is strung the same on all CR-190A and CR-190B receivers. Separate instructions for installing a replacement belt or string on the CR-190A or CR-190B chassis are given below.

CR-190A Condenser Drive Belt Replacement—Hook one end of the belt on the right-hand edge of the slot in pulley "C" so that the smooth side contacts the pulley surface. Keeping the belt near the back of the groove in pulley "C" wrap it in a clockwise direction around that pulley (as indicated by the arrows on Figure 1) over the idler pulley and under the tuning control shaft; then around the opposite side of pulley "C." One end of the belt tension spring is hooked on the free end of the belt and the other end on the left-hand edge of the slot in pulley "C," completing the operation.

CR-190B Condenser Drive Cable Replacement—Slide a short length (approximately ½-inch) of sleeving over one end of a 19-inch length of dial cable, form a small loop and tie a knot in the manner shown on Figure 2. Hook this loop over the metal hook in pulley "C" and lace the cable through the pulley slot and around the pulley in a counter-clockwise direction when viewed from the rear of the panel, keeping the cable to the rear of the pulley groove. Lace the cable in the direction indicated by the arrow on Figure 2 wrapping 2½ turns around the smaller diameter portion of the tuning control shaft *from front to back;* then around the opposite side of pulley "C." Loop one end of tension spring "D" on the right-hand edge of the slot in pulley "C"; thread the free end of the drive cable through the opposite end of spring "D" and pull back on the cable until the spring coils are stretched to approximately one inch. Tie a double knot in the cable while maintaining tension on the spring, completing the operation.

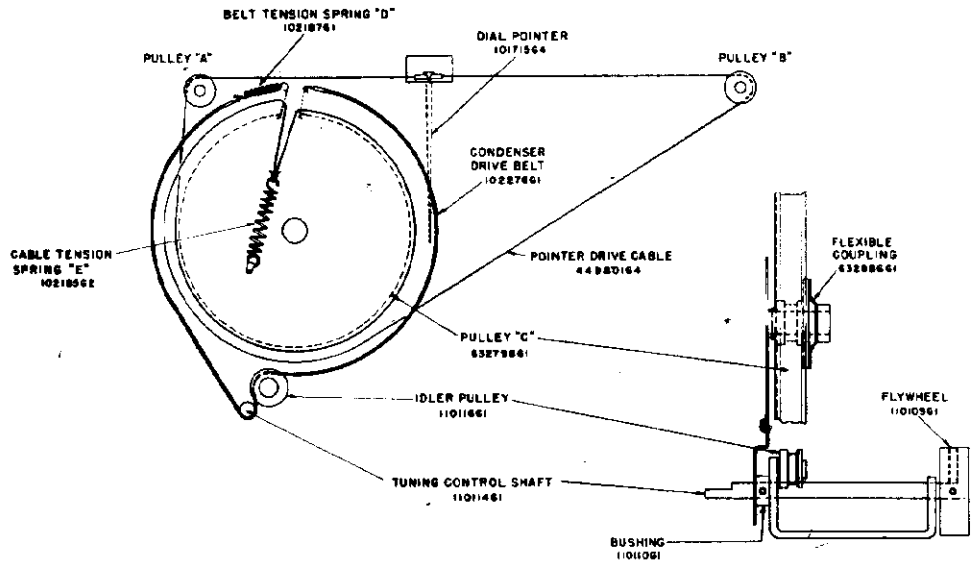

FIGURE 1

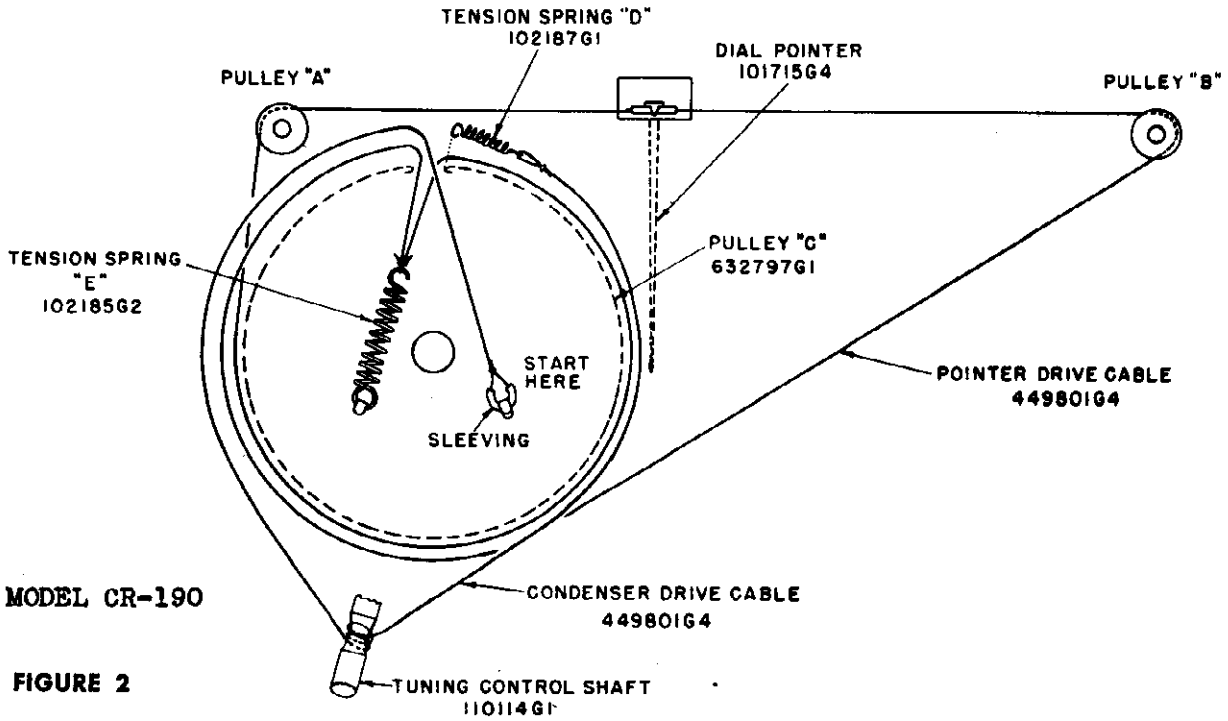
CR-190A and CR-190B Dial Pointer Drive Cable Replacement—Rotate the tuning control shaft until the slot in the groove of pulley "C" is up. Cut a piece of dial cable approximately 40 inches long and slide a short piece of sleeving over the cable. Tie a small loop in one end of the cable and temporarily hook it over the metal hook in pulley "C." Lace the other end through the slot in the pulley groove and in a counter-clockwise direction around the large pulley, then around pulley "B" and straight across the back of the dial frame; over pulley "A" and in a counter-clockwise direction around pulley "C." This last wrap around pulley "C" must be at the front of the pulley groove or nearest the panel. *This is important!* Lace the free end of the cable through the slot in pulley "C" and remove the other end of the cable from the hook. Fasten one end of tension spring "E" over the pulley hook and lace the two free ends of the drive cable through the other end of the spring. Now pull back on the cable until the tension spring coils are stretched to approximately 1⅝ inches. Tie a double knot in the cable while maintaining tension on the spring.

Turn the tuning control shaft until the condenser gang is completely meshed and slide the dial pointer on its track until it is in line with the last calibration mark at the low frequency end of the dial. The short piece of sleeving installed prior to the stringing operation should be slid to the rear of the dial pointer and the crimping lugs on the dial pointer pressed together over the sleeving. After checking to see that the condenser gang is still completely meshed and the dial pointer is in the position specified previously, apply a few drops of cement to each end of the sleeving to which the dial pointer is fastened. This completes the operation.

THE MAGNAVOX CO.



MODEL CR-190

FIGURE 2

MODEL CR-190 PUSH BUTTON ADJUSTMENTS MODEL CR-194

There are six push buttons on the panel of the receiver, five of which may be pre-set to any station whose frequency is within the range covered by the respective buttons. See Figure 3. The right-hand button must be pressed for dial tuning.

Set-up Procedure—Turn on the receiver and allow it to operate for at least five minutes to permit tubes to reach normal operating conditions. Remove the push button escutcheon plate and proceed in the following manner.

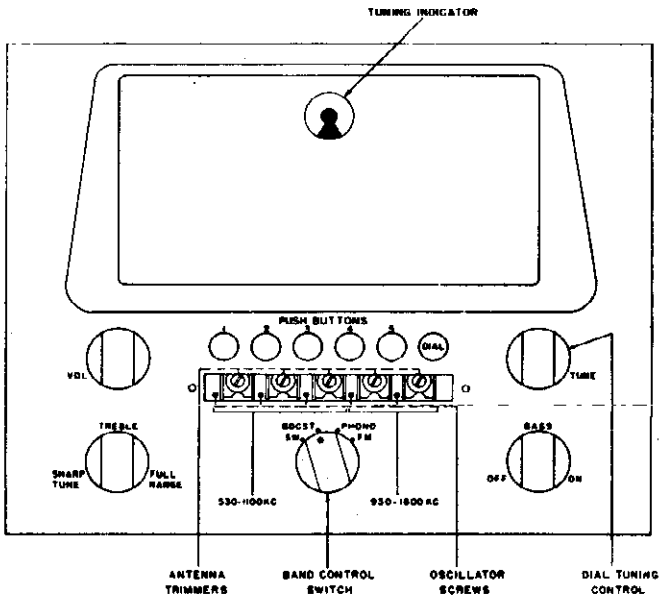


FIGURE 3

1. Turn the Band Control Switch knob to BDCST and press the push button at the right end of the assembly to permit dial tuning.

2. Using the Dial Tuning Control, carefully tune in the station to which the No. 1 push button is to be set and note the program. Be sure that the frequency of the station selected is within the frequency range covered by the No. 1 button.

3. Press the No. 1 button and carefully turn the oscillator screw for that button until the station that was tuned manually is heard. Carefully adjust the screw until the tuning indicator tube shows maximum deflection.

4. Adjust the No. 1 antenna trimmer for maximum speaker volume (tuning indicator tube shows maximum deflection).

5. Press the DIAL button to verify that the same station that was tuned manually was set up on the No. 1 button.

6. This completes the set-up of the No. 1 button. Follow the same procedure in setting up the remaining four buttons always adjusting the oscillator screw first, then the antenna trimmer screw.

7. After all five buttons have been set up, replace the escutcheon plate and insert the correct call letter tab in the space provided under each push button.

MODEL CR-190A,
CR-190B

THE MAGNAVOX CO.

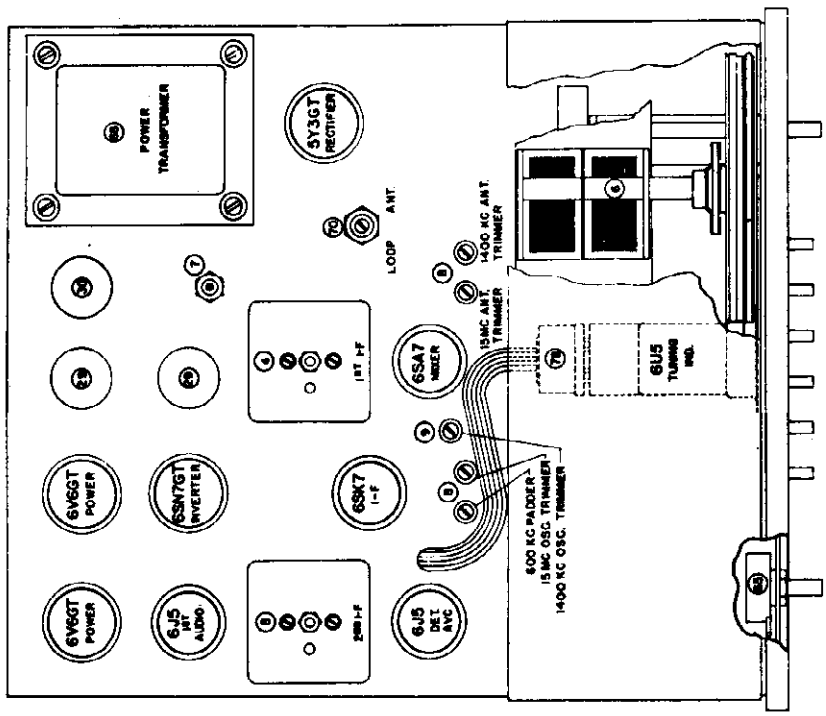

FIGURE 5

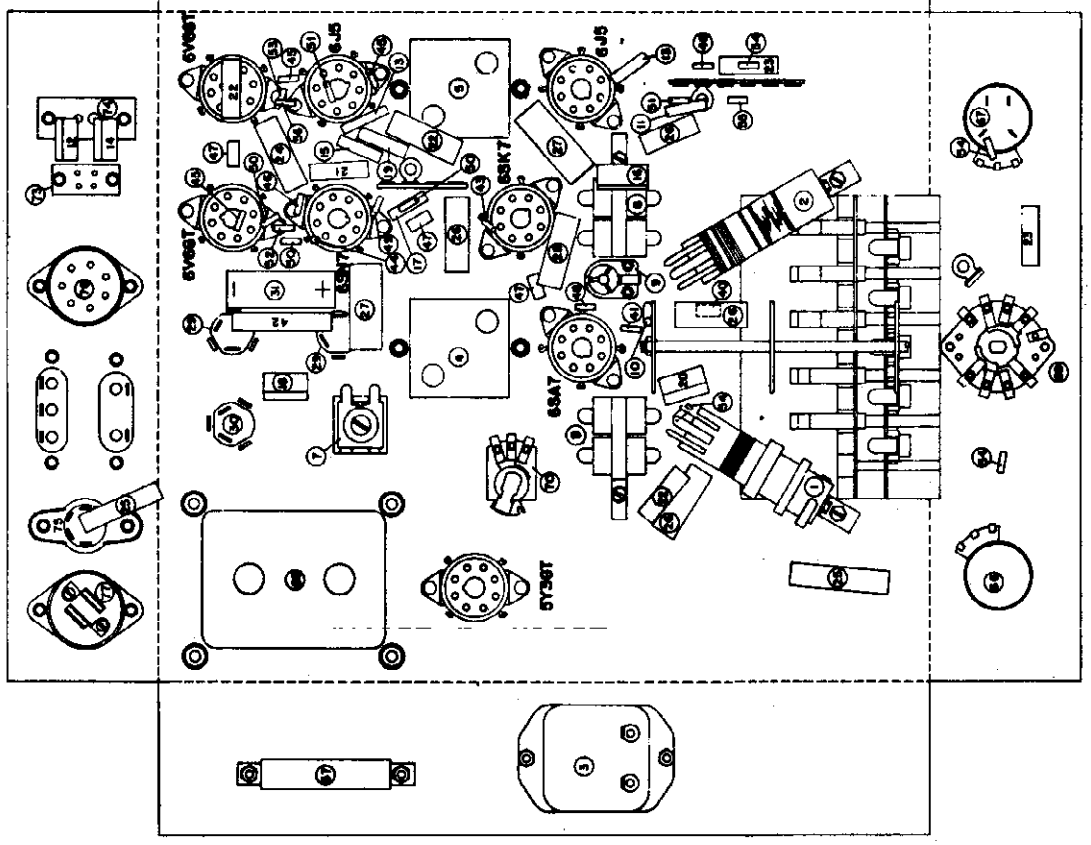
METHOD FOR REMOVING CHASSIS FROM CABINET

Model CR-190 radio chassis is designed for easy removal from the cabinet in which it is installed. As the radio panel is permanently fastened to the chassis, the control knobs need not be removed when the chassis is taken out of the cabinet for service. To remove the chassis, first remove the antenna leads from their terminals and all plugs from the receptacles on the rear of the chassis. Then remove the two Phillips-head screws from the angular slots in the flange at the rear of the chassis. Lift the rear of the chassis about one inch and pull it straight back.

Never remove the chassis tray from the cabinet—it has been properly positioned to bring the radio panel in place when the chassis is replaced.

In replacing the chassis, slide it so that the hooks near the front, ride inside the flanges on the sides of the chassis tray. Push the chassis forward as far as it will go and the hooks should then engage the slots in the chassis tray. Replace the two Phillips-head screws and nuts and tighten securely. Replace all plugs in their receptacles and the antenna leads on their correct terminals. The antenna terminal board for the loop antenna connections is designated S-L-H. The end of the short wave antenna that is fastened to the inside of the cabinet connects to S. Always disconnect this antenna from terminal S when an outdoor antenna is used as it may pick up noise. The two terminals on the loop are designated L and H. The leads connected to these terminals should be wired to the corresponding terminals (L and H) on the chassis.



The alignment of this receiver requires the use of an accurately calibrated r-f signal generator and an output meter. All trimmer condenser locations are shown on the chassis layout diagram, Figure 5. The radio volume control should be turned to maximum and the signal generator output kept as low as possible during alignment to prevent the AVC from operating and giving false readings. *Always set the Selectivity Switch to SHARP TUNE before aligning the i-f stages.* This is done by turning the Treble Control counter-clockwise as far as possible.

I-F Alignment

1. Connect the output of the signal generator to the oscillator grid (pin No. 5) of the 6SA7 tube through a .00025 mfd. capacitor. The ground on the signal generator should be connected to the radio chassis ground.

2. Turn the condenser gang until it is completely meshed (low-frequency end of dial calibration) and set the band selector switch to BDCST as for broadcast band reception.

3. Adjust the signal generator to EXACTLY 455 kc. and peak the second i-f transformer and the first i-f transformer trimmers in that order.

On early models of CR-190 chassis, the two i-f trimmers are located in the top of the respective i-f transformers as shown in the layout diagram, Figure 5. In later production, one trimmer is accessible from the top and the other from the bottom of each transformer.

Broadcast Band Alignment

1. Remove the signal generator lead from the 6SA7 grid and connect it to the radio antenna terminal through the .00025 mfd. capacitor. The ANT-LOOP switch (70) must be in the ANT setting.

2. Check the tuning dial pointer adjustment. When the plates of the tuning condenser are completely meshed, the dial pointer must be in line with the last calibration mark at the low frequency end of the dial. If it is not, slide the pointer on its string to the correct position. Be sure to crimp the lugs (on the rear of the pointer) tightly around the string to hold the pointer in adjustment.

3. With the band selector still set for broadcast band reception, adjust the signal generator and the radio receiver to 600 kc. While rocking the gang condenser a few degrees to the right and to the left, adjust the 600 kc. oscillator padder for maximum indication on the output meter.

4. Set the signal generator and the radio receiver to 1400 kc.; adjust the 1400 kc. oscillator trimmer and the 1400 kc. antenna trimmer for maximum output. If considerable adjustment was necessary, recheck the 600 kc. padder setting.

Short Wave Band Alignment

1. Set the band selector switch to SW as for Short Wave reception and substitute a 400 ohm resistor for the capacitor in series with the signal generator lead connected to the antenna terminal on the receiver.

2. Set the signal generator and the radio receiver to 15 mc.; then adjust the 15 mc. oscillator trimmer and the 15 mc. antenna trimmer for maximum output.

While adjusting the 15 mc. oscillator trimmer two peaks may be observed; only one is the correct peak for 15 mc. alignment. Screw in the trimmer to maximum capacity—then decrease the capacity until the first peak is observed. This is the correct one.

10 KC Filter Adjustment

This chassis incorporates a 10 kc. filter circuit to eliminate the beat note heard as a whistle between stations on the broadcast band. If the trimmer is out of adjustment, the following procedure should be observed.

1. Set the Selectivity Switch to FULL RANGE by turning the Treble Control knob clockwise as far as possible.

2. Connect the output of an audio oscillator to the phonograph pickup socket on the radio chassis and adjust the oscillator to EXACTLY 10,000 cycles.

3. Set the band selector to PHONO and adjust the 10 kc. trimmer (7) for minimum output.

4. If an audio oscillator is not available for making this adjustment, set the band selector to BDCST, connect an antenna to the receiver and set the gang condenser to a point between two stations on adjacent channels having approximately the same power. If the 10 kc. trimmer is out of adjustment, a whistle will be heard. Adjust the trimmer until the whistle is eliminated.

	Dial glass assembly	150283G1

Due to the fact that a change was made in the mechanical construction of the dial assembly after the first CR-190 radio chassis production run, it is important that you follow the procedure outlined below in ordering replacement glass dials.
If the glass dial for which a replacement is required is marked 150269, order a 150278 dial glass assembly. If the glass is marked 150282, order a 150280 dial glass assembly. These assemblies include the rubber strips cemented in their correct positions.

*The part number of the loop antenna assembly changes with different cabinets. It is therefore important that you specify the *Style Number* of the instrument when ordering a replacement loop antenna assembly.

CR-192B

THE MAGNAVOX CO.

ALIGNMENT PROCEDURE

The alignment of this F-M tuner is made in three major steps namely, I-F alignment, Discriminator alignment and R-F alignment. An F-M generator is not required in aligning this F-M tuner. Any *accurately calibrated* signal generator covering a range in the vicinity of 10.7 megacycles may be used in aligning the I-F and the Discriminator stages. For R-F alignment, the generator must cover the tuning range of the tuner or approximately 87 to 110 megacycles. If such a signal generator is not available, this alignment may be made by using an F-M radio station as a frequency standard.

I-F ALIGNMENT

1. Connect the "high" side of the signal generator to Grid 3 (pin #8) of the 6SB7Y converter tube and the "low" side of the generator to the radio chassis.

2. If a vacuum tube voltmeter is available, connect it across the 220,000 ohm resistor in the grid circuit of the 6SH7 limiter tube at points designated "A" and "X" on the schematic diagram (Figure 2) to measure the limiter grid bias voltage. Set the signal generator to exactly 10.7 megacycles and adjust the third, the second and the first i-f transformer trimmers in that order for maximum reading on the meter. A reading of 2 to 8 volts should be considered normal.

3. If a vacuum tube voltmeter is not available, connect a 0-50 or 0-200 microammeter in series with the "ground" end of the 220,000 ohm resistor in the grid circuit of the 6SH7 limiter tube at point "X" on the schematic diagram. Set the signal generator to exactly 10.7 megacycles and adjust the third, the second and the first i-f transformer trimmers in that order for maximum meter readings. A normal reading will be in the range of 10 to 35 microamperes. At the completion of these adjustments, remove the microammeter and ground the 220,000 ohm resistor to the point where it was originally connected.

DISCRIMINATOR ALIGNMENT

The accurate alignment of the discriminator transformer cannot be overemphasized. Incorrect alignment will result in badly distorted reception. The following steps should be followed in the order given:

1. A DC vacuum tube voltmeter is connected to the output circuit by connecting it from ground to point "B" on the schematic diagram. This measures the detector output voltage. Adjust the signal generator frequency to exactly 10.775 megacycles and adjust both trimmers on the discriminator transformer for maximum reading. If the indicated voltage is less than 3 volts readjust the output of the generator until the meter indicates 3 volts or more. Now adjust the signal generator frequency to 10.7 megacycles and turn the trimmer screw on the top of the discriminator until the voltage is zero. *This is an extremely important adjustment.* Reset the generator frequency to 10.775 and record the meter reading.

2. Reverse the meter connections and set the signal generator frequency to 10.625 megacycles. The meter reading now obtained must be within 10% of the reading recorded in the previous operation—if it is not, the discriminator alignment was not done accurately and must be repeated.

3. The discriminator may also be aligned using a 0-50 or 0-200 microammeter if a vacuum tube voltmeter is not available. In this case, the detector output current is measured. Connect the microammeter to the same points specified in paragraph 1 and proceed in the manner outlined in paragraphs 1 and 2 of this section. In the operation described in paragraph 1, the meter reading should be at least 20 microamperes when the trimmers are peaked at 10.775 megacycles; if not, the generator should be adjusted until that value is obtained.

R-F ALIGNMENT

1. Check that the dial pointer is in line with the last mark at the low frequency end of the dial calibration when the condenser gang is fully meshed. If it is not, slide the pointer on its string to the correct position, and crimp the lugs (on the rear of the pointer) tightly around the string and apply a drop of cement to hold the pointer in adjustment.

2. Connect the vacuum tube voltmeter to points "A" and "X" on the schematic diagram or connect a 0-50 or 0-200 microammeter in series with the "ground" end of the 220,000 ohm resistor in the grid circuit of the 6SH7 limiter tube at point "X" on the schematic diagram.

3. An extremely accurate signal generator is a necessity in making the following adjustments and it should be connected to the antenna post through a 300 ohm resistor. If such a generator is not available, connect an F-M antenna to the antenna terminal (A) and use an F-M transmitter for a frequency standard. It is preferable that this station be located in the high frequency end of the band—102 to 108 megacycles.

4. Set the signal generator (if one is used) and the F-M tuner to exactly 108 megacycles—if an F-M station is used as a frequency standard accurately set the tuner to the frequency of the F-M station and adjust the oscillator trimmer for a maximum reading on the meter. Then adjust the antenna trimmer and the r-f trimmer for a maximum meter indication. If too much signal is fed to the tuner, it might appear at several settings of the tuning dial and confuse the adjustment. When the adjustments are completed, the second harmonic of the oscillator frequency will be 10.7 megacycles lower than the signal frequency.

METHOD FOR REMOVING CHASSIS FROM CABINET

As the control panel is permanently fastened to the tuner in all models except those mounted in the Regency Symphony combination, it is not necessary to remove the control knobs from the cabinet. The instructions immediately following are for all combinations except the Regency Symphony. Separate instructions for removing the CR-192A chassis from that instrument are shown in this section.

Before removing the chassis, disconnect the antenna and ground leads from their terminals, and the output and the power cables from their receptacles. While holding the rear of the chassis in place with one hand, remove the two Phillips-head screws from the angular slots in the flange at the rear of the chassis. Then while lowering the chassis, pull back on it to disengage the hooks from the slots in the tray to which the chassis is mounted, and withdraw the chassis from the cabinet.

In replacing the chassis, slide it in so that the small hooks near the front ride inside the flanges on the sides of the chassis tray. Push the chassis forward as far as it will go so that the hooks engage the slots in the chassis tray; then lift up the rear of the chassis until the guide pin in the chassis tray projects through the triangular opening the flange on the rear of the F-M chassis. Now pull back on the chassis. A ledge on the guide pin referred to above, will hold the chassis in place while the mounting screws are started into the captivated nuts on the top of the chassis tray. These nuts are accessible through the angular slots in the chassis flange and the Phillips-head screws should be turned in to within a few turns of being tight. Now slide the chassis forward until its panel is flush with the panel of the A-M radio chassis and tighten the two Phillips-head screws securely, completing the replacement operation.

REGENCY SYMPHONY. To remove the CR-192A chassis from the Regency Symphony first remove the antenna and ground leads from their terminals and the output and power cables from their receptacles. Then pull the control knobs from their shafts and remove the two fancy-head screws from the front panel. Next, remove the two Phillips-head screws from the angular slots in the flange at the rear of the chassis and pull the chassis out of the rear of the cabinet.

MATION

OSCILLATOR OUTPUT VOLTAGE

The DC voltage developed across Oscillator Grid Resistor (48) at:

600 kc.	5.6
6 mc.	6.0

AUDIO GAIN

Voltage required across Volume Control to produce .05 watt speaker output** at 400 cycles is .010 volt with Band Selector Switch in BDCST setting.

* Variations of ±20% are permissible. All readings made with sufficient input signal to provide .05 watt speaker output.
** .05 watt speaker output at 400 cycles is equivalent to a reading of 0.4 volts as measured by a high resistance AC voltmeter across the voice coil of either speaker.

THE MAGNAVOX CO

METHOD FOR REMOVING CHASSIS FROM CABINET

Model CR-194 radio chassis is designed for easy removal from the cabinet in which it is installed. As the radio panel is permanently fastened to the chassis, the control knobs need not be removed when the chassis is taken out of the cabinet for service. To remove the chassis, first remove the antenna leads from their terminals and all plugs from the receptacles on the rear of the chassis. Then remove the two Phillips-head screws from the angular slots in the flange at the rear of the chassis. Lift the rear of the chassis about one inch and pull it straight back.

Never remove the chassis tray from the cabinet—it has been properly positioned to bring the radio panel in place when the chassis is replaced.

In replacing the chassis, slide it so that the small hooks near the front, ride inside the flanges on the sides of the chassis tray. Push the chassis forward as far as it will go and the hooks should then engage the slots in the chassis tray. Replace the two Phillips-head screws and nuts and tighten securely. Replace all plugs in their receptacles and the antenna leads on their correct terminals. The antenna terminal board for the loop antenna connections is designated S-L-H. The end of the short wave antenna that is fastened to the inside of the cabinet connects to S. Always disconnect this antenna from terminal S when an outdoor antenna is used as it may pick up noise. The two terminals on the loop are designated L and H. The leads connected to these terminals should be wired to the corresponding terminals (L and H) on the chassis.

ALIGNMENT PROCEDURE

The alignment of this receiver requires the use of an accurately calibrated r-f signal generator and an output meter. All trimmer condenser locations are shown on the chassis layout diagram, Figure 4. The radio volume control should be turned to maximum and the signal generator output kept as low as possible during alignment to prevent the AVC from operating and giving false readings. *Always set the Selectivity Switch to SHARP TUNE before aligning the i-f stages.* This is done by turning the Treble Control counter-clockwise as far as possible.

I-F Alignment

1. Connect the output of the signal generator to the oscillator grid (pin No. 5) of the 6SA7 tube through a .00025 mfd. capacitor. The ground on the signal generator should be connected to the radio chassis ground.

2. Turn the condenser gang until it is completely meshed (low-frequency end of dial calibration), and set the band selector switch to BDCST as for broadcast band reception.

3. Adjust the signal generator to EXACTLY 455 kc. and peak the second i-f transformer and the first i-f transformer trimmers in that order.

Broadcast Band Alignment

1. Remove the signal generator lead from the 6SA7 grid and connect it to the radio antenna terminal through the .00025 mfd. capacitor. The ANT-LOOP switch (70) must be in the ANT setting.

2. Check the tuning dial pointer adjustment. When the plates of the tuning condenser are completely meshed, the dial pointer must be in line with the last calibration mark at the low frequency end of the dial. If it is not, slide the pointer on its string to the correct position. Be sure to crimp the lugs (on the rear of the pointer) tightly around the string to hold the pointer in adjustment.

3. With the band selector still set for broadcast band reception, adjust the signal generator and the radio receiver to 600 kc. While rocking the gang condenser a few degrees to the right and to the left, adjust the 600 kc. oscillator padder for maximum indication on the output meter.

4. Set the signal generator and the radio receiver to 1400 kc.; adjust the 1400 kc. oscillator trimmer and the 1400 kc. antenna trimmer for maximum output. If considerable adjustment was necessary, recheck the 600 kc. padder setting.

Short Wave Band Alignment

1. Set the band selector switch to SW as for Short Wave reception and substitute a 400 ohm resistor for the capacitor in series with the signal generator lead connected to the antenna terminal on the receiver.

2. Set the signal generator and the radio receiver to 15 mc.; then adjust the 15 mc. oscillator trimmer and the 15 mc. antenna trimmer for maximum output.

While adjusting the 15 mc. oscillator trimmer two peaks may be observed; only one is the correct peak for 15 mc. alignment. Screw in the trimmer to maximum capacity—then decrease the capacity until the first peak is observed. This is the correct one.

10 KC Filter Adjustment

This chassis incorporates a 10 kc. filter circuit to eliminate the beat note heard as a whistle between stations on the broadcast band. If the trimmer is out of adjustment, the following precedure should be observed.

1. Set the Selectivity Switch to FULL RANGE by turning the Treble Control knob clockwise as far as possible.

2. Connect the output of an audio oscillator to the phonograph pickup socket on the radio chassis and adjust the oscillator to EXACTLY 10,000 cycles.

3. Set the band selector to PHONO and adjust the 10 kc. trimmer (7) for minimum output.

4. If an audio oscillator is not available for making this adjustment, set the band selector to BDCST, connect an antenna to the receiver and set the gang condenser to a point between two stations on adjacent channels having approximately the same power. If the 10 kc. trimmer is out of adjustment, a whistle will be heard. Adjust the trimmer until the whistle is eliminated.

THE MAGNAVOX CO.

DIAL CORD REPLACEMENT

Two separate drive cables are used in the CR-194 dial assembly. One cable is used to transmit the motion from the dial tuning knob to the large pulley that is coupled to the condenser gang; the other cable actuates the dial pointer whenever the large pulley on the condenser gang is moved. Separate instructions for replacing either of these cables is given in the following paragraphs.

CONDENSER DRIVE CABLE REPLACEMENT

Slide a short length (approximately ½-inch) of sleeving over one end of a 19-inch length of dial cable, form a small loop and tie a knot in the manner shown on Figure 1. Hook this loop over the metal hook in pulley "C" and lace the cable through the pulley slot and around the pulley in a counter-clockwise direction when viewed from the rear of the panel, keeping the cable to the rear of the pulley groove. Lace the cable in the direction indicated by the arrow on the drawing wrapping 2½ turns around the smaller diameter portion of the tuning control shaft *from front to back;* then around the opposite side of pulley "C." Loop one end of tension spring "D" on the right-hand edge of the slot in pulley "C"; thread the free end of the drive cable through the opposite end of spring "D" and pull back on the cable until the spring coils are stretched to approximately one inch. Tie a double knot in the cable while maintaining tension on the spring, completing the operation.

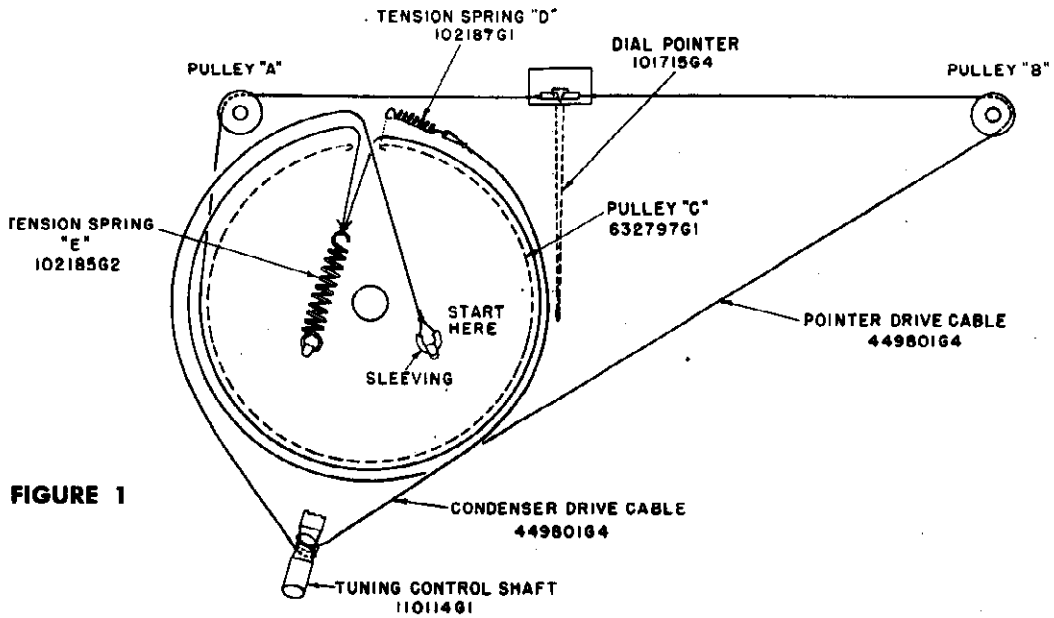

FIGURE 1

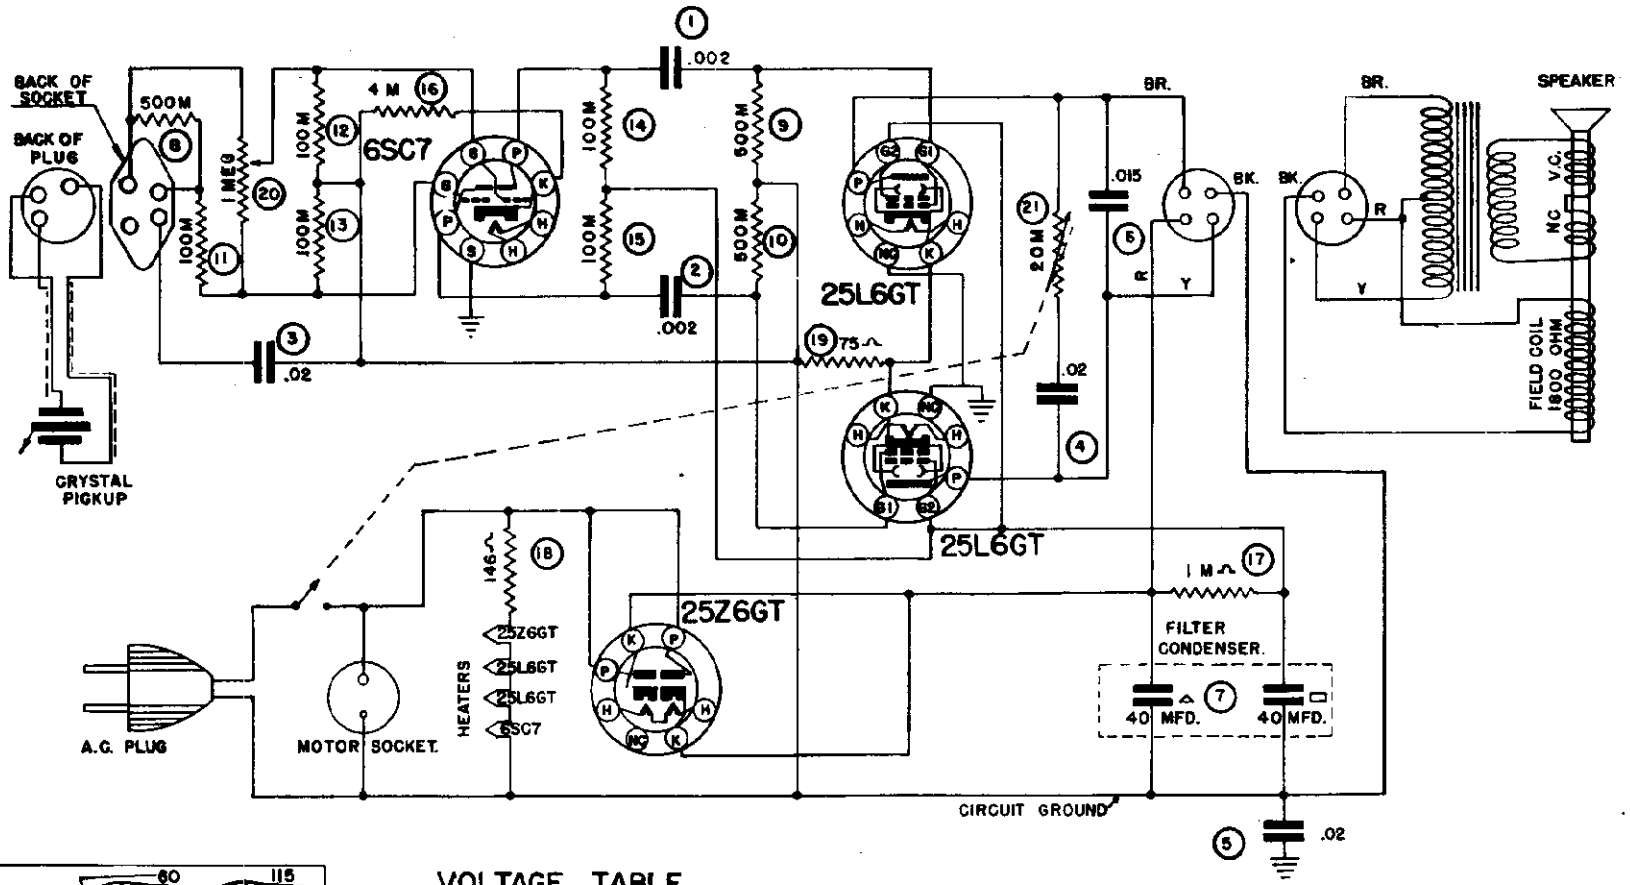
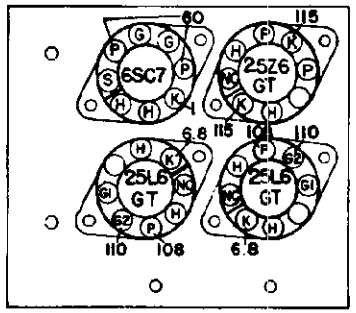
DIAL POINTER DRIVE CABLE REPLACEMENT

Rotate the tuning control shaft until the slot in the groove of pulley "C" is up. Cut a piece of dial cable approximately 40 inches long and slide a short piece of sleeving over the cable. Tie a small loop in one end of the cable and temporarily hook it over the metal hook in pulley "C." Lace the other end through the slot in the pulley groove and in a counter-clockwise direction around the large pulley, then around pulley "B" and straight across the back of the dial frame; over pulley "A" and in a counter-clockwise direction around pulley "C." This last wrap around pulley "C" must be at the front of the pulley groove or nearest the panel. *This is important!* Lace the free end of the cable through the slot in pulley "C" and remove the other end of the cable from the hook.

Fasten one end of tension spring "E" over the pulley hook and lace the two free ends of the drive cable through the other end of the spring. Now pull back on the cable until the tension spring coils are stretched to approximately 1⅝ inches. Tie a double knot in the cable while maintaining tension on the spring.

Turn the tuning control shaft until the condenser gang is completely meshed and slide the dial pointer on its track until it is in line with the last calibration mark at the low frequency end of the dial. The short piece of sleeving installed prior to the stringing operation should be slid to the rear of the dial pointer and the crimping lugs on the dial pointer pressed together over the sleeving. After checking to see that the condenser gang is still completely meshed and the dial pointer is in the position specified previously, apply a few drops of cement to each end of the sleeving to which the dial pointer is fastened. This completes the operation.





VOLTAGE TABLE
(BOTTOM VIEW OF CHASSIS)

MEASURE ALL D.C. VOLTAGES DIRECT TO CIRCUIT GROUND WITH A 1000 OHM PER VOLT VOLTMETER CATHODE(K) 30 V. SCALE ALL OTHERS ON 600 V. SCALE. LINE VOLTAGE 117 VOLTS AC.

THE MAGNAVOX CO.

IDENTIFICATION OF MAGNAVOX MODELS FROM 1937 TO 1946

The list of Magnavox models in the following pages has been arranged in such a way that the identifying number for servicing these receivers is in all cases the style number (such as C101G11). This style number is on a serial plate which is attached to all phonograph and radio-phonographs. It should not be confused with the model number (such as 155B) which can not be used in locating the necessary information since instruments having as many as ten different style numbers may all have the same model number.

The model number indicates a series of instruments while the style number indicates any changes made during the production of a series. These changes might be a different phonograph pick-up, a different radio chassis, a different speaker, etc. As an example, instrument style number 101G11 is instrument model number 155B and instrument style numbers C101G13, C101G21, C101G23, C101G41, C101G43, are also model 155B. Each of the style numbers has some change.

In previous indexes of Rider's Manuals we have listed radio chassis numbers of Magnavox receivers first, giving model numbers and style numbers. To use this new listing successfully you would look up the instrument style number, which is tabulated in numerical order, and following through to the chassis number, would refer to this chassis number in past indexes. In case of record changer troubles, you would follow the same procedure and would find the details of the record changer in Rider's "Automatic Record Changers and Recorders" or in this Manual.

STYLE NOS. C101G11
TO C103G15

THE MAGNAVOX CO.

MAGNAVOX MODEL IDENTIFICATION FROM 1937 TO 1946

The Style Number and Model Number are shown on the serial plate attached to each cabinet.

POWER OUTPUT:
Undistorted ..... 1.5 watts
Maximum ..... 3 watts
POWER SUPPLY:
105-125 volts, a.c. 60 cycles
POWER CONSUMPTION: 45 watts
LOUDSPEAKER:
5x7 inch oval (or 5-inch round); permanent magnet.
Voice Coil Impedance: 3.2 ohms at 400 cycles.

NOTES:
R19, R20 and C28, shown in the above schematic, were not included in earlier models.
The following changes were effected in later models: R2 changed from 10 to 2.2 megohms; R16 changed from 1800 to 560 ohms; R17 changed from 0.47 megohm to 0.22 megohm.
The rectifier output voltage of +110 volts, as shown above, may be 10 to 15 volts

MODEL 700

MAGUIRE INDUSTRIES INC.

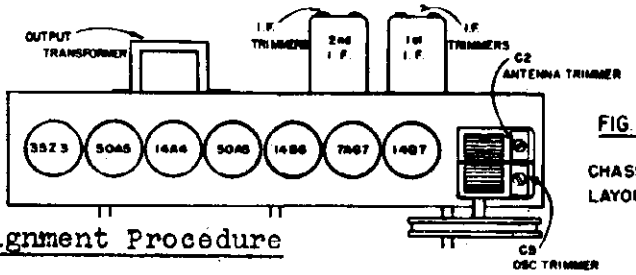

FIG. 3 CHASSIS LAYOUT

Alignment Procedure

A signal generator capable of producing a modulated radio-frequency signal, and a suitable output meter are required for proper alignment of the receiver.

Adjust the signal generator for 30%, 400 cyclo modulation. At all times, use only the minimum signal intensity which will produce a readable indication on the output meter, in order to minimize alignment error due to a.v.c. action in the receiver.

Set the receiver controls for "Radio", maximum volume, and treble tone.

Make all adjustments with the signal generator connected directly to the external antenna lead of the receiver, and with the output meter across the speaker voice coil.

Use a non-metallic screwdriver in making all receiver alignment adjustments.

NOTE: The calibrated tuning dial of the receiver is fastened in the cabinet and cannot be used for reference during alignment. Therefore, calibration marks have been stamped on the plate on the front of the chassis, as shown in Figure 2. These are the reference marks referred to in the following procedure:

Step 1. Set signal generator to 455 kc. and the receiver dial to a "quiet spot" between stations. Peak the I.F trimmer condensers (Figure 3) for maximum signal indication on the output meter, beginning with the 2nd I.F. transformer.

Step 2. Turn ganged tuning condenser to maximum capacity (fully meshed) and adjust dial pointer on cord so that it coincides with the extreme left hand white mark on the metal dial plate.

Step 3. Set signal generator to 1500 kc. Turn ganged tuning condenser until pointer coincides with extreme right hand (1500 kc.) calibration mark. Adjust oscillator trimmer condenser C5 (Figure 3) for maximum indication on the output meter.

Step 4. With the signal generator and receiver dial set as in step 3, adjust the antenna trimmer condenser C2 for maximum indication on the output meter.

When chassis has been returned to cabinet after alignment, the receiver calibration should be checked against the tuning dial. It may be found necessary to slide the dial pointer slightly in either direction on the cord to correct for small deviations in calibration.

5A430,Ch.4504

MAJESTIC RADIO & TELEV. CORP.

Before aligning, set the dial pointer as follows: Close the tuning gang condenser (plates fully meshed). Set dial pointer so that its left hand edge is in line with the right hand edge of the last mark at the low frequency end of the dial scale.

While aligning this receiver, turn the volume control full on, and keep the signal generator output as low as possible to prevent AVC action and false readings.

STEP	DUMMY ANT.	TEST OSC. CONNECTION	TEST OSC. FREQUENCY	RECEIVER DIAL	ADJUST	REMARKS
1	.01 mfd.	12SA7 grid (pin No.5)	455 kc. modulated	Any quiet spot	C13,C12,C9,C8 for max. output	Repeat in reverse order
2	--------	Loop*	1500 kc. modulated	150	C5 for maximum output	
3	--------	Loop*	1500 kc. modulated	150	C2 for maximum output	Rock gang while adjusting
4	REPEAT COMPLETE ALIGNMENT PROCEDURE CAREFULLY					

* Make a two or three turn loop about 12 inches in diameter. Connect to output terminals of the signal generator. Place this loop in a plane parallel to the receiver loop antenna and about a foot away from the receiver loop. IMPORTANT: WHEN MAKING RF. ADJUSTMENTS, THE RECEIVER LOOP ANTENNA MUST BE MOUNTED ON THE CHASSIS EXACTLY AS WHEN THE RECEIVER IS IN THE CABINET.

ALIGNMENT

Before aligning, close tuning condenser (plates fully meshed). Set pointer to center of extreme left hand mark on the dial.

When aligning broadcast band, connect to output of the signal generator a loop, about 12 inches in diameter, consisting of two or three turns of wire. Place this loop in a plane parallel to that of the receiver loop antenna and about a foot away from it. The receiver loop antenna should be in about the same position relative to the chassis as it is when installed in the cabinet.

While aligning, turn the volume control full on and keep the signal generator output as low as possible.

Step	Dummy Antenna	Test Oscillator Connection	Test Oscillator Frequency	Receiver Bandswitch	Receiver Dial	Adjust for Maximum	Notes
1	.01 mfd	6SA7 grid	455 kc	B.C.	Any quiet spot	C18, C17 C14, C12	
2	Loop	-	1500 kc	B.C.	150	C4, C7	
3	Loop	-	600 kc	B.C.	60	C8	Note #1
4	400 ohms	Receiver antenna post	17 mc	S.W.	17	C2, C5	

Note #1 - Rock gang while making this adjustment. Then recheck step 2.

ALIGNMENT

Before aligning, make sure that the dial pointer is exactly horizontal when the tuning condenser is closed (plates fully meshed). While aligning the receiver, turn the volume control full on and keep the signal generator output as low as possible, to prevent AVC action and false readings.

Band-switch positions are extreme right for Broadcast, center for 3.6 to 8.5 mc., extreme left for 8.5 to 19 mc.

25Z6 (V7)	110AC		50 A.C.	25 A.C.	140

NOTE: All voltages measured with respect to chassis with 1,000 ohm per volt meter, line voltage 117 volts A.C.

NOTES

NOTE #1 - Ground oscillator grid (1LC6 pin 4) while adjusting I.F. transformers.

NOTE #2 - "Rock" tuning gang while making this adjustment.

NOTE #3 - Carefully repeat steps 1 through 4.

NOTE #4 - When making short wave oscillator adjustments, take great care to see that alignment is not made on the image. When the trimmer is correctly adjusted, a weaker peak will be noticed at a receiver dial adjustment which is 910 KC lower than the aligning frequency. It may be necessary to greatly increase the output of the signal generator in order to find this weaker peak.

JOHN MECK INDUSTRIES

The Meck Trail Blazer Models 5C5; 5C5-A; 5C5-B; 5C5-C are five tube superhetrodyne receivers covering the broadcast band from 535 to 1720 kilocycles. A loop antenna is incorporated in the top of the cabinet. When an external antenna and ground are used, connect the antenna to the red wire and the ground wire to the black wire extending from the back of the cabinet.

The circuit employs automatic volume control (A.V.C.) through the action of the type 12SQ7GT tube. These models are designed to operate on 110 to 120 volts AC-DC in operation; the incoming signal is first passed to the tuned first detector circuit and then beats with the oscillator output to produce a 455 kilocycle intermediate frequency signal.

The intermediate frequency signal is amplified in an exceptionally high gain stage, and is then rectified by the diodes of the type 12SQ7GT tube. Detection is accomplished by the diode directly connected to the output intermediate frequency transformer. A modulated direct current voltage drop is produced across the one megohm potentiometer by the rectified current. The volume is controlled by selecting any desired portion of the audio frequency voltage with the moving arm of the potentiometer which is connected to the grid of the type 12SQ7GT tube. The triode section of this tube acts as an audio amplifier and is resistance coupled to the 50L6GT output tube.

PRELIMINARY: Before attempting to align a radio set, the service man should become familiar with the general layout of the chassis and with the function and location of the various trimmer condensers. The following discussion briefly explains the action of each alignment step.

R.F. alignment and calibration are accomplished by the two trimmer condensers located on the side of the variable condenser gang. The oscillator is kept in exact step with the R.F. circuit by the special shape of the stator plates in the oscillator tuning section.

Both windings of the I.F. transformers are tuned. The I.F. trimmers are mounted in their respective I.F. coil cans, and are reached through holes in the top of each I.F. coil can.

EQUIPMENT and PRELIMINARY STEPS: A good modulated oscillator, an output meter, an isolation or a coupling transformer and a loop antenna are essential for the proper alignment. The attenuator on the oscillator must be capable of reducing the signal to a low value because the A.V.C. will function if the signal is too strong and thus make correct alignment impossible. The output meter must be sensitive enough to give a satisfactory reading with a small signal. An isolation or a coupling transformer must be used when an AC-DC radio is to be aligned. The loop antenna can be made by winding five to ten turns of insulated wire on a three or four inch form and closely coupled to the loop antenna of the receiver.

The output meter should be connected across the speaker voice coil or connected from the plate of the 50L6GT to ground or chassis through a 0.25 mfd. condenser, depending upon the type of output meter used.

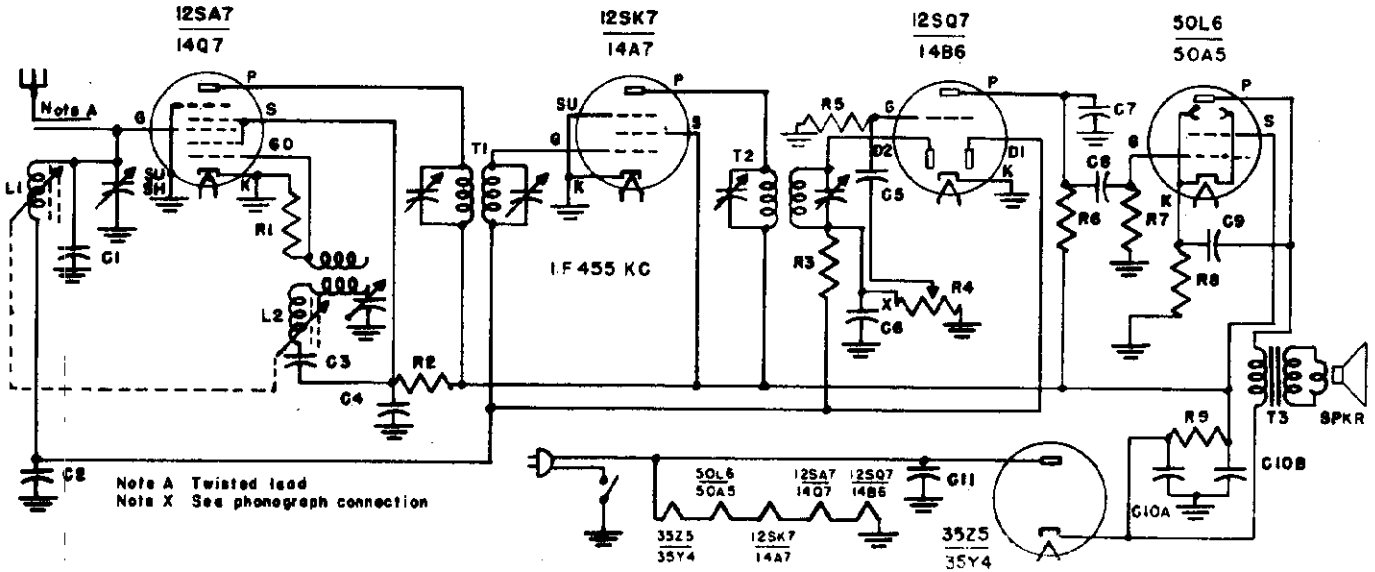
All alignment adjustments must be made with the volume control full on, but with no broadcast signal being received.

I.F. ALIGNMENT: The step-by-step routine given below should be carefully followed after reading the preceding instructions:

1. The modulated oscillator must be tuned to 455 K.C.
2. Connect the high side of the oscillator output to the lug on the R.F. section of the gang condenser. The low side of the oscillator is connected to the chassis through a .01 condenser.
3. Set the gang condenser of the radio to 1720 on the dial and turn the volume control on full.
4. Adjust the four I.F. trimmers tuning each carefully to get the maximum deflection of the output meter. Reduce the oscillator output if the output meter goes off scale.
5. Repeat all four adjustments since the adjustment of each I.F. trimmer may effect the others to a certain extent.

R.F. AND OSCILLATOR ALIGNMENT:

1. Connect the oscillator output to the external loop antenna and closely couple to the loop antenna of the receiver.
2. Set the generator at 1720 KC and turn the gang condenser to 1720 on the dial. Adjust the oscillator trimmer for maximum output.
3. Set the generator at 1400 KC and turn the gang condenser to 1400 on the dial. Adjust the R.F. trimmer for maximum output while rocking the gang.
4. Set the generator at 600 KC and turn the gang to 600 KC on the dial and check for tracking.



IF PEAK 455 KC

ALIGNMENT

PRELIMINARY: Before attempting to align the RC-5C5-P chassis, the service man should become familiar with the general layout of the chassis, with the function and location of the various trimmers. The following discussion briefly explains the action of each alignment step.

R.F. alignment and calibration are accomplished by the two trimmers mounted on top of the permeability tuner assembly. Facing the dial of the chassis, the r.f. trimmer is to the left and the oscillator trimmer to the right.

I.F. The i.f. trimmers are mounted in their respective i.f. coil cans and are reached through holes in the top of each i.f. coil can.

EQUIPMENT and PRELIMINARY STEPS: A good modulated oscillator, an output meter and an isolation transformer are essential for the proper alignment. The attenuator on the oscillator must be capable of reducing the signal to a low value because the a.v.c. will function if the signal is too strong and thus make correct alignment impossible. The output meter must be sensitive enough to give a satisfactory reading with a small signal. An isolation transformer must be used when aligning an AC-DC radio chassis.

The output meter may be connected across the voice coil of the speaker or one lead of the output meter may be connected to the plate of the output tube and the other lead of the meter to one side of a 0.25 mfd. condenser which is then connected to the chassis, depending upon the type of output meter used.

All alignment adjustments must be made with the volume control full on, but with no broadcast signal being received.

I.F. ALIGNMENT: The step-by-step routine given below should be carefully followed after reading the preceding instructions.

1. The signal generator must be set at 455 kilocycles.
2. Connect the output meter so that the output can be determined.
3. Connect the high side of the signal generator output to the antenna lead of the tuner, the white wire. The low side of the signal generator output lead is connected to the chassis through a 0.01 mfd. condenser.
4. Turn the volume control on full and turn the dial drive shaft so that the slugs of the tuner unit are all the way out against the stop.
5. Adjust the four I.F. trimmers, tuning each carefully to get the maximum deflection of the output meter. Reduce the signal generator output if the output meter goes off scale.
6. Repeat all four adjustments since the adjustment of each I.F. trimmer may effect the others to a certain extent.

OSCILLATOR and R.F. ALIGNMENT:

1. Connect the high side of the signal generator output to the insulation covering of the antenna wire and not the wire itself.
2. Set the signal generator to 1680 kilocycles with the slugs of the tuner all the way out against the stop. Adjust the oscillator trimmer, right hand trimmer screw, for maximum reading on the output meter.
3. Set the signal generator at 1120 kilocycles and turn the dial drive shaft until the 1120 kilocycle note is heard. Adjust the R.F. trimmer, left hand trimmer, for maximum reading on the output meter. Set the dial pointer on 1120 kilocycles on the dial scale. By aligning the R.F. section at 1120 kilocycles the overall alignment will be very good.

MODELS RC-5C5-CL,
RC-5C5-DL

JOHN MECK INDUSTRIES

The Meck Trail Blazer Chassis RC-5C5-CL and RC-5C5-DL are five tube superheterodyne receivers. The RC-5C5-CL covers the broadcast band from 545 to 1520 kilocycles and the RC-5C5-DL covers the broadcast band from 535 to 1720 kilocycles. A loop antenna is incorporated in the top of the cabinet. The red and black wires extending from the back of the cabinet are used when an external antenna and ground are used. The external antenna is connected to the red wire and the ground to the black wire. DO NOT CONNECT A GROUND WIRE TO THE METAL CHASSIS.

The circuit employs automatic volume control (A.V.C.) through the action of the type 1486 tube. These models are designed to operate on 110 to 120 volts AC-DC. In operation; the incoming signal is first passed to the tuned first detector circuit and then beats with the oscillator output to produce a 455 kilocycle intermediate frequency signal.

The intermediate frequency signal is amplified in an exceptionally high gain stage, and is then rectified by the diodes of the type 1486 tube. Detection is accomplished by the diode directly connected to the output intermediate frequency transformer. A modulated direct current voltage drop is produced across the one megohm potentiometer by the rectified current. The volume is controlled by selecting any desired portion of the audio frequency voltage with the moving arm of the potentiometer which is connected to the grid of the type 1486 tube. The triode section of this tube acts as an audio amplifier and is resistance coupled to the 50A5 output tube.

PRELIMINARY: Before attempting to align a radio set, the service man should become familiar with the general layout of the chassis and with the function and location of the various trimmer condensers. The following discussion briefly explains the action of each alignment step.

R.F. alignment and calibration are accomplished by the two trimmer condensers located on the side of the variable condenser gang. The oscillator is kept in exact step with the R.F. circuit by the special shape of the stator plates in the oscillator tuning section.

Both windings of the I.F. transformers are tuned. The I.F. trimmers are mounted in their respective I.F. coil cans, and are reached through holes in the top of each I.F. coil can.

EQUIPMENT and PRELIMINARY STEPS: A good modulated oscillator, an output meter, an isolation or a coupling transformer and a loop antenna are essential for the proper alignment. The attenuator on the oscillator must be capable of reducing the signal to a low value because the A.V.C. will function if the signal is too strong and thus make correct alignment impossible. The output meter must be sensitive enough to give a satisfactory reading with a small signal. An isolation or a coupling transformer must be used when an AC-DC radio is to be aligned. The loop antenna can be made by winding five to ten turns of insulated wire on a three or four inch form and closely coupled to the loop antenna of the receiver.

The output meter should be connected across the speaker voice coil or connected from the plate of the 50A5 to ground or chassis through a 0.25 mfd. condenser, depending upon the type of output meter used.

All alignment adjustments must be made with the volume control full on, but with no broadcast signal being received.

I.F. ALIGNMENT: The step-by-step routine given below should be carefully followed after reading the preceding instructions:

1. The modulated oscillator must be tuned to 455 K.C.
2. Connect the high side of the oscillator output to the lug on the R.F. section of the gang condenser. The low side of the oscillator is connected to the chassis through a .01 condenser.
3. Set the gang condenser of the radio to the low end of the dial and turn the volume control on full.
4. Adjust the four I.F. trimmers tuning each carefully to get the maximum deflection of the output meter. Reduce the oscillator output if the output meter goes off scale.
5. Repeat all four adjustments since the adjustment of each I.F. trimmer may effect the others to a certain extent.

R.F. AND OSCILLATOR ALIGNMENT:

1. Connect the oscillator output to the external loop antenna and closely couple to the loop antenna of the receiver.
2. Set the generator at 1500 KC and turn the gang condenser to 1500 on the dial. Adjust the oscillator trimmer for maximum output.
3. Set the generator at 1400 KC and turn the gang condenser to 1400 on the dial. Adjust the R.F. trimmer for maximum output while rocking the gang.
4. Set the generator at 600 KC and turn the gang to 600 KC on the dial and check for tracking.

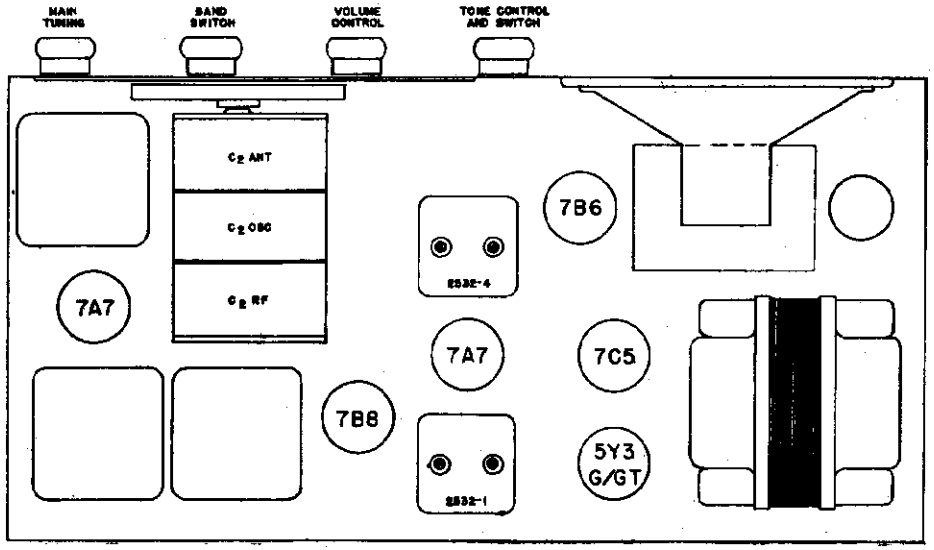
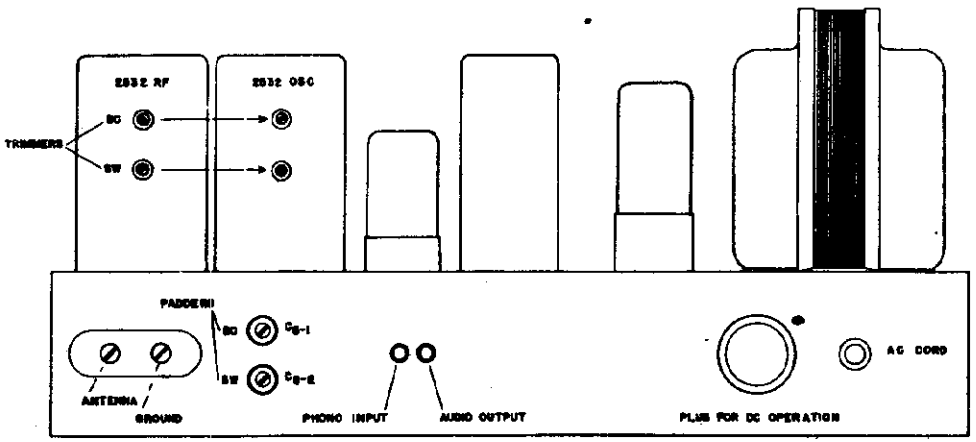
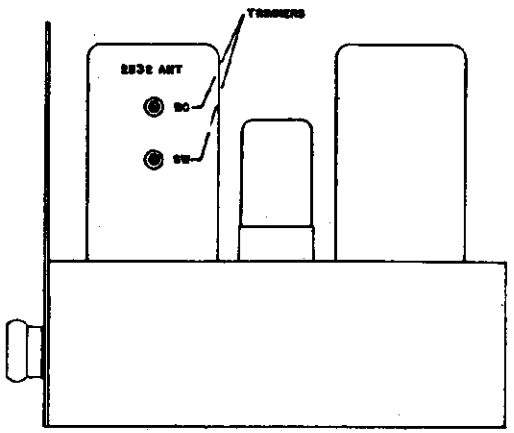
BATTERY OPERATION

The HE-621 is intended to be supplied from a 115 volt 50 to 60 cycle A.C. source but if desired the jumper wires of the plug located next to the A.C. cord on the rear apron of the chassis may be removed and the plug wired as indicated on the diagram to allow operation from batteries or a battery pack.







MEGARD CORP.

INTERMEDIATE FREQUENCY ALIGNMENT

Prepare the receiver as follows:
Remove the antenna completely.
Band switch on "BC" or middle position.
Set dial to a point near the high frequency or 1500 Kc. end where no station is received.
Turn tone and volume controls to maximum clockwise rotation

Connect a signal generator to the stator connection of the tuning condenser section C2 RF or to the RF input grid (socket connection #6) of the 7B8 tube. If there is no blocking condenser in the output lead of the signal generator, the lead should be connected through a .1 Mfd. condenser instead of directly. Connect the ground of the signal generator to the chassis of the receiver or to the terminal on the antenna ground strip marked "G".

After the above connections have been made, set the signal generator for 455 Kc. 30% modulated signal output.

Now adjust the condensers on IF transformers 2532-1 and 2532-4 for exact resonance which will be indicated by maximum signal output. An output meter of the rectifier type should be used and may be connected through a suitable coupling condenser to the plate (socket connection #2) of the 7C5 output tube or to the voice coil leads of the speaker. When making the final adjustments to the IF tuning condensers, it is advisable to use as low an input signal level as possible.

RADIO FREQUENCY ALIGNMENT

Replace the .1 Mfd. condenser in series with the generator lead with a 400 ohm resistor. Connect the generator to the terminal marked "A" on the antenna-ground strip which is mounted on the rear apron of the chassis. All trimmer adjustments are for the high frequency ends of the bands and are located in the sides of the coil shield cans. The Broadcast band trimmer is the uppermost one in each case. All padder adjustments are for the low frequency ends of the bands and are located on the rear apron of the chassis. The padder for the Broadcast band is the uppermost one.

BROADCAST BAND.

Place band switch in the middle or BC position. Set generator to 1400 Kc. and adjust the oscillator trimmer to receive the signal at the proper calibration on the receiver dial. Adjust the "BC" RF and ANT trimmers for maximum signal. Re-set generator and receiver to 600 Kc. and adjust padder condenser C8-1 for proper calibration or maximum signal. If it should prove necessary to change the adjustment of padder C8-1 to any appreciable extent, it may also be necessary to re-adjust the oscillator trimmer condenser for exact calibration at the high frequency end of the band.

SHORT WAVE BROADCAST BAND.

Place band switch in the clockwise or "SW" position. Set generator and receiver dial to 15 Mc. and adjust oscillator trimmer for proper calibration. (More than one signal may be heard as the trimmer condenser is rotated. At least two major signals will be observed. The proper signal will be the one tuned nearest maximum anti-clockwise rotation of the trimmer condenser.) Re-set receiver and signal generator to approximately 13 Mc. and adjust "SW" RF and ANT trimmers for maximum signal. (Again more than one position of the trimmers may result in maximum signal. The one nearest maximum clockwise rotation is the correct one.) Re-set signal generator to 6 Mc. and adjust padder condenser C8-2 for maximum signal.

ANTENNA

The receiver should be used with as short an antenna as may be practical under the particular conditions of use. An antenna length of 6 to 15 feet is recommended for average conditions.

PHONO OR TUNER

To use the HE-621 receiver as a tuner to feed a public address amplifier etc., output may be obtained from the jack farthest from the antenna-ground strip on the rear apron of the receiver. An amplifier of high impedance input should be used.

To use the HE-621 as an amplifier for use with a record player turntable and pickup, the output of the pickup (which should be of the high impedance type) may be plugged into the jack nearest the antenna-ground strip on the rear apron of the chassis. The band change switch should be turned to its extreme counterclockwise or "PHONO" position

Speaker - - - - - - - - - 8" P-M Dynamic

Tuning Frequency Range - - - - 42 to 50 Megacycles

Sensitivity - - - - - - - - 10 Microvolts Average

ALIGNMENT

If distortion, weak reception or other type of unsatisfactory performance is thought to be due to improper alignment, do not attempt to align the I-F or R-F system. Because of the wide band accepted by the I-F system and the lack of suitable generators and test equipment required to do a satisfactory job, it is recommended that the chassis be sent to one of the main Montgomery Ward Service Shops.

VOLTAGES AT SOCKETS

The voltages that should be considered normal at each tube socket terminal are indicated in the table at the bottom of the schematic circuit diagram. All voltages indicated are measured between the socket terminal and ground (chassis). Readings shown are positive on the socket terminal with the chassis as the negative terminal except where a negative voltage reading is given in which case the chassis is positive. Readings marked "AC" indicate normal AC heater voltage and should not be read with a DC meter.

These voltages are read under the following conditions:

Line Voltage—117 volts
Volume Control—Maximum
No Signal Being Received

Readings are taken with a 1000-ohm-per-volt meter. Plate and screen voltages are read on the 500-volt scale. All readings under 50 volts are read on the 50-volt scale.

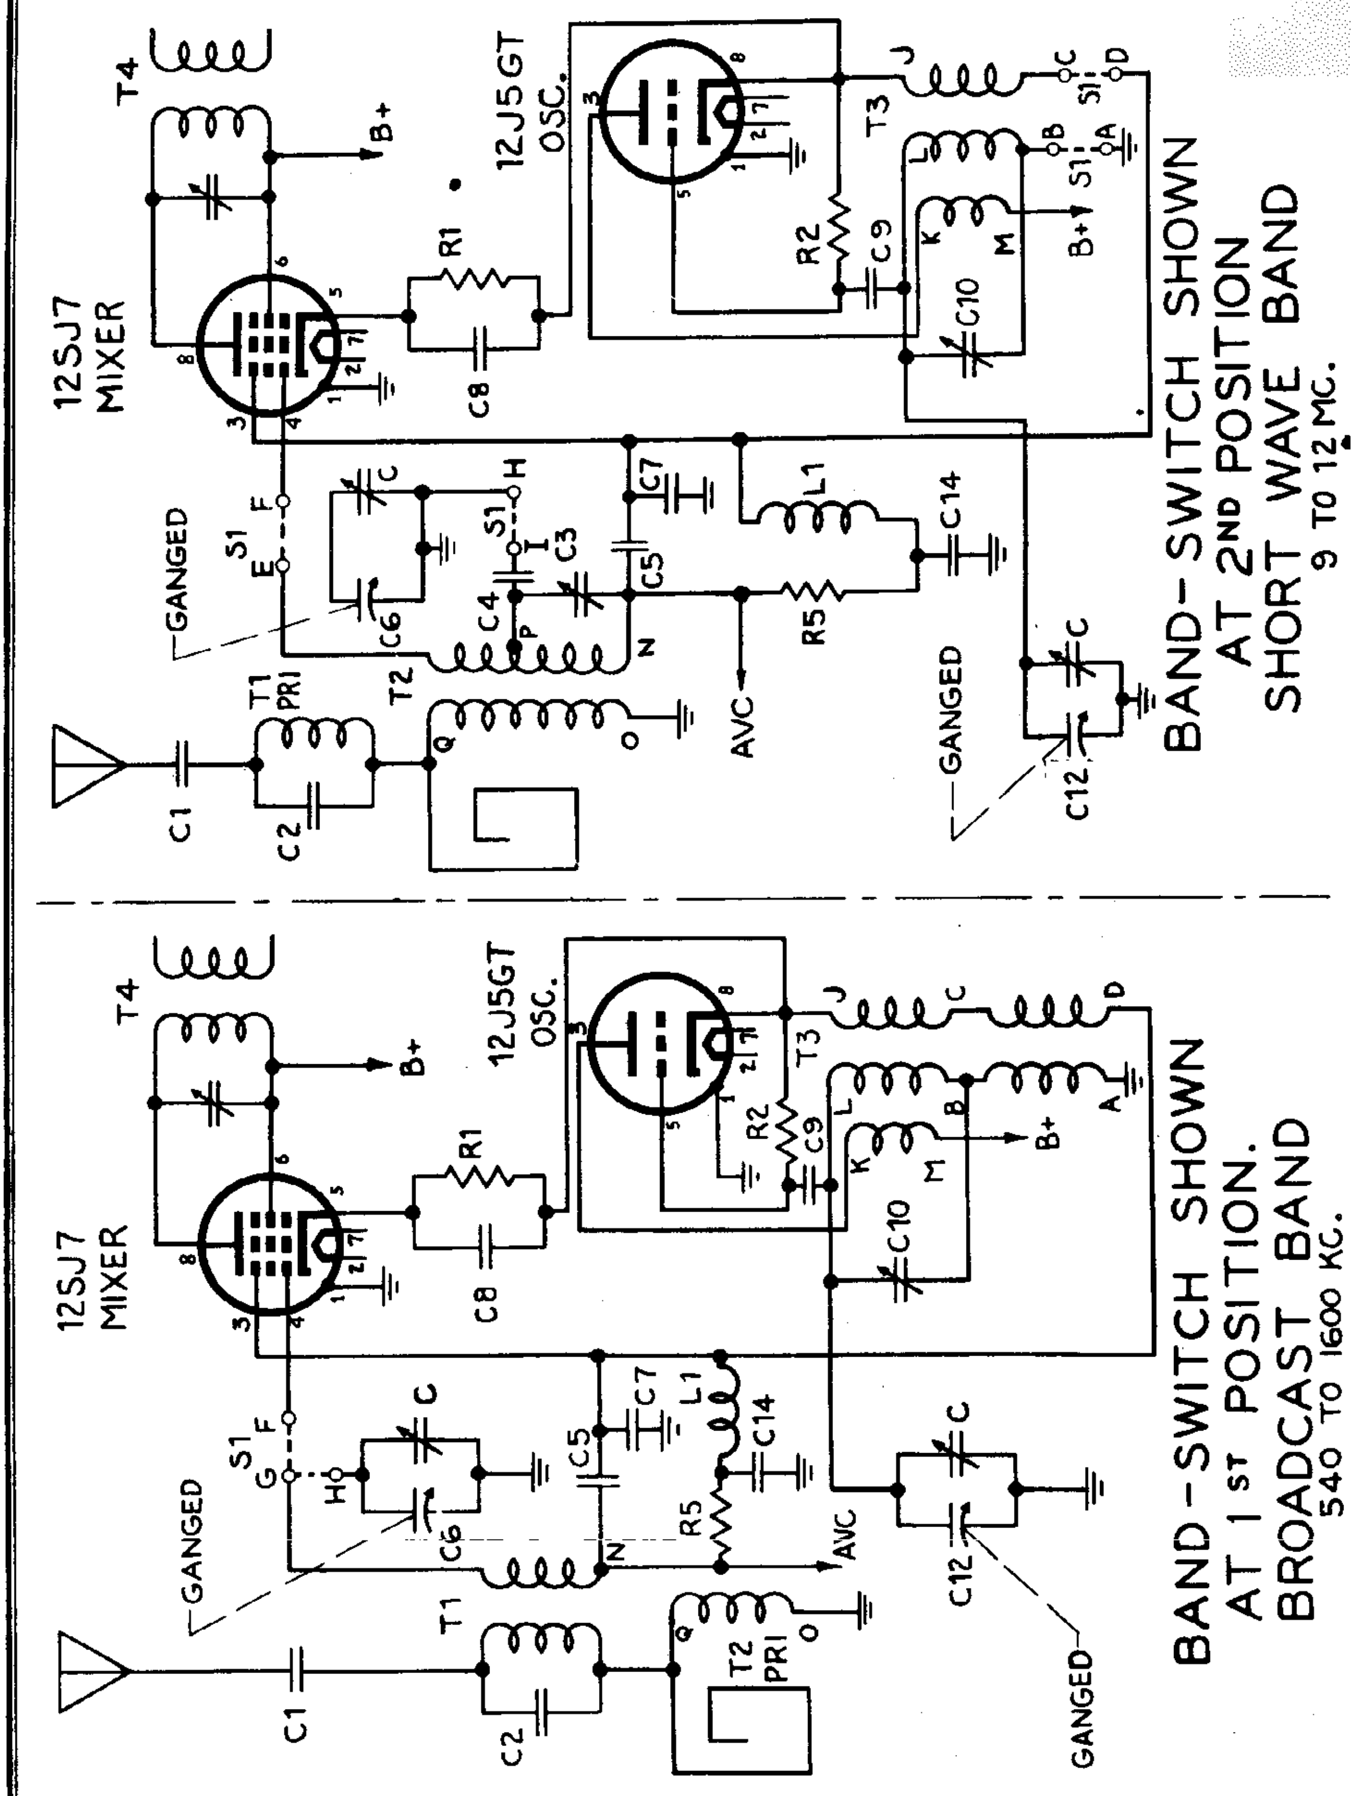
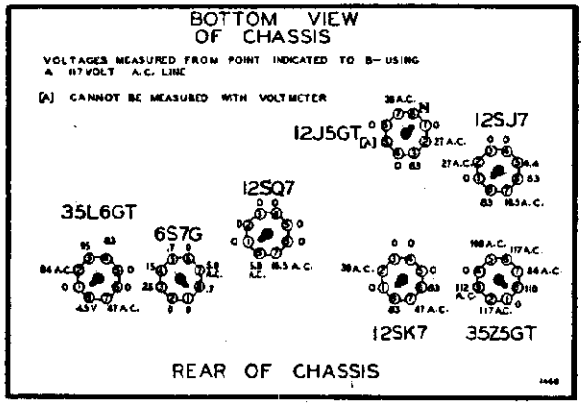
NOTICE—There is a model number label on the chassis. This model number identifies the radio as to year, manufacturer, chassis and issue number or letter. When ordering parts or writing, be sure to mention the complete model number.

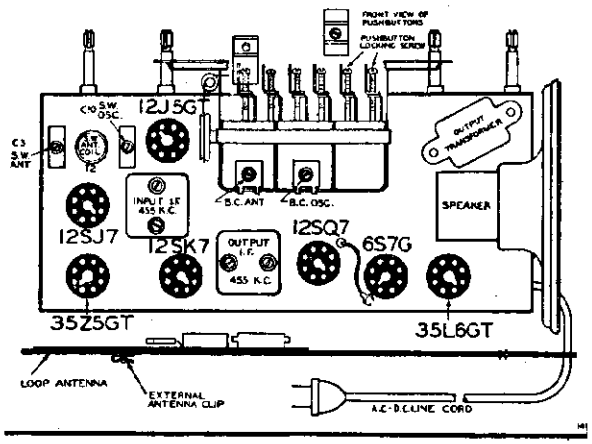
PRICES SUBJECT TO CHANGE WITHOUT NOTICE

MONTGOMERY WARD





Voltage Chart



Chassis View, showing Tube Location and the Outside Antenna Clip.

SETTING THE PUSHBUTTONS

Make a list of your 6 favorite stations—push out the call letters of these stations from the call letter sheets supplied. Next insert a long slim screw driver into the hole in front of one of the pushbuttons and unscrew the pushbutton locking screw (to the left) several turns. Now with the screw driver still engaged in the locking screw slot push it all the way in. Hold it in this position and tune in the station you want with the tuning knob. Now tighten up the pushbutton locking screw by turning it to the right. Tighten firmly. Continue setting each button in the same way. When you have set your stations insert the call letter of each station in the front of the proper button and put one of the celluloid tabs over the station call letter.

To change stations simply repeat the above procedure.

If you are unable to set a station on any particular button it is probably because the pushbutton locking screw has not been fully unloosened (turned to the left).

ALIGNMENT PROCEDURE

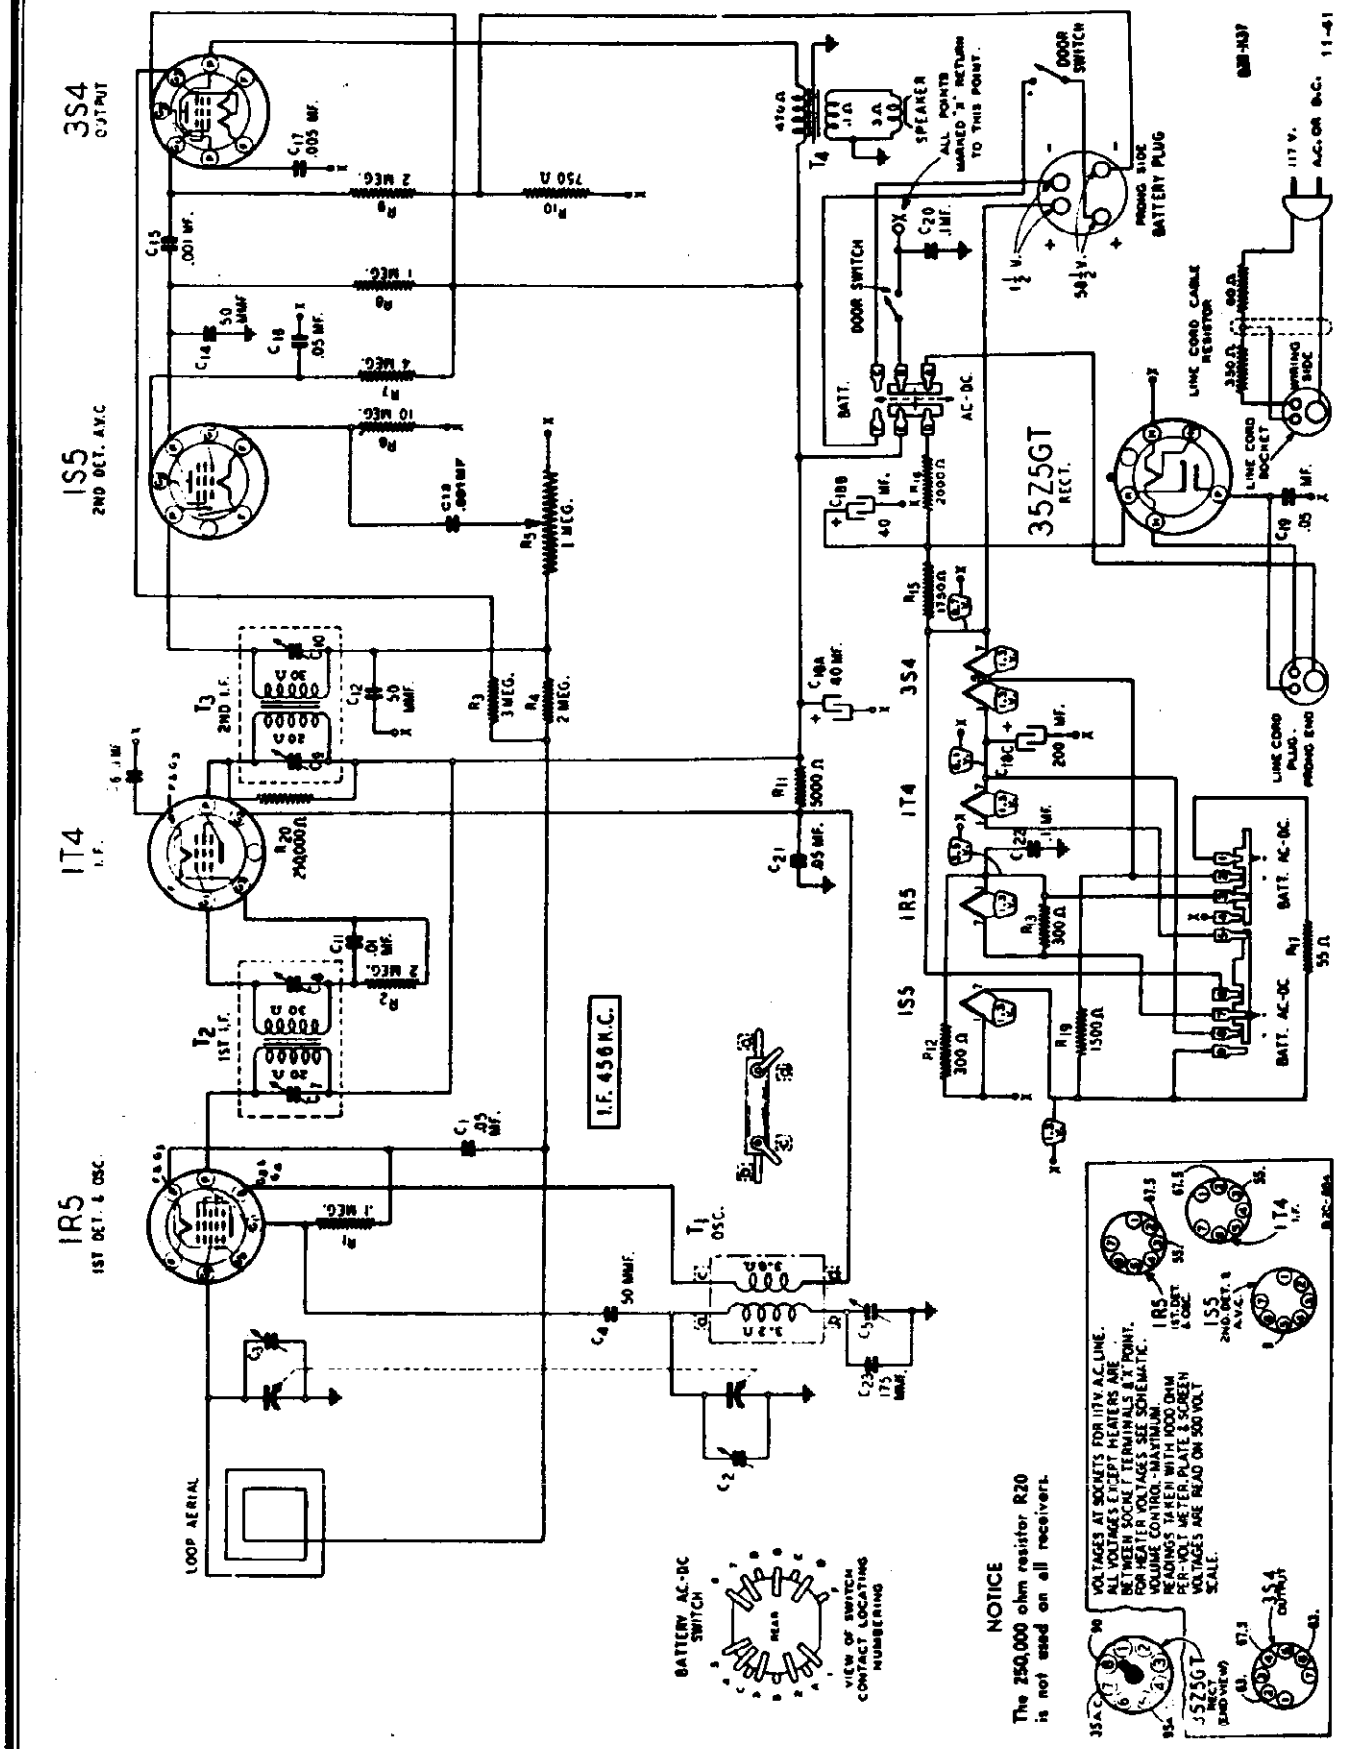
- Volume control—Maximum all adjustments.
- Connect B—of radio chassis to ground post of signal generator through .1 Mfd. condenser.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Position of Band Switch	Variable Condenser Setting	Trimmers Adjusted to Maximum
I. F.	455 Kc.	.1 MFD.	Grid of 12SK7 I. F.	Broadcast	Rotor full open (Plates out of mesh)	Two trimmers on top of Output I. F.
	455 Kc.	.1 MFD.	Grid of 12SJ7 Mixer	Broadcast	Rotor full open (Plates out of mesh)	Two trimmers on top of Input I. F.
SHORT WAVE BAND	12 Mc.	400 Ohms	External Antenna and B—	Short Wave	Set Dial at 12 Mc.	S.W. Osc. trimmer C10 S.W. Ant. trimmer C3
BROAD-CAST BAND	1600 Kc.	.1 mmf.	Grid of 12SJ7	Broadcast	Rotor full open (Plates out of mesh)	B.C. Osc. trimmer C12 on Gang
	1400 Kc.	200 mmf.	External Antenna and B—	Broadcast	Set Dial at 1400 K. C.	B.C. Ant. trimmer C6

NOTE: The Oscillator Frequency is lower than the signal frequency and should be aligned accordingly.

The loop antenna should be connected to the radio when making all adjustments.

MONTGOMERY WARD



MODEL 14WG-538B

MONTGOMERY WARD

SPECIFICATIONS

Input Voltages and Currents—Battery Operation

"A" Battery - - - - - 1½ Volts—.25 Amp.

"B" Battery - - - - 88½ Volts—6. Ma.

Power Consumption - - - - - - 30 Watts (At 117 Volts AC Supply)

Power Output

Battery Operation - 85 Mw. Undistorted 110 Mw. Maximum

AC Operation - - 80 Mw. Undistorted 170 Mw. Maximum

Selectivity - 40 KC Broad at 1000 Times Signal

Intermediate Frequency - - - - - 456 KC

Speaker - - - - - - - - 4" P.M. Dynamic

Tuning Frequency Range - 535 to 1610 KC

Sensitivity - 400 Microvolts per Meter Average (For .05 Watt Output)

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.

Allow Chassis and Signal Generator to "Heat Up" for several minutes.

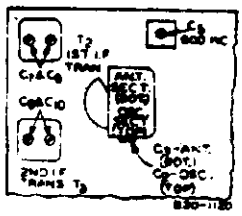
The following equipment is required for aligning:

A Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.

Output Indicating Meter—Non-Metallic Screwdriver.

Use Loop for All Adjustments—See Note "A"

Signal Gen. FREQUENCY SETTING	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM (See Trimmer Illustration)
456 KC	Turn Rotor to Full Open	1st I.F. (C7) & (C8) 2nd I.F. (C9) & (C10)
1610 KC	Turn Rotor to Full Open	Oscillator (C2)
1500 KC	Turn Rotor to Max. Output Set Knob to 1500 KC	Antenna (C3)
600 KC	Turn Rotor to Max. Output	600 KC (C6) Rock Rotor—See Note B
1500 KC	Turn Rotor to Max. Output	Antenna (C3)



NOTE A—Connect a loop approximately one foot in diameter across the antenna and ground posts of the signal generator. Place radio approximately 2 feet (6" for I.F. adjustment) from loop.

NOTE B—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

To replace the 35Z5GT rectifier tube, pull line cord plug out of case. Carefully pry off the 2 control knobs. Remove screw on the front panel above tuning knob at side of on-off switch plunger. Then take out the 3 chassis screws (shown in illustration) with a ¼ inch socket wrench. Carefully lift chassis, tilting it at the same time, as far as connecting wires permit. Insert a screwdriver between rectifier tube and socket and pry tube out of socket.

CONDENSER UNIT C16A, C16B, C16C IS REPLACED BY NEW UNIT HAVING CAPACITIES 50 MF., 40 MF., AND 20 MF. RESPECTIVELY—SEE PARTS LIST.

MODELS 14WG-610B, 14WG-611B

MONTGOMERY WARD

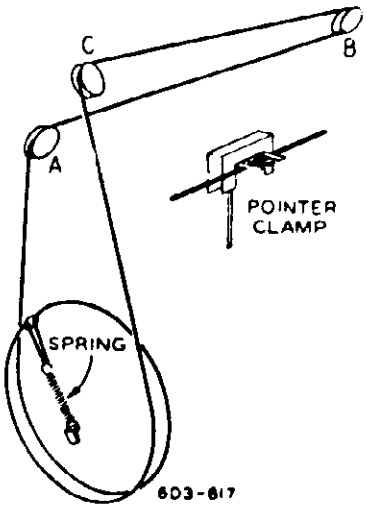
DRIVE CORD REPLACEMENT

Knot both ends of new drive cord to same loop on tension spring. The doubled drive cord should measure 16¼ inches. Turn gang condenser to full open position—See illustration.

Thread looped end of drive cord up through hole in rim of drive pulley. Pull spring flush against inside of rim. Wind right hand portion of drive cord (from drive pulley side of chassis) one turn clockwise around drive pulley. This turn should be on right side of pulley groove (from back of chassis).

Continue cord over pulleys A, B, and C as shown. Loop remaining portion of cord counter-clockwise (from spring) (drive pulley side of chassis) around drive pulley. Secure spring to hook on drive pulley—See illustration.

Calibration — Tune in a signal of known frequency. Set pointer at this frequency mark on the dial scale. Fasten pointer to drive cord —See illustration.



Power Consumption - 28 Watts (At 117 volts AC Supply)
Power Output - - - - - - - .8 Watt Undistorted
Selectivity - - 50 KC Broad at 1000 times Signal
Intermediate Frequency - - - - - - - - 456 KC

Speaker - - - - - - - - - 5" Electro Dynamic
Tuning Frequency Range - - - 528 to 1600 KC
Sensitivity (For .05 Watt Output)
External Antenna - - - - - 10 Microvolts Average

CAUTION

The metal chassis is connected to one side of the line through a .2 mfd. condenser. Both AC and DC power lines are generally grounded on one side. If the side of the line not connected to the metal chassis through this condenser is grounded and the metal chassis comes in contact with an external ground, this condenser will be connected across the line and there will be an increase in hum.

Therefore, in any service work on the chassis, keep it on a wood or other insulated surface to avoid contacts with ground. The person working on the set should avoid getting in contact with any ground.

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.

Allow Chassis and Signal Generator to "Heat Up" for several Minutes.

The equipment in column at right is required for aligning:

Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.

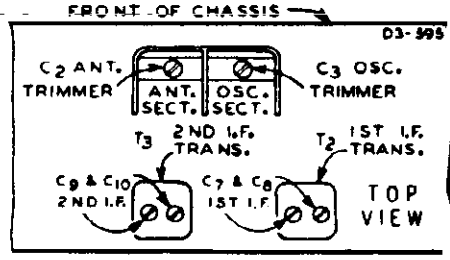
Output Indicating Meter; Non-Metallic Screwdriver.

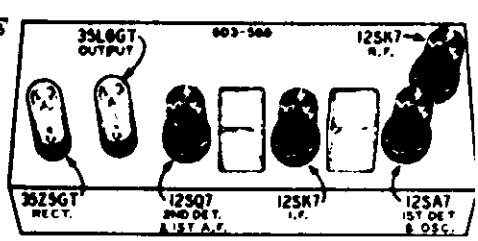
Dummy Antennas—.1 mf., 100 mmf.

SIGNAL GENERATOR					
FREQUENCY SETTING	ANTENNA CONNECTION	GROUND CONNECTION	DUMMY ANTENNA	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM (See Trimmer Illustration)
456 KC	Control Grid 12SK7—I.F.	Point "X" (12SK7—R.F. Prong No. 3)	.1 mf.	Turn Rotor to full open	2nd I.F. (C9) & (C10)
456 KC	Control Grid 12SA7—1st Det.	Same As Above	.1 mf.	Turn Rotor to full open	1st I.F. (C7) & (C8)
1600 KC	Control Grid 12SA7—1st Det.	Same As Above	.1 mf.	Turn Rotor to full open	Oscillator (C3)
1500 KC	External Antenna Clip On Loop —See Note A	External Ground Clip On Loop	100 mmf.	Turn Rotor to Max. Output Set Indicator to 1500 KC— See Note B	Antenna (C2)

NOTE A—By means of wooden blocks, stand the loop aerial assembly upright exactly 1¼ inches from the back of the chassis.

NOTE B—If the pointer is not at 1500 KC on the dial, tune in a 1500 KC signal. Set pointer at the 1500 KC mark on the dial scale.





PROCEDURE FOR SETTING THE STATION BUTTONS

SELECTING THE STATIONS TO BE SET

There are 6 buttons on the automatic tuning dial by means of which 6 stations may be set for quick tuning.

Make a list of your favorite stations, those which you tune in regularly. There may be any number up to and including 6 in this list.

It is better to list the station with the lowest kilocycle number first, the station with the next higher kilocycle number next, and so on.

Any button may be used for any station you can receive, although it will be more convenient to set the stations so that the kilocycle numbers increase from left to right.

SETTING A STATION BUTTON

Pull the button at the left off the shaft. When this is done, the locking screw shaft will be exposed.

Insert a screwdriver in the slot of the locking screw and depress it by pressing in with the screwdriver. Loosen the locking screw by turning 3 or 4 turns in a counter-clockwise direction. Continue to press in firmly on the screwdriver, thus holding the locking screw shaft depressed. Select the first station from the list you have prepared and carefully tune in this station by means of the manual tuning control until the station is clearest and strongest.

Continue to press in firmly on the screwdriver and lock the mechanism by turning the locking screw in a clockwise direction. Tighten firmly but not excessively. The station is now set on this button.

Proceed in the same manner to set stations on any of the remaining buttons.

Remove the correct station call letter tab from the sheets supplied by bending the sheet back and forth at the score mark until the tab can be broken off. Press this tab all the way to the bottom of the space provided in the button. Cover the call letter tab with a celluloid tab, pressing this in until it snaps into place.

Replace the button on its shaft with the lip at the bottom and the button placed so that the call letters are straight up and down.

If at any time you wish to change the setting of a button from one station to another, repeat the above procedure. Changing the setting of one button will not affect the setting of any of the other buttons.

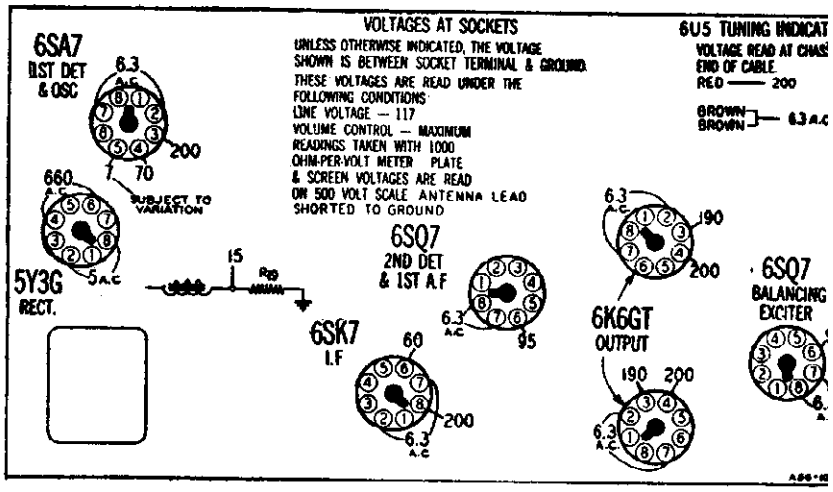
DRIVE CORD REPLACEMENT

Turn gang condenser to full closed position. Using a new drive cord 42 inches in length, tie one end to tension spring. Fasten other end of tension spring to hook on drive pulley. Pass drive cord through slot in drive pulley rim. Continue cord ½ turn counter-clockwise (from gang end of chassis) around drive pulley—See illustration. Wind 2½ turns, counter-clockwise (from rear of chassis), around wooden spool on tuning shaft. Turns should progress toward the rear of chassis.

Pass cord through wire string guide and around pulleys A, B, and C as shown. Continue cord ½ turn, counter-clockwise (from gang end of chassis) around drive pulley and pass through slot in pulley rim. Stretch tension spring and tie drive cord to tension spring.

Power Consumption	57 Watts (at 117 volts 60 cycles) 77 Watts (Phonograph Operating)
Power Output	3.0 Watts Undistorted 4.5 Watts Maximum
Selectivity	38 KC Broad at 1000 times Signal
Intermediate Frequency	456 KC
Speaker	10" Electro-Dynamic

Band	Tuning Frequency Range	Sensitivity External Antenna (For 0.5 Watt Output)
B Range	535 to 1610 KC	15 Microvolts Aver.
19 Meter	14.6 to 15.8 MC	26 Microvolts Aver.
25 Meter	11.1 to 12.0 MC	25 Microvolts Aver.
31 Meter	9.3 to 10.05 MC	22 Microvolts Aver.



PROCEDURE FOR SETTING THE STATION BUTTONS

Make a list of your six favorite stations, those which you tune in regularly. It is better to list the station with the highest kilocycle number first, the station with the next lower kilocycle number next, and so on.

Grasp the left-hand button at the sides (depress the adjacent button) and pull it out as far as it will go. A click will be heard. If it is impossible to depress the button which is adjacent to the button you are setting, rotate the tuning knob a few turns.

Select the first station from the list you have prepared. *Carefully* tune in this station by means of the manual tuning knob until the dark sector in the tuning eye is narrowest.

Now lock the mechanism by pushing the button all the way in until it is felt to lock into place.

Proceed in the same manner to set stations on any of the remaining buttons. Any button may be used for any station you can receive, although it will be more convenient to set the stations so that the kilocycle numbers decrease from left t right.

Remove the correct station cal letter tab from the sheets supplie by bending the sheet back and fortl at the score mark until the tab ca be broken off. Press the tab all th way to the bottom of the space pro vided in the button. Cover the cal letter tab with a celluloid tab, press ing this in until it snaps into place

Changing the setting of one but ton will not affect the setting of an of the other buttons.

REPLACING BAND SPREAD COILS

It is not practicable to make field replacements of the individual antenna and oscillator coils in the Band Spread Assembly Unit.

Should one of these coils be damaged in any way, remove the Band Spread Assembly Unit (consisting of the 3 antenna and 4 oscillator coils, the right-angle mounting plate, and the band switch) from the chassis and return to the factory for replacement.

CAUTION—Two of the coils in the band spread coil assembly, the 19 Meter Antenna and Oscillator coils, have adjustable iron cores. One of the adjusting screws extends out from the front panel of the chassis base at the left of the band switch. The other adjusting screw extends up from the chassis base in front of the 1st I.F. Transformer.

DO NOT CHANGE THE POSITION OF THESE ADJUSTING SCREWS as they have been properly set at the factory and cannot be satisfactorily re-adjusted in the field.

After each range is completed, repeat the procedure as a final check.

NOTE A—If the pointer is not at 1400 KC on the dial, remove pointer from drive cord. Set pointer at the 1400 KC mark on the dial scale. Attach pointer to drive cord.

NOTE B—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

NOTE C—Reassemble chassis in cabinet.

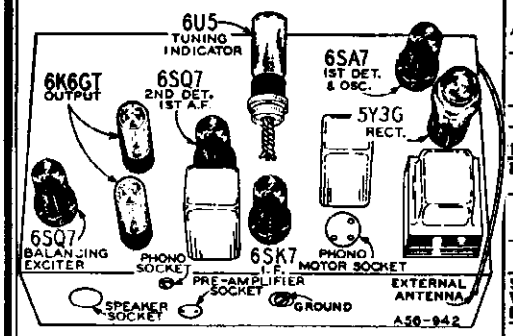
MODELS 14WG-808WA,
14WG-808MA

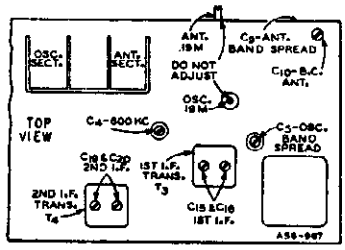
MONTGOMERY WARD

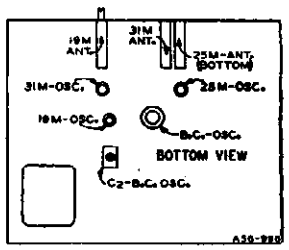
ANTENNA AND GROUND

Two built-in Air Wave Aerials are incorporated in the cabinet.

One of these, the loop aerial, is used for broadcast band reception. The other, a counterpoise foil aerial, is used for reception on the short wave band. For the reception of local or nearby stations, an outside antenna and ground are usually not required.







ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for several minutes.

The following equipment is required for aligning: An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.

Output Indicating Meter—Non-Metallic Screwdriver. Dummy Antennas—.1 mf., 100 mmf., and 400 ohms.

	SIGNAL GENERATOR FREQUENCY SETTING	CONNECTION AT RADIO	DUMMY ANTENNA	BAND SWITCH SETTING	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM
	Remove chassis from cabinet but do not disconnect leads to loop aerial.

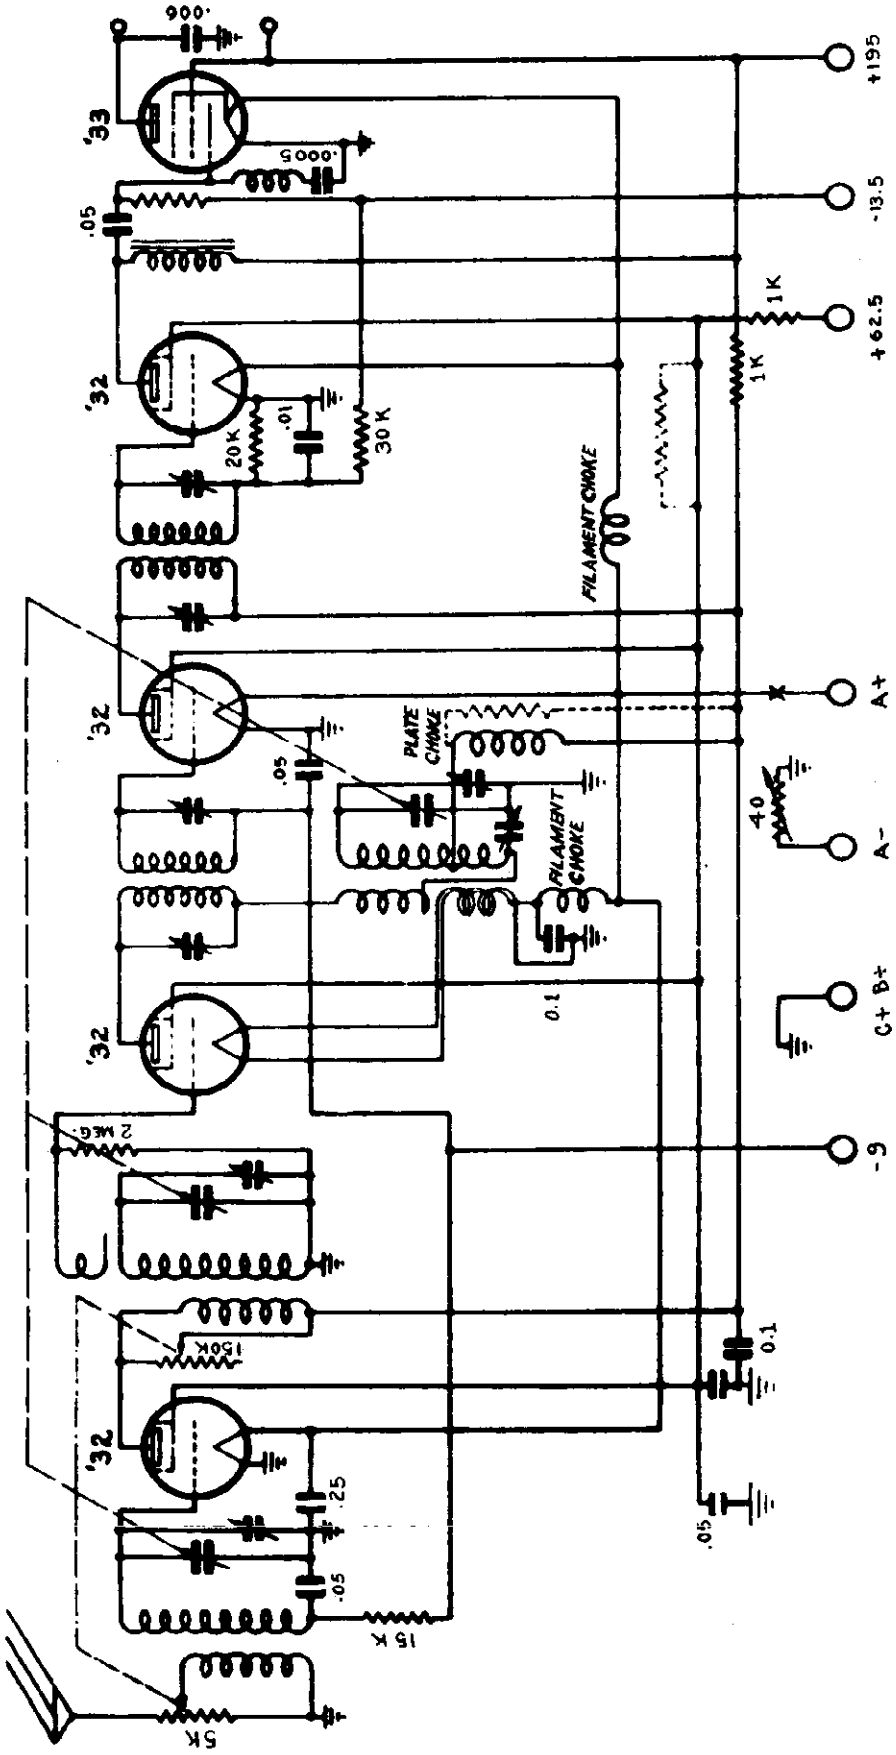
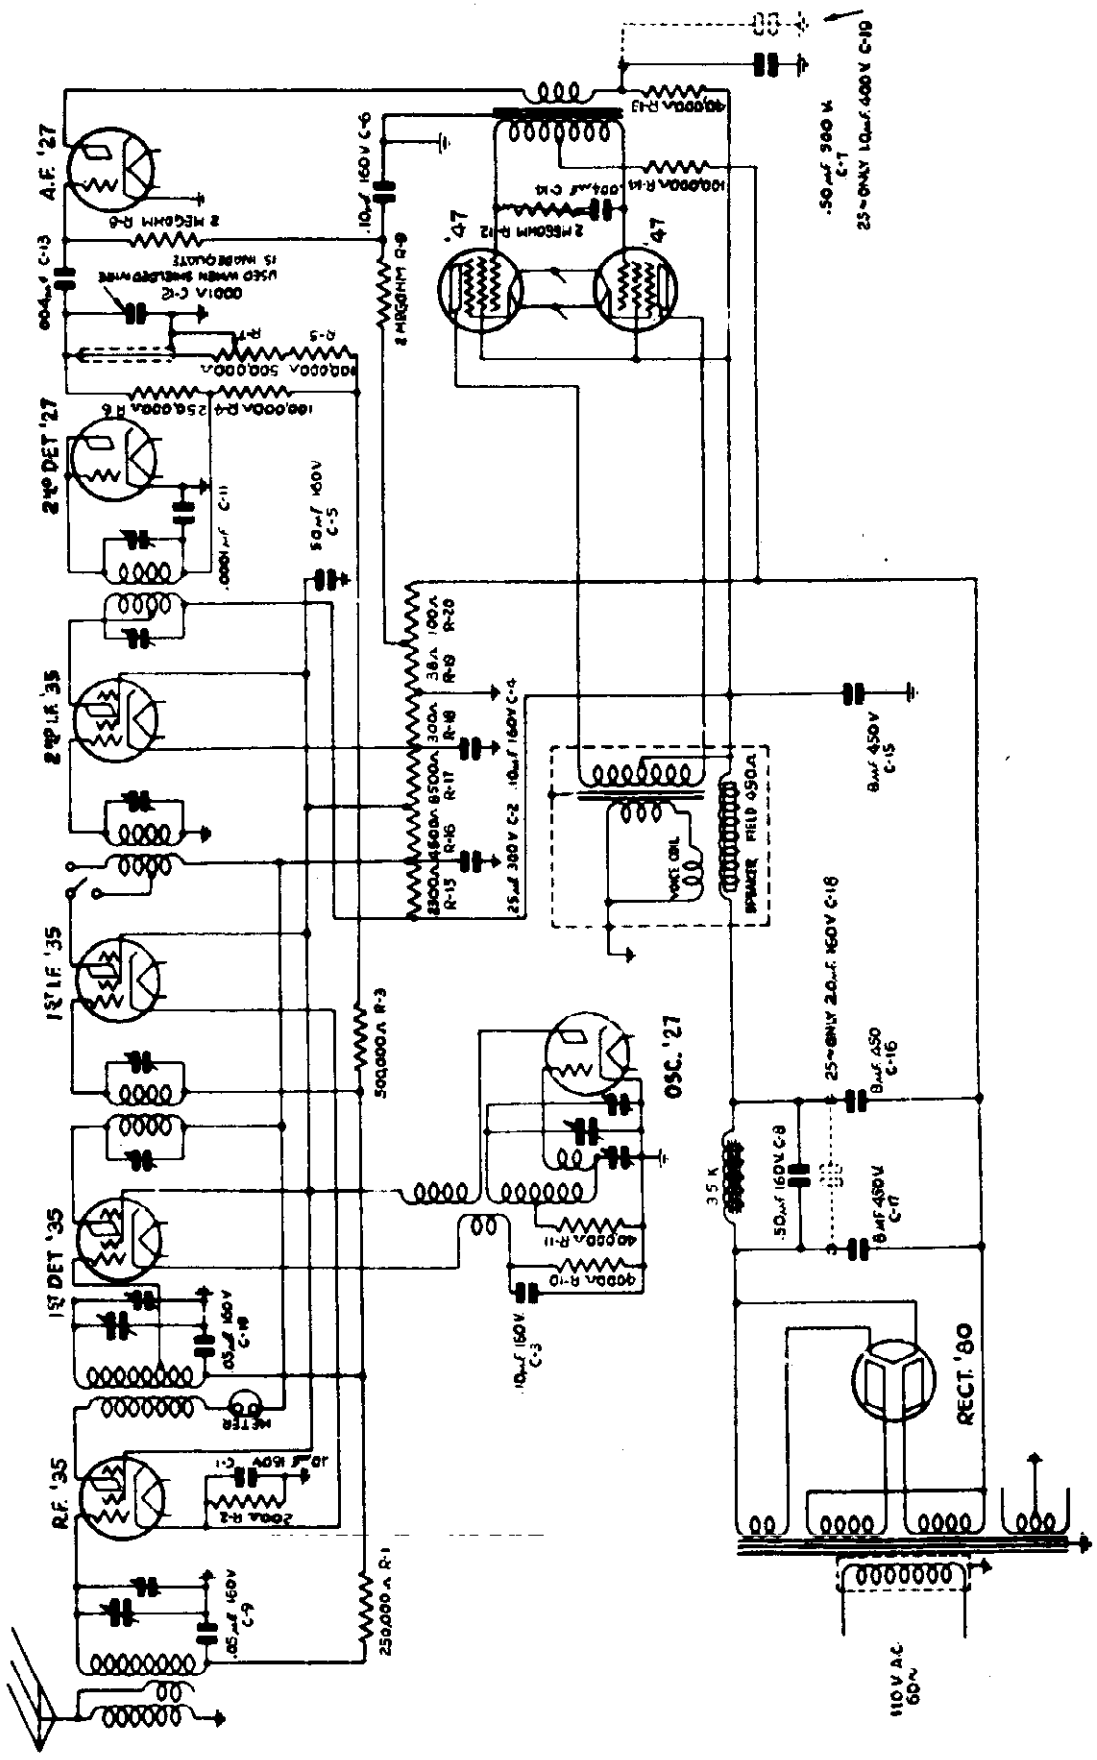
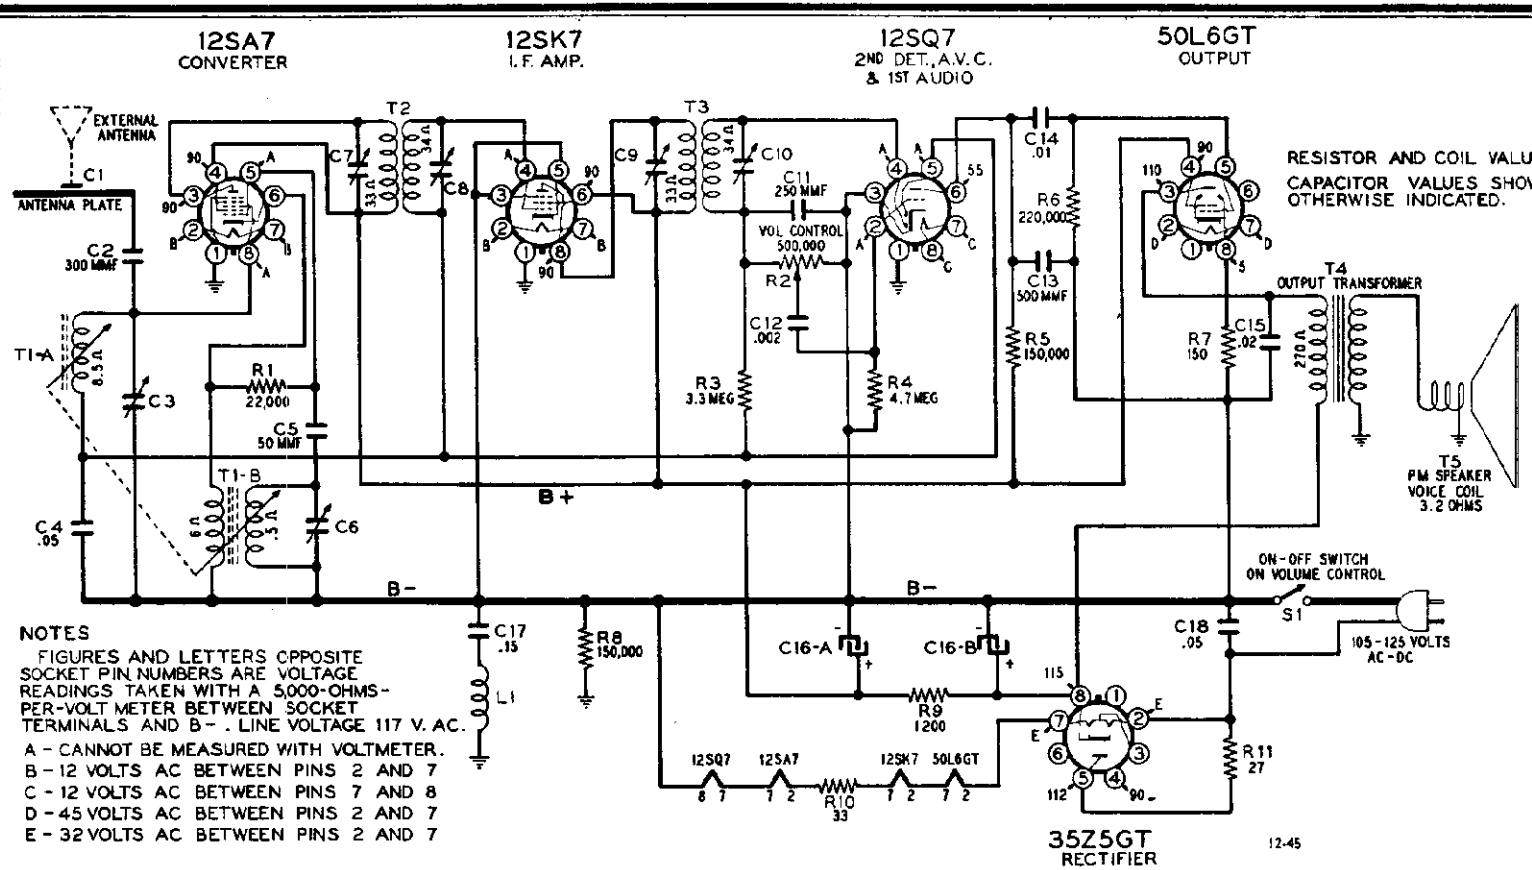
MONTGOMERY WARD



MODEL 24

MONTGOMERY WARD





RESISTOR AND COIL VALUES SHOWN IN OHMS.
CAPACITOR VALUES SHOWN IN MFD UNLESS OTHERWISE INDICATED.

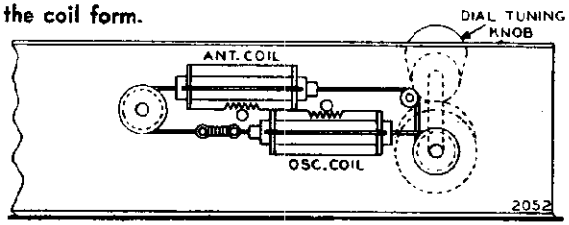
NOTES

FIGURES AND LETTERS OPPOSITE SOCKET PIN NUMBERS ARE VOLTAGE READINGS TAKEN WITH A 5,000-OHMS-PER-VOLT METER BETWEEN SOCKET TERMINALS AND B- . LINE VOLTAGE 117 V. AC.

A - CANNOT BE MEASURED WITH VOLTMETER.
B - 12 VOLTS AC BETWEEN PINS 2 AND 7
C - 12 VOLTS AC BETWEEN PINS 7 AND 8
D - 45 VOLTS AC BETWEEN PINS 2 AND 7
E - 32 VOLTS AC BETWEEN PINS 2 AND 7

ANTENNA COIL ADJUSTMENT

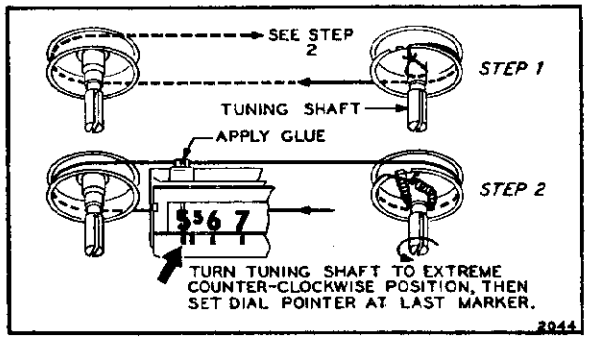
The antenna coil assembly (see illustration) is made so that it is movable left or right. When making the adjustment as required in the alignment procedure, move the coil assembly very slowly, either by hand or by pivoting one edge of the blade of a screwdriver in the hole and engaging the blade in the gear teeth of the coil form.



View of Tuning Coil Assembly

NOTES ON DRIVE CORD REPLACEMENT

1. Eighteen inches (18") of cord are required.
2. When tying the string to the tension spring (step 2), make sure that the spring takes up all slack.



ELECTRICAL SPECIFICATIONS

Power Supply	105 to 125 volts, DC or 50-60 cycle AC, 28 watts. Also made for 25-cycle AC.
Frequency Range	540 to 1720 kc.
Intermediate Freq.	455 kc.
Selectivity	At 1000 kc, 69 kc at 1000 x signal.
Sensitivity	28 microvolts average for .05 watt output.
Power Output	0.96 watts undistorted, 1.58 watts maximum.
Loud Speaker	4", P.M., v.c. impedance 3.2 ohms.

54BR-1502A

MONTGOMERY WARD

Output meter across 3.2-ohm output load.
Volume control at maximum for all adjustments.

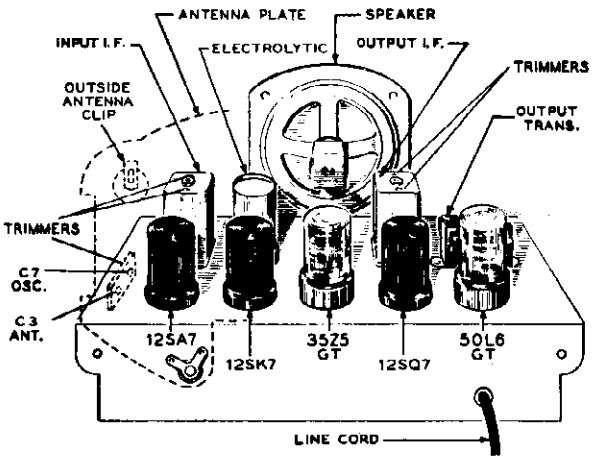
- Align for maximum output.
- Reduce input as needed to keep output near 0.4 volts.

SIGNAL GENERATOR				TUNER SETTING	ADJUST TRIMMERS TO MAXIMUM OUTPUT in order shown
Frequency	Coupling Capacitor	Connection to Radio	Ground Connection		
455 kc	.1 mf	Metal antenna plate	12SQ7 Pin 3	Iron cores all the way out	Trimmers on output and input I.F. cans
1720 kc	.1 mf	Metal antenna plate	12SQ7 Pin 3	Iron cores all the way out	Oscillator trimmer C6
1720 kc	200 mmf	External antenna clip	12SQ7 Pin 3	Iron cores all the way out	Antenna trimmer C3
1400 kc	200 mmf	External antenna clip	12SQ7 Pin 3	Turn dial to 1400 kc	Adjust position of ant. coil (see coil assembly view)
1720 kc	200 mmf	External antenna clip	12SQ7 Pin 3	Turn dial to 1720 kc	Antenna trimmer C3*

*After the antenna coil has been tracked at 1400 kc, it is necessary to check the antenna trimmer C3 again at 1720 kc. If no appreciable change in trimmer adjustment is necessary, the coil is in track. If the trimmer requires considerable change, the position of the antenna coil at 1400 kc must be readjusted. These two adjustments should be made several times, until no trimmer adjustment is required at 1720 kc.

The table below lists the sensitivity at the input of each stage. The receiver should be tuned to 1000 kc for all readings. All measurements are based on an output of 50 milliwatts. This may be measured by disconnecting the speaker voice coil and substituting a 3.2-ohm, 5-watt resistor across the secondary winding of the output transformer. A reading of .4 volts AC across this resistor will be equivalent to a 50-milliwatt output with the speaker connected.

The signal source must be an accurately calibrated signal generator capable of supplying both 1000-kc and 455-kc signals modulated 30% with a 400-cycle audio signal. Variations of plus or minus 25% are usually permissible.



SIGNAL GENERATOR				INPUT FOR 50-MILLIWATT OUTPUT
Frequency	Coupling Capacitor	Connection to Radio	Ground Connection	
1000 kc	200 mmf or RMA dummy antenna	External antenna clip	12SQ7 Pin 3	28 microvolts
1000 kc	.1 mf	Converter 12SA7, pin 8	12SQ7 Pin 3	89 microvolts
455 kc	.1 mf	Converter 12SA7, pin 8	12SQ7 Pin 3	79 microvolts
455 kc	.1 mf	I.F. amplifier 12SK7, pin 4	12SQ7 Pin 3	4000 microvolts
400 cycles	.1 mf	Audio amplifier 12SQ7, pin 2	12SQ7 Pin 3	.05 volts
400 cycles	.1 mf	Power amplifier 50L6GT, pin 5	12SQ7 Pin 3	2.2 volts

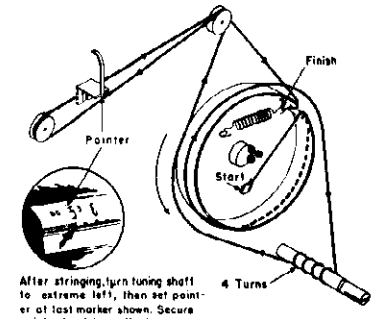
*The values of the resistors listed above are based on RMA standards. Due to conditions beyond our control some receivers have been shipped with resistors of pre-standardized values. This receiver will operate equally well with resistors of either group. An illustration of the difference follows:

Pre-standardized value—50,000 ohms, ±10%, ½ watt
RMA value—47,000 ohms, ±10%, ½ watt

NOTE ON TUBE REPLACEMENT

Replace a defective metal 12SK7 tube with another metal tube. Replace a glass 12SK7 tube with a metal tube or with an exact duplicate of the tube now in the set.

MODELS 54BR-1503B, 1504B



After stringing, turn tuning shaft to extreme left, then set pointer at last marker shown. Secure pointer to string with glue.

NOTES:
- VOLTAGES MEASURED WITH A 5000-OHMS-PER-VOLT METER BETWEEN B- AND SOCKET TERMINALS. LINE VOLTAGE 117 VOLTS AC
- (A) CANNOT BE MEASURED WITH VOLTMETER.
- (B) 11 VOLTS AC ACROSS PINS 2 AND 7.
- (C) 11 VOLTS AC ACROSS PINS 7 AND 8
- (D) 35 VOLTS AC ACROSS PINS 2 AND 7
- (E) 49 VOLTS AC ACROSS PINS 2 AND 7
- (F) 117 VOLTS AC ACROSS PINS 2 AND 4

WHERE NO READING IS INDICATED VOLTAGE IS *ZERO*.

CAPACITOR VALUES IN MFD UNLESS OTHERWISE INDICATED.
RESISTOR AND COIL VALUES IN OHMS.
WHERE VALUE OF COIL IS NOT SHOWN, RESISTANCE IS LESS THAN ONE OHM.

Power Supply.....105 to 125 volts, DC or 50-60 cycle AC, 24 watts. Also made for 25-cycle AC.
Power Output.....0.9 watt undistorted, 1.0 watt maximum.
Loud Speaker.....4" x 6" oval, P.M., v.c. impedance 3.2 ohms.
Frequency Range.....530 to 1630 kc.
Intermediate Freq.....455 kc.
Selectivity.....At 1000 kc, 60 kc at 1000 x signal.
Sensitivity.....26 microvolts average for .05-watt output.

MODELS 54BR-1503A,-1504A and 54BR-1503B, 1504B are the same with the exception of the dial drive and certain mechanical parts.

For Parts list, see P.15-21

54BR-1504C

ALIGNMENT PROCEDURE

Output meter across 3.2-ohm output load.
Volume control at maximum for all adjustments.
Align for maximum output. Reduce input as needed to keep output near 0.4 volts.
Loop antenna should be connected to receiver and its proper position when making adjustments.

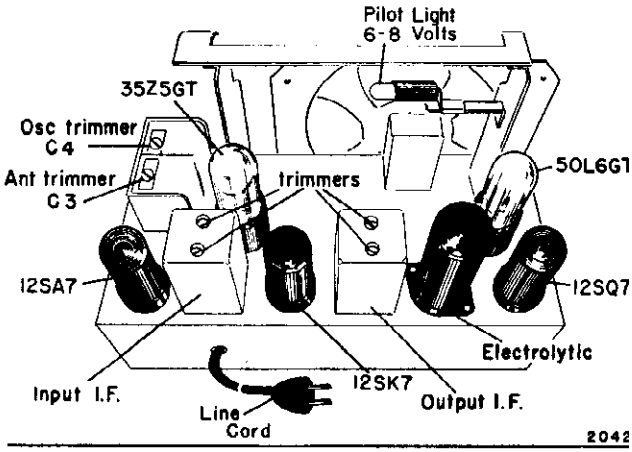
SIGNAL GENERATOR				TUNER SETTING	ADJUST TRIMMERS TO MAXIMUM OUTPUT in order shown
Frequency	Coupling Capacitor	Connection to Radio	Ground Connection		
455 kc	0.1 mf	Grid (pin 4) of 12SK7	Pin 3 of 12SK7 (B- of set)	Capacitor full open (plates out of mesh)	2 trimmers on output IF can
455 kc	0.1 mf	Grid (pin 8) of 12SA7	Pin 3 of 12SK7 (B- of set)	Capacitor full open (plates out of mesh)	2 trimmers on input IF can
1630 kc	0.1 mf	Grid (pin 8) of 12SA7	Pin 3 of 12SK7 (B- of set)	Capacitor full open (plates out of mesh)	Oscillator trimmer C4 on gang
1400 kc	200 mmf	External antenna clip	Pin 3 of 12SK7 (B- of set)	Set dial pointer at 1400 kc	Antenna trimmer C3 on gang

RECEIVER STAGE SENSITIVITIES

The table below lists the sensitivity at the input of each stage. The receiver should be tuned to 1000 kc for all readings. All measurements are based on an output of 50 milliwatts. This may be measured by disconnecting the speaker voice coil and substituting a 3.2-ohm, 5-watt resistor across the secondary winding of the output transformer. A reading of 0.4 volts AC across this resistor will be equivalent to a 50-milliwatt output with the speaker connected.

The signal source must be an accurately calibrated signal generator capable of supplying both 1000 kc and 455 kc signals modulated 30% with a 400-cycle audio signal. Variations of plus or minus 25% are usually permissible.

The volume control must be set to maximum.



Chassis View, Showing Trimmer Location

SIGNAL GENERATOR				INPUT FOR 50-MILLIWATT OUTPUT
Frequency	Coupling Capacitor	Connection to Radio	Ground Connection	
1000 kc	200 mmf or RMA dummy antenna	External antenna clip	Pin 3 of 12SK7 (B- of set)	24 microvolts
1000 kc	0.1 mf	Grid (pin 8) of converter (12SA7)	Pin 3 of 12SK7 (B- of set)	98 microvolts
455 kc	0.1 mf	Grid (pin 8) of converter (12SA7)	Pin 3 of 12SK7 (B- of set)	74 microvolts
455 kc	0.1 mf	Grid (pin 4) of I.F. amp. (12SK7)	Pin 3 of 12SK7 (B- of set)	3200 microvolt
400 cycles	0.1 mf	Grid (pin 2) of audio amp. (12SQ7)	Pin 3 of 12SK7 (B- of set)	.043 volts
400 cycles	0.1 mf	Grid (pin 5) of output amp. (50L6GT)	Pin 3 of 12SK7 (B- of set)	2.0 volts

*SPECIAL NOTE ON RESISTORS: The values of all resistors listed above are based on RMA standards. Due to conditions beyond our control some receivers have been shipped with resistors of pre-standardized values. This receiver will operate equally well with resistors of either group. An illustration of the difference follows:

Pre-standardized value—50,000 ohms, ±10%, 1/3 watt
RMA value—47,000 ohms, ±10%, 1/2 watt

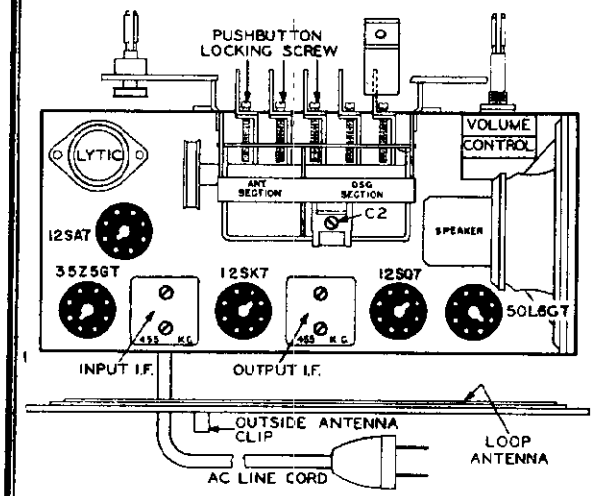
ALIGNMENT PROCEDURE

Volume control setting—Maximum (extreme clockwise) for all adjustments.
Connect ground lead of signal generator to B— of radio chassis through a 0.1 mfd. condenser.
The loop antenna should be connected to the radio and in its proper position when making all adjustments.

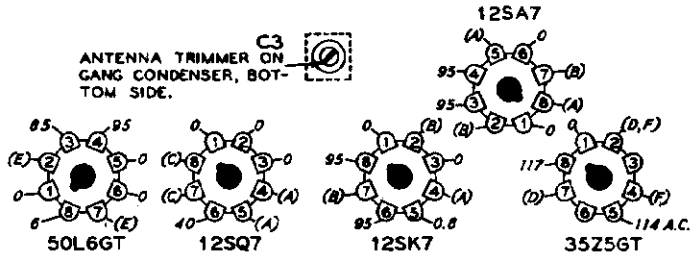
BAND	Signal Generator Frequency Setting	Dummy Antenna	Connection to Radio	Variable Condenser Setting	Trimmer Adjusted to Maximum
I. F.	455 Kc.	.1 mfd.	Grid of 12SK7 I. F.	Rotor full open (Plates out of mesh)	Two trimmers on top of Output I. F.
	455 Kc.	.1 mfd.	Grid of 12SA7 Mixer	Rotor full open (Plates out of mesh)	Two trimmers on top of Input I. F.
BROADCAST	1600 Kc.	200 mmf.	Grid of 12SA7	Rotor full open (Plates out of mesh)	B.C. Osc. trimmer C2 on Gang
	1400 Kc.	200 mmf.	External Antenna and B—	Set Dial at 1400 K. C.	B.C. Ant. trimmer C3 under Gang



A—CANNOT BE MEASURED BY VOLTMETER
B—11 VOLTS A.C. ACROSS PINS 2 AND 7
C—11 VOLTS A.C. ACROSS PINS 7 AND 8
D—33 VOLTS A.C. ACROSS PINS 2 AND 7
E—48 VOLTS A.C. ACROSS PINS 2 AND 7
F—117 VOLTS A.C. ACROSS PINS 2 AND 4

ALL VOLTAGES MEASURED WITH A 1000-OHMS/VOLT VOLTMETER BETWEEN TERMINAL INDICATED AND B-. LINE VOLTAGE 117 VOLTS A.C.

Voltages at tube socket terminals



Technical Data

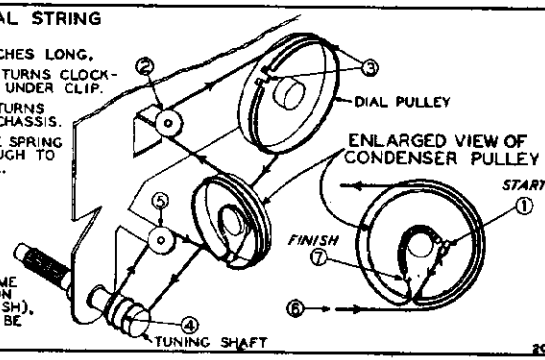
Tuning range	535 to 1600 Kc.
Intermediate Frequency	455 Kc.
Power consumption	35 watts
Sensitivity (for 0.05 watt output)	30 microvolts average
Selectivity. 58 Kc. broad at 1000 times signal at 1000 Kc.	
Power output (in voice coil)	
Undistorted	1.0 watt at 10%
Maximum	1.7 watts
Voice coil impedance	3.2 ohms

BOTTOM VIEW OF CHASSIS

REPLACING DIAL STRING

NOTES:
USE STRING 36 INCHES LONG.
IN STEP 3, WIND 1½ TURNS CLOCKWISE. PASS STRING UNDER CLIP.
IN STEP 4, WIND 3 TURNS TOWARD FRONT OF CHASSIS.
IN STEP 7, BE SURE SPRING IS STRETCHED ENOUGH TO TAKE UP ALL SLACK.

IMPORTANT!
WHEN CONDENSER PULLEY IS IN EXTREME CLOCKWISE POSITION (ROTORS OUT OF MESH), DIAL POINTER MUST BE AT 16 (1600 KC).



SETTING THE PUSHBUTTONS

The pushbuttons may be used, after adjustment, for the automatic tuning of any five stations which you select. They can be set up in any order.

1. Turn on the radio. Allow it to warm up for at least one minute.

2. Push out the call letters of the five stations from the sheets supplied with this manual.

3. Insert the long thin screwdriver (supplied with the set) into the hole in one of the pushbuttons and turn the pushbutton locking screw several turns to the left.

4. With the screwdriver still engaged in the locking screw slot, push the screw all the way in. Hold it in this position and with the tuning knob tune in the station you want.

5. Now turn the pushbutton locking screw to the right and **tighten it firmly.** Remove the screwdriver.

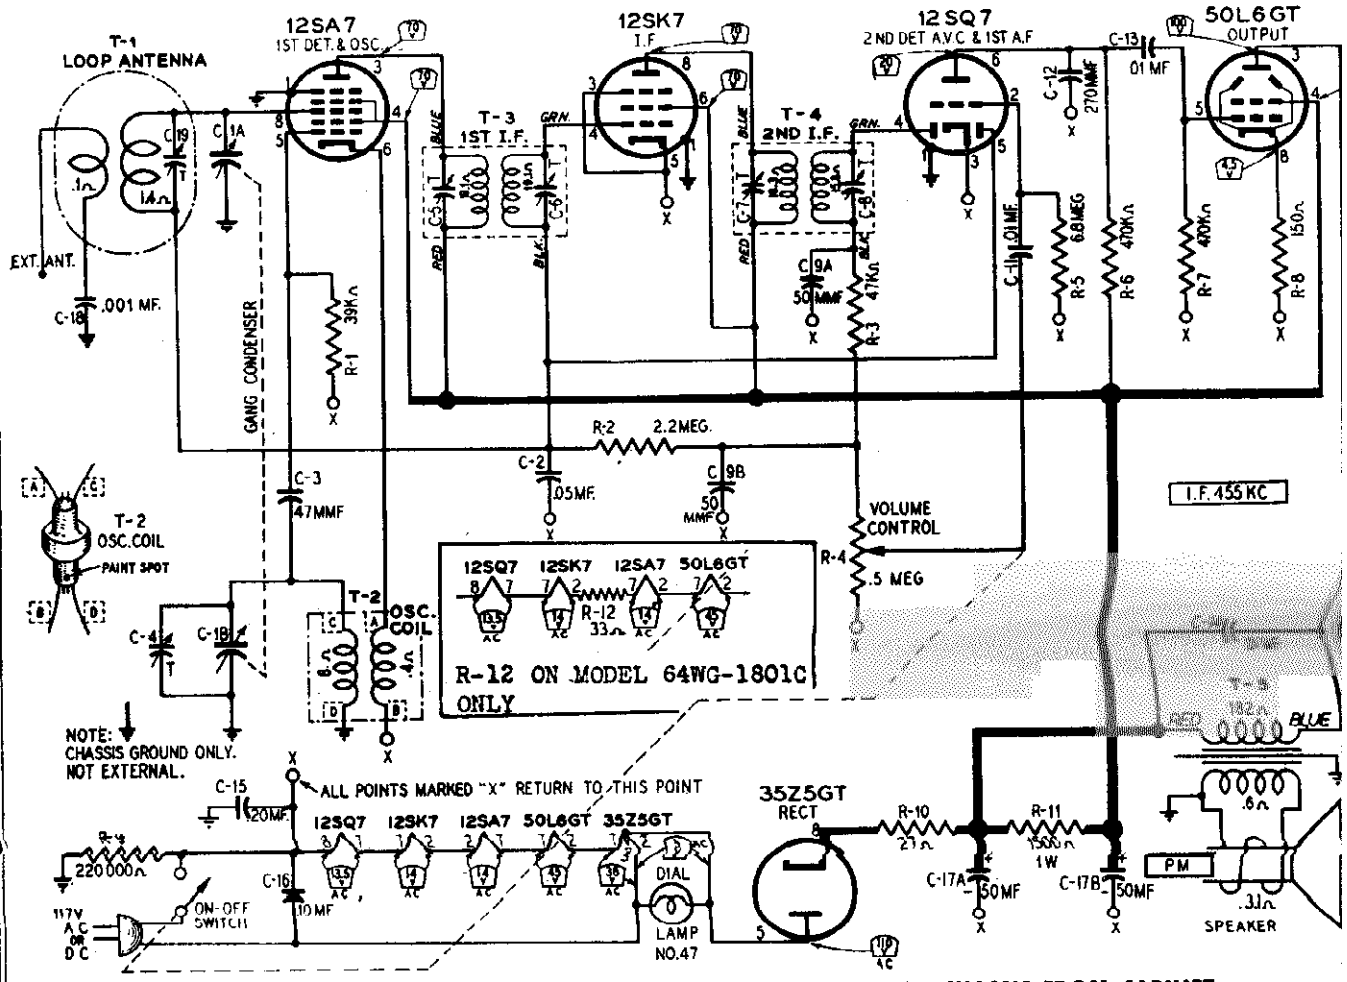
6. Press the pushbutton all the way in (this tunes in the station) and, by rotating the tuning dial back and forth, determine whether the button has been properly set. If it has not, repeat the procedure described above.

7. Insert the call letters for the station in the button and put one of the celluloid tabs over the letters.

8. Set each of the four other buttons, one for each station, in the same way. If you are unable to set a station on any particular button, it is probably because the pushbutton locking screw has not been loosened.

9. Any of the five stations may now be tuned in simply by pushing the proper button in as far as it will go.

MONTGOMERY WARD



Socket voltages are shown on the schematic diagram at the tube socket terminals. All voltages except those for the heater and dial lamp are between the socket terminal and "X" point.

The readings were taken with a 1000 ohm per volt meter and all plate and screen voltages read on a 500 volt scale. Conditions of measurement are:

Line voltage.....117 volts AC
Volume control.....maximum
Signal input.....none

REMOVAL OF CHASSIS FROM CABINET

To remove the chassis from the cabinet it is necessary to pull the two control knobs and the dial pointer from their shafts. Remove the four screws in the bottom of the cabinet and the four snap pins that hold the cabinet back in place.

Care must be taken when removing the dial pointer that it is not damaged in such a manner that reinstallation will not be possible.

RECEIVER STAGE SENSITIVITIES

The table below lists the sensitivity at the input of each stage. The receiver should be tuned to 1000 KC for all readings. All measurements are based on an output of 50 milliwatts. This may be measured by disconnecting the speaker voice coil and substituting a 3.2 ohm 5 watt resistor across the secondary winding of the output transformer. A reading of .4 volts across this resistor will be equivalent to a 50 milliwatt output with the speaker connected. The volume control must be set to maximum.

The signal source must be an accurately calibrated signal generator capable of supplying both 1000 KC and 455 KC signals modulated 30% with a 400 cycle audio signal. Variations of plus or minus 25% are usually permissible.

SIGNAL GENERATOR				INPUT FOR 50 MILLIWATT OUTPUT
Freq.	Coupling Capacitor	Connection to Receiver	Ground Connection	
1000 kc	200 mmf or RMA Dummy Antenna	Loop Antenna—external antenna clip	Chassis	24 microvolts
1000 kc	.05 mf	12SA7 1st Detector pin 8	Point "X" (12SK7 pin 3)	125 microvolts
455 kc	.05 mf	12SA7 1st Detector pin 8	Same as above	100 microvolts
455 kc	.05 mf	12SK7, I-F Amp. pin 4	Same as above	2500 microvolts
400 cycles	.05 mf	12SQ7, 1st AF, pin 2	Same as above	.042 volts
400 cycles	.05 mf	50L6GT Output, pin 5	Same as above	1.9 volts

MODEL 64WG-1801C
MODEL 54WG-2007A, 54WG-2007B

MONTGOMERY WARD

MODELS 54 WG-1801A, 54 WG-2007A

Volume Control—Maximum All Adjustments.

Allow Chassis and Signal Generator to "Heat Up" for several Minutes.

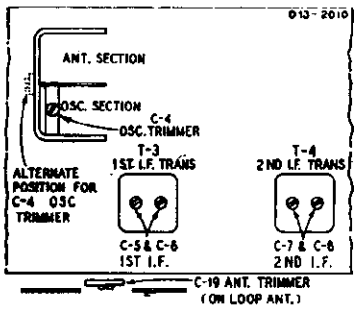
The equipment in column at right is required for aligning: Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed. Output Indicating Meter; Non-Metallic Screwdriver. Dummy Antennas—.1 mf., 50 mf.

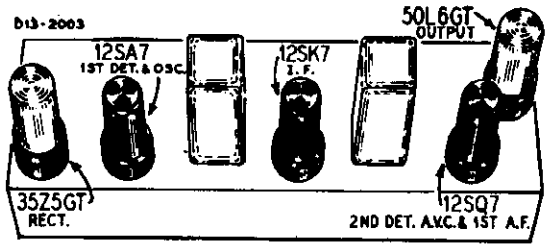
SIGNAL GENERATOR				CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM See Trimmer Illustration
Frequency Setting	Coupling Capacitor	Connection To Radio	Ground Connection		
455 kc	.1 mf	Control Grid 12SK7—I-F	Point "X" 12SK7—I-F Prong No. 3	Turn Rotor to full open	2nd I-F (C7) & (C8)
455 kc	.1 mf	Control Grid 12SA7—1st Det.	Same as above	Turn Rotor to full open	1st I-F (C5) & (C6)
1600 kc	.1 mf	Control Grid 12SA7—1st Det.	Same as above	Turn Rotor to full open	Oscillator (C4)
1400 kc	50 mmf	External Antenna Clip on Loop See Note A	Chassis	Turn Rotor to Max. Output Set Indicator to 1400 KC— See Note B	Antenna (C19)

NOTE A—Re-assemble chassis in cabinet. Replace back on cabinet.

NOTE B—Tune in a 1400 KC signal. If pointer is not at the 1400 KC mark on the dial scale, pull pointer off shaft. Set pointer at the 1400 KC mark and push back on shaft.

TRIMMER POSITIONS





Power Supply	105-125 volts AC—50-60 cycles—30 watts 105-125 volts DC
Frequency Range	535 to 1620 KC
Intermediate Frequency	455 KC
Selectivity	55.5 KC broad at 1000 times signal, 1000 KC
Sensitivity (for .05 watt output) with external antenna	25 microvolts average
Power Output	1.5 watts maximum, .9 watt (10% distortion)
Loud speaker	5" PM dynamic
Voice coil impedance	3.2 ohms at 400 cycles

DRIVE CORD REPLACEMENT
MODELS 54 WG-1801A, 54 WG-2007A

Turn the gang condenser to the fully closed position. Use a new drive cord 12 inches in length and tie one end to the tension spring. Fasten the other end of the tension spring to the hook on the drive pulley. Pass the cord through the slot in the drive pulley rim and continue around pulley one half turn, counterclockwise. Wind 2½ turns counterclockwise (from front of chassis) around tuning shaft. Turns should progress toward rear of chassis. (Wind 3 1/2 turns in tuning shaft for 54 WG-1801-B.) Wind cord counterclockwise around drive pulley in back of previous ½ turn. Pass cord through the slot in the pulley rim. Stretch tension spring and tie free end of cord to the spring. Cut off any excess string.

MODELS 54WG-2007A, 64WG-2007B

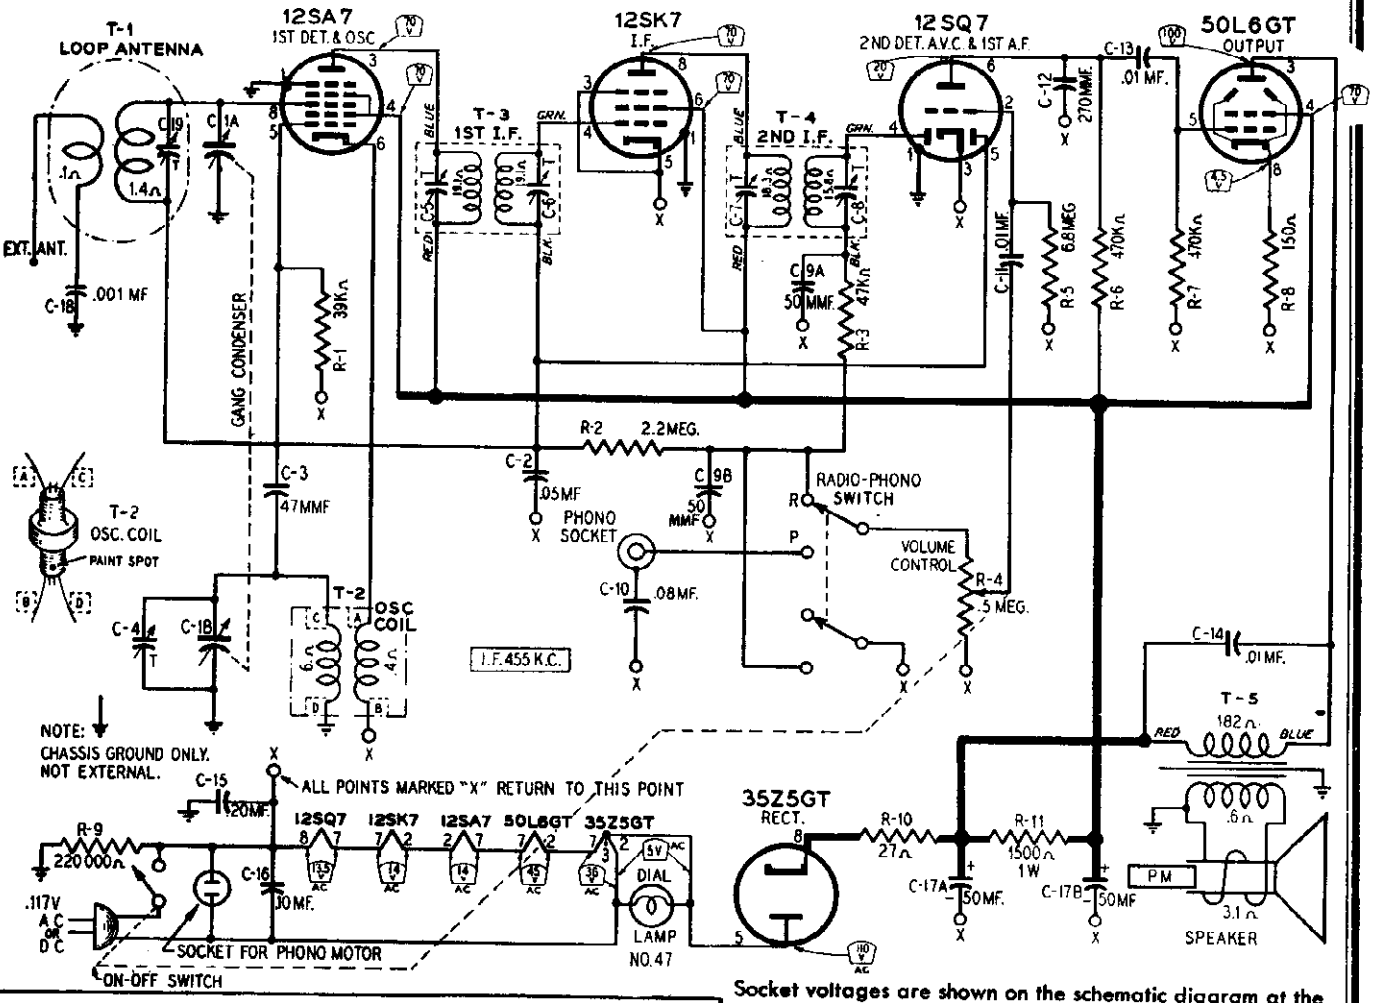
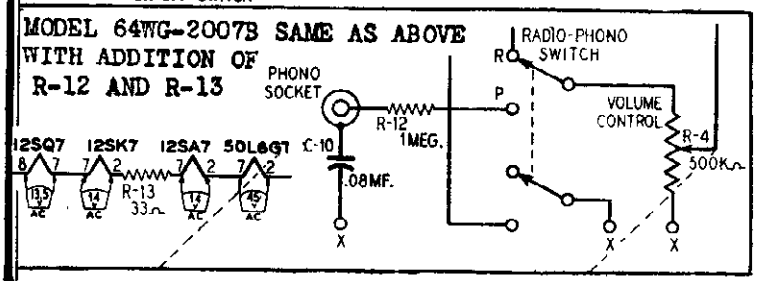
MONTGOMERY WARD





Socket voltages are shown on the schematic diagram at the tube socket terminals. All voltages except those for the heater and dial lamp are between the socket terminal and "X" point.

The readings were taken with a 1000 ohm per volt meter and all plate and screen voltages read on a 500 volt scale. Conditions of measurement are:

Line voltage.....117 volts AC
Volume control.....maximum
Signal input.....none

The table below lists the sensitivity at the input of each stage. All measurements are based on an output of 50 milliwatts. This may be measured by disconnecting the speaker voice coil and substituting a 3.2 ohm 5 watt resistor across the secondary winding of the output transformer. A reading of .4 volts across this resistor will be equivalent to a 50 milliwatt output with the speaker connected. The volume control must be set to maximum. The signal source must be an accurately calibrated signal generator capable of supplying both 1000 KC and 455 KC signals modulated 30% with a 400 cycle audio signal. Variations of Plus or Minus 25% are usually permissible.

SIGNAL GENERATOR				INPUT FOR 50 MILLIWATT OUTPUT
Frequency	Coupling Capacitor	Connection to Receiver	Ground Connection	
1000 kc	200 mmf or RMA Dummy Antenna	Loop Antenna—external antenna clip	Chassis	24 microvolts
1000 kc	.05 mf	12SA7 1st Detector Pin 8	Point "X" (12SK7 Pin 3)	125 microvolts
455 kc	.05 mf	12SA7 1st Detector Pin 8	Same as above	100 microvolts
455 kc	.05 mf	12SK7, I-F Amp. Pin 4	Same as above	2500 microvolts
400 cycles	.05 mf	12SQ7, 1st A-F, Pin 2	Same as above	.042 volts
400 cycles	.05 mf	50L6GT Output, Pin 5	Same as above	1.9 volts

SHORT WAVE BAND
5.75 - 18.3 MC.

MODELS 54WG-2500A, 54WG-2700A, RECEIVER STAGE SENSITIVITIES 64WG-2500B, 64WG-2700A

The table below lists the sensitivity at the input of each stage. The receiver should be tuned to 1000 KC for all readings. All measurements are based on an output of .5 watts. This may be measured by disconnecting the speaker voice coil and substituting a 3.2 ohm, 5 watt resistor across the secondary winding of the output transformer. A reading of 1.26 volts across this resistor will be equivalent to a .5 watt output with the speaker connected. The volume control must be set to maximum.

The signal source must be an accurately calibrated signal generator capable of supplying both 1000 KC and 455 KC signals modulated 30% with a 400 cycle audio signal. Variations of Plus or Minus 25% are usually permissible.

SIGNAL GENERATOR				INPUT FOR .5 WATT OUTPUT
Frequency	Coupling Capacitor	Connection to Receiver	Ground Connection	
1000 kc	200 mmf or RMA Dummy Antenna	External antenna lead (white)	Chassis	2.3 microvolts
1000 kc	.05 mf	6SJ7 1st Detector, Pin 4	Same as above	17 microvolts
455 kc	.05 mf	6SJ7 1st Detector, Pin 4	Same as above	5.0 microvolts
455 kc	.05 mf	6SK7 1st I-F, Pin 4	Same as above	1300 microvolts
455 kc	.05 mf	6SK7 2nd I-F, Pin 4	Same as above	3400 microvolts
400 cycles	.05 mf	6SQ7 1st A-F, Pin 2	Same as above	.07 volts
400 cycles	.05 mf	6V6GT Output, Pin 5	Same as above	3.8 volts

ELECTRICAL SPECIFICATIONS

MODEL 54 WG-2500A, MODEL 64WG-2500B
Power Supply.....105-125 volts AC, 50-60 cycles, 55 watts.

MODEL 54 WG-2700A, MODEL 64WG-2700A
Power Supply.....105-125 volts AC, 60 cycles, 55 watts normal, 72 watts phono operating

MODELS 54WG-2500A, 54WG-2700A, *64WG-2500B, 64WG-2700A

Frequency Range.....B range—528-1600 KC
D range—5.75 to 18.3 MC

Intermediate Frequency.455 KC

Selectivity.....43 KC broad at 1000 times signal, 1000 KC

Sensitivity.....(for .5 watt output) with external antenna
B range—2.5 microvolts average
D range—12 microvolts average

Power Output.....3.5 watts maximum
2 watts, 10% distortion

Loud Speaker.....8" electro dynamic

*MODEL 64WG-2500B uses a 10" speaker

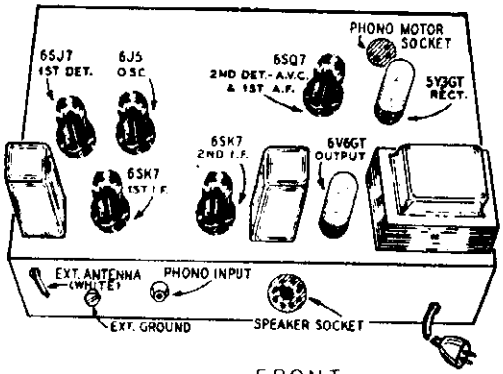
MODEL 64WG-2700A
MODEL 54 WG-2700A

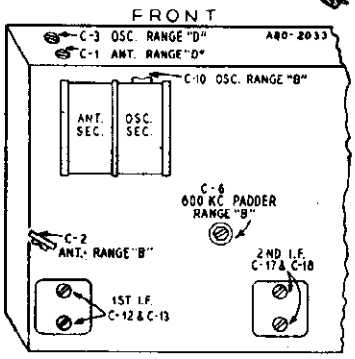
50 CYCLE OPERATION

If it is desired to use the radio and record player on a 50 cycle power supply, it will be necessary to replace the metal drive pulley on the record player motor shaft with a 50 cycle pulley. This pulley is listed in the parts list.

To change the pulley, turn the record selector post to the 12" position and lift the turntable off of the record changer. Loosen the set screw holding the drive pulley on the motor shaft and remove the old pulley. Install the new 50 cycle pulley and replace the turntable.

MODELS 54WG-2500A, 54WG-2700A
64WG-2500B, 64WG-2700A MONTGOMERY WARD

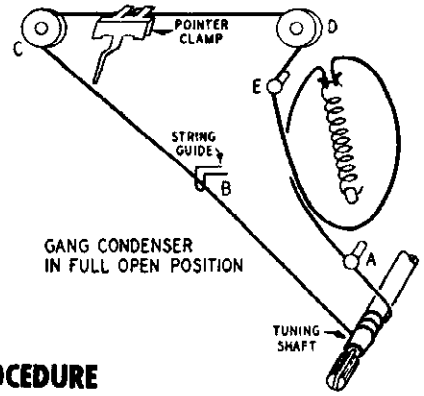




TRIMMER POSITIONS

DRIVE CORD REPLACEMENT

Turn the gang condenser to the fully open position. Use a new drive cord 40" long and tie one end to the tension spring. Hook the other end of the tension spring to the tab on the drive pulley. Pass the cord through the slot in the drive pulley rim and continue one half turn counterclockwise around the drive pulley. Then pass the cord around idler stud A and wind three turns clockwise around the tuning shaft (turns must progress away from chassis). Pass cord through string guide B, over pulleys C and D and around idler stud E. Wrap ¾ turn counterclockwise around drive pulley, stretch the tension spring and tie free end of the cord to spring. Cut off any excess string.



DRIVE CORD DIAGRAM

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.
Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.
Allow Chassis and Signal Generator to "Heat Up" for several Minutes.

The following equipment is required for aligning:
An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.
Output Indicating Meter; Non-Metallic Screwdriver.
Dummy Antennas—.1 mf., 100 mmf., and 400 ohms.

	SIGNAL GENERATOR		Dummy Antenna	Band Switch Setting	Condenser Setting	ADJUST TRIMMERS TO MAXIMUM
	Frequency Setting	Connection at Radio				
I-F	455 kc	6SJ7, Pin 4	.1 mf	B Range	Turn Rotor to Full Open	2nd I-F (C17) & (C18) 1st I-F (C12) & (C13)
RANGE B	1600 kc	Antenna Lead	100 mmf	B Range	Turn Rotor to Full Open	Oscillator Range B (C10)
	1400 kc	Antenna Lead	100 mmf	B Range	Turn Rotor to Max. Output Set Indicator to 1400 KC See Note A	Antenna Range B (C2)
	600 kc	Antenna Lead	100 mmf	B Range	Turn Rotor to Max. Output	600 kc (C6) Rock Rotor—See Note B
	Repeat above oscillator adjustments at 1600 and 600 KC until readjusting the oscillator Range B Trimmer (C10) causes no further improvement in output.					
RANGE D	18,300 kc	Antenna Lead	400 Ohm	D Range	Turn Rotor to Full Open	Oscillator Range D (C3)
	17,000 kc	Antenna Lead	400 Ohm	D Range	Turn Rotor to Max. Output	Antenna Range D (C1) Rock Rotor—See Note B
LOOP RANGE B	Reassemble chassis in cabinet. 1400 kc	Antenna Lead	100 mmf	B Range	Turn Rotor to Max. Output	Antenna Range B (C2)

After each range is completed, repeat the procedure as a final check.

NOTE A—If the pointer is not at 1400 KC on the dial, re-set pointer at the 1400 KC mark on the dial scale.

NOTE B—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

MONTGOMERY WARD

Complete Unit Wiring Diagram

Voltages at Sockets

In the following chart are given the voltages at the sockets. Before checking the voltages at the sockets, a convenient point, in some cases, to check the applied "A" and "B" voltages is at the speaker terminal strip. A high resistance voltmeter should be used.

CAUTION—Do not check the "A" and "B" voltages at the multi-point socket on the cable head, as the pilot light may be burned out when the switch is turned off. This is due to the high inductance of the speaker field, which will increase the voltage at the break of the circuit. Also, when the cable head and multi-point socket is taken off, the connections between the chassis and power unit are open so that readings are not made under load conditions.

To read the voltages at the sockets, the chassis box, in most cases, will have to be taken off of its mounting. In some instances, the cables, which may be attached to the dash or at other points, will have to be taken off. The voltages can be read at the sockets with a long plug or with a pair of long, insulated test prods. If these are not available, it will be necessary to remove the chassis from the box. The multi-point socket on the cable head is then re-connected to the multi-point plug on the chassis. Considerable care must be taken when the chassis is out of the case in this manner to prevent accidental short circuits of plus "B" or plus "A" points to ground.

All tubes must be inserted and all units connected. A signal will effect the control voltages on the R. F., I. F., and first audio tubes. If signals are received, ground the antenna and remove the second detector tube to make the other readings.

Type of Tube	*Function*	*Across Heater*	*Plate to Cathode*	*Screen to Cathode*	*Grid to Cathode*	*Normal Plate MA*
'39	R. F.	6.	177	80	3	3.6
'36	1st Det.	6.	173	76	7(1)	.9(1)
'39	I. F.	6.	177	80	3	3.6
'37	2nd Det.	6.	0		0	0
'39	1st Audio	6.	54	77	6	1.2
'38	Output	6.	159	165	15.5	10

(1) Will vary with dial setting.

NOTE: All bias voltages must be read from cathode to ground.

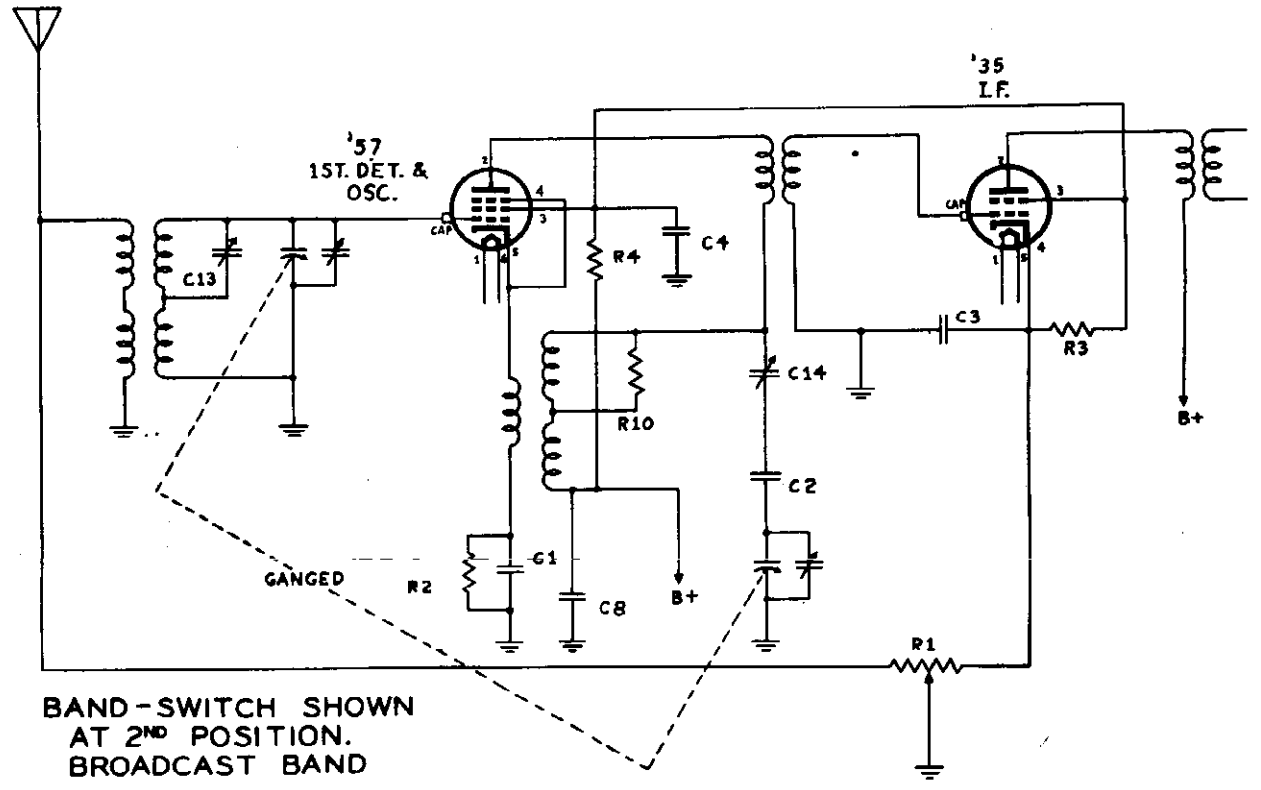
1.6-4 MC.



BAND-SWITCH SHOWN
AT 2ND POSITION.
BROADCAST BAND

Condenser Alignment

Misalignment or mistracking of condensers generally manifests itself in broad tuning and lack of volume at portions or all of the broadcast band. The receivers are all properly aligned at the factory with precision instruments and realignment should not be attempted unless all other possible causes of the faulty operation have first been investigated. A signal generator that will provide accurately calibrated signals over the broadcast band and an output indicating meter are desirable. The procedure is as follows:

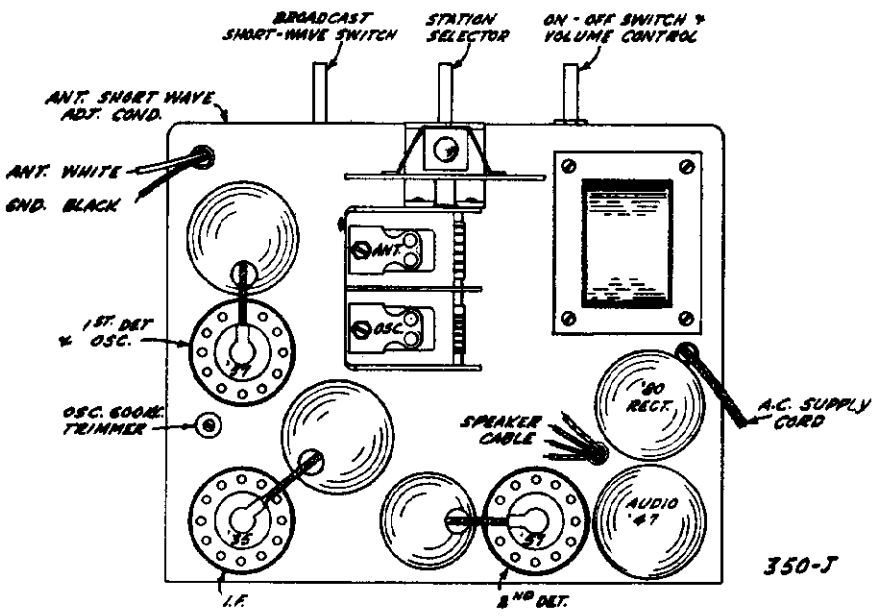
As the I.F. stages are self-tuned, no I.F. aligning at the intermediate frequency of 262 K.C. is required.

First set the signal generator for a signal of exactly 1400 K.C. Connect the antenna lead from the signal generator to the antenna lead of the receiver and the ground lead of the signal generator to the ground of the receiver. Then turn the tuning condenser rotor until the marker is at 1400 K.C. on the dial scale. In order to do this, it will be necessary to put the chassis back in the cabinet. Adjust the two trimmers on the tuning condenser for maximum output adjusting the oscillator trimmer first (section nearest back of receiver).

Next set the signal generator for a signal of 600 K.C. and adjust the oscillator 600 K.C. trimmer. This adjusting screw is between the 1st detector '57 and I.F. '35 sockets and is reached from the top of the chassis. A non-metallic screwdriver is necessary for this adjustment. Turn the tuning condenser rotor until maximum output is obtained. Then turn the rotor slowly back and forth over this setting, at the same time adjusting the 600 K.C. trimmer screw until the highest output is obtained.

Then set the signal generator again for a signal of 1400 K.C. and check the adjustment of the tuning condenser trimmers at this frequency for maximum output.

The last step is to adjust the antenna short-wave adjusting condenser. Turn the Broadcast Short-Wave switch to the short-wave position. Set the signal generator for a signal of 1700 K.C. If the generator does not cover that frequency the 2nd harmonic of an 850 K.C. signal is satisfactory. Set the signal generator for a signal of 850 K.C. and the 2nd harmonic of this signal will be 1700 K.C., the required frequency. Turn the tuning condenser rotor until maximum output is obtained. Then adjust the antenna short-wave trimmer condenser to maximum output. The adjusting nut for this condenser is reached from the front of the chassis at the right hand side. A No. 4 Spintite wrench is necessary.



Voltages at Sockets

(1) If read with cord and plug, ground the control grid.
(2) Computed figure—cannot be accurately read with ordinary voltmeter. Voltage consists of drop across 1 megohm resistor, R 8.

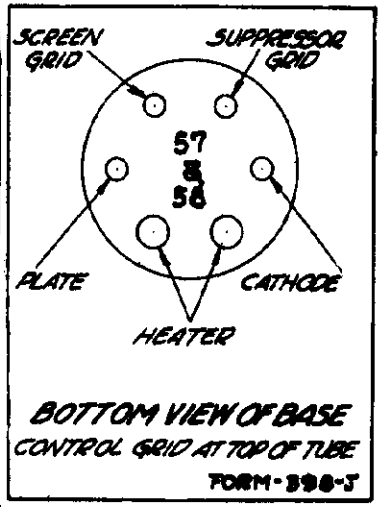

Fig. 3—Terminal Arrangement of 57 and 58 Tubes

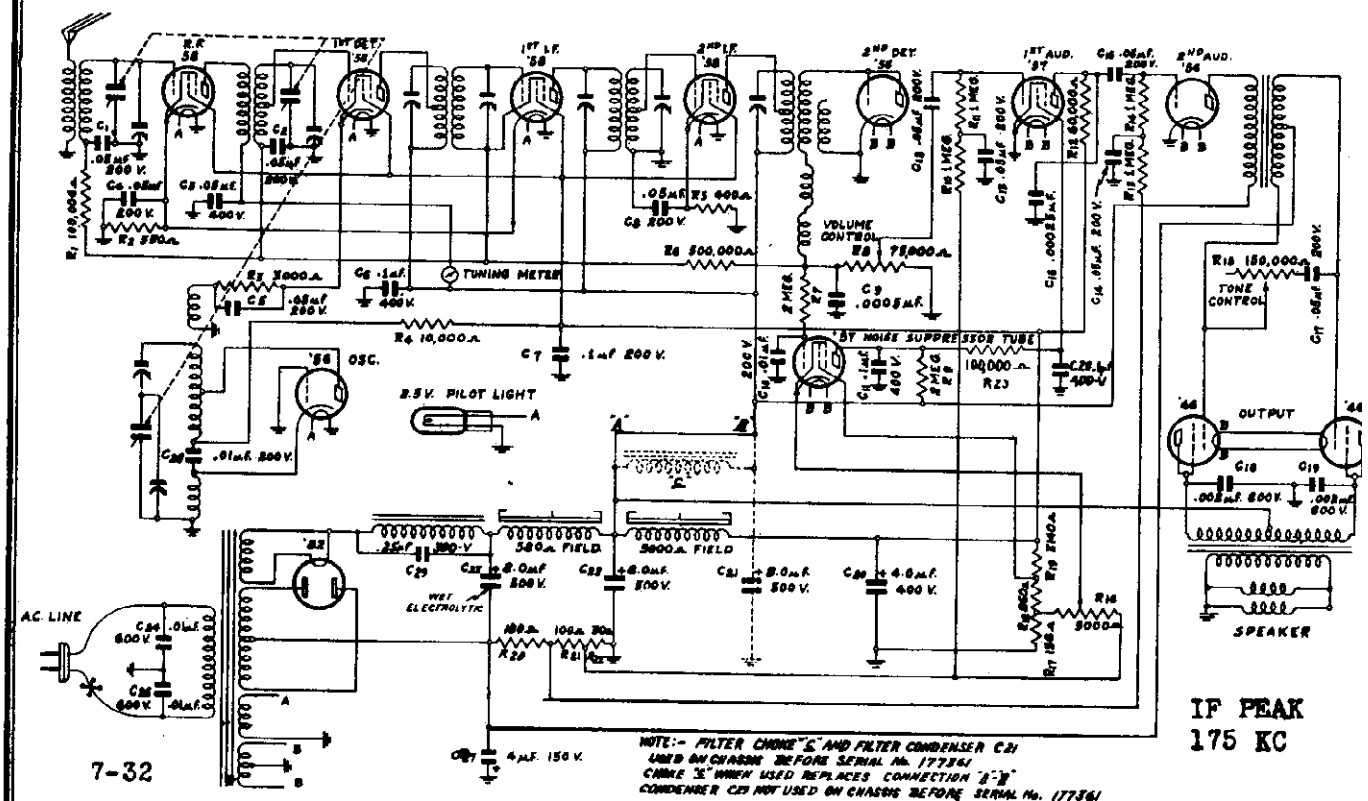
MONTGOMERY WARD



Differences in Early Models

In the first models of this receiver a slightly different filter system was used in the power unit. Condenser C-29, which tunes the separate choke, was not used. Condenser C-21, shown with dashed lines and the choke shown with dashed lines above the 5,000 ohm speaker field in Fig. 1 were used.

In the first models of this receiver individual tubular condensers were used instead of Condenser Block No. 80922. The condensers which make up this block are shown in the parts list. If replacements of any of the condensers are required, it is recommended that the individual tubular condensers be used.

In the early models, a vitreous enamel, six-section voltage divider resistor was used instead of the wire wound type used at the present time.

Setting the Noise Suppressor

The action of the noise suppressor is to establish a certain signal strength level below which all signals are cut out, and above which all signals come through without being reduced in intensity.

The general method of using the noise suppressor is to first turn the knob to the "Power" or right hand position. At this point there is usually considerable noise received. Turn the knob to the left until the noise is eliminated, and then continue to tune the set in the regular manner to whatever stations are wanted.

When tuning for far, distant stations, the knob should be turned to the extreme right hand or "Power" position, as the weak station signals may be cut out along with the noise signals if the noise suppressor is used.

When tuning in local stations the knob may be turned well toward the left hand or "Quiet" position, as the station signals are very powerful compared with the noise signals.

If the signal of a station is distorted, turn the noise suppressor knob to the right until the signal becomes clear.

Voltages at Sockets

(1) Read from cathode to ground.
(2) If I.F. readings are made with a cord and plug, ground the control grid through a condenser to prevent oscillation and motor boating.
(3) Read across 30 ohm section of voltage divider.
(4) Read across 30 ohm and 100 ohm section of voltage divider.

MODELS 62-51, 62-64, 62-64X

MONTGOMERY WARD

Condenser Alignment

Misalignment or mistracking of condensers generally manifests itself in broad tuning and lack of volume at portions or all of the broadcast band. The receivers are all properly aligned at the factory with precision instruments and realignment should not be attempted unless all other possible causes of the faulty operation have first been investigated and unless the service technician has the proper equipment. A signal generator that will provide an accurately calibrated signal of 175 K.C. and accurately calibrated signals over the broadcast band, and an output indicating meter are desirable. The procedure is as follows:

Set the signal generator for 175 K.C. Connect the signal lead from the signal generator to the grid of the 1st detector tube through a .05 mfd. condenser. Turn the tuning condenser rotor until the plates are completely out. The ground lead from the signal generator goes to the ground lead of the receiver. Then adjust the five intermediate frequency condensers for maximum output. The adjusting screws for these condensers are reached from the bottom of the chassis.

Next set the signal generator for a signal of exactly 1400 K.C. The antenna lead from the signal generator is, in this instance, connected to the antenna lead of the receiver. Set the dial pointer on the 1400 K.C. mark on the dial scale and adjust the three trimmer condensers on the gang tuning condenser for maximum output, adjusting the oscillator trimmer first.

Next set the signal generator for a signal of 600 K.C. and adjust the oscillator 600 K.C. trimmer. The adjusting screw for this condenser is reached from the top of the chassis and is between the tuning condenser and the coil cans. A non-metallic screwdriver is necessary for this adjustment. Turn the tuning condenser rotor until maximum output is obtained. Then turn the rotor slowly back and forth over this setting, at the same time adjusting the 600 K.C. trimmer screw until the highest output is obtained.

Then set the signal generator again for a signal of 1400 K.C. and check the adjustment of the tuning condenser trimmers at this frequency for maximum output.

Replacing Rubber Drive

You will note that the Vernier tuning drive on this chassis uses a rubber pinion. Under normal operating conditions this rubber will last for a number of years. Should it become worn it can be readily replaced by loosening the set screw of the brass bushing located next to the rubber pinion and pulling out the station selector shaft. Place a new bushing in position, slip the station selector shaft in place and tighten the set screw.

Condenser Alignment

Misalignment or mistracking of condensers generally manifests itself in broad tuning and lack of volume at portions or all of the broadcast band. The receivers are all properly aligned at the factory with precision instruments and realignment should not be attempted unless all other possible causes of the faulty operation have first been investigated and unless the service technician has the proper equipment. A signal generator that will provide an accurately calibrated signal of 175 K.C. and accurately calibrated signals over the broadcast band, and an output indicating meter are desirable. The procedure is as follows:

Set the signal generator for 175 K.C. Disconnect the grid cap from the first detector tube. Connect the antenna lead from the signal generator to the grid terminal of this tube. The ground lead goes to the ground connection. Then adjust the four intermediate frequency condensers for maximum output. The adjusting screws for these condensers are reached from the bottom of the chassis.

Next, set the signal generator for a signal of 1400 K.C. The input in this instance is made to the antenna lead of the receiver. Replace the grid cap on the first detector tube. Set the dial pointer on the 1400 K.C. mark on the dial scale and adjust the three trimmer condensers on the gang tuning condenser for maximum output, adjusting the oscillator trimmer first.

Then, set the signal generator for a signal of 600 K.C. The oscillator 600 K. C. trimmer condenser is underneath the chassis but the adjusting screw is reached from the top of the chassis and is adjacent to the oscillator coil can. Adjust this oscillator 600 K.C. trimmer condenser for maximum output, turning the rotor slowly back and forth over the 600 K.C. setting until highest output is obtained. A recheck may then be made of the alignment at 1400 K.C.

Condenser Alignment

Misalignment or mistracking of condensers generally manifests itself in broad tuning and lack of volume at portions or all of the broadcast band. The receivers are all properly aligned at the factory with precision instruments and realignment should not be attempted unless all other possible causes of the faulty operation have first been investigated and unless the service technician has the proper equipment. A signal generator that will provide an accurately calibrated signal of 175 K.C. and accurately calibrated signals over the broadcast band, and an output indicating meter are desirable. The procedure is as follows:

Set the signal generator for 175 K.C. Connect the signal lead from the signal generator to the grid of the 1st detector tube through a .05 mfd. condenser. Turn the tuning condenser rotor until the plates are completely out. The ground lead from the signal generator goes to the ground lead of the receiver. Then adjust the four intermediate frequency condensers for maximum output. The adjusting screws for these condensers are reached from the bottom of the chassis.

Next set the signal generator for a signal of exactly 1400 K.C. The antenna lead from the signal generator is, in this instance, connected to the antenna lead of the receiver. Set the dial pointer on the 1400 K.C. mark on the dial scale and adjust the three trimmer condensers on the gang tuning condenser for maximum output, adjusting the oscillator trimmer first.

Next set the signal generator for a signal of 600 K.C. and adjust the oscillator 600 K.C. trimmer. The adjusting screw for this condenser is reached from the top of the chassis and is between the I.F. and oscillator coil cans.

A non-metallic screwdriver is necessary for this adjustment. Turn the tuning condensor rotor until maximum output is obtained. Then turn the rotor slowly back and forth over this setting, at the same time adjusting the 600 K.C. trimmer screw until the highest output is obtained.

Then set the signal generator again for a signal of 1400 K.C. and check the adjustment of the tuning condenser trimmers at this frequency for maximum output.

(2) Measured across Resistor R6.

Voltages

Check the voltages at the sockets to see if correct volt ages are being delivered to the tubes. The antenna an ground should be disconnected and the antenna and groun leads from the set connected together.

All of the D.C. voltage readings as shown on the char are read with a 1,000 ohm per volt meter. As high a rang as possible should be used. In general, the higher the re sistance of the meter, the more accurate the reading will be

Owing to the high resistance in the grid circuits of th R.F., 1st I.F., 1st audio and output tubes, the bias voltag cannot be read between the control grid and cathode o these tubes but must be read across the points as indicate in the references under the chart.

If a cable and plug are used to read the voltages, whe making the readings at the I.F. socket, ground the con trol grid through a condenser to prevent oscillation.

The voltage chart gives the voltages with all tubes in the speaker connected and the set in operating condition These voltages are typical of the sets but will vary slightl with variations in individual receivers and variations in tub characteristics. All voltages in the chart are taken with line voltage of 115. Differences in line voltage as well a differences in test equipment used will introduce other varia tions in the voltage readings.

Condenser Alignment

Misalignment or mistracking of condensers generally manifests itself in broad tuning and lack of volume at portions or all of the broadcast band. The receivers are all properly aligned at the factory with precision instruments and realignment should not be attempted unless all other possible causes of the faulty operation have first been investigated and unless the service technician has the proper equipment. A signal generator that will provide an accurately calibrated signal of 175 K.C. and accurately calibrated signals over the broadcast band, and an output indicating meter are desirable. The procedure is as follows:

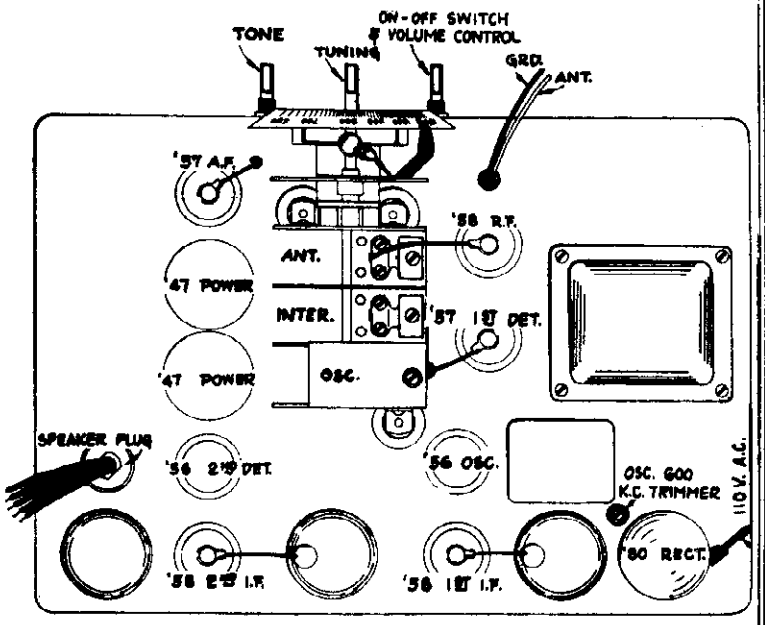
Set the signal generator for 175 K.C. Connect the signal lead from the signal generator to the grid of the 1st detector tube through a .05 mfd. condenser. Turn the tuning condenser rotor until the plates are completely out. The ground lead from the signal generator goes to the ground lead of the receiver. Then adjust the four intermediate frequency condensers for maximum output. The adjusting screws for these condensers are reached from the bottom of the chassis.

Next set the signal generator for a signal of exactly 1400 K.C. The antenna lead from the signal generator is, in this instance, connected to the antenna lead of the receiver. Set the dial pointer on the 1400 K.C. mark on the dial scale and adjust the three trimmer condensers on the gang tuning condenser for maximum output, adjusting the oscillator trimmer first.

Next set the signal generator for a signal of 600 K.C. and adjust the oscillator 600 K.C. trimmer. The adjusting screw for this condenser is reached from the top of the chassis and is between the I.F. and oscillator coil cans.

A non-metallic screwdriver is necessary for this adjustment. Turn the tuning condensor rotor until maximum output is obtained. Then turn the rotor slowly back and forth over this setting, at the same time adjusting the 600 K.C. trimmer screw until the highest output is obtained.

Then set the signal generator again for a signal of 1400 K.C. and check the adjustment of the tuning condenser trimmers at this frequency for maximum output.



Replacing Rubber Drive

You will note that the Vernier tuning drive on this chassis uses a rubber pinion. Under normal operating conditions this rubber will last for a number of years. Should it become worn it can be readily replaced by loosening the set screw of the brass bushing located next to the rubber pinion and pulling out the station selector shaft. Place a new bushing in position, slip the station selector shaft in place and tighten the set screw.

Dual Speaker Connections

Two speakers are used in this model. The fields of these speakers are connected in series and the voice coils in parallel. The resistance of each speaker field is 275 ohms

Circuit Description And Aligning Procedure

The tubes employed are as follows, and are operated at rated voltages and biases:

R.F.	58	Osc.	56
1st Det.	57	2nd Det.	55
I.F.	58	Audio	47

Rectifier..... 80

The second detector is the new dual diode triode, the diode portion operating as a detector and providing automatic volume control—acting on the grids of the R.F. and I.F. stages. The triode portion of this tube is operated as an individually biased A.F. amplifier.

In aligning, it is first desirable to see that the I.F. transformers are properly set. Both are on top of the base, the first having two adjustments, the second but one adjustment. The intermediate frequency is 175 K.C. Couple test oscillator into grid of first detector. Use an output meter.

The tuning condenser may be adjusted for alignment or "tracking" of the tuned circuits by means of an oscillator and output meter, also. The oscillator should cover the band from 550 to 1500 K.C. The energy from the oscillator should be coupled weakly into the antenna circuit. The receiver and oscillator are first tuned to approximately 1500 K.C., and, by watching the output meter the three condenser trimmers are adjusted for maximum output. These three trimmers must then be left untouched for all further aligning.

The next step is to tune both receiver and oscillator to some point near 550 K.C. Here the alignment is made by adjusting the oscillator "pad" condenser for maximum response. It may be reached through hole in base between 1st detector and oscillator tubes. If necessary to adjust the two R.F. condenser sections it may be done by bending the slotted condenser rotor end plates. If necessary to align at points other than the ends of the "band" it may be done by bending portions of these slotted plates. Alignment of the two ends of the scale is usually quite sufficient.

IMPORTANT: It is desirable to move the dial back and forth across the signal while making the above alignments. This is particularly necessary when altering any capacities connected with the oscillator circuit. Use an insulated or bakelite screw driver.

Be certain that good tubes are used in all sockets.

Alignment

This receiver may be aligned on a broadcasting station or oscillator It is advisable, however, to insert a dummy 56 tube which has one filament prong removed in the AVC socket, to prevent any AVC action from making determination of the output peak difficult. The intermediate frequency is 262 K. C. and the I. F. trimming condenser adjusting screws are accessible from beneath the chassis.

These chassis may be easily distinguished by keeping in mind that the No. 62-84 uses dual dynamic speakers, while the No. 62-94 uses a single dynamic. The No. 62-79 is the same in all respects as the No. 62-84, with the exception that this chassis uses chromatic tuning and, therefore, a different tuning condenser assembly and drive. The tone, volume, and noise suppressor control are also of slightly different values.

The chassis may be aligned either on the oscillator or a broadcasting station

When any defects are located in the Oscillator I.F. assembly, other than simple wiring breaks which are easily repaired, the entire unit should be replaced rather than attempting to replace any of the component parts. The replacement assembly will be supplied as a unit but none of the component parts can be supplied separately.

Aligning I.F. Condensers. During I.F. alignment, the oscillator should be rendered inoperative by shorting a portion of the oscillator coil. Connecting a wire jumper between the two vertical insulated terminals located near the base of the oscillator—I.F. assembly beneath the chassis will accomplish this.

General Description and Aligning Procedure

The tubes employed are as follows, and are operated at rated voltages and biases:

Oscillator and Mixer	57
Intermediate Frequency	58
Second Detector	55
Output	247
Rectifier	280

This receiver employs a combination oscillator and first detector, or mixer. The second detector is the new dual diode-triode, the diode portion acting as detector and providing automatic volume control—acting on the grid of the type 58 I.F. tube. The triode portion of the second detector is operated as an individually biased A.F. amplifier.

The first two variable tuned circuits are not electrically coupled. They are mutually coupled by being placed close together and left unshielded. In all other respects the circuits are entirely conventional.

In aligning, it is first desirable to see that the I.F. transformers are properly set. The First I.F. transformer is on top of the base and has two adjustments. The second is inside the base but its single adjustment may be reached through a hole in the rear-center of the base. The intermediate frequency is 175 K.C.

The tuning condenser may be adjusted for alignment or "tracking" of the tuned circuits by means of an oscillator and output meter. The oscillator should cover the band from 550 to 1500 K.C. The energy from the oscillator is coupled weakly into the antenna circuit—a simple means being to place the oscillator near the antenna wire. The receiver and oscillator are first tuned to approximately 1500 K.C., and by watching the output indicator, the three condenser trimmers are adjusted for maximum output. These three trimmers must then be left untouched for all further aligning.

The next step is to tune both receiver and oscillator to some point near 550 K.C. Here the alignment is made by adjusting the oscillator "pad" condenser for maximum response. It may be reached through hole in base near the first I.F. transformer. If necessary to adjust the two R.F. condenser sections, it may be done by bending the condenser end plates. If necessary to align at points other than the ends of the "band" it may be done by bending portions of the slotted end plates of the condenser rotor sections. Alignment of the two ends of the scale is usually quite sufficient.

Prices subject to change without notice.

IMPORTANT: It is desirable to move the dial back and forth across the signal while making the above alignments. This is particularly necessary when altering any capacities connected with the oscillator circuit. Use an insulated or bakelite screw driver. No aligning, other than the I.F. transformers, is necessary for the short wave band (75 to 200 meters) as no attempt has been made to tune more than the oscillator.

Be certain that a good 57 tube is used in the first socket.

Condenser Alignment

Misalignment or mistracking of condensers generally manifests itself in broad tuning and lack of volume at portions or all of the broadcast band. The receivers are all properly aligned at the factory with precision instruments and realignment should not be attempted unless all other possible causes of the faulty operation have first been investigated and unless the service technician has the proper equipment. A signal generator that will provide an accurately calibrated signal of 175 K.C. and accurately calibrated signals over the broadcast band, and an output indicating meter are desirable. The procedure is as follows:

Set the signal generator for 175 K.C. Connect the signal lead from the signal generator to the grid of the 1st detector tube through a .05 mfd. condenser. Turn the tuning condenser rotor until the plates are completely out. The ground lead from the signal generator goes to the ground lead of the receiver. Then adjust the four intermediate frequency condensers for maximum output. The adjusting screws for these condensers are reached from the bottom of the chassis.

Next set the signal generator for a signal of exactly 1400 K.C. The antenna lead from the signal generator is, in this instance, connected to the antenna lead of the receiver. Keep the signal weak enough to prevent action of the A.V.C. Set the dial pointer on the 1400 K.C. mark on the dial scale and adjust the three trimmer condensers on the gang tuning condenser for maximum output, adjusting the oscillator trimmer first.

Next set the signal generator for a signal of 600 K.C. and adjust the oscillator 600 K.C. trimmer. The adjusting screw for this condenser is reached from the top of the chassis and is between the I.F. and oscillator coil cans.

A non-metallic screwdriver is necessary for this adjustment. Turn the tuning condensor rotor until maximum output is obtained. Then turn the rotor slowly back and forth over this setting, at the same time adjusting the 600 K.C. trimmer screw until the highest output is obtained.

Then set the signal generator again for a signal of 1400 K.C. and check the adjustment of the tuning condenser trimmers at this frequency for maximum output.

Line Voltage Range

The receiver will operate satisfactorily within a line voltage range of 28 to 36 volts. If the line voltage runs higher, it will have to be cut down and one method of doing this is to use a series resistor. Let us say the line voltage is 40. The receiver uses 1.55 amps. at 32 volts. A resistance of 5.16 ohms, therefore, capable of dissipating 12.4 watts will be required in the receiver line to cut the voltage down to 32. If the line voltage varies a variable resistor may be required.

IMPORTANT—POLARITY OF THE POWER SUPPLY TO THE RECEIVER MUST BE OBSERVED. There is a red mark on the plug. The prong of the plug at which the red mark is placed must be plugged into the positive side of the line. Use a receptacle on the 32 volt line from which the plug will not have to be removed after it

MONTGOMERY WARD

NOTES

FIGURES OPPOSITE SOCKET PIN NUMBERS ARE VOLTAGES MEASURED WITH A 5000-OHMS-PER-VOLT METER BETWEEN SOCKET TERMINALS AND B- WHERE NO READING IS SHOWN VALUE IS ZERO.

LINE VOLTAGE 117 VOLTS AC.

VOLUME CONTROL AT MAXIMUM.

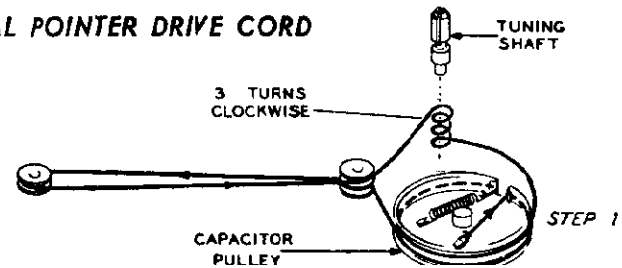
VOLTAGE AT PIN 5 OF 1A7GT CANNOT BE MEASURED WITH STANDARD VOLTMETER.

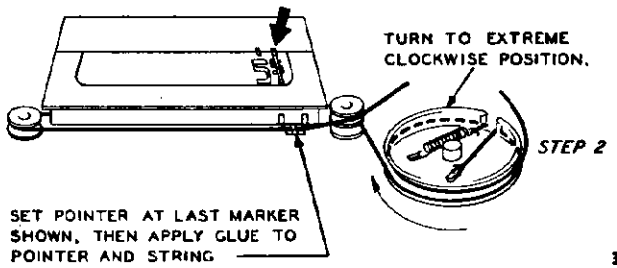
RESISTOR AND COIL VALUES ARE IN OHMS.

CAPACITOR VALUES ARE IN MF UNLESS OTHERWISE SPECIFIED.

IF PEAK 455 KC

REPLACING DIAL POINTER DRIVE CORD



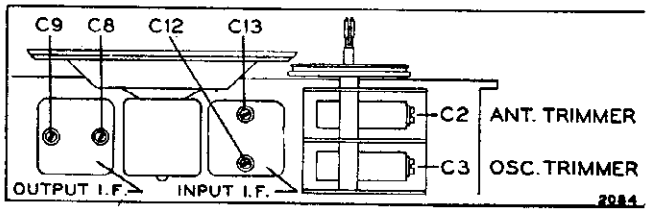


3.46

MODEL 64BR-1051A

MONTGOMERY WARD
ALIGNMENT PROCEDURE

- Output meter across 3.2 ohm output load.
- Volume control at maximum for all adjustments.
- Align for maximum output.
- Reduce input as needed to keep output near 0.4 volts.



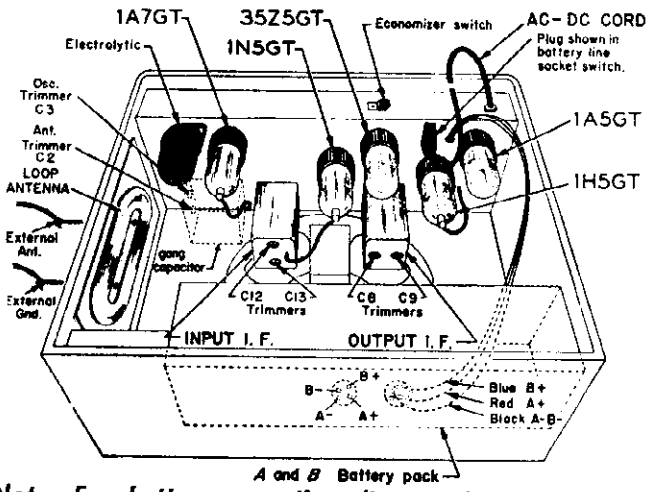
SIGNAL GENERATOR					
Frequency	Coupling Capacitor	Connection to Radio	Ground Connection	DIAL SETTING	ADJUST TRIMMERS TO MAXIMUM OUTPUT in order shown
455 kc	.1 mf	1A7GT grid cap*	1A7GT Pin 7	Rotor full open (plates out of mesh)	Input and output trimmers on IF cans
1650 kc	.1 mf	1A7GT grid cap*	1A7GT Pin 7	Rotor full open (plates out of mesh)	Osc. trimmer on gang (see trimmer view)
1400 kc	200 mmf	External antenna clip	External ground clip	1400 kc	Ant. trimmer on gang (see trimmer view)

*For these adjustments insert a 1 megohm resistor between loop antenna and 1A7GT grid cap.

RECEIVER STAGE SENSITIVITIES

The table below lists the sensitivities at the input of each stage. The receiver should be tuned to 1000 KC for all readings. All measurements are based on an output of 50 milliwatts. This may be measured by disconnecting the speaker voice coil and substituting a 3.2 ohm 5 watt resistor across the secondary winding of the output transformer. A reading of .4 volts AC across this resistor will be equivalent to a 50 milliwatt output with speaker connected. The volume control must be set to maximum.

The signal source must be an accurately calibrated signal generator capable of supplying both 1000 KC and 455 KC signals modulated 30% with a 400 cycle audio signal. Variations of plus or minus 25% are usually permissible.



Note: For battery operation, line cord plug must be inserted in battery-line socket switch as shown; switch contacts are automatically moved.

SIGNAL GENERATOR				
Frequency	Coupling Capacitor	Connection to Radio	Ground Connection	INPUT FOR 50 MILLIWATT OUTPUT
1000 kc	200 mmf or RMA dummy antenna	External antenna clip	External ground clip	25 microvolts
1000 kc	.05 mf	Converter (1A7GT) grid cap	1A7GT Pin 7	140 microvolts
455 kc	.05 mf	Converter (1A7GT) grid cap	1A7GT Pin 7	100 microvolts
455 kc	.05 mf	IF amp. (1N5GT) grid cap	1A7GT Pin 7	4500 microvolts
400 cycles	.05 mf	AF amp. (1H5GT) grid cap	1A7GT Pin 7	.06 volts
400 cycles	.05 mf	Power amp. (1A5GT) grid (pin 5)	1A7GT Pin 7	3 volts

MODEL 64BR-1051A

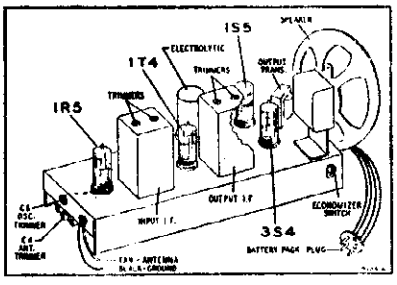
ELECTRICAL SPECIFICATIONS

Power Supply	105-125 volts DC or 50-60 cycle AC, 30 watts. Also made for 25 cycle AC. Battery: Wards Battery Pack No. 62-30 Size: 10-9/16" by 2¾" by 4¼". "A"—6 volts, 50 milliamperes. "B"—90 volts, 8.5 milliamperes.
Frequency Range	530 to 1650 kc.
Intermediate Freq.	455 kc.
Selectivity	At 1000 kc, 48 kc at 1000 x signal.
Sensitivity	40 microvolts average for .05 watt output.
Power Output	80 milliwatts undistorted. 180 milliwatts maximum.
Loud Speaker	5", P.M., v.c. impedance 3.2 ohms.
Tube Complement	35Z5GT rectifier. 1A7GT converter. 1N5GT i.F. amplifier. 1H5GT detector, AVC, audio amplifier. 1A5GT output amplifier. T-47 pilot lamp, 6-8 volts.

MODELS 64BR-1205A, 1206A

ELECTRICAL SPECIFICATIONS

Power Supply	Battery: Wards Battery Pack 62-59 Size: 10¾"x 2⅝"x 6¼". "A"- 1½-volts, 250 milliamperes "B"- 90 volts, 10.5 milliamperes
Frequency Range	540 to 1700 kc.
Intermediate Freq.	455 kc.
Selectivity	At 1000 kc, 49 kc at 1000 x signal
Sensitivity	40 microvolts average for 50-milli-watt output.
Power Output	0.120 watt undistorted. 0.140 watt maximum.
Loud Speaker	5-inch; P. M.; voice coil impedance 3.2 ohms.
Tube Complement	1R5, converter 1T4, I. F. amplifier 1S5, detector, AVC, audio 3S4, output amplifier



Chassis and Trimmer View

ALIGNMENT PROCEDURE

- Output meter across 3.2-ohm output lead.
- Align for maximum output. Reduce input as needed to keep output near 0.4 volts.
- Volume control at maximum for all adjustments.
- Connect ground post of signal generator to radio chassis.

SIGNAL GENERATOR			TUNER SETTING	ADJUST FOR MAXIMUM OUTPUT (in order shown)
Frequency	Coupling Capacitor	Connection to Radio		
455 kc	.1 mf	Grid (pin 6) of 1R5	Iron cores all the way out	Trimmers on output and input I. F. cans
1700 kc	.1 mf	Grid (pin 6) of 1R5	Iron cores all the way out	Oscillator trimmer C6
1700 kc	200 mmf	Antenna lead	Iron cores all the way out	Antenna trimmer C4
1400 kc	200 mmf	Antenna lead	Turn dial to 1400 kc	Adjust position of ant. coil (see coil view)*

*This adjustment and the previous adjustment are interlocking; therefore repeat the two adjustments alternately for best results.

NOTES

LETTERS AND FIGURES OPPOSITE SOCKET PIN NUMBERS ARE VOLTAGE READINGS TAKEN WITH A 5000-OHMS PER-VOLT METER BETWEEN SOCKET TERMINALS AND CHASSIS.

BATTERIES AT FULL VOLTAGE ECONOMIZER SWITCH OPEN.

A- CANNOT BE MEASURED WITH ABOVE METER.

RESISTOR AND COIL VALUES SHOWN IN OHMS.

CAPACITOR VALUES SHOWN IN MFD UNLESS OTHERWISE INDICATED.

4-13-46

RECEIVER STAGE SENSITIVITIES

The table below lists the sensitivities at the input of each stage. The receiver should be tuned to 1000 KC for all readings. All measurements are based on an output of 50 milliwatts. This may be measured by disconnecting the speaker voice coil and substituting a 3.2-ohm, 5-watt resistor across the secondary winding of the output transformer. A reading of .4 volts AC across this resistor will be equivalent to a 50-milliwatt output with speaker connected.

The volume control must be set to maximum.

The signal source must be an accurately calibrated signal generator capable of supplying both 1000 kc and 455 kc signals modulated 30% with a 400-cycle audio signal.

Variations in sensitivities of plus or minus 25% are usually permissible.

SIGNAL GENERATOR				INPUT FOR 50-MILLIWATT OUTPUT
Frequency	Coupling Capacitor	Connection to Radio	Ground Connection

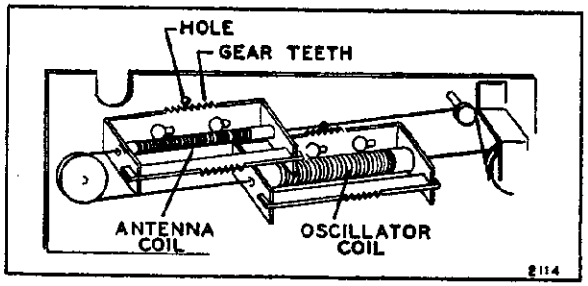
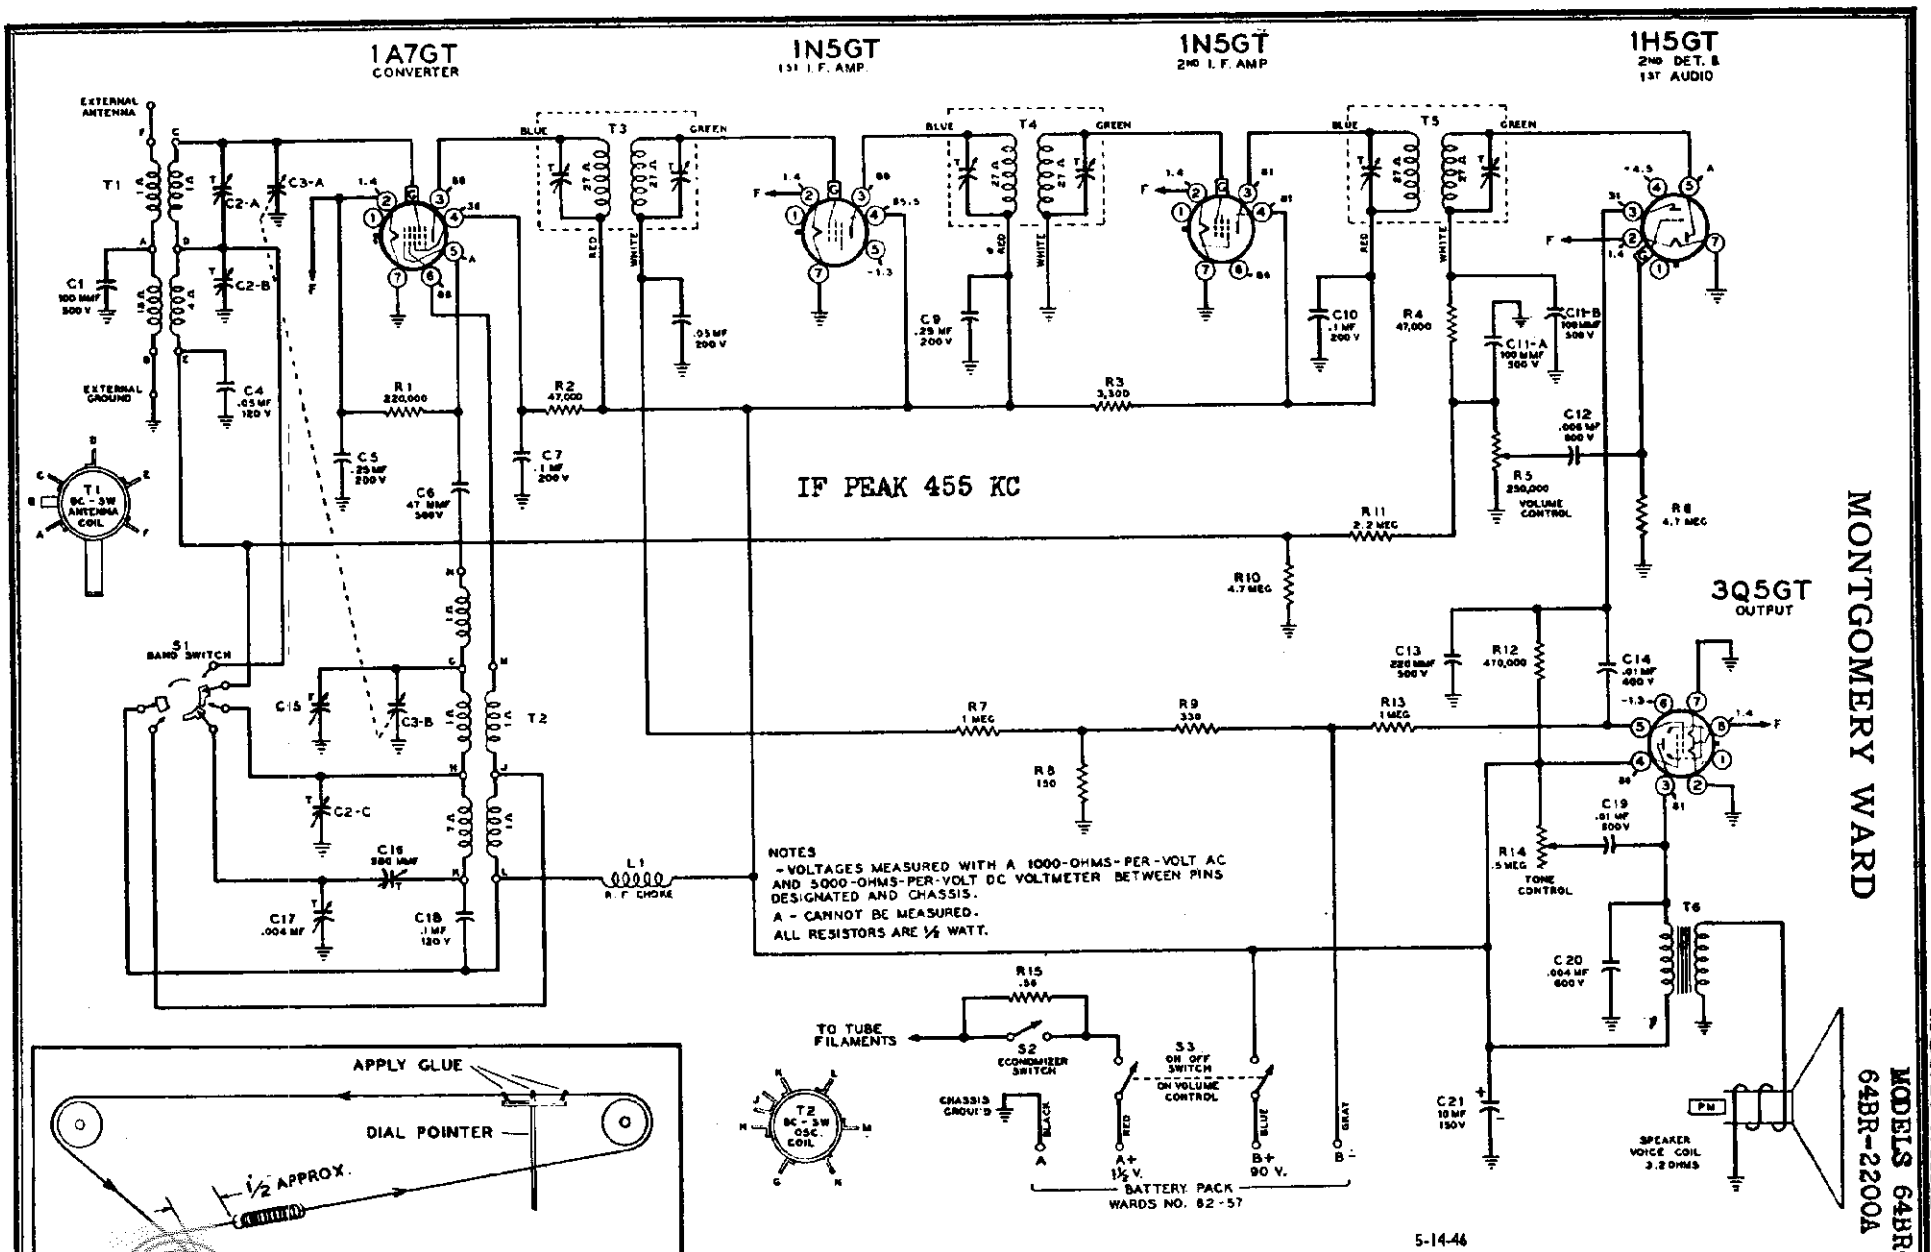
400 cycles	.1 mf	Power amp. 3S4 (pin 3)	Chassis	2.5 volts



View of Coil Assembly

The antenna coil asembly is movable left or right. When making the adjustment as required in the alignment procedure, move the coil assembly very slowly, either by hand or by pivoting one edge of a screwdriver blade in the hole and engaging the blade in the gear teeth of the coil form.

For other data, see P.15-63



5-14-46

Replacement of Dial Pointer Drive Cord

After installing cord and spring as shown, tune to station of known frequency. Then set pointer to proper position along dial and

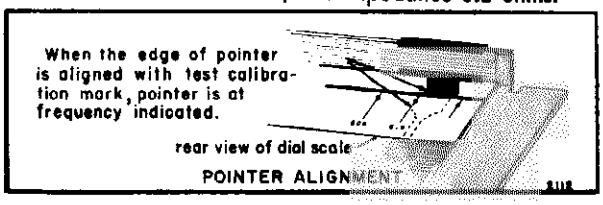
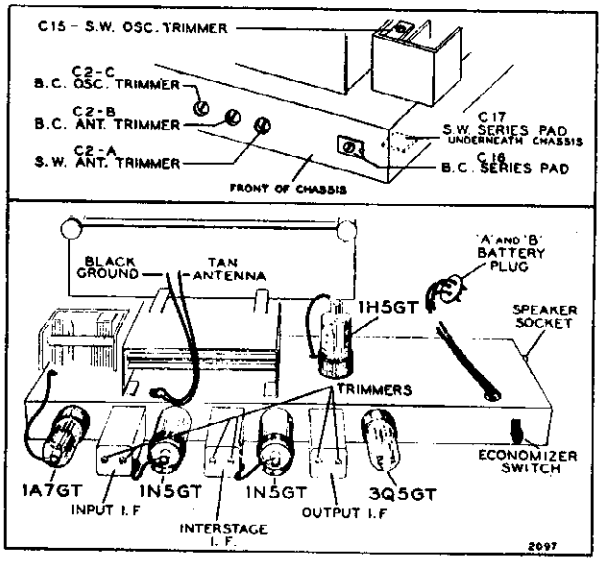
Power Supply	Wards Battery Pack No. 62-57. Size: 16" x 6⅝" x 4½". "A"- 1½ volts, 300 ma. "B"- 90 volts, 13 ma.
Frequency Range	Broadcast—535 to 1720 kc. Short Wave—5.6 to 18.1 mc.
Intermediate Freq.	455 kc.
Selectivity	At 1000 kc, 36 kc at 1000 x signal.
Sensitivity	10 microvolts average for 50-milliwatt output.
Power Output	150 milliwatts undistorted. 250 milliwatts maximum.
Speaker	6" (1208A) or 8" (2200A). P.M., v.c. impedance 3.2 ohms.





View of Chassis and Trimmers

ALIGNMENT PROCEDURE

- Output meter across 3.2-ohm output load.
- Volume control at maximum.
- Tone control at maximum treble.
- Connect ground post of signal generator to ground lead of radio.
- Align for maximum output. Reduce input as needed to keep output near 0.4 volts.

BAND SWITCH SETTING	SIGNAL GENERATOR Frequency	Coupling Capacitor	Connection to Radio	TUNER SETTING	ADJUST TO MAXIMUM OUTPUT (in order shown)
BROADCAST *(counter-clockwise)*	455 kc	.1 mf	Second I.F. (1N5GT) grid cap	Rotor full open (plates out of mesh)	Trimmers on top of output I.F. can
	455 kc	.1 mf	First I.F. (1N5GT) grid cap	Rotor full open (plates out of mesh)	Trimmers on top of interstage I.F. can
	455 kc	.1 mf	Converter (1A7GT)	Rotor full open (plates out of mesh)	Trimmers on top of input I.F. can
SHORT WAVE *(clockwise)*	18.1 mc	400 ohms	Antenna lead	Rotor full open (plates out of mesh)	S.W. osc. trimmer C15
	16 mc	400 ohms	Antenna lead	16 mc* (see below for pointer alignment)	S.W. ant. trimmer C2-A
	6 mc	400 ohms	Antenna lead	6 mc (see below for pointer alignment)	S.W. osc. series pad C17†
BROADCAST *(counter-clockwise)*	1720 kc	200 mmf	Antenna lead	Rotor full open (plates out of mesh)	B.C. osc. trimmer C2-C
	1500 kc	200 mmf	Antenna lead	1500 kc (see below for pointer alignment)	B.C. ant. trimmer C2-B
	600 kc	200 mmf	Antenna lead	600 kc (see below for pointer alignment)	B.C. osc. series pad C16†

* First set signal generator to 16 mc; then, with gang all the way out, approach 16 mc by slowly rotating gang inward. The first signal is the one on which the alignment should be made. The next signal is the image; do not align on this signal.

† Turn the dial back and forth slightly (rock) and adjust padder until peak output is obtained. After this adjustment check previous adjustments for interlocking effects.

RECEIVER STAGE SENSITIVITIES

The table below lists the sensitivity at the input of each stage. The receiver should be tuned to 1000 kc for all readings on the standard broadcast band and to 10 mc for the short-wave readings. All measurements are based on an output of 50 milliwatts. This may be measured by disconnecting the speaker voice coil and substituting a 3.2-ohm, 5-watt resistor across the secondary winding of the output transformer. A reading of 0.4 volts AC across this resistor will be equivalent to a 50-milliwatt output with the speaker connected.

The signal source must be an accurately calibrated signal generator capable of supplying the frequencies designated, modulated 30% with a 400-cycle audio signal. Variations in sensitivities of plus or minus 25% are usually permissible.

The volume control should be set at maximum, and the tone control at maximum treble.

SIGNAL GENERATOR				INPUT FOR 50-MILLIWATT OUTPUT
Frequency	Coupling Capacitor	Connection to Radio	Ground Connection	
10 mc	400 ohms	Antenna lead	Ground lead	18 microvolts
1000 kc	200 mmf	Antenna lead	Ground lead	10 microvolts
10 mc	.1 mf	Converter (1A7GT) grid cap	Ground lead	32 microvolts
1000 kc	.1 mf	Converter (1A7GT) grid cap	Ground lead	35 microvolts
455 kc	.1 mf	Converter (1A7GT) grid cap	Ground lead	32 microvolts
455 kc	.1 mf	First I.F. (1N5GT) grid cap	Ground lead	630 microvolts
455 kc	.1 mf	Second I.F. (1N5GT) grid cap	Ground lead	.01 volt
400 cycles	.1 mf	Audio amp. (1H5GT) grid cap	Ground lead	.06 volt
400 cycles	.1 mf	Power amp. (1A5GT) grid (pin 5)	Ground lead	3 volts

ALIGNMENT PROCEDURE

MECHANICAL ADJUSTMENT—The core tuning bar (see illustration of coils below) and dial pointer must be adjusted mechanically before any electrical alignment is attempted. Rotate the manual tuning control until the core bar is farthest from the coils. For proper adjustment the bar should be approximately 1/32 of an inch from the two rod guide angles.

With the core bar in this position, adjust the dial pointer to coincide with 1600 kc on the dial scale

Rotate the core of each of the three broadcast coils (see illustration) until the end of the core is 1-5/32" from the end of the coil form. Rotate the three 9-mc cores until this dimension is 1-1/6" for these coils. After these adjustments have been made, the unit can be aligned electrically.

ELECTRICAL ADJUSTMENT—To align the set make the following preliminary adjustments: Set the tone pushbutton for treble tone; set the volume control at maximum; connect the ground post of the signal generator to the radio chassis; connect the output meter across a 3.2-ohm output load; and allow the receiver and signal generator to warm up for several minutes.

Align the set according to the sequence given in the chart. The indicated coupling capacitor is to be connected in series between the signal generator output lead and the receiver. Adjust the set for maximum output; reduce the input as needed to keep the output near 1.3 volts.

Locations of all the trimmers and coils are shown in the illustrations below. After adjustment, seal the coil cores with collodion or a similar substance (do not use cement).

BAND SWITCH SETTING	SIGNAL GENERATOR			DIAL POINTER SETTING	ADJUST TO MAXIMUM OUTPUT IN ORDER SHOWN

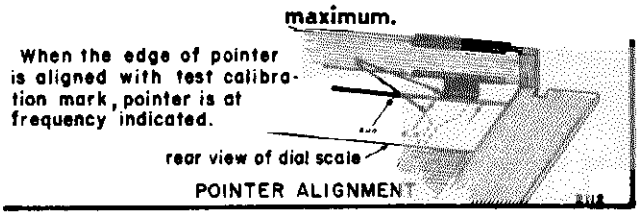
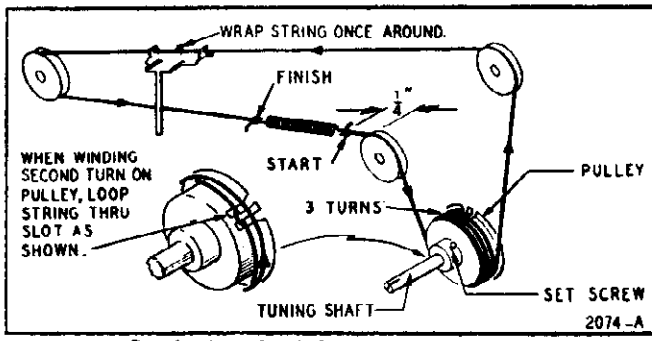
MONTGOMERY WARD

Frequency Ranges.....Broadcast band—540 to 1600 kc.
49-meter band—5.96 to 6.19 mc.
31-meter band—9.1 to 10 mc.
25-meter band—11.45 to 12.16 mc.
19-meter band—14.94 to 15.46 mc.
Intermediate Freq....455 kc.
Selectivity.....at 1000 kc, 35 kc at 1000 x signal
Sensitivity.....3.75 microvolts average for ½ watt output.
Power Output.....5.5 watts undistorted, 7.5 watts maximum.





Replacing Dial Pointer Drive Cord

After stringing, spring must be 1/4" from idler when tuning shaf is in extreme counterclockwise position. To do this: Loosen set screw hold tuning shaft firm and turn pulley by hand until spring is 1/4 from idler; tighten screw.

RECEIVER STAGE SENSITIVITIES

The table below lists the sensitivities at the inputs of various stages. All measurements are based on an output of ½ watt. This may be measured by disconnecting the speaker voice coil and substituting a 3.2-ohm resistor across the secondary winding of the output transformer. A reading of 1.3 volts AC across this resistor will be approximately equivalent to a ½-watt output with the speaker connected. The volume control must be set at maximum.

The signal source must be an accurately calibrated signal gene rator capable of supplying the frequencies designated, modulate 30% with a 400-cycle audio signal. Variations in sensitivities of plu or minus 25% are usually permissible.

BAND	SIGNAL GENERATOR				INPUT FOR 500-MILLIWATT OUTPUT
	Frequency	Dummy Antenna	Connection to Receiver	Ground Connection	
Broadcast	1000 kc	200 mmf	External Antenna clip	Chassis	3.5 microvolts
	1000 kc	.1 mf	Grid (pin 4) of R. F. amp. (6SK7)	Chassis	8.9 microvolts

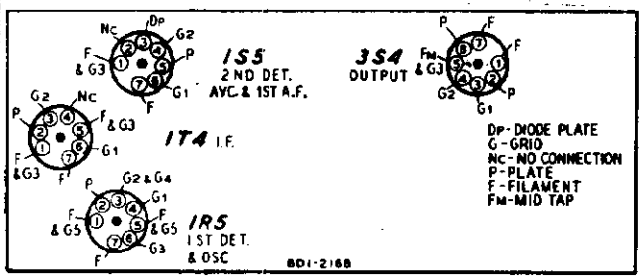
* IN MODEL 64WG-1050B, C-11 IS CONNECTED TO -B FROM PIN NO.1 OF 1R5 SOCKET INSTEAD OF TO CHASSIS GROUND.

IF PEAK 455 KC



TUBE SOCKET VOLTAGES

Socket voltages are shown on the schematic diagram at the tube socket terminals. All voltages except those for the filaments are between the socket terminal and the black or negative lead on C-17.

The readings were taken with a 1000 ohm per volt meter and all plate and screen voltages read on a 500 volt scale. Conditions of measurement are:

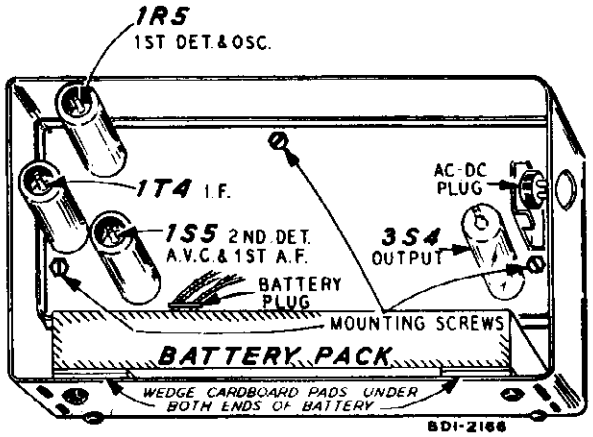
Line voltage	117 volts AC
Volume control	maximum
Signal input	none

A variation of ±10% is usually permissible.

MODELS 64WG-1050A,
64WG-1050B

MONTGOMERY WARD

The table below lists the sensitivity at the input of each stage. The receiver should be tuned to 1000 KC for all readings. All measurements are based on an output of 50 milliwatts. This may be measured by disconnecting the speaker voice coil and substituting a 3.2 ohm 5 watt resistor across the secondary winding of the output transformer. A reading of .4 volts across this resistor will be equivalent to a 50 milliwatt output with the speaker connected. The volume control must be set to maximum.
The signal source must be an accurately calibrated signal generator capable of supplying both 1000 KC and 455 KC signals modulated 30% with a 400 cycle audio signal. Variations of plus or minus 25% are usually permissible.



SIGNAL GENERATOR				INPUT FOR 50 MILLIWATT OUTPUT
Freq.	Coupling Capacitor	Connection to Receiver	Ground Connection	
1000 kc	.05 mf	1R5 Mixer Pin 6	C-17 Black Lead	148 microvolts
455 kc	.05 mf	1R5 Mixer Pin 6	Same as above	118 microvolts
455 kc	.05 mf	1T4 IF Amp. Pin 6	Same as above	5000 microvolts
400 cycles	.05 mf	1S5 2nd Det. Pin 6	Same as above	.068 Volts
400 cycles	.05 mf	3S4 Output Pin 3	Same as above	4.2 volts

Volume Confrol — Maximum All Adjustments.

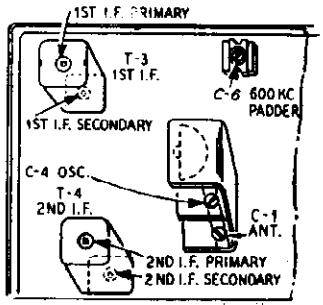
Allow Chassis and Signal Generator to "Heat Up" for several minutes.

The following equipment is required for aligning.

A Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.

Output Indicating Meter — Non-Metallic Screwdriver.

Dummy Antenna—.1 mf.



SIGNAL GENERATOR				RECEIVER	
Frequency Setting	Coupling Capacitor	Connection to Radio	Ground Connection	Condenser Setting	Adjust for maximum output. See trimmer illustration.
Remove chassis from case (See paragraph Removal of Chassis From Case) and temporarily solder a 50,000 ohm resistor across the two antenna leads on the chassis.					
455 kc	.1 mf	Control Grid 1R5—Pin 6	Chassis	Rotor to full open	1st IF Pri. & Sec. 2nd IF Pri. & Sec.
Remove temporary resistor, replace chassis in case and solder antenna leads to hinges.					
1610 kc	.1 mf	Door Hinge Above Tuning Control	Chassis	Rotor to full open	Oscillator (C-4)
1500 kc	.1 mf	Door Hinge Above Tuning Control	Chassis	Turn Rotor to Maximum Output	Set Tuning Knob at 1500 kc
1400 kc		Loop See Note A	Loop See Note A	Turn Rotor to Maximum Output	Antenna (C-1)
600 kc		Loop See Note A	Loop See Note A	Turn Rotor to Maximum Output	600 kc (C-6) Rock Rotor—See Note B
1400 kc		Loop See Note A	Loop See Note A	Turn Rotor to Maximum Output	Antenna (C-1)

NOTE A: Connect a loop approximately one foot in diameter across the antenna and ground posts of the signal generator. Place radio approximately 2 feet from loop.

NOTE B: Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

MODEL 64WG-1050A

To remove the chassis from the case it will be necessary to remove the line cord if connected, and the back panel from the case. Open the front cover and carefully remove the two control knobs and the screw on the front panel above the tuning knob at the side of the ON-OFF switch plunger. Withdraw the battery pack from the case and disconnect the plug connecting to the battery pack. Then remove the 3 chassis mounting screws protruding above the chassis as shown in the tube position illustration. Carefully lift the chassis, and move it over into the battery space. Unsolder the two antenna wires at the door hinges.

OPERATING VOLTAGES—Chassis for Model 64WG-1050A are available for operation on the following power supplies:

Power Line — 105-125 Volts AC 50-60 Cycles or 105-125 Volts DC

Battery — Wards Battery Pack No. 62-32 — A Section 1.5 Volts, B Section 60 Volts

REMOVAL OF CHASSIS FROM CABINET

Pull off the three control knobs and disconnect the battery plug. Unwrap the power cord from the radio at the top of the cabinet if necessary. Remove the four screws that fasten the chassis to the cabinet (2 on the outside at each end of the cabinet). Tip the chassis slightly forward and at the same time withdraw it from the cabinet.

TRANSFORMERS AND COILS

Volume Control—Maximum All Adjustments.

Allow Chassis and Signal Generator to "Heat Up" for several Minutes.

The equipment in column at right is required for aligning:

Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.

Output Indicating Meter; Non-Metallic Screwdriver.

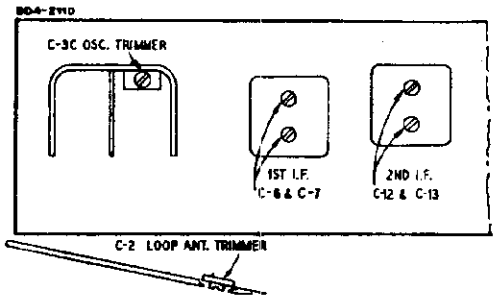
Dummy Antenna—.1 mf., 50 mmf.

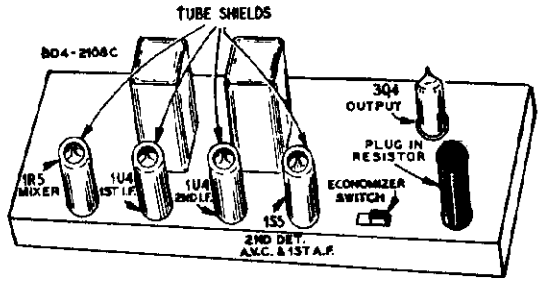
SIGNAL GENERATOR				CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM See Trimmer Illustration
Frequency Setting	Coupling Capacitor	Connection to Radio	Ground Connection		
455 kc	.1 mf	Control Grid 1U4—1st I-F Pin 6	Point "X" At Electrolytic Capacitor Black Lead	Turn Rotor to full open	2nd I-F (C13) & (C12)
455 kc	.1 mf	Control Grid 1R5—Mixer Pin 6 See Note C	Same as above	Turn Rotor to full open	1st I-F (C7) & (C6)
1620 kc	.1 mf	Control Grid 1R5—Mixer Pin 6	Same as above	Turn Rotor to full open	Oscillator (C3C)
1400 kc	50 mmf	External Antenna Clip on Loop See Note A	External Ground connection on loop	Turn Rotor to Max. Output Set Indicator to 1400 KC See Note B	Antenna (C2)

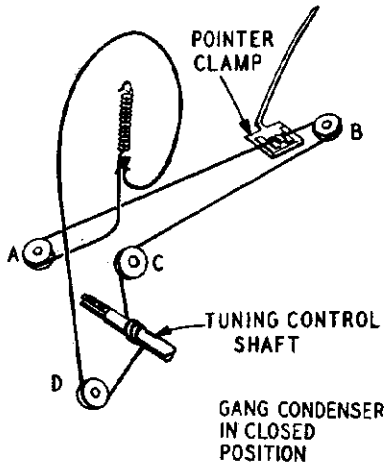
NOTE A—Re-assemble chassis in cabinet and close the cabinet back before making adjustment.

NOTE B—Tune in a 1400 KC signal. If pointer is not at the 1400 KC mark on the dial scale, move the pointer on the string to the 1400 KC mark.

NOTE C—Short out the oscillator section of the gang condenser for this adjustment only.





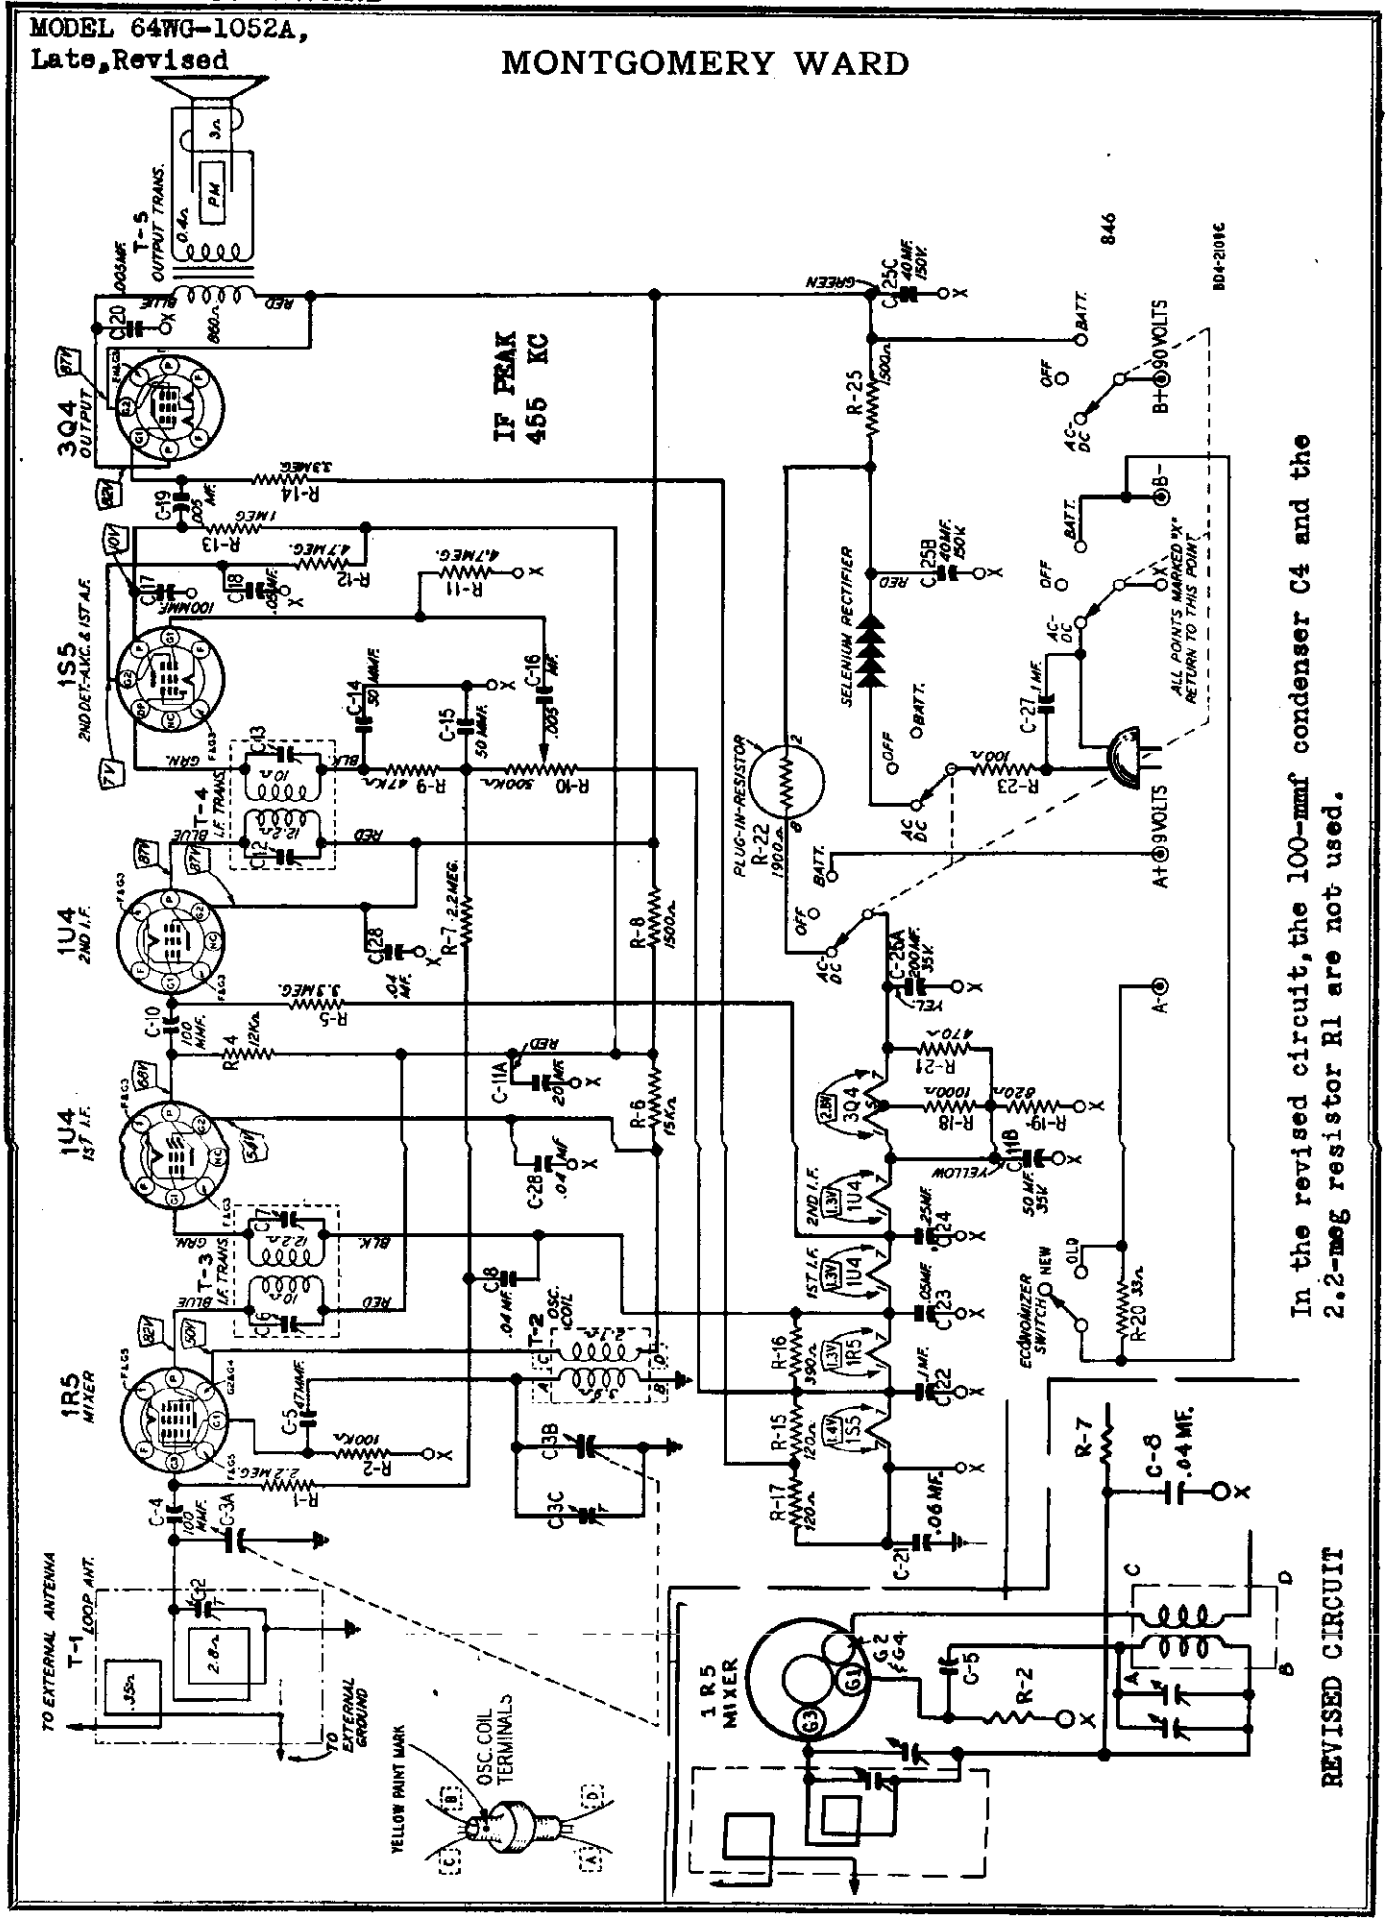


DRIVE CORD REPLACEMENT

Turn the gang condenser to the fully closed position. Use a new cord 23" long and tie one end to the tension spring. Fasten the other end of the tension spring to the hook on the drive pulley. Pass the cord through the slot in the drive pulley rim and continue around pulley rim ¼ turn clockwise. Pass cord around pulleys A, B, and C as shown in the illustration. Wind three turns clockwise (viewed from rear of chassis) around tuning control shaft. The turns must progress toward rear of chassis. Pass cord around pulley D and continue ¾ turn clockwise around large drive pulley. Pass cord through the slot in the pulley rim then stretch the tension spring and tie free end of cord to it. Cut off any excess string.

MODEL 64WG-1052A,
Late, Revised

MONTGOMERY WARD



MODEL 64 WG-1052A

RECEIVER STAGE SENSITIVITIES

The table below lists the sensitivity at the input of each stage. The receiver should be tuned to 1000 KC for all readings. All measurements are based on an output of 50 milliwatts. This may be measured by disconnecting the speaker voice coil and substituting a 3.2 ohm 5 watt resistor across the secondary winding of the output transformer. A reading of .4 volts AC across this resistor will be equivalent to a 50 milliwatt output with the speaker connected. The volume control must be set to maximum.
The signal source must be an accurately calibrated signal generator capable of supplying both 1000 KC and 455 KC signals modulated 30% with a 400 cycle audio signal. Output variations of Plus or Minus 25% are usually permissible.

SIGNAL GENERATOR				
Frequency	**Coupling Capacitor**	**Connection to Receiver**	**Ground Connection**	**INPUT FOR 50 MILLIWATT OUTPUT**
1000 kc	200 mmf or RMA Dummy Antenna	Loop Antenna—External antenna clip	Chassis	20 microvolts
1000 kc	.05 mf.	1R5 Mixer—Pin 6	Point "X" (1S5 Pin 1)	30 microvolts
*455 kc	.05 mf.	1R5 Mixer—Pin 6	Same as above	15 microvolts

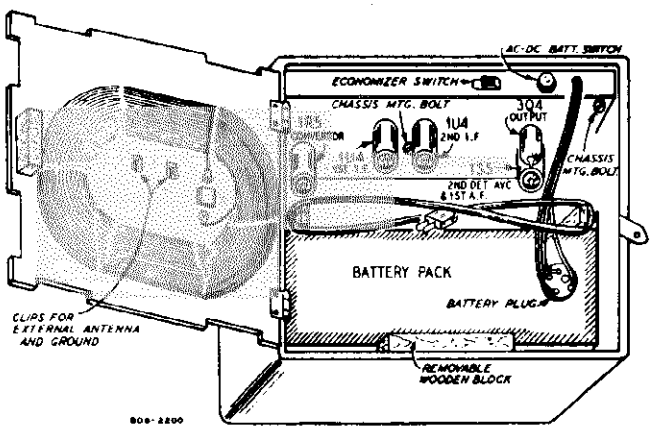
Battery Pack.....Ward's Battery Pack No. 62-33

Loud Speaker.....5” PM dynamic
Voice Coil Impedance..3.2 ohms at 400 cycles

MONTGOMERY WARD

REMOVAL OF CHASSIS FROM CABINET

To remove the chassis from the cabinet, it is necessary to pull off the 2 control knobs, disconnect the battery and then unscrew the 2 screws fastening the chassis to the cabinet. (The 2nd I-F Tube must be removed in order to reach the mounting screw in the center of the chassis.) Se the tube position illustration for the location of these screw After these screws have been removed, carefully pull o the chassis taking care not to damage the connections the loop antenna.



TUBE SOCKET VOLTAGES

Socket voltages are shown on the schematic diagram at the tube sock terminals. All voltages except those for the filaments are between tl socket terminal and "X" point.

The readings were taken with a 1000 ohm-per-volt meter and all pla and screen voltages read on a 500 volt scale. Conditions of measur ment are:

Line voltage.....117 volts AC
Volume control.....maximum
Signal input.....none

A variation of ±10% is usually permissible.

455 kc	.1 mf	Control Grid 1U4 1st I-F Pin 6	Point "X" At Electrolytic Capacitor Black Lead	Turn Rotor to full open	2nd I-F (C-15A) & (C-15
455 kc	.1 mf	Antenna Wire connecting to Stator of Antenna Section of Tuning Condenser	Same as above	Turn Rotor to full open	1st I-F (C-7A) & (C-7B)
1620 kc	.1 mf		Same as above	Turn Rotor to full open	Oscillator (C-3)
1400 kc	50 mmf	External Antenna Clip on Loop See Note A	External Ground connection on loop	Turn Rotor to Max. Output Set Indicator to 1400 KC See Note B	Antenna (C-1)

NOTE A—Re-assemble chassis in cabinet and close the cabinet back before making adjustment.

NOTE B—Tune in a 1400 KC signal. If pointer is not a the 1400 KC mark on the dial scale, pull pointer off shaft Set pointer at the 1400 KC mark and push back on shaft

MODEL 64WG-1054A

MONTGOMERY WARD

RECEIVER STAGE SENSITIVITIES

The table below lists the sensitivity at the input of each stage. The receiver should be tuned to 1000 KC for all readings. All measurements are based on an output of 50 milliwatts. This may be measured by disconnecting the speaker voice coil and substituting a 3.2 ohm 5 watt resistor across the secondary winding of the output transformer. A reading of .4 volts AC across this resistor will be equivalent to a 50 milliwatt output. The volume control must be set to maximum.

The signal source must be an accurately calibrated signal generator capable of supplying both 1000 KC and 455 KC signals modulated 30% with a 400 cycle audio signal. Variations in sensitivity of Plus or minus 25% are usually permissible.

SIGNAL GENERATOR				INPUT FOR 50 MILLIWATT OUTPUT
Frequency	Coupling Capacitor	Connection to Receiver	Ground Connection	
1000 kc	200 mmf or RMA Dummy Antenna	Loop Antenna—External antenna clip	Chassis	15 microvolts
1000 kc	.05 mf.	1R5 Mixer—Pin 6	Point "X" (1S5 Pin 1)	30 microvolts
455 kc	.05 mf.	1R5 Mixer—Pin 6	Same as above	20 microvolts
455 kc	.05 mf.	1U4 1st I-F—Pin 6	Same as above	440 microvolts
455 kc	.05 mf.	1U4 2nd I-F—Pin 6	Same as above	2200 microvolts
400 cycles	.05 mf.	1S5 1st A-F—Pin 6	Same as above	.022 volts
400 cycles	.05 mf.	3Q4 Output—Pin 3	Same as above	2.2 volt

REPLACEMENT PARTS LIST

Use only genuine factory tested parts to insure service jobs you can depend on and to obtain original set performance

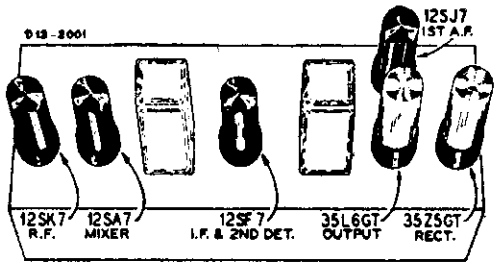
64WG-1809A,-1809B

MONTGOMERY WARD

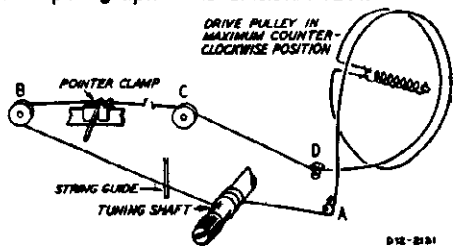


DRIVE CORD REPLACEMENT

Turn the large drive pulley counterclockwise to the stop position. Use a new drive cord 36" long and tie one end to the tension spring. Hook the other end of the tension spring over the tab on the drive pulley. Pass the cord through the slot on the drive pulley rim and continue around pulley 1¼ turns counterclockwise. Pass cord around stud A and wind three turns clockwise (from front of chassis) around the tuning shaft. Turns must progress away from chassis. Run the cord in front of the string guide, then pass cord around pulleys B and C and stud D. Pass cord under drive pulley and wind ¾ turn counterclockwise around drive pulley. Stretch tension spring and tie free end of cord to spring. Cut off any excess string.

Note: On sets having a black vinylite sleeve on the tuning shaft wind only two turns clockwise around the tuning shaft.

Attach the dial pointer to the cord and position, as instructed in paragraph DIAL CALIBRATION.

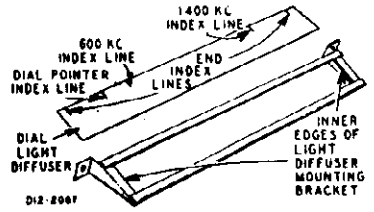


DIAL CALIBRATION

In order to align the receiver, the dial pointer must be positioned on the dial string correctly with reference to the dial. Index lines are provided on the dial light diffuser for this purpose.

Before aligning the receiver (or when replacing the dial light diffuser) check the position of the diffuser strip, making certain that the two end index lines are aligned with the inner edges of the diffuser mounting bracket opening. The bracket should be crimped at one point to prevent movement of the diffuser strip. To position the dial pointer, adjust the radio to the stop position at the low frequency end of the dial. The dial pointer should be directly over the dial pointer index line (see illustration). If not, move the pointer along the drive cord until it is directly over the index line.

The 1400 KC index line is for use when aligning the receiver.



TUNING ASSEMBLY SERVICE

Exacting requirements in the tuning assembly make it impractical to replace the drive cord, coils and components in this assembly other than the trimmer condensers. Should the drive cord break, or components other than the trimmer condensers require service, the entire assembly must be ordered and replaced as a unit.

ALIGNMENT PROCEDURE

Check dial pointer position, see Dial Calibaration paragraph.

Volume Control—Maximum All Adjustments.

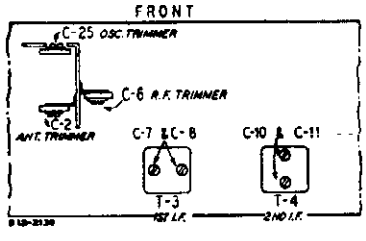
Allow Chassis and Signal Generator to "Heat Up" for several minutes.

The equipment in column at right is required for aligning:

Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.

Output Indicating Meter; Non-Metallic Screwdriver.

Dummy Antennas—.1 mf., 50 mmf.



NOTE A:—Index line is on dial light diffuser strip. See DIAL CALIBRATION paragraph.

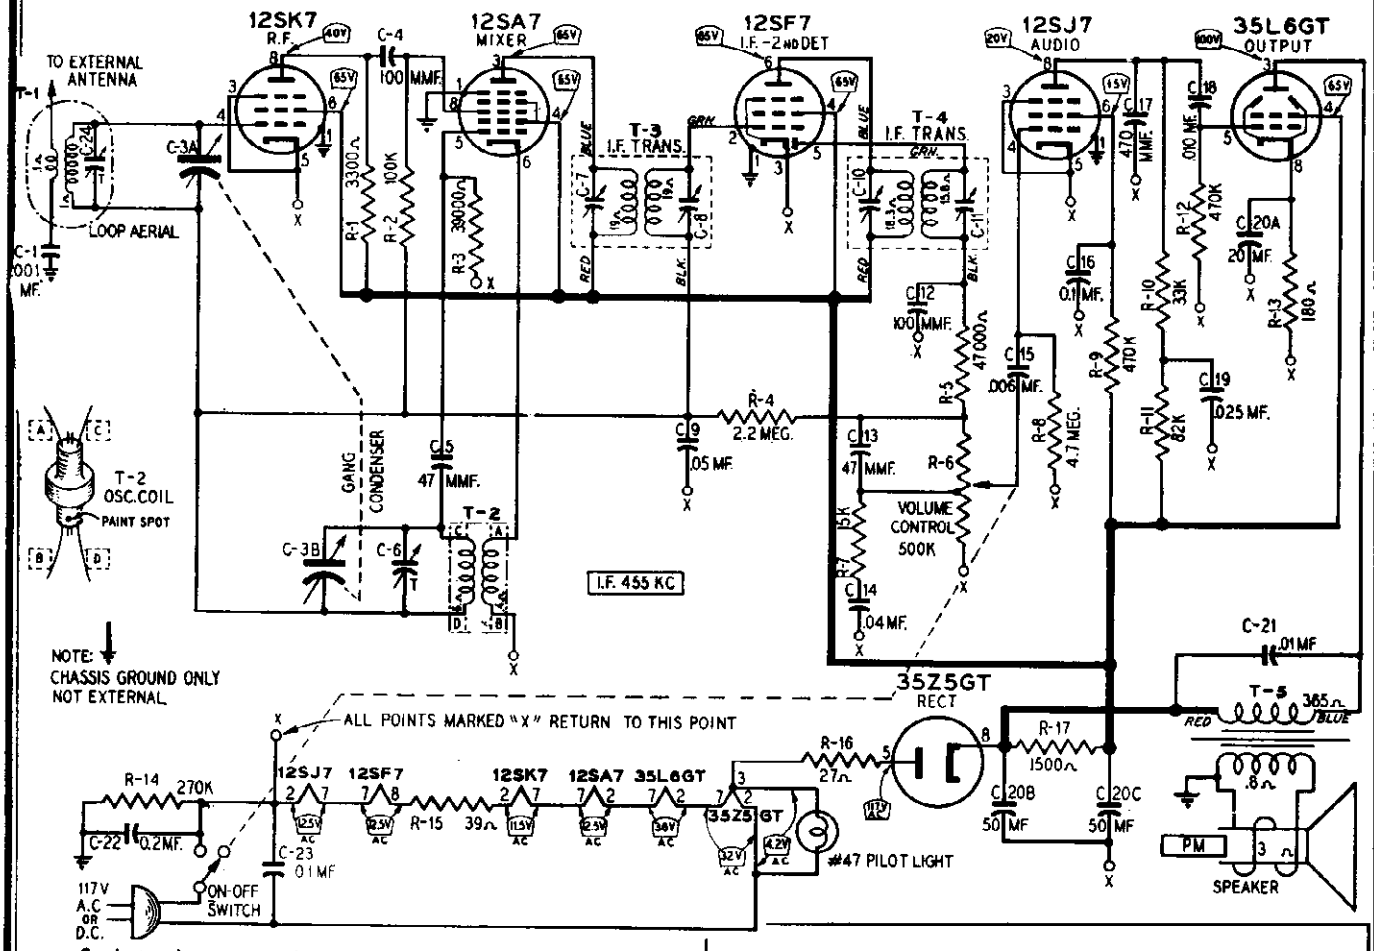
MODEL 64WG-1804A

MONTGOMERY WARD

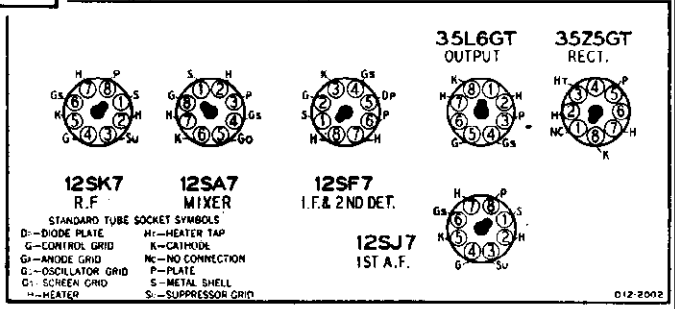


Socket voltages are shown on the schematic diagram at the tube socket terminals. All voltages except those for the heater and dial lamp are between the socket terminal and "X" point.

The readings were taken with a 1000 ohm-per-volt meter and all plate and screen voltages read on a 500 volt scale. Conditions of measurement are:

Line voltage.....117 volts AC
Volume control.....maximum
Signal input.....none

A variation of ± 10% is usually permissible.



The table below lists the sensitivity at the input of each stage. The receiver should be tuned to 1000 KC for all readings. All measurements are based on an output of 50 milliwatts. This may be measured by disconnecting the speaker voice coil and substituting a 3.2 ohm 5 watt resistor across the secondary winding of the output transformer. A reading of .4 volts AC across this resistor will be equivalent to a 50 milliwatt output with the speaker connected. The volume control must be set to maximum. The signal source must be an accurately calibrated signal generator capable of supplying both 1000 KC and 455 KC signals modulated 30% with a 400 cycle audio signal. Variations of Plus or Minus 25% are usually permissible.

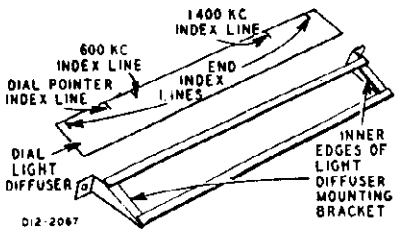
MONTGOMERY WARD

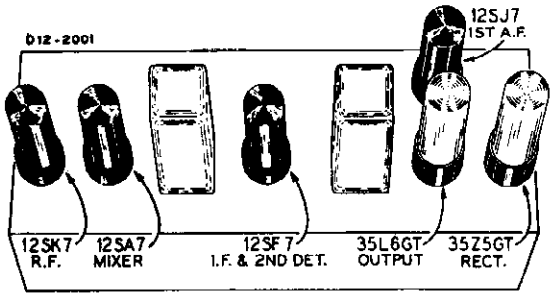
Power Supply.....105-125 volts AC, 50-60 cycles, 35 watts or 105-125 volts DC
Frequency Range.....535-1620 KC
Intermediate Frequency.455 KC
Selectivity.....At 1000 KC, 50 KC wide at 1000 times signal
Sensitivity.....(for .05 watt output with external antenna) 15 microvolts average
Power Output.....1.3 watts maximum
.75 watt 10% distortion
Loud Speaker.....4"x 6" PM dynamic
Voice Coil Impedance...3.2 ohms at 400 cycles

In order to align the receiver, the dial pointer must be positioned on the dial string correctly with reference to the dial. Index lines are provided on the dial light diffuser for this purpose.

Before aligning the receiver (or when replacing the dial light diffuser) check the position of the diffuser strip, making certain that the two end index lines are aligned with the inner edges of the diffuser mounting bracket opening. The bracket should be crimped at one point to prevent movement of the diffuser strip. To position the dial pointer, turn the gang condenser to the fully closed position. The dial pointer should be directly over the dial pointer index line. (See illustration)

The 1400 KC index line is for use when aligning the receiver.

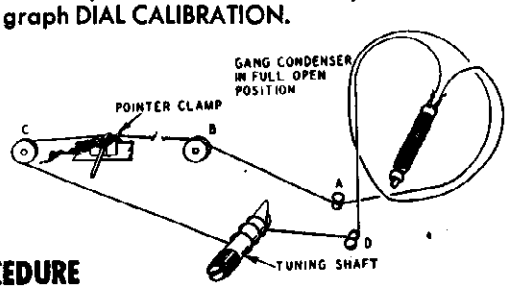




DRIVE CORD REPLACEMENT

Turn the gang condenser to the fully open position. Use new drive cord 36" long and tie one end to the tensio spring. Hook the other end of the tension spring over th tab on the drive pulley. Pass the cord through the slot c the drive pulley rim and continue around pulley ½ tur counterclockwise. Pass cord around stud D and wind thre turns clockwise (from front of chassis) around the tunin shaft. Turns must progress away from chassis. Pass cor around pulleys C and B and stud A. Pass cord under driv pulley and wind 1½ turns counterclockwise around driv pulley. Stretch tension spring and tie free end of cord t spring. Cut off any excess string.

Attach the dial pointer to the cord and position as instructe in paragraph DIAL CALIBRATION.



ALIGNMENT PROCEDURE

Check dial pointer position, see Dial Calibration paragraph.

Volume Control—Maximum All Adjustments.

Allow Chassis and Signal Generator to "Heat Up" for several Minutes.

The equipment in column at right is required for aligning:

Signal Generator which will provide an accurately ca brated signal at the test frequencies as listed.

Output Indicating Meter; Non-Metallic Screwdriver.

TRANSFORMERS AND COILS

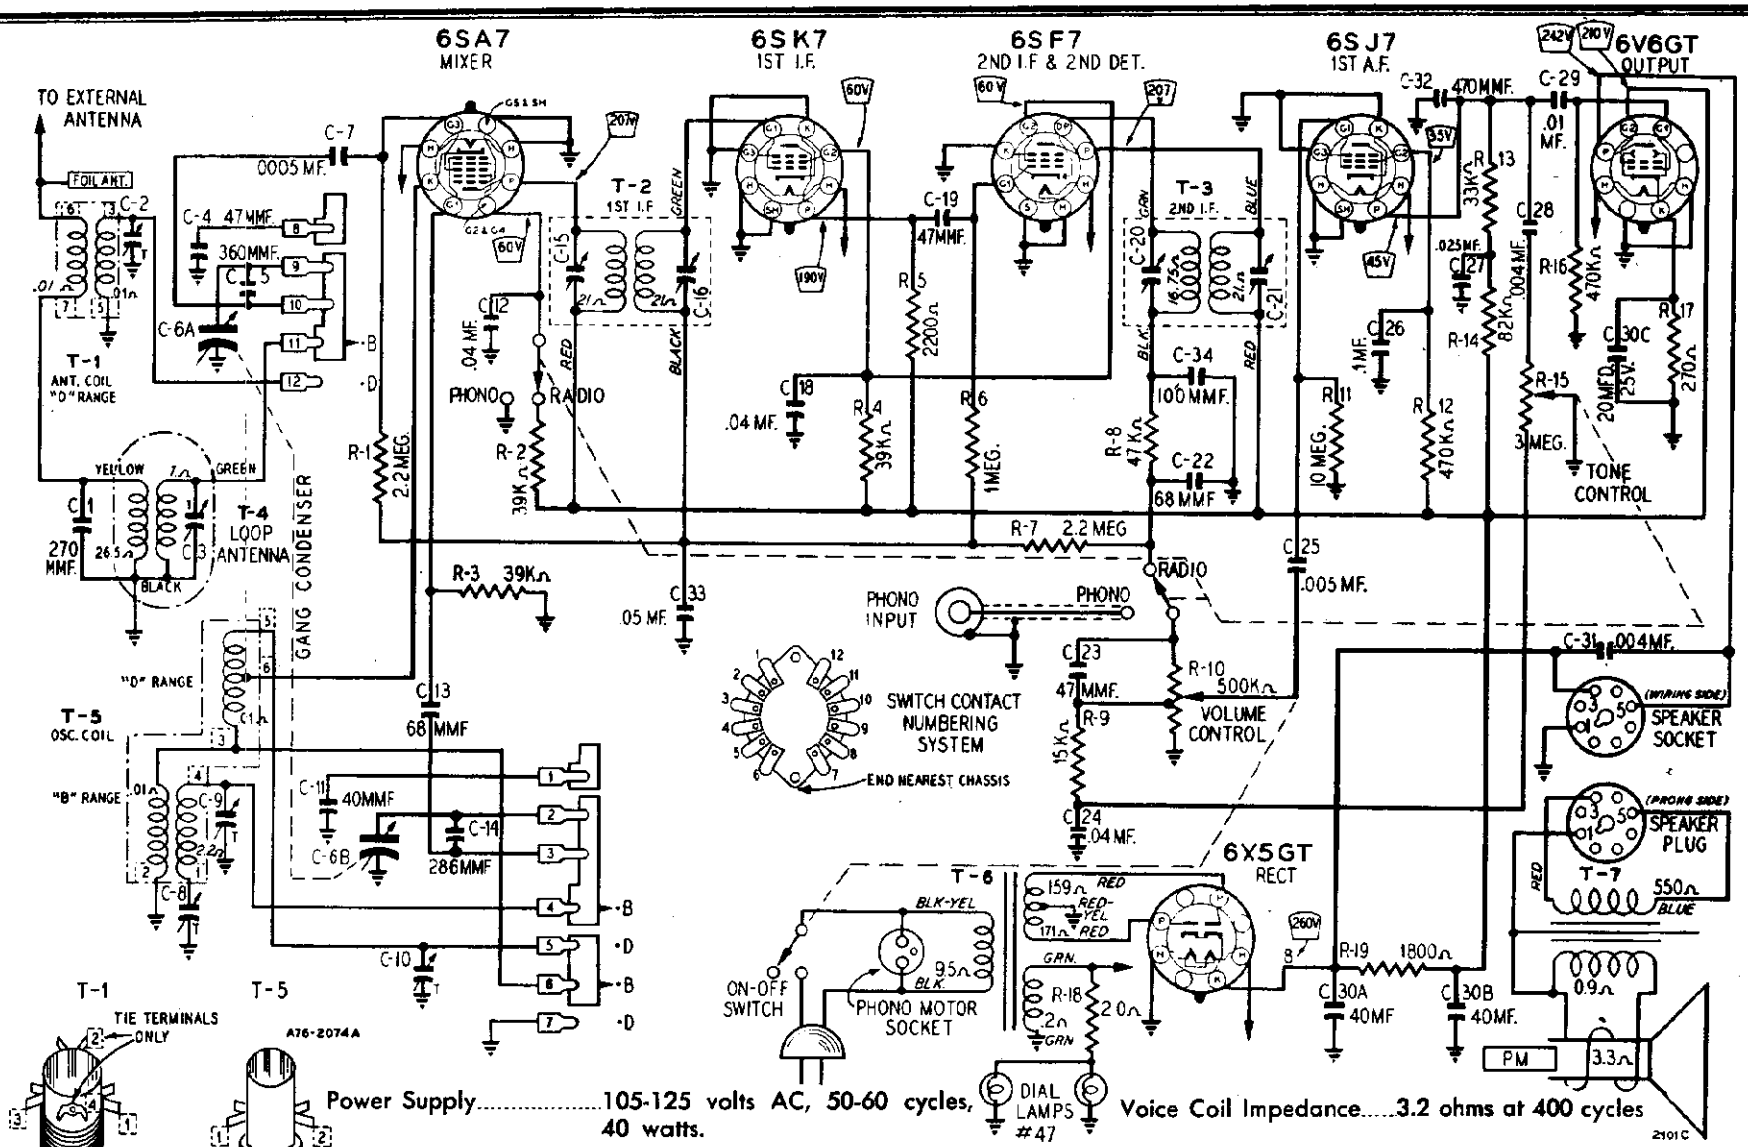
Ref. No.	Part No.	Description	Qty. Used in Set
T-1	9A1804	"B" Range loop antenna (wood mantel)	1
T-2	9A1805	Oscillator coil assembly	1
T-3	9A1775	1st I-F Transformer and can assembly	1
T-4	9A1776	2nd I-F Transformer and can assembly	1
T-5	51X116	Output transformer	1

DIAL AND DRIVE ASSEMBLY

	24X446	Idler pulley	2
	25X1382	Idler bracket	1
	6X21	Rubber grommets (Gang condenser mounting)	3
	57X176	Mounting plate (Gang condenser mounting)	1
	20X329	Cond. cushion stud (Gang condenser mounting)	3
	58X594	Dial (for wood mantel)	1
	25X1461	Dial bracket (for dial 58X594)	1
	25X1384	Pointer bracket	1
	15X217	Pointer	1
	25X1398	Pilot light bracket	1
	7A192	Pilot light socket assembly	1
		Pilot light No. 47	1
		3 ft. drive cord (18 lb. test)	1
	28X44	Drive cord tension spring	1
	26X464	Drive shaft (tuning)	1
	19X192	"C" washer for above drive shaft	2
	41X69	Dial light diffuser	1
	25X1385	Holder, light diffuser	1
	4X884	Escutcheon (wood mantel only)	1
	25X1460	Escutcheon mounting bracket	2

MISCELLANEOUS

	12A431	4" x 6" speaker with mounting bracket 1
		Cone and voice coil assembly for the above speaker (specify part number and letters stamped on above speaker) 1
	3A303	Tube socket—octal (8 prong) molded 5
	3A421	Tube socket—octal (8 prong) with shield 1
	10A297	Knob (walnut) on-off switch, volume control and tuning 2
	28X292	Snap button (mounting loop to cabinet) 2
		6 x ¼" slotted hex head P-K type "Z" screw (mounting loop to chassis) 2
	13X328	Line cord and plug assembly 1



Power Supply.....105-125 volts AC, 50-60 cycles, 40 watts.

Voice Coil Impedance.....3.2 ohms at 400 cycles

TUBE SOCKET VOLTAGES

Socket voltages are shown on the schematic diagram at the tube socket terminals. All voltages are between the socket terminal and chassis ground.

The readings were taken with a 1000 ohm per volt meter and all plate and screen voltages read on a 500 volt scale. Conditions of measure-

Frequency Range.....B range—540-1600 KC
D range—9 to 15.6 MC

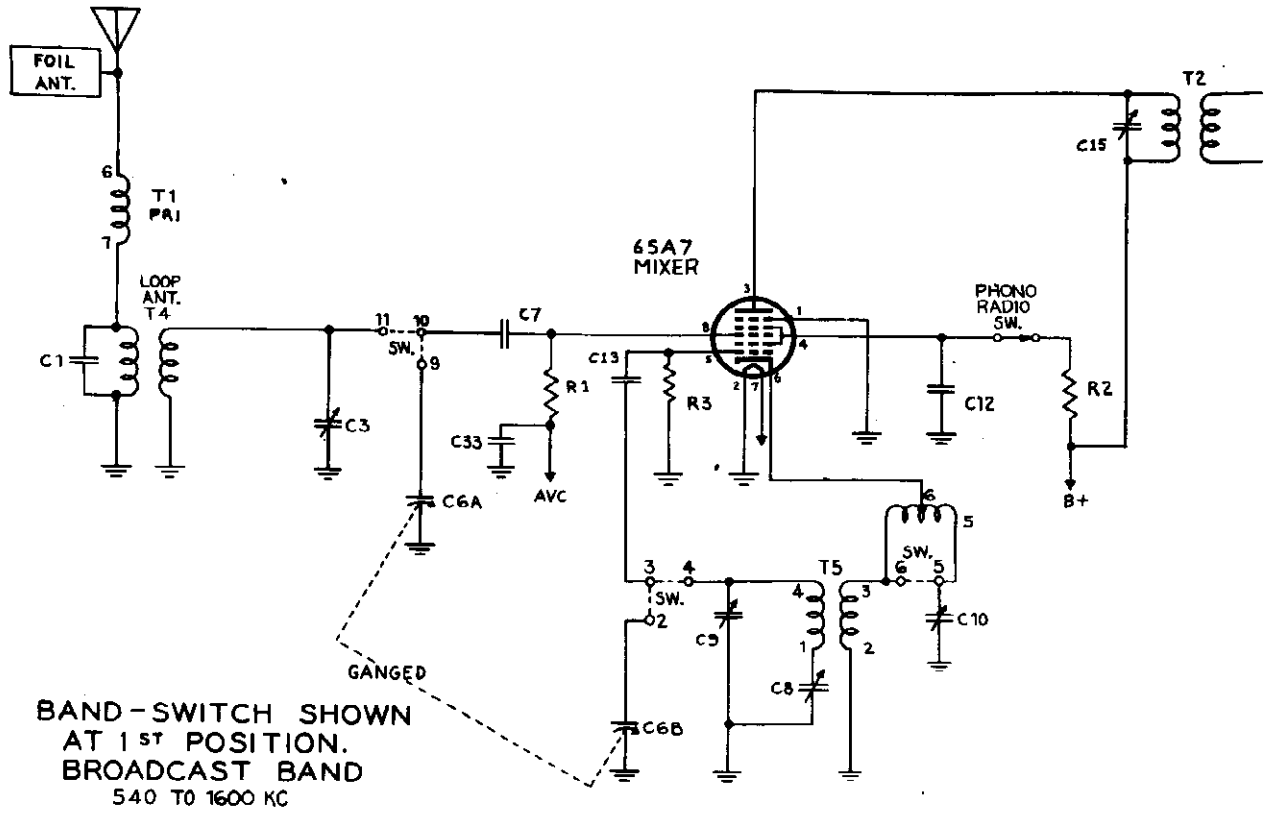
Intermediate Frequency...455 KC

Line voltage..... 117 volts AC 646
Volume control.....maximum
Signal input..... none

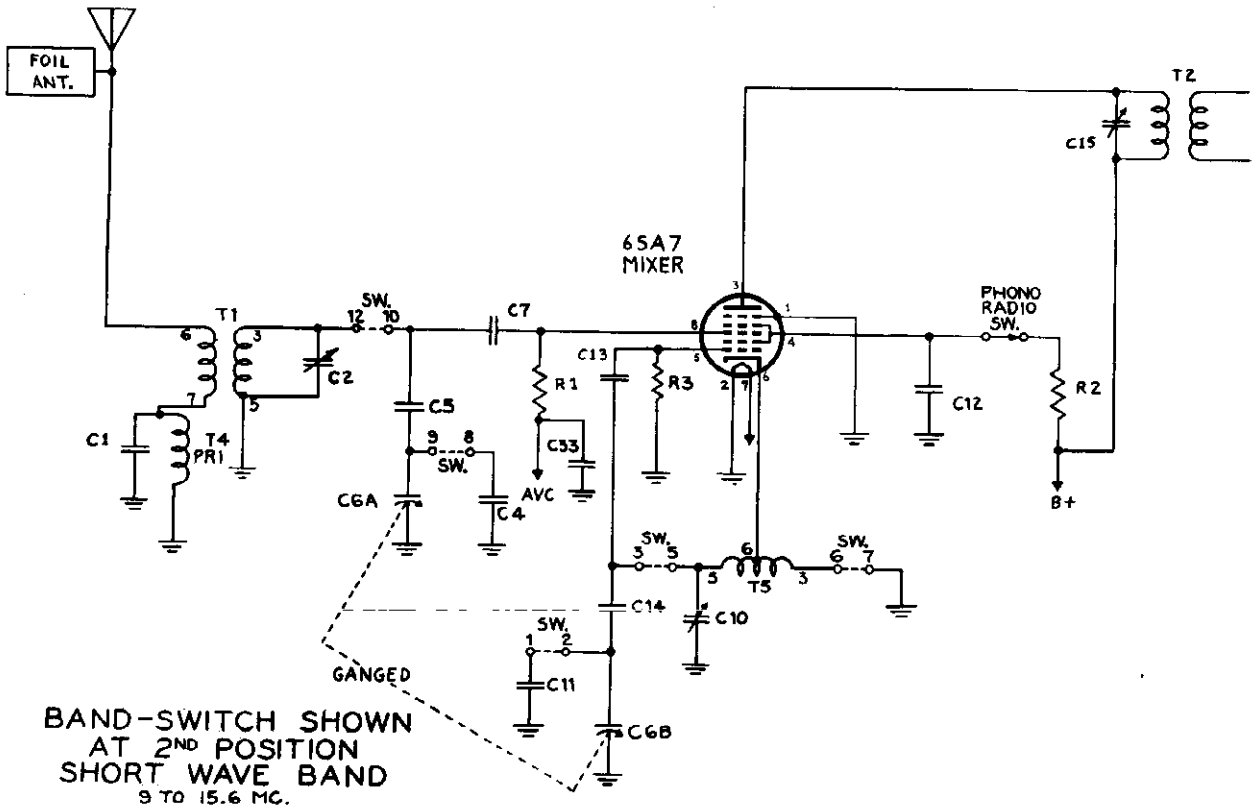
"clarified schematics"

MODEL 64WG-1807A

MONTGOMERY WARD



BAND-SWITCH SHOWN AT 1ST POSITION. BROADCAST BAND 540 TO 1600 KC



BAND-SWITCH SHOWN AT 2ND POSITION SHORT WAVE BAND 9 TO 15.6 MC.

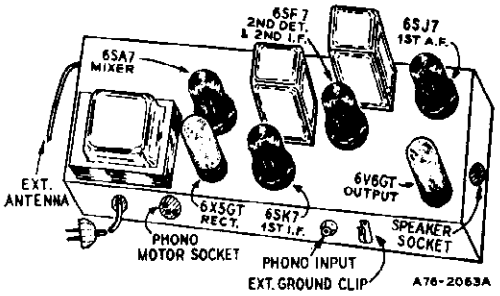
MONTGOMERY WARD

MODEL 64WG-1807A

Selectivity.....40 KC broad at 1000 times signal, 1000 KC

Sensitivity.....(for .5 watt output) with external antenna
B range—9 microvolts average
D range—20 microvolts average

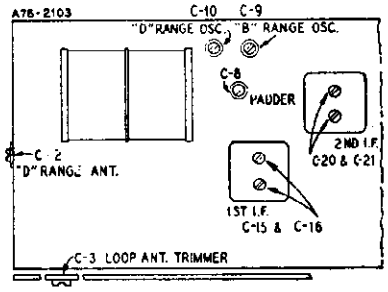
Power Output.....4 watts maximum
2.3 watts, 10% distortion

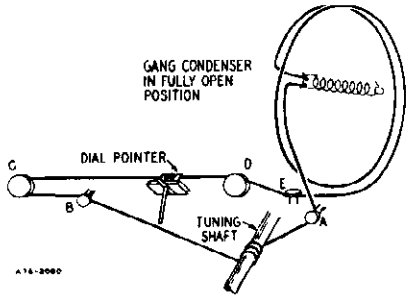


DRIVE CORD REPLACEMENT

Turn the gang condenser to the fully open position. Use a new drive cord 46" long and tie one end to the tension spring. Hook the other end of the tension spring to the tab on the drive pulley. Pass the cord through the slot in the drive pulley rim and continue one half turn counterclockwise around the drive pulley. Then pass the cord around idler stud A and wind three turns clockwise around the tuning shaft (turns must progress away from chassis). Pass cord over idler stud B, around pulleys C and D and around idler stud E. Wrap cord counterclockwise around drive pulley, stretch the tension spring and tie free end of the cord to spring. Cut off any excess string.

TRIMMER POSITIONS





DRIVE CORD DIAGRAM

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.
Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.
Allow Chassis and Signal Generator to "Heat Up" for several minutes.

The following equipment is required for aligning:
An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.
Output Indicating Meter; Non-Metallic Screwdriver.
Dummy Antennas—.1 mf., 100 mmf., and 400 ohms.

	SIGNAL GENERATOR		Dummy Antenna	Band Switch Setting	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM
	Frequency Setting	Connection at Radio				
I-F	455 kc	6SA7, Pin 8	.1 mf	B Range	Turn Rotor to Full Open	2nd I-F (C-20) & (C21) 1st I-F (C15) & (C16)
RANGE B	1620 kc	Antenna Lead	100 mmf	B Range	Turn Rotor to Full Open	Oscillator Range B (C9)
	1400 kc	Antenna Lead	100 mmf	B Range	Tune Rotor to Max. Output Set Indicator to 1400 KC See Note A	Antenna Range B (C3)
	600 kc	Antenna Lead	100 mmf	B Range	Tune Rotor to Max. Output	600 kc (C8) Rock Rotor—See Note B
Repeat above oscillator adjustments at 1620 and 600 KC until readjusting the oscillator Range B Trimmer (C9) causes no further improvement in output.						
RANGE D	15.6 mc	Antenna Lead	400 Ohm	D Range	Turn Rotor to Full Open	Oscillator Range D (C10)
	14 mc	Antenna Lead	400 Ohm	D Range	Tune Rotor to Max. Output	Antenna Range D (C2) Rock Rotor See Note B
LOOP RANGE B	Reassemble chassis in cabinet. 1400 kc	Antenna Lead	100 mmf	B Range	Tune Rotor to Max. Output	Antenna Range B (C3)

After each range is completed, repeat the procedure as a final check.

NOTE A—If the pointer is not at 1400 KC on the dial, re-set pointer at the 1400 KC mark on the dial scale.

NOTE B—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

MODEL 64 WG-1807A RECEIVER STAGE SENSITIVITIES

The table below lists the sensitivity at the input of each stage. The receiver should be tuned to 1000 KC for all readings. All measurements are based on an output of .5 watts. This may be measured by disconnecting the speaker voice coil and substituting a 3.2 ohm, 5 watt resistor across the secondary winding of the output transformer. A reading of 1.26 volts across this resistor will be equivalent to a .5 watt output with the speaker connected. The volume control must be set to maximum. The signal source must be an accurately calibrated signal generator capable of supplying both 1000 KC and 455 KC signals modulated 30% with a 400 cycle audio signal. Variations of Plus or Minus 25% are usually permissible.

SIGNAL GENERATOR				INPUT FOR .5 WATT OUTPUT
Frequency	Coupling Capacitor	Connection to Receiver	Ground Connection	
1000 kc	200 mmf or RMA Dummy Antenna	External antenna lead (white)	Chassis	9 microvolts
1000 kc	.05 mf	6SA7 Mixer, Pin 8	Same as above	42 microvolts
455 kc	.05 mf	6SA7 Mixer, Pin 8	Same as above	40 microvolts
455 kc	.05 mf	6SK7 1st I-F, Pin 4	Same as above	1075 microvolts
455 kc	.05 mf	6SF7 2nd I-F, Pin 2	Same as above	3900 microvolts
400 cycles	.05 mf	6SJ7 1st A-F, Pin 4	Same as above	.08 volts
400 cycles	.05 mf	6V6GT Output, Pin 5	Same as above	3.75 volts

MODEL 64 WG-2009A RECEIVER STAGE SENSITIVITIES

The table below lists the sensitivity at the input of each stage. The receiver should be tuned to 1000 KC for all readings. All measurements are based on an output of 50 milliwatts. This may be measured by disconnecting the speaker voice coil and substituting a 3.2 ohm 5 watt resistor across the secondary winding of the output transformer. A reading of .4 volts AC across this resistor will be equivalent to a 50 milliwatt output with the speaker connected. The volume control must be set to maximum.

The signal source must be an accurately calibrated signal generator capable of supplying both 1000 KC and 455 KC signals modulated 30% with a 400 cycle audio signal. Variations of Plus or Minus 25% are usually permissible.

SIGNAL GENERATOR				INPUT FOR 50 MILLIWATT OUTPUT
Frequency	Coupling Capacitor	Connection to Receiver	Ground Connection	
1000 kc	200 mmf or RMA Dummy Antenna	Loop Antenna—External antenna clip	Chassis	15 microvolts
1000 kc	.05 mf.	12SA7 Mixer—Pin 8	Point "X" (12SK7 Pin 3)	100 microvolts
455 kc	.05 mf.	12SA7 Mixer—Pin 8	Same as above	80 microvolts

TUBE SOCKET VOLTAGES

Socket voltages are shown on the schematic diagram at the tube socket terminals. All voltages except those for the heater and dial lamp are between the socket terminal and "X" point.

The readings were taken with a 1000 ohm-per-volt meter and all plate and screen voltages read on a 500 volt scale.

Conditions of measurement are:

Line voltage.....117 volts AC
Volume control.....maximum

Power Supply.....105-125 volts AC, 60 cycles, 35 watts (55 watts phono operating)

Frequency Range.....540-1600 KC
Intermediate Frequency.455 KC

Selectivity.....At 1000 KC, 50 KC wide at 1000 times signal

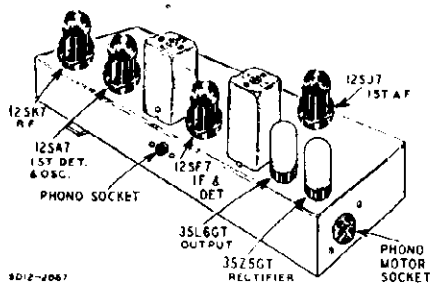
Sensitivity.....(for .05 watt output with external antenna) 15 microvolts average

Power Output.....1.3 watts maximum
.75 watt 10% distortion

Loud Speaker.....4"x6" PM dynamic

MODEL 64WG-2009A

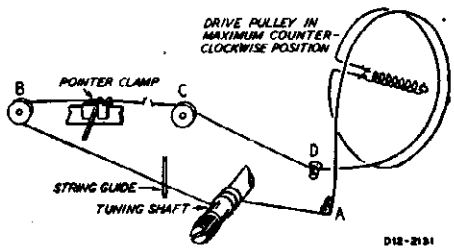
MONTGOMERY WARD



DRIVE CORD REPLACEMENT

The illustration below shows the method of stringing the drive cord. Use a new drive cord 40" long and tie one end to the tension spring. Hook the other end of the tension spring over the tab on the drive pulley. Pass the cord through the slot in the pulley rim and continue counter-clockwise around the pulley as shown. Three turns must be wound around the tuning shaft in a clockwise direction with the turns progressing away from the chassis. (On sets with a black vinylite sleeve on the tuning shaft, wind only two turns around the shaft).

Attach the dial pointer to the cord and position, as instructed in paragraph DIAL CALIBRATION.

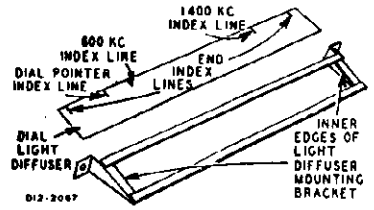


DIAL CALIBRATION

In order to align the receiver, the dial pointer must be positioned on the dial string correctly with reference to the dial. Index lines are provided on the dial light diffuser for this purpose.

Before aligning the receiver (or when replacing the dial light diffuser) check the position of the diffuser strip, making certain that the two end index lines are aligned with the inner edges of the diffuser mounting bracket opening. The bracket should be crimped to prevent movement of the diffuser strip. To position the dial pointer, adjust the radio to the "stop" position at the low frequency end of the dial. The dial pointer should be directly over the dial pointer index line. (See illustration.) If not, move the pointer along the drive cord until it is directly over the index line.

The 1400 KC index line is for use when aligning the receiver.



TUNING ASSEMBLY SERVICE

Exacting requirements in the tuning assembly make it impractical to replace the drive cord, coils and components in this assembly other than the trimmer condensers. Should the drive cord break, or components other than the trimmer condensers require service, the entire assembly must be ordered and replaced as a unit.

50 CYCLE OPERATION

If it is desired to use the radio and record player on a 50 cycle power supply, it will be necessary to install a new bushing on the motor shaft and to wire a 70 ohm, 20 watt resistor in series with the motor and the AC supply.

To install the new bushing, align the upper part of the center spindle with the lower part of the spindle and turn the record shelf to the 12" position. Lift the turntable off the record changer. On record players having a turned metal bushing fastened on with a set screw, loosen the set screw holding the old bushing to the motor shaft, remove the old pulley and install the new bushing No. G-25-72438.

On record players having a spring bushing on the motor shaft, remove the old spring bushing and install a new spring bushing No. G-33-72435.

On record players having no bushing on the motor shaft, install a spring bushing No. G-33-72436.

When replacing the turntable on the record player, make certain that the turntable rim is placed over both of the rubber drive puileys.

ALIGNMENT PROCEDURE

Check dial pointer position, see Dial Calibration paragraph.

Volume Control—Maximum All Adjustments.

Allow Chassis and Signal Generator to "Heat Up" for several Minutes.

The equipment in column at right is required for aligning:

Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.

Output Indicating Meter; Non-Metallic Screwdriver.

Dummy Antennas—.1 mf., 50 mmf.

R.F. Coils

Four coils are used in the chassis, and although they appear to be the same, there are three types and they cannot be interchanged.

To remove any one of the coils, remove the condenser shield, unsolder the wire leading from the condenser stator to the coil lug, remove the bottom plate of the chassis and bend out the three clips which hold the coil shield. Unsolder the leads to the coil and bend the clips holding the coil so that it may be removed. Handle any radio frequency coils carefully so the inside primary coil is not bent out of position. If this happens the receiver will oscillate. You will notice a white wire wound one-quarter turn around the grid end of the secondary having one end soldered to the plate side of the primary. This wire acts as an R.F. coupling condenser and is shown in the schematic diagram Fig. 1 as a condenser. Unless the chassis is damaged it is very rarely that an R.F. coil has to be replaced.

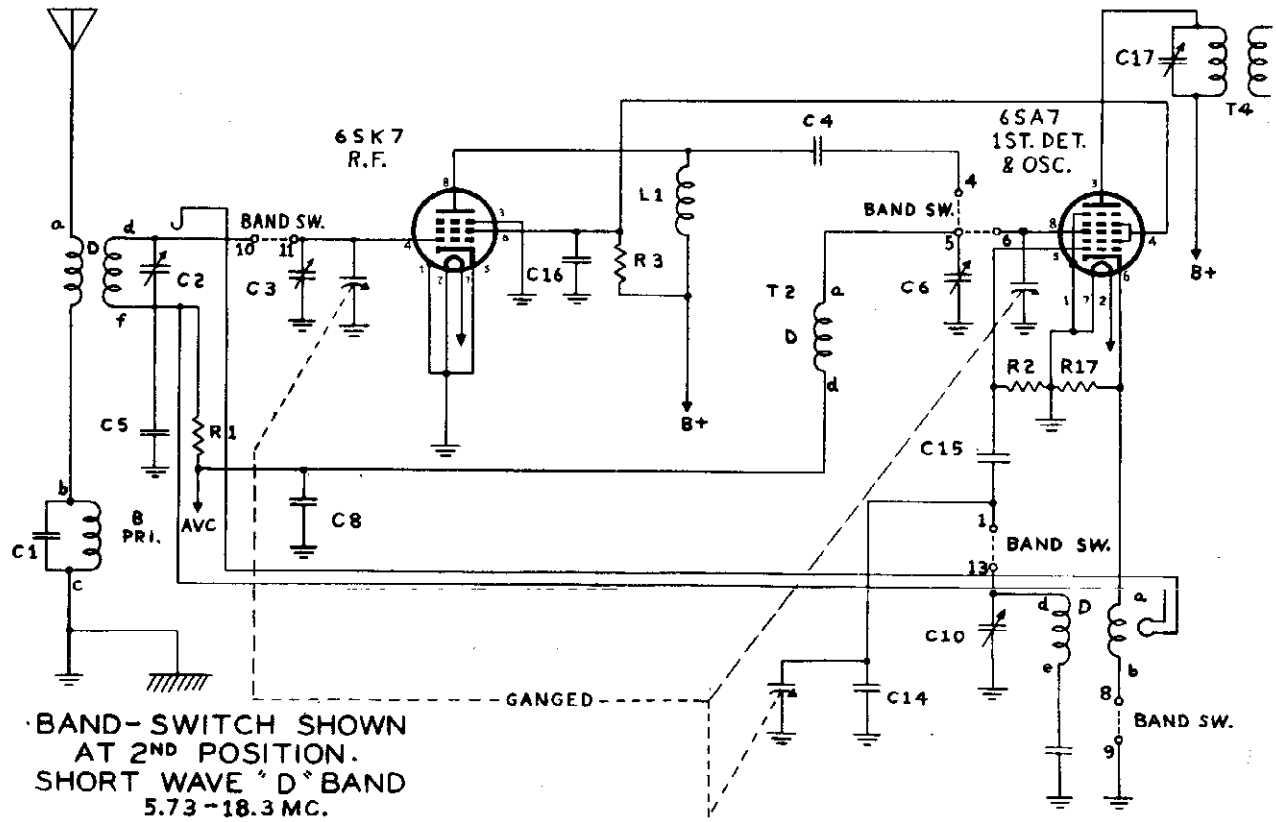
BAND-SWITCH SHOWN AT 1ST POSITION.
BROADCAST "B" BAND
528-1730KC.



BAND-SWITCH SHOWN AT 2ND POSITION.
SHORT WAVE "D" BAND
5.73-18.3 MC.

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for several minutes.

The following equipment is required for aligning:

An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.

Output Indicating Meter—Non-Metallic Screwdriver.

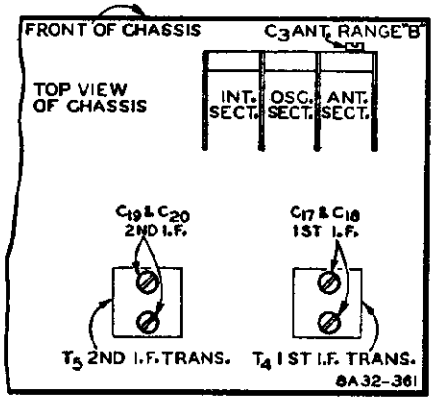
Dummy Antennas—.1 mf., 200 mmf., and 400 ohms.

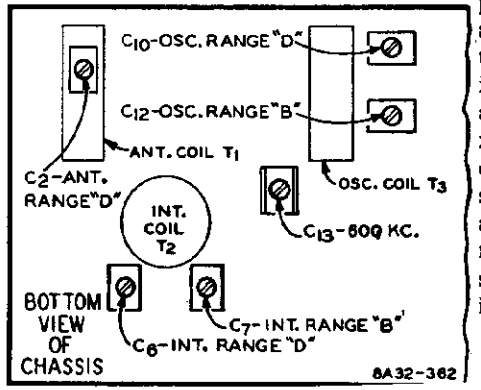
SIGNAL GENERATOR FREQUENCY SETTING	SIGNAL GENERATOR CONNECTION AT RADIO	DUMMY ANTENNA	BAND SWITCH SETTING	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM
I. F.					
456 KC	Grid of 1st Det.	.1 mf.	B Range	Turn Rotor to Full Open	1st I.F. (C17) & (C18) 2nd I.F. (C19) & (C20)
RANGE B					
1730 KC	Antenna Lead	200 mmf.	B Range	Turn Rotor to Full Open	Oscillator Range B (C12)
1500 KC	Antenna Lead	200 mmf.	B Range	Turn Rotor to Max. Output Set Indicator to 1500 KC—See Note A	Ant. Range B (C3) Int. Range B (C7)
600 KC	Antenna Lead	200 mmf.	B Range	Turn Rotor to Max. Output	600 KC (C13) Rock Rotor—See Note B
RANGE D					
18,300 KC	Antenna Lead	400 Ohm	D Range	Turn Rotor to Full Open	Oscillator Range D (C10)
18,300 KC	Antenna Lead	400 Ohm	D Range	Keep Rotor at Full Open Position	Ant. Range D (C2) Int. Range D (C6) Rock Rotor—See Note B

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each range is completed, repeat the procedure as a final check.

NOTE A—If the indicator is not at 1500 KC, it will be necessary to re-calibrate. Loosen the set screw on the dial hub near the volume control drum. Hold the tuning control drum stationary and at the same time turn the dial drum the necessary amount in the required direction. Retighten the set screw.





Tubes

The type and position of each tube are shown in the illustration.

To replace the tuning eye tube, BE SURE THE RADIO IS TURNED OFF. Pull out the escutcheon cap which partially covers this tube. First loosen the tuning eye tube in its socket by moving it up and down and from one side to the other. At the back of the cabinet will be seen a "U" shaped tube puller attached to a cord. Place the open ends of the tube puller over the tuning eye tube and push the puller in as far as it will go. Compress the puller until the hooked end grips under the base of the tube and then pull the tube out.

Power Supply

CAUTION — Unless otherwise marked, this radio must be operated on a 117 volt, 60-cycle AC supply only. Do not insert the plug of the power cord in the receptacle unless all tubes and the speaker plug are in their proper sockets. The power rating of this radio is shown on the tube arrangement label. Receivers of this model which are to be used on 25 cycle, 230 volt, or other service are so marked on this label. If there is any doubt regarding the voltage and frequency of the power supply, consult the local power company before inserting the plug.

Procedure for Setting the Station Buttons

Selecting the Stations to be Set

There are 6 buttons on the automatic tuning dial by means of which 6 stations may be set for quick tuning.

Make a list of your favorite stations, those which you tune in regularly. There may be any number up to and including 6 in this list.

It is better to list the station with the lowest kilocycle number first, the station with the next higher kilocycle number next, and so on.

Any button may be used for any station you can receive, although it will be more convenient to set the stations so that the kilocycle numbers increase from left to right.

Setting a Station Button

Turn the manual tuning control so that the dial moves toward 1700 KC until the stop is reached.

At the right side of the escutcheon (from the front) will be seen a cap which covers a hole in the escutcheon —See illustration. Pull off this cap.

At the end of the tube in back of the hole in the escutcheon is the locking screw. Using a small handle screwdriver, unlock the mechanism by turning this screw in a counter-clockwise direction several turns.

TO SET STATIONS ACCURATELY, DO NOT JAR THE RADIO OR BUTTONS WHILE THE MECHANISM IS UNLOCKED.

Select the first station from the list you have prepared, and carefully tune in this station by means of the manual tuning control using the tuning eye as a guide.

With one hand, hold the manual tuning control to prevent it from turning and with the other hand, push one of the station buttons shown in the illustration *all the way in*. It is better to start with button No. 1.

Hold *this* button all the way *in*. With the other hand, see whether or not this station is still accurately tuned in by moving the tuning control a slight amount back and forth while observing the tuning eye. *Be sure to hold the button all the way in.*

Release the button slowly after the station is tuned in.

CAUTION—Do not touch this button again while the mechanism is unlocked as the setting may be altered.

Carefully tune in the second station on your list. Then hold the tuning control and push the second button slowly and firmly all the way in. Check for accurate tuning.

Proceed in the same manner to set any additional stations on your list on the remaining station buttons.

After all the stations are set, it will be necessary to lock the mechanism so that the settings will not change. Turn the manual tuning control so that the dial moves toward 1700 KC until the stop is reached. Then, with a SMALL HANDLE screwdriver, turn the locking screw in a clockwise direction until it is tight. Tighten the locking screw firmly but not excessively to avoid stripping the threads. Replace the cap over the hole.

Remove the correct station call letter tabs from the sheets supplied by bending the sheet back and forth at the score mark until the tab can be broken off. Press the tab all the way to the bottom of the space provided in the button. Cover the call letter tab with a celluloid tab, pressing this in until it snaps into place.

If at any time you wish to change the setting of a button from one station to another, repeat the above procedure. Changing the setting of one button will not affect the setting of any of the other buttons.

SPECIFICATIONS

Power Consumption 71 Watts (At 117 volts 60 cycles)

Power Output - - - - - - - 3.0 Watts Undistorted, 4.5 Watts Maximum

Selectivity - - 35 KC Broad at 1000 times Signal

Intermediate Frequency - - - - - - - 456 KC

Speaker - - - - - - - - - 8" Electro dynamic

Tuning Frequency Range

B Range..... 528 to 1730 KC
D Range.....5750 to 18300 KC

Sensitivity (For 0.5 watt output)

B Range.....2.0 Microvolts Average
D Range.....4.0 Microvolts Average

Voltages at Sockets

The voltages at sockets are shown on the schematic circuit diagram. Unless otherwise specified, the voltage indicated is between the socket terminal and ground.

These voltages are read under the following conditions:

Line Voltage—117.

Volume Control—Maximum.

Antenna Shorted to Ground.

Readings taken with 1000 ohm-per-volt meter. Plate and screen voltages are read on 500 volt scale.

DIAL ADJUSTMENT:

Mount control head to steering column by means of bracket and strap or under dash by means of bracket or to instrument panel (see illustrations). Attach cables as above. Tune set to some station of a known frequency (between 800 and 1200 K.C.), hold selector knob, then with a screw driver adjust the slotted screw on back of the control head, and in that way adjust the dial pointer to the correct frequency setting.

Part No.	Description	List Price Each
150-24	Selector Shaft—24"	1.50
151-2	Remote Control Head, less flexible shafts, less tone control and pilot assemblies, but with knobs and mounting hardware	4.50
152-1	Antenna cable	.40
152-2	Battery cable	.35
131-5	Black bakelite remote control knobs	.15
146-8	Die Cast Remote Control Mounting Bracket	.30
146-12	Steering Column Strap	.15
168-1	Spark-plug type suppressor	.30
168-2	Distributor plug-type suppressor	.50
168-3	Cable type suppressor	.40
168-4	Special Ford spark-plug suppressor	.35
	Unless otherwise listed, all Carbon Resistors	.20
	Unless otherwise listed, all Single Section Tubular Paper By-Pass Condensers	.25
	Unless otherwise listed, all Dual Section Tubular Paper By-Pass Condensers	.50
	Unless otherwise listed, all Molded Mica Condensers	.25
	All Sockets	.20
167-1	Dynamic Speakers	5.00
	Plate antenna (clamps to frame of car)	2.50

Note: Part No. 145-5 consisting of five separate sections can be replaced with tubular single section condensers at 25c each. It will not be necessary to replace the entire unit should any section thereof fail.

Vibrators can be reconditioned at a cost of $3.00 each, if the old unit is returned.

Part No.	Description	List Price Each
101-9	Volume Control with Switch	$1.35
101-12	Tone Control Assembly, complete	.35
102-7	Three Gang Geared Variable Condenser	4.00
104-6	Vibrator Transformer	3.00
105-3	"A" Choke—40T—No. 16E—½" Dia.	.10
105-4	380 Ohm Filter Choke	.85
106-6	200 Ohm Center Tapped Resistor	.25
106-14	5800 Ohm Metal Clad Resistor	.50
108-20	Input I. F. Transformer completely assembled in can (175 K. C.)	1.50
108-21	Output I. F. Transformer complete with can, but less resistor and Condenser Assembly (175 K. C.)	1.50
	Resistor and Condenser Assembly for 108-21	1.50
109-7	R. F. Coil	.65
110-7	Osc Coil & bracket	1.25
111-7	Antenna Coil	1.25
112-43	Volume Control Shaft complete with knob	.30
115-18	Special partition shield	.20
115-22	Tube shield	.15
116-5	6-8 Volt T-50 pilot lamp	.10
116-6	Pilot light assembly, complete, less bulb	.40
119-4	8-8 Mfd. x 350 Volt Electrolytic Filter Condenser	2.50
142-1	Plug-In Vibrator	5.00
145-5	.4 Mfd. By-Pass Block	1.00
146-14	Special bracket including battery antenna, pilot light and tone control cable fittings, but less antenna coil volume control	.50
148-4	Dual .5 Mfd. 120 Volt Condenser	.75
161-1	20 Ampere fuse	.05
147-1	Selector Control Coupling	.10
147-2	Bushing and bracket complete	.20
147-11	Volume control coupling	.10
135-5	⅝x3" carriage bolt	.05

MODEL 102

MONTGOMERY WARD

TUBE COMPLEMENT:

1—Type 6D6—remote cut-off pentode as an R. F. amplifier.
1—Type 6C6—pentode as an oscillator and first detector.
1—Type 6D6—remote cut-off pentode as an intermediate frequency amplifier (175 K.C.).
1—Type 75 —duplex diode triode second detector automatic volume control and first audio.
1—Type 42 —pentode output tube.
1—Type 84 —high vacuum full wave rectifier.

SERVICE NOTES:

Model 670 is a six tube superheterodyne receiver with an intermediate frequency of 175 kilocycles and a tuning range of from 530 to 1550 kilocycles.

This receiver has been carefully designed to facilitate servicing, the top and bottom covers are both removable, any part is replaceable without removing the chassis from the cabinet. All adjustments are made without removing the chassis from the cabinet.

Should it ever become necessary or desirable to re-align this receiver, the proper method is as follows:

I. F. ALIGNMENT:

1. With variable condenser at its maximum capacity position and with volume control full on, connect in series with a .1 mfd. condenser, an oscillator set at 175 kilocycles to the grid cap of the 6C6 tube.

2. Adjust trimming condensers of both input and output I. F. transformers, parts number 108-20 and 108-21 (see top view of chassis) to resonance with an oscillator, as indicated on an output meter connected across the primary terminals of the speaker input transformer or between the plate and screen terminals of the type 42 output tube. The connection to the tube can be made by means of an adapter. Maximum deflection on the output meter indicates resonance.

Note: Each I. F. transformer has two adjustments, both of these adjustments on both transformers are accessible through holes located in the back of the case between the two mounting plates and directly under the louvres.

R. F. ALIGNMENT:

1. Attach oscillator connected in series with a 200 mmfd. condenser to the antenna lead and with the variable condenser at its minimum capacity position (extreme right of its rotation) and with an oscillator set at 1550 kilocycles, adjust condenser trimmer of oscillator section (Front shaft end) to resonance.

2. Re-set oscillator to 1400 kilocycles, rotate variable condenser to pick up signal, adjust antenna (center section) and R. F. (rear section) trimmers to resonance.

3. Check alignment at 1500-1000-800-600-530 kilocycles by setting oscillator to these frequencies and picking up signal by rotating condenser.

4. Bend slotted plates of antenna and R. F. sections only if necessary. UNDER NO CIRCUMSTANCES BEND PLATES OF OSCILLATOR SECTION.

NOTES:

Voltages from chassis to different points are indicated on schematic circuit diagram, and should be measured with a voltmeter having a resistance of 1000 ohms per volt.

Failure to operate, noisy or weak reception, may be due to defective tubes or poor contact between cap on top of tube and grid clip.

Tubes may be checked by replacing with another tube which is known to be good.

If fuse blows out frequently, and insulating sleeve has been properly placed over fuse, the trouble probably is in the vibrator and vibrator should be replaced.

NEVER ATTEMPT TO ADJUST VIBRATOR POINTS.

Case rattles may be due to one or more of the following:

Loose screws in top or bottom covers. Loose elements in tubes. Loose tube shield. Loose R. F. coil shield. Loose grill cloth.

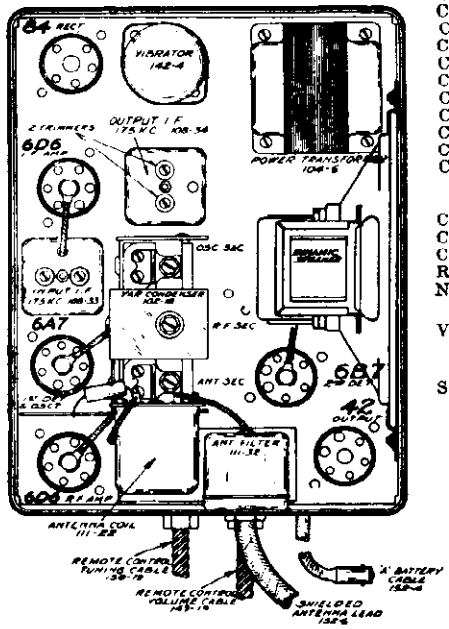
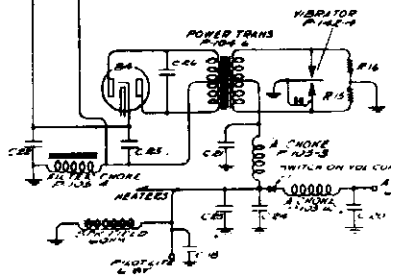
Serial No. 40001 up.





1935

ALIGNING INSTRUCTIONS:

All of the adjustments have been very carefully set with signal generators at the factory and require no further adjustment, unless it becomes necessary to replace a coil or transformer or if the adjustments have been tampered with in the field. Under no circumstances attempt any adjustments without first making certain that adjustment is necessary and only after voltages, tubes and condensers have been checked and found to be normal. To properly re-align this receiver, a test oscillator, as well as an output meter, must be used.

DUMMY ANTENNAS:

The dummy antennas referred to in the following instructions are:

"I.F. Dummy" —A .1 mfd. condenser connected in series with the test oscillator output lead.

"Broadcast Dummy"—A 200 mmfd. condenser connected in series with the output lead of the test oscillator.

RESONANCE INDICATOR:

Use as a resonance indicator an output meter connected across the primary of the speaker input transformer, or by means of an adapter between the plate and the screen of the type 42 output tube. Maximum deflection of the meter indicates resonance. Use only enough signal to get a readily readable output. A low range output meter or the low scale of a multi-range meter should be used.

I.F. ALIGNMENT:

1. With variable condenser in its minimum capacity position (plates entirely out of mesh) and with volume control full on, connect test oscillator set at 175 K.C., in series with I.F. dummy antenna, to the grid cap of the type 6A7 tube.
2. Adjust trimmer condensers of both input (108-33) and output (108-34) I.F. transformers to resonance with oscillator. See top view for location of these transformers. There are two adjustments on each and they are accessible from the top of the transformer shield and should be adjusted with an insulated screw driver.

BROADCAST ALIGNMENT:

1. With variable condenser in its minimum capacity position, connect test oscillator set at 1550 K.C. and in series with broadcast dummy, to the antenna lead of receiver.
2. Adjust oscillator trimmer of variable condenser to resonance (this adjustment is on the end section of the three gang condenser—see top view).
3. Shift test oscillator to 1400 K.C. and pick up signal by rotating condenser and adjust R.F. (center) and antenna (front) trimmers to resonance, see top view.

(a) Check for sensitivity at 1000, 800 and 600 K.C. by setting test oscillator to these frequencies and picking up the signal by rotating variable condenser. Under no circumstances bend plates of oscillator section, bend R.F. and antenna plates only if absolutely necessary.

DIAL ADJUSTMENT:

Tune set to some station of a known frequency (between 800 and 1200 K.C.) hold selector knob, then with a screw driver adjust the slotted screw on the back of the control head, and in that way adjust the dial pointer to the correct frequency setting.

SERVICE NOTES:

Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt. These voltages are clearly indicated on the circuit diagram.

In order to prevent signal from acting upon A.V.C. and affecting accuracy of voltage measurements, aerial and ground leads should be short circuited while making measurements.

All voltages are to be measured with 6.3 volts input to receiver. Resistances of coils and transformer windings are indicated in ohms on schematic circuit diagram.

To check for open by-pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating, which is known to be good, until the defective unit is located.

Failure to operate, noisy or weak reception is usually due to defective tubes, the tubes making poor contact with sockets or grid clips making poor contact with the caps of the tubes. Tubes may be checked very easily by replacing with other tubes which are known to be good. If fuse blows out frequently and insulating sleeve has been properly placed over fuse, the trouble is probably in the vibrator, it should be replaced. Do not attempt to make any adjustments on the vibrators.

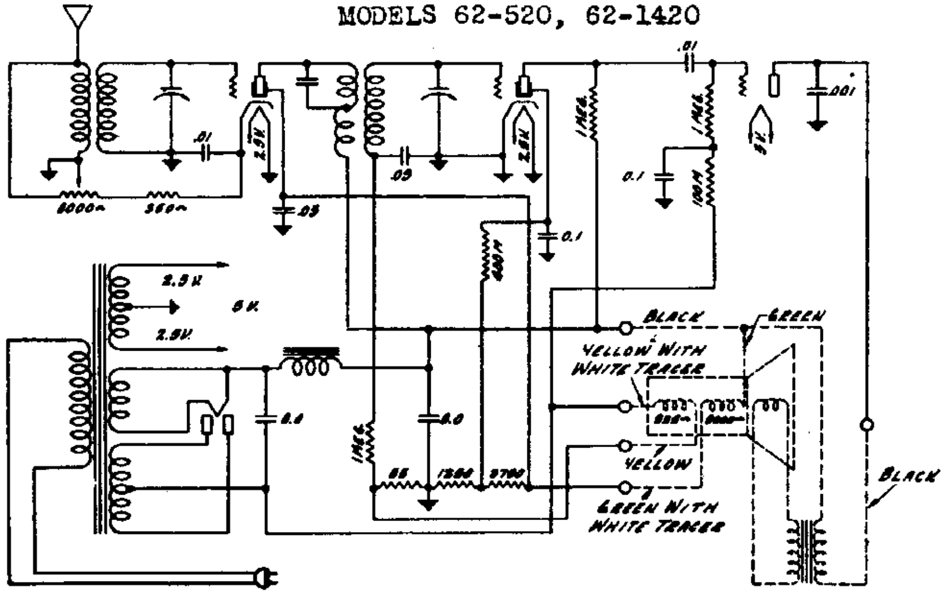
MONTGOMERY WARD

MODELS 62-520, 62-1420



DOTTED LINES SHOWN ARE IN SPEAKER.

2-31

The Model 20W chassis is the same in general design as the 26W chassis used in our five tube midgets, and the general servicing procedure is the same.

The tubes required are—

1—171 A power tube.
2—224 screen-grid tubes.
1—280 rectifier tube.

It is possible to substitute a 235 super control tube for the 224 tube used in the RF portion of this set. When this is done, the 235 super control tube should be used in the socket between the 280 rectifier and the 171 power tube.

ALIGNING INSTRUCTIONS

Dummy Antennas

The following dummy antennas are used in aligning and are referred to in the following alignment instructions as "Dummy 1", "Dummy 2", and "Dummy 3"

Dummy 1: (I.F.)—Consists of a .1 mfd. condenser connected in series with the external oscillator.

Dummy 2: (Broadcast)—Consists of a 200 mmfd. condenser and a 20 ohm resistor connected in series with each other and in series with the external oscillator.

Dummy 3: (Intermediate and Short Wave)—Consists of a .1 mfd. condenser and a 400 ohm resistor connected in series with each other and in series with the external oscillator.

Resonance Indicator:

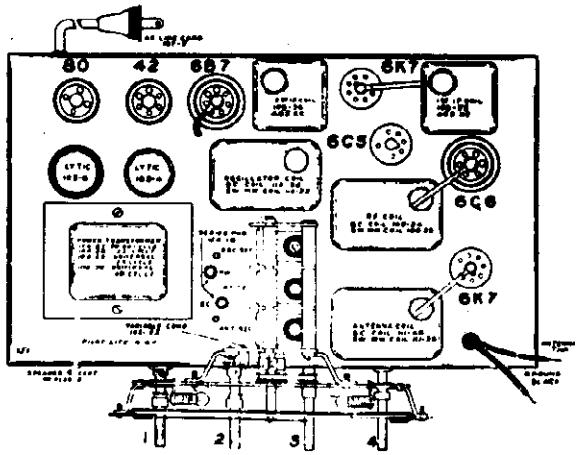
Use as a resonance indicator an output meter connected across the primary of the speaker input transformer or by means of an adapter between the plate and screen terminals of the type 42 output tube. Maximum deflection of the meter indicates resonance. Use only enough signal to get a readily readable output. A low range output meter or the low scale of a multi-range meter should be used.

ALIGNING I.F. TRANSFORMERS (465 K.C.)

Part No. 108-54 Output I.F. Transformer
Part No. 108-56 Input I.F. Transformer

These I.F. transformers have two adjustments, both of which are accessible from the underside of chassis (see bottom view).

1. With volume control full on, (the extreme right of its rotation), the wave changing switch in the broadcast position, (extreme left of its rotation), the tone control on "Hi" part of the sharp position (as much right rotation as possible without operating the Hi Fidelity switch), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments:
   (a) Connect external oscillator set at 465 kilocycles, in series with "Dummy 1", to the control grid cap of the type 6K7 tube, located between the two I.F. transformers, and adjust the output I.F. transformer to resonance.
   (b) With "Dummy 1" still connected, move oscillator output clip from grid of 6K7 to grid cap to 6C6 and adjust input I.F. transformer to resonance.
   (c) With oscillator still connected to 6C6, re-adjust output I.F. transformer.



ALIGNMENT PROCEDURE

The following adjustments to be made after the I.F.'s have been aligned as explained above.

BROADCAST BAND ALIGNMENT:

1. With wave changing switch, in the broadcast position, extreme left of its rotation, and with external oscillator set at 600 kilocycles and connected in series with "Dummy 2" to the tan antenna and black ground lead, make the following adjustments:
   (a) Adjust broadcast series pad to resonance with oscillator. Keep set in tune with oscillator by slowly rocking to and fro the variable condenser until maximum output is obtained. Note: This adjustment is accessible from the top of the chassis and is located between the variable condenser and the electrolytic condenser. See top view.
   (b) Re-set external oscillator to 1400 K.C., move dial pointer to 1400 K.C. and adjust oscillator (adjustment number 3), R.F. (adjustment number 2) and antenna (adjustment number 1) to resonance. See bottom view for location of these adjustments.
   (c) Repeat adjustments "a" and "b" until sensitivity is at its maximum.

NOTE: IT IS EXTREMELY NECESSARY IN MAKING ALL OF THESE ADJUSTMENTS THAT THE FUNDAMENTAL OSCILLATOR SIGNAL BE TUNED IN AND NOT THE IMAGE FREQUENCY WHICH WILL FALL BELOW THE FUNDAMENTAL.

SHORT WAVE BAND ALIGNMENT:

1. With wave changing switch in the short wave position, extreme right of its rotation, and with external oscillator set at 17 megacycles and connected in series with "Dummy 3" to the tan antenna and black ground lead, make the following adjustments:
   (a) Move dial pointer to 17 megacycles and adjust short wave oscillator (adjustment number 8), short wave R.F. (adjustment number 7) and short wave antenna (adjustment number 6) to resonance.
   (b) Re-set external oscillator to 6 megacycles and pick up signal by rotating variable condenser and check for sensitivity.

INTERMEDIATE BAND ALIGNMENT:

1. With wave changing switch in the intermediate wave position, center of its rotation, and with external oscillator set at 1800 K.C. and connected in series with "Dummy 3" to the tan antenna and black ground lead, make the following adjustments:
   (a) Rotate variable condenser to approximately 1800 K.C., tune in oscillator signal and adjust M.W. series pad (see top view) to resonance. Slowly rock condenser to and fro while making this adjustment to be sure maximum output is obtained.
   (b) Set external oscillator at 5 M.C., rotate condenser, pick up signal and adjust intermediate wave R.F. (adjustment number 5), intermediate wave antenna (adjustment number 4) and intermediate wave oscillator (adjustment number 9) to resonance.
   (c) Re-check broadcast alignment and if it is found necessary to re-adjust either R.F. or antenna trimmers, repeat the 17 M.C. short wave and 5 M.C. intermediate wave adjustments.

MODEL 222

MONTGOMERY WARD

The tube complement of this chassis is as follows:

1—Type 6K7—remote cut-off pentode R.F. amplifier.
1—Type 6C8—pentode first detector.
1—Type 6C5—oscillator.
1—Type 6K7—remote cut-off pentode I.F. amplifier (465 K.C.)
1—Type 6B7 duplex diode pentode second detector, A.V.C. and audio.
1—Type 42—pentode output.
1—Type 80—high vacuum rectifier.

TUNING RANGE—

Standard Broadcast Band 535-1785 Kilocycles.

Intermediate Band 1789-5500 Kilocycles

Short Wave Band 5.5-18.1 Megacycles.

Transformers are available and chassis are sometimes equipped with universal transformers for operation on 40 and 60 cycles and with primary taps for 108, 125, 150, 220 and 250 volts (see instructions) and also sometimes equipped with 25 cycle transformers with 105-115 volt or 220 volt primaries, not universals.

128-17	Large Wood Knob with Spring	.15

All resistors and mica condensers are RMA color coded—specify value and/or resistor or condenser (per schematic diagram) and model number.

Mica condensers are coded with an additional dot indicating tolerance:

Tolerance Percent	Color of Dot
2½%	White
5%	Green
10%	Blue
15%	Yellow
20%	Red
More than 20%	None.

When ordering condensers, specify part number, model and/or capacitor (per schematic diagram) and model number.

When ordering parts, always specify part and model number as well as serial number of chassis.

All prices quoted are list and are subject to the usual trade discounts.

Prices subject to change without notice.

Shipments are F.O.B. our Factory. When remitting in advance, please include postage.

WE CANNOT SUPPLY SPEAKER PARTS, CONES, TRANSFORMERS OR FIELDS SEPARATELY. WE CAN REPLACE OR REPAIR A DAMAGED SPEAKER FOR $2.50 NET, IF IT IS RETURNED TO OUR FACTORY, TRANSPORTATION CHARGES PREPAID.

INTERMEDIATE FREQUENCY 465 K.C.

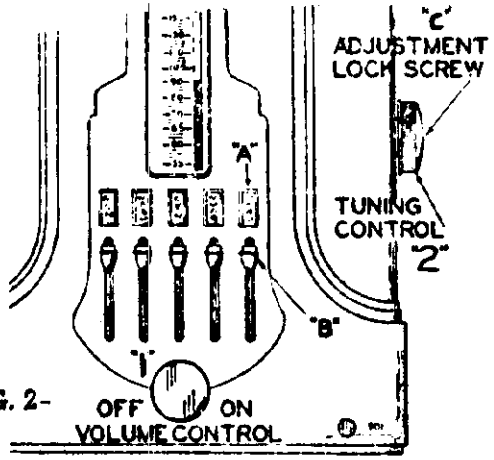

FIG. 2-

PROCEDURE FOR SETTING THE AUTOMATIC LEVERS:

There are five levers on the dial by means of which five stations may be selected, (See "B" Fig. 2).

Make a list of local stations you tune in regularly; any number up to and including five.

Punch out from the set of station call letter tabs supplied. the call letters of the stations you have selected.

Above each automatic tuner lever an opening in the escutcheon is provided for inserting the call letter tabs (See "A" Fig. 2).

Insert the call letter tabs in the rectangular openings in the escutcheon above each of the automatic tuner levers. One of the small celluloid tabs supplied should be snapped into place over each of the station call letter tabs.

Press DOWN ALL THE WAY any one of the automatic tuner levers. Holding it down FIRMLY, tune in by means of the tuning knob (No. 2) the station indicated on the station call letter tab above this lever. Turn the tuning knob very slowly back and forth (while still holding lever in downward position) until the signal is clearest. The station will then be accurately tuned in. Release the lever.

Press down another automatic tuner lever. Holding it down FIRMLY, carefully tune in the station indicated on the call letter tab above this lever. Release this lever.

Follow this procedure until you have selected all of your favorite stations.

Now hold tuning knob securely with left hand to prevent it from turning, or Rotate the tuning knob (No. 2) to the right (clockwise) as far is it will turn and with a coin (half dollar), tighten the special locking screw ("C") in the center of the tuning knob, (See Fig. 2).

It is VERY IMPORTANT that this locking screw is turned until it is ABSOLUTELY TIGHT.

This screw will lock in place all the stations you have selected on the automatic tuner levers. (Note: Locking screw "C" is loose when radio is shipped from factory).

MODEL 559

MONTGOMERY WARD

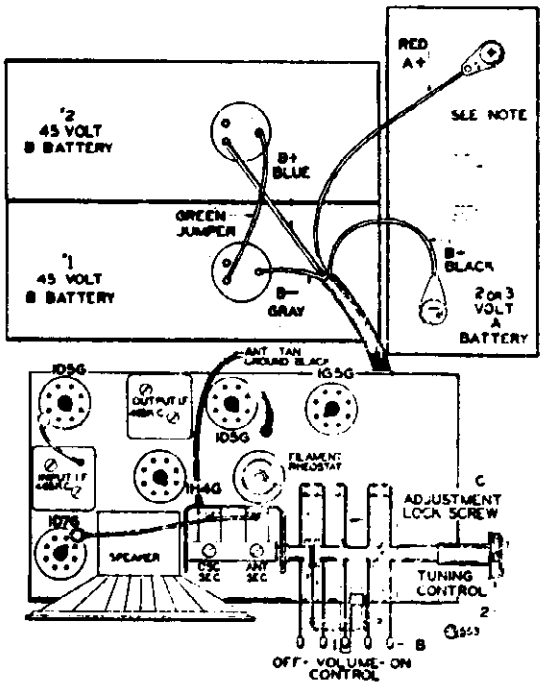

FIG. 1—TOP VIEW

DESCRIPTION:

TUBES:

The tube complement of this chassis consists of the following tubes:

1—Type 1D7G Pentagrid Mixer, First Detector-oscillator.
1—Type 1D5G. Remote Cut-off Pentode, I.F. Amplifier (465 K.C.)
1—Type 1H4G Triode Second Detector, A.V.C.
1—Type 1D5G First Audio Amplifier.
1—Type 1G5G Pentode Output Amplifier.

SERVICE NOTES:

Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt.

All voltages as indicated on diagram are measured with a new set of batteries.

Resistances of coil windings are indicated in ohms on the schematic circuit diagram.

To check for open by-pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating, which is known to be good, until the defective unit is located.

The approximate current consumption is as follows:

"A"—360 ma., "B"—15 ma.

Failure to operate, noisy or weak reception is usually due to defective tubes, the tubes making poor contact with sockets or grid clips making poor contact with the caps of the tubes. Tubes may be checked very easily by replacing with other tubes which are known to be good.

ALIGNING INSTRUCTIONS:

CAUTION:—No aligning adjustments should be attempted without first thoroughly checking over all other possible causes of trouble, such as poor installations, open or grounded antenna systems, low battery voltage, defective tubes, condensers and resistors. In order to properly align this chassis, an oscillator (generator) is absolutely necessary. No aligning adjustments should be attempted with the chassis in the cabinet.

(See part 5, for instructions on how to remove chassis from cabinet).

Connecting "A" Battery

First—Place the A Battery as shown in Fig. 1, (Either the 2 volt Storage A or the 3 Volt Dry A).

Next—Connect the Red wire marked A plus (+) to the A plus (+) Red post on battery.

Now—Connect the Black wire marked A minus (—) to the A minus (—) post on battery.

CAUTION: Before connecting a 3-volt dry A Battery, read the instructions which are attached to the bottom of the cabinet. NOTE: A special connector plug is supplied for connecting the "A" leads to a 3-volt dry "A" battery which has socket connections, (see dotted lines on "A" battery in Fig. 1).

Connecting "B" Batteries

First—Place both B Batteries exactly as shown.

NEXT—Insert the special three-prong connector plugs into the sockets on the B batteries as shown in illustration.

NOTE:—The above procedure and illustration pertains to the new style B batteries which have sockets; however, the old style B batteries which have terminals can be used by connecting them as follows:

FIRST—Remove the special plugs by cutting the wires off at the plugs.

NEXT—Connect grey colored B minus (—) wire to minus (—) terminal of battery (marked Battery No. 1 in illustration).

NEXT—Connect one end of green connecting wire to plus (+45) terminal of Battery No. 1 and other end to the minus (—) terminal of Battery No. 2.

NOW—Connect blue B plus (+) wire to the plus (+45) terminal of Battery No. 2.

All adjustments should be made with a non-metallic screw driver.

RESONANCE INDICATOR:

Use as a resonance indicator an output meter connected across the primary of the speaker input transformer, or by means of an adapter between the plate and screen terminals of the type 1G5G output tube. Maximum deflection of the meter indicates resonance. Use only enough signal to get a readily readable output. A low range output meter or the low scale of a multi-range meter should be used.

ALIGNING I.F. TRANSFORMERS: (465 K.C.):

Part No. 108112. Output I.F. Transformer.

Part No. 108111. Input I.F. Transformer.

These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see Fig. 1).

1. With volume control full on (the extreme right of its rotation), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments:
   (a) Connect external oscillator set at 465 kilocycles, in series with .1 mfd condensor, to the control grid cap of the type 1D5G I.F. tube, and adjust the output I.F. transformer (No. 108112) to resonance.
   (b) Move oscillator output clip from grid of 1D5G to grid of 1D7G and adjust input I.F. transformer (No. 108111) to resonance.
   (c) With oscillator still connected to 1D7G. readjust output I.F. transformer (108112) if necessary.

R. F. ALIGNMENT: (535-1720 K.C.)

1. With the gang condenser in its minimum capacity position, plates entirely out of mesh, connect an external oscillator in series with a 100 mmf. condensor to the antenna lead and chassis ground and make the following adjustments:
   (a) With external oscillator set at 1720 kilocycles, adjust oscillator trimmer to resonance. This adjustment is on the top of rear section of variable gang condenser. (See Fig 1).
   (b) Re-set external oscillator to 1400 kilocycles, rotate condenser, pick up oscillator signal and adjust antenna trimmer to resonance. (Top of front section of gang condenser).
   (c) Check sensitivity at 600 and 1000 kilocycles.

132144		No. 10 x 32 x ¾" Fibre Screw (Four used to Hold Chassis to Bottom Plate)	.10
13448B		Rubber Grommet (For Bottom Plate)	.03
13466E		Black Felt Shield for Lever Openings in Cabinet	.05
13466BR		Walnut Felt Shield for Lever Openings in Cabinet	.05
13466W		Ivory Felt Shield for Lever Openings in Cabinet	.05

Tubes are coded and guaranteed by the tube manufacturer.

Prompter service can be rendered on adjustments if defective tubes are returned direct to the tube manufacturer rather than through our factory.

All resistors are RMA color coded—specify value and/or resistor number (per schematic diagram) and model number.

When ordering condensers, specify part number, model number and/or capacitor (per schematic diagram) and model number.

Mica condensers are coded with an additional dot indicating tolerance:

Tolerence percent	Color of Dot
2½%	White
5%	Green
10%	Blue
15%	Yellow
20%	Red
More Than 20%	None

All prices quoted are list and are subject to the usual trade discounts. Shipments are F.O.B. our Factory. When remitting in advance, please include postage.

WE CANNOT SUPPLY SPEAKER CONES OR FIELDS SEPARATELY. WE CAN REPLACE OR REPAIR A DAMAGED SPEAKER FOR $1.25 NET, IF IT IS RETURNED TO OUR FACTORY. TRANSPORTATION CHARGES PREPAID.

PRICES SUBJECT TO CHANGE WITHOUT NOTICE.

DOTTED LINES SHOWN ARE IN SPEAKER.

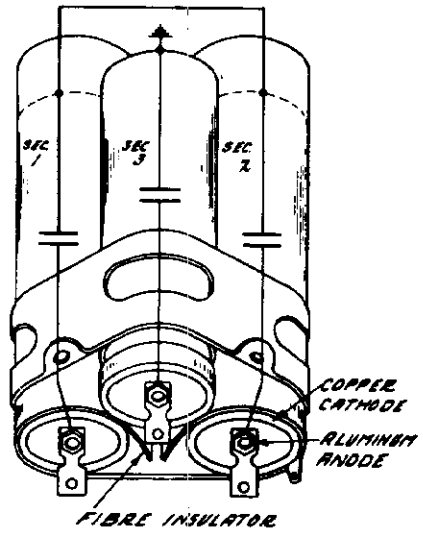

Figure 4

Condenser Block

This is of the electrolytic type having three sections of eight M.F.D. capacity respectively. Very little trouble should be experienced with this condenser as it is self healing in case it breaks down. The connections are shown in Fig. 4.

Loud Speaker

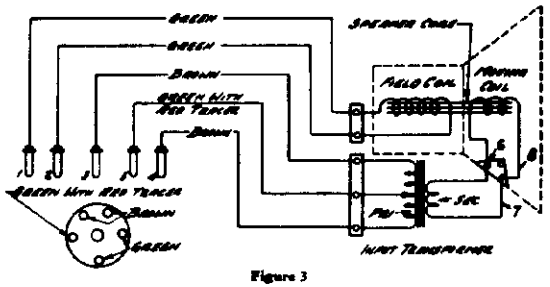

Figure 3

Fig. 3 shows the loud speaker connections and color code of wiring. The field has a resistance of 1000 ohms and is part of the filter circuit. It must therefore be connected at all times or the chassis will not operate. The speaker input transformer is mounted on the speaker chassis. The primary has a center tap connected to the positive high voltage side of the power pack and it is through this primary that the 245 tubes receive their plate supply. The secondary is a low impedance winding connecting to the voice coil of the speaker. The speaker and input transformer may be easily tested by temporarily connecting another speaker which is known to be good. Additional speakers may be used as explained on Page 7 of the instructions for the 2955 chassis, but this is not recommended.

Gang Condenser

The gang condenser is of heavy construction and all trimming condensers are aligned at the factory and set. Very seldom do they need adjustment, however, if you are positive they are out of line they may be adjusted by means of a small modulated oscillator or signal as explained on page 3 of the 2955 service manual. The trimming condensers are located directly beneath the four holes of the condenser shield. Begin by adjusting the condenser next to the tuning dial and adjust each one carefully, always making sure that your main tuning knob is adjusted to exact resonance. Align trimming condensers with the tuning dial as near 1400 kilocycles as possible. No trimming condenser adjustment is necessary for the detector stage.

Neutralizing

The screen grid tube has such a small capacity between grid and plate that no neutralizing is necessary. There is usually as much capacity between the grid and plate prongs of the tube socket and the wiring in the chassis as there is in the tube itself.

Volume Control

The volume control is wire wound and has a resistance of 8000-ohms. It is so connected as to serve a dual purpose by varying the amount of energy to the antenna input transformer and also controlling the grid bias on the three screen grid tubes. The on, off switch is also operated from the projecting stud attached to the arm of the control.

Pilot Light

The pilot is a 3.2-volt bulb, and is shown in the schematic diagram connected to the filament line supplying the heater tubes and 245s. A flickering pilot light is caused by a defective bulb, a poor socket, a loose connection in one of the leads, or by a poorly soldered joint.

25 Cycle Chassis No. 3067 and 3037

This chassis is the same as the 60 cycle with the exception of the power transformer and the filter choke condenser. A 0.45 M.F. condenser is connected across the choke in the 25 cycle chassis, instead of the 0.1 M.F. condenser as in the 60 cycle chassis. Service instructions are the same for both.

Note #1: Used only on A, B and C Bands.

MODEL 1-10A

NATIONAL CO. INC.

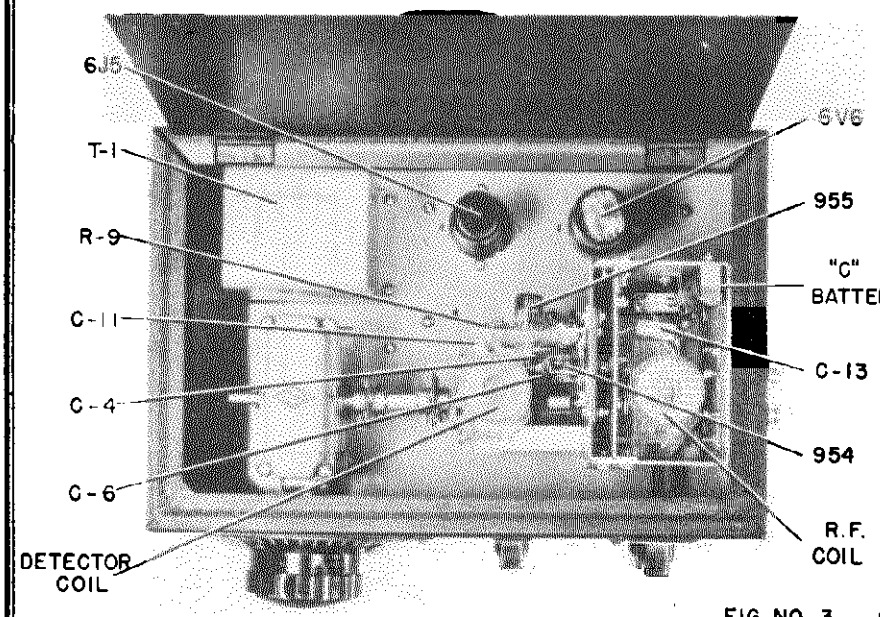

FIG. NO. 3

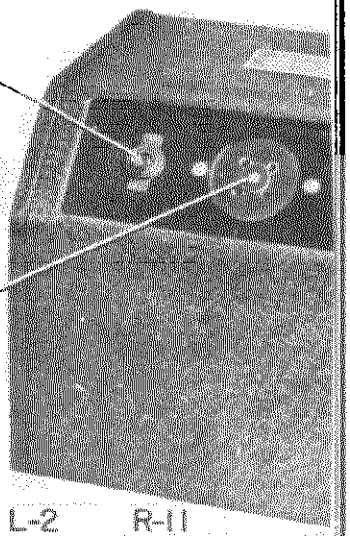

5886 POWER UNIT

FIG. NO. 4

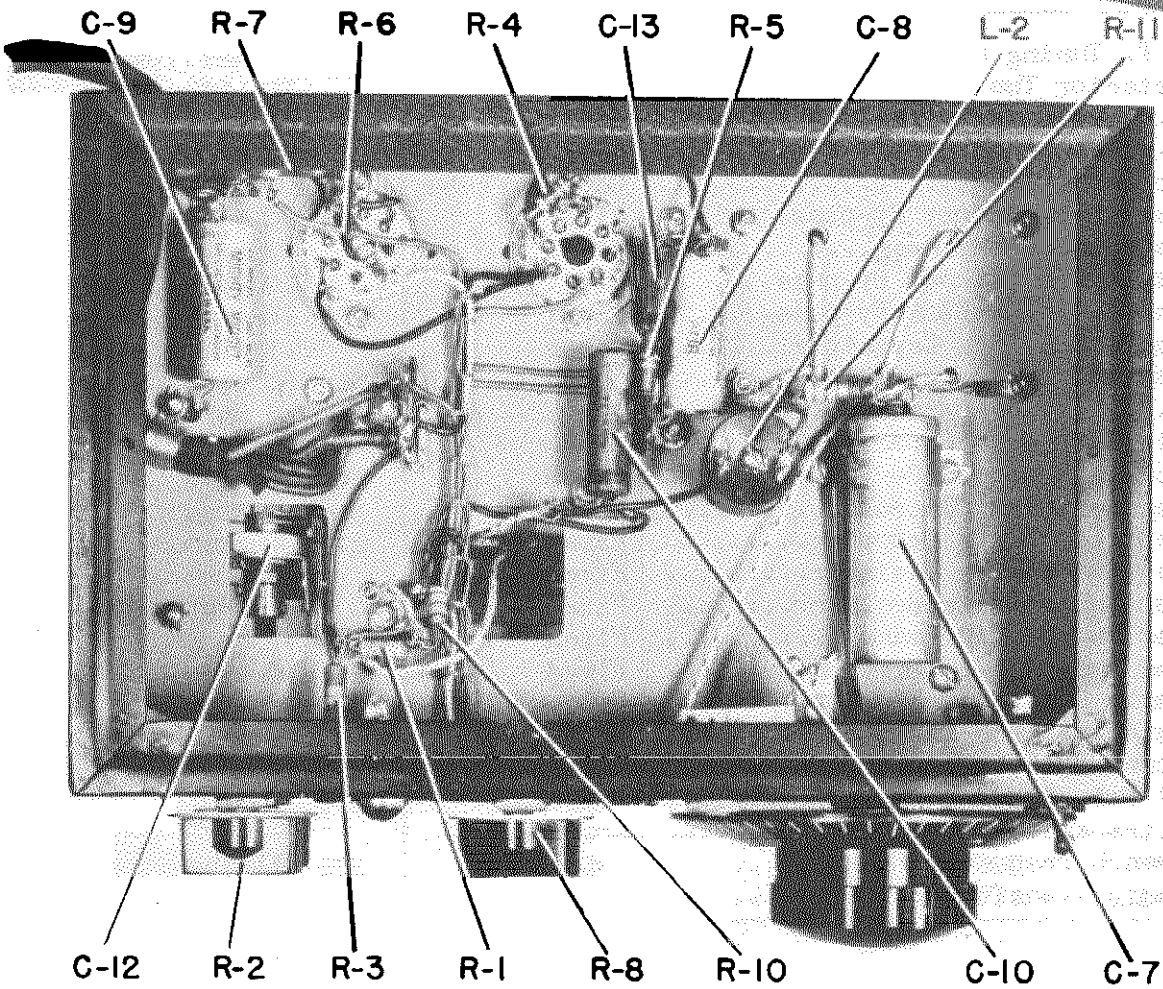

FIG. NO. 5

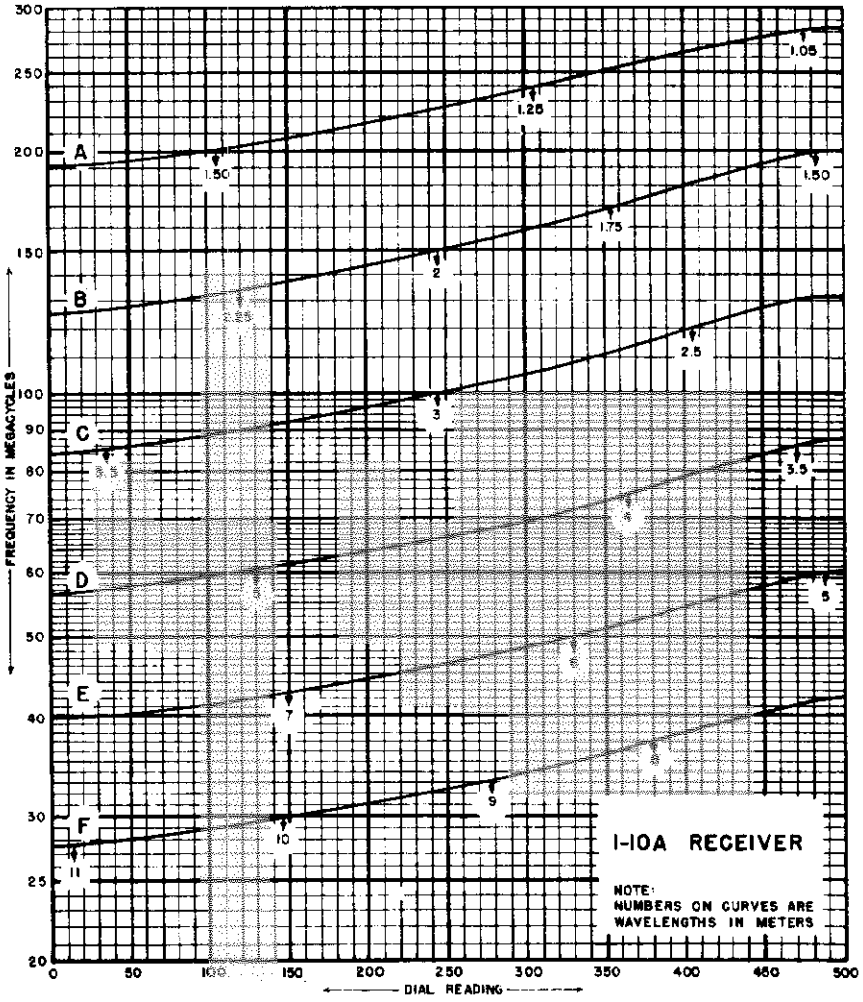
THE 1-10A RECEIVER

A complete National 1-10A communications equipment consists of the 1-10A Radio Receiver, #5886 Power Supply, and a MCS 8" PM dynamic loud-speaker with matching transformer in matching cabinets for table mounting installation.

CIRCUIT

The 1-10A Receiver employs a 4-tube circuit, consisting of one stage of tuned R.F., a self-quenching superregenerative detector, transformer coupled to a first stage of audio which, in turn, is resistance coupled to a power output stage.



DWG. NO. 2 CALIBRATION CURVES

TUNING SYSTEM

The tuning capacitors C1 and C2 plus 6 pairs of plug-in type coils are used to tune the frequency range of the receiver in six tuning bands. The frequency coverage and calibration curve of each band is shown in Dwg. 2.

The various coils are stamped "A-1", "A-2", "B-1", "B-2" etc., definitely identifying each coil. These coils are used in pairs, the letter designating the band and the number indicates the circuit position. The coil sockets of the R.F. and detector stages are marked "1" and "2", respectively, to correspond with the coil designations. The location of these coils make them readily accessible for band changing. It should be borne in mind, however, that the high frequency coils, (particularly the "A-1"), must be pushed down in the socket as far as they will go. If they are not, the inductance of the primary and secondary circuits will be increased and the calibration of the circuit will be altered.

POWER SUPPLY

The 1-10A Receiver is designed for operation from National type 5686 power unit, all voltage dividers, etc., being built in so that but one B voltage lead is necessary. The 5886 power unit is designed for operation from a 105-120 volt, 50-60 cps A.C. supply source. This power supply furnishes six volts at 1.6 amperes to the heater circuit and 180 volts at 35 milliamperes to the plate and screen circuits. A 3 volt C battery is used to supply bias to the R.F. tube. This battery is mounted in the rear right-hand corner of the R.F. compartment, being held in place by a spring clip. Two Everready type 915 cells, or equivalent, are needed. They are mounted in a bakelite tube and the positive (center) terminal of the upper cell is grounded at the top by a retaining bracket.

The 1-10A Receiver may be operated from batteries permitting portable or emergency operation. The operator is cautioned that either the loud-speaker connection or a jumper across the output terminals be maintained at all times. Failure to do this breaks the B supply to the plate of the 6V6 tube and places excessive voltage on the screen of the tube. This may result in serious damage to the tube.

If remote stand-by control is desired make a connection from the terminal on the BSW terminal panel to an external switch or relay.

BATTERY OPERATION

The 1-10A Receiver may be operated in portable or emergency service by connecting batteries to the pins of the 4 prong power plug. A 6 volt battery should be used to supply the heater circuits, (the two large prongs on the power plug), and the plate and screen circuit requirements from B batteries. To effect battery economy, the 6V6 may be removed from its socket and headphone operation used. Voltages in excess of 180 are not recommended and receiver performance will be unsatisfactory on the "A" range at voltages below 167. If lower voltages must be used, as in portable operation, resistors R1 and R3 may both be shorted out. This will allow the receiver to function normally with a maximum voltage of 90, but with reduced audio output.

In battery operation aging A and B batteries with a resultant decreasing voltage supply may render the receiver inoperative. This effect will first be noticed at the extreme ends of the "A" band.

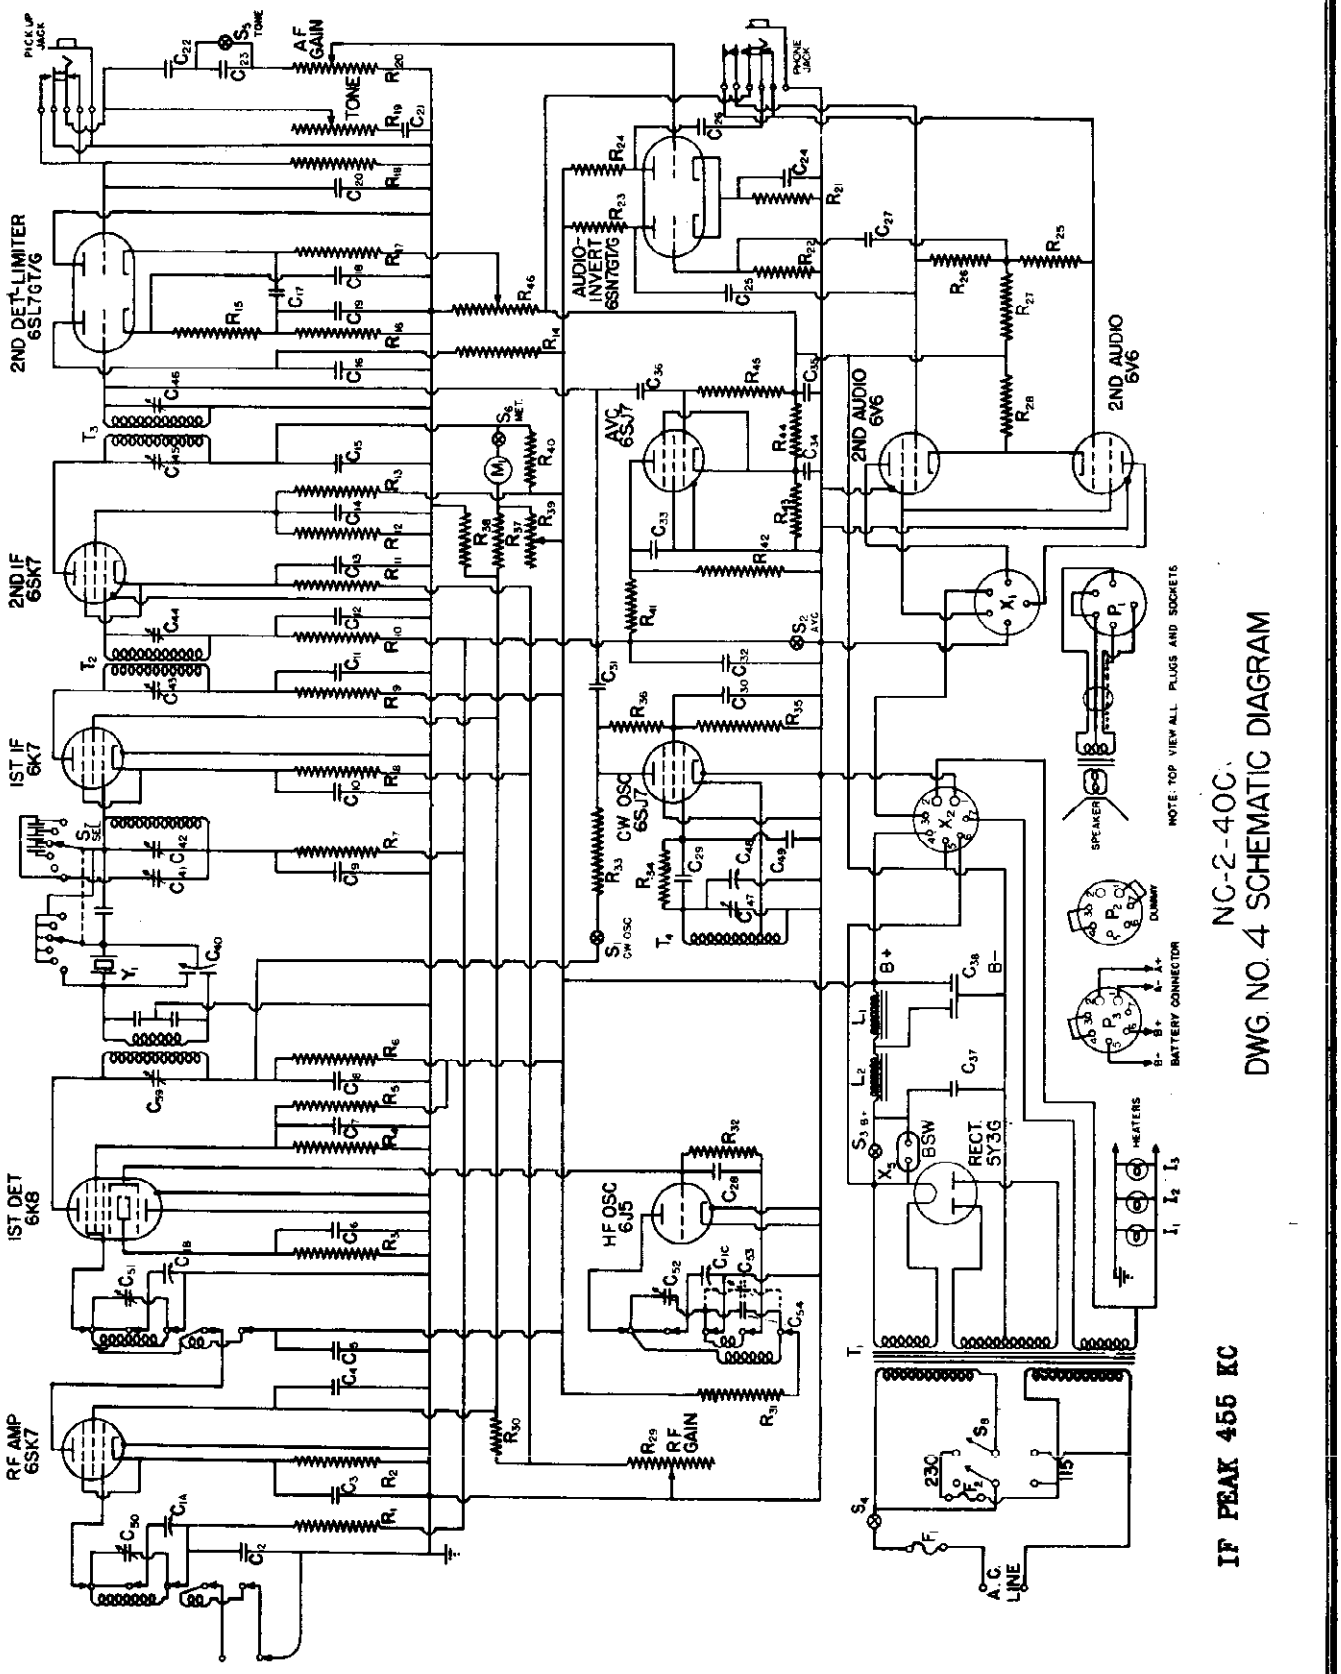
The B supply "On/Off" Switch functions to break the positive B supply lead and in the "Off" position is useful for temporarily rendering the receiver inoperative during periods of transmission, or when changing coils, while permitting the heater circuits to remain closed. When using B battery plate supply, the switch should be thrown to the "Off" position at all times when the receiver is not in use, in order to avoid parasitic drain.

The Regeneration control functions to adjust the level at which the detector circuits go into superregeneration. This condition is indicated by a loud rushing or hissing noise. The hiss will drop down to a very low level or disappear entirely when a signal is tuned in, the reduction depending somewhat upon signal strength. Sensitivity will depend upon the adjustment of the Regeneration control, the maximum occurring just beyond the point where the hiss starts. The setting of the Regeneration control at which the detector goes into superregeneration will vary with different sets of coils and with the condition of the 955 detector tube. On the "A" range it may be necessary to advance the control to the full "On" position as the detector tube begins to wear out.

A BSW terminal panel is mounted at the rear of the receiver chassis. These terminals are connected in parallel with the B supply switch. If external (remote) stand-by control is desired, it can be accomplished by connecting a switch or relay to the terminals provided on the BSW terminal panel.

MODEL NC-2-40C

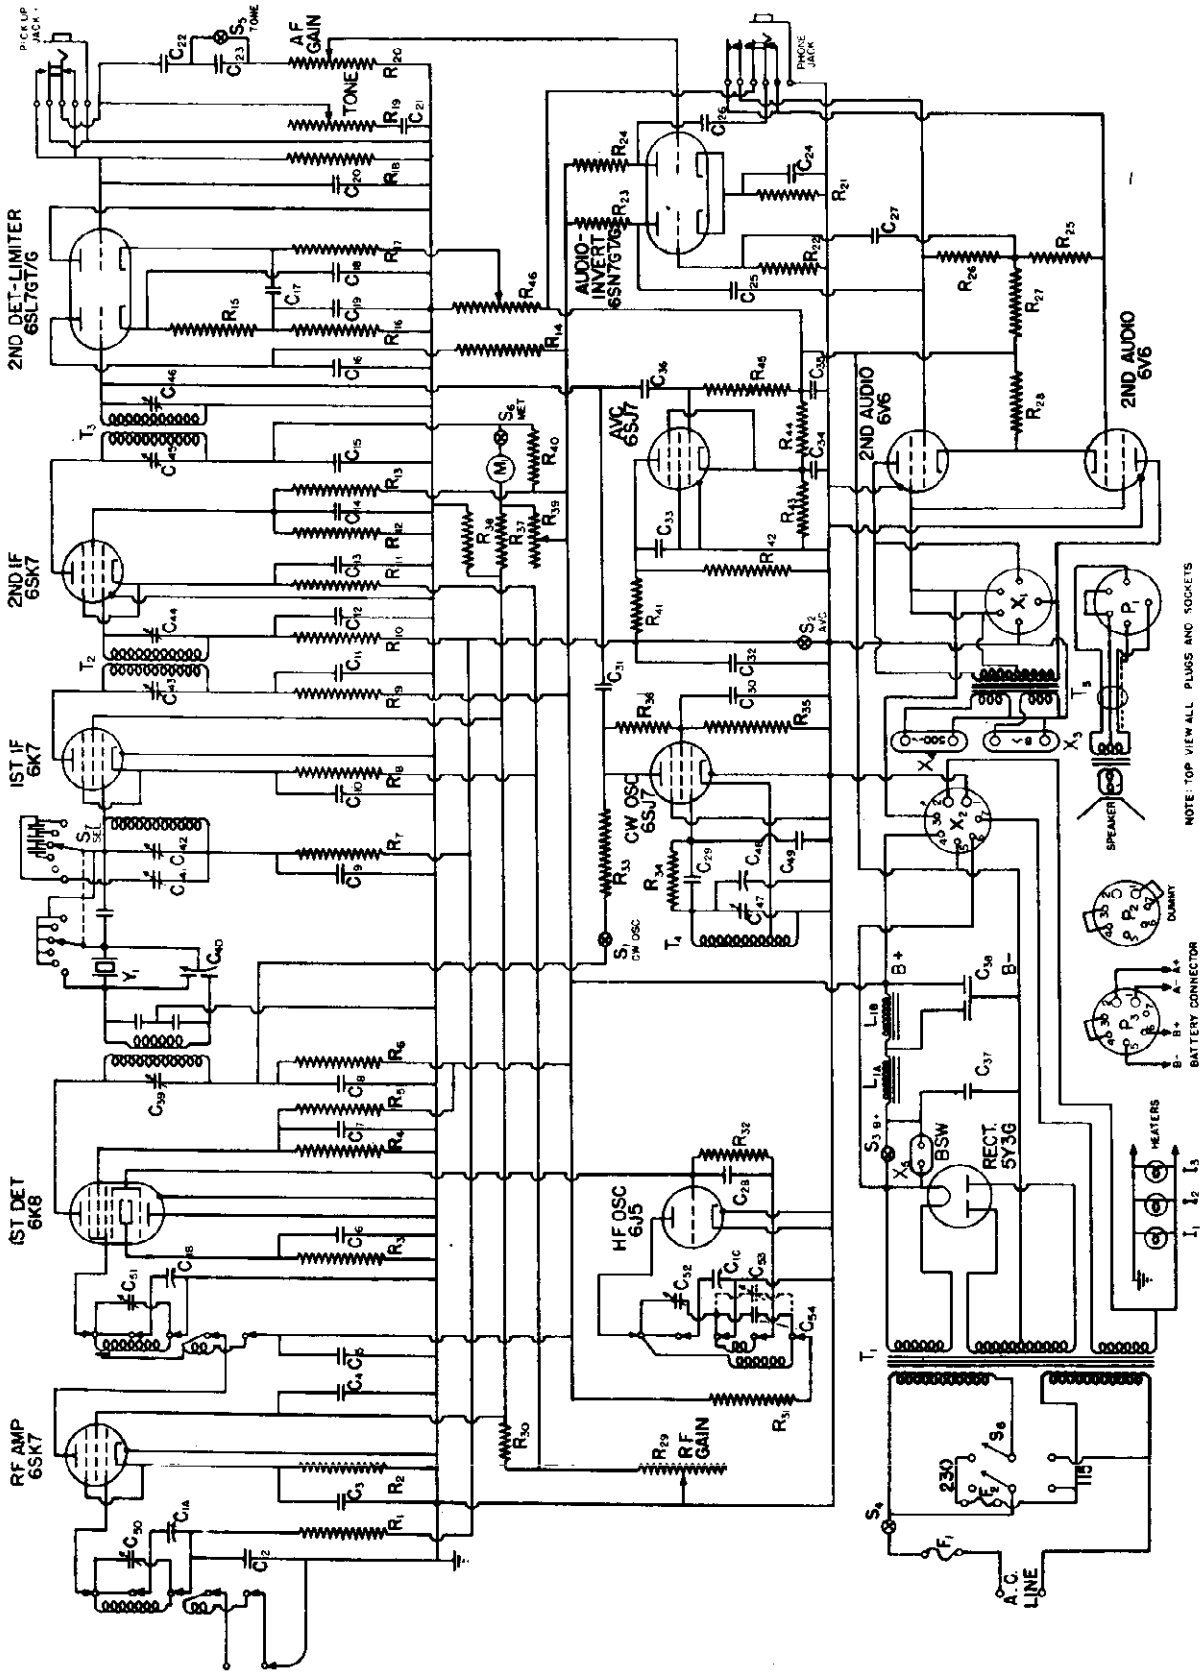
NATIONAL CO. INC.



NC-2-40C
DWG. NO. 4 SCHEMATIC DIAGRAM

IF PEAK 455 KC

NATIONAL CO. INC.



NC-2-40CS
DWG. NO. 5 SCHEMATIC DIAGRAM

IF PEAK 455 KC

MODELS NC-2-40C,
NC-2-40CS

NATIONAL CO. INC.

1-1. *General*

The NC-2-40C RADIO RECEIVER is a twelve tube superheterodyne covering a continuous frequency range of from 490 to 30,000 kilocycles. The NC-2-40CS RADIO RECEIVER is identical with the NC-2-40C except for the frequency range covered and output terminations. The NC-2-40CS has a frequency range of from 200 to 400 and from 1,000 to 30,000 kilocycles.

Each equipment consists of a receiver and speaker built for either relay rack or table mounting and an instruction manual.

Throughout the text of this instruction manual all references to the NC-2-40C shall also apply to the NC-2-40CS except where indicated.

1-2. *Circuit*

The circuit employed on all bands consists of one stage of radio frequency amplification, a separate first detector and stabilized high frequency oscillator, two intermediate frequency stages, an infinite impedance second detector, a self-balancing phase inverter and audio amplifier, and a push-pull audio output stage.

The second detector utilizes one set of elements of a dual triode; the other set of elements is utilized for a series valve noise limiter. Separate tubes are used in the automatic volume control and beat frequency oscillator circuits. The latter is coupled to the second detector for C.W. reception.

A crystal filter is connected between the first detector and first I.F. amplifier tubes.

1-3. *Tube Complement*

The NC-2-40C is supplied complete with tubes which are tested in the receiver at the time of alignment.

1-4. *Tuning System*

The master tuning capacitor C-1 and six sets of coils are used to tune the frequency range of the receiver in six tuning bands.

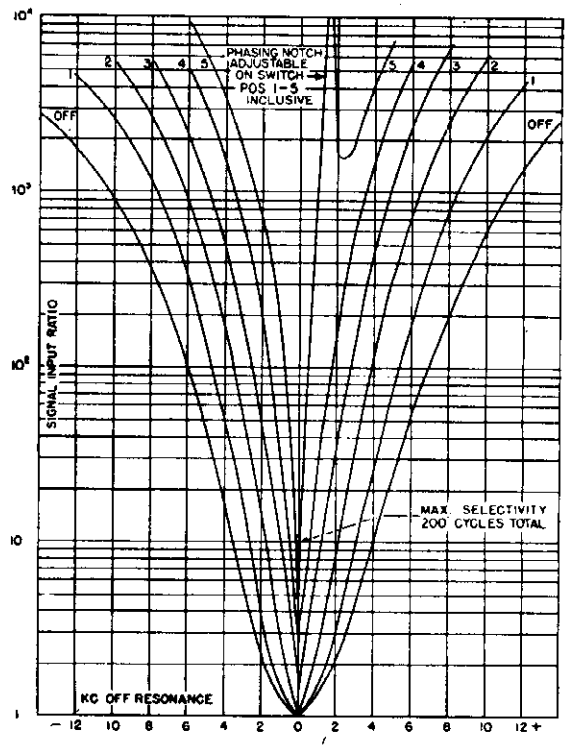
The frequency coverage of the six bands is as follows:

NC-2-40C		NC-2-40CS	
Band A	14.-30. MC	Band A	14.-30. MC
Band B	7.-14.4 MC	Band B	7.-14.4 MC
Band C	3.5-7.3 MC	Band C	3.5-7.3 MC
Band D	1.7-4. MC	Band D	1.7-4. MC
Band E	1.0-2.0 MC	Band E	1.0-2.0 MC
Band F	0.49-1. MC	Band F	200-400 KC

All transformer coils of the R.F. amplifier, first detector and H.F. oscillator stages with their associated padder and air-dielectric trimmer capacitors are mounted in a rigid aluminum casting which slides the length of the chassis, being moved by the MAIN TUNING control. The various coil assemblies are fitted with heavy contact pins which engage spring contactors mounted immediately under the variable tuning capacitor. This system permits thorough shielding of each individual coil while, at the same time, the coils in use are moved to the best position in the chassis, giving shortest leads to the tubes and master tuning capacitor, and all other coils are completely disconnected from the circuit.

1-5. *Crystal Filter*

Undoubtedly, the most efficient, flexible crystal filter yet designed is used in the NC-2-40C Receiver. Six uniform steps of selectivity, as shown in Dwg. No. 1, and a variable phasing control allow the receiver to be adjusted to almost any operating condition, a highly desirable feature for both short wave communication and broadcast band reception. The curves show that any degree of selectivity between that of full single signal operation and wide band broadcast reception is available, the ratio between the two being almost forty to one.



Dwg. No. 1. Typical Selectivity Characteristics

1-6. *Noise Limiter*

The noise limiter of the NC-2-40C Receiver is of the series valve type developed in the national laboratories. Its effectiveness and superior performance as compared to the more common types of 'silencers' were proved in the NHU and modernized NC-100 receivers. A threshold control on the front panel permits adjustment of the level at which limiting action starts.

1-7. *Tone Control*

The tone control is used to vary the frequency characteristic of the audio amplifier. The control is particularly helpful when receiving weak signals through interference, as explained in Section 3.

1-8. *Signal Strength Meter*

A 0 to 1 millimeter, serving as a signal strength meter, is front panel mounted. It is fitted with a scale in S-Units from 1 to 9 and in DB above S-9 from 0 to 40 DB. The bridge circuit, in which the meter is connected, makes possible accurate signal input readings from below 1 microvolt to 1,000 microvolts.

1-9. *Antenna Input*

Antenna input terminals are located at the rear of the receiver chassis near the center. The input circuit is suitable for use with a single wire antenna, a balanced feed-line or a low impedance concentric transmission line. Average input impedance is 500 ohms.

1-10. *Audio Output*

(1) A headphone jack is mounted on the front panel and is wired so as to silence the loud speaker when the phone plug is inserted. The correct load impedance for the headphone circuit is 20,000 ohms, this being the usual impedance of phones having a DC resistance of between 2,000 and 3,000 ohms. Maximum audio output available at the phone jack is 15 milliwatts.

(2) A five prong speaker socket (X-1) is provided at the rear of the receiver chassis. To this socket are brought the audio output leads. The proper load impedance (total) for the output circuit is 10,000 ohms. Maximum undistorted audio power output available is 8 watts.

(3) The NC-2-40CS is provided with an output transformer (T5) having a secondary with two windings which are connected to two terminal strips on the rear of the chassis. Both 8 ohm and 500 ohm terminations in addition to the speaker socket termination of 10,000 ohms are thus provided. The 8 and 500 ohm strips are the screw terminal type.

1-11. *Power Supply*

The standard NC-2-40C Receiver is designed for operation from a 110/120 volt, or 220/240 volt, 50/60 cycle power source. A toggle switch is provided in the dual primary circuit of the power transformer to permit operation from either voltage. Normal power consumption is approximately 100 volt-amps. The built-in power supply delivers all voltages required by the heater and B supply circuits-4.5 amperes at 6.3 volts and 100 milliamperes at 250 volts, respectively. One side of the AC input line is connected through a 2 ampere and a 1 ampere fuse each housed in an extractor post marked 'FUSE' which are mounted at the rear of the receiver chassis. The 2 ampere fuse is used in the circuit for 115 volt operation; both 2 and 1 ampere fuses are used for 230 volt operation.

All NC-2-40C Receivers are equipped with a seven prong plug and socket combination to permit portable or emergency operation from batteries; See Section 2-3.

1-12. *Loud Speaker*

The loud speaker supplied with the table model NC-2-40C receiver is of the permanent magnet field type having a nominal diameter of 10 inches. A coupling transformer, mounted on the loud speaker chassis, matches the voice coil to the output impedance of the receiver. A shielded three wire cable and plug is furnished for connection between the loud speaker and receiver.

1-13. *Pick-up Jack*

A pick-up jack mounted on the front panel of the receiver may be used to connect auxiliary apparatus, such as phonograph pick-up, to the audio system of the NC-2-40C Radio Receiver. This input circuit is high impedance and feeds into the 6F8G, Audio Amplifier-Phase Inverter tube. The TONE and AF GAIN controls are operative with this connection.

2-1. *Antenna Recommendations*

When using a single-wire antenna, the lead-in should be connected to one antenna input terminal and the short flexible lead, which is attached to the chassis, should be fastened to the other terminal. The dimensions of the single-wire antenna system are not critical, the recommended length, including lead-in, being from 75 to 100 feet, although any length between 25 and 200 feet may be used.

Feed-lines of doublet systems should be connected to the two input terminals. The flexible lead is not used.

The inner conductor of a concentric transmission line should be connected to one input terminal. The outer conductor and the flexible grounding lead should be connected to the other terminal.

An external ground connection to the chassis may or may not be necessary. It should be used unless it reduces signal strength.

2-2. *AC Operation*

Insert the dummy connector plug P-2 in the seven prong socket X-2.

Insert loud speaker plug P-1 in the five prong audio output socket X-1 of the Receiver.

Connect antenna feed line.

Set primary selector switch for line voltage to be used i.e. 115 or 230.

2-3. *Battery Operation*

The NC-2-40C may be operated in portable or emergency service by connecting batteries to the terminals of battery connector plug P-3 and inserting it in socket X-2, in place of plug P-2. See Fig. No. 1. For normal operation with somewhat reduced loud speaker output, a 6 volt heater supply (storage battery) should be connected to terminals 1 and 2 of plug P-3, and a 180 volt B supply should be connected to plug terminals 5 and 6. The jumper between terminals 3 and 4 (of P-3) completes the plate and screen supply circuits of the 6V6 output tubes. It may be omitted, with greater battery economy, when operation with headphones only is desired. A suggested refinement is to connect a switch between terminals 3 and 4, thus permitting the 6V6 B supply to be opened at will. Alternatively, removal of speaker plug P-1 from socket X-1 will open the 6V6 B supply in the same manner, without harming the output tubes. A further economy of battery power may be effected by removing the 6V6 tubes from their sockets.

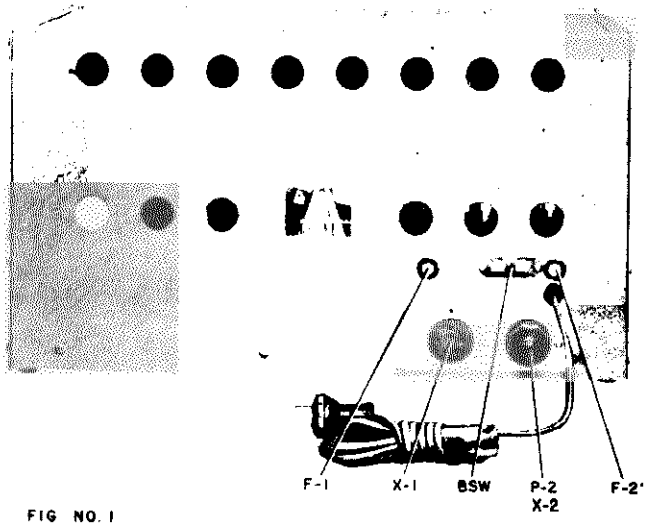


FIG NO. 1

Do not attempt to use plug P-2 for battery connection, since the jumper between terminals 1 and 7 would be incorrect.

3-1. *Controls*

The MAIN TUNING control knob is located at the middle of the front panel and operates a three gang variable capacitor C-1 through approximately a 60 to 1 ratio reduction drive mechanism.

The accuracy of the calibration can be relied upon to be better than plus or minus 1%.

The tuning system of the NC-2-40C is truly single control; in fact, the MAIN TUNING control referred to above is used for band changing as well as tuning. To select any one of the six tuning bands, the MAIN TUNING control knob is pulled out about ¼ inch. When this is done, the dial and capacitor drive mechanism is disengaged and the knob is geared to the coil castings. As the knob is turned, the coil carriage is moved across the chassis until the proper coil pin contacts engage the circuit contactors, as indicated by the scale markers. Approximately one full turn of the MAIN TUNING knob is required to change from one tuning band to an adjacent tuning band. After the desired band has been selected, the tuning knob is pushed in to its original position, disengaging the coil carriage rack.

The LIMITER control, at the left-hand side of the receiver panel, is used to adjust the DC potential applied to the elements of the series valve noise limiter tube. The limiter circuit is thus provided with an adjustable threshold at which limiting starts. Any audio voltages, or peaks, in excess of this threshold are prevented from reaching the audio amplifier. With the LIMITER control set at 0, the limiter circuits will pass all but the strongest audio peak voltages; when the control is set at 10, the threshold is lowered to a point where the audio signal will be distorted due to suppression of the positive peaks.

The R.F. GAIN knob is located below and to the right of the LIMITER knob. It is used to adjust the amplification of the R.F. amplifier and two I.F. amplifier tubes. Amplification increases as the control is turned clockwise towards 9. With the knob set at 10, the meter switch is closed, connecting the signal strength meter. See Section 3-4 regarding meter use.

A CONTROL SWITCH is mounted above the R.F. GAIN control knob. In the AVC position, the automatic volume control circuits are in operation; in the MVC position, automatic volume control is turned off; in the CWO position, the beat frequency oscillator is turned on and the automatic volume control is turned off.

The POWER SUPPLY control knob is directly above the CONTROL SWITCH. In the counterclockwise position, OFF, the receiver is turned off, the primary circuit being opened by the AC line switch; in the mid-position B+ OFF, the AC line switch is turned on but the B supply circuits are incomplete since the B+ switch is opened; in the clockwise position, B+ ON, the B+ switch is closed, completing the B supply circuit. The B+ OFF position may thus be used for rendering the receiver inoperative, as may be required during transmission periods.

The PRIMARY SELECTOR SWITCH of the power transformer is mounted on the receiver chassis to the right of the power transformer. This switch selects the proper circuit arrangement of thedual primary for operation from either 115 or 230 volt power source. There is a shield provided to prevent unintentional throwing of the switch.

The A.F. GAIN control knob is located to the right of the MAIN TUNING control. It is used to adjust the audio amplification of the receiver.

Audio amplification increases as the control is turned towards 10 on the scale.

The PHASING and SELECTIVITY controls, located above the A.F. GAIN knob, are part of the crystal filter. When the SELECTIVITY control is set at OFF, the crystal is switched out of the circuit. With the crystal switched out, the phasing control has little influence on receiver performance. With the SELECTIVITY control knob set at any point between 1 and 5, inclusive, the crystal filter is in operation, selectivity increasing as the knob is advanced to 5. The PHASING control is then used to balance the crystal bridge circuit and eliminate interferring signals or heterodynes. See Sections 3-2 and 3-3.

The C.W. OSC. control knob located to the right of the SELECTIVITY control is used for varying the frequency of the beat oscillator. At 0 on the C.W. OSC. scale, the beat oscillator is tuned to the intermediate frequency. See Section 3-3.

A TONE control knob is located above the C.W. OSC. knob and is used to vary the frequency characteristic of the audio amplifier as previously described.

A BSW terminal panel is mounted at the rear of the receiver chassis. The terminals are connected in parallel with the B+ switch. If external (remote) stand-by control is desired, it can be accomplished by connecting a switch or relay to these terminals.

3-2. *Phone Reception*

After the equipment is properly installed, in accordance with Section 2, it is placed in operation by turning the POWER SUPPLY switch to B+ ON. The LIMITER control should be set at 0. The CONTROL SWITCH should be set at AVC. The PHASING knob should be set at 0; the SELECTIVITY at OFF; the TONE control should be set to give the desired audio characteristic; the R.F. GAIN control should be advanced to some point between 8 and 10, depending upon receiving conditions; the A.F. GAIN control should be set at the point providing the desired audio volume. The receiver is now adjusted for the reception of phone signals and will tune to the frequency indicated by the MAIN TUNING dial. The C.W. OSC. knob has no influence on receiver performance under these conditions.

With the CONTROL SWITCH set in the AVC position, as recommended, the R.F. GAIN knob should be advanced as far as receiving conditions permit, or until background noise becomes objectionably loud. Audio output should be adjusted entirely by means of the A.F. GAIN knob. The operator must remember that automatic volume control action will be restricted unless the R.F. GAIN knob is fully advanced.

The CONTROL SWITCH may be set at MVC, in which case the operator must be careful not to advance the R.F. GAIN knob to a point where I.F. or audio amplifier overload occurs. Such overload is indicated by distortion. In general, the A.F. GAIN control may be set at about half way on, i.e., a 5 and the audio output adjusted by means of th R.F. GAIN control.

If a signal is weak and partially obscured b background noise and static, best signal-to-nois ratio will be obtained by turning the TONE contro toward the LOW position. The most effective set ting must be determined by trial as too much at tenuation of high audio frequencies will impai the intelligibility of speech.

When a signal is accompanied by static peak or noise pulses of high intensity and short dur ation, the best signal-to-noise ratio will be ob tained by advancing the LIMITER control toward 10. The best setting must be determined by tria as too much limiter action will impair audio qual ity. If static peaks and noise pulses are ex tremely strong or if they are of fairly long dur ation, the effectiveness of the limiter will b best with the CONTROL SWITCH in the MVC position In such cases both R.F. GAIN and LIMITER control must be carefully adjusted for optimum signal-to noise ratio.

The selectivity of the receiver may be ad justed by means of the crystal filter. The norma setting of the SELECTIVITY control in phone re ception is at one of the positions affording broa selectivity. Positions 1 or 2 are recommended Selectivity may be progressively increased b turning the SELECTIVITY control to positions 3, and 5 although advancing the control too far wil increase selectivity to a degree where phone sig nals become unintelligible.

The PHASING control is used to eliminate o attenuate heterodynes. The normal setting of th PHASING control in phone reception is at 0 on th scale. If, after a signal has been tuned in, a interfering signal causes a heterodyne or whistle the PHASING control should be adjusted until th interference is reduced to a minimum. The settin of the PHASING control which provides maximum at tenuation of the heterodyne will depend upon th pitch of the heterodyne whistle. If the beat not is above 1,000 cycles, the optimum PHASING contro setting will be near 0; if the beat note is 300 o 400 cycles, the optimum PHASING control settin will be near one end of the scale or the other depending upon whether the interfering signal ha a higher or lower frequency than the desired sig nal.

It is recommended that the TONE control be se in the HIGH position when using the crystal filte in phone reception. The resulting attenuation o low audio frequencies tends to compensate for th side-band cutting action of the crystal filter

3-3. *C.W. Reception*

The initial adjustment of the receiver fo C.W. reception is as described in Section 3-2, ex cept that the CONTROL SWITCH must be in the C.W.C position. The C.W. OSC. control should be set a mid-scale.

The sensitivity of the receiver should be adjusted by means of the R.F. GAIN control, care being taken not to advance the control to the point where strong signals will cause I.F. or audio amplifier overload, as indicated by excessive thumping.

The action of the TONE and LIMITER controls will be similar to that described under Section 3-2. When receiving C.W. signals, it will be possible to advance both TONE and LIMITER controls considerably further than is possible in phone reception, since audio distortion is relatively unimportant.

Turning the C.W. OSC. control will change the characteristic pitch of the receiver background noise. The pitch will become higher as the beat frequency oscillator is detuned from the I.F. amplifier. With the C.W. OSC. control set at 2 or 3 (on either side of 0), the characteristic pitch of the receiver background noise will be in the neighborhood of 2,000 cycles. Under these conditions, the audio beat note of any C.W. signal will show a broad peak at approximately 2,000 cycles. This peak will appear on 'one side of the carrier' only and the other side, where the audio beat note is around 2,000 cycles, will be considerably weaker. This characteristic, known as 'semi-single signal', is helpful in receiving weak signals through interference.

As stated in Section 3-2, the selectivity of the receiver may be adjusted by means of the crystal filter, the action of the SELECTIVITY and PHASING controls in C.W. reception being similar to that described. It is possible, however, to utilize the full range of crystal filter selectivity in C.W. reception. Maximum selectivity is obtained with the SELECTIVITY control set at 5. With this setting the single-signal effect, outlined above, becomes very pronounced; in other words, the audio beat note is very sharply peaked at a definite audio frequency which is determined by the setting of the C.W. OSC. control. The operator may have difficulty in finding the audio-peak when first attempting to use the crystal filter. After a signal has been accurately tuned to give peak response, the R.F. GAIN control may need to be retarded in order to prevent I.F. or audio overloading. With the receiver tuned to 'crystal peak', an interfering signal may be attenuated by proper setting of the PHASING knob since this control does not appreciably affect the desired signal.

3-4. *Measurement of Signal Strength*

To make a measurement of signal strength by means of the S-meter, the R.F. GAIN control must be advanced to 10, and the CONTROL SWITCH set at the AVC position. The crystal filter should be turned OFF by means of the SELECTIVITY control; the PHASING knob set at 0. The TONE, LIMITER and A.F. GAIN controls do not affect the meter reading.

Tuning the receiver to a signal will cause the meter to read, indicating the signal input in S-units or in decibels above the S-9 level.

With no R.F. input to the receiver, or with the antenna disconnected, the S-meter should read 0, plus or minus 1 S-unit. If it does not, the S-meter circuit requires adjustment. See Section 5-5.

Measurement of the signal strength of C.W. signals cannot be made with the beat frequency oscillator in operation.

4-1. *Tube Failures*

Failure of a vacuum tube in the receiver may reduce the sensitivity, produce intermittent operation, or cause the equipment to be completely inoperative. In such cases, all tubes should be checked either in an analyzer or similar tube testing equipment, or by replacement with tubes of proven qualities. All tubes should be marked as they are removed from the receiver so that they may be returned to their original sockets thereby reducing the necessity for realignment.

Individual tubes of the same type will vary slightly in their characteristics and it is well to remember this fact when replacements become necessary. Even though the circuit is designed to reduce the effect of such variations to a minimum, the high frequency oscillator and I.F. tubes should be selected with some care. A replacement high frequency oscillator should be checked in the receiver to make sure that the inter-electrode capacities are the same as those of the tube originally employed. This is easily determined by noting any change in dial calibration.

Substitution of new tubes in the I.F. amplifier may possibly alter overall gain and selectivity characteristics. Instructions for realignment are given in detail in Section 5-2.

One other point should be checked when trying the new high frequency oscillator; a fairly strong steady signal should be tuned in, preferably on some frequency above 10 mc.; the beat frequency oscillator should be turned off; jarring the receiver, or lightly tapping the tube, should not show any evidence of noise in the output.

4-2. *Circuit Failures*

Even though all component parts of the receiver have an ample factor of safety, failure may occur in individual cases. Excluding tubes, the most common failure will probably be due to some defect in a capacitor or resistor. Measurement of voltage in accordance with Section 4-4 will no doubt show where failure has occurred.

4-3. *Stage Gain Measurements*

The sensitivity measurements listed below are made with the equipment set up as specified in Section 5-1. The CONTROL SWITCH should be set at MVC, the A.F. GAIN at 10, the SELECTIVITY at OFF

NATIONAL CO. INC.

and the PHASING at 0. The signal generator should be adjusted to deliver a test signal of 455 plus or minus 2 kc. either modulated or unmodulated. The high output lead should be attached to the grid of the tube specified in the table below and the ground lead connected to the receiver chassis.

With 1 milliwatt output at the phone jack, the test signal should be within the limits specified below.

Terminal	Test Signal
First Det. Grid...	50 ± 10 Microvolts
First I.F. Grid...	250 ± 50 Microvolts
Sec. I.F. Grid....	50,000 ± 10,000 Microvolts
Sec. Det. Grid....	Over 1 volt

4-1. *Voltage Tabulation*

All measurements of voltages should be made with the equipment connected for normal operation with AC supply of 115 volt, 50/60 cycle or 230 volt, 50/60 cycle. Except as noted, the R.F. GAIN knob is at 9, the LIMITER knob set at 0 and the CONTROL SWITCH knob set at MVC. A DC Voltmeter of 1,000 ohms per volt sensitivity should be used. The following table must not be considered as a list of the actual operating voltages since loading effects of the measuring instrument will disturb many of the circuits and alter normal voltage distribution. All voltages are measured between specified terminal and chassis.

The Power Output Tubes used in the NC-2-40C Radio Receiver may be the metal type 6V6 or the glass type 6V6GT/G. It is necessary, however, to provide glass type 6V6GT/G output tubes with metal shields to avoid oscillation in the audio amplifier. The recommended shield is Goat type G1222K with type G1004 connector.

5-1. *General*

All circuits are carefully aligned, before shipment, using precision crystal oscillators which insure close conformability to the dial calibration. No readjustment will be required, therefore, unless the receiver is tampered with or damaged.

To determine the necessity for realignment, the receiver should first be carefully checked against its normal performance as described in Section 3. In no case should realignment be attempted unless tests indicate that such realignment is necessary.

The coil group which is plugged into the circuit at any time is the one directly underneath the three gang master tuning capacitor. The coil nearest the front panel of the receiver is in the H.F. oscillator circuit, the middle coil is in the first detector circuit and the coil nearest the antenna input terminal panel is in the R.F. amplifier circuit. See Fig. No. 5.

All coils have individual trimmer capacitors. The H.F. oscillator circuits of tuning bands E & F

MODEL NC-2-40C

NATIONAL CO. INC.

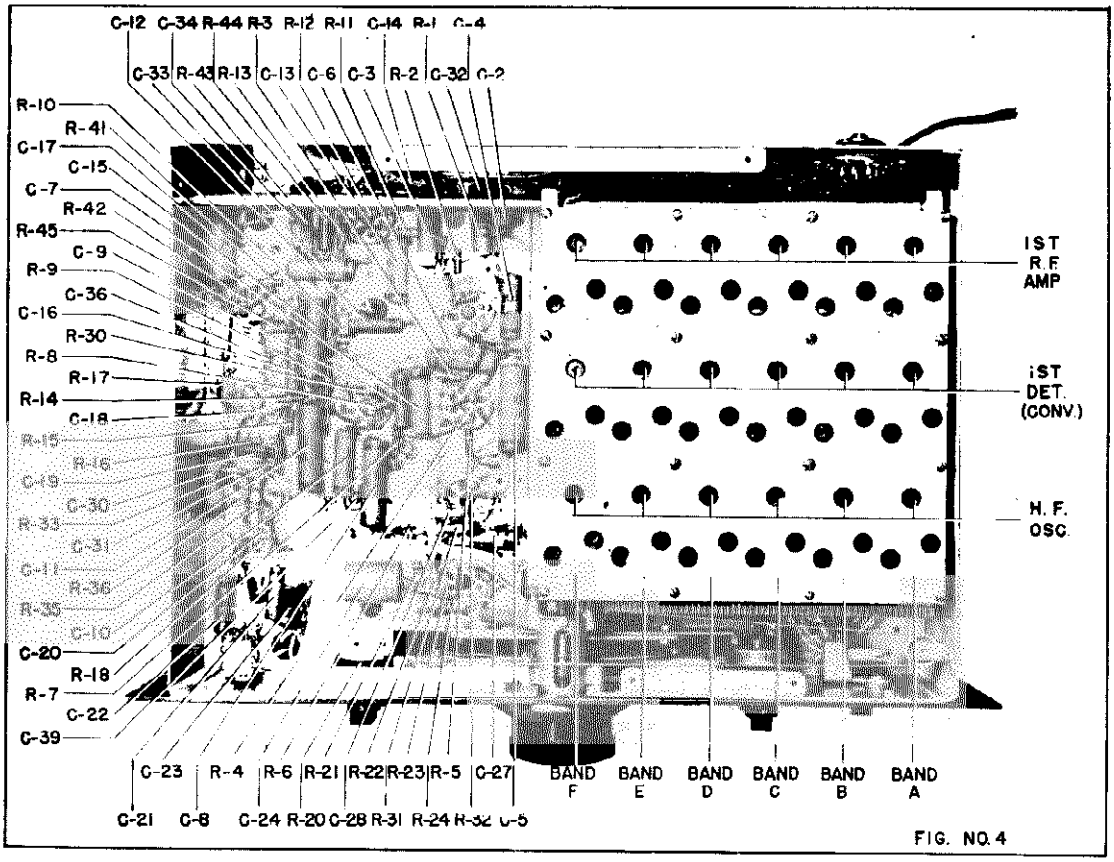

FIG. NO. 4

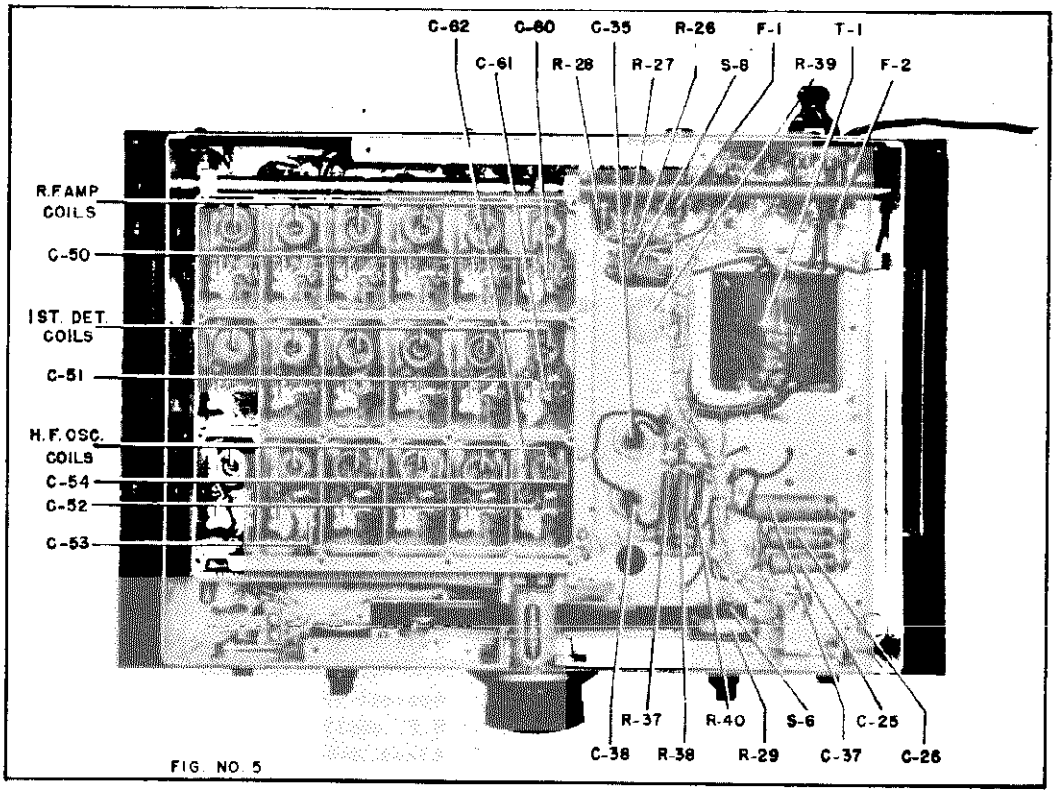

FIG. NO. 5

The two bottom views above show the NC-2-40C Receiver with the coil carriage at the extreme end of its travel. It will be noted that such construction makes all components readily accessible.

have, also, variable series padding capacitors. These capacitors are identified in Fig. No. 5.

A screwdriver having a metal shaft may be used to make adjustments in the high frequency circuits but capacity effects will be noticeable, and the shaft should not touch any part of the aluminum casting.

Before proceeding with the alignment of any circuit of the receiver, the equipment must be set up as specified in Section 2, except that the antenna lead-in or transmission line must be disconnected. An output meter having a 20,000 ohm resistor load should be connected to the phone output jack. The POWER SUPPLY knob should be set at B+ ON and the R.F. GAIN knob set at 9. The TONE control knob should be set at N and the LIMITER knob should be retarded to 0.

Alignment of the equipment may be divided into two major steps:

(1) I.F. Amplifier Alignment
(2) H.F. Circuits Alignment
  (a) H.F. Oscillator
  (b) First Detector and R.F. Amplifier
  (c) Tracking of H.F. Circuits

The circuits MUST be tuned in the above order when complete alignment is necessary.

5-2. *I.F. Amplifier Alignment*

The intermediate frequency of the NC-2-40C Receiver is 455 kilocycles, plus or minus 2 kilocycles. The exact frequency is determined by the quartz crystal resonator Y-1.

Tuning capacitors are provided on the crystal filter and on each I.F. transformer. These capacitors are designated by symbol numbers C-39 and C-41 to C-46, inclusive on Fig. Nos. 3 and 4.

The high output lead of an accurately calibrated signal generator should be connected to the grid terminal of the first detector tube and the grounded lead to any convenient point on the

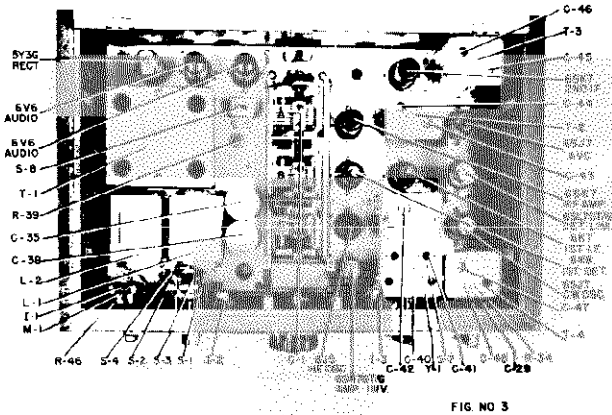

FIG. NO 3

chassis. The flexible lead need not be disconnected from the grid of the tube. Connection is made directly from the output jack of the signal generator, the dummy antenna being omitted. The CONTROL SWITCH of the receiver should be in the CWO position and the modulation of the signal generator turned off to provide a steady C.W. test signal. The PHASING control of the receiver should be set at 0 and the SELECTIVITY control at 5. The A.F. GAIN control should be fully advanced.

Adjust the output attenuator of the signal generator to provide a signal of approximately 100 microvolts and vary the tuning control of the signal generator slowly between the frequencies of 453 and 457 kilocycles. At some frequency between these limits the I.F. amplifier of the receiver will show a very sharply peaked response, as indicated on the output meter. The output attenuator of the signal generator should be retarded after the signal generator has been tuned to the I.F. peak in order to avoid I.F. or audio overload; the C.W. OSC. control must be set to provide an audio beat note in the middle of the audio range (between 400 and 1,000 cycles).

The I.F. tuning capacitors C-39 and C-43 to C-46, inclusive, should each be carefully adjusted to give a maximum reading on the output meter. The order in which the adjustments are made is not important. While making I.F. amplifier adjustments, it will be necessary to retard the attenuator of the signal generator if the readjustment increases I.F. amplifier gain to the point where overload occurs.

The crystal filter SELECTIVITY knob should then be set at 1 and the signal generator detuned between 3 and 4 kilocycles either side of the crystal frequency. Capacitor C-42 should be tuned for maximum output meter reading. After this adjustment is made, the SELECTIVITY knob should be set at OFF and the signal generator retuned to exact crystal frequency. Compensator capacitor C-41 should then be adjusted for maximum reading on the output meter.

The performance of the I.F. amplifier and audio circuits may be checked against the stage gain data in Section 4-3 after alignment has been completed. Selectivity may be checked against the curves of Dwg. No. 1.

After alignment of the I.F. amplifier has been completed, the C.W. OSC. control should be set at 0 at which setting the C.W. oscillator should be at zero beat with the test signal. If zero beat does not occur at zero, readjust capacitor C-47 of transformer T-4, as shown in Fig. No. 3.

The quartz crystal resonator Y-1 may be checked at the conclusion of I.F. amplifier alignment as follows: the SELECTIVITY control should be set at 5 and the signal generator tuned to the crystal frequency. The output meter reading should be noted. When the SELECTIVITY knob is turned to OFF, the meter reading should decrease 1 to 2 db. provided the PHASING knob is at 0. An

NATIONAL CO. INC.

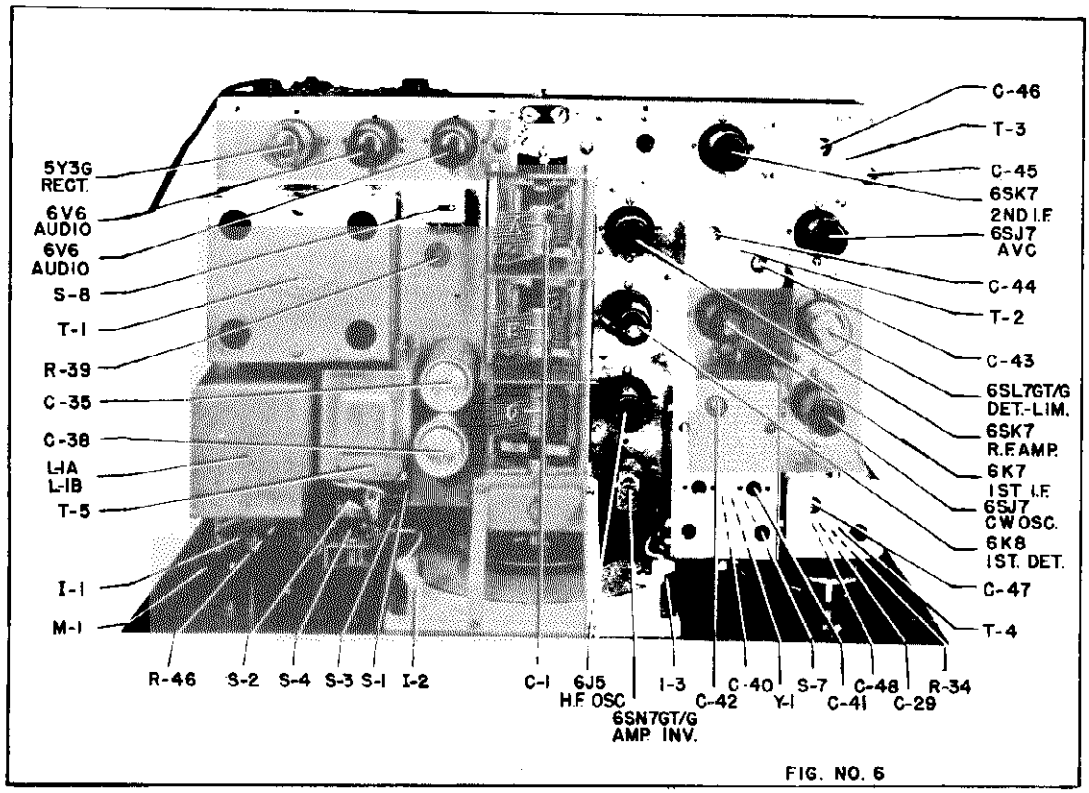

FIG. NO. 6

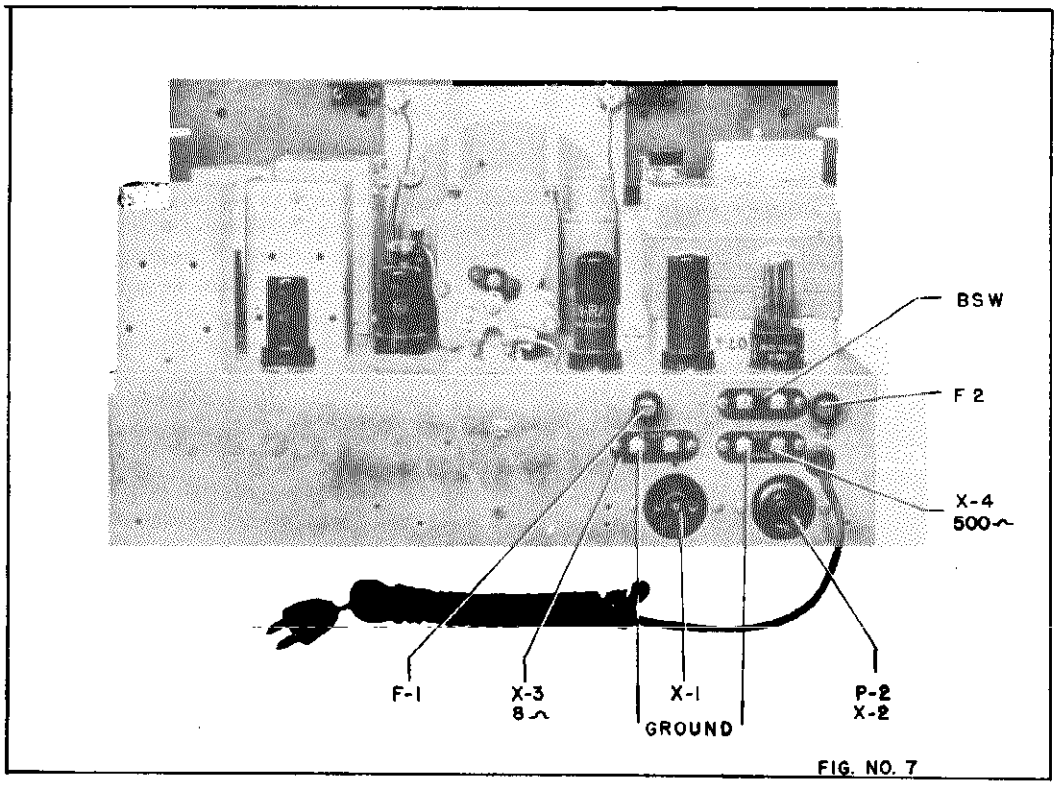

FIG. NO. 7

Top and rear views of NC-2-40CS receiver

increase in meter reading can, in most cases, be traced to an improper adjustment in the I.F. amplifier, since the crystal resonator is mounted in a sealed holder, and it is rather unlikely that trouble will be had from that source.

5-3. *General Coverage Alignment*

(a) H.F. oscillator

Alignment is effected as follows: with the coil range to be aligned connected in the circuit and with the receiver controls set as recommended in Section 5-1, the MAIN TUNING dial should be set near the high frequency end of the range. A signal generator should be connected to the antenna input terminal through a standard IRE dummy antenna and accurately tuned to deliver a signal of the same frequency as that indicated by the receiver dial setting. If, when this signal is tuned in, the dial reading is too high, the capacity of the H.F. oscillator trimmer C-52 should be decreased to make corrections. Conversely, low dial readings are corrected by increasing the capacity of trimmer C-52.

It is imperative that the high frequency oscillator circuits operate at a higher frequency than that of the first detector and R.F. amplifier circuits. This can be checked by tuning in the image signal, which should appear at a dial reading approximately 910 kilocycles below that of the real signal. The image signal should be considerably weaker if the R.F. amplifier is correctly aligned and a stronger test signal may be required before the image can be found. If the image does not appear at the lower frequency dial setting, the H.F. oscillator circuit is incorrectly adjusted and the capacity of the H.F. oscillator trimmer capacitor in question must be decreased until the real signal and image signal appear at the proper points on the dial.

(b) First Detector and R.F. Amplifier

With the signal generator adjusted to deliver a modulated signal near the high frequency limit of the band to be checked, the receiver should be tuned to give maximum output, as indicated by the output meter. The first detector and R.F. amplifier trimmer capacitors C-51 and C-50, respectively, should then be varied until the output meter reads maximum. On the highest frequency bands, adjustment of the first detector and R.F. amplifier trimmers may change the calibration of the high frequency oscillator, necessitating retuning of the MAIN TUNING dial. If these trimmers should require considerable realignment, it may be necessary to readjust the high frequency oscillator trimmer C-52 in order to maintain correct calibration.

A very simple and quick method of first detector and R.F. trimmer alignment may be used if a signal generator is not available. This method consists of setting the trimmers at the adjustment which provides maximum circuit or background noise. It will be found that trimmer settings under this method are sufficiently sharp to provide good alignment, although the adjustment must be made with care to avoid alignment to the image frequency.

(c) Tracking of H.F. Circuits

After the H.F. oscillator, first detector and R.F. amplifier trimmers have been properly set at the high frequency limit of the band, the receiver should be tuned to a frequency toward the low frequency end. Tracking at any point up to the low frequency limit may be checked by adjusting the signal generator to the proper frequency and testing the settings of the first detector and R.F. amplifier trimmers for maximum gain. Calibration may be checked also at these points. After such a test, all trimmers checked should be reset at the high frequency end of the band since their settings are most critical at this point.

Errors in tracking near the low frequenc limits of the band can be caused by defects in an of three circuit elements.

(1) The tuning capacitor section.
(2) The circuit inductance.
(3) The H.F. oscillator series padding capac itor.

In order to determine if one or more section of the master tuning capacitor C-1 are the caus of any mistracking present, it is necessary t make the check described above on two or mor different bands. If the same tracking error ap pears on all bands, the master tuning capacitor i definitely at fault. The error should be cor rected by permanently bending the rotor or stato plates to provide the proper capacity.

If the tracking error appears only in the R.F amplifier or first detector stage of only on band, the inductance of the tuned circuit of th stage is incorrect. Should the tracking check indicate that the H.F. oscillator circuit of particular band is at fault, either the inductanc of the circuit, the series padding capacitor o both may be responsible.

After any change or readjustment is made t any high frequency circuit inductance or serie padding capacity, it will be necessary to relig the associated trimmer at the high frequency limi of the coil range. Tracking should then be re checked.

5-4. *S-Meter Adjustment*

The S-meter balancing resistor R-39, shown in Fig. No. 3, is used to obtain zero meter reading in the absence of signal input to the receiver. The adjustment is as follows: Set the R.F. GAIN control at 10, CONTROL SWITCH at MVC, and disconnect the antenna leads; adjust R-39 until the S-meter reads zero.

MODELS NC-2-40C,
NC-2-40CS

NATIONAL CO. INC.

5-5. *Band Indicator Adjustment*

An adjustment for centering the band indicator markers in the horizontal slots of the dial face is located in back of the MAIN TUNING knob. It is recommended that the MAIN TUNING knob be pulled out to engage the band changing mechanism, and turned clockwise to the last position before the stop. The red band marker should then indicate the 14-30mc. tuning band. To make the adjustment, simply remove the tuning knob and set the ¼" hex-head screw as may be required. The screw is self-locking.

It is often found necessary in various communication services to provide a means for feeding the output of the receiver into a standard 500 ohm telephone transmission line at a 6 milliwatt or 0DB level. Also means for monitoring the receiver and the telephone circuit may be required. The NC-2-40CS can be readily provided with a voltage divider and monitor circuit to fulfill these requirements. A suitable divider will consist of a 5000 ohm, 2 watt resistor connected in series with 500 ohm, 1 watt resistor across the 500 ohm termination of T5 (see X-4 in Fig. 7). In addition to the divider, the output circuit must be terminated at all times, either by use of a properly matched loud-speaker or a suitable load resistor. A loud-speaker or load resistor may be connected to any-one of the three output circuits, but the voltage divider mentioned above must be connected to the 500 ohm output circuit.

Drawing number 3 shows a possible circuit arrangement using a 500 ohm loud-speaker or a 500 ohm, 10 watt load resistor as the receiver load. The switch functions merely to silence the loud-speaker when required. If either a 10,000 ohm loud-speaker or an 8 ohm speaker is used no additional 500 ohm load is required across the 500 ohm receiver output circuit. Headphone monitoring connections should be made to the 500 ohm telephone line as shown because plugging the head-phones into the receiver phone jack disables the speaker output circuits. A high impedance headset is recommended for use across the 500 ohm telephone line. The total attenuation of the voltage divider is approximately 20 decibels. The power supplied to the 500 ohm telephone line corresponding to maximum receiver output is approximately 20 milliwatts.

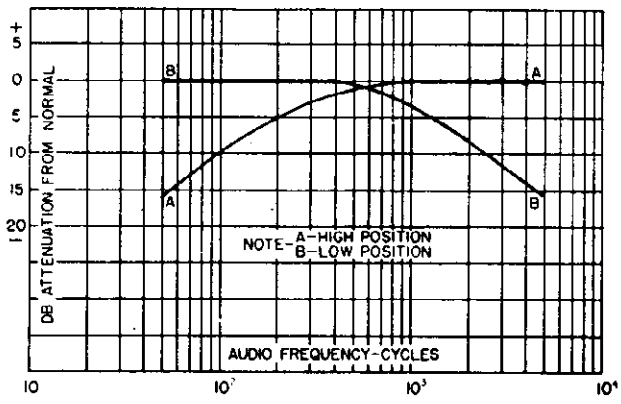
* FIXED BANDSPREAD TRIMMER, NOT USED ON ALL BANDS

Fig. No. 4. B-3 Coil--Typical H.F. Oscillator Bandspread Coil



Dwg. No. 2. Tone Control Action

NATIONAL CO. INC.

The circuit description, installation, operation, service and test data, and alignment data sections applying to Models NC-2-40C and NC-2-40CS (see page numbers below), also apply to Model NC-2-40D, with the exceptions of the following sections:

1-4. *Tuning System*

The master tuning capacitor C-1 and six sets of coils are used to tune the 490 to 30,000 kilocycle range of the receiver. By means of a highly developed band change mechanism, four of these same coil sets are made to spread the 10, 20, 40 and 80 meter amateur bands uniformly over the major portion of the tuning dial (HRO System). All ten ranges are calibrated

1-6. *Noise Limiter*

The noise limiter of the NC-2-40D Receiver is of the series valve type developed in the National Laboratories. Its effectiveness and superior performance as compared to the more common types of "silencers" were proved in the NHU and modernized NC-200 receivers. A threshold control on the front panel permits adjustment of the level at which limiting action starts.

1-7. *Tone Control*

The tone control is used to vary the frequency characteristic of the audio amplifier as shown in the accompanying curves, Dwg. No. 2. The control is particularly helpful when receiving weak signals through interference, as explained in Section 3.

1-13 *Pick-up Jack*

A pick-up jack mounted on the front panel of the receiver may be used to connect auxiliary apparatus, such as a phonograph pick-up, to the audio system of the NC-2-40D Radio Receiver. This input circuit is high impedance and feeds into the 6SN7GT/G Audio Amplifier-Phase Inverter tube. The TONE and A.F. GAIN controls are operative with this connection.

3-1. *Controls*

The tuning system of the NC-2-40D is truly single control; in fact, the MAIN TUNING control referred to above is used for band changing as well as tuning. To select either a general coverage or bandspread coil range, the MAIN TUNING control knob is pulled out about 1/4 inch. When this is done, the dial and capacitor drive mechanism is disengaged and the knob is geared to the coil casting. As the knob is turned, the coil carriage is moved across the chassis until the proper coil pin contacts engage the circuit contactors, as indicated by the scale markers. Approximately one full turn of the MAIN TUNING knob is required to change from one general coverage range to an adjacent general coverage range. Approximately one-quarter turn of the knob is required to shift from a general coverage range to the associated band-spread range near the high frequency end. The knob does not turn smoothly between ranges, but only a few minutes is required to become familiar with its action. After the desired range has been selected, the tuning knob is pushed in to its original position, engaging the capacitor drive and disengaging the coil carriage rack.

5-1. *General*

All coils have individual general coverage trimmer capacitors. The H.F. oscillator circuits of broadcast ranges E & F have, also, general coverage variable series padding capacitors. All coils of ranges A, B, C and D have band-spread trimmer capacitors. Variable series padding capacitors are used in all H.F. oscillator band-spread circuits. These capacitors are identified on Fig. No. 6.

Adjustment of general coverage circuits affects the alignment of the band-spread circuits. On the other hand, band-spread circuit adjustments have little effect on general coverage circuit alignment. This fact must be kept in mind when any high frequency circuit is adjusted.

Alignment of the equipment may be divided into three major steps:

(1) I.F. Amplifier Alignment
(2) General Coverage Alignment
  (a) H.F. Oscillator
  (b) First Detector and R.F. Amplifier
  (c) Tracking of H.F. Circuits
(3) Band Spread Alignment
  (a) H.F. Oscillator
  (b) First Detector and R.F. Amplifier
  (c) Tracking of H.F. Circuits

The circuits MUST be tuned in the above order when complete alignment is necessary.

5-4. *Band-Spread Alignment*

(a) H.F. Oscillator

The method of adjusting the H.F. oscillator band-spread trimmer C-57 of any band is the same as that described under Section 5-3 (a) above. As stated previously (Section 5-1), the adjustment of the general

NATIONAL CO. INC.

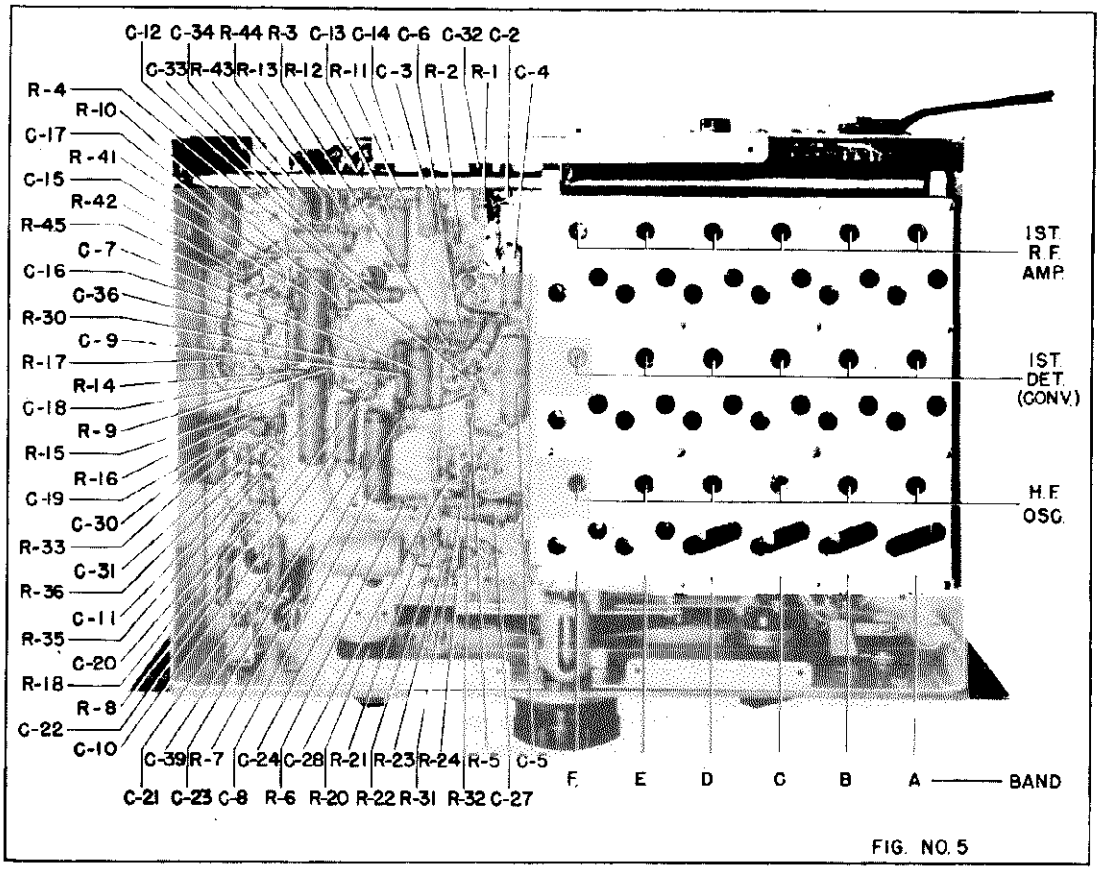


FIG. NO. 5

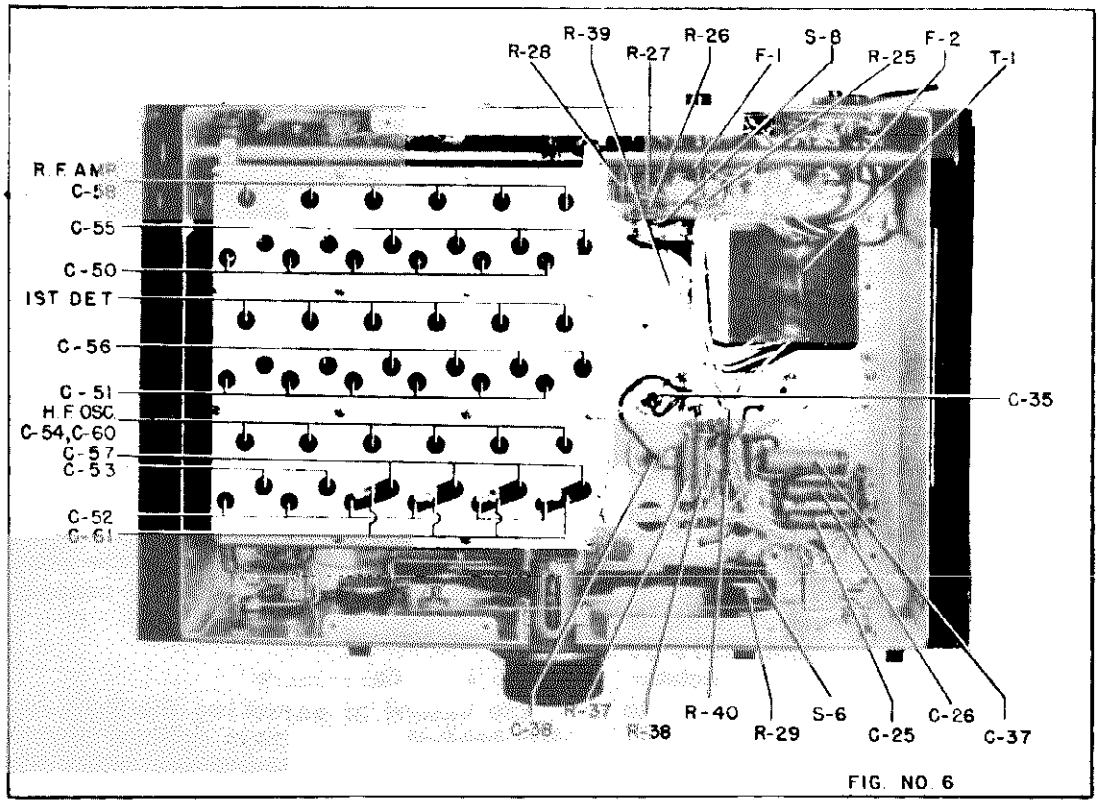

FIG. NO. 6

Band-spread Alignment (cont'd)

coverage trimmers must not be altered at this time.

(b) First Detector and R.F. Amplifier

The method of adjusting the band-spread trimmers C-59 and C-58 of the first detector and R.F. Amplifier circuits is the same as that described under Section 5-3 (b).

(c) Tracking of H.F. Circuits

After steps (a) and (b) have been completed, the MAIN TUNING control should be turned to the low frequency band limit, and the accuracy of the dial reading checked. If the dial reading is too low, the capacity of the series padding capacitor C-61 (See Fig. No. 6) should be increased until the dial reading is correct, and vice versa. The MAIN TUNING control should then be reset at the high frequency band limit, and step (a) repeated. Recheck the low frequency dial reading and repeat the whole procedure if necessary.

The detector and R.F. amplifier stages have fixed band-spread padding capacitors. These circuits will, therefore, track properly with the H.F. oscillator stage provided that the general coverage circuits are properly aligned and that the band-spread H.F. oscillator circuits are accurately tuned.

5-5. *S-Meter Adjustment*

The S-meter balancing resistor R-39, shown in Fig. No. 3, is used to obtain zero meter reading in the absence of signal input to the receiver. The adjustment is as follows: Set the R.F. GAIN control at 10, CONTROL SWITCH at MVC, and disconnect the antenna leads; adjust R-39 until the S-meter reads zero.

5-6. *Band Indicator Adjustment*

An adjustment for centering the band indicator markers in the horizontal slots of the dial face is located in back of the MAIN TUNING knob. It is recommended that the MAIN TUNING knob be pulled out to engage the band changing mechanism, and turned clockwise to the last position before the stop. The red band marker should then indicate 28 to 30 mc. (10 meter) band-spread. To make the adjustment, simply remove the tuning knob and set the 1/4" hex-head screw as may be required. The screw is self-locking.

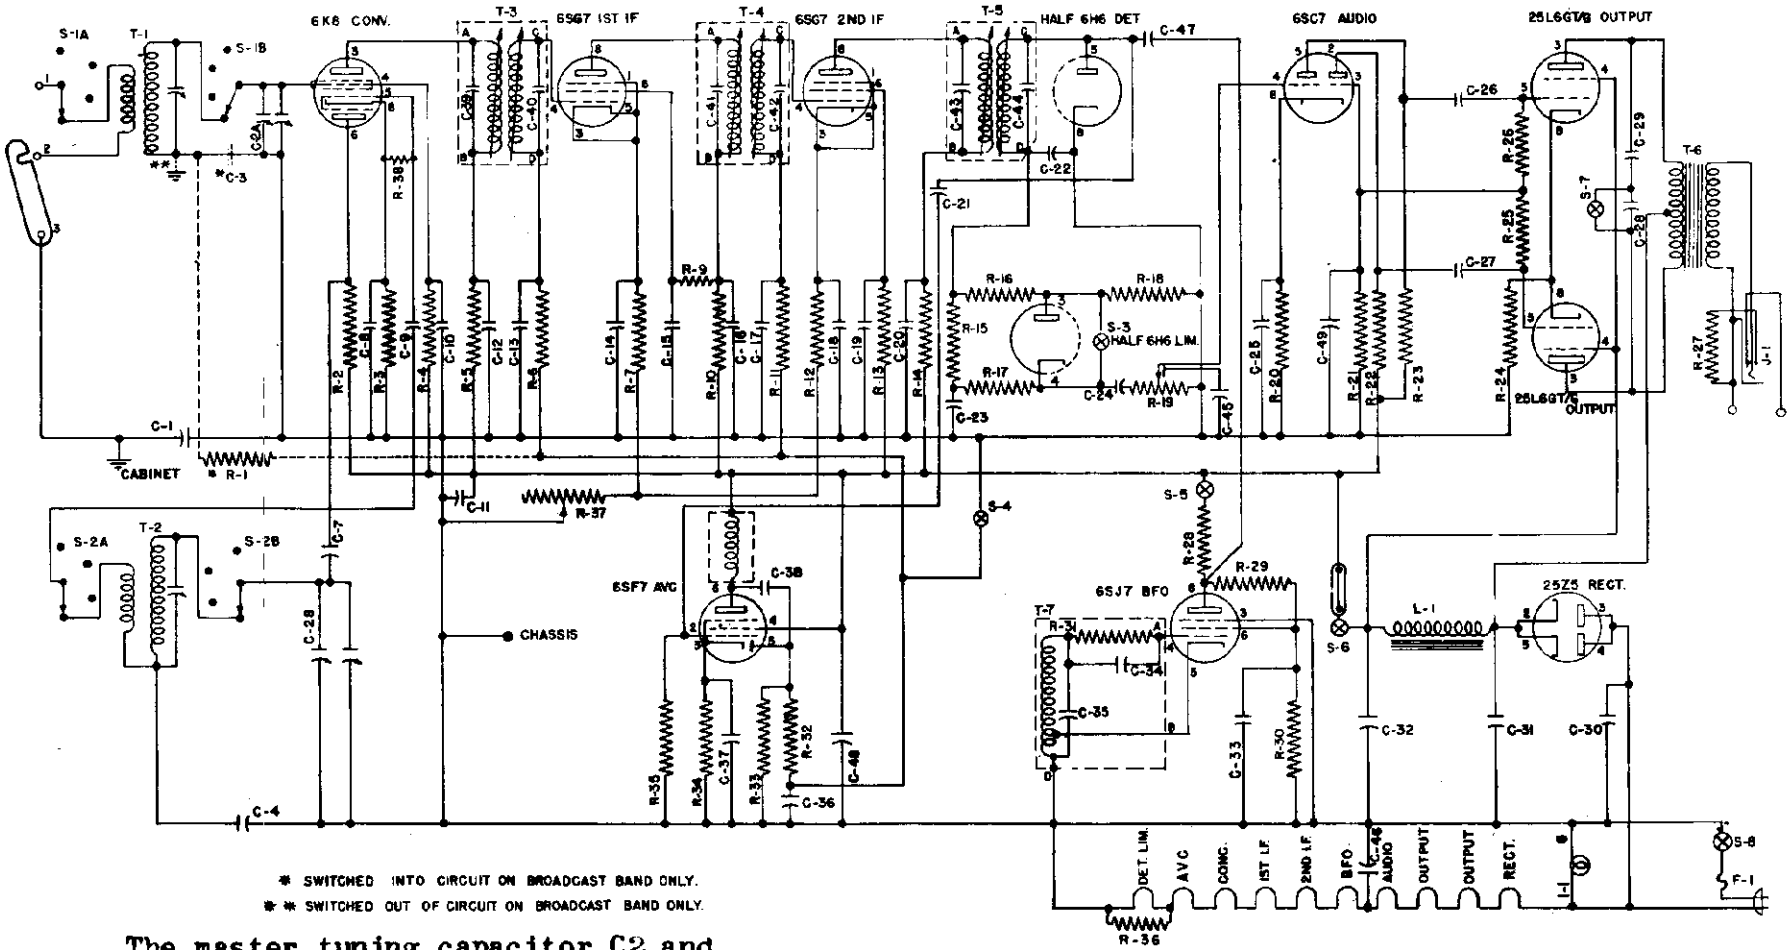
* These Capacitors used on the A band only.



* SWITCHED INTO CIRCUIT ON BROADCAST BAND ONLY.

** SWITCHED OUT OF CIRCUIT ON BROADCAST BAND ONLY.

The master tuning capacitor C2 and four sets of associated coils are used to tune the frequency range of the receiver in four tuning bands for both general coverage and bandspread operation.

The overall frequency coverage of the four bands is as follows:

Band A	11.5	-	30 0 MC
Band B	4.4	-	12.0 MC
Band C	1.55	-	4.6 MC
Band D	0.54	-	1.6 MC

IF PEAK 455 KC

NC-46 RECEIVER
DWG. NO. 1-SCHEMATIC DIAGRAM

The following bands in the short wave ranges are tunable by the bandspread capacitor and are spread as follows:

3.5 - 4.0 MC	65 Divisions
7.0 - 7.3 MC	50 Divisions
14.0 - 14.4 MC	56 Divisions
28.0 - 30.0 MC	40 Divisions

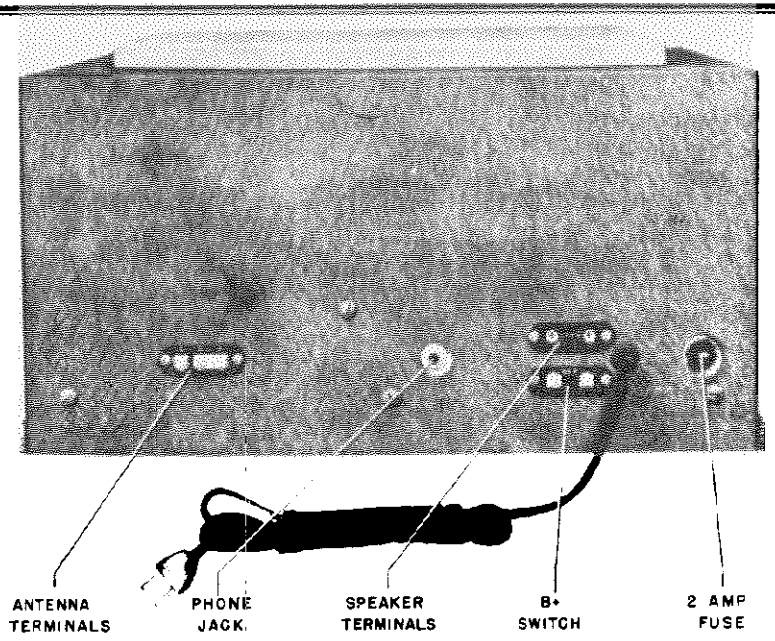


FIG. NO. 1

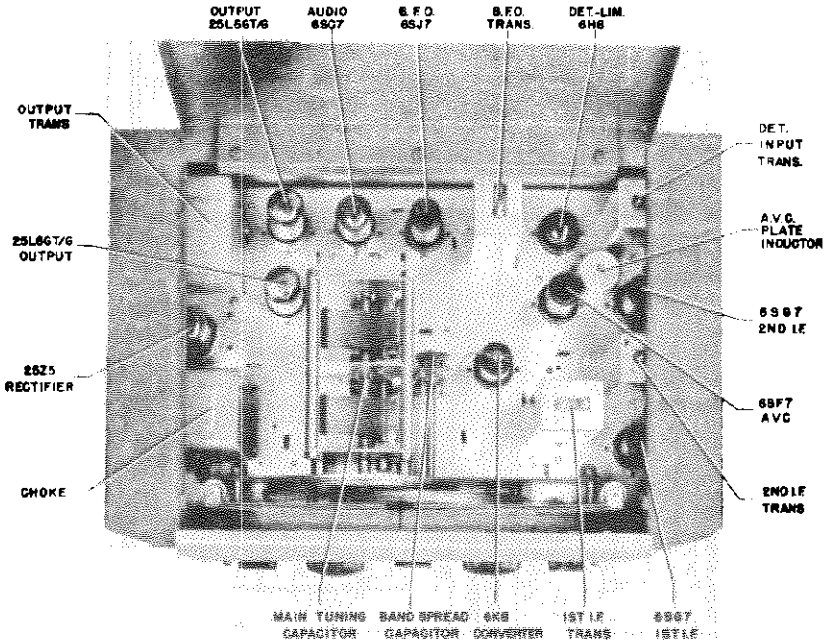

FIG. NO. 3

Circuit

The circuit employed in the NC-46 consists of a converter stage, two intermediate frequency stages, diode detector, limiter, beat frequency oscillator, AVC amplifier, phase inverter, push-pull output and rectifier stages.

The second detector utilizes one set of elements of a dual diode; the other set of elements is used for a noise limiter. Separate tubes are used in the automatic volume control and beat frequency oscillator circuits. The latter is coupled to the second detector for C.W. reception.

All voltages required by the receiver circuits are supplied by a built-in power supply.

Audio Output

Two audio output circuits are provided:

(1) A headphone jack is mounted on the rear of the receiver and is so wired as to silence the loudspeaker when the phone plug is inserted. The load impedance for the headphone output is not critical and any good set of headphones may be used.

(2) Tip-jack terminals are provided at the rear of the receiver for speaker connection. The output load impedance of the receiver is 10 ohms. This allows the use of a permanent magnet speaker with a voice coil of 8 to 10 ohms. The use of a matching output transformer is not required. Maximum undistorted audio power output available is approximately 4 watts.

Antenna Recommendations

There is an antenna terminal strip mounted at the rear of the receiver with three screw-type connections available marked #1, #2 and #3. Terminal #3 is the ground connection. The strip is furnished with a sliding link to short out terminals #2 and #3 for operation with a single wire antenna. Doublet antennae, directive arrays etc., having two wire feeder systems may be used connecting directly to terminals #1 and #2, terminal #3 and strap not being used. For general coverage a single wire antenna of approximately 50 to 100 feet will be found to give satisfactory results. To obtain peak performance on any particular desired channel the antenna length should be approximately an odd quarter-wave length of the band in use.

Controls

The MAIN TUNING control knob is located to the left of the center of the front panel. This knob operates a two gang variable capacitor through a 30 to 1 ratio reduction drive mechanism.

The ELECTRICAL BANDSPREAD control knob is located to the right of the center of the front panel. This knob operates a separate two gang variable capacitor to provide bandspread tuning.

The BAND SELECTOR switch is located at the center of the front panel and functions to select the tuning-band desired. The band in use is indicated by the designating letters on this switch dial. The four tuning scales on the main tuning dial are marked at either end of the dial by these designating letters.

Tuning is accomplished by the following steps:

(a) Select the band to be used by means of the BAND SELECTOR switch.

(b) The frequency calibration of the main tuning dial will only be correct with the bandspread pointer set at 90. After this setting has been made the MAIN TUNING control knob is used to tune in the desired station. The bandspread pointer may then be used to give greater accuracy in logging.

The TONE CONTROL switch is located at the upper left-hand side of the receiver and functions to select the frequency characteristic of the audio amplifier as desired, i.e. HIGH or LOW. The HIGH position will give the better fidelity and the LOW a better signal to noise ratio.

The C.W.O. CONTROL switch is located to the right of the TONE CONTROL switch functioning to switch on or off the beat frequency oscillator.

The VOLUME control is located to the left of the MAIN TUNING knob functioning to adjust the audio amplification of the receiver. Part of this control is a stand-by switch permitting the A.C. line switch to remain on but with B supply circuit open.

The LIMITER CONTROL switch is located at the upper right-hand side of the front panel functioning to switch "On" or "Off" the noise limiter. This control is normally in the "Off" position

The A.V.C. CONTROL switch is located to the left of the LIMITER switch functioning to switch the automatic volume control circuits into or out of the receiver circuits.

The SENSITIVITY control is located to the right of the BANDSPREAD control knob and functions to adjust the amplification of the two I.F. amplifier tubes. Incorporated in this control is the power supply "ON" "OFF" switch; with this switch in the "Off" position the receiver is inoperative.

There is a B.S.W. terminal panel provided at the rear of the receiver to permit remote stand-by control. The terminals are connected in series with the B switch.

After the equipment is properly installed, it is placed in operation by turning the SENSITIVITY control to 10 and the VOLUME control to the point which provides the desired audio volume. The TONE control should be "On"; the C.W.O. control should be "Off"; the A.V.C. control should be "On"; the LIMITER should be "Off". The receiver is now adjusted for the reception of phone signals and can be tuned to the desired frequency and band by means of the MAIN TUNING control and BAND SELECTOR switch.

Individual tubes of the same type are apt to vary slightly in their characteristics and it is well to remember this fact when replacements become necessary. The circuit of the receiver has been designed to reduce the effect of such variations to a minimum but care should be taken in replacing the converter and I.F. amplifier tubes. A replacement converter tube should be checked in the receiver to make sure that the inter-electrode capacities are the same as those of the tube originally employed. This is readily checked by noting any change in the calibration at the high end of any tuning band. This change should not exceed two or three dial division.

Power Supply

The NC-46 Receiver is designed for operation from a 110/130 volt, A.C. or D.C. power source. Normal power consumption is approximately 65 watts. All voltages required for the heater and B supply circuits are delivered by a built-in power supply.

One side of the input power line is connected through a 2 ampere fuse to prevent any possible damage to the receiver due to a short-circuit or ground. This fuse is housed in an extractor post mounted at the rear of the receiver which permits ease in removal or inspection of the fuse.

MODEL NC-46

NATIONAL CO. INC.

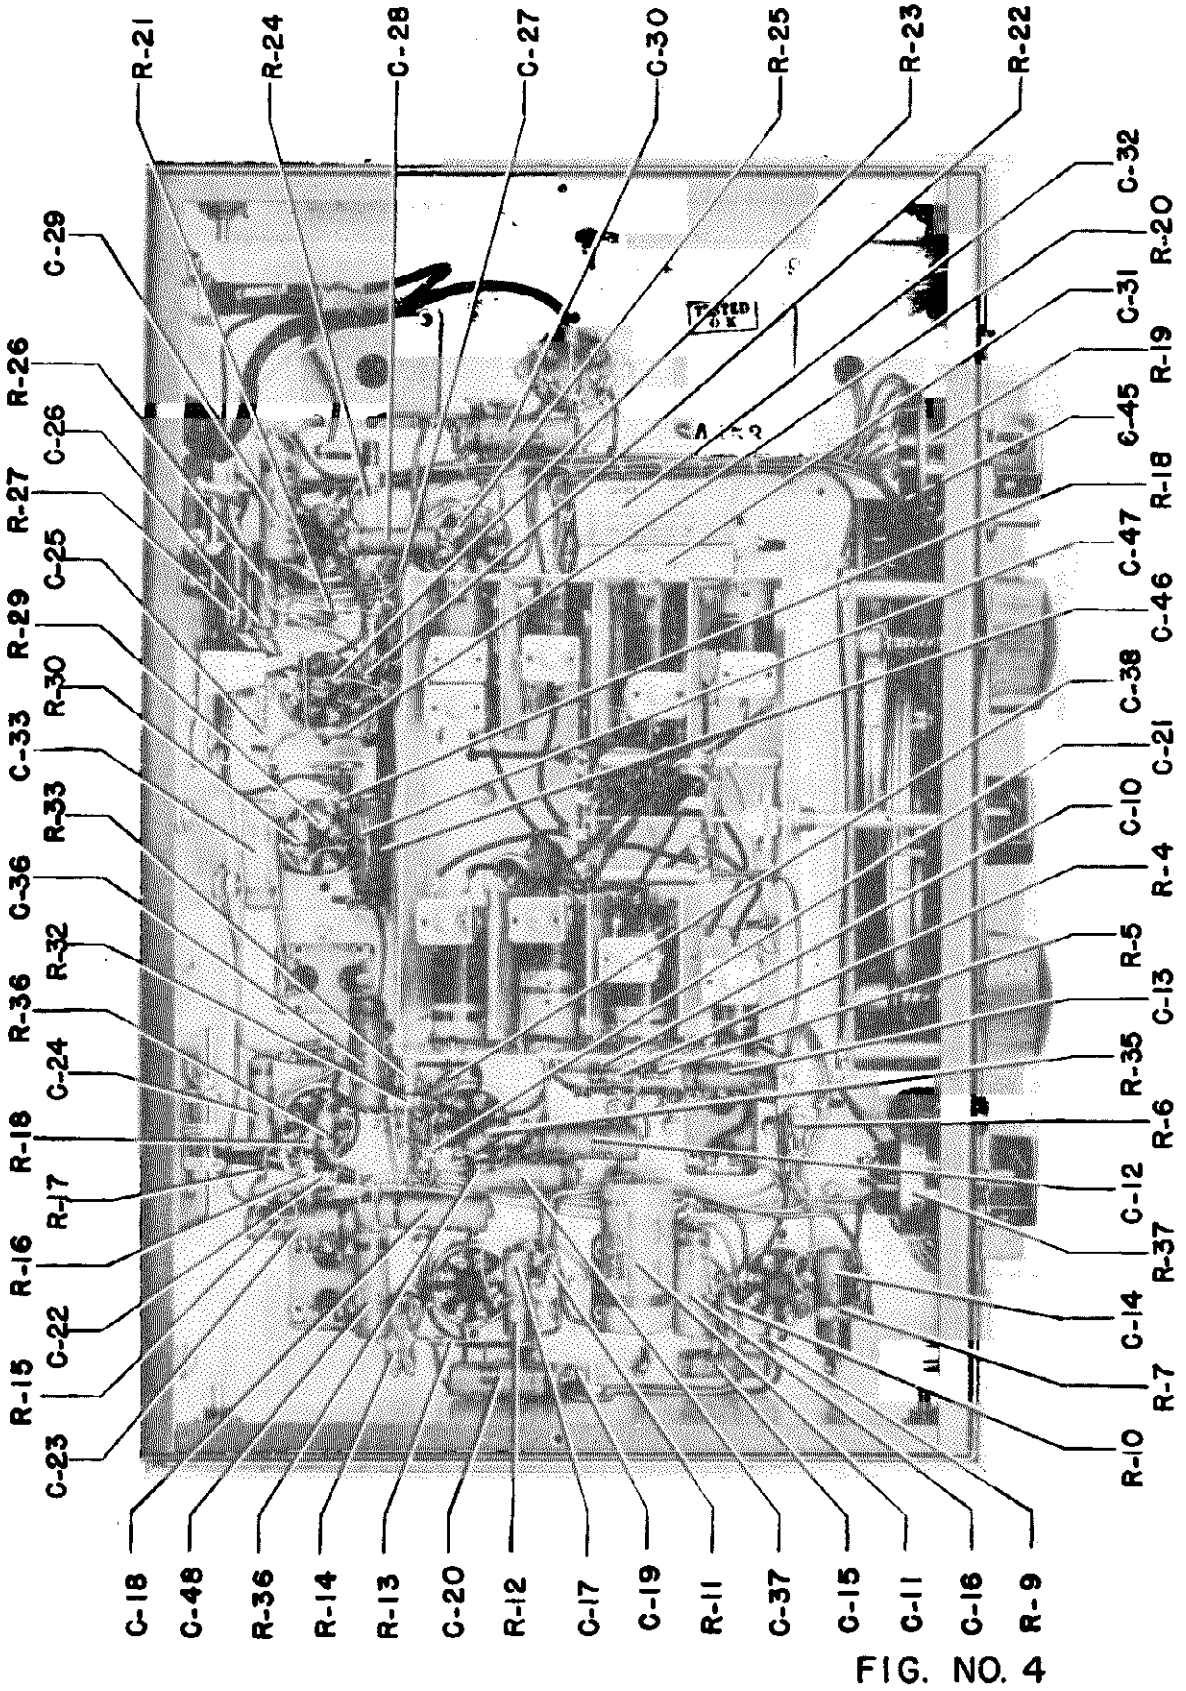

FIG. NO. 4

NATIONAL CO. INC.

The coil groups are mounted in a cadmium plated steel compartment which is directly below the main two gang variable capacitor. The oscillator coils are mounted nearest the left-hand side of the receiver with the first detector coils at the right. All coils have individual trimmer capacitors.

I.F. Amplifier Alignment

The intermediate frequency of the NC-46 Receiver is 455 kilocycles. The three I.F. transformers are of the permeability tuned iron-core type with primary and secondary adjustments.

The first I.F. transformer adjustments, the primary of the second I.F. transformer and the secondary of the third I.F. transformer adjustments are made from inside the cabinet; the secondary of the second I.F. transformer and the primary of the third I.F. transformer adjustments are made through holes in the top of the cabinet. These holes are concealed by means of sliding buttons.

To properly align the receiver the equipment should be set up as specified except that the antenna be disconnected and the A.V.C. switch turned to "Off", the VOLUME control turned to 10 and the TONE control be switched "Off" An output meter having a 10 ohm resistive load should be connected to speaker output terminals. The high output lead of an accurately calibrated signal generator should be connected to the grid terminal of the converter tube and the grounded lead to any convenient point on the chassis. Adjust the output attenuator of the signal generator to provide a signal of approximately 100 microvolts and vary the tuning control of the signal generator slowly between the frequencies of 452 and 458 kilocycles. At some frequency between these points the I.F. amplifier of the receiver will show a sharply peaked response as indicated on the output meter. The I.F. tuned iron cores should be carefully adjusted to give a maximum reading on the output meter. The order in which these adjustments are made is not important.

Coil Alignment

Controls should be set as outlined Alignment is effected as follows:

a. H.F. Oscillator alignment

(1) Set the MAIN TUNING dial to some frequency at the high end of the tuning band to be aligned.

(2) Connect a signal generator, accurately tuned to deliver a signal of the same frequency as that indicated by the receiver dial setting, to the antenna input terminals through a standard 500 ohm dummy antenna.

(3) By checking the calibration of the receiver against the signal delivered by the signal generator, the accuracy of the H.F. oscillator alignment can be observed. If the dial reading of the receiver is found to be high it can be corrected by decreasing the capacity of the H.F. oscillator trimmer capacitor; conversely, low dial readings can be corrected by increasing the capacity of the trimmer.

(4) Care should be taken to insure that the H.F. oscillator is tuned to the fundamental frequency and not the image. This can be checked by tuning to the image frequency which should appear 910 kilocycles below the fundamental frequency and should be considerably weaker. If the operator finds the receiver is tuned to the image signal the capacity of the H.F. oscillator trimmer capacitor should be decreased until the fundamental frequency appears at the proper dial setting.

b. 1st Detector alignment.

(1) With the signal generator adjusted to deliver a modulated signal near the high frequency limit of the tuning band to be checked, the receiver should be tuned to give maximum output, as indicated by the output meter. The 1st detector trimmer capacitor should then be adjusted to give a maximum reading on the output meter. If this trimmer requires considerable realignment it may necessitate the realignment of the H.F. oscillator trimmer to maintain correct calibration.

(2) An alternate method of aligning the 1st detector in the event a signal generator is not available is to set the trimmers at the setting giving the maximum background noise. It will be found that this method gives a sufficiently sharp indication to provide good alignment.

SERVICE NOTES

HUM MODULATION:

On Early Production runs Condenser C-18 consisted of two — .05 mfd. units. One ground terminal was connected to CHASSIS, the other to B—. Disconnect the CHASSIS terminal of the .05 Condenser now connected to Pin No. 1 of the NU-12SA7GT tube and connect this lead to Pin No. 5 of either of the NU-12SK7GTs or to any other convenient B— point. This effectively by-passes the A.C. Modulation hum to B— instead of to Chassis.

OSCILLATION:

Remove one side of Resistor R-2 (in grid circuit of 12SA7GT) now connected to A.V.C. bus and reconnect to cathode (#5 pin) of

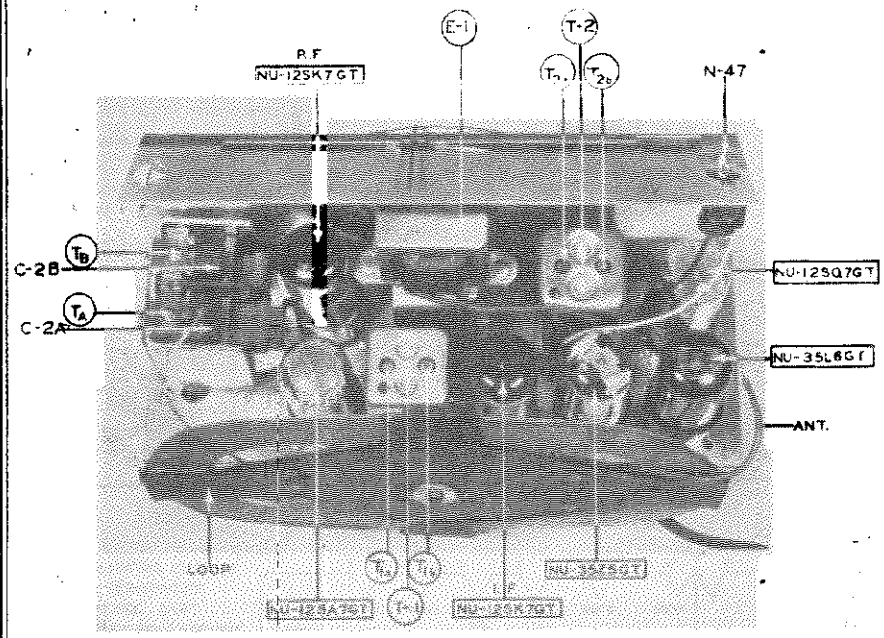

FIG. 1

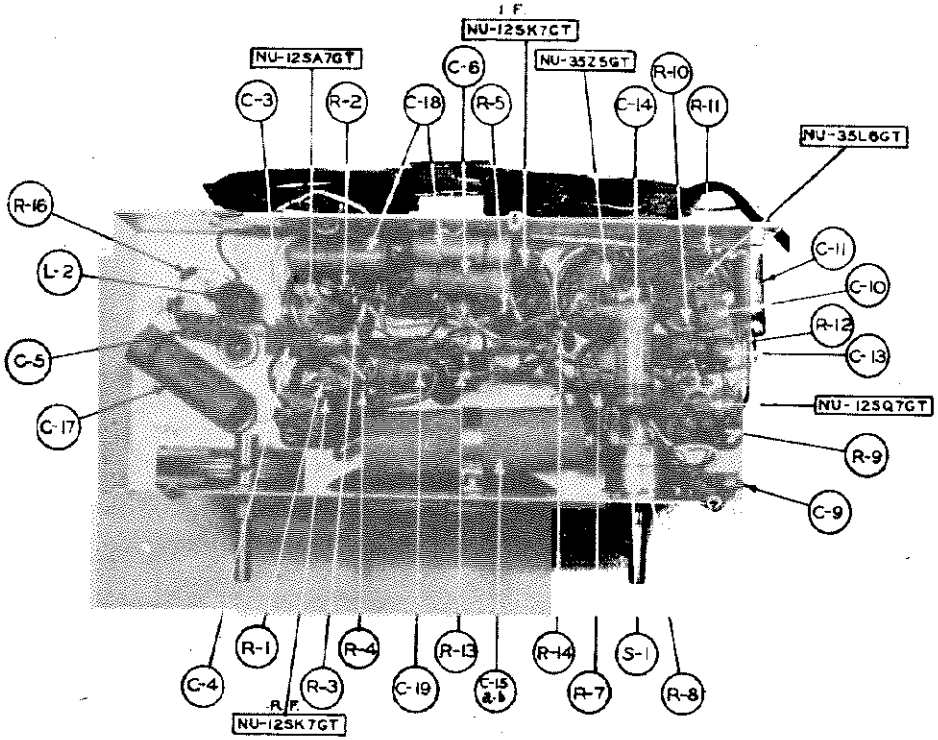

FIG. 2

ALIGNMENT PROCEDURE

PRELIMINARY.

(a) Adjust the DIAL POINTER along the dial cord to the position opposite the first right-hand *punch mark* on the dial backing-plate, with the tuning condenser gang completely out of mesh (Minimum Capacity); (b) Set VOLUME CONTROL to the FULL ON position; (c) Maintain SIGNAL GENERATOR output at MINIMUM consistent with a readable Output Meter indication; (d) OUTPUT METER across voice coil; (e) Follow sequence indicated below.

SEQUENCE	DUMMY ANTENNA	DIAL SETTING	SIGNAL GENERATOR CONNECTIONS	SIGNAL GENERATOR SETTING	ADJUST TRIMMERS	NOTES

CIRCUIT CHANGES.

The following changes have been made in Chassis RE-200 since the start of production.

1. Connections to pins 2 & 7 have been interchanged on 12SA7 tube.
2. A 15 ohm resistor, R-11 has been added in B+ lead at Cathode of 35Z5GT tube.
3. .005 Condenser C-5 and 150 ohm Resistor R-3 have been deleted from oscillator circuit.
4. Tap has been added to Primary of IF transformer T-3 and trimmer connected directly across primary winding.

PRELIMINARY.

ALIGNMENT PROCEDURE

Output meter connection ..... Across loudspeaker voice coil
Output meter reading to indicate 200 milliwatts (standard output) ..... 0.8 volts
Dummy antenna to be in series with signal generator output ..... See chart below
Connection of generator ground lead ..... Floating ground
Generator modulation ..... 30% 400 cycles
Position of Volume Control ..... Fully clockwise
Position of pointer with vzriable fully closed ..... 54 on dial

Position of Variable	Generator Frequency	Dummy Antenna	Generator Output Connection	Trimmers Adjusted	Trimmer Function	Approximate Sensitivity
Open	455 Kc	.05 uf	12SA7 Grid (Stator of C-1)	2 trimmers on top of T-3	IF	3000 uv
1400 Kc	1400 Kc	.00005 uf	Antenna lead	**C-2	Oscillator	360 uv

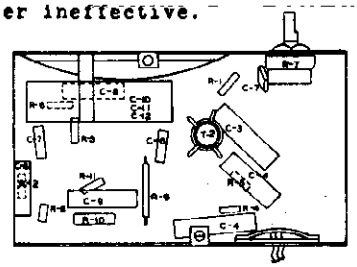
**Since the antenna section of the variable has no trimmer, the rotor of the variable should be rocked back and forth on both sides of 1400 Kc while adjusting the oscillator trimmer for maximum output. This is to obtain the combination of rotor and trimmer setting to give perfect tracking of the two sections of the variable condenser and consequently give maximum output.

Check sensitivity at 600 Kc. If weak, adjust antenna section plates for maximum output at 600 Kc. Tracking of the condenser at points other than 1400 Kc is accomplished by bending the outside plates on the variable condenser rotor, which are cut for this purpose. When bending plates to track the condenser at any given frequency, keep in mind the fact that this will effect the tracking at all frequencies below that point. A tuning wand is very helpful in checking the tracking of this condenser, to indicate whether more or less capacity is needed.

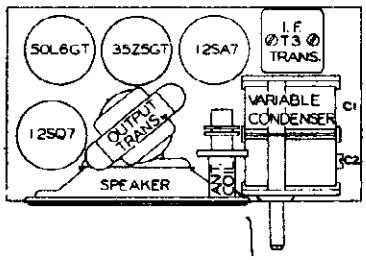
The alignment procedure should be repeated stage by stage in the original order for greatest accuracy.

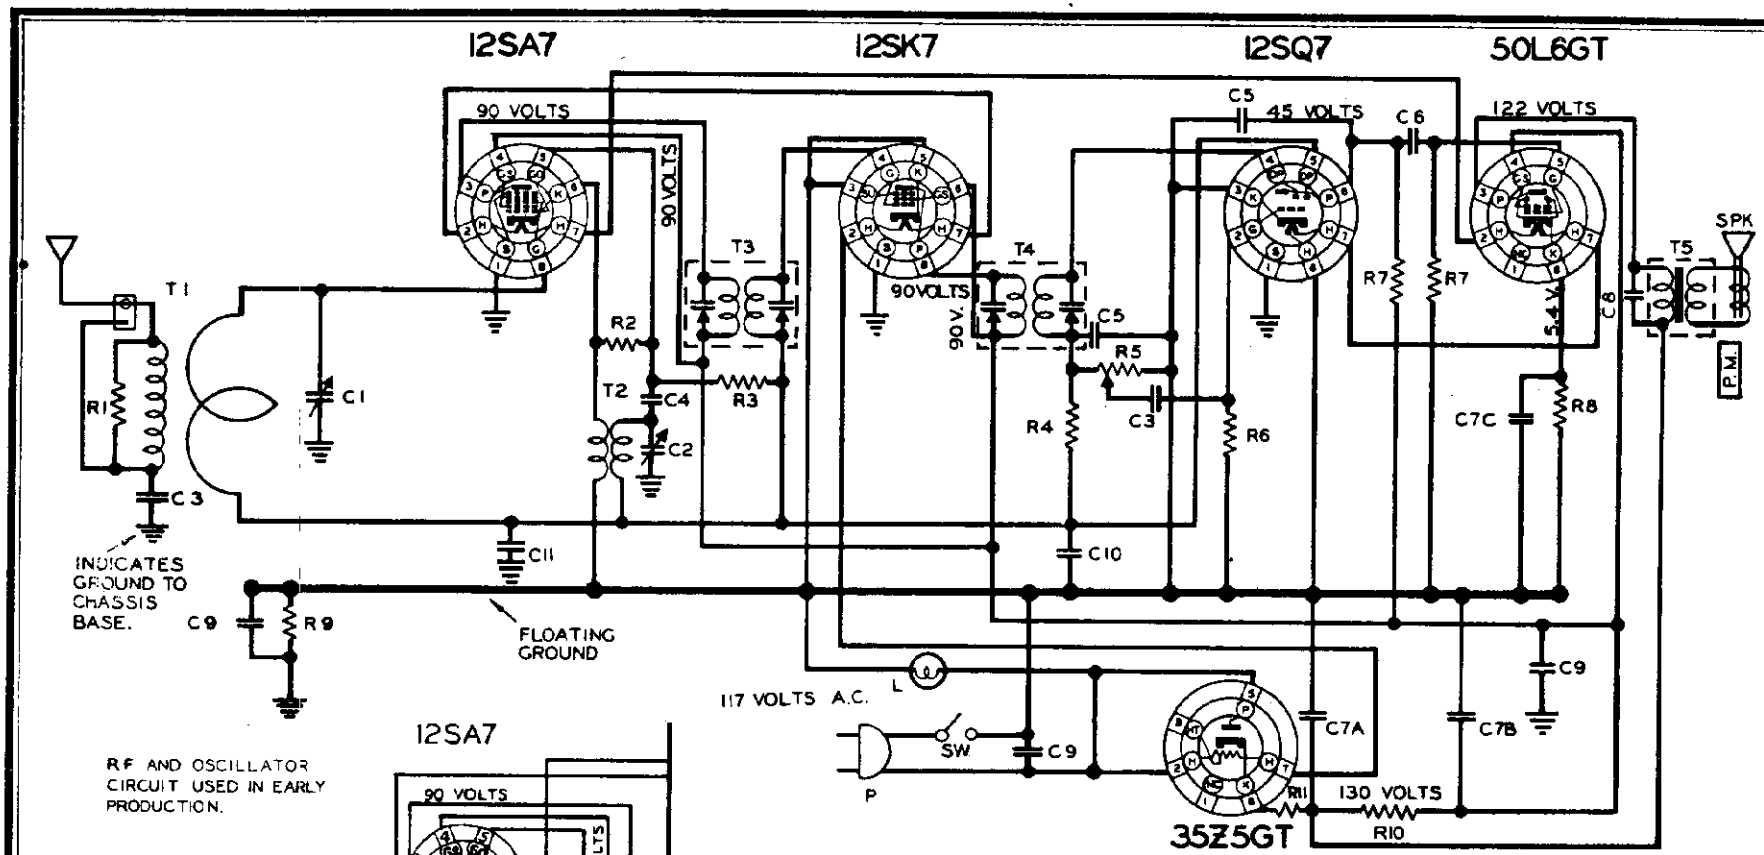
Always keep the output from the test oscillator at its lowest possible value to make the AVC action of the receiver ineffective.

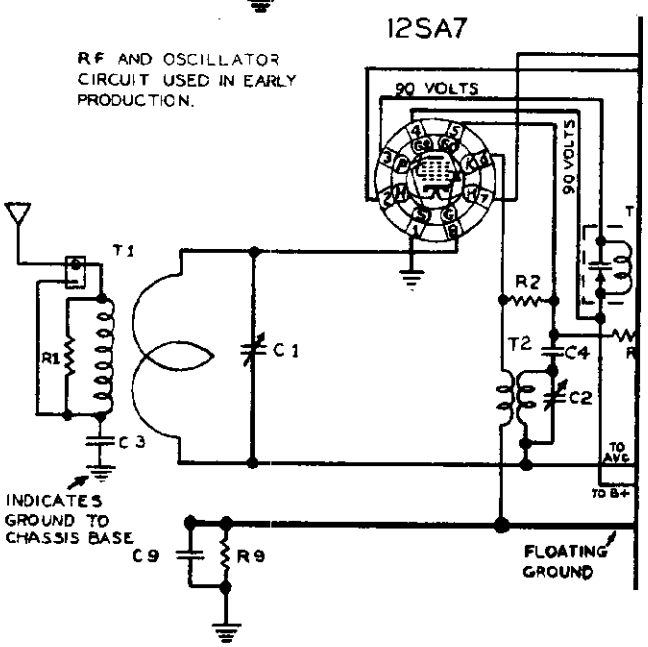
LOCATION OF PARTS UNDER CHASSIS



TUBE LAYOUT







RF AND OSCILLATOR CIRCUIT USED IN EARLY PRODUCTION.

TUBE SOCKETS ARE VIEWED FROM UNDER SIDE OF CHASSIS. VOLTAGE READINGS SHOWN AT SOCKET PRONGS ARE TO FLOATING GROUND AND ARE TAKEN WITH NO SIGNAL. A C LINE VOLTAGE AT 117 VOLTS. WHERE NO READING IS GIVEN THE VOLTAGE IS ZERO OR TOO LOW TO READ.

1946

SERVICE HINTS AND CIRCUIT CHANGES.

Sets made previously to March, 1946 had the Variable Condenser rotors connected to the AVC line instead of being grounded to chassis base, and did not have the .1 ufd condenser C-11 connected from the AVC line to chassis base. (In a few sets this is a .05 ufd condenser C-9)

On the early sets, if the dial pointer, shaft, or metal pulley on variable is allowed to touch the dial scale, or plate, the rotor of variable will be grounded, causing noise and distortion. The circuit was changed to eliminate this condition.

If distortion or a chopped output signal is encountered in this set, try replacing the 50L6 tube.

600	600	.00005 mfd.	Antenna Clip (With blue wire removed)	**Adj. antenna section plates of variable cond. for Max. output.	Antenna

If a standard test loop is used with the signal generator for alignment of the receiver, the blue wire will be left in the antenna clip, and the approximate sensitivities should be 300 uv/m and 250 uv/m or less at 600 Kc and 1400 Kc respectively.

Approximate stage by stage sensitivities for 200 Milliwatt output.

IF. - 455 Kc. --------	3350 uv	Antenna 1000 Kc --------	50 uv
Mixer 455 Kc. --------	75 uv	Antenna 1400 Kc --------	25 uv
Mixer 1000 Kc.--------	60 uv	Antenna 600 Kc --------	50 uv

The alignment procedure should be repeated in the original order for greatest accuracy. Always keep the output from the signal generator at its lowest possible value to make the AVC action of the receiver ineffective.

*A floating ground connection can be obtained on either of the lugs on the back of the AC switch or the black lead on the Volume Control.

**AS THE CONDENSERS ARE ALL TRACKED BEFORE LEAVING THE FACTORY IT IS NOT PROBABLE THAT THE PLATES WILL NEED TO BE ADJUSTED UNLESS WIDE VARIATIONS IN TUBES ARE ENCOUNTERED.

The outside plates on the antenna section of the variable condenser are cut, so they can be bent in or out to give more or less capacity at any given position of the rotor, after the trimmers on the variable have been adjusted at 1400 Kc. A disc type tuning wand affords a quick method of determining whether more or less capacity is needed in the antenna circuit. If the output increases when the Iron end of the wand is placed near the loop, the plates should be bent in to give more capacity. If the output increases when the brass or aluminum end of the wand is placed near the loop the plates should be spread out. If the wand indicates

cont'd on next page

NOBLITT-SPARKS INDUSTRIES INC.

that the plates should go closer, but cannot go closer without shorting, the oscillator section plates can be spread, but the calibration should be checked after adjusting the oscillator section. Also the band coverage should be checked to see that 540 Kc can be received.

If the receiver is weak at 1000 Kc the same procedure can be followed at 1000 Kc as outlined above for 600 Kc but this will change the tracking at 600 Kc and may affect 1400 Kc so that all points should be rechecked in the original order.

The condenser should be checked for any possible shorting of ths plates after the alignment is completed.

FREQUENCY RANGE

Broadcast ..... 540-1600 kc

POWER SUPPLY

105-125 Volts AC-DC, 35 Watts

POWER OUTPUT

Undistorted ..... .8 Watts
Maximum ..... 2.5 Watts
Plate load ..... 2000 ohms

Due to variations in tubes some sets which are equipped with 12SK7GT tubes may have a tendency to oscillate. This condition can usually be corrected by placing a shield on the 12SK7GT tube or replacing it with a 12SK7 metal tube. In some cases the IF transformers may need to be repeaked after changing this tube.

Several cases of weak sets have been caused by a defective 12SA7GT tube which will check good on the average tube tester. Alignment should be checked after changing this tube.

MODELS 664 & 664A

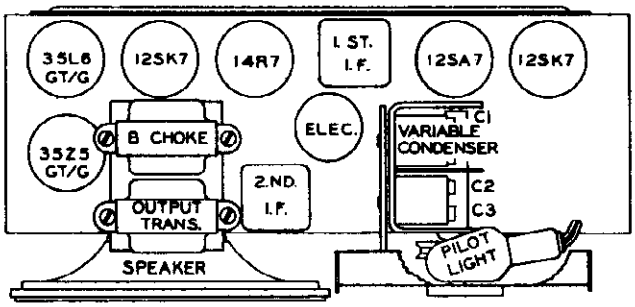
ALIGNMENT PROCEDURE

PRELIMINARY.

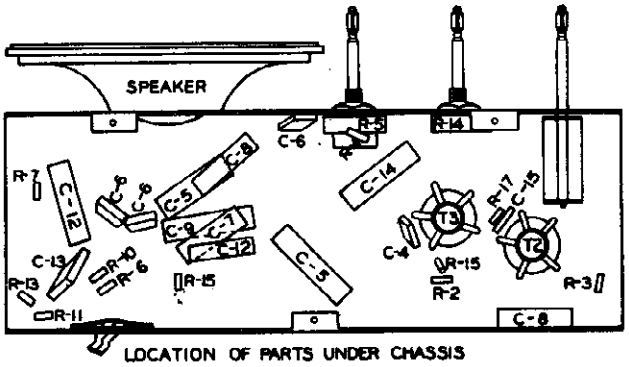
Output meter connection ..... Across loudspeaker voice coil
Output meter reading to indicate 200 milliwatts (standard output) ..... .8 volts
Dummy antenna value to be used in series with generator output ..... See chart below
Connection of generator output lead ..... See chart below
Connection of generator ground lead ..... Floating ground
Generator modulation ..... 30% 400 cycles
Position of Volume Control ..... Fully clockwise
Position of dial pointer with variable fully closed ..... Vertical
Place the set loop in the same position with respect to the rear of the chassis, and the same distance from the chassis, as it would be with the set mounted in the cabinet. This distance is 1 3/16" from the plate on back of chassis to back of the loop. If the position of the loop is not correct while adjustments are made on the antenna circuit, the antenna circuit will not track and the set will be weak, when placed in the cabinet.

MODELS 664,664A
Chassis RE-206

NOBLITT-SPARKS INDUSTRIES INC.



TUBE LAYOUT



LOCATION OF PARTS UNDER CHASSIS

Position of Variable	Frequency of Generator	Dummy Antenna	Generator Output Connection	Trimmers adjusted in Order Shown for Max. Output	Function of Trimmer.
Open	455	.01 mfd.	12SA7 Grid or (Stator of center section of variable condenser)	Top of 2nd & 1st IF Trans.	IF
1400	1400	.00005 mfd.	Antenna Clip (With black wire removed)	*C3; C2; C1, trimmers on Variable Condenser	Osc. RF Ant.
600	600	.00005 mfd.	Antenna Clip (With black wire removed)	**Adj. plates of variable cond. for Max. output.	Osc. RF Ant.

If a standard test loop is used with the signal generator for alignment of the receiver, the black wire will be left in the antenna clip, and the approximate sensitivities should be 250 uv/m and 150 uv/m or less at 600 Kc and 1400 Kc respectively. Sets using glass 12SA7 tube may have slightly weaker sensitivities.

Approximate stage by stage sensitivities for 200 Milliwatt output.

IF. - 455 Kc. --------	10,000 uv	Antenna 1000 Kc --------	15 uv
Mixer 455 Kc. --------	150 uv	Antenna 1400 Kc --------	15 uv
Mixer 1000 Kc. --------	170 uv	Antenna 600 Kc --------	25 uv

The alignment procedure should be repeated in the original order for greatest accuracy. Always keep the output from the signal generator at its lowest possible value to make the AVC action of the receiver ineffective.

*Trimmer C3 (oscillator) is located either on the top or bottom of the variable condenser, depending on the type variable used on any particular set.

**AS THE CONDENSERS ARE ALL TRACKED BEFORE LEAVING THE FACTORY IT IS NOT PROBABLE THAT THE PLATES WILL NEED TO BE ADJUSTED UNLESS WIDE VARIABIONS IN TUBES ARE ENCOUNTERED OR THE CONDENSER HAS BEEN DAMAGED. PLATE BENDING SHOULD NOT BE ATTEMPTED WITHOUT THE PROPER EQUIPMENT, OR BY ANYONE NOT EXPERIENCED AT TRACKING CONDENSERS.

The outside plates on the antenna & RF sections of the variable condenser are cut, so they can be bent in or out to give more or less capacity at any given position of the rotor, after the trimmers on the variable have been adjusted at 1400 Kc. A disc type tuning wand affords a quick method of determining whether more or less capacity is needed in the antenna circuit. If the output increases when the Iron end of the wand is placed near the loop, the plates should be bent in to give more capacity. If the output increases when the brass or aluminum end of the wand is placed near the loop the plates should be spread out. If the wand indicates that the plates should go closer, but cannot go closer without shorting, the oscillator section plates can be spread, or vice versa, but the calibration should be checked after adjusting the oscillator section. Also the band coverage should be checked to see that 540 Kc can be received.

Since the osc. section has much less capacity than the RF & antenna sections, plate bending will be much more effective in the osc. circuit, and a small change in or out in the plates of this section will have the same effect as a large change in the opposite direction in the other sections.

If the receiver is weak at 1000 Kc the same procedure can be followed at 1000 Kc as outlined above for 600 Kc but this will change the tracking at 600 Kc and may affect 1400 Kc so that all points should be rechecked in the original order.

The condenser should be checked for any possible shorting of the plates after the alignment is completed.

SERVICE HINTS AND CIRCUIT CHANGES.

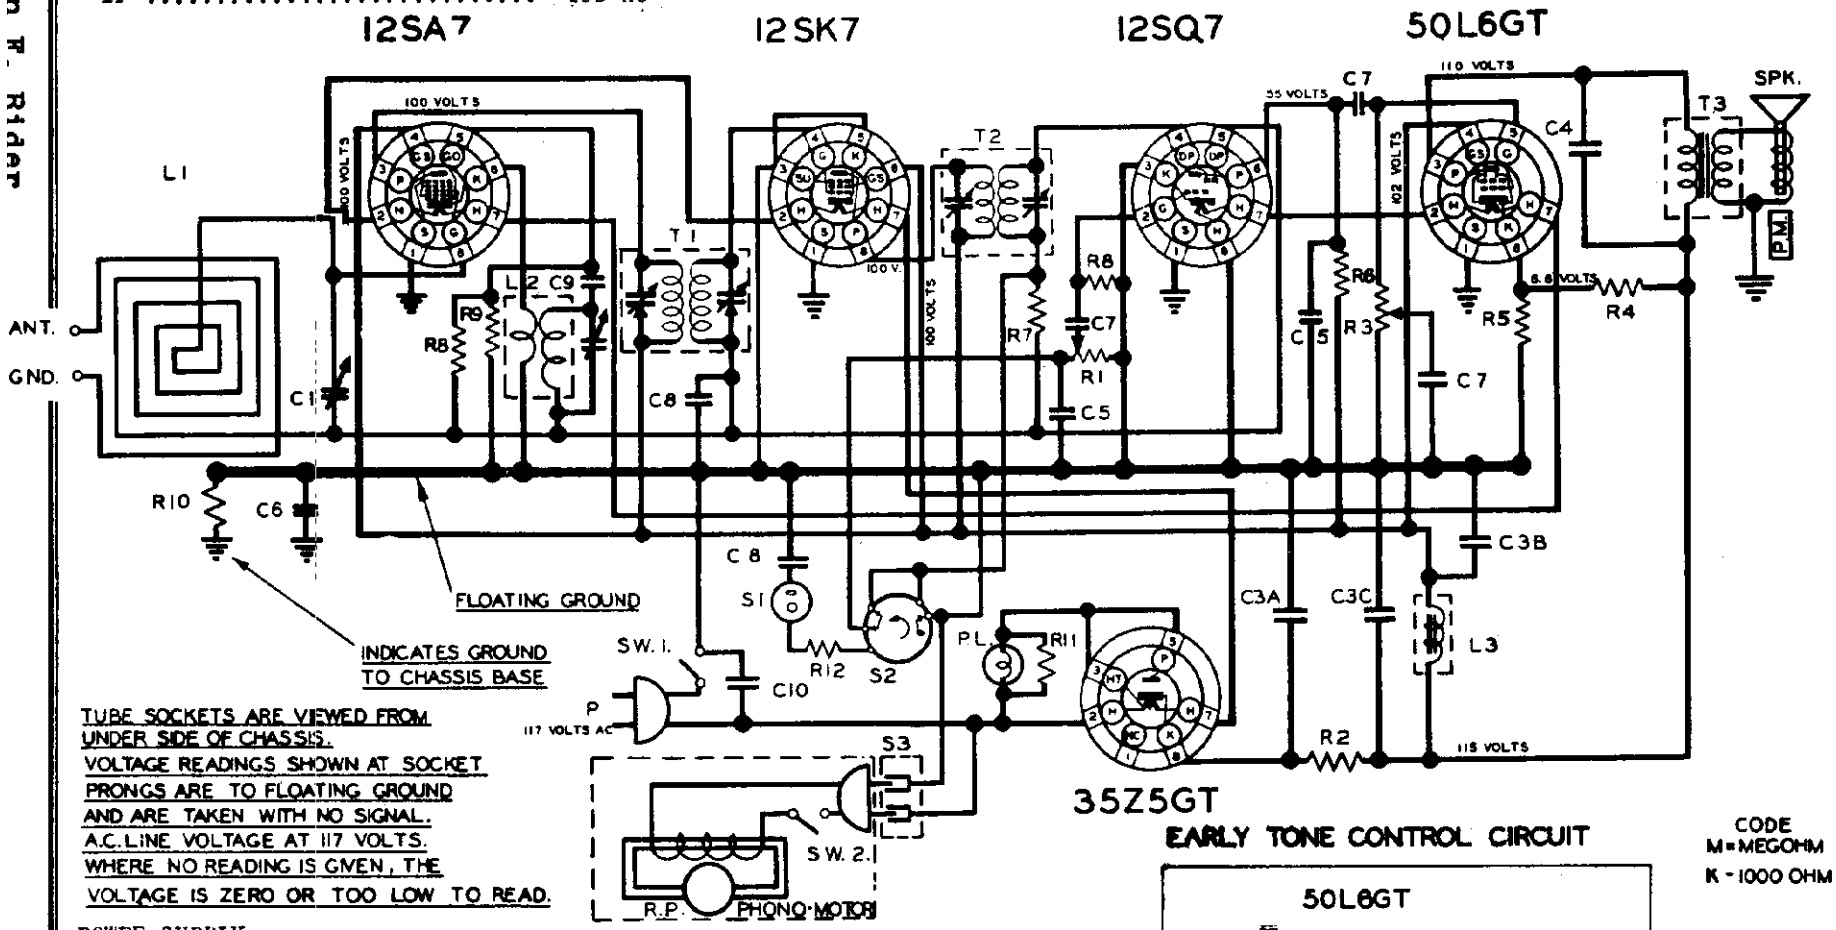
If the dial pointer is allowed to touch the dial scale, the rotor of the variable condenser, which is connected to the AVC Line, will be grounded, causing noise & distortion.

If the set has a tendency to be microphonic, check the rubber grommets on the Variable Condenser mounting, if these are hard replace them with soft rubber grommets.

C15 (14 mmf. cond.) was added to RF Circuit and R17 was changed from 3300 ohms to 6800 ohms, after start of production.

CHASSIS-RE-204

FREQUENCY RANGE
Broadcast ..... 540-1600 kc
IF ..... 455 kc



TUBE SOCKETS ARE VIEWED FROM UNDER SIDE OF CHASSIS.
VOLTAGE READINGS SHOWN AT SOCKET PRONGS ARE TO FLOATING GROUND AND ARE TAKEN WITH NO SIGNAL.
A.C. LINE VOLTAGE AT 117 VOLTS.
WHERE NO READING IS GIVEN, THE VOLTAGE IS ZERO OR TOO LOW TO READ.

CODE
M=MEGOHM
K=1000 OHM

POWER SUPPLY

105-125 Volts AC-DC, 50 Watts

POWER OUTPUT

Undistorted	1 Watt
Maximum	1.9 Watts
Plate load	2000 ohms

Sets made previous to July, 1946 had the tone control in the plate circuit. See Drawing In these sets the tone control R3 was 50K ohms.

Output meter reading to indicate 200 milliwatts (standard output)..... .8 volts
Dummy antenna value to be used in series with generator output..... See chart below
Connection of generator output lead ..... See chart below
Connection of generator ground lead ..... *Floating ground
Generator modulation ..... 30% 400 cycles
Position of Volume Control ..... Fully clockwise.
Position of dial pointer with variable fully closed...Last rectangular mark at left edge of dial

Place the set loop in the same position with respect to the rear of the chassis, and the same distance from the chassis, as it would be with the set mounted in the cabinet.

Position of Variable	Frequency of Generator	Dummy Antenna	Generator Output Connection	Trimmers adjusted in Order Shown for Max. Output	Function of Trimmer
Open	455	.05 mfd.	12SA7 Grid (Stator of rear section of variable condenser)	Top of 2nd & 1st IF Trans.	IF
1400	1400	.00005 mfd.	Antenna connection on back of loop	C2; C1, trimmers on Front & Rear sections of Variable Condenser	Osc. Ant
600	600	.00005 mfd.	Antenna connection on back of loop	**Adj. antenna section plates of variable cond. for Max. output	Antenna.

If a standard test loop is used with the signal-generator for alignment of the receiver, the approximate sensitivities should be 350 uv/m and 250 uv/m or less at 600 Kc and 1400 Kc respectively.

Approximate stage by stage sensitivities for 200 Milliwatt output.

IF. - 455 Kc. --------	2600 uv	Mixer 1000 Kc. --------	75 uv
Mixer 455 Kc. --------	60 uv	Antenna 1400 Kc. -------	70 uv

The alignment procedure should be repeated in the original order for greatest accuracy. Always keep the output from the signal generator at its lowest possible value to make the AVC action of the receiver ineffective.

*A floating ground connection can be obtained on either of the lugs on the back of the AC switch.

**AS THE CONDENSERS ARE ALL TRACKED BEFORE LEAVING THE FACTORY IT IS NOT PROBABLE THAT THE PLATES WILL NEED TO BE ADJUSTED UNLESS WIDE VARIATIONS IN TUBES ARE ENCOUNTERED.

The outside plates on the antenna section of the variable condenser are cut, so they can be bent in or out to give more or less capacity at any given position of the rotor, after the trimmers on the variable have been adjusted at 1400 Kc. A disc type tuning wand affords a quick method of determining whether more or less capacity is needed in the antenna circuit. If the output increases when the Iron end of the wand is placed near the loop, the plates should be bent in to give more capacity. If the output increases when the brass or aluminum end of the wand is placed near the loop the plates should be spread out. If the wand indicates that the plates should go closer, but cannot go closer without shorting, the oscillator section plates can be spread, but the calibration should be checked after adjusting the oscillator section. Also the band coverage should be checked to see that 540 Kc can be received.

If the receiver is weak at 1000 Kc the same procedure can be followed at 1000 Kc as outlined above for 600 Kc but this will change the tracking at 600 Kc and may affect 1400 Kc so that all points should be rechecked in the original order.

The condenser should be checked for any possible shorting of the plates after the alignment is completed.

NOBLITT-SPARKS INDUSTRIES INC.

If a set is found to be microphonic when playing records, check for the presence of 4 felt washers under the chassis and a wood block 3½" x 8" x ⅝" mounted under the phono-motor board, in front of the center brace. If these are not present, installing them should correct the microphonic condition. The block should be glued to the under side of the motor board against the front side of the center brace, with two ¾" wood screws driven from the top side of the motor board into the block, to draw it up tight. Place the screws so the heads will be under the turntable.

POSITION OF POWER CORD PLUG.

On AC, the power cord plug should be tried in both its possible positions in the receptacl and left in the position that gives least hum. Do not attempt to operate on DC.

MODEL T5TS1
MODEL T5TS3

NORTHEASTERN ENGINEERING INC.
Model T5TS1 Broadcast Receiver

GENERAL DESCRIPTION

The Model T5TS1 ELECTONE is a five tube superheterodyne broadcast entertainment receiver designed for operation from either a direct or alternating current power source. The circuit utilizes multi-unit tubes and incorporates automatic volume control. The chassis is enclosed in an all-metal cabinet of modern styling and having the following dimensions: Width 12"; Depth 7"; Height 7".

ELECTRICAL SPECIFICATIONS

Power Supply.....105-125 volts, 50-60 cycles, AC or 105-125 volts DC
Power Consumption.....30 watts
Frequency Range.....500-1700 Kcs.
Intermediate Frequency.....456 Kcs.
Audio Output.....1.5 watts

TUBE COMPLEMENT

Converter and Oscillator.....12SA7
I.F. Amplifier.....12SK7
Detector-AVC-Audio.....12SQ7
Power Output.....50L6GT
Rectifier.....35Z5GT
Dial Lamp.....Mazda #6S6

LOUDSPEAKER

Permanent Magnet.....5" Diameter

INSTALLATION FACILITIES PROVIDED

Power.....5' cord and plug
Antenna.....10' indoor type
Ground.....None required

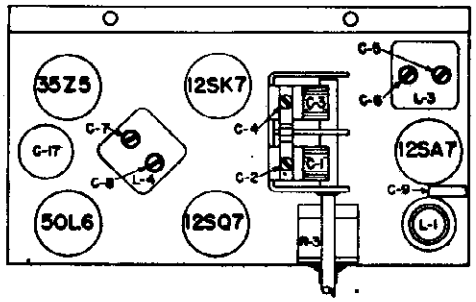

FIG. 1 - Tube and Trimmer Locations (Top View)

ALIGNMENT PROCEDURE

Alignment Frequencies:

I.F. .....456 Kcs.
R.F. .....1500 Kcs.

I. F. Alignment:

Connect output meter across the voice coil. Turn the receiver volume control to maximum. Connect high side of the alignment oscillator, through a .05 mfd. capacitor, to the converter grid.

Set alignment oscillator at 456 Kcs. and adjust output to give the lowest conveniently readable indication on the output meter. Adjust trimmers C-7 and C-8 in 2nd I.F. transformer to give maximum indication on output meter. Repeat this procedure for trimmers C-5 and C-6 in the 1st I.F. transformer. Repeat procedure to check accuracy.

R. F. Alignment:

Retain output meter connected as above and receiver volume control set at maximum. Connect alignment oscillator to antenna.

Set alignment oscillator at 1500 Kcs. and place in operation. Rotate receiver tuning capacitor (C-1 and C-3) to give maximum signal indication on output meter. Adjust output of alignment oscillator to give the lowest conveniently readable indication on the output meter. Adjust oscillator trimmer C-4 to peak the signal indication on output meter. Then, adjust antenna trimmer C-2 to further peak the signal. Repeat procedure to check accuracy.

Trimmer locations are shown in Figure 1.

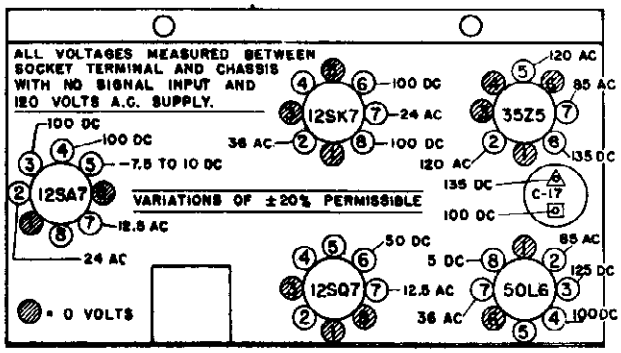

FIG. 2 - Socket Terminal Voltages (Bottom View)

NOTES:

An electronic voltmeter may be connected to the AVC bus and used for alignment indication in lieu of the output meter across the voice coil.

An electronic voltmeter or a voltmeter with a minimum resistance of 20,000 ohms per volt should be used for voltage measurements.

The polarity of the power connection must be correct when operating the receiver on direct current. If the receiver does not operate when the power plug is first inserted, remove and re-insert in opposite position. Reversal of plug position on alternating current supply may reduce hum in some cases.

CAUTION:

A direct ground connection should not be placed on the receiver at any time. Particular care should be exercised when removing and replacing chassis to insure that the insulators between chassis and cabinet are in position and that the insulation is complete and effective.

OLDSMOBILE DIV.-GENERAL MOTORS

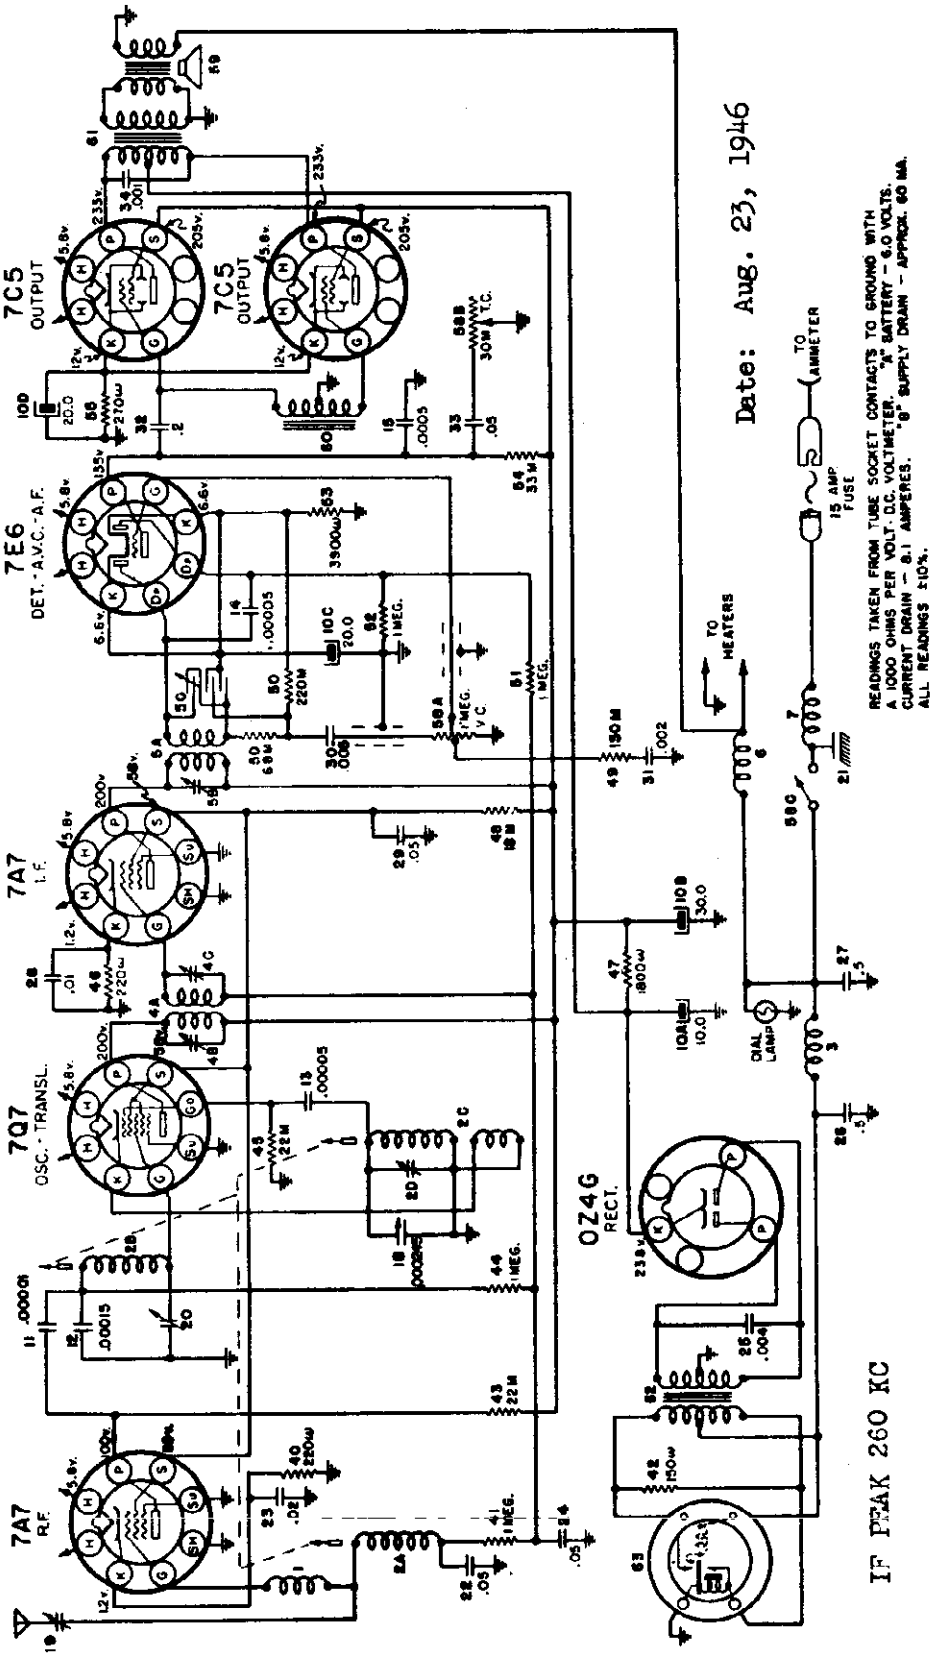

Fig. 3 - Circuit Diagram - 982375

The Oldsmobile model 982375 is a single unit Deluxe Receiver with Automatic Push Button Tuning, in addition to Manual Tuning, Volume and Tone Controls.

The receiver was designed specifically for the 1946 Oldsmobiles. The push Button Assembly, Controls, Receiver and Speaker are built into a housing

OLDSMOBILE DIV.-GENERAL MOTORS

CIRCUIT ALIGNMENT

All of the adjustable condensers in this receiver are very accurately adjusted at the factory and will need no further adjustment (excepting antenna trimmer) unless tampered with or a defective coil has been replaced. If re-alignment is found to be necessary, the circuits can be properly adjusted only with the use of a calibrated test oscillator or signal generator and an output meter.

DO NOT ATTEMPT TO PEAK THE I-F STAGES OF THIS RECEIVER WITHOUT CAREFULLY NOTING THE FOLLOWING INSTRUCTIONS:

1. Aligning I-F Stages at 260 Kilocycles

   (a) Turn volume control to the maximum position.

   (b) Connect the signal lead of the test oscillator through a .1 mfd. condenser to terminal X (See Parts Layout), which is the grid prong of the 7Q7 tube.

   (c) Connect the ground lead of the test oscillator to the chassis frame.

   (d) Connect the output meter across the speaker voice coil at the terminal board mounted on the speaker. Connect between point "Z" and ground. This terminal is color coded green on strip. (See Parts Layout)

   (e) Set the test oscillator to exactly 260 Kilocycles.

   (f) Adjust the trimmers "A", "B", "C" and "D" on the I-F Transformers for maximum output. (See Parts Layout) The adjustments should be repeated several times and during alignment the test oscillator output should be kept to as low a value as is consistent with obtaining a readable indication on the output meter.

2. Aligning at 1610 Kilocycles

   (a) Remove the signal lead of the test oscillator from the grid of the 7Q7 tube and connect to the Antenna terminal of the receiver THROUGH a .00065 mfd. MICA CONDENSER connected in place of the .1 mfd. condenser previously used. (It is very important that a .00065 mfd. mica condenser be used when aligning the antenna stage of these receivers in order that this circuit can be made to track properly.)

   (b) Tune the receiver to the extreme high frequency end of the dial.

   (c) Set the test oscillator to 1610 Kilocycles.

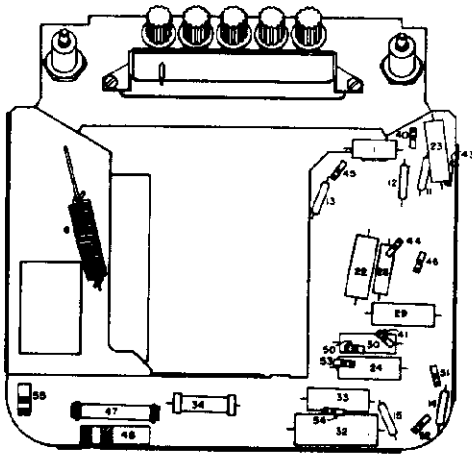
   (d) Adjust the Oscillator Trimmer Condenser "E" for maximum output. (See Parts Layout) (It is very important that this frequency be set accurately as a slight mis-setting will cause the receiver to be out of track over the high frequency end of the dial.)

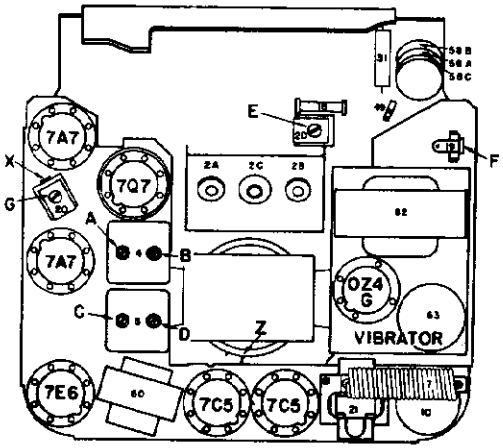
   (e) Adjust the Antenna Trimmer Condenser "F" for maximum output. (See Parts Layout)

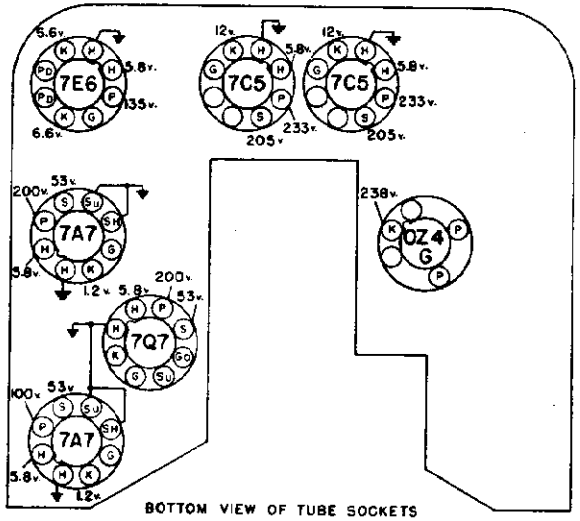
   (f) Adjust the R.F. Trimmer Condenser "G" for maximum output.

NOTE - With permeability tuning it is necessary to adjust the capacity at only one frequency. The coils are so wound that tracking is automatic and the usual low frequency adjustments are not necessary.

If the entire alignment procedure has been accomplished accurately, the receiver should be uniformly sensitive over the entire frequency range.







BOTTOM VIEW OF TUBE SOCKETS

READINGS TAKEN FROM TUBE SOCKET CONTACTS TO GROUND WITH A D.C. VOLTMETER HAVING A RESISTANCE OF 1000 OHMS PER VOLT "A" BATTERY 6.0 VOLTS. CURRENT DRAIN 8.1 AMPERES. "B" SUPPLY DRAIN APPROXIMATELY 60 MA. ALL READINGS ±10%.

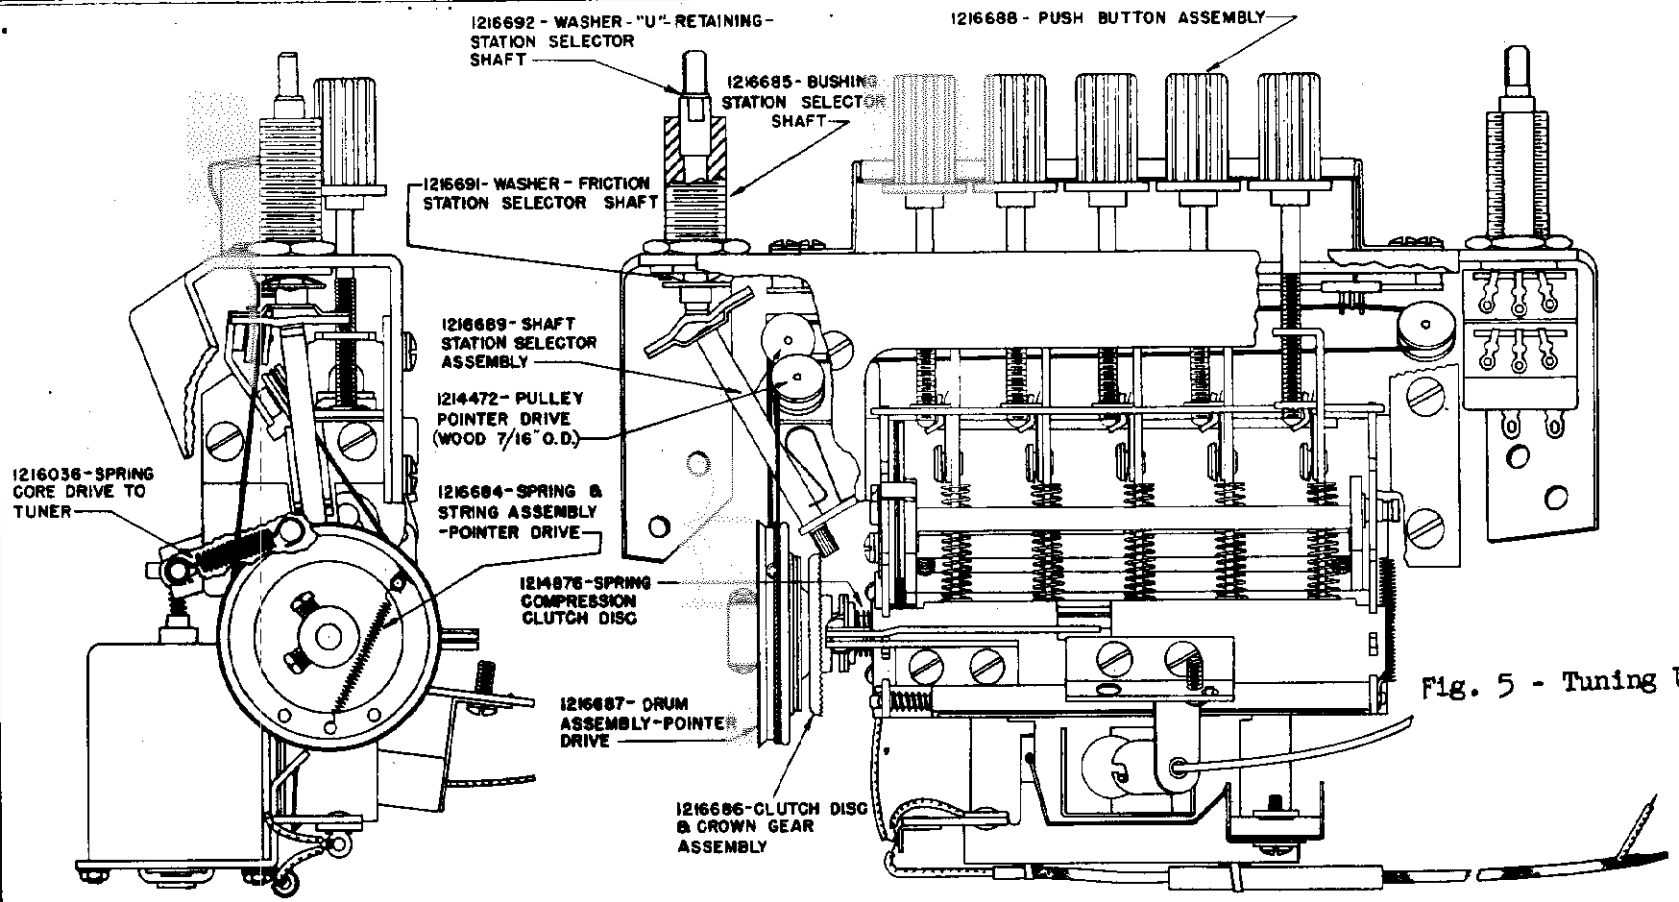

Fig. 5 - Tuning Unit

ANTENNA CIRCUIT

The Antenna Circuit is directly coupled to the antenna. A small adjustable condenser is provided for adjusting the antenna circuit to the antenna. This adjustment is made near the high frequency end of the band (1400 to 1600 KC.)

AUTOMATIC PUSH BUTTON TUNING

This is accomplished by a mechanical unit of rugged construction assuring accuracy. A special compensating condenser is employed in the oscillator circuit to minimize over-all receiver drift due to normal variation in car voltage and temperature ranges.

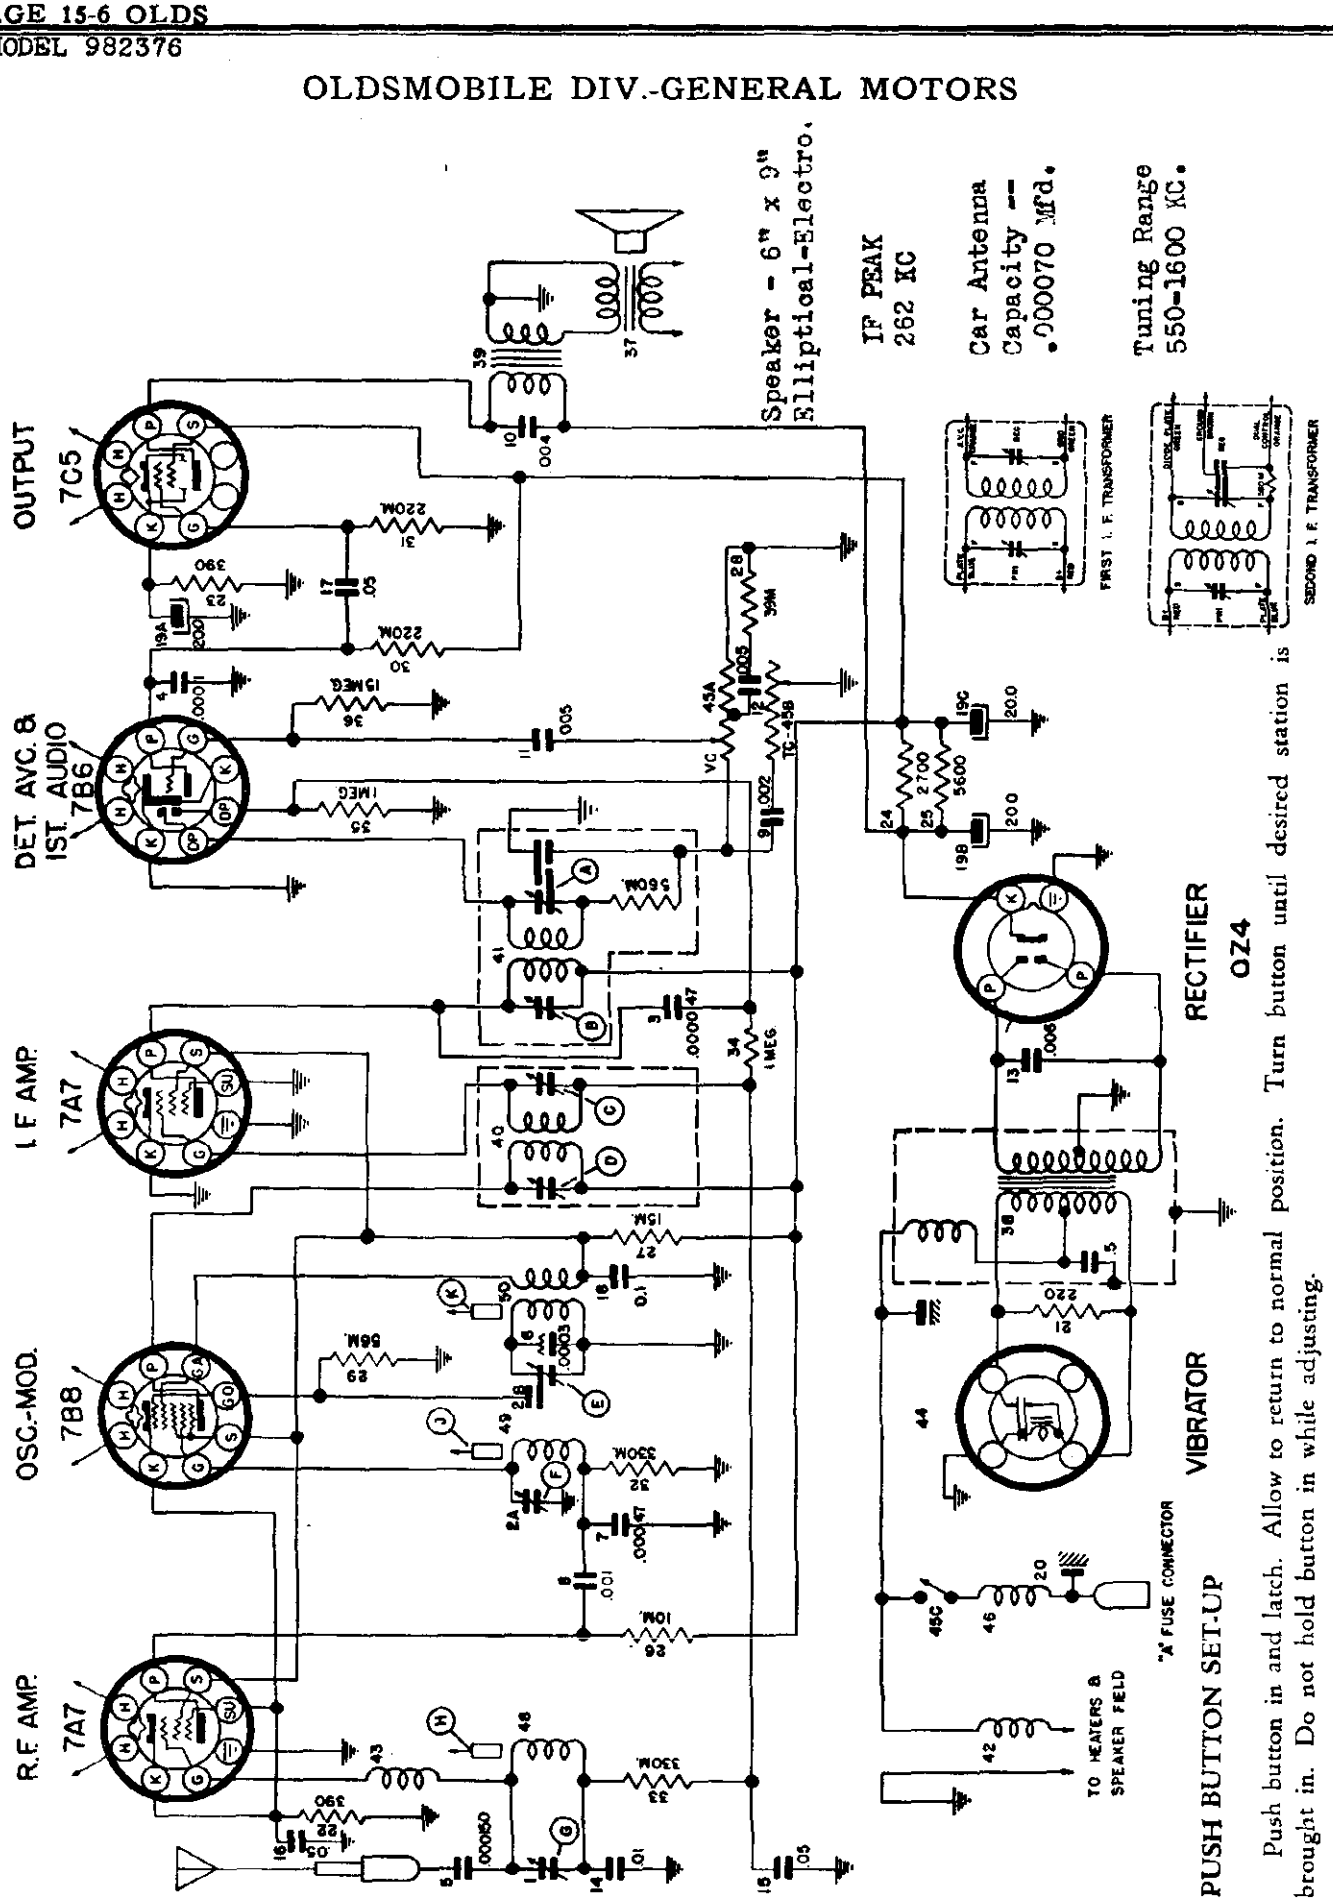
MODEL 982376

OLDSMOBILE DIV.-GENERAL MOTORS



PUSH BUTTON SET-UP

Push button in and latch. Allow to return to normal position. Turn button until desired station is brought in. Do not hold button in while adjusting.

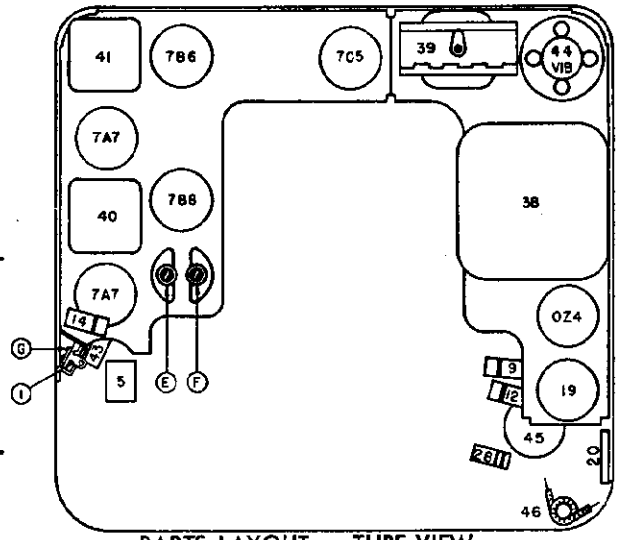
ALIGNMENT PROCEDURE

Volume Control Maximum — Tone Control on treble.

Signal Generator minimum for satisfactory output indication.

Series Condenser Or Dummy Antenna	Connect To	Signal Generator Frequency	Adjust Screws In Order
0.1 MFD	Grid side of Trimmer F	262 KC	A B C D
.000070 MFD	Antenna Terminal	1615 KC	E
.000070 MFD	Antenna Terminal	1430 KC	F G

Adjust trimmer G to match car antenna (1430 KC) when radio is installed.



PARTS LAYOUT — TUBE VIEW

SPECIAL INSTRUCTIONS

Mechanical alignment of iron cores. Tune to stop at H. F. end of dial. Adjust cores H, J, and K to extend $1\frac{5}{32}$" from end of coil form. Adjust trimmers E, F, and G, (1615 KC). Adjust cores H and J for maximum output at 1430 KC. Repeat alignment of trimmers E, F, and G at 1615 KC. Repeat alignment of cores H and J at 1430 KC. Align trimmers F and G at 1430 KC.

AUTOMATIC PUSH BUTTON TUNER

The iron cored automatic tuner consists of three coils with iron cores actuated by a rugged mechanical device for varying the position of the cores in the coils. Changing the position of the cores changes the inductance of the antenna, R.F. and oscillator coils, and provides a means of tuning the radio over the entire broadcast band. A special compensating condenser is employed in the oscillator circuit to prevent the set from drifting off station due to normal variations in car and radio temperatures.

OLYMPIC RADIO & TELEV. INC.

Equipment Required:

Modulated R.F. signal generator; output meter; insulated screw-driver; two .1 mfd 400 volt and one 50 mmfd 400 volt condensers.

To align the receiver it is necessary to remove the chassis from the cabinet, check that the pointer is horizontal and coincides with the two horizontal reference lines on the dial. In this position the condenser should be completely closed. Connect the output meter and signal generator as follows:

Output meter — Connect across voice coil and turn volume control to maximum.

Signal generator — Connect the low side of the signal generator to the receiver chassis thru a .1 mfd condenser and keep the output as low as possible, then proceed in the sequence shown on the alignment chart.

ALIGNMENT PROCEDURE CHART

STEP	CONNECT HIGH SIDE OF SIGNAL GENERATOR TO-	SET SIGNAL GENERATOR TO-	TURN RECEIVER DIAL TO-	ADJUST THE FOLLOWING FOR MAXIMUM OUTPUT. (KEEP SIGNAL FROM SIGNAL GENERATOR AS LOW AS POSSIBLE.)

OLYMPIC RADIO & TELEV. INC.

Equipment Required:

Modulated R.F. signal generator; output meter; insulated screw-driver; two .1 mfd 400 volt and one 50 mmfd 400 volt condensers.

To align the receiver it is necessary to remove the chassis from the cabinet, check that the pointer is horizontal and coincides with the two horizontal reference lines on the dial. In this position the condenser should be completely closed. Connect the output meter and signal generator as follows:

Output meter — Connect across voice coil and turn volume control to maximum.

Signal generator — Connect the low side of the signal generator to the common B-bus thru a .1 mfd condenser and keep the output as low as possible, then proceed in the sequence shown on the alignment chart.

STEP	CONNECT HIGH SIDE OF SIGNAL GENERATOR TO -	SET SIGNAL GENERATOR TO -	TURN RECEIVER DIAL TO -	ADJUST THE FOLLOWING FOR MAXIMUM OUTPUT (KEEP SIGNAL FROM SIGNAL GENERATOR AS LOW AS POSSIBLE.)

ALIGNMENT INSTRUCTIONS

Equipment Required:

Modulated r-f signal generator; output meter; insulated screw driver; two .1 mfd 400 volt and one 50 mmfd 400 volt condensers.

The receiver should be aligned with chassis and loop mounted in the cabinet. With the condenser completely closed the pointer should be checked so that it coincides with the two horizontal reference lines on the dial. Connect the output meter and signal generator as follows:

Output meter — Connect across voice coil and turn volume control to maximum.

Signal generator — Connect the low side of the signal generator to the receiver chassis thru a .1 mfd condenser and keep the output as low as possible, then proceed in the sequence shown on the alignment chart.

ALIGNMENT PROCEDURE CHART

STEP	SET BAND SWITCH ON	CONNECT HIGH SIDE OF SIGNAL GENERATOR TO-	SET SIGNAL GENERATOR TO-	TURN POINTER TO-	ADJUST THE FOLLOWING FOR MAXIMUM OUTPUT. (KEEP SIGNAL FROM SIGNAL GENERATOR AS LOW AS POSSIBLE).
1	B.C.	R.F. SECTION OF VARIABLE CONDENSER OR PIN 4 OF THE 6SK7 TUBE IN SERIES WITH A .1 MFD, 400 VOLT CONDENSER.	455 KC.	EXTREME RIGHT HAND POSITION. (CONDENSER PLATES FULLY OPEN).	C11 AND C10 (2nd. I.F. TRANSFORMER)
2	B.C.	R.F. SECTION OF VARIABLE CONDENSER OR PIN 8 OF THE 6SA7 TUBE IN SERIES WITH A .1 MFD, 400 VOLT CONDENSER.	455 KC.	EXTREME RIGHT HAND POSITION. (CONDENSER PLATES FULLY OPEN).	C9 AND C8 (1st. I.F. TRANSFORMER)
3	B.C.	REPEAT STEPS 1 AND 2			
4	B.C.	USE RADIATED SIGNAL (CONNECT BOTH SIDES OF SIGNAL GENERATOR TO RADIATION LOOP).	1700 KC.	1700 KC. CALIBRATION POINT ON DIFFUSER PLATE.	C3 (OSCILLATOR TRIMMER)
5	B.C.	↓	1400 KC.	RESONANCE, APPROXIMATELY 1400 KC. CALIBRATION POINT ON DIFFUSER PLATE.	C6 AND C1 (R. F. AND ANTENNA TRIMMERS)
6	B.C.	↓	600 KC.	RESONANCE, APPROXIMATELY 600 KC. CALIBRATION POINT ON DIFFUSER PLATE.	C5 (PADDER) ROCK VARIABLE FOR MAXIMUM SIGNAL
7	B.C.	↓	REPEAT STEPS 4, 5 AND 6		
8	S.W.	↓	18 MC.	18 MC. CALIBRATION POINT ON DIFFUSER PLATE	C4 (OSCILLATOR TRIMMER) SECOND PEAK FROM TIGHT POSITION. C7 (R.F. TRIMMER) SECOND PEAK FROM TIGHT POSITION. C2 (ANTENNA TRIMMER)
9	S.W.	↓	6 MC.	RESONANCE	CHECK THAT POINTER (AT RESONANCE) COINCIDES WITH 6 MC. CALIBRATION POINT. IF NOT REPEAT STEP 8.
10	S.W.	↓	REPEAT STEPS 8 AND 9		

NOTE: In order to adjust the short wave oscillator trimmer and the short wave r-f trimmer accurately to the fundamental frequency and not to the image signal, turn the trimmers first to the maximum capacity position (fully tight). From this position loosen the trimmer through one peak indication on the outputmeter until a second peak is obtained. Adjust for maximum output on this second peak.

To check whether this procedure has been accurately performed, ascertain that an image signal can be received (much weaker) by tuning the signal generator to a frequency 910 kilocycles above the alignment frequency.

SERVICE AND ALIGNMENT INSTRUCTIONS

To insure proper alignment, it is suggested to use a radiated signal. To radiate a signal connect a loop of about 6" to 8" diameter, 1 turn of #14 or #12 wire across the output of the signal generator and place this loop parallel to the loop of the receiver to be aligned, at a distance of about 8" or 10".

Equipment required: Modulated r-f signal generator, output meter, insulated screw driver, one .1 mfd 400 volt condenser.

With the receiver removed from the cabinet, connect output meter across voice coil. Connect ground side of the signal generator to receiver chassis. Turn volume control fully on, and keeping the output of the signal generator as low as possible, proceed in the sequence as shown on the alignment chart.

To facilitate alignment of the receiver, when removed from cabinet, calibration points are provided on the light diffuser plate which is mounted on the chassis. These points are from left to right.

.(Dot, Reference point); 600 kc; 1000 kc; 1400 kc; 1700 kc for the broadcast band and .(Dot, reference point); 6 mc; 12 mc; 18 mc for the short wave band.

Before aligning close the variable condenser fully counterclockwise (plates fully closed) and check that pointer coincides with the reference dot (extreme left dot) on the diffuser plate.

MODEL 6-606

OLYMPIC RADIO & TELEV. INC.

SERVICE AND ALIGNMENT INSTRUCTIONS

WHEN SERVICING THIS RECEIVER DO NOT PLACE CHASSIS ON A GROUNDED METALLIC BENCH.

For tube replacement it is not necessary to remove the chassis from the cabinet. Access to the tubes may be made by removing the center screw on the loop holding same to the bracket, and then lifting loop carefully off the bracket so as to avoid breaking of wires connecting same.

For ALIGNMENT the chassis must be removed from case. Remove first batteries and then the three screws holding chassis to the bottom of the shelf.

ALIGNMENT

Equipment Required: Modulated r-f signal generator; output meter; insulated screw driver; two .1 mfd 400 volt and one 50 mmfd 400 volt condensers.

Turn variable condenser fully counterclockwise (plates fully closed) and check that pointer coincides with the first thin calibration mark on the dial. Connect the output meter and signal generator as follows:

Output meter: Connect across voice coil and turn volume control to maximum.

Signal generator: Connect the low side of the signal generator to the receiver chassis thru a .1 mfd condenser and keep output as low as possible, then proceed in the sequence shown on the alignment chart.

Part No.	Description
BK-405	Bracket-Resistor mounting bracket

SERVICE AND ALIGNMENT INSTRUCTIONS

ALIGNMENT PROCEDURE CHART

STEP	CONNECT HIGH SIDE OF SIGNAL GENERATOR TO-	SET SIGNAL GENERATOR TO-	TURN POINTER TO-	ADJUST THE FOLLOWING FOR MAXIMUM OUTPUT. (KEEP SIGNAL FROM SIGNAL GENERATOR AS LOW AS POSSIBLE.)
1	R.F. SECTION OF THE VARIABLE COND. IN SERIES WITH A .1/400 MFD. COND.	455 KC.	EXTREME RIGHTHAND POSITION. (CONDENSER PLATES FULLY OPEN.)	C7, C6, C5, C4 AND REPEAT IN SAME ORDER (1st. AND 2nd I.F. TRANSFORMERS.)
2	ANTENNA TERMINAL OF ANTENNA LOOP IN SERIES WITH 50 MMFD. COND.	1400 KC.	1400 KC. CALIBRATION POINT	C3, C2, C1.
3		600 KC.	RESONANCE	CHECK THAT POINTER EDGE AT RESONANCE COINCIDES WITH 600 KC. CALIBRATION POINT. IF DEVIATION IS TOO LARGE REPEAT STEP 2.

To service this receiver it is first necessary to remove the motorboard with the record changer and then remove the chassis through the top opening of the cabinet. To lift the entire motorboard with the changer, unfasten the six screws holding the motorboard in place, disconnect motor and pick-up plugs from chassis, and lift up. It is unnecessary to remove the screws holding the metal-shield in front. CAUTION: WHEN REMOVING THE CHANGER BE SURE TO PLACE IT IN A POSITION WHEREBY THE CHANGER MECHANISM WILL NOT BE DAMAGED.

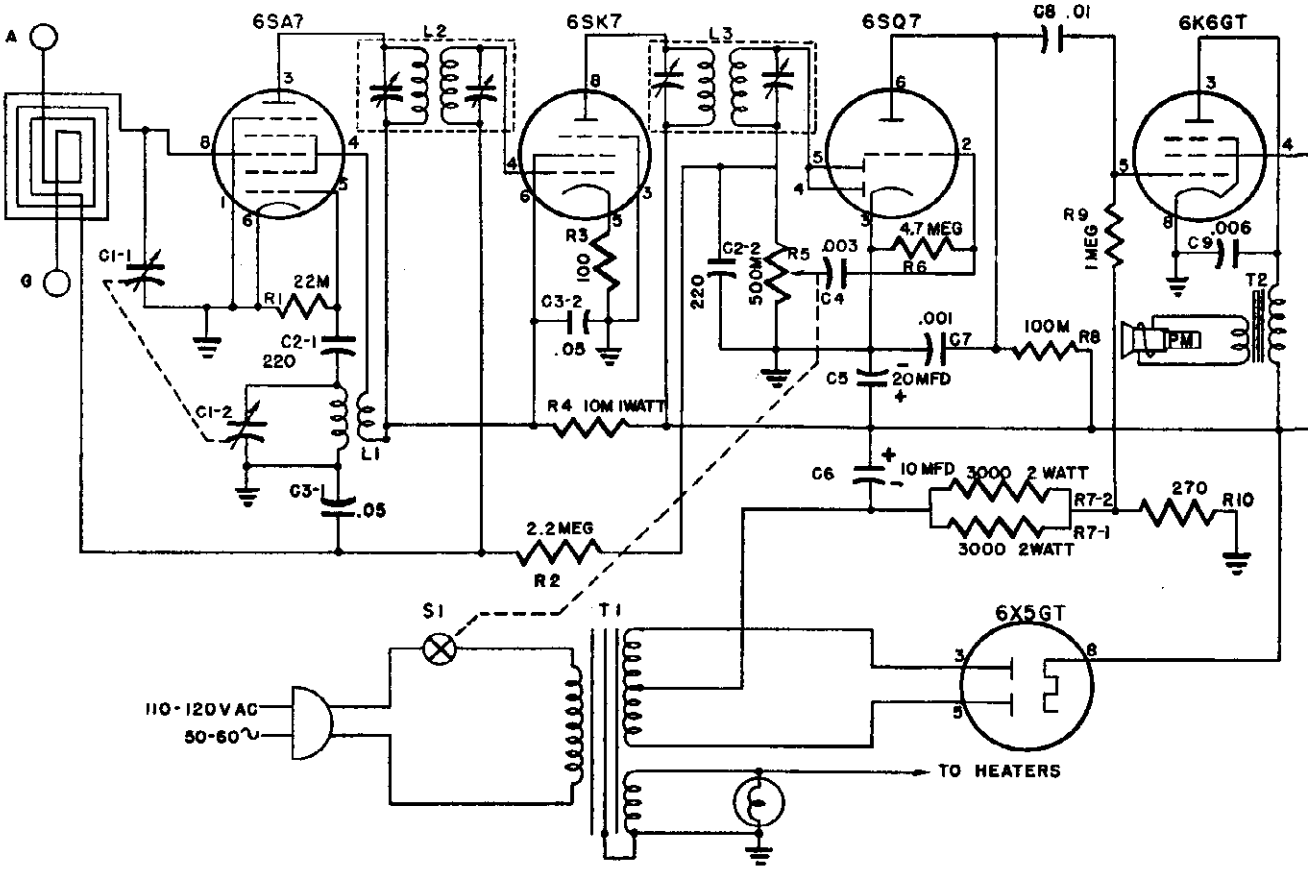
Equipment Required: Modulated r-f signal generator; output meter; insulated screw driver; one .1 mfd 400 volts and one 50 mmfd 400 volts condenser.

With the receiver removed from the cabinet, connect output meter across voice coil. Connect ground side of the signal generator to chassis; turn volume control fully on, and keeping the output of the signal generator as low as possible, proceed in the sequence as shown on the alignment chart.

To facilitate alignment of the receiver when removed from cabinet, calibration points are provided on the pointer slide bar (see drawing).

Before aligning, close the variable condenser fully counterclockwise (plates fully closed) and check that pointer carriage coincides with the "reference line" on the pointer slide bar.

PACKARD BELL CO.



ALIGNMENT PROCEDURE

Alignment procedure consists of the four steps outlined in the Alignment Procedure Chart. Test oscillator leads should be connected to the mixer grid and ground in series with an .01 Mfd. capacitor (dummy load) for the I. F. alignment (Step No. 1).

The alignment procedure outlined in steps 2 to 4 utilizes a standard test loop.* The test oscillator leads should be connected across this loop. The loop should be placed about two feet from the receiver loop in a vertical position.

Upon completion of the I. F. Alignment the variable condenser should be "Rocked" to gain assurance that the I. F.'s have not been aligned to the image frequency.

*NOTE: Hazeltine Test Loop #1150

ALIGNMENT PROCEDURE

Alignment Procedure consists of the four steps outlined in the Alignment Procedure Chart.

Connect the test oscillator leads to the mixer grid and ground in series with a .01 Mfd. capacitor (dummy load) for step No. 1, I.F. Alignment. The receiver loop must be shifted in order to reach trimmers A, B, C, and D (see Fig. 1). Return the loop to its original position before proceeding with the balance of the alignment.

Upon completion of the I.F. Alignment, the variable condenser should be "Rocked" to assure that the I.F.s have not been aligned to the image frequency.

The procedure outlined in steps 2 to 4 utilizes a standard test loop*. Connect the test oscillator leads across this loop and place it in a vertical position about two feet from the receiver loop.

*NOTE: Hazeltine Test Loop No. 1150.

GENERAL INFORMATION

Model 561 is a five tube superheterodyne receiver and phonograph combination. This model employs a permanent magnet speaker and a "HI-Q" loop antenna. It is enclosed in a fabricoid covered carrying case.

The schematic diagram shows a tweet filter network in the 2nd I.F. This network is comprised of two 100 Mmf capacitors and a 56,000 ohm resistor. Also shown is a .005 Mfd. capacitor parallel with the primary of the output transformer. In a few of the earlier models a 220 Mmf. AVC by-pass was used in place of the tweet filter, and the .005 Mfd. capacitor is connected to the plate of the 6K6-GT and ground.

ALIGNMENT PROCEDURE

Alignment procedure consists of the four steps outlined in the Alignment Procedure Chart.

For step No. 1, I.F. Alignment, connect the test oscillator leads to the mixer grid and ground in series with a .01 Mfd. capacitor (dummy load). Upon completion of this step, "Rock" the variable condenser to assure that the I.F.s have not been aligned to the image frequency.

Steps 2 to 4 employ a standard test loop.* Connect the test oscillator leads across this loop and place it in a vertical position about two feet from the receiver loop.

ALIGNMENT CHART

STEP	CONNECT TEST OSC. TO	TEST OSC. SETTING	POINTER SETTING	ADJUST FOR MAXIMUM OUTPUT

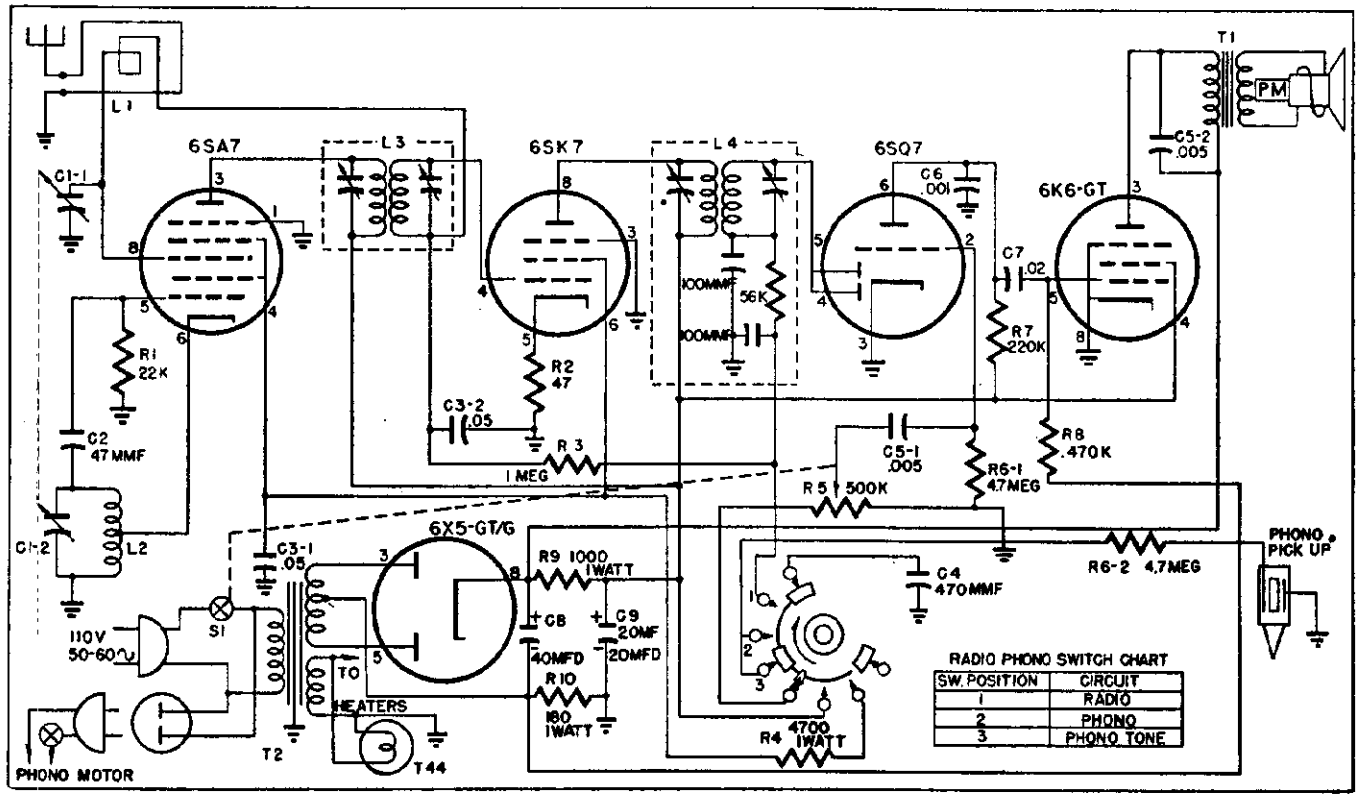
STAGE GAIN MEASUREMENTS

Measurements taken with volume control maximum, and switch in RADIO position. AVC shorted out.
Standard Output . . . 50 milliwatts
Dummy Antenna . . . 200 Mmf.
Antenna to Converter Grid . . . 4.65 X at 1000 KC
Converter Grid to 1st I.F. Grid . . . 79 X at 1000 KC
Converter Grid to 1st I.F. Grid . . . 95 X at 455 KC
1st I.F. Grid to 2nd Detector . . . 62.3 X at 455 KC
Overall Audio Gain . . . 700 X at .5 watts 400 cycles

OSCILLATOR GRID VOLTAGES

Measured at Oscillator grid to ground, no signal, with A.C. V.T.V.M. input loading above 10 megohms. 117 volts A.C. line voltage. Switch in RADIO position.

1750 KC . . . 19.8 volts AC
1300 KC . . . 19.8 volts AC
750 KC . . . 18.3 volts AC
570 KC . . . 17.2 volts AC



GENERAL INFORMATION

Model 563 is a combination superheterodyne receiver and phonograph. This model employs a permanent magnet speaker and a specially designed "Hi Q" loop antenna. The model is capable of playing ten or twelve-inch records and is enclosed in a fabricoid covered carrying case.

ALIGNMENT PROCEDURE

Alignment procedure consists of the four steps outlined in the Alignment Procedure Chart.

For step No. 1, I.F. Alignment, connect the test oscillator leads to the mixer grid and ground in series with a .01 Mfd. capacitor (dummy load). Upon completion of this step, "Rock" the variable condenser to assure that the I.F.s have not been aligned to the image frequency.

Steps 2 to 4 employ a standard test loop.* Connect the test oscillator leads across this loop and place it in a vertical position about two feet from the receiver loop.

*NOTE: Hazeltine Test Loop #1150.

ALIGNMENT CHART

STEP	CONNECT TEST OSC. TO	TEST OSC. SETTING	POINTER SETTING	ADJUST FOR MAXIMUM OUTPUT
1	Mixer grid & Grd. .01 Mfd. Dummy load	455 KC	540 KC	Trimmers # A, B, C & D
2	Standard* Test Loop	1750 KC	1750 KC	Trimmer #E to 1750 KC
3	Standard* Test Loop	1500 KC	1500 KC	Trimmer #F
4	Standard* Test Loop	600 KC	600 KC	Loop

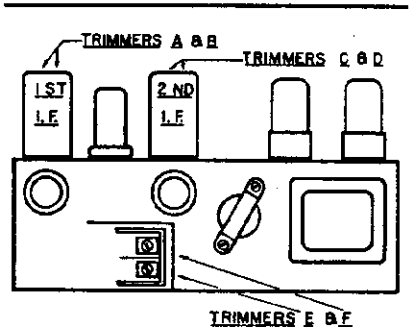


FIG. 2—TRIMMER LOCATION

MODEL 563

PACKARD BELL CO.

D.C. RESISTANCE MEASUREMENTS

1st I.F. Coil and 2nd I.F. Coil*
Primary . . . 14.5 ohms
Secondary . . . 14.5 ohms

Oscillator Coil
Start to Finish . . . 8 ohms
Start to Tap . . . 7 ohms

*To obtain the true reading of the secondary of the 2nd I.F. coil, the coil must be removed from the can. This is true because of a 56,000 ohm resistor in series with the AVC lead.

ALIGNMENT PROCEDURE

The alignment procedure consists of the eight steps outlined in the alignment procedure chart.

Connect the test oscillator leads to the mixer grid and ground in series with a .01 mfd. capacitor (dummy load) for steps 1 and 2, I.F. alignment. The receiver loop must be shifted in order to reach trimmers A, B, C, and D (see Fig. No. 1). Return the loop to its original position before proceeding with the balance of the alignment.

Upon completion of the I.F. alignment the variable condenser should be "Rocked" to assure that the I.F.s have not been aligned to the image frequency.

The procedure outlined in steps 3 to 5 utilizes a standard test loop.* Connect the test oscillator leads across this loop and place it about two feet from the receiver loop in a vertical position.

Steps 6 and 7 cover the short wave alignment. Connect the test oscillator leads to the short wave antenna and ground in series with a 400 ohm resistor.

ALIGNMENT CHART

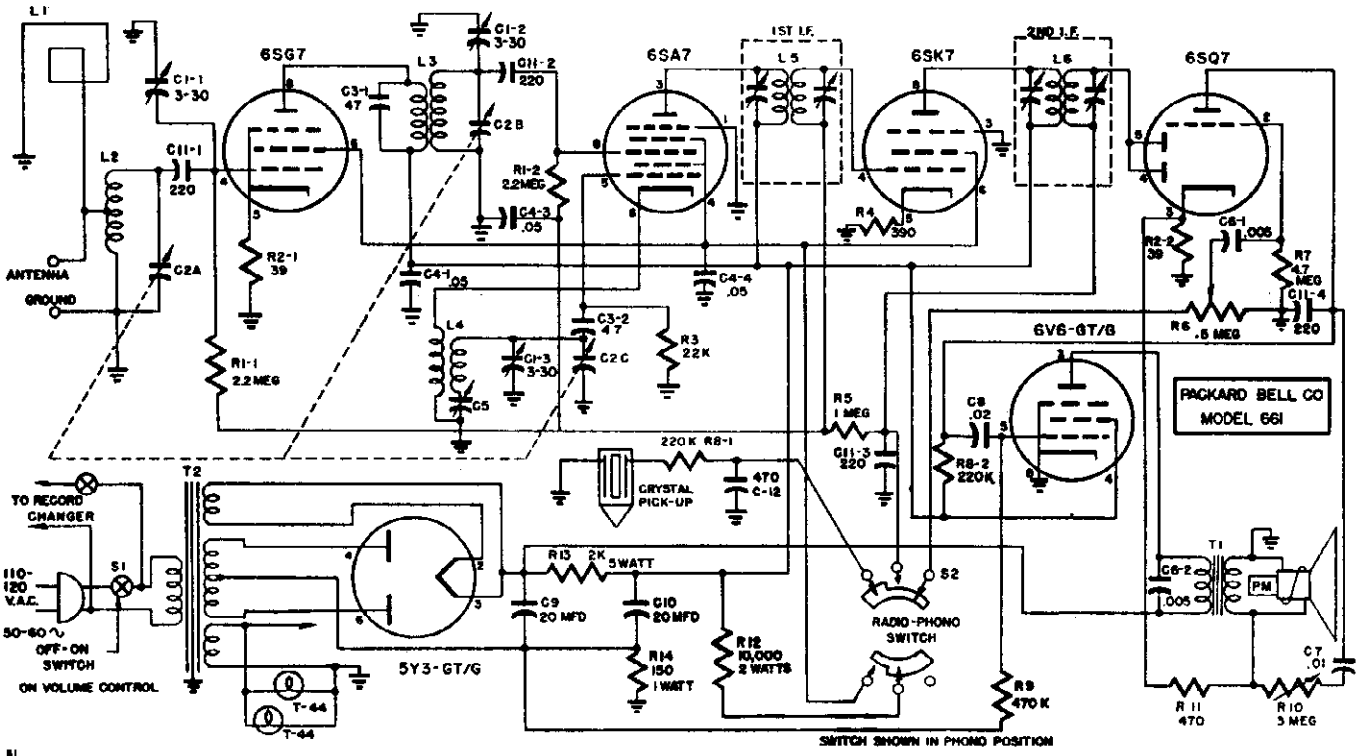
78009B		Socket, lamp: bayonet base
83001		Speaker, permanent magnet, 5"
84001B		Spring, dial

MODEL 661

PACKARD BELL CO.



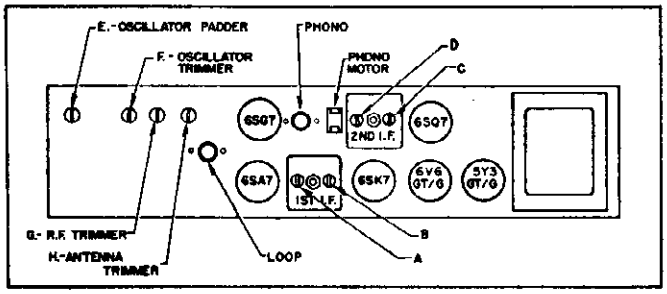


FIG. 2 TRIMMER LOCATION

ALIGNMENT PROCEDURE

Alignment procedure consists of the 5 steps outlined in the Alignment Procedure Chart.

Connect the test oscillator leads to the mixer grid and ground in series with an .01 Mfd. capacitor (dummy load) for step No. 1. I.F. Alignement. Upon completing this step "Rock" the variable condenser to assure that the I.F.s have not been aligned to the image frequency.

Use the Hazeltine Standard Test Loop No. 1150, or a reasonable substitute, for the balance of the alignment. Place the test loop about two feet from the receiver loop in a vertical position.

It will be noted that all alignment trimmers are accessible without removing the chassis from the cabinet. (See Fig. 2, Trimmer location.)

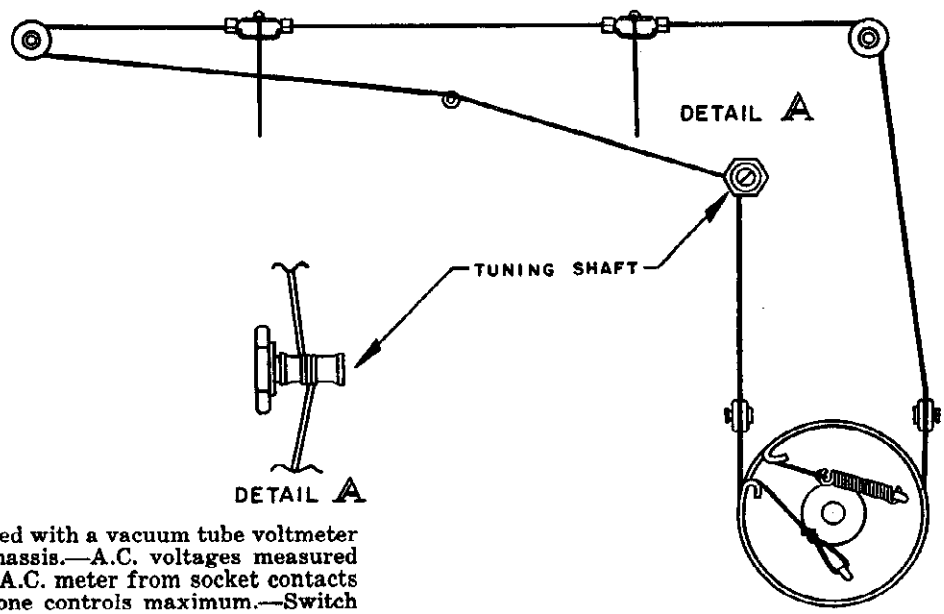
ALIGNMENT CHART

STEP	CONNECT TEST OSC. TO	TEST OSC. SETTING	POINTER SETTING	ADJUSTMENT FOR MAX. OUTPUT
1	Mixer Grid & Grd. .01 Mfd. Capacitor	455 KC	540 KC	Trimmers A, B, C & D
2	Standard* Test Loop	1740 KC	1740 KC	Trimmer F to 1740 KC
3	Standard* Test Loop	600 KC	600 KC	Trimmer E to 600 KC
4	Standard* Test Loop	1500 KC	1500 KC	Trimmers G & H
5	REPEAT	STEPS	2, 3 & 4	

*NOTE: Hazeltine Test Loop No. 1150

Record Changer: Detrola Model 550 For Parts list, see P.15-10

PACKARD BELL CO.



All D.C. voltages measured with a vacuum tube voltmeter from socket contacts to chassis.—A.C. voltages measured with a 1000 ohms per volt A.C. meter from socket contacts to chassis.—Volume and tone controls maximum.—Switch in Radio position.—No signal.—All voltages shown are positive D.C. unless otherwise noted.

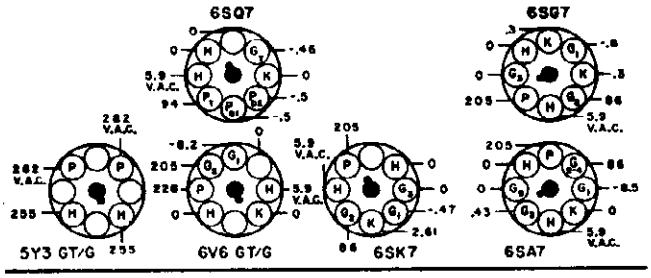


FIG. 1 SOCKET VOLTAGES

STAGE GAIN MEASUREMENTS:

Measurements taken with volume and tone controls maximum.

Switch in RADIO position.

AVC shorted out.

Standard Output . . . 50 milliwatts

Dummy Antenna . . . 200 Mmf.

Antenna to R.F. Grid . . . 4X at 1000 KC
R.F. Grid to Converter Grid . . . 21X at 1000 KC
Converter Grid to 1st I.F. Grid . . . 32X at 1000 KC

1st I.F. Grid to 2nd Detector . . . 48X at 455 KC
Overall Audio Gain . . . 253X at .5 watts 400 cycles

OSCILLATOR CATHODE VOLTAGES:

Measured at 120 volts AC line voltage with AC vacuum tube voltmeter input loading above 10 megohms.

1500 KC . . . 2.75 volts AC
1000 KC . . . 2.5 volts AC
800 KC . . . 2.62 volts AC
600 KC . . . 2.9 volts AC

D.C. RESISTANCE MEASUREMENTS:

1st & 2nd I.F. Coils	**Antenna Coil**
Primary . . . 14.5 ohms	Start to Tap . . . 1.5 ohms
Secondary . . . 14.5 ohms	Start to Finish . . . 2 ohms
Oscillator Coil	**R.F. Coil**
Primary . . . 1 ohm	Primary . . . 58 ohms
Secondary . . . 6 ohms	Secondary . . . 4.2 ohms

NOTE: Due to the variation of winding methods, the D.C. resistance on all coils is subject to a 20% tolerance.

The permanent magnet speaker contained in this model is equipped with the ADJUST-A-CONE feature. This feature provides the radio service technician with a quick and simple means of centering an "Off Center" or "Dragging" voice coil.

Centering the voice coil is accomplished by simply adjusting the two screws on the spider support until the voice coil moves freely in the air gap. This adjustment is very critical, consequently the use of an audio oscillator is recommended. Set the audio oscillator at cone resonance, which should be approximately 120 cycles, when making this adjustment.

In most cases, a very slight turn of either adjustment screw will correct an "Off Center" voice coil.

In the first run of sets a 39 ohm resistor was used in the cathode circuit of the 6SG7. This resistor has been replaced by a 220 ohm resistor. This change was made to stabilize the R.F., thereby eliminating critical dressing of leads surrounding the 6SG7.

Electrical Rating:
Line Voltage . . . 110-120 volts, 50-60 cycle A.C.
Power Consumption . . . 68 watts

Tuning Frequency Range:
540 to 1740 KC

Intermediate Frequency:
455 KC

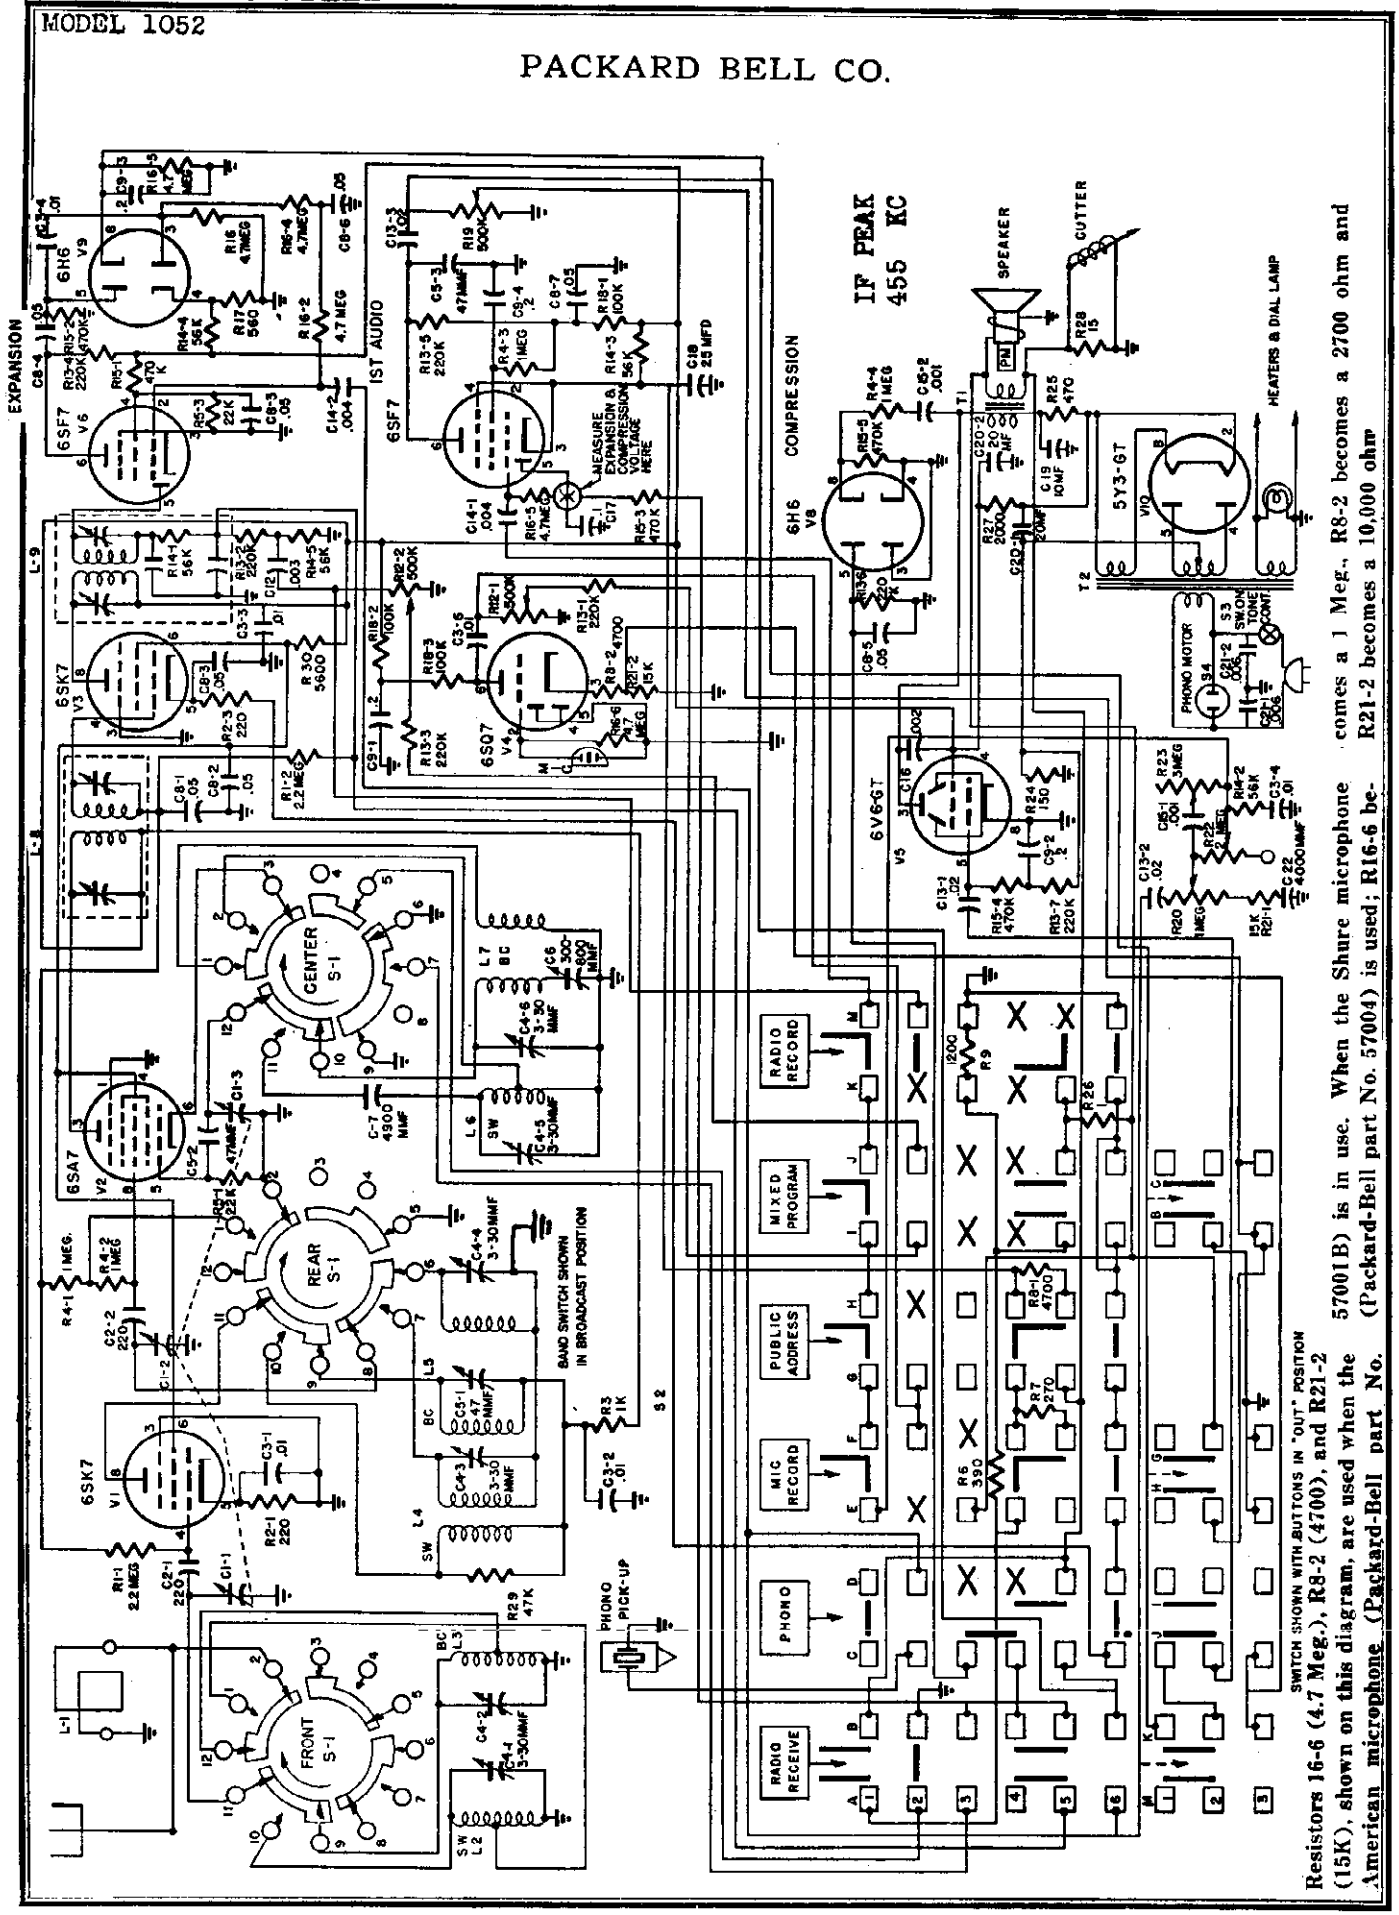
Electrical Output:
Maximum . . . 4 watts

Loudspeaker:
Type . . . Permanent Magnet
Outside Cone Diameter . . . 6½"
Voice Coil Impedance . . . 3.5 ohms at 400 cycles
Magnet Rating . . . 2.15 Oz. Alnico 5

Tubes:

Tube	Function
6SG7	R.F. Amplifier
6SA7	Frequency Converter
6SK7	I.F. Amplifier
6SQ7	Detector Amplifier
6V6-GT/G	Power Amplifier
5Y3-GT/G	Rectifier

MODEL 1052



Resistors 16-6 (4.7 Meg.), R8-2 (4700), and R21-2 (15K), shown on this diagram, are used when the 57001B) is in use. When the Shure microphone comes a 1 Meg., R8-2 becomes a 2700 ohm and American microphone (Packard-Bell part No. 57004) is used; R16-6 be- R21-2 becomes a 10,000 ohm

Expanson is switched into grid of 1st audio, (6SF7) when "RADIO RECEIVE" button is depressed by connecting switch contacts B-5 and B-6.

Expansion is switched into grid of 1st audio, (6SF7) when "PHONO" button is depressed by connecting switch contacts C-4 and C-5.

Expansion is in the circuit ONLY when the "RADIO RECEIVE" and "PHONO" buttons are depressed.

ALIGNMENT PROCEDURE

Alignment procedure consists of the 7 steps outlined in the Alignment Procedure Chart.

Connect the test oscillator leads to the mixer grid and ground in series with an .01 Mfd. capacitor (dummy load) for step No. 1, I.F. alignment. Upon completing this step, "Rock" the variable condenser to assure that the I.F.s have not been aligned to the image frequency.

Use the Hazeltine Standard Test Loop #1150 for the balance of the alignment. Place the test loop about two feet from the receiver loop in a vertical position.

Step	Connect Test Osc. To	Test Osc. Setting	Pointer Setting	Adjustment For Maximum Output
1	Mixer Grid & Grd. .01 Mfd. Capacitor	455 KC	540 KC	Trimmers ABC & D
2	Standard Test Loop*	1750 KC	1750 KC	Trimmer F to 1750 KC
3	Standard Test Loop*	600 KC	600 KC	Trimmer G to 600 KC
4	Standard Test Loop*	1500 KC	1500 KC	Trimmers I & J
5	Repeat Steps 2, 3 & 4			—
6	Standard Test Loop*	18 MC	18 MC	Trimmer E to 18 MC
7	Standard Test Loop*	15 MC	15 MC	Trimmers K & H

*REMARKS: Hazeltine Test Loop No. 1150.

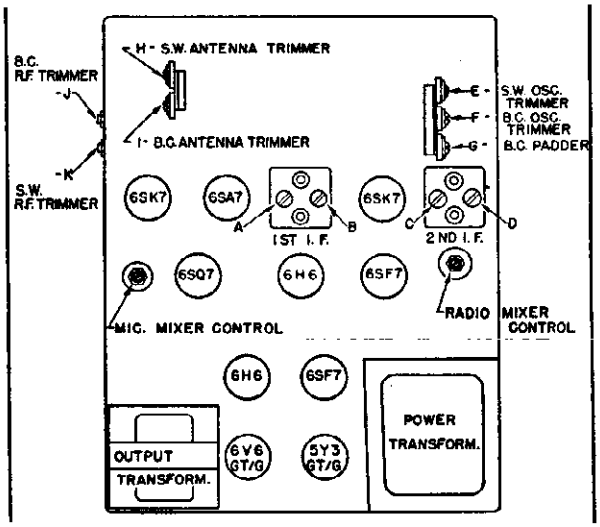

FIG. 1 TRIMMER LOCATION

Compression switched out of Radio Receive by breaking contact from B-4 to B-5.

Compression switched out of Phonograph by breaking contact from C-3 to C-4.

Compression is in circuit on ALL RECORD POSITIONS and PUBLIC ADDRESS.

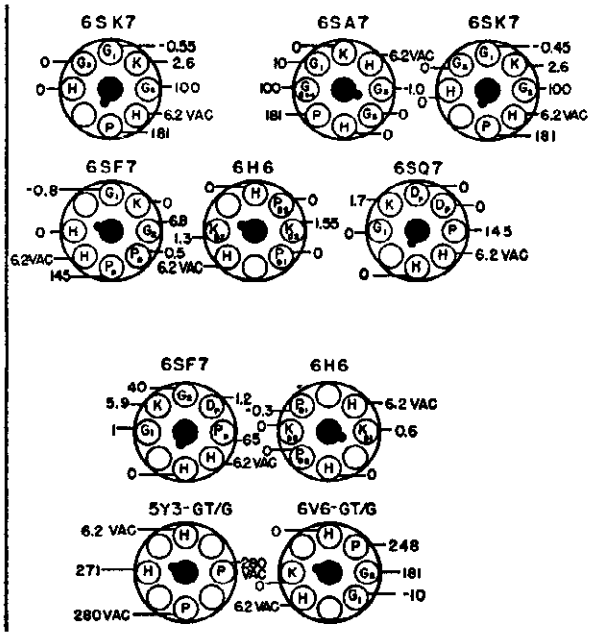

FIG. 2 VOLTAGE CHART

All D.C. voltages measured with a vacuum tube voltmeter from socket contacts to chassis. A.C. voltages measured with a 1000 ohms per volt A.C. meter from socket contacts to chassis. Volume control maximum. No signal. 117 volts A.C. line voltage. All voltages shown are positive D.C. unless otherwise noted.

Recording Head Pressure

The proper recording head pressure may be identified by the small red dot painted on the indicator on the cutter arm. This pressure is 1¼ Oz.

Brief Description of Expansion and Compression Circuits

V6, 6SF7 and V9, 6H6 embrace the expansion circuit. Referring to Figure 3, Schematic Diagram, it will be noted that expansion is present in the circuit at all times on Phono and Radio Receive. V6, 6SF7 serves as the 2nd Detector and expansion amplifier, while V9, 6H6 functions as the expansion rectifier in one diode section and furnishes delayed audio AVC in the other diode section. V8, 6H6 functions as the compressor.

How to Check Expansion Voltage

The following method is suggested for checking expansion voltage.

Feed a 1 volt (RMS) 400 cycle signal into the phono input plug. Make certain the phono button is depressed. Connect the leads of a vacuum tube voltmeter* to the location indicated on Figure 3, Schematic Diagram and ground. The voltage at this point should be between 3 and 4 volts positive DC. As a cross check measure the cathode voltage of V7, 6SF7 which should read about 5 volts DC. The expansion voltage should be approximately 1 volt less.

How to Check Compression Voltage

Depress the Radio Record button. Feed a 1 volt (RMS) 400 cycle signal into the diode return of the 2nd I.F. (brown lead). In the same manner outlined in the preceding paragraph measure the compression voltage, which should be approximately a minus 2 to 3 volts DC.

***NOTE: VTVM input loading above 10 megohms.**

Electrical Power Output
Undistorted . . . 3.5 watts
Maximum . . . 6 watts

Loudspeaker
Type . . . Permanent Magnet
Outside Cone Diameter . . . 10"
Voice Coil Impedence . . . 3.2 ohms at 400 cycles
Magnet Rating . . . 6.8 Oz. Alnico 5

Tubes

Tube	Function
6SK7	R.F. Amplifier
6SA7	Frequency Converter
6SK7	I.F. Amplifier
6SF7	2nd Detector & Expansion Amplifier
6H6	Expansion Rectifier & Delayed Audio AVC
6SQ7	Microphone Amplifier
6SF7	1st Audio Amplifier
6H6	Compression Rectifier
6V6-GT/G	Power Amplifier
5Y3-GT/G	Rectifier

STAGE GAIN MEASUREMENTS
Measurements taken with volume and tone controls maximum.
Band switch in standard broadcast position. AVC shorted out.
Standard Output . . . 50 milliwatts
Dummy Antenna . . . 200 Mmf.
Antenna Grid to R.F. Grid . . . 6X at 1000 KC
R.F. Grid to Converter Grid . . . 12.5X at 1000 KC
Converter Grid to 1st I.F. Grid . . . 61X at 455 KC
1st I.F. Grid to 2nd Detector . . . 120X at 455 KC
Overall Audio Gain . . . 620X at 1 watt 400 cycles

OSCILLATOR CATHODE VOLTAGES
Measured at 117 volts A.C. line voltage with A.C. V.T.V.M. input loading above 10 megohms.
1750 KC . . . 3.4 volts AC
1300 KC . . . 3.2 volts AC
750 KC . . . 3.2 volts AC
550 KC . . . 3.7 volts AC

D.C. RESISTANCE MEASUREMENTS

I.F. COILS

1st I.F.	2nd I.F.
Primary . . . 17 ohms	Primary . . . 17 ohms
Secondary . . . 17 ohms	Secondary . . . 17 ohms*

*NOTE: To obtain the true reading of the secondary of the 2nd I.F. it must be removed from the can. This is so because of the 56,000 ohm resistor in series with the AVC lead inside the can.

OSCILLATOR COILS

Broadcast	Short Wave
Primary . . . 1 ohm	Start to Finish . . . 4 ohms
Secondary . . . 6 ohms	Start to Tap . . . . 2 ohms

ANTENNA COILS

Broadcast	Short Wave
Start to Finish . . 12.2 ohms	Start to Finish . . . .25 ohms
Start to Tap . . . . 10.5 ohms	Start to Tap . . . . .20 ohms

R.F. COILS

Broadcast	Short Wave
Primary . . . . 75 ohms	Primary . . . 5.5 ohms
Secondary . . . 6.5 ohms	Secondary . . . .2 ohms

NOTE: Due to the variation of winding methods, the D.C. resistance on all coils is subject to a 20% tolerance.

MODEL 1054

PACKARD BELL CO.

No signal.
117 volts A.C. line voltage.

All voltages measured from socket contacts to chassis. D.C. voltages measured with a vacuum tube voltmeter. A.C. voltages measured with a 1000 ohm per volt A.C. meter.

Volume and tone controls maximum.

Band switch in standard broadcast position.

Compression switched out of Radio Receive by breaking contact from B-4 to B-5.

Compression switched out of Phonograph by breaking contact from C-3 to C-4.

Compression is in circuit on ALL RECORD POSITIONS

All voltages shown are positive D.C. unless otherwise noted.

Expanson is switched into grid of 1st audio, (6SF7) when "RADIO RECEIVE" button is depressed by connecting switch contacts B-5 and B-6.

Expansion is switched into grid of 1st audio, (6SF7) when "PHONO" button is depressed by connecting switch contacts C-4 and C-5.

Expansion is in the circuit **ONLY** when the "RADIO

ALIGNMENT PROCEDURE

Alignment procedure consists of the 7 steps outlined in the Alignment Procedure Chart.

Connect the test oscillator leads to the mixer grid and ground in series with an .01 Mfd. capacitor (dummy load) for step No. 1, I.F. Alignment. Upon completing this step, "Rock" the variable condenser to assure that the I.F.s have not been aligned to the image frequency.

Use the Hazeltine Standard Test Loop #1150 for the balance of the alignment. Place the test loop about two feet from the receiver loop in a vertical position.

STEP	CONNECT TEST OSC. TO	TEST OSC. SETTING	POINTER SETTING	ADJUST FOR MAX. OUTPUT
1	Mixer Grid & Grd. .01 Mfd. Cap.	455 KC	540 KC	Trimmers A, B, C & D
2	Standard Test Loop*	1750 KC	1750 KC	Trimmer H to 1750 KC
3	Standard Test Loop*	600 KC	600 KC	Trimmer G to 600 KC
4	Standard Test Loop*	1500 KC	1500 KC	Trimmers F & J
5	Repeat Steps	2, 3, & 4		
6	Standard Test Loop*	18 MC	18 MC	Trimmer I to 18 MC
7	Standard Test Loop*	15 MC	15 MC	Trimmers E & K

*NOTE: Hazeltine Test Loop #1150.

BRIEF DESCRIPTION OF EXPANDER AND COMPRESSOR CIRCUITS

V7 6SF7 and V6 6H6 embrace the expansion circuit. Referring to Figure 3, Schematic Diagram, it will be noted that volume expansion is in the circuit at all times when the Phono or Radio receive buttons are depressed. V7, 6SF7 serves as the 2nd detector and expansion amplifier. V6, 6H6 functions as the expansion rectifier in one diode section and furnishes delayed audio AVC in the other diode section. V8, 6H6 functions as the compressor rectifier.

HOW TO CHECK EXPANSION VOLTAGE

Feed a 1 volt (RMS) 400 cycle signal into the Phono input plug. Make certain the Phono button is depressed. Connect the leads of a vacuum tube voltmeter* to the location indicated on Figure 3, Schematic Diagram and ground. The voltage at this point should be between 3 and 4 volts positive D.C. As a cross check measure the cathode voltage of V4, 6SF7, which should read about 5 volts D.C. The expansion voltage should be about 1 volt less.

HOW TO CHECK COMPRESSION VOLTAGE

Depress the Radio Record button. Feed a 1 volt (RMS) 400 cycle signal into the diode return of the 2nd I.F. (brown lead). In the same manner outlined in the preceding paragraph, measure the compression voltage, which should be approximately a minus 2 to 3 volts.

PACKARD BELL CO.

SPECIFICATIONS

Overall Dimensions:
Height . . . . 26⅞" Depth . . . . 18½"
Width . . . . 29⅞" Weight . . . 70 Lbs.

Electrical Rating:
Line Voltage . . . 110-120 volts, 50-60 cycle A.C.
Power Consumption . . . 67 watts

Tuning Frequency Range:
540 to 1740 KC

Intermediate Frequency:
455 KC

Electrical Output:
5 watts maximum

Loudspeaker:
Type . . . Permanent Magnet
Outside Cone Diameter . . . 10"
Voice Coil Impedance . . . 3.5 ohms at 400 cycles
Magnet Rating . . . 4.64 Oz. Alnico 5

Tubes:

Tube	Function
6SK7	R.F. Amplifier
6SA7	Frequency Converter
6SK7	I.F. Amplifier
6SQ7	Detector-Amplifier
6V6-GT/G	Power Amplifier
5Y3-GT/G	Rectifier

GENERAL INFORMATION

Model 662 is a console, radio-phonograph combination with an automatic record changer. This model employs a specially designed high impedance loop antenna and a permanent magnet speaker. It is housed in a wood cabinet of bleach or walnut design.

For service information concerning the record changer, refer to the Model 550 Automatic Record Changer Manual. This record changer is also used on Packard-Bell Model 661.

Chassis mounting procedure will be found on the tube layout-license label.

To Service tubes, remove plate in record changer compartment.

Referring to Figure 4, Record Changer Motor Diagram, a 50 ohm, 10 watt resistor will be noted in series with the motor. This resistor was added after an early run to avoid motor heating on 50 cycle current. The resistor is enclosed in a small metal shield. The addition of this resistor does not, in any manner, detract from the efficiency of the motor on 50 or 60 cycle operation.

ALIGNMENT PROCEDURE

Alignment Procedure consists of the 5 steps outlined in the Alignment Procedure Chart.

Connect the test oscillator leads to the mixer grid and ground in series with an .01 Mfd. capacitor (dummy load) for step No. 1, I.F. Alignment. Upon completion of this step "Rock" the variable condenser to assure that the I.F.s have been aligned to the correct frequency. Output should remain constant for any setting of variable capacitor.

Use the Hazeltine Standard Test Loop No. 1150, or a reasonable substitute, for the balance of the alignment. Place the test loop about two feet from the receiver loop in a vertical position.

It will be noted that all alignment trimmers are accessable without removing the chassis from the cabinet.

IMPORTANT NOTICE: Make certain that each alignment is done with a minimum input signal.

ALIGNMENT CHART

	CONNECT TEST OSC.	TEST OSC. SETTING	POINTER SETTING	ADJUST FOR MAX. OUTPUT
STEP 1	Mixer Grid & Grd. (.01 Mfd. Cap.)	455 KC	540 KC	Trimmers A, B, C & D

SPECIAL SERVICE INFORMATION

D.C. Resistance Measurements:

1st & 2nd I.F. Coils
Primary . . . 17 ohms
Secondary . . 17 ohms*

Oscillator Coil
Primary . . . . 1 ohm
Secondary . . . 6 ohms

R.F. Coil
Primary . . . 58 ohms
Secondary . . . 4.2 ohms

*NOTE: To obtain the true reading of the secondary of the 2nd I.F. Coil, it must be removed from the can. This is so because of the 47K resistor inside the can.

NOTICE: The D.C. Resistance measurements on all coils are subject to a 20% tolerance due to the variation of winding methods.

STAGE GAIN MEASUREMENTS:
Measurements taken with volume and tone controls maximum.
Switch in RADIO position.
AVC shorted out.
Standard Output . . . 50 milliwatts
Dummy Antenna . . . 200 Mmf.

Antenna to R.F. Grid . . . 6X at 1000 KC
R.F. Grid to Converter Grid . . . 7X at 1000 KC
Converter Grid to 1st I.F. Grid . . . 46X at 455 KC
1st I.F. Grid to 2nd Detector . . . 62X at 455 KC
Overall Audio Gain . . . 320X at .5 watts 400 cycles

OSCILLATOR CATHODE VOLTAGES:
Measured at 120 volts AC line voltage with AC vacuum tube voltmeter input loading above 10 megohms.

1500 KC . . . 2.25 volts AC
1000 KC . . . 2.15 volts AC
800 KC . . . 2.3 volts AC
600 KC . . . 2.5 volts AC

All D.C. voltages measured with a vacuum tube voltmeter from socket contacts to chassis. — A.C. voltages measured with a 1000 ohms per volt A.C. meter from socket contacts to chassis. — Volume and tone controls maximum. — Switch in Radio position. — No signal. — All voltages shown are positive D.C. unless otherwise noted.

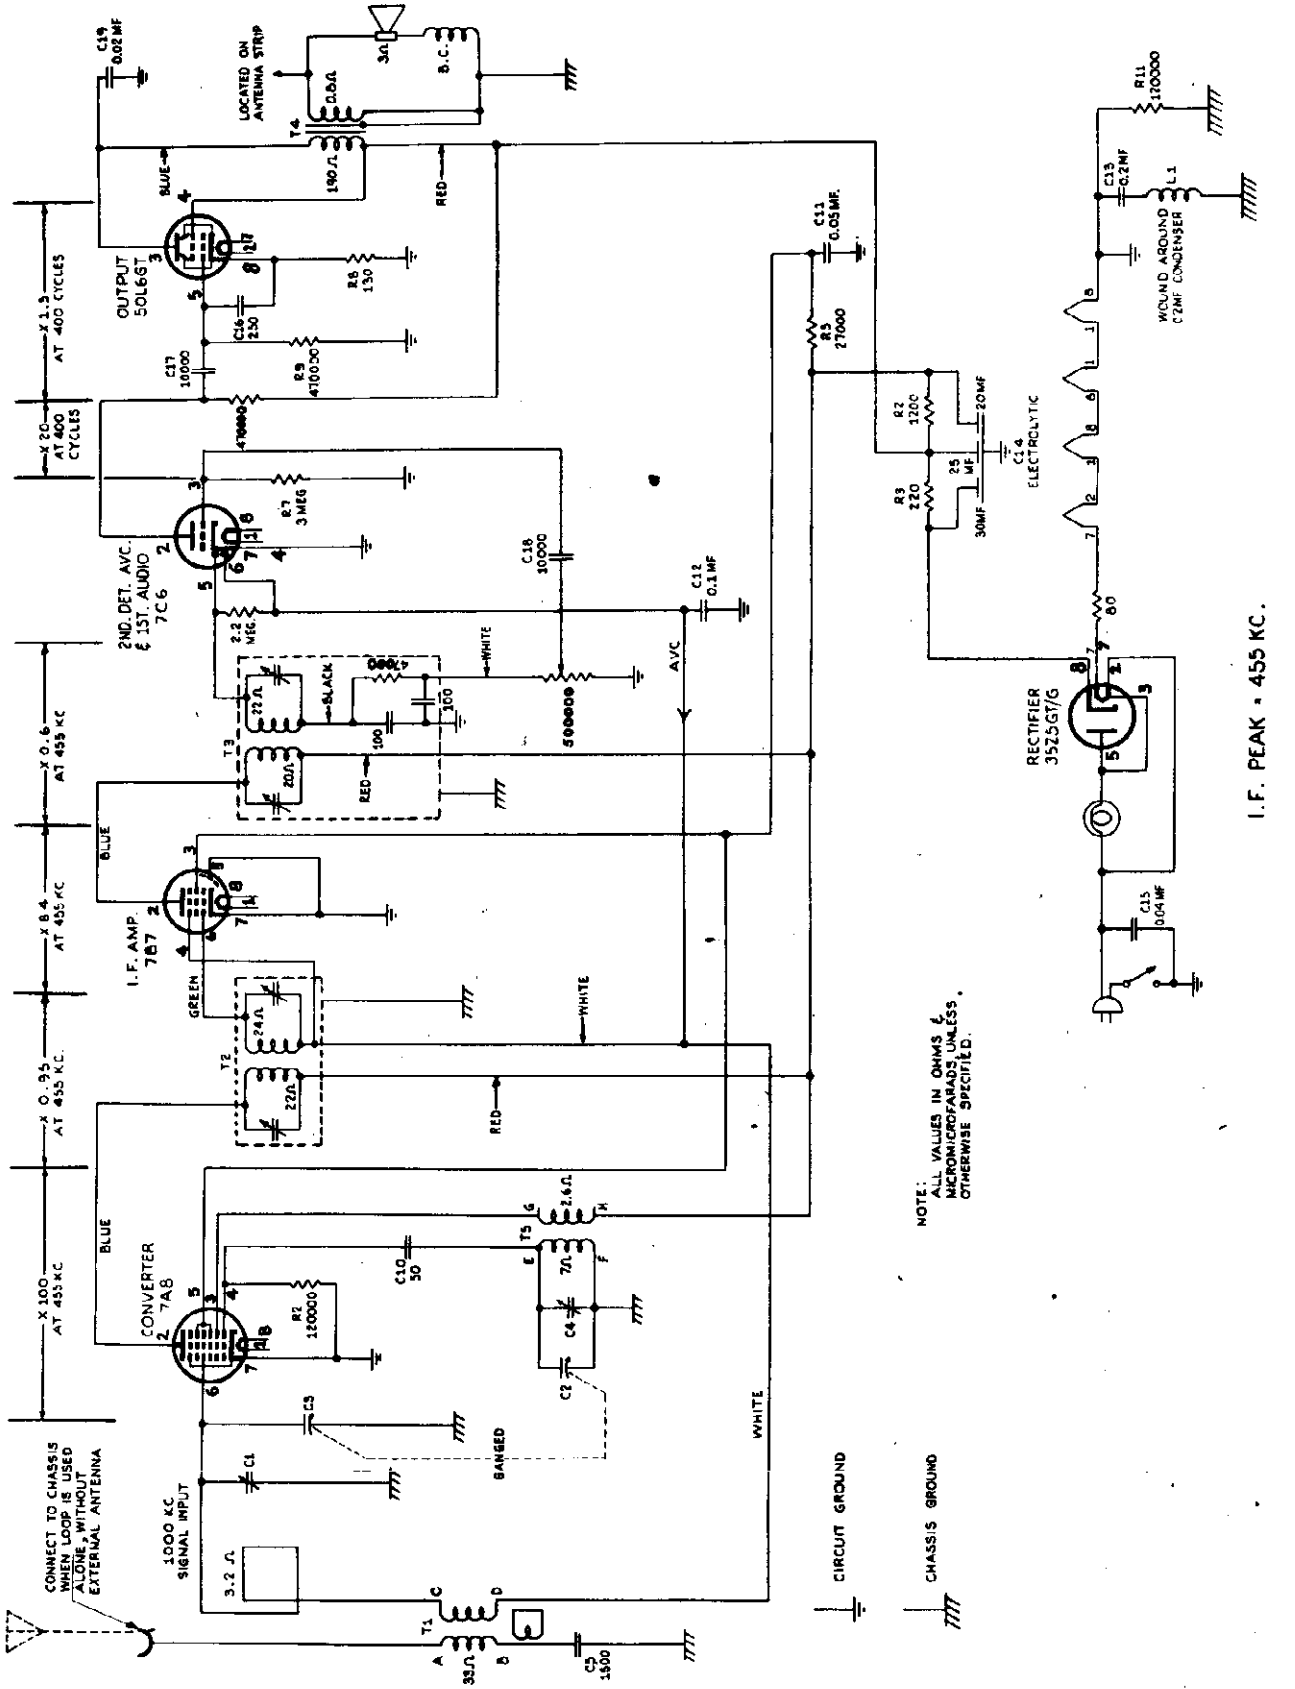
PHILCO RADIO & TELEV. CORP.



ALIGNMENT

PHILCO 46-250

Alignment may be accomplished with the chassis in the cabinet if a small alignment screwdriver is used. Connect the output meter between the left hand terminal (high) and center terminal (low) of the chassis antenna terminal strip. Connect the signal generator to the standard Hazeltine loop Model 1150 and couple it loosely to the receiver loop. The volume control should be set at maximum. The tuning condenser plates should be fully meshed when the dial pointer is at the index mark at the low frequency end of the dial. The generator output should always be just sufficient to obtain a minimum indication on the output meter. Set the signal generator to 455 kc. and adjust the i-f trimmers for maximum meter deflection in the following sequence: C9, C8, C7, C6. Set the generator and receiver to 1600 kc. and adjust the oscillator trimmer C4 for maximum output. Set the generator and receiver to 1500 kc. and adjust the r-f trimmer C1 for maximum output.

ALIGNMENT

PHILCO 46-350

The receiver should be aligned with the chassis installed in the cabinet. Connect the output meter from the voice coil lug (green wire) on the speaker to ground. Disconnect the blue external antenna lead from ground. Connect the signal generator through a .01 mf condenser to the external antenna lead. Set the receiver volume control at maximum. The tuning condenser should be fully meshed when the dial pointer is at the index mark at the low frequenc end of the dial. The signal generator output should at all times be just sufficient to obtain a minimum deflection on the output meter. Set the signal generator to 265 kc. and adjust the intermediate frequency amplifier transformer trimmers for maximum meter deflection in the following sequence: C18, C17, C16, C15. Set the generator and receiver to 1600 kc. and adjust the oscillator shunt trimmer C12 for maximum output. Set the generator and receiver to 580 kc. and adjust the oscillator series padder C10 for maximum output. Proper low frequency adjustment of the oscillator requires rocking the receiver dial slightly while adjusting this trimmer for maximum output. Repeat the adjustment of the oscillator shunt trimmer C12 at 1600 kc. Set the generator and receiver to 1500 kc. and adjust the mixer trimm C8 and the r-f trimmer C5 for maximum output.

ALIGNMENT

PHILCO 46-420

Alignment may be accomplished with the chassis in the cabinet if a small alignment screwdriver is used. Connect the output meter between the left hand terminal (high) and center terminal (low) of the chassis antenna terminal strip. Connect the signal generator to the standard Hazeltine loop Model 1150 and couple it loosely to the receiver loop. The volume control should be set at maximum. The tuning condenser plates should be fully meshed when the dial pointer is at the index mark at the low frequency end of the dial. The generator output should always be just sufficient to obtain a minimum deflection on the output meter. Set the signal generator to 455 kc. and adjust the i-f trimmers for maximum meter deflection in the following sequence: C9, C8, C7, C6. Set the generator and receiver to 1600 kc. and adjust the oscillator trimmer C4 for maximum output. Set the generator and receiver to 1500 kc. and adjust the r-f trimmer C3 for maximum output.

ALIGNMENT

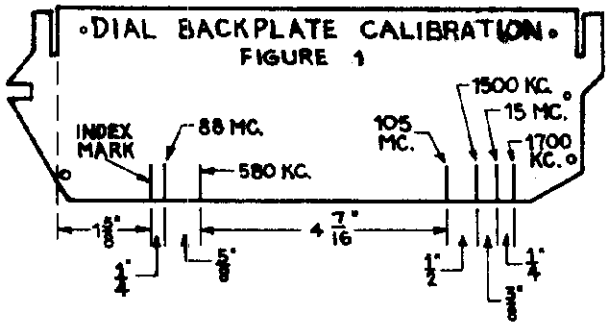
PHILCO 46-480

This chassis must be removed from the cabinet for aligning. Power should not be turned on in this receiver unless the speaker is connected. A-M alignment should be completed before F-M alignment. Alignment of the A-M circuits may not disturb the alignment of the F-M circuits. Calibrate the receiver dial backplate as shown in Figure 1. The receiver dial pointer should coincide with the index mark at the low frequency end of the dial when the gang condenser is fully in mesh.

A-M ALIGNMENT

Connect the output meter between terminals 3 (high) and 2 (ground) of the antenna terminal strip. The receiver loop should be connected between terminals 1 (high) and 2 (ground) of the antenna terminal strip. The signal generator should be connected to the standard Hazeltine loop Model 1150 and should be loosely coupled to the receiver loop. The volume control should be set at maximum and the tone control at maximum high. The generator output should always be just sufficient to obtain a minimum deflection on the output meter.

	Signal Generator Frequency	Receiver Band Switch Position	Receiver Dial Position	Adjust for Maximum
1.	455 kc.	Broadcast	Index Mark (condenser plates fully meshed)	C33 C29 C24 L16
2.	1700 kc.	Broadcast	1700 kc.	C17
3.	1500 kc.	Broadcast	1500 kc.	C16
4.	580 kc.	Broadcast	580 kc.	Adjust C23 for peak while rocking tuning control.
5.	1700 kc.	Broadcast	1700 kc.	Readjust C17
6.	15 mc.	Short Wave	15 mc.	Starting with trimmer C22 screw loosened, slowly tighten for peak on first signal heard. Image should be obtained with receiver tuned to 15.9 mc.
7.	15 mc.	Short Wave	15 mc.	C21



F-M Alignment

Connect a d-c vacuum tube voltmeter across the 5-mf condenser C43 in the ratio detector circuit. The alignment should be carried through without modulation of the generator output. The receiver band switch should be in the F-M position.

	Signal Generator Connection	Signal Generator Frequency	Receiver Dial Position	Adjust as Noted
1.	High side connected to projecting brass screw of L16 coil slug (first i-f transformer T1) through a .01 mf condenser.	9.1 mc.	Index mark (condenser plates fully meshed) Approximately 88 mc.	Fully tighten trimmer C32
2.	Same	9.1 mc.	Index Mark	Adjust for maximum C31 C30 C28 C26 C25
3.	Same	9.1 mc.	Index mark	Input should be adjusted for approximately 25 volts on dc meter. Loosen C32 slowly, recording the minimum and maximum readings. Set trimmer so that average of these voltage readings is obtained. Another method to obtain correct setting of C32 is to adjust this condenser so that the voltage across the 1200 mmf condenser in the T5 can (obtainable between the R18-R19 junction and chassis) is one-half the voltage obtained across the 5-mf condenser C43.
4.	Through a .01 mf condenser to the left rear terminal of the chassis FM female socket	105 mc.	105 mc.	Adjust for maximum C18 C20 C19

If a maximum voltage indication can not be obtained because either C18, C20, or C19 are completely screwed tight, it may be necessary to slightly compress manually the corresponding coils L3, L2, or L1. Similarly if maximum voltage indication is not obtained because C18, C20 or C19 are almost entirely screwed out, it will be necessary to slightly pull the turns apart of coils L3, L2 or L1. Then realign C18, C20 and C19 at 105 mc.

PHILCO RADIO & TELEV. CORP.

MODEL 46-1201
Code 122

PHILCO RADIO & TELEV. CORP.

ALIGNMENT

PHILCO 46-1201

The receiver should be aligned with the chassis installed in the cabinet. Connect the output meter from the voice coil lug (green wire) on the speaker to ground. Disconnect the blue external antenna lead from ground. Connect the signal generator through a .01 mf condenser to the external antenna lead. Set the receiver volume control at maximum. The tuning condenser should be fully meshed when the dial pointer is at the index mark at the low frequency end of the dial. The signal generator output should at all times be just sufficient to obtain a minimum deflection on the output meter. Set the signal generator to 455 kc. and adjust the intermediate frequency amplifier transformer trimmers for maximum meter deflection in the following sequence: C10, C9, C8, C7. Set the generator and receiver to 1600 kc. and adjust the oscillator shunt trimmer C6 for maximum output. Set the generator and receiver to 1500 kc. and adjust the r-f trimmer C2 for maximum output.

ALIGNMENT

PHILCO 46-1209

Power should not be turned on in this receiver unless the speaker is connected. The chassis must be removed from the cabinet for alignment. Calibrate the receiver dial backplate as shown in **Fig. 1, Page 15-36** The receiver loop should be connected to terminals 1 (high) and 2 (low) of the antenna terminal strip. The output meter should be connected to terminals 3 (high) and 2 (low) of the antenna terminal strip.

	Signal Generator Frequency	Receiver Band Switch Position	Receiver Dial Position	Adjust for Maximum
1.	455 kc.	Broadcast	Index mark (condenser plates fully meshed)	C28 C26 C25 Coil slug of T1
2.	1700 kc.	Broadcast	1700 kc.	C6

6.	15 mc.	Short Wave	15 mc.	Starting with trimmer C14 screw loosened, slowly tighten for peak on first signal heard. Image should be obtained with receiver tuned to 15.9 mc.
7.	15 mc.	Short Wave	15 mc.	C12

46-480 PUSH BUTTON ADJUSTMENT 46-1209

Note: Good reception of stations by use of push buttons depends on the accuracy of the manual tuning during the setting-up operation.

1. Allow the receiver to warm up for at least 20 minutes before setting up any stations.
2. The band switch must be in the push-button position.
3. Choose the most powerful local stations, those which are free from excess fading. Setting up weak or distant stations is not recommended.
4. List the desired stations, in order, from the low to the high frequencies. The station on your list that comes in nearest the left-hand end of the dial should be called station No. 1 and should be set up on button No. 1. Do not skip buttons but set up stations in numerical order.
5. Insert the proper station call tabs into the recesses of the respective buttons.
6. Manually tune in the desired station accurately.
7. Set the bandswitch to the push button position.
8. Push in the button to be set up to its depressed position.
9. Adjust its corresponding oscillator trimmer for the station signal which you tuned in manually above. Peak the adjustment for clearest reception.
10. Adjust its corresponding antenna trimmer for clearest reception.
11. Repeat the above procedure from step 6 to 10 for each button to be set up.

ALIGNMENT

PHILCO 46-1226

Power should not be turned on in this receiver unless the speaker is connected. The chassis should be removed from the cabinet and the dial backplate calibrated as shown in Figure 1. The receiver loop should be connected between terminals 1 (high) and 2 (low) of the antenna terminal strip. The signal generator is connected to the Hazeltine standard loop Model 1150 which is loosely coupled to the receiver loop. The output meter should be connected between terminal 1 (high) and 2 (low) of the antenna terminal strip. The tone control should be in the maximum high position. The volume control should be at maximum. The generator output should at all times be just sufficient to obtain a minimum deflection on the output meter.

DIAL AND POINTER DRIVE CORD ARRANGEMENT

To string dial cord, turn the main drive drum to maximum **counter - clockwise** position and use following parts:

114955	Clip on end of cord
117057	Cord (55 inches)
119087	Ring for dial cord
161384	Tension Spring

SOCKET VOLTAGES

Measured with voltmeter having sensitivity of 1000 ohms per volt except where indicated by (*).

VOLUME ON FULL WITH NO SIGNAL — DIAL TUNED TO 540 KC.

BOTTOM VIEW OF CHASSIS

HEATER VOLTAGES MEASURED ACROSS SOCKET TERMINALS. ALL OTHER VOLTAGES MEASURED BETWEEN SOCKET TERMINALS AND B- LUG.

117 VOLT 60 CYCLE A.C. POWER SUPPLY USED FOR THESE MEASUREMENTS.

MODELS 3-1A, 3-2A

MODELS 3-1A, 3-2A

PHILLIPS PETROLEUM CO.

Remove chassis and loop from cabinet. Solder approximately 8" of insulated wire to any B— connection (see voltage chart on opposite side for convenient B— location). Then reinstall chassis and loop in cabinet. The B— lead should extend from under the chassis at the back.

Connect ground lead of signal generator to B— lead.

Connect output meter across the speaker voice coil (terminals at back of speaker.)

Turn the tuning control knob clockwise as far as it will go (tuner mechanism is now in maximum open position with tuning slugs almost completely withdrawn from coils). Dial pointer should then point to 1600 Kc mark on scale. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.

Set volume control at maximum volume position and use a weak signal from the signal generator.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF GENERATOR TO	SIGNAL GENERATOR FREQUENCY	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT

Set tuner mechanism to maximum open position by turning the tuning control knob clockwise as far as it will go (Dial pointer at 1600 Kc). Then check whether the positions of the tuning slugs correspond to the positions shown in Fig. 1 below. If settings are incorrect, rotate the individual core and threaded stem until desired position is reached. Note that threaded stem is prevented from moving by a dab of speaker cement at top.

.1 MFD. Condenser	Ungrounded terminal of trimmer No. 6 (see Fig. 2 below for location of trimmer.)	455 KC	Any point where it does not affect the signal.	1-2	2nd I.F.	Adjust for maximum output. Then repeat adjustment.
				3-4	1st I.F.	
300 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1600 KC	1600 KC	5	Broadcast Oscillator (Shunt)	Adjust for maximum output.
300 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1600 KC	Tune to 1600 KC generator signal	6	Broadcast R.F.	Adjust for maximum output.
				7	Broadcast Antenna	Adjust for maximum output.
300 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1400 KC	Tune to 1400 KC generator signal	Ant. coil tuning slug		Adjust position of slug for maximum output.
				R.F. coil tuning slug		Adjust position of slug for maximum output.
300 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1600 KC	Tune to 1600 KC generator signal	6	Broadcast R.F.	Recheck adjustment for maximum output.
				7	Broadcast Antenna	Recheck adjustment for maximum output.

Apply a coating of speaker cement at top of each tuning core stem to prevent movement.

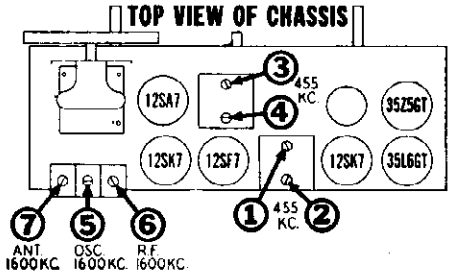

FIG. 2

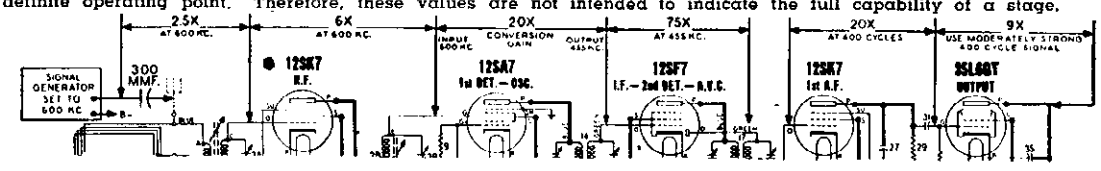
AUDIO OSCILLATION

The audio system of this receiver utilizes a two stage type of inverse feed-back arrangement and, should it ever be necessary to replace the speaker or output transformer, it is important to maintain a definite phase relationship in the feed-back circuit. If the connections to the output transformer are reversed or if the feed-back connection is made to the wrong side of the output transformer secondary, the system will become regenerative instead of degenerative. Under those conditions audio oscillation may result. If that occurs, oscillation may be prevented by reversing the connections to the secondary of the output transformer.

Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe following precautions:

1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes.)
2. For R.F. and I.F. measurements connect negative terminal of a 3 volt battery (two 1½ volt cells in series) to A.V.C. lead and positive terminal to B—. This provides a definite operating point. IMPORTANT: Disconnect battery when measuring audio stage gains.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
4. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 3 volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.

ALIGNMENT PROCEDURE

1. The chassis and loop antenna should remain in their normal position in the cabinet throughout the following procedure.
2. Check arrangement of leads to push-button switch as shown in illustration on following page.
3. With the gang condenser fully meshed, dial pointer should be in the position indicated by the last division below 55 on the dial. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.
4. Connect output meter across speaker voice coil.
5. Connect the ground lead of the signal generator to the receiver chassis.
6. Set volume control at maximum volume position and use a weak signal from the signal generator.
7. Push in the manual button and leave it in that position throughout the alignment procedure.

IMPORTANT:—Align this receiver in exactly the order shown below. Broadcast band must be aligned before short wave bands.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF SIGNAL GENERATOR TO	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT

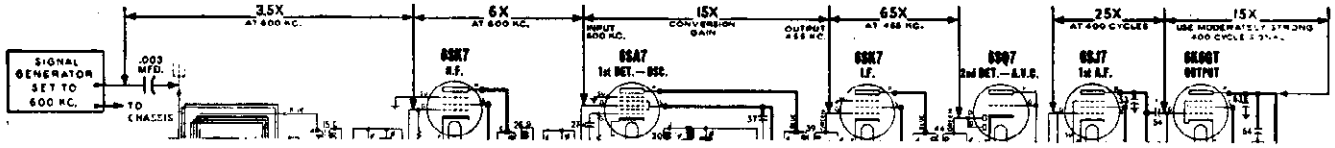
PHILLIPS PETROLEUM CO.

APPROXIMATE STAGE GAIN DATA

Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe following precautions:

1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes.)
2. For R.F. and I.F. measurements connect negative terminal of a 3 volt battery (two 1½ volt cells in series) to A.V.C. lead and positive terminal to chassis. This provides a definite operating point. IMPORTANT: Disconnect battery when measuring audio stage gains.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
4. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 3 volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.

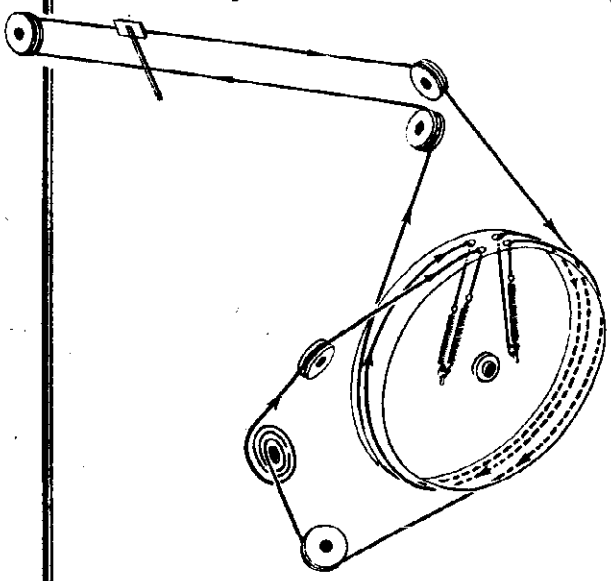


Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.

DIAL AND POINTER DRIVE CORD ARRANGEMENT

To string dial cord, set gang condenser to fully meshed position and use following parts:

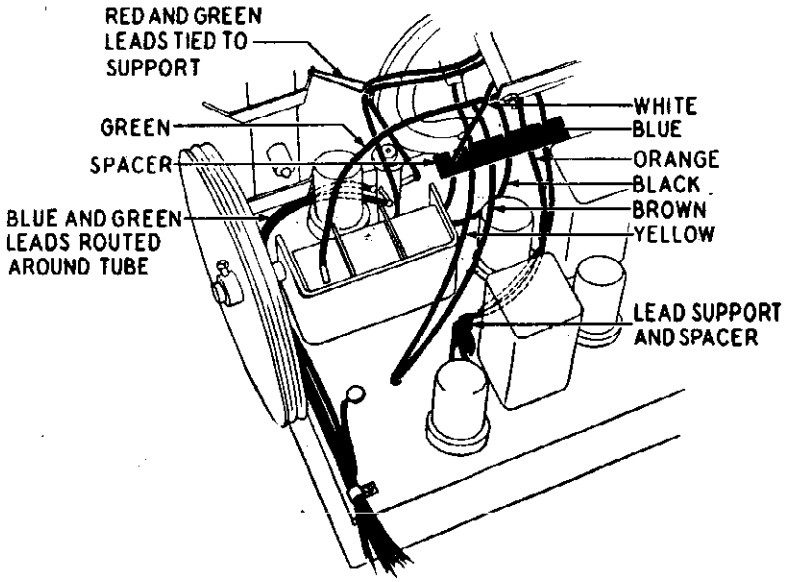
113177	Tension Spring
114955	Clip on end of cord
119087	Ring for dial cord
117057	Cord (102 inches) Pointer drive 72 inches Gang drive 30 inches



IMPORTANCE OF MAINTAINING FIXED POSITIONS FOR LEADS AT TOP OF CHASSIS

The wires shown in the above illustration are associated with tuned circuits which carry radio frequency currents. Therefore, care must be exercised to insure that they are properly routed and spaced. Anchoring and fixing spacing of wires minimizes freedom of movement and is utilized to maintain a stable arrangement.

Since the relative positions of these wires may affect tuned circuits it is important to avoid any change in arrangement after the receiver has been aligned. If the position of the wires has been disturbed, it is advisable to re-check alignment



AUDIO OSCILLATION

The audio system of this receiver utilizes a two stage type of inverse feed-back arrangement and should it ever be necessary to replace the speaker or output transformer it is important to maintain a definite phase relationship in the feedback circuit. If the connections to the output transformer are reversed or if the feed-back connection is made to the wrong side of the output transformer secondary, the system will become regenerative instead of degenerative. Under those conditions audio oscillation may result. If that occurs, oscillation may be prevented by reversing the connections to the primary of the output transformer.

PHILLIPS PETROLEUM CO.

MODEL 3-4A

PHILLIPS PETROLEUM CO.

Slide chassis partially out of cabinet by removing staples at each side of wood shelf and pulling entire shelf back about 2 inches. Do not disturb connections to loop antenna.

Connect an output meter across the voice coil of the speaker or between the plate of the 3Q5GT output tube and chassis through a .1 mfd. condenser.

Connect the ground lead of the signal generator to chassis through a .25 mfd. condenser.

Set the volume control in the maximum position and use a weak signal from the generator.

Set "AC-DC—BAT.—CHARGE" Switch in "AC-DC" position.

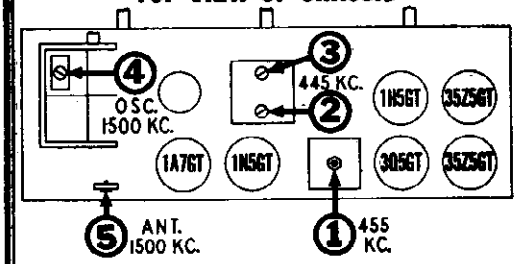
TOP VIEW OF CHASSIS



INDICATOR LAMP

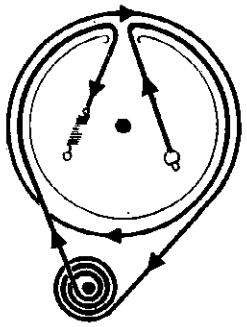
The flashing neon lamp on the dial face indicates condition of batteries. This lamp is included in an oscillating (R-C) circuit which is designed to oscillate at approximately 3 pulses per second when batteries are in a fully charged condition. As the battery voltage decreases with use, number of pulses per second decreases.

This lamp will only show the true condition of the batteries when the Selector Switch is in the "Battery" position. Lamp flashes more rapidly during charging or "AC-DC" operation.

When battery voltage is low (approximately 72 volts) the lamp flashes more slowly (about once per second). The set should not be operated from battery power after this point is reached and batteries should be recharged immediately. Charge for at least twice the time they were used and as soon as possible after they are run down. As batteries age it is necessary to charge for a longer period. For longest battery life, charge immediately after using.

IMPORTANT:

1. Completely dead batteries cannot be recharged.
2. When set is connected to a DC line, check for correct polarity by operating it before attempting to charge the batteries.
3. Batteries will be discharged if ON-OFF switch is left ON when power cord is not connected to wall outlet.



CHARGING CIRCUIT

The battery charging circuit consists of a 35Z5GT rectifier and a suitable resistor voltage dividing network. This circuit provides a very low charging current when the receiver is operated on AC-DC and is just enough to maintain the batteries but will not charge them. A separate charging position is provided for the regular charging operation. A charging rate of approximately 1/3 the discharge rate is used to give best results.

DIAL DRIVE CORD ARRANGEMENT

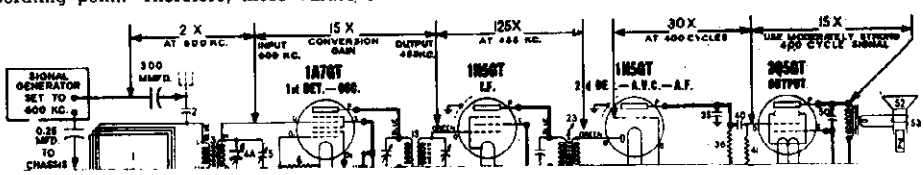
To string dial cord, set gang condenser to fully meshed position and use following parts:

114955	Clip on end of cord
117057	Cord (28 inches)
119087	Ring for dial cord
161384	Tension Spring

Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements.

1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes).
2. For R.F. and I.F. measurements connect negative terminal of a 1½-volt battery to A.V.C. lead and positive terminal to chassis. This provides a definite operating point.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning).
4. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 1½ volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.

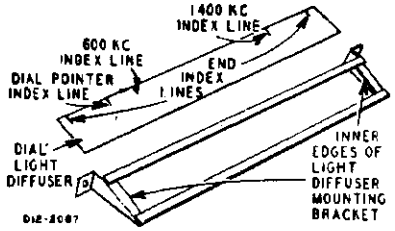
	No 47 pilot light
58X639	Dial (for ivory cabinet)
58X641	Dial (for walnut cabinet)
30X508	Dial clamp (upper)
30X509	Dial clamp (lower)

DIAL CALIBRATION

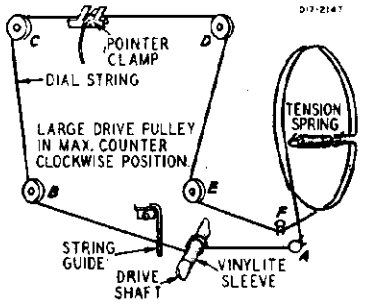


In order to align the receiver, the dial pointer must be positioned on the dial string correctly with reference to the dial. Index lines are provided on the dial light diffuser for this purpose.

Before aligning the receiver (or when replacing the dial light diffuser) check the position of the diffuser strip, making certain that the two extreme index lines are aligned with the inner edges of the diffuser mounting bracket opening. The bracket should be crimped at one point to prevent movement of the diffuser strip. To position the dial pointer, turn the large drive pulley to the maximum clockwise position. The dial pointer should be directly over the dial pointer index line. (See illustration).

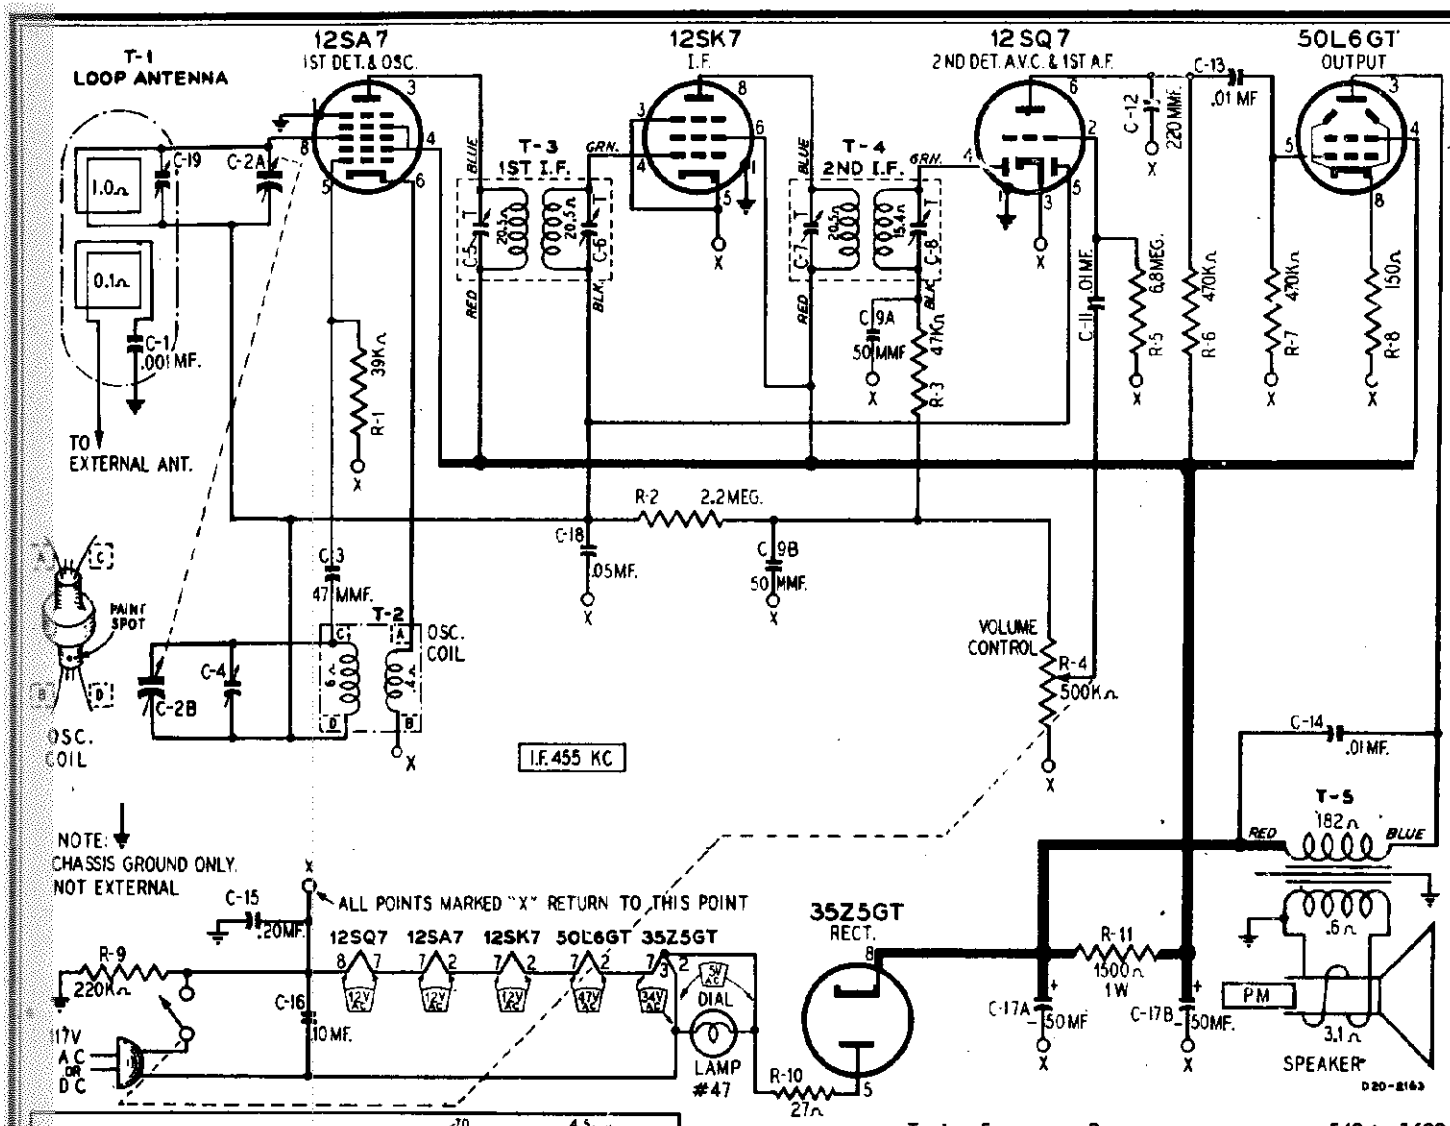
TUNING ASSEMBLY SERVICE

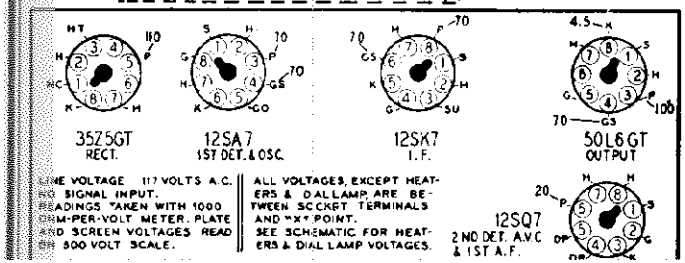
Exacting requirements in the tuning assembly make it impractical to replace the drive cord, coils and components in this assembly other than the trimmer condensers. Should the drive cord break, or components other than the trimmer condensers require service, the entire assembly must be ordered and replaced as a unit.

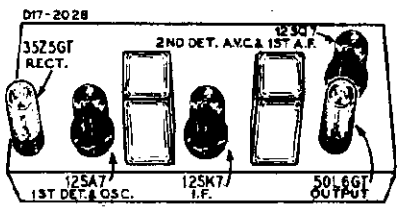


DRIVE CORD REPLACEMENT

Turn the large drive pulley to the maximum counterclockwise position. Use a new 53 inch drive cord, tie one end to the tension spring and fasten the other end of the spring to the drive pulley. Install the cord as shown in the illustration. Wind two turns clockwise around the tuning shaft with the turns progressing away from the chassis. After string is installed, stretch the tension spring and tie free end of cord to spring. Cut off excess string.

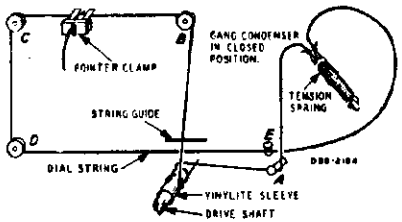




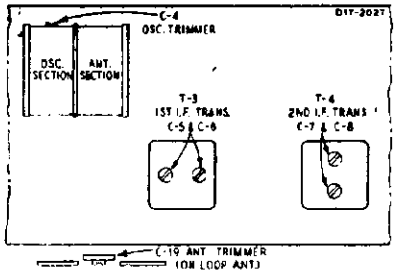


DRIVE CORD REPLACEMENT

Turn the large drive pulley to the maximum counterclockwise position. Use a new 53 inch drive cord, tie one end to the tension spring and fasten the other end of the spring to the drive pulley. Install the cord as shown in the illustration. Wind 2¾ turns counterclockwise around the tuning shaft with the turns progressing away from the chassis. After string is installed, stretch the tension spring and tie free end of cord to spring. Cut off excess string.

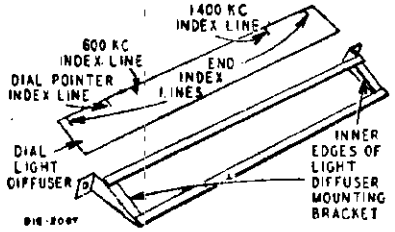


Tuning Frequency Range	540 to 1600 KC
Power Consumption	30 watts (At 117 volts AC)
Power Output	1.5 watt maximum, .9 watt (10% harmonics)
Selectivity	55 KC Broad at 1000 Times Signal
Intermediate Frequency	455 KC
Speaker	5" PM Dynamic
Sensitivity (for .05 watt output)	25 microvolts average



Note A—Set dial pointer to 1400 KC index line on dial light diffuser.

DIAL CALIBRATION



In order to align the receiver, the dial pointer must be positioned on the dial string correctly with reference to the dial. Index lines are provided on the dial light diffuser for this purpose.

Before aligning the receiver (or when replacing the dial light diffuser) check the position of the diffuser strip, making certain that the two extreme index lines are aligned with the inner edges of the diffuser mounting bracket opening. The bracket should be crimped to prevent movement of the diffuser strip. To position the dial pointer, turn the large drive pulley to the maximum counterclockwise position. The dial pointer should be directly over the dial pointer index line. (See illustration).

ALIGNMENT PROCEDURE

Check dial pointer position, see DIAL CALIBRATION paragraph.
Volume Control—Maximum All Adjustments.
Allow Chassis and Signal Generator to "Heat Up" for several Minutes.
The equipment in column at right is required for aligning:

Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.

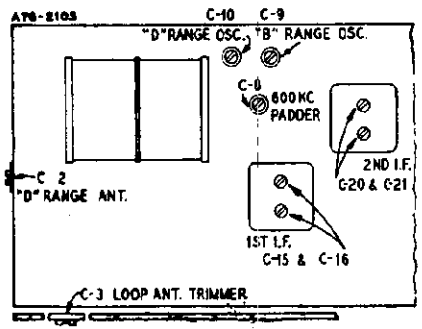
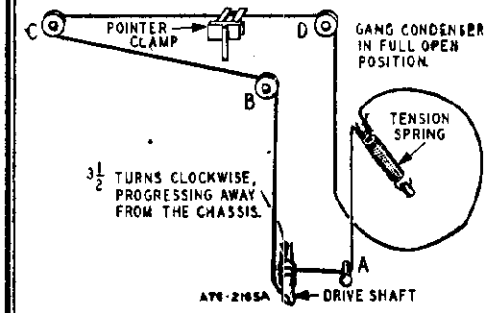
SPECIFICATIONS

Speaker.....6" PM Dynamic
Intermediate Frequency.....455 KC
Selectivity.....40 KC Broad at 1000 Times Signal
Sensitivity (For 0.5 Watt Output, with External Antenna)
B Range..... 9 Microvolts Av.
D Range.....20 Microvolts Av.
Power Consumption (at 117 Volts AC) .....40 Watts (normal)
Power Output.....4 Watts Maximum
2.3 Watts, 10% Harmonics
Tuning Frequency Range
B Range.....540-1600 Kilocycles
D Range.....9-15.5 Megacycles



DRIVE CORD REPLACEMENT

The drive cord may be replaced as shown in the accompanying illustration. For this purpose use a 58" piece of cord. After installing the cord, stretch the tension spring before fastening the free end of the string.



ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for several minutes.

The following equipment is required for aligning:
An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.
Output indicating Meter—Non Metallic Screwdriver.
Dummy Antennas—.1 mf., 100 mmf., and 400 ohms.

	SIGNAL GENERATOR FREQUENCY SETTING	SIGNAL GENERATOR CONNECTION AT RADIO	DUMMY ANTENNA	BAND SWITCH SETTING	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM
I.F.	455 KC	Grid of 6SA7 Pin 8	.1 mf.	B Range	Turn Rotor to Full Open	2nd I.F. (C20) & (C21 1st I.F. (C15) & (C1
RANGE B	1620 KC	Antenna Lead	100 mmf.	B Range	Turn Rotor to Full Open	Oscillator Range B(C9)
	1400 KC	Antenna Lead	100 mmf.	B Range	Tune Rotor to Max. Output Set Pointer to 1400 KC (See Note A)	Ant. Range B (C3)
	600 KC	Antenna Lead	100 mmf.	B Range	Tune Rotor to Max. Output	Oscillator (C8) Rock Rotor—See Note B
	Repeat above steps at 1620 and 600 KC until readjusting the oscillator Range B Trimmer (C9) causes no further improvement of output.					
RANGE D	15,600 KC	Antenna Lead	400 Ohm	D Range	Turn Rotor to Full Open	Oscillator Range D (C10)
	14,000 KC	Antenna Lead	400 Ohm	D Range	Tune Rotor to Max. Output	Ant. Range D (C2) Rock Rotor—See Note B
LOOP RANGE B	Reassemble chassis in cabinet. 1400 KC	Antenna Lead	100 mmf.	B Range	Tune Rotor to Max. Output	Ant. Range B(C3)

NOTE A—Set pointer at the 1400 KC mark on the dial scale. Attach pointer to drive cord.

NOTE B—Turn Rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

REPLACEMENT PARTS LIST

NOTICE: There is a power rating label on the chassis. This label specifies the power supply on which the radio may be used, and identifies the radio as to chassis, dial and issue letter. When ordering parts or writing, give ALL information appearing on this label.

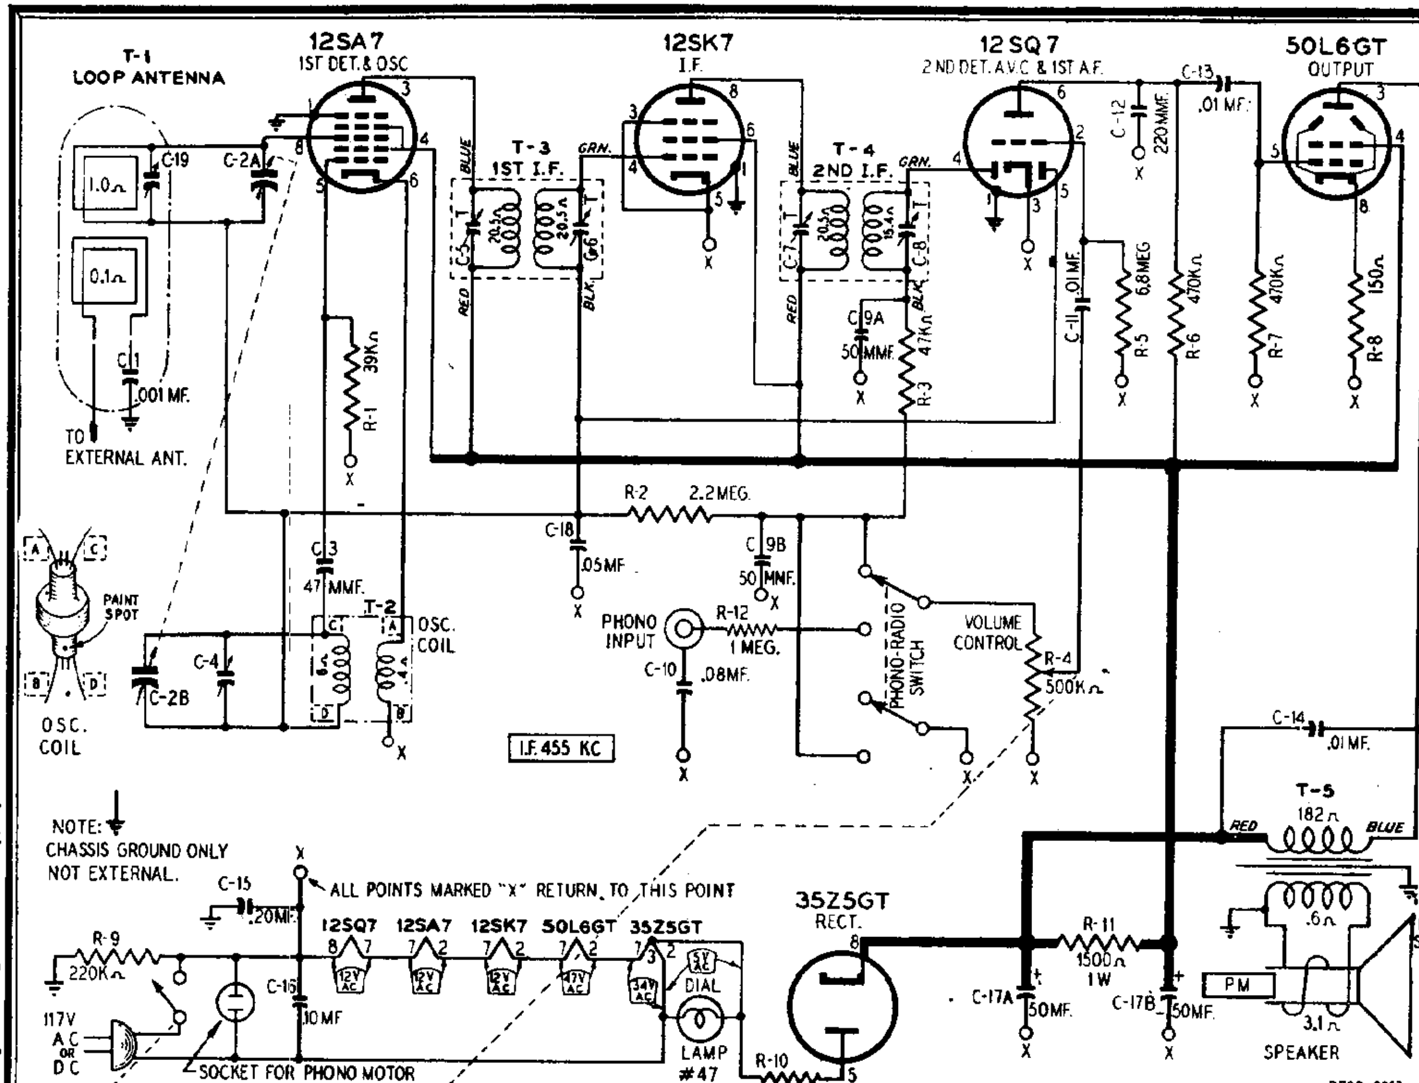
SUBSTITUTE REPLACEMENT PARTS

These are used on some receivers only. Check part number on part before ordering and order part originally used in receiver.

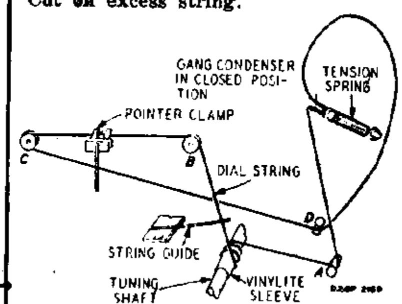
*40X280	Tone Control (substitute for 40X275)
*25X1539	Radio-Phono Switch Lever (when 40X280 is used)
*2A161	D.P.D.T. Switch (when 40X280 is used)
‡12A439	6" P.M. Speaker Complete with Output Transformer (substitute for 12A442)

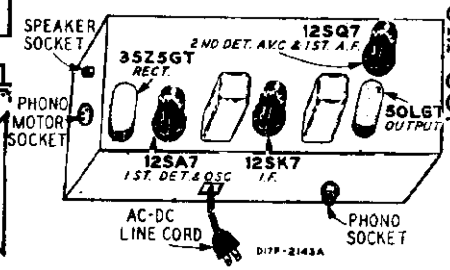
PHILLIPS PETROLEUM CO.



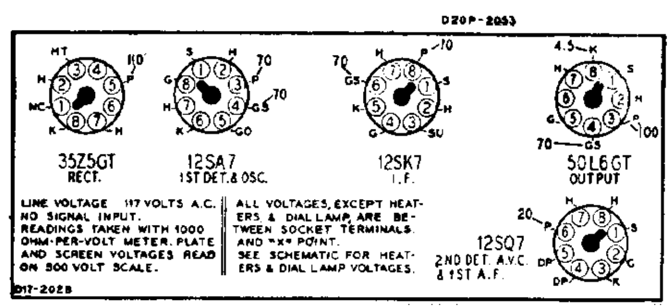
DRIVE CORD REPLACEMENT

Turn the large drive pulley to the maximum counterclockwise position. Use a new 57 inch drive cord, tie one end to the tension spring and fasten the other end of the spring to the drive pulley. Install the cord as shown in the illustration. Wind 2¾ turns counterclockwise around the tuning shaft with the turns progressing away from the chassis. After string is installed, stretch the tension spring and tie free end of cord to spring. Cut off excess string.





Tuning Frequency Range	540 to 1600 KC
Power Consumption	30 watts (At 117 volts AC) 50 watts Phono Operating
Power Output	1.5 watt maximum, .9 watt (10% harmonics)
Selectivity	55 KC Broad at 1000 Times Signal
Intermediate Frequency	455 KC
Speaker	5" PM Dynamic
Sensitivity (for .05 watt output)	25 microvolts average

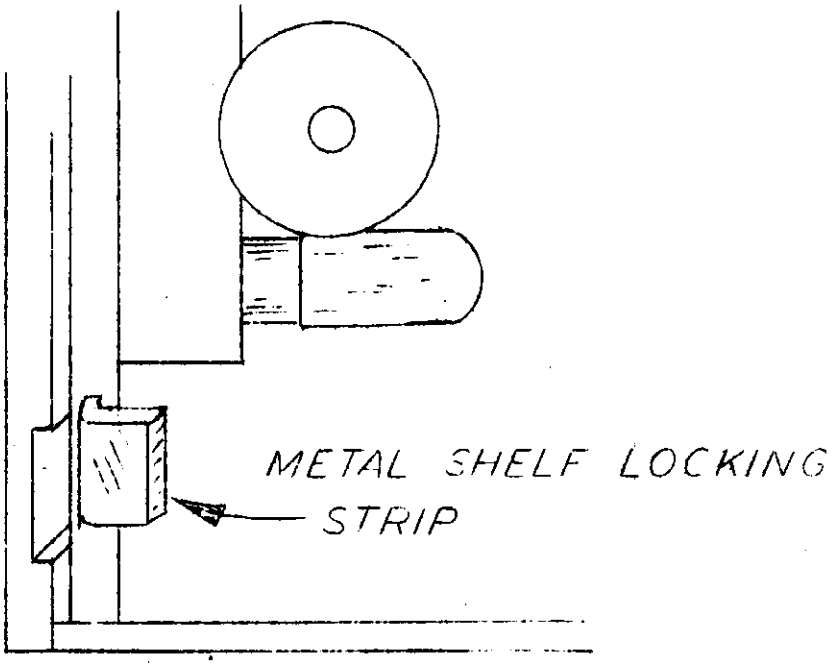


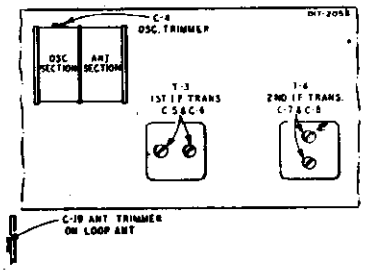
MODEL 3-29A

PHILLIPS PETROLEUM CO.

REMOVAL OF RADIO CHASSIS

To remove the radio chassis for servicing, pull off the three control knobs, disconnect the cables and wires leading to the loud speaker, built-in antenna, etc., then withdraw the metal shelf locking strip from near the lower corner of the chassis. Swing the bottom of the chassis and the mounting shelf out from the cabinet until the top of the shelf is disengaged. The unit may then be withdrawn from the cabinet.





ALIGNMENT PROCEDURE

Volume Control--Maximum All Adjustments.

Allow Chassis and Signal Generator to "Heat Up" for several Minutes.

The equipment in column at right is required for aligning:

Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.

Output Indicating Meter: Non-Metallic Screwdriver.

Dummy Antennas—.1 mf., 50 mmf.

SIGNAL GENERATOR				GANG	ADJUST TRIMMERS
FREQUENCY SETTING	ANTENNA CONNECTION	GROUND CONNECTION	DUMMY ANTENNA	CONDENSER SETTING	TO MAXIMUM (See Trimmer Illustration)
455 KC	Control Grid 12SK7—I.F.	Point "X" 12SK7—I.F. Prong No. 3	.1 mf.	Turn Rotor to Full Open	2nd I.F. (C7) & (C8)

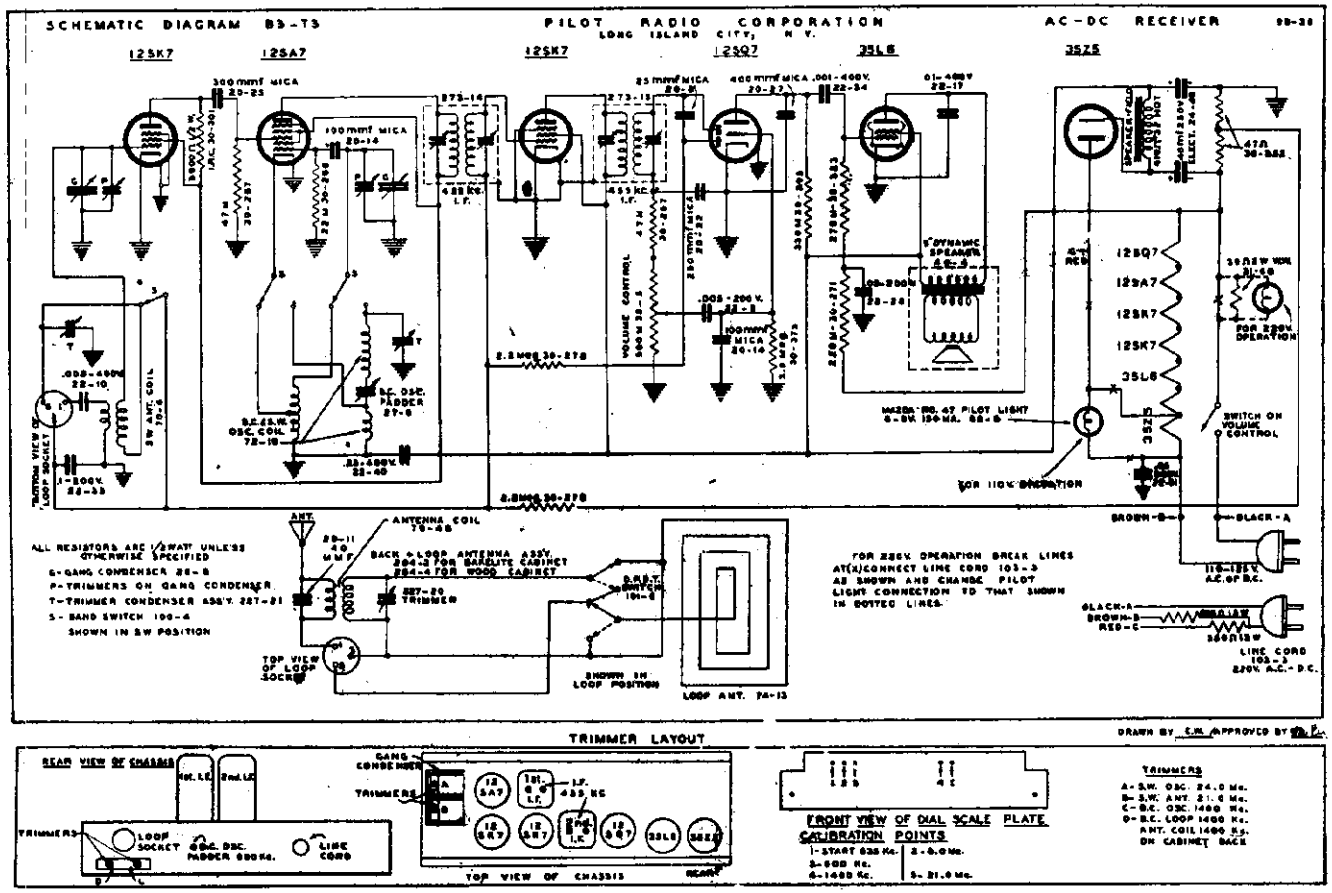
The screws for adjusting both the R.F. and I.F. amplifiers of this receiver, together with the frequencies at which they should be adjusted, are pictured in the diagram. Before aligning the I.F. amplifier, the generator must be connected to the grid of the 12SK7 R.F. tube through a .1 mfd. condenser. Before aligning the short wave band, connect the signal generator to the "OUTSIDE ANTENNA" post through a 400 ohm resistor.

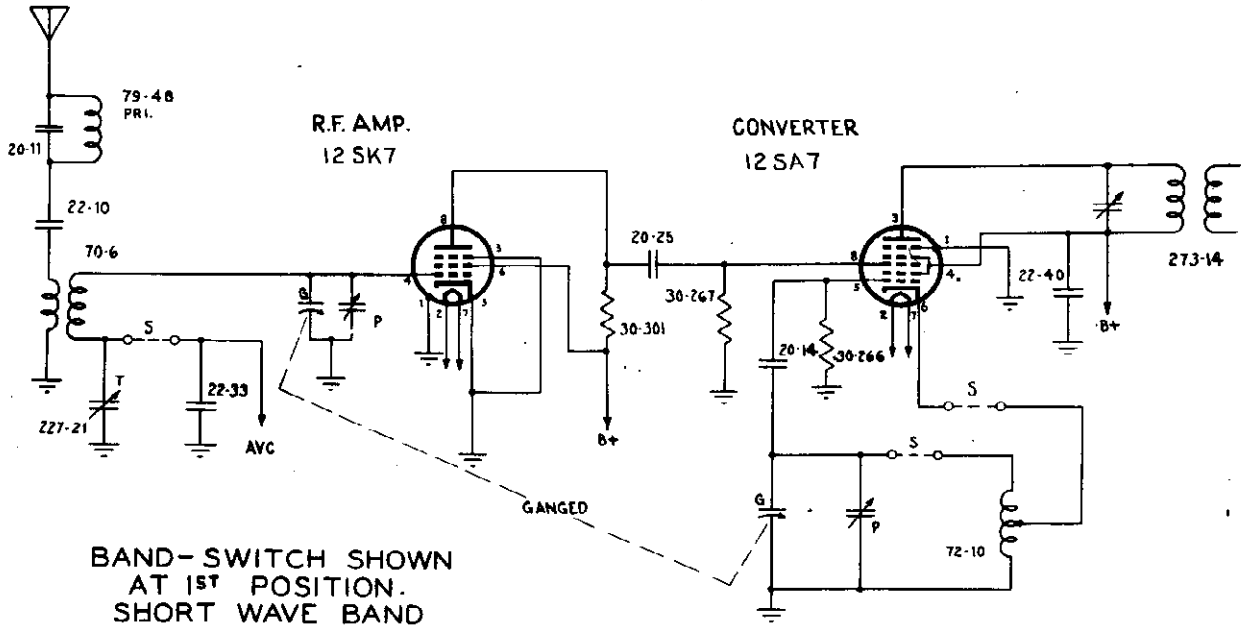
To align the "LOOP" antenna the receiver should be in the cabinet with the back in place and the Antenna Selector Switch set for "LOOP". Through the slot in the lower left-hand side of the cabinet back adjust the trimmer on the extreme left for maximum signal strength at about 1400 kc. Then set the Antenna Selector Switch for "OUTSIDE ANTENNA" and adjust the trimmer located next to the switch for maximum signal strength at 1400 kc.

Broadcast Band—535 to 1720 kc.

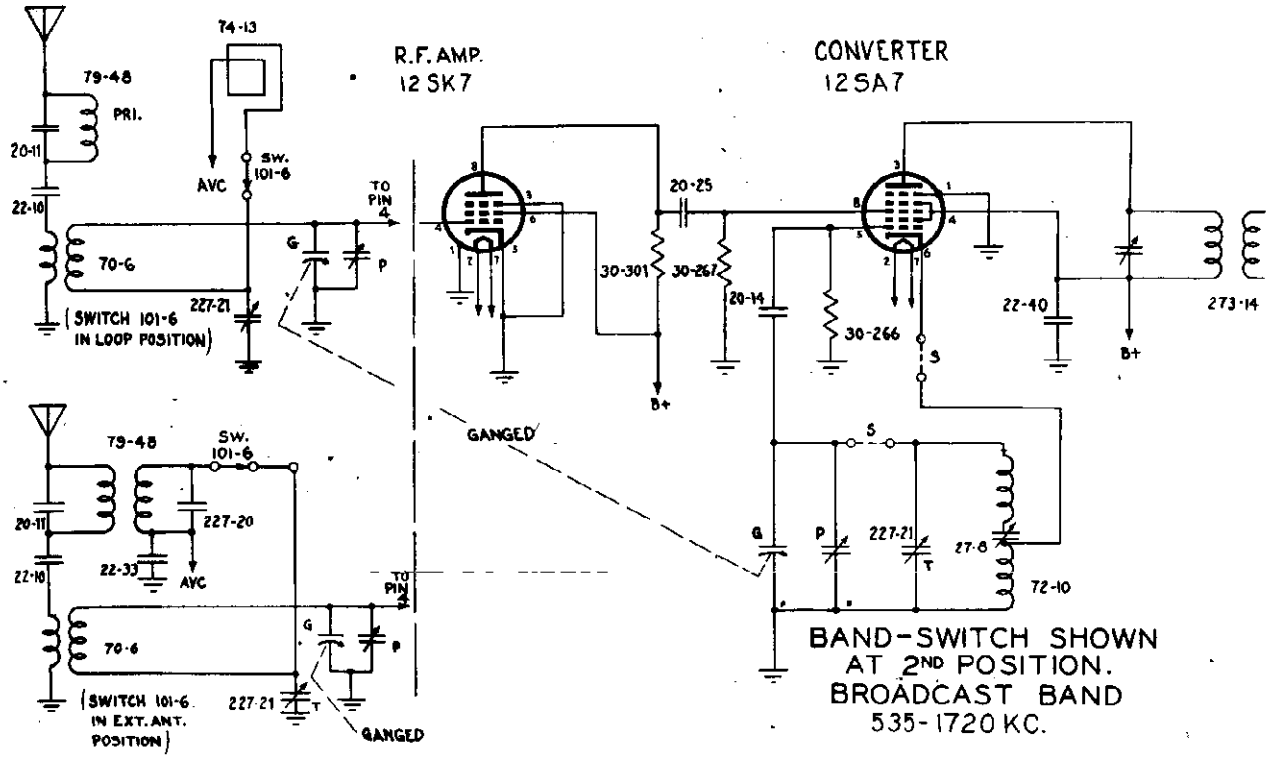
Short Wave Band—5.6 to 24.0 mc.



PILOT RADIO CORP.



BAND-SWITCH SHOWN
AT 1ST POSITION.
SHORT WAVE BAND
5.6 - 24.0 Mc.



BAND-SWITCH SHOWN
AT 2ND POSITION.
BROADCAST BAND
535-1720 KC.

BATTERY INSTALLATION

Remove the screws from the back and carefully lift off the back.

When removing the batteries, first unscrew clamps, and then remove battery plugs. Be sure not to pull on the cables, but on the plugs themselves.

Place the new "A" and "B" batteries in position shown on diagram below and replace clamps in position shown below.

The blue and white cable, coming from the chassis, has two 2-prong plugs which are then plugged into the "A" batteries. The red and black cable has two 3-prong plugs, both of which are plugged into the "B" batteries.

The I.F. amplifier may be aligned with the chassis out of the cabinet but with the loop antenna plugged in. For the I.F. alignment the signal generator must be connected to the grid of the 1A7GT tube through the .1 mfd. condenser. The R.F. trimmers should also be peaked for maximum with the chassis out of the cabinet. When aligning the ANT. trimmers, the "A" and "B" batteries must be in place, the loop antenna and receiver correctly mounted in the cabinet. The receiver may be aligned on either batteries or house current. When the receiver is aligned on the broadcast band, connect the signal generator to the ANT. post at the back through a .0002 mfd. condenser, and on the shortwave band use a 400 ohm carbon resistor.

OPERATION OF PUSHBUTTONS

Four pushbuttons are provided. These pushbuttons operate in pairs, the left two control the choice of either battery or AC-DC power supply. The right two select either the Shortwave or the Broadcast band, as desired.

For example, when it is desired to operate the Broadcast band from house current, plug the electric cord into the light socket. Rotate the left-hand knob approximately half way to the right and push the button marked A.C.-D.C, and the button marked B.C. If after a period of one minute the dial light does not light or the electric hum is too apparent, reverse the plug in the light socket. WHEN OPERATING THIS RECEIVER FROM THE HOUSE CURRENT BE ABSOLUTELY SURE THAT THE DIAL LIGHT IS LIT AND THAT THE A.C.-D.C. PUSHBUTTON IS PUSHED.

To turn off the receiver it is only necessary to turn the left-hand knob to the left until the red indicator disappears, regardless of the position of the buttons.

In order to light the pilot light for the dial ON BATTERY OPERATION, the switch button on the lower left-hand ledge inside the front door must be pressed down. When the button is released the light is switched off automatically to save the batteries.

Broadcast Band: 187 to 561 meters; or 535 to 1605 kc.

Short Wave Band: 5.63 to 16.56 mc.; or 18.2 to 53.2 meters

Broadcast Band 535 to 1720 Kc
Short Wave Band 5.7 to 18.7 Mc

A battery beacon is provided to serve as a combination "ON" "OFF" and battery life indicator.

The battery beacon will flicker approximately once each second when the batteries are new. With the aging of the batteries, the rate of flickering and the brilliancy will be reduced

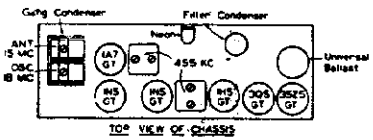
End of useful battery life will occur when the battery beacon ceases to operate. Short period operation may be secured if the batteries are permitted long periods of rest after the end of the useful life occurs.

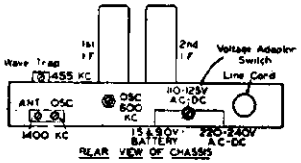
In case battery packs, as listed below, are unavailable, separate batteries may be used by cutting off the plug and connecting the leads as follows:

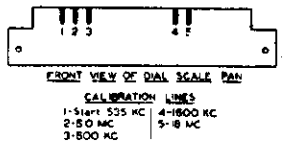
White	1.5 volts	+
Black	1.5 volts	-
Red	90 volts	+
Green	90 volts	-

Battery packs that may be used:

Eveready	#748
Ray-O-Vac	#AB-82
Burgess	#17GD60
Bond	#0528







The location of all adjustments used in re-aligning this receiver, and the frequencies at which these adjustments should be made are shown in the accompanying diagram.

When aligning the I. F. amplifier, the generator must be connected to the grid of the 1A7GT tube through a .1 mfd condenser. When aligning the receiver on the Broadcast Band, connect the generator to the Antenna wire through a .0002 mfd condenser, and on the short wave band through a 400 ohm carbon resistor.

ALIGNMENT CHART

Steps	Circuit Aligned	RECEIVER Band Switch	RECEIVER Dial Pointer	SIGNAL GENERATOR Frequency	SIGNAL GENERATOR Connection	Dummy Antenna	Trimmer to be adjusted
1	IF	BC	low end of dial	455 kc	grid of 12SA7	0.1 mfd	#1, 2, 3, 4
2	SW	SW	18 mc	18 mc	antenna clip	400 ohm carbon resistor	first, osc. #5; then, ant. #6
3	BC	BC	1500 kc	1500 kc	antenna clip	200 mmfd mica condenser	osc. #7
4	BC	BC	600 kc	600 kc	antenna clip	200 mmfd mica condenser	rock-in for max. reading with padder #8
5	Repeat Step No. 3						

Alignment should be attempted only if a low range A.C. meter, a signal generator, and insulated alignment tools are at your disposal. The A.C. meter is used as an outputmeter. The signal generator must cover a frequency range from 450 kc to 24 mc.

It is essential that the signal generator be connected to the points indicated in the alignment chart through the proper dummy antenna.

A good ground connection, secured between the groundpost of the signal generator and the chassis, is necessary.

The output of the signal generator must always be kept at its lowest possible value. This is to prevent the automatic volume control of the receiver from interfering with accurate alignment.

During alignment, the line voltage feeding the receiver power supply should be kept at approximately 117 volts.

The locations of adjustment screws are indicated clearly on the schematic diagram. Alignment adjustments should be made only in the sequence given in the chart.

For all alignments, connect the outputmeter across the voice coil. With the volume control turned fully clockwise, tune for a maximum reading.

PORTO-SERVER INC.

Remove chassis and loop from cabinet. Reconnect both leads to loop and space it approximately same distance from chassis as when installed in cabinet.

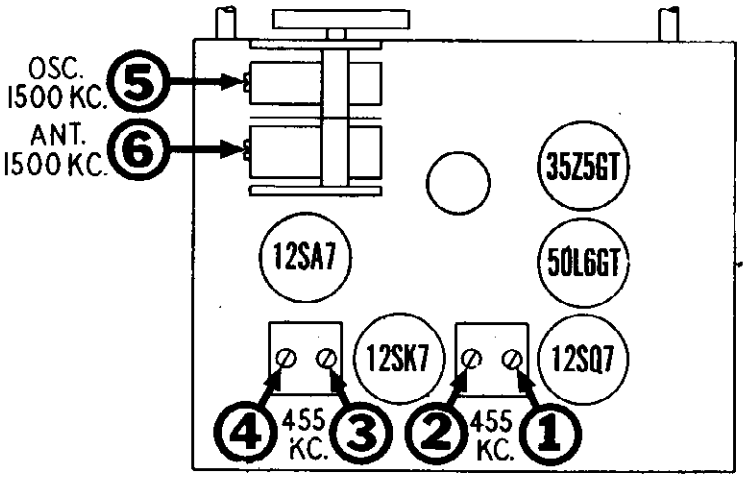
With the gang condenser fully meshed, dial pointer should be in the position indicated by the last division below 55 on the dial. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.

Connect an output meter across the speaker voice coil or from the plate of the 50L6GT tube to chassis through a .1 Mfd. condenser.

Connect the ground lead of the signal generator to the receiver chassis through a .25 Mfd. condenser.

Set volume control at maximum volume position and use a weak signal from the signal generator.

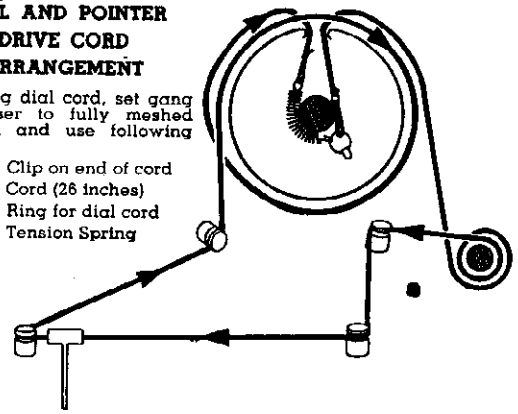
DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF GENERATOR TO	SIGNAL GENERATOR FREQUENCY	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
200 MMFD. Mica Condenser	Lug on trimmer No. 6 on rear section of gang (see figure below for location of trimmer.)	455 KC	Any point where it does not affect the signal.	1 - 2	2nd I.F.	Adjust for maximum output. Then repeat adjustment.
				3 - 4	1st I.F.	
200 MMFD. Mica Condenser	External antenna lead on loop.	1500 KC	1500 KC	5	Broadcast Oscillator	Adjust for maximum output.
200 MMFD. Mica Condenser	External antenna lead on loop.	1500 KC	Tune to 1500 KC generator signal.	6	Broadcast Antenna	Adjust for maximum output.



DIAL AND POINTER DRIVE CORD ARRANGEMENT

To string dial cord, set gang condenser to fully meshed position and use following parts:

114955	Clip on end of cord
117057	Cord (26 inches)
119087	Ring for dial cord
161384	Tension Spring

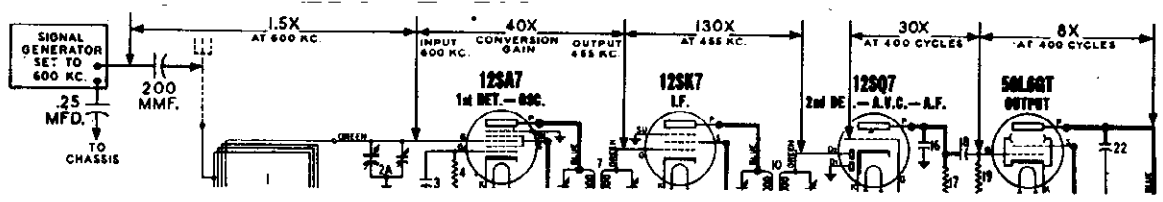


APPROXIMATE STAGE GAIN DATA

Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe following precautions:

1. For all gain measurements connect signal generator as shown. Use 600 KC signal with 400 cycles modulation (use nearby frequency if local station interferes.)
2. For R.F. and I.F. measurements connect negative terminal of a 3-volt battery (two 1½ volt cells in series) to A.V.C. lead and positive terminal to chassis. This provides a definite operating point.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
4. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 3 volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.

PORTO-SERVER INC.

ALIGNMENT PROCEDURE

1. Remove chassis and loop from cabinet. Solder approximately 8" of insulated wire to any B— connection (see voltage chart on opposite side for convenient B— location). Then reinstall chassis and loop in cabinet. The B— lead should extend from under the chassis at the back.
2. Connect ground lead of signal generator to B— lead.
3. Connect output meter across the speaker voice coil (terminals at back of speaker.)
4. Turn the tuning control knob clockwise as far as it will go (tuner mechanism is now in maximum open position with tuning slugs almost completely withdrawn from coils). Dial pointer should then point to 1600 Kc mark on scale. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.
5. Set volume control at maximum volume position and use a weak signal from the signal generator.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF GENERATOR TO	SIGNAL GENERATOR FREQUENCY	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
Set tuner mechanism to maximum open position by turning the tuning control knob clockwise as far as it will go (Dial pointer at 1600 Kc). Then check whether the positions of the tuning slugs correspond to the positions shown in Fig. 1 below. If settings are incorrect, rotate the individual core and threaded stem until desired position is reached. Note that threaded stem is prevented from moving by a dab of speaker cement at top.

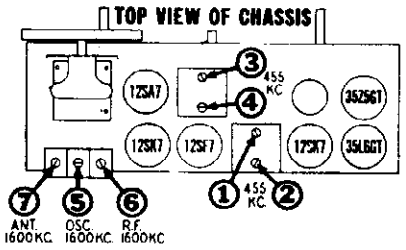

FIG. 2

AUDIO OSCILLATION

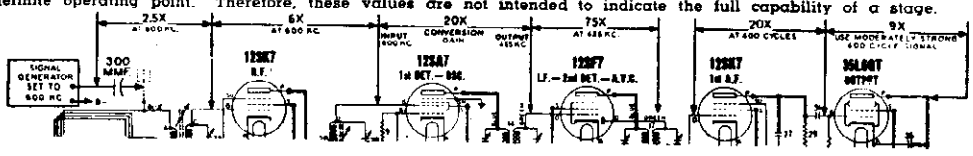
The audio system of this receiver utilizes a two stage type of inverse feed-back arrangement and, should it ever be necessary to replace the speaker or output transformer, it is important to maintain a definite phase relationship in the feed-back circuit. If the connections to the output transformer are reversed or if the feed-back connection is made to the wrong side of the output transformer secondary, the system will become regenerative instead of degenerative. Under those conditions audio oscillation may result. If that occurs, oscillation may be prevented by reversing the connections to the secondary of the output transformer.

APPROXIMATE STAGE GAIN DATA

Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe following precautions:

1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes.)
2. For R.F. and I.F. measurements connect negative terminal of a 3 volt battery (two 1½ volt cells in series) to A.V.C. lead and positive terminal to B—. This provides a definite operating point. IMPORTANT: Disconnect battery when measuring audio stage gains.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
4. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 3 volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.

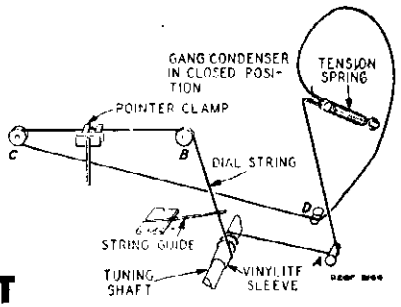
DRIVE CORD REPLACEMENT

Turn the large drive pulley to the maximum counterclockwise position. Use a new 57 inch drive cord, tie one end to the tension spring and fasten the other end of the spring to the drive pulley. Install the cord as shown in the illustration. Wind 2¾ turns counterclockwise around the tuning shaft with the turns progressing away from the chassis. After string is installed, stretch the tension spring and tie free end of cord to spring. Cut off excess string.



REPLACEMENT PARTS LIST

NOTICE: There is a power rating label on the chassis. This label specifies the power supply on which the radio may be used, and identifies the radio as to chassis, dial and issue letter. When ordering parts or writing, give ALL information appearing on this label.

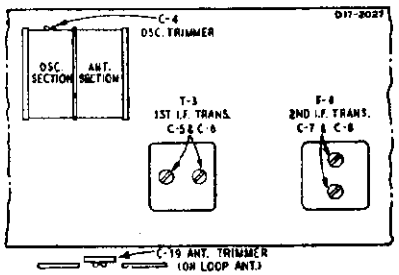
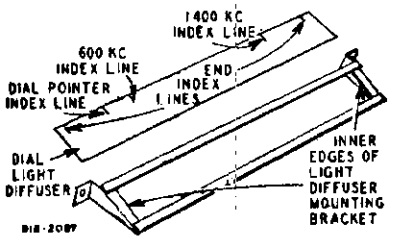
Power Consumption.....30 watts (At 117 volts AC)
Power Output..1.5 watt maximum, .9 watt (10% harmonics)



Note A—Set dial pointer to 1400 KC index line on dial light diffuser.

DIAL CALIBRATION



In order to align the receiver, the dial pointer must be positioned on the dial string correctly with reference to the dial. Index lines are provided on the dial light diffuser for this purpose.

Before aligning the receiver (or when replacing the dial light diffuser) check the position of the diffuser strip, making certain that the two extreme index lines are aligned with the inner edges of the diffuser mounting bracket opening. The bracket should be crimped to prevent movement of the diffuser strip. To position the dial pointer, turn the large drive pulley to the maximum counterclockwise position. The dial pointer should be directly over the dial pointer index line. (See illustration).

ALIGNMENT PROCEDURE

Check dial pointer position, see DIAL CALIBRATION paragraph.
Volume Control—Maximum. All Adjustments.

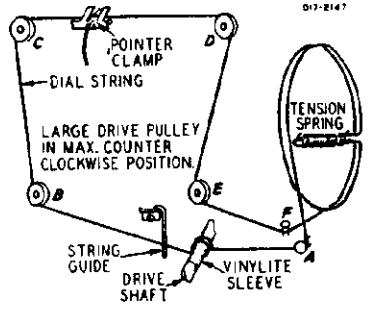
Turn the large drive pulley to the maximum counterclockwise position. Use a new 53 inch drive cord, tie one end to the tension spring and fasten the other end of the spring to the drive pulley. Install the cord as shown in the illustration. Wind two turns clockwise around the tuning shaft with the turns progressing away from the chassis. After string is installed, stretch the tension spring and tie free end of cord to spring. Cut off excess string.

TUNING ASSEMBLY SERVICE

Exacting requirements in the tuning assembly make it impractical to replace the drive cord, coils and components in this assembly other than the trimmer condensers. Should the drive cord break, or components other than the trimmer condensers require service, the entire assembly must be ordered and replaced as a unit.



Selectivity	59 KC Broad at 1000 Times Signal
Intermediate Frequency	455 KC
Speaker	5" PM Dynamic
Sensitivity (for .05 watt output)	560 microvolts per meter average

PURE OIL CORP.

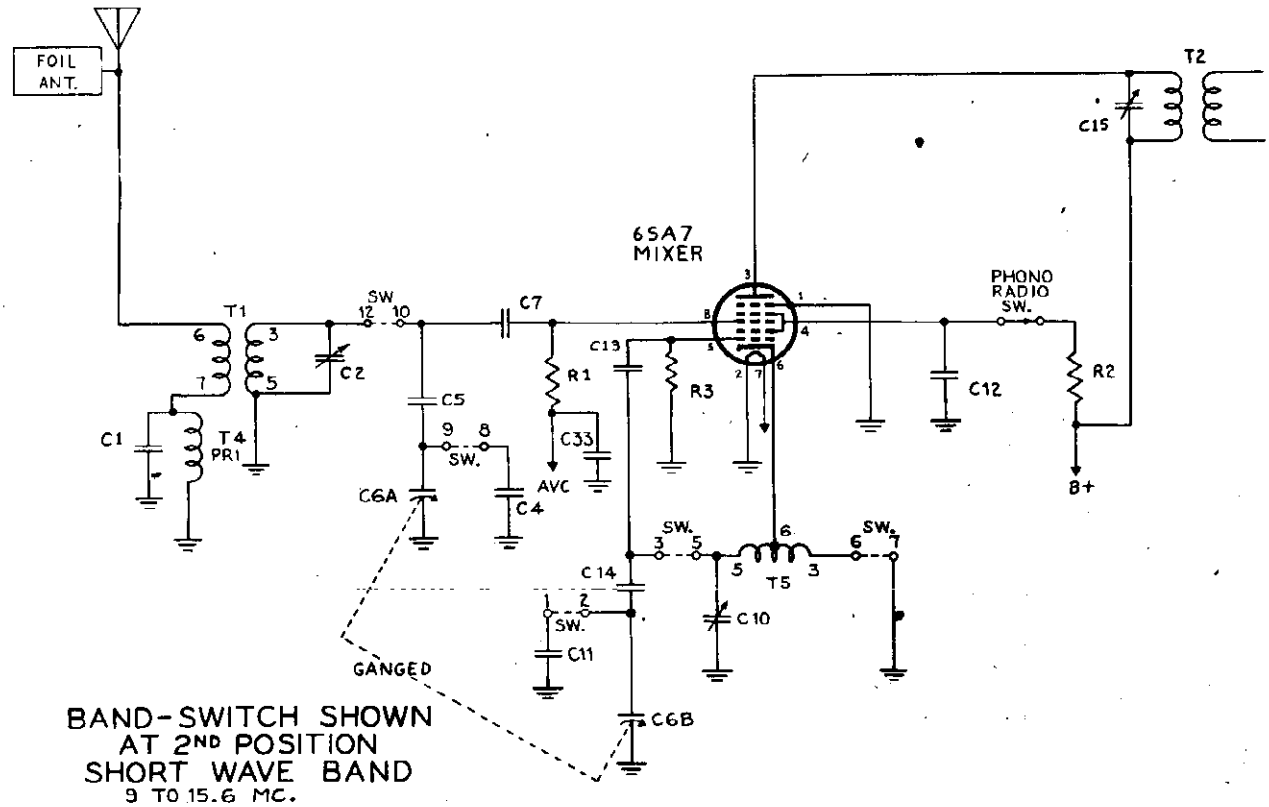
BAND-SWITCH SHOWN AT 1ST POSITION. BROADCAST BAND 540 TO 1600 KC.



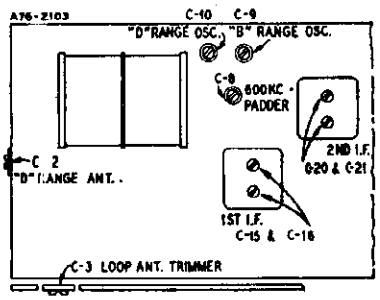
BAND-SWITCH SHOWN AT 2ND POSITION SHORT WAVE BAND 9 TO 15.6 MC.

MODEL 6A35WG-504

PURE OIL CORP.

SPECIFICATIONS

Speaker.....6" PM Dynamic
Intermediate Frequency.....455 KC
Selectivity.....40 KC Broad at 1000 Times Signal
Sensitivity (For 0.5 Watt Output, with External Antenna)
B Range..... 9 Microvolts Av.
D Range.....20 Microvolts Av.
Power Consumption (at 117 Volts AC) .....40 Watts (normal)
Power Output.....4 Watts Maximum
2.3 Watts, 10% Harmonics
Tuning Frequency Range
B Range.....540-1600 Kilocycles
D Range.....9-15.5 Megacycles



ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for several minutes.

The following equipment is required for aligning:
An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.
Output Indicating Meter—Non Metallic Screwdriver.
Dummy Antennas—.1 mf., 100 mmf., and 400 ohms.

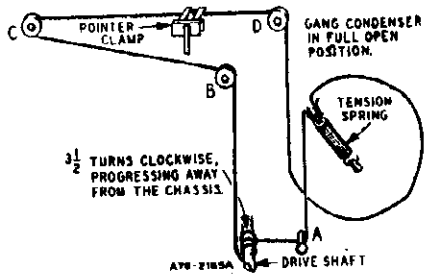
	SIGNAL GENERATOR FREQUENCY SETTING	SIGNAL GENERATOR CONNECTION AT RADIO	DUMMY ANTENNA	BAND SWITCH SETTING	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM
I.F.	455 KC	Grid of 6SA7 Pin 8	.1 mf.	B Range	Turn Rotor to Full Open	2nd I.F. (C20) & (C21) 1st. I.F. (C15) & (C16)
RANGE B	1620 KC	Antenna Lead	100 mmf.	B Range	Turn Rotor to Full Open	Oscillator Range B(C9)
	1400 KC	Antenna Lead	100 mmf.	B Range	Tune Rotor to Max. Output Set Pointer to 1400 KC (See Note A)	Ant. Range B (C3)
	600 KC	Antenna Lead	100 mmf.	B Range	Tune Rotor to Max. Output	Oscillator (C8) Rock Rotor—See Note B
	Repeat above steps at 1620 and 600 KC until readjusting the oscillator Range B Trimmer (C9) causes no further improvement of output.					
RANGE D	15,600 KC	Antenna Lead	400 Ohm	D Range	Turn Rotor to Full Open	Oscillator Range D (C10)
	14,000 KC	Antenna Lead	400 Ohm	D Range	Tune Rotor to Max. Output	Ant. Range D (C2) Rock Rotor—See Note B
LOOP RANGE B	Reassemble chassis in cabinet. 1400 KC	Antenna Lead	100 mmf.	B Range	Tune Rotor to Max. Output	Ant. Range B(C3)

NOTE A—Set pointer at the 1400 KC mark on the dial scale. Attach pointer to drive cord.

NOTE B—Turn Rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

DRIVE CORD REPLACEMENT

The drive cord may be replaced as shown in the accompanying illustration. For this purpose use a 58" piece of cord. After installing the cord, stretch the tension spring before fastening the free end of the string.



REPLACEMENT PARTS LIST

NOTICE: There is a power rating label on the chassis. This label specifies the power supply on which the radio may be used, and identifies the radio as to chassis, dial and issue letter. When ordering parts or writing, give ALL information appearing on this label.

DIAL AND POINTER DRIVE CORD ARRANGEMENT

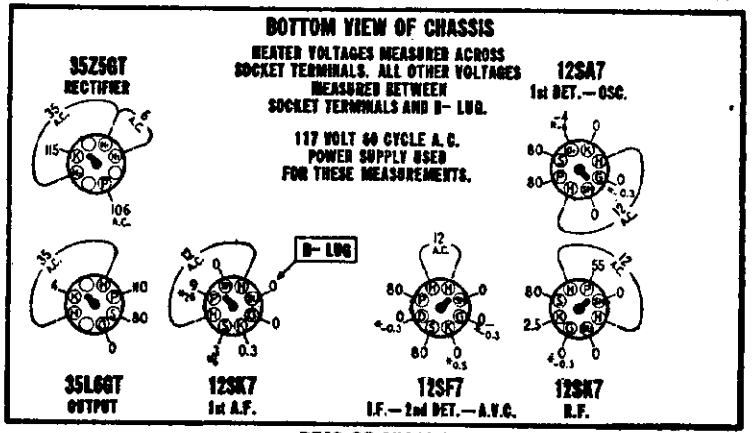
To string dial cord, turn the main drive drum to maximum counter - clockwise position and use following parts:

114955 Clip on end of cord
117057 Cord (55 inches)
118087 Ring for dial cord
161384 Tension Spring

SOCKET VOLTAGES

Measured with voltmeter having sensitivity of 1000 ohms per volt except where indicated by (*).

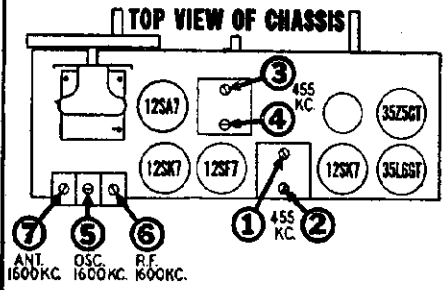
VOLUME ON FULL WITH NO SIGNAL **DIAL TUNED TO 540 KC.**



REAR OF CHASSIS

*—Measured with vacuum tube voltmeter

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF GENERATOR TO	SIGNAL GENERATOR FREQUENCY	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
Set tuner mechanism to maximum open position by turning the tuning control knob clockwise as far as it will go (Dial pointer at 1600 Kc). Then check whether the positions of the tuning slugs correspond to the positions shown in Fig. 1 below. If settings are incorrect, rotate the individual core and threaded stem until desired position is reached. Note that threaded stem is prevented from moving by a dab of speaker cement at top.						
.1 MFD. Condenser	Ungrounded terminal of trimmer No. 6 (see Fig. 2 below for location of trimmer.)	455 KC	Any point where it does not affect the signal.	1-2	2nd I.F.	Adjust for maximum output. Then repeat adjustment.
				3-4	1st I.F.	
300 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1600 KC	1600 KC	5	Broadcast Oscillator (Shunt)	Adjust for maximum output.
300 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1600 KC	Tune to 1600 KC generator signal	6	Broadcast R.F.	Adjust for maximum output.
				7	Broadcast Antenna	Adjust for maximum output.
300 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1400 KC	Tune to 1400 KC generator signal	Ant. coil tuning slug		Adjust position of slug for maximum output.
				R.F. coil tuning slug		Adjust position of slug for maximum output.
300 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1600 KC	Tune to 1600 KC generator signal	6	Broadcast R.F.	Recheck adjustment for maximum output.
				7	Broadcast Antenna	Recheck adjustment for maximum output.
Apply a coating of speaker cement at top of each tuning core stem to prevent movement.						



AUDIO OSCILLATION

The audio system of this receiver utilizes a two stage type of inverse feed-back arrangement and, should it ever be necessary to replace the speaker or output transformer, it is important to maintain a definite phase relationship in the feed-back circuit. If the connections to the output transformer are reversed or if the feed-back connection is made to the wrong side of the output transformer secondary, the system will become regenerative instead of degenerative. Under those conditions audio oscillation may result. If that occurs, oscillation may be prevented by reversing the connections to the secondary of the output transformer.

1. Remove chassis and loop from cabinet. Solder approximately 8" of insulated wire to any B— connection (see voltage chart on opposite side of convenient B— location). Then reinstall chassis and loop in cabinet. The B— lead should extend from under the chassis at the back.
2. Connect ground lead of signal generator to B— lead.
3. Connect output meter across the speaker voice coil (terminals at back of speaker.)
4. Turn the tuning control knob clockwise as far as it will go (tuner mechanism is now in maximum open position with tuning slugs almost completely withdrawn from coils). Dial pointer should then point to 1600 Kc mark on scale. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.
5. Set volume control at maximum volume position and use a weak signal from the signal generator.

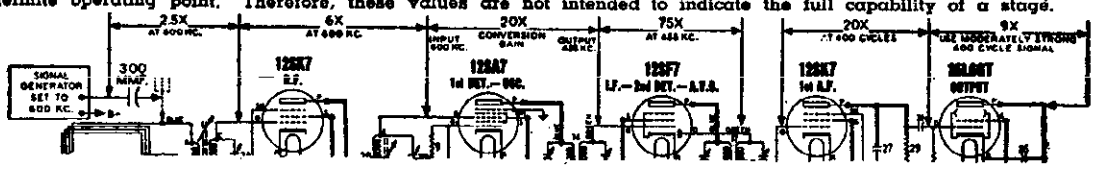
APPROXIMATE STAGE GAIN DATA

Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument co taining a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe followi precautions:

1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes.)
2. For R.F. and I.F. measurements connect negative terminal of a 3 volt battery (two 1½ volt cells in series) to A.V.C. lead and positive terminal to B—. This provides a definite operating point. IMPORTANT: Disconnect battery when measuring audio stage gains.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
4. When using a "cha nel" type instrume carefully tune it maximum output desired frequency fore making measu ments.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 3 volts fixed bias in order establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence sta gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your t equipment. These factors may create considerable variation in gain measurements.

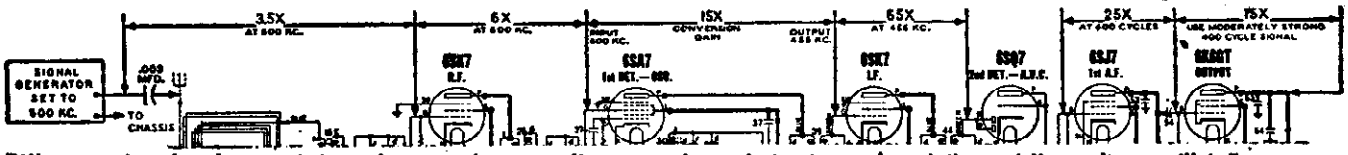
MODEL 508

PURE OIL CORP.

Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe following precautions:

1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes.)
2. For R.F. and I.F. measurements connect negative terminal of a 3 volt battery (two 1½ volt cells in series) to A.V.C. lead and positive terminal to chassis. This provides a definite operating point. IMPORTANT: Disconnect battery when measuring audio stage gains.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
4. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 3 volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.

AUDIO OSCILLATION

The audio system of this receiver utilizes a two stage type of inverse feed-back arrangement and should it ever be necessary to replace the speaker or output transformer it is important to maintain a definite phase relationship in the feedback circuit. If the connections to the output transformer are reversed or if the feed-back connection is made to the wrong side of the output transformer secondary, the system will become regenerative instead of degenerative. Under those conditions audio oscillation may result. If that occurs, oscillation may be prevented by reversing the connections to the primary of the output transformer.

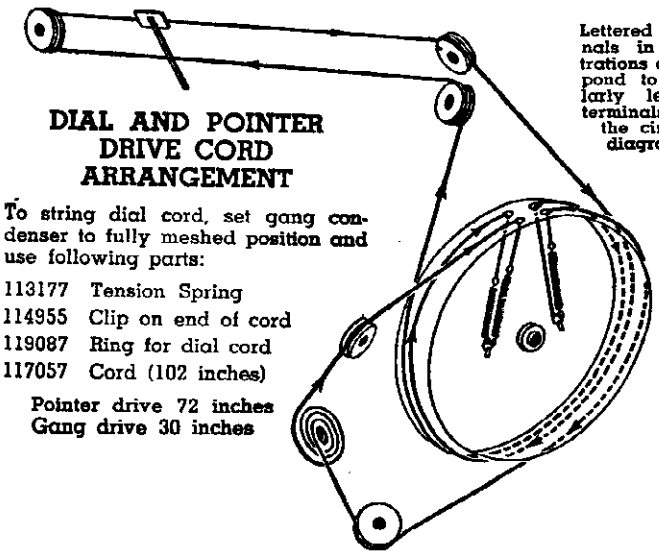
DIAL AND POINTER DRIVE CORD ARRANGEMENT

To string dial cord, set gang condenser to fully meshed position and use following parts:

113177 Tension Spring
114955 Clip on end of cord
119087 Ring for dial cord
117057 Cord (102 inches)

Pointer drive 72 inches
Gang drive 30 inches



Lettered terminals in illustrations correspond to similarly lettered terminals on the circuit diagram.

bove illustration are associated with tuned frequency currents. Therefore, care must be y are properly routed and spaced. Anchor- wires minimizes freedom of movement and is arrangement.

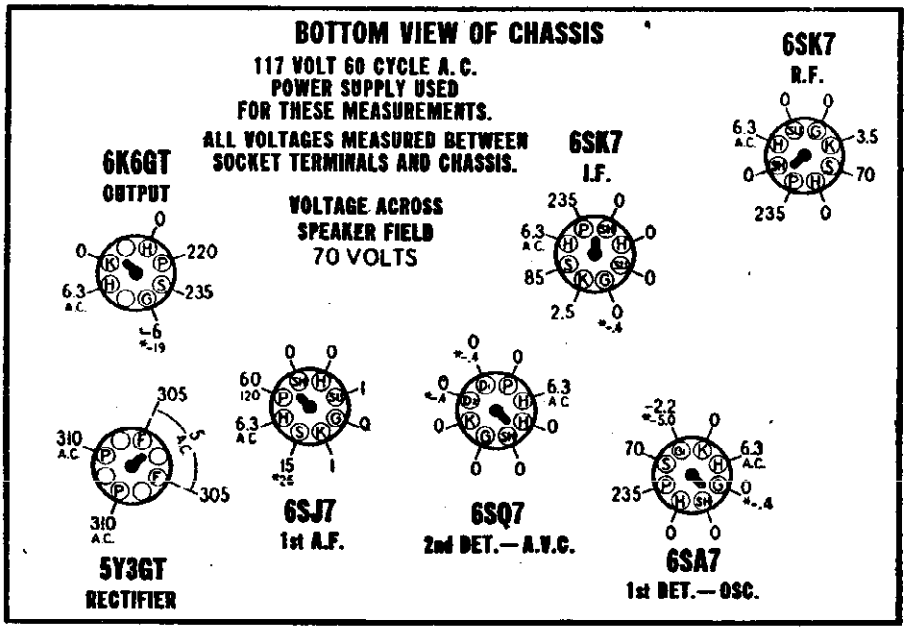
of these wires may affect tuned circuits it is ange in arrangement after the receiver has on of the wires has been disturbed, it is ad- t (see previous page for alignment procedure).

SOCKET VOLTAGES

Measured with voltmeter having sensitivity of 1000 ohms per volt except where indicated by (*).

VOLUME ON FULL WITH NO SIGNAL
RANGE SWITCH IN BROADCAST POSITION

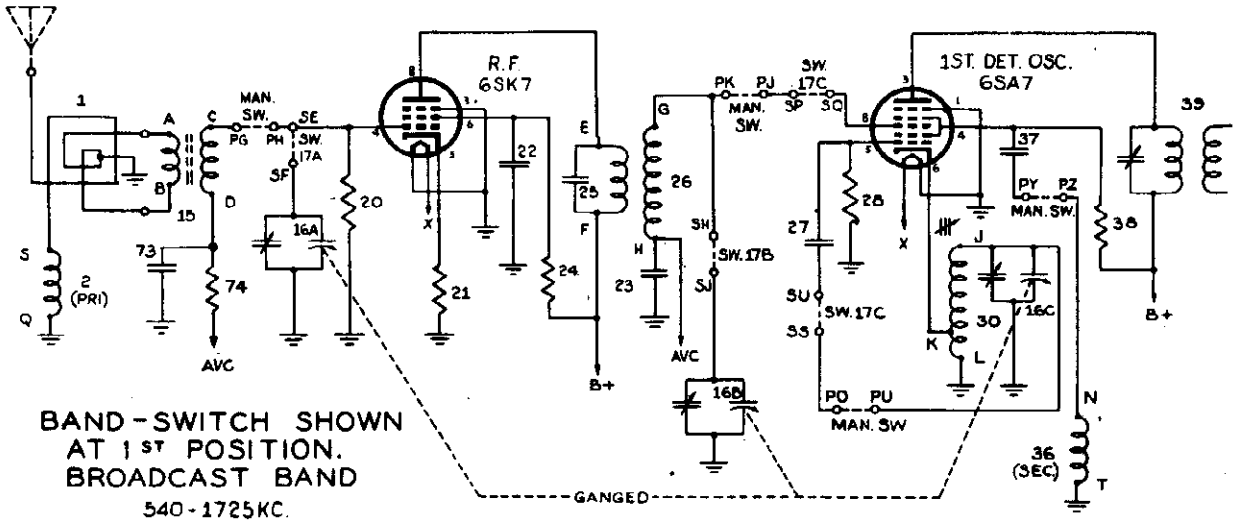
DIAL TUNED TO 540 KC.
MANUAL BUTTON PUSHED IN

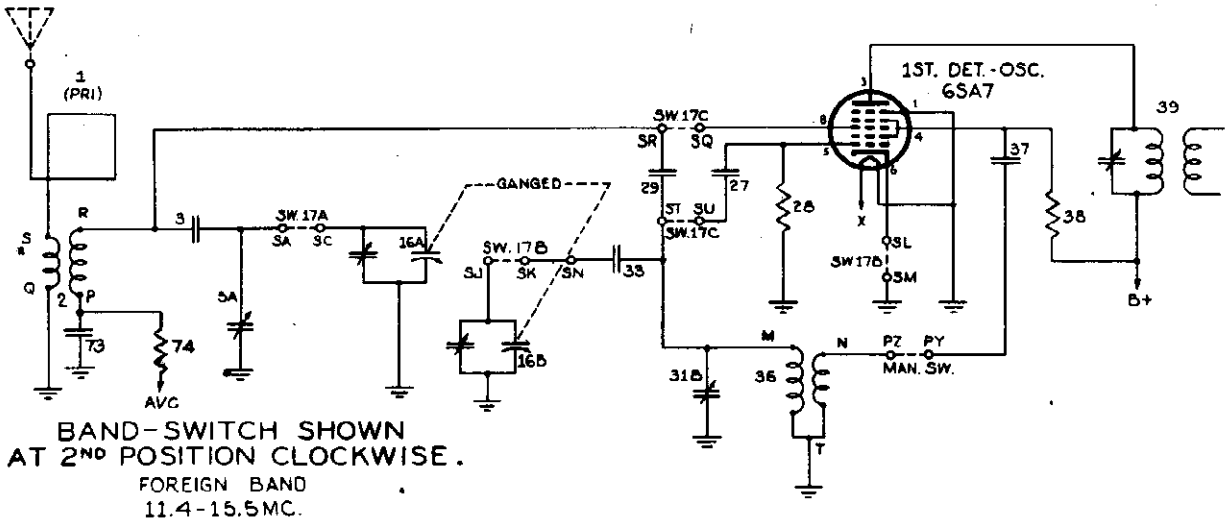


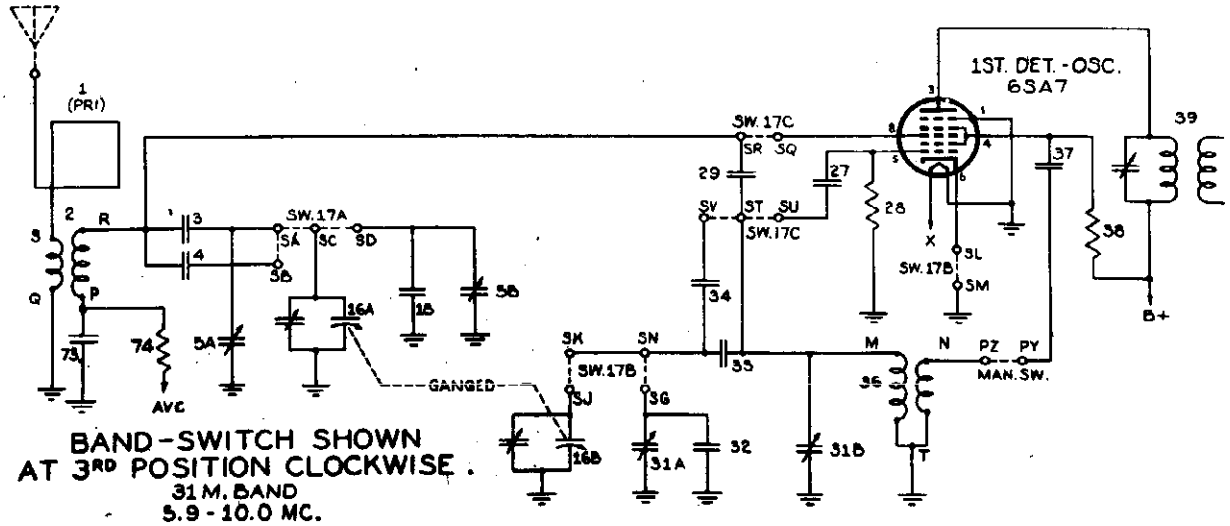
*—Measured with vacuum tube voltmeter.

NOTE:—The 6K6GT grid bias of —19 volts can be measured across resistor No. 72.

PURE OIL CORP.







MODEL 508

PURE OIL CORP.

1. The chassis and loop antenna should remain in their normal position in the cabinet throughout the following procedure.
2. Check arrangement of leads to push-button switch as shown in illustration on following page.
3. With the gang condenser fully meshed, dial pointer should be in the position indicated by the last division below 55 on the dial. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.
4. Connect output meter across speaker voice coil.
5. Connect the ground lead of the signal generator to the receiver chassis.
6. Set volume control at maximum volume position and use a weak signal from the signal generator.
7. Push in the manual button and leave it in that position throughout the alignment procedure.

IMPORTANT:—Align this receiver in exactly the order shown below. Broadcast band must be aligned before short wave bands.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF SIGNAL GENERATOR TO	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
.1 MFD. Condenser	Trimmer on rear section of gang	455 KC	Broadcast (counter-clockwise)	Any point where it does not affect the signal.	1-2	2nd I.F.	Adjust for maximum output. Then repeat adjustment.
					3-4	1st I.F.

RCA MFG. CO.

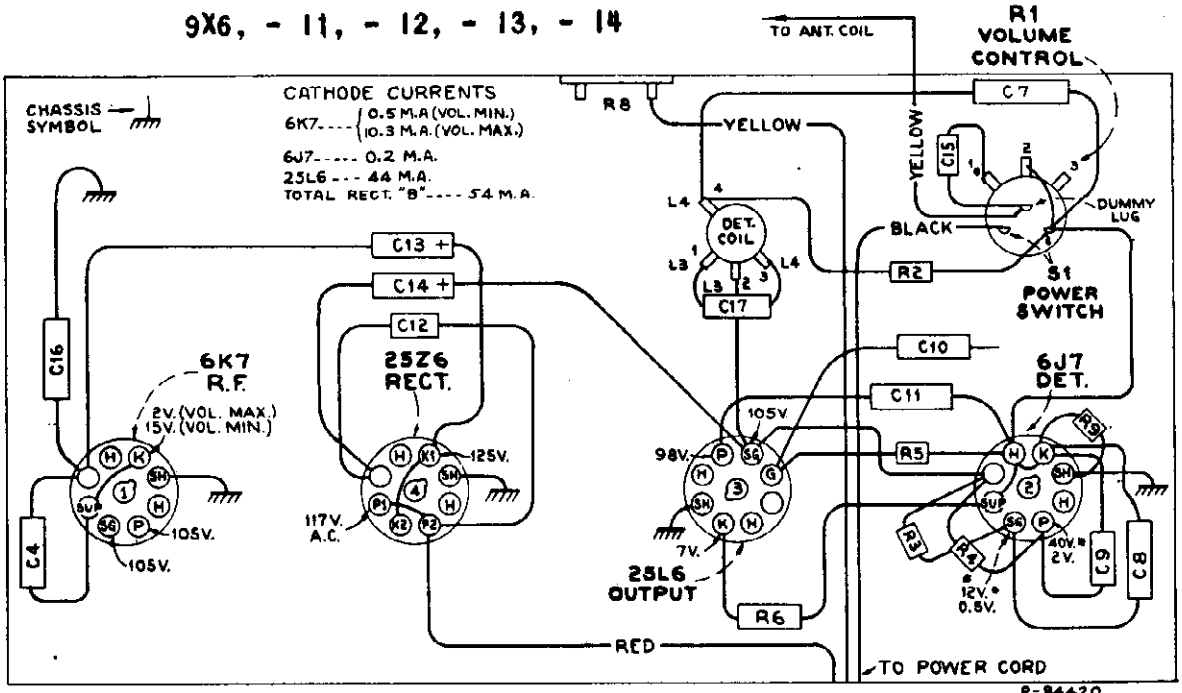
Schematic Circuit Diagram

9X6, - 11, - 12, - 13, - 14



BOTTOM VIEW - REAR OF CHASSIS

R-F Wiring Diagram and Socket Voltages

* **Note: Values with (*) are operating voltages. Values not starred are actual measured voltages.**

Measurements made to common negative line, unless otherwise specified.

Measurements made with set tuned to quiet point, volume control at minimum, using 1,000-ohm-per-volt meter, having ranges of 10, 50, and 250 volts. (Use nearest range above the specified measured voltage.)

Values should hold within approximately ± 20% for 117-volt 60-cycle a-c supply. On d-c, voltages are approximately 10% lower, except heaters, which remain the same.

Precautionary Lead Dress

1. Dress green lead from antenna coil to gang up from speaker chassis.
2. Green lead from gang to grid of 6J7 must be dressed down and away from top of bracket, and centered in gang section.
3. Green lead from detector coil to gang must be dressed under pilot lamp bracket: Any excess wire should be pulled through to under side of chassis.
4. Pilot lamp leads must be dressed clear of gang rotor.
5. Magnetite core in detector coil must not be in contact with base or mounting screw.

Power-Supply Polarity.—For operation on d-c, the power plug must be inserted in the outlet for correct polarity. If the set does not function, reverse the plug. On a-c, reversal of the plug may reduce hum.

Antenna.—The set is equipped with a 25-foot antenna. Do not connect the antenna to ground. If an outdoor antenna is used, it should not be longer than 100 feet, including lead-in. If it is longer, connect a 100 to 200 mmfd. capacitor in series with the lead-in.

25-Cycle Operation

For 25-cycle operation, connect a 16 mfd., 150-volt dry electrolytic capacitor (Stock No. 31323) in parallel to C13.

POWER SUPPLY RATINGS

A-C Rating ..... 105-125 volts, 50-60 cycles, 50 watts
D-C Rating ..... 105-125 volts, 50 watts

POWER OUTPUT (125-volt, 60-cycle supply)

Undistorted ..... 1.0 watt
Maximum ..... 1.5 watts

LOUDSPEAKER

Type ..... 8-inch Electrodynamic
Voice-Coil Impedance ..... 3 ohms at 400 cycles

Alignment Procedure

Reel up the antenna wire, and keep it away from chassis during alignment. Connect the high side of test-oscillator through an 80 mmfd. capacitor to the antenna terminal. Connect low side of oscillator to receiver chassis through a 0.1 mfd. capacitor. Turn gang condenser to minimum (full out), tune oscillator to 1,760 kc, connect an output meter across the voice coil, and turn volume control to maximum.

Adjust the two trimmers (C3 and C6) on side of gang condenser for maximum output, using lowest possible output from test-oscillator.

Pre-setting Dial.—With gang condenser rotor plates turned full in for maximum capacity, loosen dial-drum set-screw, and turn drum so that the top edge of dial (low-frequency end) is approximately 1/16-in. below level of gang frame, and tighten set-screw.

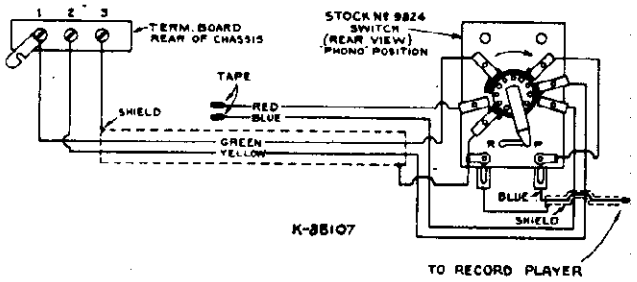
Adjustments for Push-Button Tuning MODEL X-55

The push-buttons should be adjusted for six favorite stations after the receiver has been operating for a brief warm-up period. Each button may be set up to any standard broadcast station. The preferable arrangement is to adjust for stations in the order of frequency, from low to high. Proceed as follows:

1. Pull off the push-buttons and loosen the push-button rods with a small screwdriver.
2. Turn the accessory switch to "Radio" position and accurately tune in the station for which the first button is to be set.
3. Press in push-button rod No. 1 (left) with the screwdriver, as far as it will go without undue pressure, hold in, retune station with manual control if necessary for best reception, and then carefully tighten up the rod. Do not tighten more than ¼ turn after the rod begins to grip or damage to the mechanism may result.
4. Replace the push-button on its shaft.
5. Proceed in a similar manner for the remainder of the push-buttons.

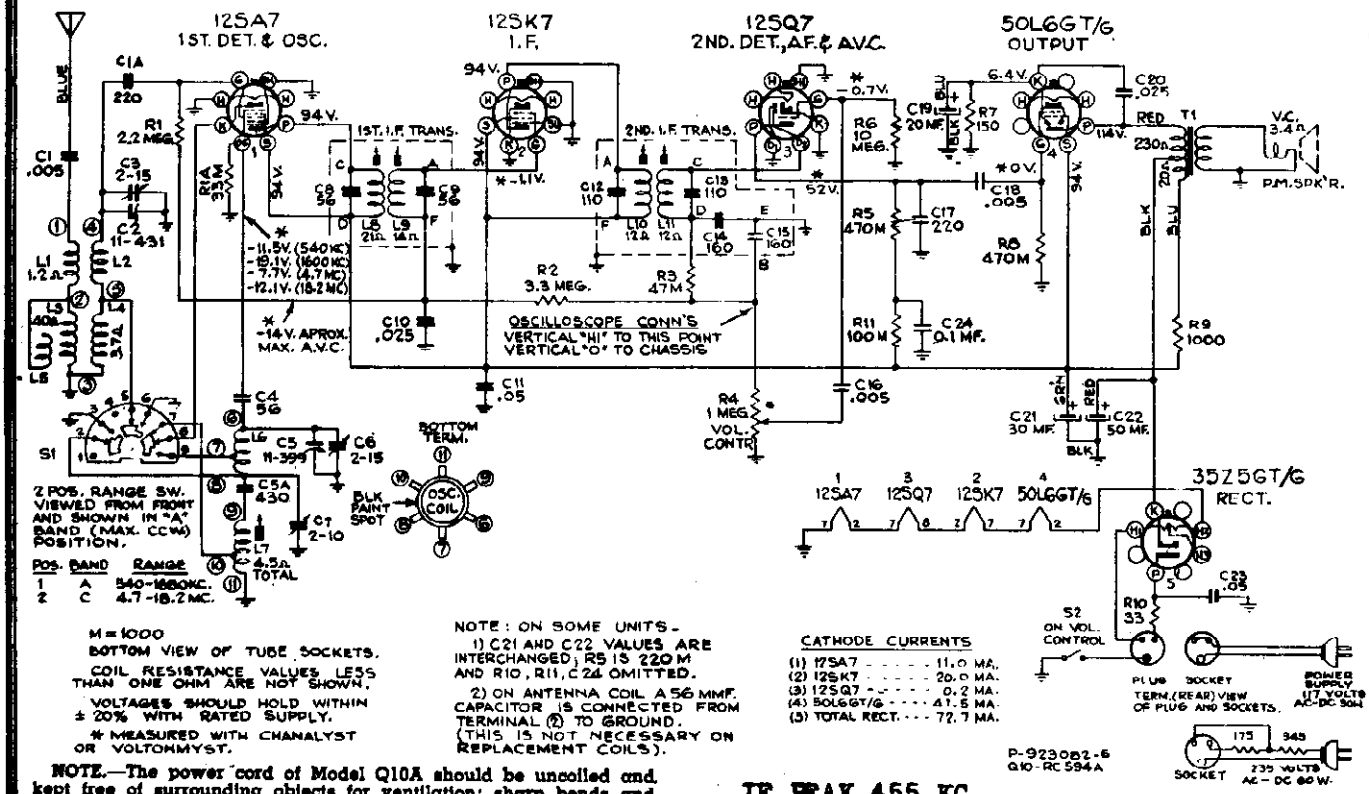


Record Player Connections, Using a No. 9824 Switch

STOCK No.	DESCRIPTION
	CHASSIS ASSEMBLY (RC-473A)
33719	Belt—Push button arm adjustment belt and rivets
34024	Board—"Antenna-Ground" board
34025	Board—"Radio-Phono" board
33731	Button—Push button
12720	Capacitor—100 mmfd., moulded mica
12725	Capacitor—150 mmfd., moulded mica
34213	Capacitor—430 mmfd., mica
30433	Capacitor—470 mmfd., moulded mica
14393	Capacitor—.01 mfd., 300 volt
11315	Capacitor—.015 mfd., 400 volt
32787	Capacitor—.05 mfd., 400 volt
4839	Capacitor—0.1 mfd., 400 volt
34505	Capacitor—0.2 mfd., 300 volt
34212	Capacitor—Electrolytic comprising 2 sections of 50 mfd. each, 150 volts
33724	Coil—Oscillator coil (L1)
33728	Condenser—Tuning condenser and drum assembly
33631	Control—Volume control and power switch (S1)
32634	Cord—Tuning condenser drive cord
33633	Indicator—Station selector pointer
11765	Lamp—Pilot lamp—Mazda No. 51
33721	Loop—Antenna loop
33727	Plate—Dial plate frame
30880	Resistor—150 ohm, ½ W
30152	Resistor—1,000 ohms, 1 W
12454	Resistor—33,000 ohms, ½ W
12412	Resistor—47,000 ohm, ½ W
12264	Resistor—220,000 ohms, ½ W
12285	Resistor—470,000 ohms, ½ W
30271	Resistor—4.7 megohm, ½ W
13601	Resistor—10 megohm, ½ W
33735	Screw—Push arm lock screw
33725	Shaft—Tuning condenser drive shaft and retainer
31365	Socket—Lamp socket
31319	Socket—Tube socket
33720	Spring—Push button arm return spring
31418	Spring—Tuning condenser drive cord spring
33722	Transformer—1st i.f. transformer
34026	Transformer—2nd i.f. transformer
33726	Washer—"C" washer for drive shaft
	SPEAKER ASSEMBLIES (RL 85-2)
32907	Cap—Cone center dust cap
34554	Cone—Speaker cone and voice coil
34802	Speaker—5-inch permanent magnet—less transformer
34803	Transformer—Output transformer
	MISCELLANEOUS ASSEMBLIES
31456	Cover—8 protective covers for push-button markers
33729	Dial—Glass dial scale
33637	Escutcheon—Dial and button escutcheon
30863	Knob—Tuning, volume control, or power switch knob
30900	Spring—Retaining spring for knob or button
33973	Marker—1 set push-button marker

MODELS Q10, Q10A,
Ch. RC-594C, Early

RCA MFG. CO.



M = 1000

BOTTOM VIEW OF TUBE SOCKETS.

COIL RESISTANCE VALUES LESS THAN ONE OHM ARE NOT SHOWN.

VOLTAGES SHOULD HOLD WITHIN ± 20% WITH RATED SUPPLY.

* MEASURED WITH CHANALYST OR VOLTOHMYST.

NOTE: ON SOME UNITS -
1) C21 AND C22 VALUES ARE INTERCHANGED; R5 IS 220 M AND R10, R11, C24 OMITTED.
2) ON ANTENNA COIL A 56 MMF. CAPACITOR IS CONNECTED FROM TERMINAL ② TO GROUND. (THIS IS NOT NECESSARY ON REPLACEMENT COILS).

NOTE.—The power cord of Model Q10A should be uncoiled and kept free of surrounding objects for ventilation; sharp bends and kinks should also be avoided.

MODELS Q10,Q10A,Ch.RC-594C Early

RCA MFG. CO.

MODELS Q10,Q10A,Q10-2,Q10A-2, Ch.RC-594C, Late

Cathode-Ray Alignment is the preferable method. Connections for the oscilloscope are shown in the schematic drawing.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the oscillator output as low as possible to avoid a-v-c action.

FOR EARLY MODELS

Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator through a .01 mfd. capacitor to the receiver chassis, and keep the oscillator output low to avoid a-v-c action.

FOR LATE MODELS

Calibration Scale.—The glass tuning dial may be easily removed from the cabinet and mounted above the pointer for reference during alignment. The extreme left hand mark of the Standard Broadcast scale must be in line with the left hand mark on the dial backing plate.

Dial Backing Plate.—In the event that only the chassis is returned for service, the marks on the dial backing plate may be used during alignment; refer to the Dial Indicator and Drive Mechanism drawing for corresponding frequencies.

Dial Pointer.—With the gang condenser in full mesh the dial pointer should be set to the left hand reference mark on the dial backing plate.

Steps	Connect high side of test osc. to—	Tune test osc. to—	Turn radio dial to—	Adjust following for max. output—
1	12SK7 I-F grid through 0.1 mfd. capacitor	455 kc	B. C.; 1500 kc quiet point	L11-L10 (2nd I-F Trans.)
2	Stator of gang cond. C2 through 0.1 mfd.	455 kc	B. C.; 1500 kc quiet point	L9-L8* (1st I-F Trans.)
3	Antenna lead through 300 ohm resistor	18.2 mc	S. W.; gang condenser open	C6 (osc.)**
4	Antenna lead through 300 ohm resistor	15.2 mc	S. W.; maximum signal rock gang	C3 (ant.)***
5	Antenna lead through 200 mmf. capacitor	600 kc	B. C.; 600 kc (2nd mark from left)	L7 (osc.)
6	Antenna lead through 200 mmf. capacitor	1300 kc	B. C.; rock gang at 1300 kc†	C7 (osc.)
7	Antenna lead through 200 mmf. capacitor	600 kc	B. C.; rock gang at 600 kc	L7 (osc.)
8	Repeat steps 6 and 7			

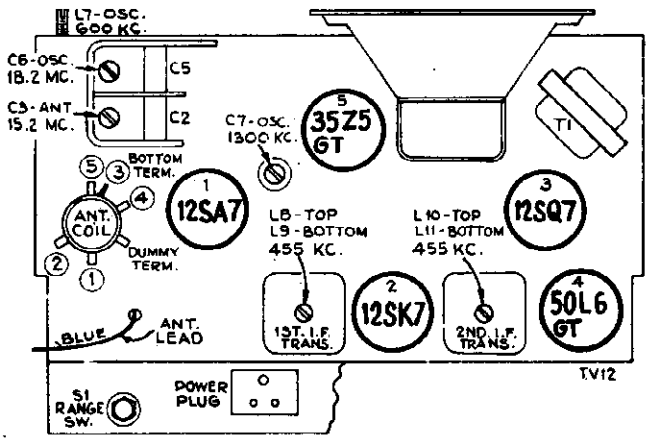
† 1300 kc corresponds to a point ½ inch to the left of the right hand mark on the dial backing plate.

* Do not readjust L10 or L11 when test oscillator is connected to C2.

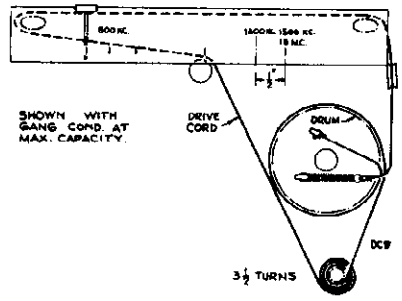
** Use minimum capacity peak if two peaks can be obtained.

*** Image signal of lesser amplitude should occur at 14.3 mc.

NOTE.—Oscillator tracks above signals on both bands.



Tube and Trimmer Locations



Dial Indicator and Drive Mechanism

Frequency Ranges

Standard Broadcast ("A" Band) ..... 540-1,680 kc (555-178 m)
Short Wave ("C" Band) ..... 4.7-18.2 mc (63.8-16.5 m)

Intermediate Frequency ..... 455 kc

RCA Tube Complement

(1) RCA-12SA7 ..... 1st Detector-Oscillator
(2) RCA-12SK7 ..... I-F Amplifier
(3) RCA-12SQ7 ..... 2nd Detector, A.V.C., and A-F Amplifier
(4) RCA-50L6GT/G ..... Power Output
(5) RCA-35Z5GT/G ..... Rectifier

Power Supply Ratings (D-C or 40 to 100 cycles A-C)

Q10 ..... 105-125 volts ..... 30 watts
Q10A ..... 210-250 volts ..... 60 watts

Q10, Q10-2 ..... 105-125 volts ..... 30 watts
Q10A, Q10A-2 ..... 210-250 volts ..... 60 watts

Power Output Rating

Undistorted ..... 1.25 watts
Maximum ..... 3.1 watts

Loudspeaker (92510-2)

Type ..... 5-inch Round Permanent-Magnet Dynamic
Voice Coil Impedance ..... 4 ohms at 400 cycles

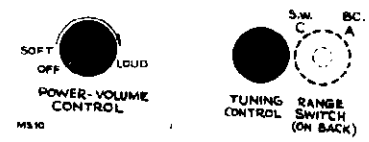
Tuning Drive Ratio ..... 18 to 1

PRECAUTIONARY LEAD DRESS

1. Dress output plate capacitor and output transformer leads down next to chassis.
2. Dress 12SQ7 grid resistor down next to chassis, and away from power ground wire to switch.
3. Dress lead from 2nd I-F transformer to volume control down to chassis and away from adjacent parts.
4. Keep grid end of R1 as short as possible.
5. Keep body of C1A slightly away from chassis.

POWER SUPPLY POLARITY.—For operation on d-c, the power plug must be inserted in the outlet for correct polarity. If the set does not function, reverse the plug. On a-c, reversal of the plug may reduce hum.

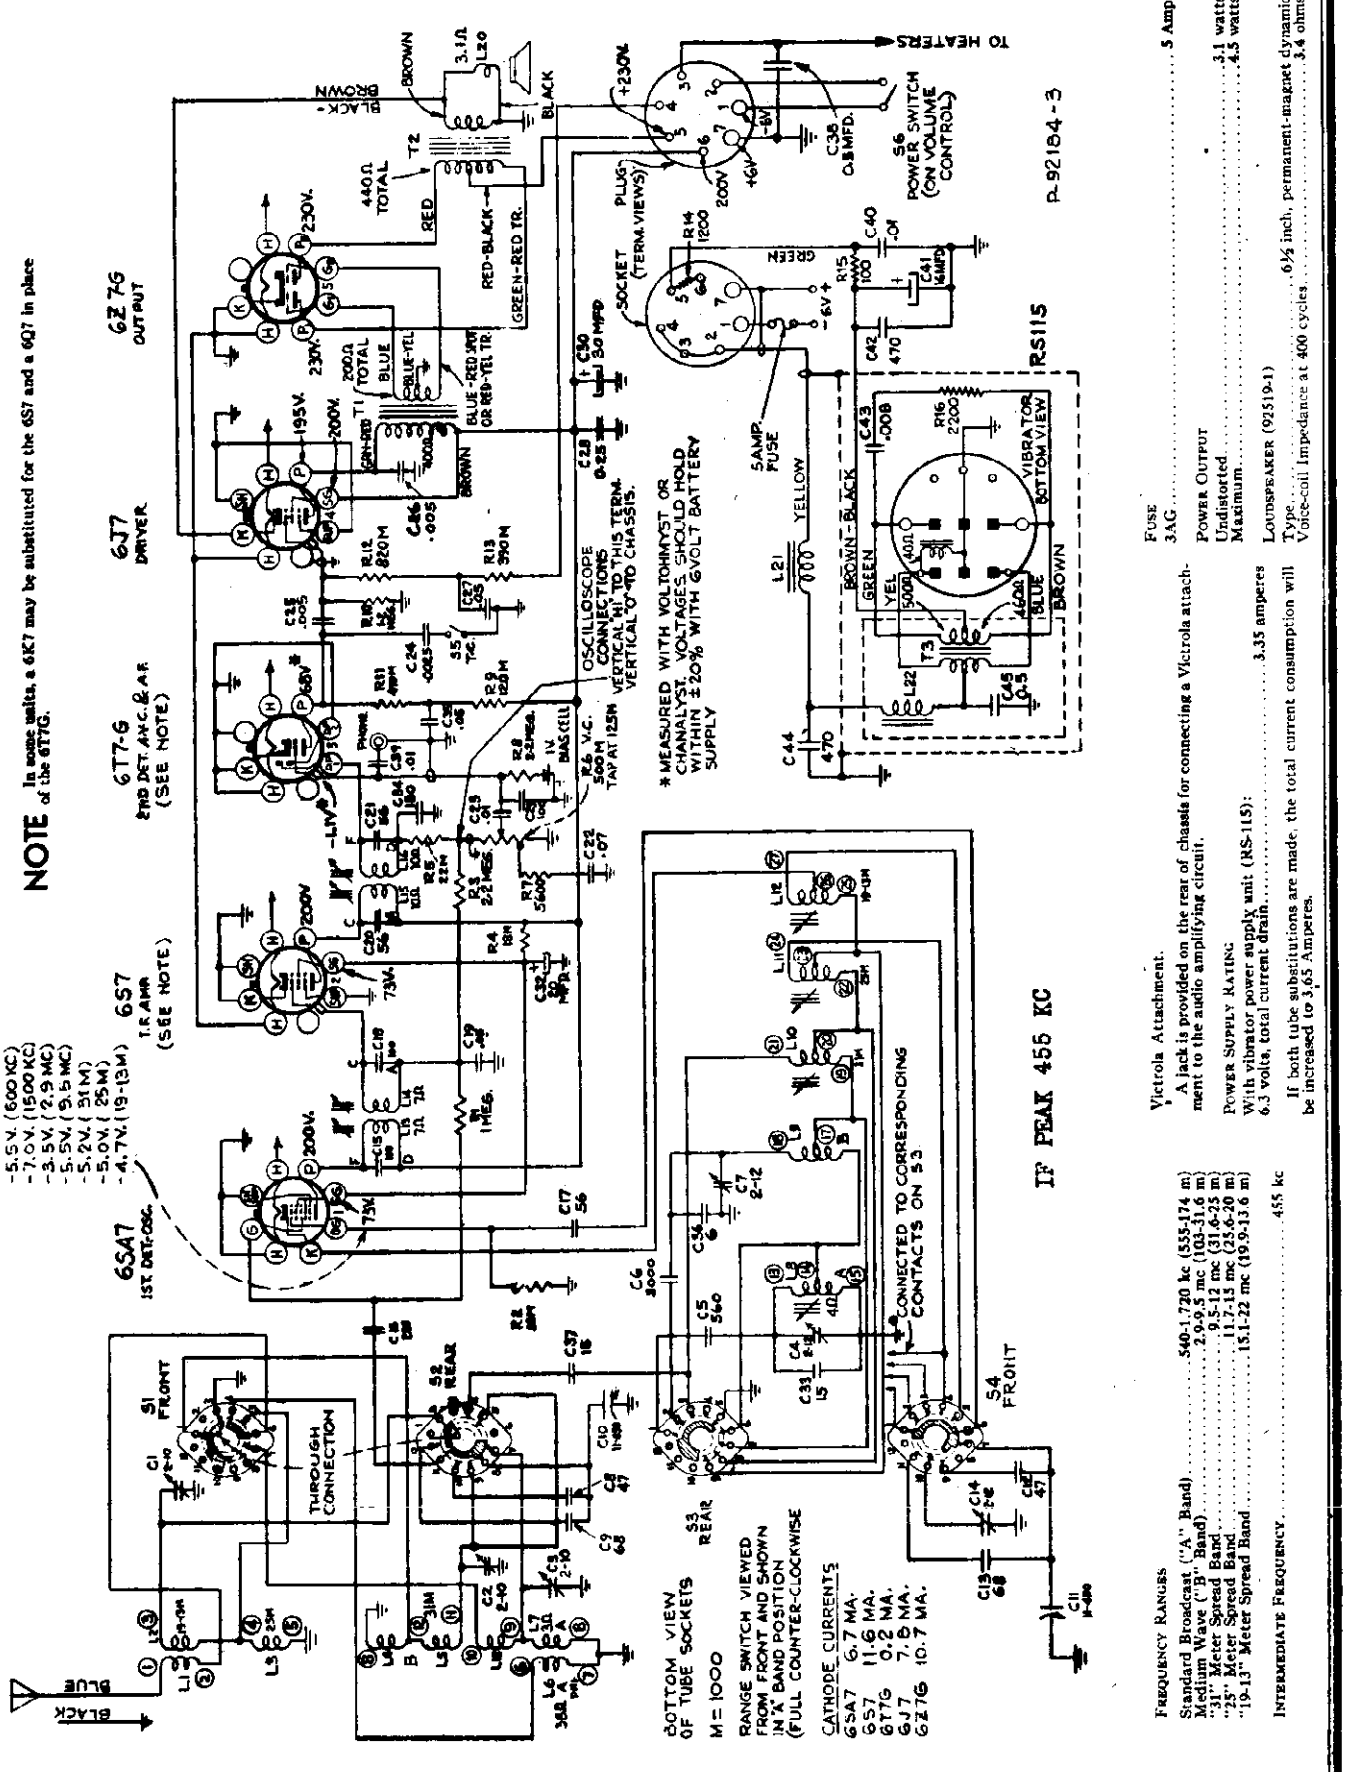
CAUTION.—Repair of the power cord furnished with Model Q10A should not be attempted; apply to your RCA Distributor for a replacement.



Location of Controls

MODEL QB11, Ch. RC-529A

RCA MFG. CO.



FREQUENCY RANGES

Standard Broadcast ("A" Band)	540-1,720 kc (555-174 m)
Medium Wave ("B" Band)	2.9-9.5 mc (103-31.6 m)
"31" Meter Spread Band	9.5-12 mc (31.6-25 m)
"25" Meter Spread Band	11.7-15 mc (25.6-20 m)
"19-13" Meter Spread Band	15.1-22 mc (19.9-13.6 m)

INTERMEDIATE FREQUENCY ..... 455 kc

Victrola Attachment.

A jack is provided on the rear of chassis for connecting a Victrola attachment to the audio amplifying circuit.

POWER SUPPLY RATING

With vibrator power supply unit (RS-115): ..... 3.35 amperes
6.3 volts, total current drain.

If both tube substitutions are made, the total current consumption will be increased to 3.65 Amperes.

FUSE

3AG ..... 5 Amp.

POWER OUTPUT

Undistorted ..... 3.1 watts
Maximum ..... 4.5 watts

LOUDSPEAKER (92519-1)

Type ..... 6½ inch, permanent-magnet dynamic
Voice-coil Impedance at 400 cycles ..... 3.4 ohms

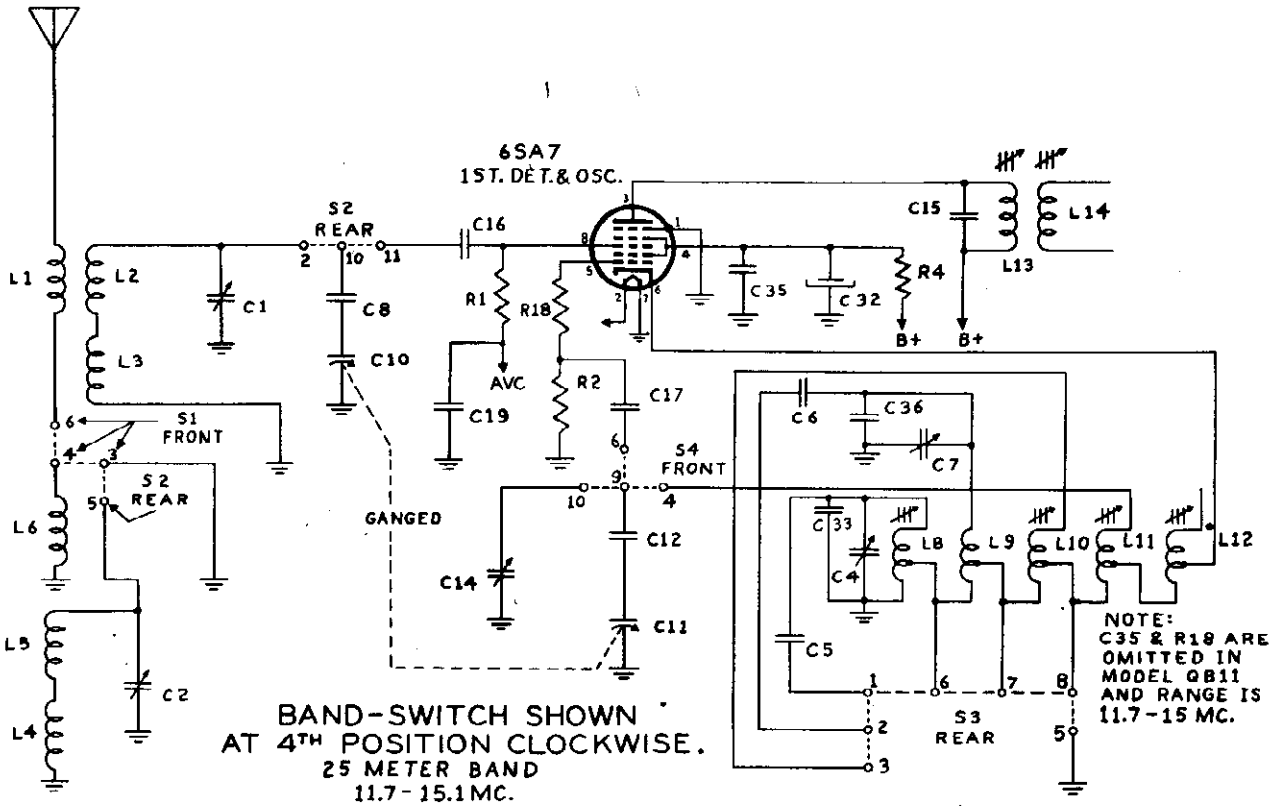
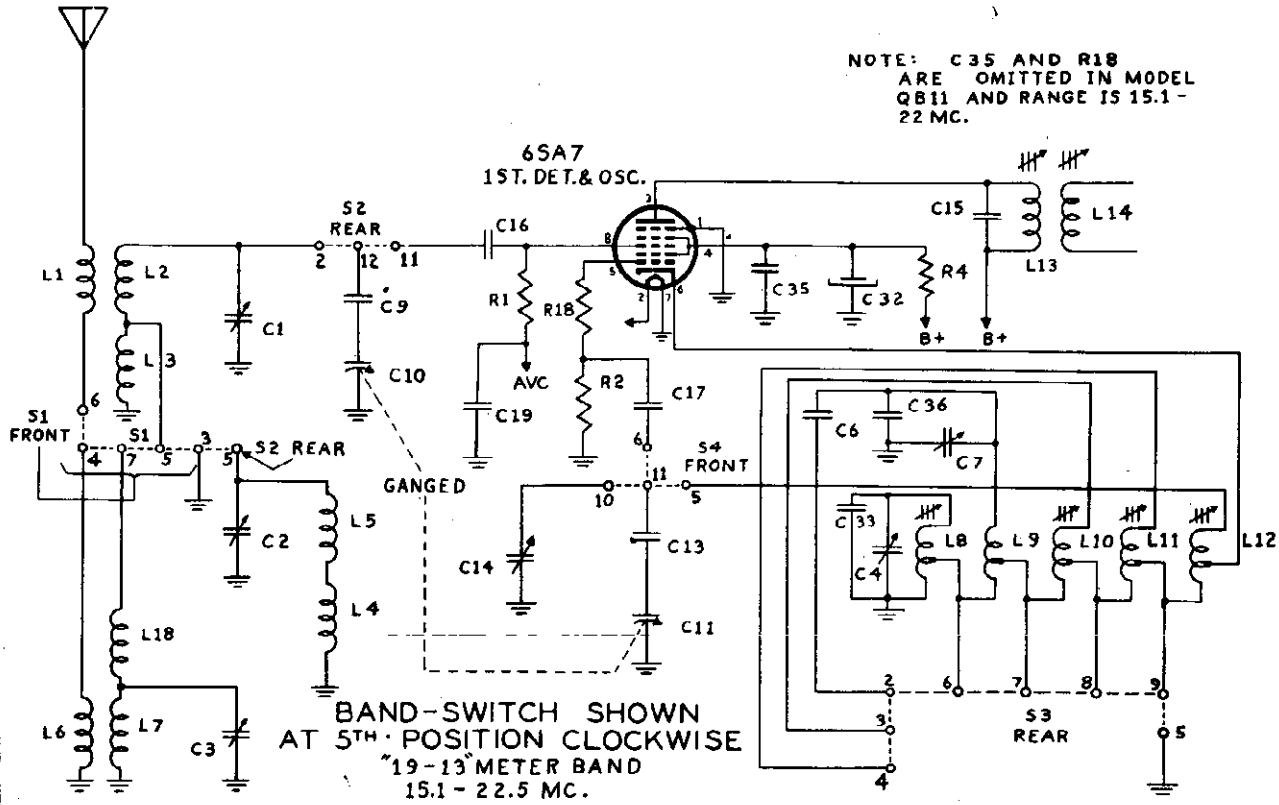
NOTE: C35 & R18 ARE OMITTED IN MODEL QB11 AND RANGE IS 9.5-12 MC.

MODEL QB11
MODELS Q22A,Q32

RCA MFG. CO.





RCA MFG. CO.

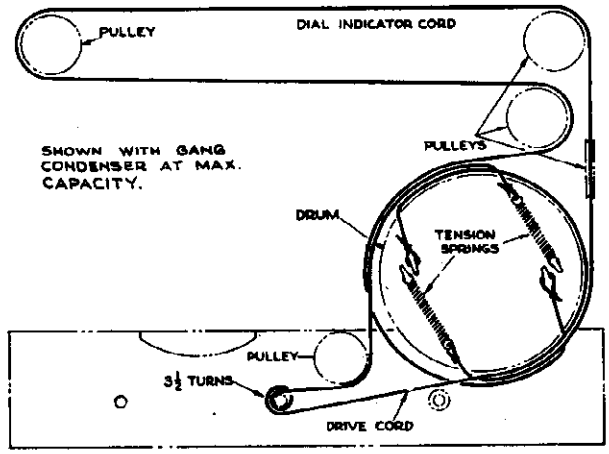
Cathode-Ray Alignment is the preferable method. Connections for the oscilloscope are shown in the diagram.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the oscillator output as low as possible to avoid a-v-c action.

Calibration Scale on Indicator-Drive-Cord Drum.—The tuning dial is fastened in the cabinet and cannot be used for reference during alignment, therefore a calibration scale is attached to the indicator-drive-cord drum which is mounted on the shaft of the gang condenser. The setting of the gang condenser is read on this scale, which is calibrated in degrees.

As the first step in r-f alignment, check the position of the drum. The "180°" mark on the drum scale must be vertical and directly over the center of the gang-condenser shaft when the plates are fully meshed. The drum is held to the shaft by means of two set screws, which must be tightened securely when the drum is in the correct position.



Victrola Attachment.

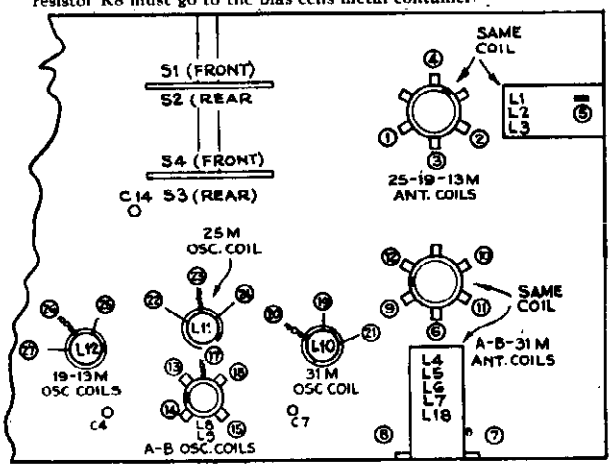
The cable from the Victrola attachment should be terminated with a Stock No. 31048 plug.

When Victrola attachment is in use, the volume control on the radio should be at minimum, and, if necessary, tune set off frequency from any very strong station.

When Victrola attachment is not in use its plug should be disconnected.

Precautionary Lead Dress.

1. Twist yellow lead from terminal 14 of L8 to terminal 6 of S3 with the lead from terminal 27 of L12 to terminal 5 of S4.
2. All other oscillator coil leads must be kept apart from each other as well as from other leads and parts. No two leads may be less than ⅛ inch apart.
3. The lead from the tap on 19-13 oscillator coil to pin number 6 of 6SA7 socket should be dressed up and away from all parts as far as possible.
4. Condensers C8, C9 and C16 must be as far away from all metal parts as possible.
5. All leads from the antenna coil to the range switch should be dressed together.
6. The green lead from pin 4 of 6SA7 socket to pin 4 of the 6S7 socket should be dressed down against the chassis and away from the I. F. terminals.
7. AVC by-pass condenser C19 and the lead from pin number 7 of the 6T7G socket must clear the tuning flywheel by at least ⅛ inch.
8. The leads to the power switch should be twisted and dressed up and away from the bias cell.
9. The bias cell must be installed in the correct polarity. The lead from resistor R8 must go to the bias cells metal container.



Coil and Band Switch Locations (Bottom Chassis View)

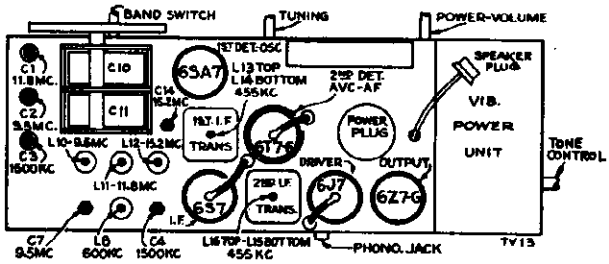
Steps	Connect the high side of the test-osc. to—	Tune test-osc. to—	Range switch	Turn radio dial to—	Adjust the following for max. peak output
1	I-F grid cap, in series with .01 mfd.	455 kc	A	Quiet point near 180°	L16—L15 2nd I-F transformer
2	1st Det. grid, in series with .01 mfd.				L14—L13 1st I-F transformer
3	Ant. lead in series with 300 ohms	11.8 mc	25M	138.5°	L11 (osc.)* C1 (ant.)
4		15.2 mc		17°	C14 (osc.)***
5		Repeat steps 3 and 4.			
6		15.2 mc	19-13M	156°	L12 (osc)*
7		9.5 mc	31M	156°	L10 (osc.)* C2 (ant.)
8		9.5 mc	B	11.5°	C7 (osc.)**
9	Ant. lead in series with 200 mmf.	1,500 kc	A	26°	C4 (osc.)** C3 (ant.)
10		600 kc		150°	L8 (osc.)* (Rock gang.)
11	Repeat steps 9 and 10.				

*If two peaks can be obtained, use the one obtained when the core scr is farthest out (counter-clockwise).

**Use minimum capacity peak if two can be obtained.

***Use minimum capacity peak if two can be obtained. Check image determine that C14 has been adjusted to the correct peak by tuning receiv to approximately 14.29 mc (29°) where a weaker signal should be receive

NOTE: Oscillator tracks above signal on all bands.



Tube and Trimmer Locations (Top Chassis View)

Pointer for Calibration Scale.—Improvise a pointer for the calibratio scale by fastening a piece of wire to the gang-condenser frame, and ben the wire so that it points to the "180°" mark on the calibration scale whe the plates are fully meshed. The correct setting of the gang in degrees, fo each alignment frequency, is given in the alignment table.

Receiver Dial with Calibration Scale.—To determine the correspondin frequency for any setting of the calibration scales, refer to the dial wit calibration scale drawing.

Dial-Indicator Adjustment.—After fastening the chassis in the cabinet attach the dial indicator to the drive cable with indicator at the 540 k mark, and gang condenser fully meshed. The indicator has a clip fo attachment to the cable.

Spread-Band Alignment.—The most satisfactory method of aligning o checking the spread-band ranges is on actual reception of short-wav stations of known frequency, by adjusting the oscillator coil magnetite core for each band so that these stations come in at the correct points on the dial.

In exceptional cases, when the set is being serviced in a location where the noise level is high enough to prevent reception of short-wave stations, a test-oscillator may be used for alignment, but an extremely high degree of accuracy is required in the frequency settings of the test-oscillator, as a slight error will produce considerable inaccuracy on the spread-band dials. The frequency settings of the test-oscillator may be checked by one or both of the following methods:

1. Determine the exact dial settings of the test-oscillator (for frequencies at or close to the specified alignment frequencies) by zero-beating the test-oscillator against short-wave stations of known frequency.
2. Use harmonics of the standard-broadcast range of the test-oscillator, first checking the frequency settings on this range by means of a crystal calibrator, or by zero-beating against standard broadcast stations.

When a test oscillator is employed for spread-band alignment, a final check should be made on actual reception of short-wave stations of known frequency, and the oscillator coil magnetite-core for each band should be re-touched so that the stations come in at the correct points on the dial.

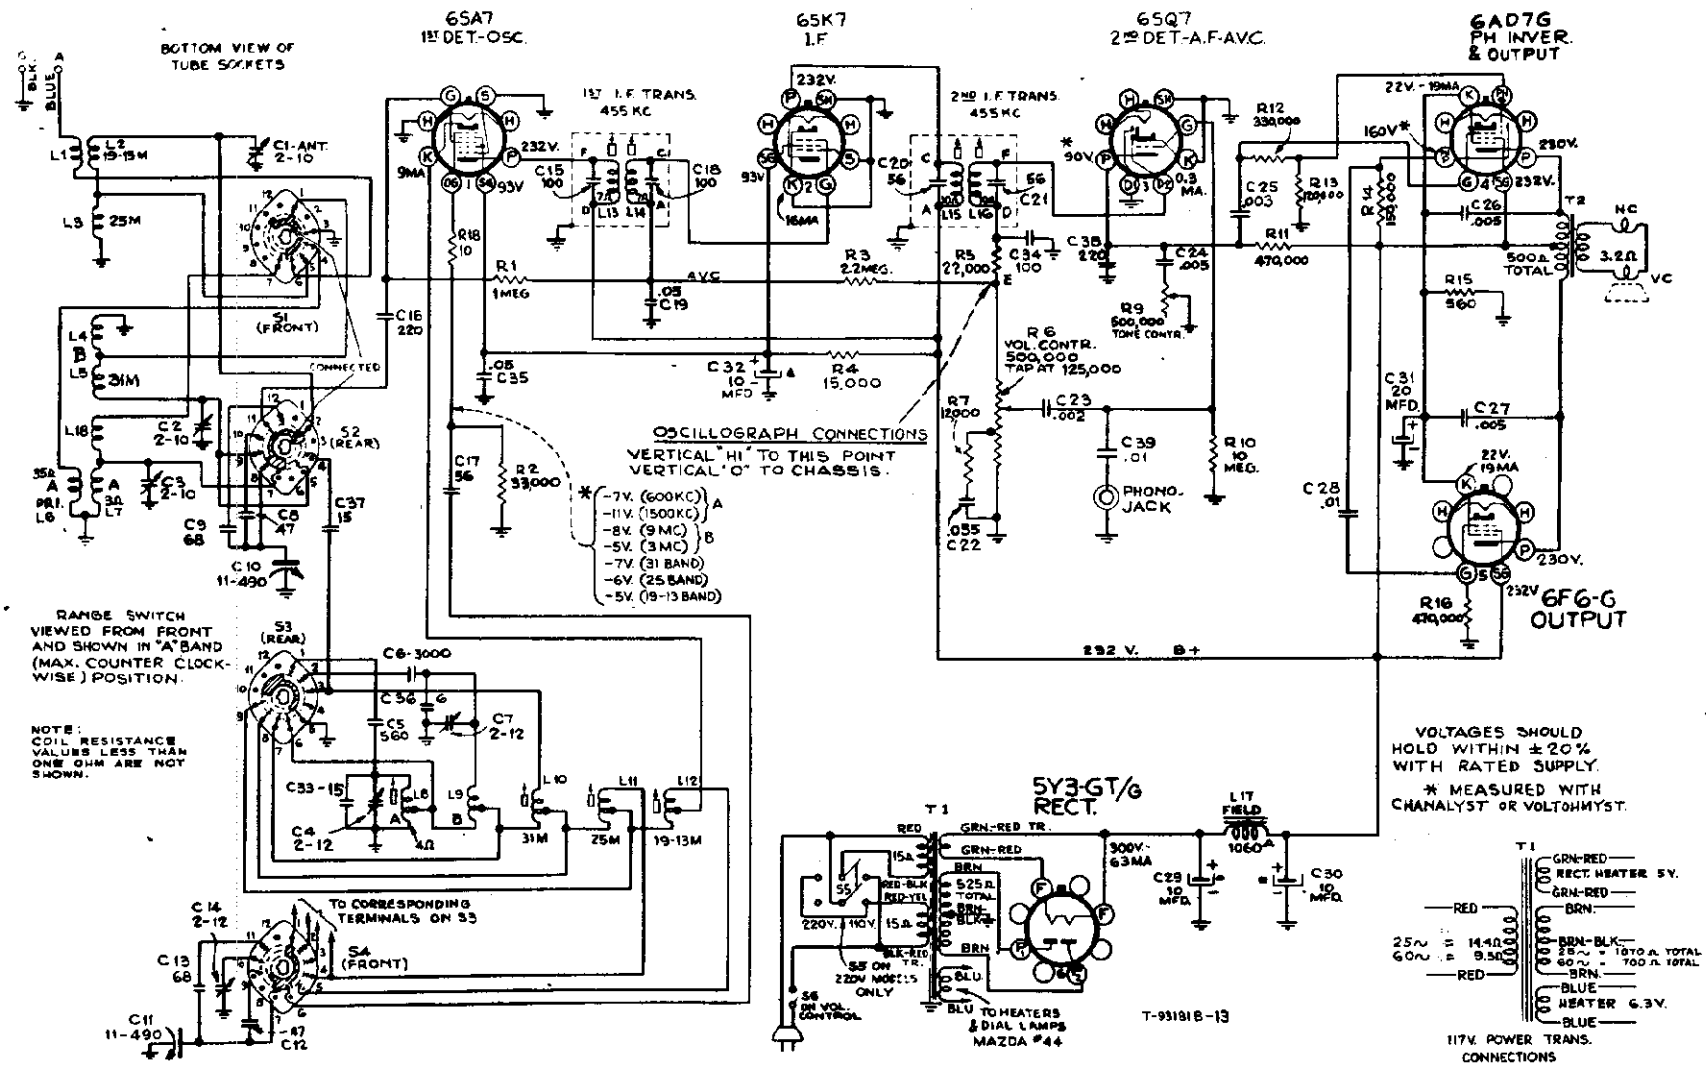
12714	Capacitor—Air trimmer, 2-12 mmf. (C-4, C-7, C-14)
34654	Capacitor—Mica trimmer, triple, 2.5-10 mmf. (C-1, C-2, C-3)
35646	Capacitor—Ceramic, 6 mmf. (C-36)
36012	Capacitor—Ceramic, 15 mmf. (C-37)
45465	Capacitor—Ceramic, 15 mmf. (C-33)
70582	Capacitor—Ceramic, 47 mmf. (C-8)
35644	Capacitor—Ceramic, 47 mmf. (C-12)
39622	Capacitor—Mica, 56 mmf. (C-17)
39632	Capacitor—Mica, 56 mmf. (C-20, C-21)
35645	Capacitor—Ceramic, 68 mmf. (C-13)
70586	Capacitor—Mica, 68 mmf. (C-9)
39628	Capacitor—Mica, 100 mmf. (C-15, C-18, C-29)
39634	Capacitor—Mica, 180 mmf. (C-34)
39636	Capacitor—Mica, 220 mmf. (C-16)
70667	Capacitor—Mica, 560 mmf. (C-5)
70687	Capacitor—Mica, 3000 mmf. (C-6)
70644	Capacitor—Tubular, .0025 mfd., 1400 volts (C-24)
70627	Capacitor—Tubular, .005 mfd., 500 volts (C-25, C-26)
70652	Capacitor—Tubular, .01 mfd., 1000 volts (C-23, C-39)
70615	Capacitor—Tubular, .05 mfd., 400 volts (C-19, C-27, C-35)
71010	Capacitor—Tubular, .07 mfd., 400 volts (C-22)
70619	Capacitor—Tubular, 0.5 mfd., 150 volts (C-38)
70618	Capacitor—Tubular, 0.25 mfd., 300 volts (C-28)
37250	Capacitor—Electrolytic, 20 mfd., 250 volts (C-32)
37867	Capacitor—Electrolytic, 30 mfd., 250 volts (C-30)
31581	Cell—Bias cell
35632	Coil—Antenna coil, "A", "B" and 31 meter bands (L-4, L-5, L-6, L-7, L-18)
35631	Coil—Antenna coil, 25 meter and 19-13 meter bands (L-1, L-2, L-3)
35624	Coil—Oscillator coil, 19-13 meter band (L-12)
35625	Coil—Oscillator coil, 25 meter band (L-11)
35626	Coil—Oscillator coil, 31 meter band (L-10)
35623	Coil—Oscillator coil, "A" and "B" bands (L-8, L-9)
35619	Condenser—Variable tuning condenser (C-10, C-11)
37833	Control—Volume control and power switch (R-6, S-6)
32634	Cord—Drive cord (approx. 28" overall length)
34662	Cord—Indicator cord (approx. 53" overall length)
35788	Core—Adjustable core and stud for "A" and "B" band oscillator coil
31259	Core—Adjustable core and stud for 19-13 meter, 25 meter and 31 meter bands oscillator coils
12006	Core—Adjustable core and stud for I.F. transformers
35627	Drum—Drive drum less calibrator
35638	Flywheel—Tuning knob shaft flywheel
31580	Holder—Bias cell holder
5119	Plug—3 contact female plug for speaker cable
14404	Plug—7 prong plug for power input cable
35641	Pulley—Drive cord pulley
35630	Pulley—Idler pulley, located between tuning knob and range switch shafts
30734	Resistor—5600 ohms, ¼ watt (R-7)
30151	Resistor—18,000 ohms, 1 watt (R-4)
30492	Resistor—22,000 ohms, ¼ watt (R-5)
30685	Resistor—33,000 ohms, ¼ watt (R-2)
30180	Resistor—120,000 ohms, ¼ watt (R-9)
11988	Resistor—390,000 ohms, ¼ watt (R-13)
30648	Resistor—470,000 ohms, ¼ watt (R-11)
30161	Resistor—820,000 ohms, ¼ watt (R-12)
30652	Resistor—1 megohm, ¼ watt (R-1)
30162	Resistor—1.2 megohm, ¼ watt (R-10)
30649	Resistor—2.2 megohm, ¼ watt (R-3, R-8)
14350	Screw—# 8-32 square head set screw for drive drum
35633	Shaft—Range indicator shaft
35637	Shaft—Tuning knob shaft
35787	Socket—Phono-input socket
31251	Socket—Tube socket
31418	Spring—Indicator cord spring or drive cord spring
12007	Spring—Retaining spring for I.F. transformers' core and stud assemblies
31261	Spring—Retaining spring for oscillator coils core and stud assemblies
35621	Switch—Range switch (S-1, S-2, S-3, S-4)
33397	Switch—Tone control switch (S-5)
37898	Transformer—Driver transformer (T-1)
35636	Transformer—First I.F. transformer (L-13, L-14, C-15, C-18)
35628	Transformer—Second I.F. transformer (L-15, L-16, C-20, C-21)
37924	Transformer—Output transformer (T-2)
33726	Washer—"C" washer for idler pulley
2917	Washer—"C" washer for tuning knob shaft
	VIBRATOR POWER SUPPLY
4289	Body—Fuse connector body
4288	Cap—Fuse connector cap
39644	Capacitor—Mica, 470 mmf. (C-42, C-44)
71008	Capacitor—Paper, .008 mfd., 1200 volts (C-43)
70652	Capacitor—Tubular, .01 mfd., 1000 volts (C-40)
37877	Capacitor—Electrolytic, 16 mfd., 350 volts (C-41)
37834	Case—Power supply case less cover
14289	Clip—Battery clips (1 set)
37925	Coil—Choke coil (L-21)
37836	Cover—Power supply case cover
4286	Ferrule—Fuse connector ferrule and bushing
5140	Fuse—5 ampere
4290	Insulator—Fuse connector insulator
14409	Plug—7 contact female plug for power supply cable
34765	Resistor—100 ohms, ¼ watt (R-15)
6134	Resistor—1200 ohms, 1 watt (R-14)
90382	Resistor—2200 ohms, 1 watt (R-16)
12241	Socket—Vibrator socket
4284	Spring—Fuse connector spring
35544	Transformer—Vibrator transformer (T-3, C-45, L-22)
35543	Vibrator—Plug-in vibrator
4285	Washer—Fuse connector insulating washer
	SPEAKER ASSEMBLIES 92519-1
70578	Cone—Cone and voice coil assembly
5118	Plug—3 prong male plug for speaker cable
70577	Speaker—6½" P.M. speaker complete with cone and voice coil less plug
	NOTE: If stamping on speaker in instrument does not agree with above speaker number, order replacement parts by referring to model number of instrument, number stamped on speaker and full description of part required.
	MISCELLANEOUS ASSEMBLIES
70579	Decal—Trademark decal
35654	Dial—Glass dial scale
35656	Extension—Tone control shaft extension
37838	Frame—Dial frame assembly less indicator and dial
X1611	Grille—Cabinet grille cloth for Model QB11
70580	Indicator—Station selector indicator
35652	Knob—Range indicator knob
35651	Knob—Range switch knob
35650	Knob—Tone control knob
34489	Knob—Tuning or volume control knob
4982	Spring—Retaining spring for range indicator knob
14270	Spring—Retaining spring for tone control knob, tuning or volume control knob, and for range switch knob



Precautionary Lead Dress.—

1. All leads between antenna coils and switch must be as short as possible and kept away from oscillator coil, leads and switches.
2. All oscillator coil leads must be kept apart from each other and other leads and parts.
3. Blue plate lead of 2nd I-F transformer should be dressed under other leads and against chassis.

NOTE.—On some sets C23 may be .0015 mf., C25 may be .0025 mf.

Loudspeaker.—

To center the loudspeaker voice coil, first remove the dust cover. Then loosen the center suspension by thoroughly soaking the outer edge of this suspension with repeated applications of acetone.

(Caution: Keep acetone from flowing to other parts of the loudspeaker.)

Keep the outer edge of the suspension soaked, and lift the cone, near the voice coil, up and down until the suspension is pulled away from the cone housing.

Insert 3 feelers, equally spaced, between the voice coil and the pole piece, and allow the center suspension to re-cement itself. Additional cement should be applied if necessary. Remove feelers

MODELS Q22A,Q32,
Ch.507

RCA MFG. CO.

Cathode-Ray Alignment is the preferable method. Connections for the oscillograph are shown on the Schematic Circuit Diagram.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the oscillator output as low as possible to avoid a-v-c action.

Calibration Scale on Indicator-Drive-Cord Drum.—The tuning dial is fastened in the cabinet and cannot be used for reference during alignment, therefore a calibration scale is attached to the indicator-drive-cord drum which is mounted on the shaft of the gang condenser. The setting of the gang condenser is read on this scale, which is calibrated in degrees. The correct setting of the gang in degrees, for each alignment frequency, is given in the alignment table.

As the first step in r-f alignment, check the position of the drum. The "180°" mark on the drum scale must be vertical, and directly over the center of the gang-condenser shaft when the plates are fully meshed. The drum is held to the shaft by means of two set screws, which must be tightened securely when the drum is in the correct position.

To determine the corresponding frequency for any setting of the calibration scales, refer to the calibration scale drawing which shows the dial with 0-180° calibration scales drawn at top and bottom.

Pointer for Calibration Scale.—Improvise a pointer for the calibration scale by fastening a piece of wire to the gang-condenser frame, and bend the wire so that it points to the "180°" mark on the calibration scale when the plates are fully meshed.

Dial-Indicator Adjustment.—After fastening the chassis in the cabinet, attach the dial indicator to the drive cable with indicator at the 540 kc mark (the first mark on "A" band to the left of "550"), and gang condenser fully meshed. The indicator has a spring clip for attachment to the cable.

Spread-Band Alignment.—The most satisfactory method of aligning or checking the spread-band ranges is on actual reception of short-wave stations of known frequency, by adjusting the magnetite-core oscillator coil for each spread-band so that these stations come in at the correct points on the dial.

In exceptional cases, when the set is being serviced in a location where the noise level is high enough to prevent reception of short-wave stations, a test-oscillator may be used for alignment, but an extremely high degree of accuracy is required in the frequency settings of the test-oscillaor, as a slight error will produce considerable inaccuracy on the spread-band dials. The frequency settings of the test-oscillator may be checked by one or both of the following methods:

1. Determine the exact dial settings of the test-oscillator (for frequencies at or close to the specified alignment frequencies) by zero-beating the test-oscillator against short-wave stations of known frequency.
2. Use harmonics of the standard-broadcast range of a test-oscillator, first checking the frequency settings on this range by means of a crystal-controlled oscillator, or by zero-beating against standard broadcast stations.

When a test oscillator is employed for spread-band alignment, a final check should be made on actual reception of short-wave stations of known frequency, and the magnetite-core oscillator coil for each band should be retouched so that the stations come in at the correct points on the dial.

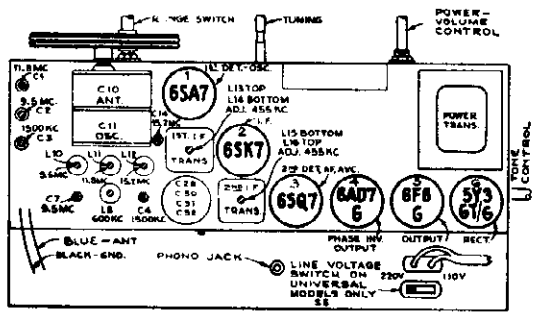
Steps	Connect the high side of the test-osc. to—	Tune test-osc. to—	Range switch	Turn radio dial to—	Adjust the following for max. peak output
1	6SK7 I-F grid in series with .01 mfd.	455 kc	A	Quiet Point near 180°	L15 and L16 2nd I-F Trans.
2	6SA7 1st Det. grid in series with .01 mfd.				L13 and L14 1st I-F Trans.
3	Ant. lead in series with 300 ohms	11.8 mc	25 M	138.5°	L11 (osc.)** C1 (ant.)
4		15.2 mc		17°	C14 (osc.)*
5		Repeat steps 3 and 4			
6		15.2 mc	19-13 M	156°	L12 (osc.)**
7		9.5 mc	31 M	156°	L10 (osc.)** C2 (ant.)
8		9.5 mc	B	11.5°	C7 (osc.)***
9	Ant. lead in series with 200 mmf.	1.500 kc	A	28°	C4 (osc.) C9 (ant.)
10		600 kc		150°	L8 (osc.) (Rock gang)
11		Repeat steps 9 and 10			

* Use minimum capacity peak if two can be obtained. Check image to determine that C14 has been adjusted to the correct peak by tuning receiver to approximately 14.29 mc (29°) where a weaker signal should be received.

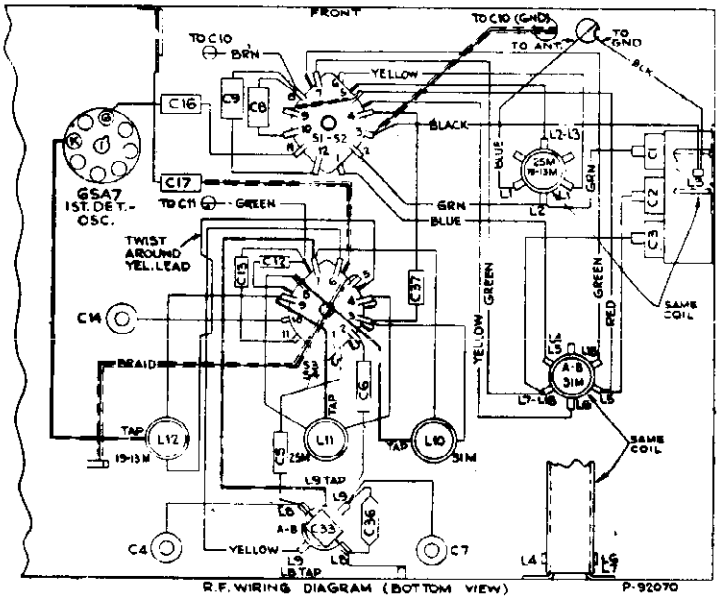
** If two peaks can be obtained use the one obtained when the core screw is farthest out (counter-clockwise).

*** Peak at minimum capacity if two peaks can be obtained.

NOTE: Oscillator tracks above signal on all bands.



Tube and Trimmer Locations



Frequency Ranges

Standard Broadcast ("A" Band)	540-1,720 kc (556-174 m)
Medium Wave ("B" Band)	3.0-9.5 mc (100-31.6 m)
"31" Meter Spread Band	9.5-11.7 mc (31.6-25.6 m)
"25" Meter Spread Band	11.7-15.1 mc (25.6-19.9 m)
"19-13" Meter Spread Band	15.1-22.5 mc (19.9-13.3 m)

Intermediate Frequency ..... 455 kc

Tuning Drive Ratio ..... 25 to 1

Power Supply Ratings

Symbol	Voltages	Frequency (cycles)	Watts
Rating A	105-125	50-60	65
Rating B	105-125	25-60	65
Rating C	105-125, 200-250	50-60	65

(Shipped in 225-250 volt position)

Victrola Attachment.—A jack is provided on the rear of chassis for connection to a Victrola Attachment. The cable from the attachment should be terminated in a Stock No. 31048 plug.

When Victrola is not in use its plug should be removed. When Victrola is in use the volume control on the radio should be at minimum and, if necessary, tune set off frequency from any very strong station.

Power Output Rating

Undistorted	3 watts
Maximum	3.5 watts

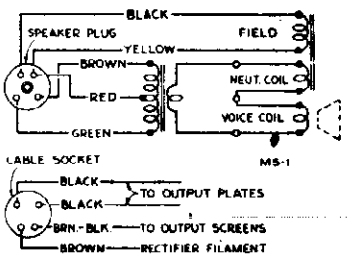
Loudspeaker

Model	92517-1
Type (Electrodynamic)	6½ inches
V-C Impedance at 400 c.p.s.	3.4 ohms

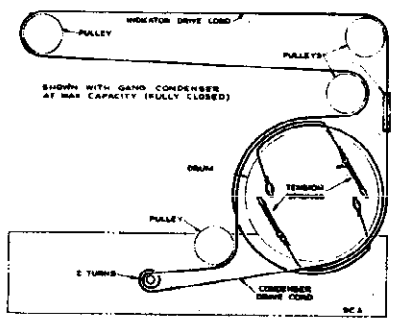
RCA MFG. CO.

Replacement Parts

STOCK No.	DESCRIPTION
	CHASSIS ASSEMBLIES
	RC-507
35640	Bracket—Drive cord pulley bracket complete with one (1) pulley
35639	Bracket—Drive cord pulley bracket complete with three (3) pulleys
35622	Bracket—Flywheel support bracket
37976	Bracket—Tone control support bracket
35642	Calibrator—Drive drum calibrator
12714	Capacitor—Air trimmer (2-12 mmf.) (C4, C7, C14)
33014	Capacitor—Electrolytic, consisting of three (3) sections of 10 mfd., 450 volts, and one (1) section of 20 mfd., 25 volts (C29, C30, C31, C32)
34654	Capacitor—Mica trimmer, triple, 2.5-10 mmf. (C1, C2, C3)
35646	Capacitor—Ceramic, 6 mmf. (C36)
36012	Capacitor—Ceramic, 15 mmf. (C37)
45465	Capacitor—Ceramic, 15 mmf. (C33)
70592	Capacitor—Ceramic, 47 mmf. (C8)
35644	Capacitor—Ceramic, 47 mmf. (C12)
39622	Capacitor—Mica, 56 mmf. (C17)
39632	Capacitor—Mica, 56 mmf. (C20, C21)
70586	Capacitor—Mica, 68 mmf. (C9)
35645	Capacitor—Ceramic, 68 mmf. (C13)
39628	Capacitor—Mica, 100 mmf. (C15, C18, C34)
39636	Capacitor—Mica, 220 mmf. (C16, C38)
70667	Capacitor—Mica, 560 mmf. (C5)
70687	Capacitor—Mica, 3000 mmf. (C6)
70601	Capacitor—Tubular, .002 mfd., 200 volts (C23)
70624	Capacitor—Tubular, .003 mfd., 600 volts (C25)
70627	Capacitor—Tubular, .005 mfd., 600 volts (C24)
70648	Capacitor—Tubular, .005 mfd., 1000 volts (C26, C27)
70610	Capacitor—Tubular, .01 mfd., 200 volts (C39)
70631	Capacitor—Tubular, .01 mfd., 600 volts (C28)
70614	Capacitor—Tubular, .035 mfd., 200 volts (C22)
70615	Capacitor—Tubular, .05 mfd., 200 volts (C19)
70636	Capacitor—Tubular, .05 mfd., 600 volts (C35)
35631	Coil—Antenna coil, 19-13 meter and 25 meter bands (L1, L2, L3)
35632	Coil—Antenna coil, "A," "B" and 31 meter bands (L4, L5, L6, L7, L18)
35623	Coil—Oscillator coil, "A" and "B" bands (L8, L9)
35624	Coil—Oscillator coil, 19-13 meter band (L12)
35625	Coil—Oscillator coil, 25 meter band (L11)
35626	Coil—Oscillator coil, 31 meter band (L10)
35619	Condenser—Variable tuning condenser (C10, C11)
35629	Control—Tone control (R9)
35620	Control—Volume control and power switch (R6, S6)
32634	Cord—Drive cord (approx. 28 inches overall length)
34652	Cord—Indicator cord (approx. 53 inches overall length)
12006	Core—Adjustable core and stud assemblies for I-F transformers
35788	Core—Adjustable core and stud for "A" and "B" band oscillator coil
31259	Core—Adjustable core and stud for 19-13 meter, 25 meter and 31 meter oscillator coil
35627	Drum—Drive drum less calibrator
35638	Flywheel—Tuning knob shaft flywheel
5040	Plug—4 contact female plug for speaker cable
35641	Pulley—Drive cord pulley
35630	Pulley—Idler pulley located between the range switch and tuning knob shafts
34761	Resistor—10 ohms, ¼ watt (R18)
30735	Resistor—560 ohms, 1 watt (R15)
30436	Resistor—12,000 ohms, ¼ watt (R7)
35595	Resistor—15,000 ohms, 3 watt (R4)
30492	Resistor—22,000 ohms, ¼ watt (R5)
30685	Resistor—33,000 ohms, ¼ watt (R2)
30180	Resistor—120,000 ohms, ¼ watt (R13)
30493	Resistor—150,000 ohms, ½ watt (R14)
14983	Resistor—330,000 ohms, ¼ watt (R12)
30648	Resistor—470,000 ohms, ½ watt (R11, R16)
30652	Resistor—1 megohm, ¼ watt (R1)
30649	Resistor—2.2 megohms, ¼ watt (R3)
30992	Resistor—10 megohms, ¼ watt (R10)
14350	Screw—8-32 square head set screw for drive drum
35633	Shaft—Range switch indicator knob shaft
35637	Shaft—Tuning knob shaft
31364	Socket—Lamp socket
14278	Socket—Phono input socket
31251	Socket—Tube socket
31418	Spring—Drive cord or indicator cord spring.
12007	Spring—Retaining spring for I-F transformers' core and stud assemblies
31261	Spring—Retaining spring for oscillator coils' core and stud assemblies
35621	Switch—Range switch (S1, S2, S3, S4)
32827	Switch—Voltage switch (S5)
35636	Transformer—First I-F transformer (L13, L14, C15, C18)
35628	Transformer—Second I-F transformer (L15, L16, C20, C21)
32852	Transformer—Power transformer, 105-125 volts, 50/60 cycle or 105-125/200-250 volts, 50/60 cycle (T1)
35588	Transformer—Power transformer, 105-125 volts, 25/60 cycle (T1)
33726	Washer—"C" washer for idler pulley
2917	Washer—"C" washer for tuning knob shaft
	SPEAKER ASSEMBLY
	STAMPED 92517-1J
70578	Cone—Cone and voice coil assembly
5118	Plug—4-prong male plug for speaker
70583	Speaker—6½-inch E.M. speaker complete with cone and voice coil less plug and output transformer
70584	Transformer—Output transformer (T2)
	Note: If stamping on speaker in instrument does not agree with above speaker number, order replacement parts by referring to model number of instrument, number stamped on speaker and full description of part required.
	MISCELLANEOUS ASSEMBLIES
35649	Back—Cabinet back for Q22A
71038	Back—Cabinet back for Q32
70579	Decal—Trade mark decal
35654	Dial—Glass dial scale
36658	Extension—Tone control shaft extension for Q32
35647	Frame—Dial frame complete less indicator
70581	Grille—Grille cloth for Q22A
X1611	Grille—Grille cloth for Q32
70580	Indicator—Station selector indicator
35652	Knob—Range indicator knob
35651	Knob—Range switch knob
35650	Knob—Tone control knob
34489	Knob—Tuning or volume control knob
11891	Lamp—Dial lamp (Mazda No. 44)
14270	Spring—Retaining spring for tone control, volume control, range switch and tuning knobs
4982	Spring—Retaining spring for range indicator knob



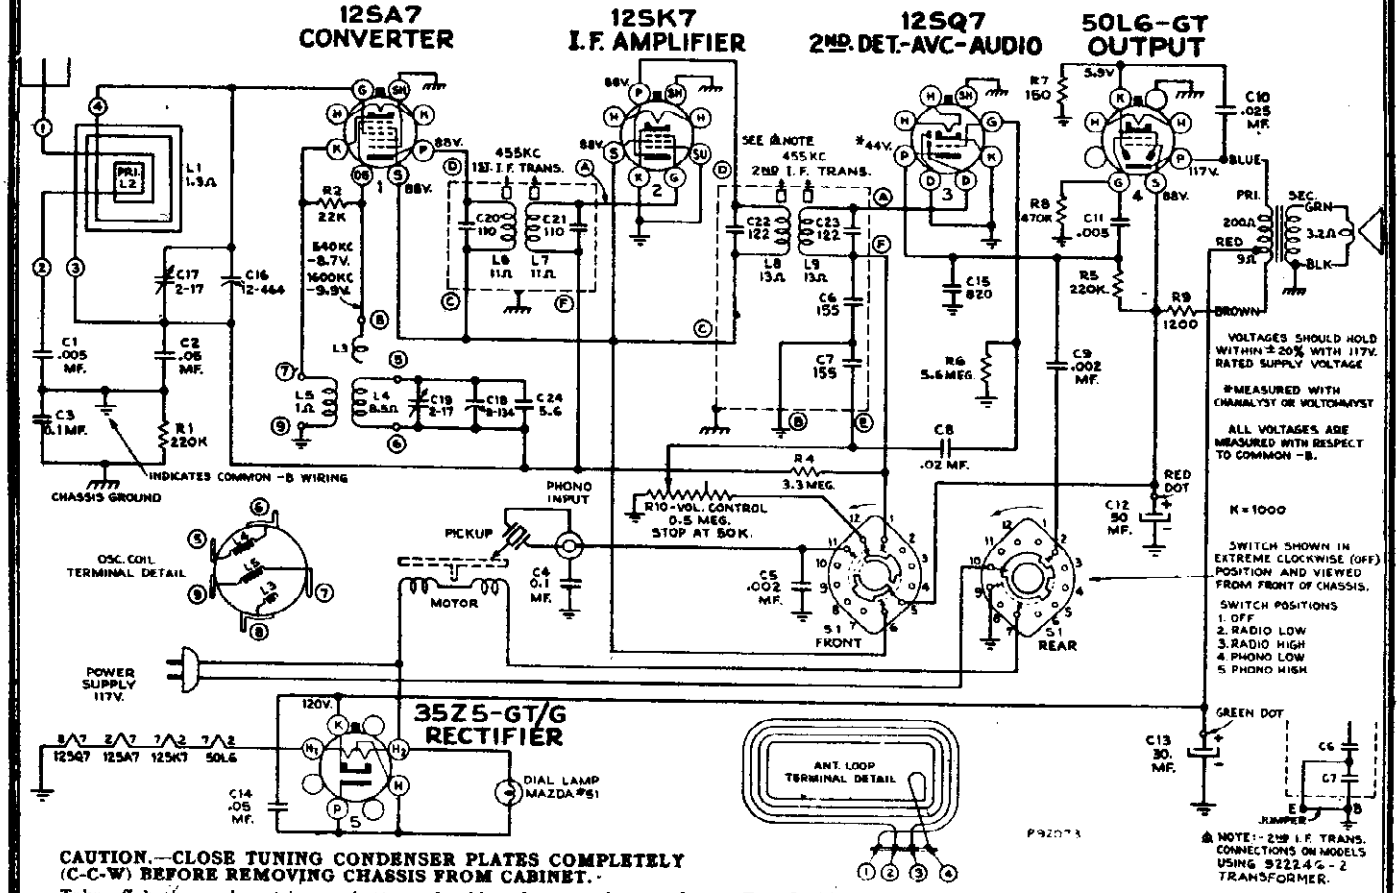
Connections and Colors of Loudspeaker and Cable



Dial-Indicator and Drive Mechanism

MODELS 55U, 55AU,
Ch. RC-1017

RCA MFG. CO.

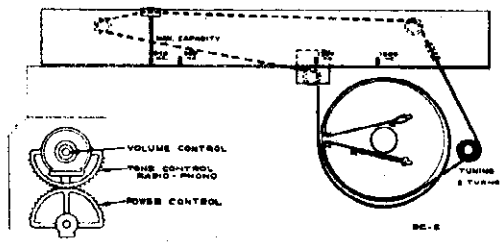


CAUTION.—CLOSE TUNING CONDENSER PLATES COMPLETELY (C-C-W) BEFORE REMOVING CHASSIS FROM CABINET.

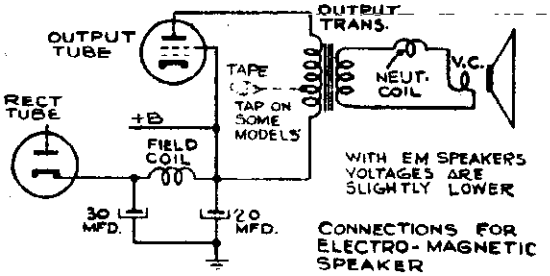
Take off both wooden strips on bottom of cabinet by removing wood screws before loosening chassis bolts.

CRITICAL LEAD DRESS.—

1. All filament wires should be dressed close to chassis.
2. Dress lead from switch to phono jack close to chassis and away from power cord.
3. Dress capacitor between 12SQ7 grid and terminal board away from chassis and away from other parts.
4. Dress all exposed leads away from each other and away from chassis to prevent short circuits.
5. In instrument assembly the lead from the rear section of gang to loop shall be dressed away from chassis and other wires to loop.



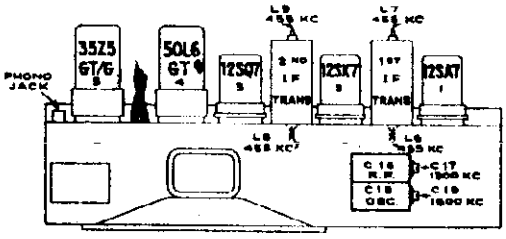
Dial Pointer Adjustment.—Rotate tuning condenser fully counter-clockwise plates (fully meshed). Adjust indicator pointer to left (max. cap.) mark on dial back plate.



Test Oscillator.—Connect high side of test oscillator as shown in chart. Connect low side through a .01 mf capacitor to common "—B". Keep the output signal as low as possible to avoid a.v.c. action.

Output Meter.—Connect meter across speaker voice coil. Turn volume control clockwise to radio maximum high position (3) for alignment.

Steps	Connect the high side of test-oscillator to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. peak output
1	I.F. grid, in series with .01 mfd.	455 kc	Quiet point 1,600 kc end of dial	L8 and L9 2nd I.F. transformer
2	1st Det. grid in series with .01 mfd.			L6 and L7 1st I.F. transformer
NOTE.—ANTENNA LOOP MUST BE IN CABINET				
3	Antenna terminal in series with 220 mmfd.	1600 kc	Gang at minimum	C19 (osc.)
4	Radiated signal 1300 kc		Signal Frequency	C17 (ant.)
5	Repeat steps 3 and 4.			



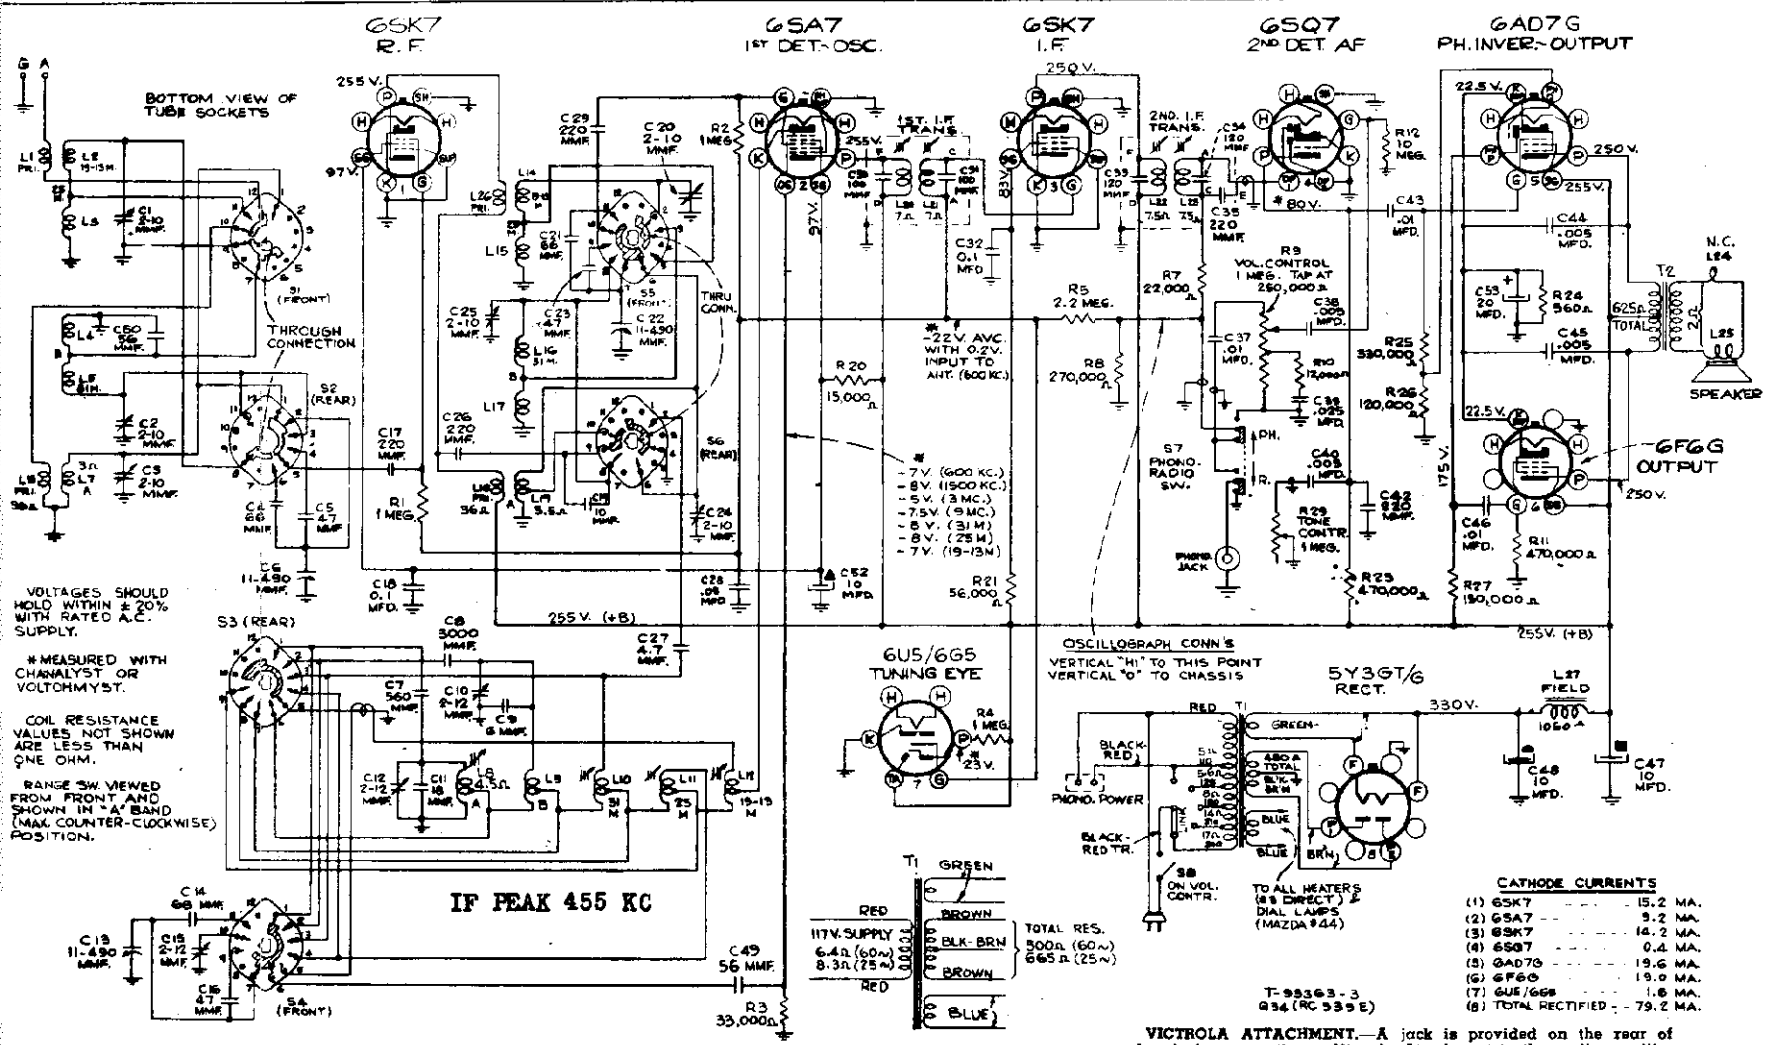
FREQUENCY RANGE.....540-1,600 kc

INTERMEDIATE FREQUENCY.....455 kc

POWER SUPPLY RATING

105-125 volts, AC, 60 cycles.....60 watts

IMPORTANT.—Do not plug chassis into a d.c. power supply.



CATHODE CURRENTS	
(1) 6SK7	15.2 MA.
(2) 6SA7	9.2 MA.
(3) 6SK7	14.2 MA.
(4) 6SQ7	0.4 MA.
(5) 6AD7G	19.6 MA.
(6) 6F6G	19.0 MA.
(7) 6U5/6G5	1.6 MA.
(8) TOTAL RECTIFIED	79.2 MA.

PRECAUTIONARY LEAD DRESS

1. Dress green leads from antenna and R-F sections of the gang condenser away from all metal including chassis shield plates. The spaghetti-covered braid in the antenna section should be at least ¼ inch away from the gang.
2. Black and brown twisted filament leads between 6SA7 (1st Det.-Osc.) and 6SK7 (R-F) must run along front side of shield plate.
3. Dress mica capacitors and switch leads away from shield plates. Turn flat sides of capacitors away from shield plates.
4. Closely twist the leads from terminals E and A of the second I-F transformer, and dress them close to the chassis.
5. Dress volume control-arm lead and capacitor (C38) close to front apron and away from output tube bypass capacitors (C44 and C45).
6. 6SQ7 10 megohm grid resistor (R12) should have minimum lead length on the grid side.
7. Dress the capacitor (C37) on the high side of the volume control as far as possible from a-c switch.
8. Leads to 6SA7 socket must not impede flexible mounting.
9. The 6SA7 control grid must be clear of any other leads, especially filament leads which must be at least ¼ inch away. The 1 megohm grid resistor (R2) must have its body as close to the grid terminal as possible.
10. Dress 6SA7 control grid capacitor (C49) away from the coil form (L12), away from the oscillator grid capacitor (C29), and ¼ inch away from any other part.
11. 6AD7G plate to cathode capacitor (C44) must be flat against chassis.

VICTROLA ATTACHMENT.—A jack is provided on the rear of chassis for connecting a Victrola Attachment to the audio amplifying circuit. The cable from the attachment should be terminated in a Stock No. 31048 plug. A 110-volt outlet for Victrola motor is available on back of the chassis.

For Radio reception, the Radio-Phono switch (S7) should be placed in the Radio position.

When Victrola is in use, the volume control on the radio should be at minimum, and, if necessary, tune set off frequency from any very strong station.

Power Supply Ratings

105-125 volts, 50-60 cycles	80 watts
105-125 volts, 25-60 cycles	80 watts
100-130, 140-160, 200-250 volts, 50-60 cycles	80 watts

(Shipped in 225-250 volt position)

Cathode-Ray Alignment is the preferable method. Connections for the oscillograph are shown in the chassis drawing.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

Steps	Connect the high side of the test-osc. to—	Tune test-osc. to—	Range Switch	Turn Radio Dial to—	Adjust the following for max. peak output
1	6SK7 I-F grid in series with .01 mfd.	455 kc	"A" band	Quiet point 600 kc end of dial	L23-L22 2nd I-F transformer
2	6SA7 1st det. grid in series with .01 mfd.				L21-L20 1st I-F transformer
3	Antenna terminal in series with 300 ohms	11.8 mc	25 meter band	11.8 mc (41.5°)	L11 (osc.) C1 (ant.) C20 (det.)
4		15.2 mc		15.2 mc (161.7°)	C15 (osc.)*† Rock in
5	Repeat steps 3 and 4 until aligned.				
6	Antenna terminal in series with 300 ohms	15.2 mc	19-13 meter band	15.2 mc (24°)	L12 (osc.)**
7		9.5 mc	31 meter band	9.5 mc (23.8°)	L10 (osc.)** C2 (ant.) C25 (det.)***
8		9.5 mc	"B" band	9.5 mc (168.5°)	C10 (osc.)*
9	Antenna terminal in series with 200 mmfd.	1,500 kc	"A" band	1,500 kc (153°)	C12 (osc.) C3 (ant.) C24 (det.)
10		600 kc		600 kc (30.5°)	L8 (osc.) Rock in
11	Repeat steps 9 and 10.				

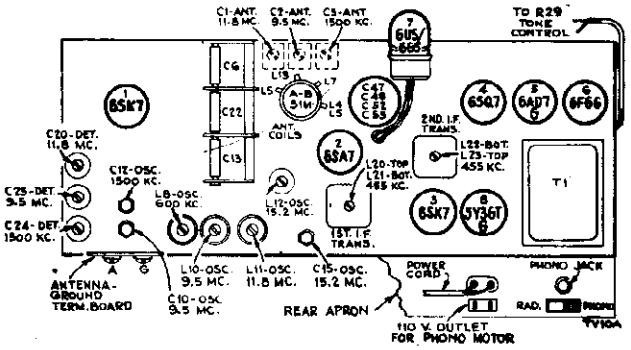
* Use minimum capacity peak if two can be obtained.

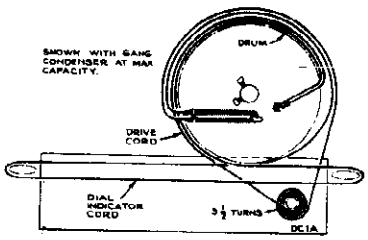
** If two peaks can be obtained, use the one obtained when the core screw is farthest out (counter-clockwise).

*** Use maximum capacity peak if two peaks can be obtained.

† Check image to determine that C15 has been adjusted to correct peak by tuning receiver to approximately 14.29 mc (147°) where a weaker signal should be received.

NOTE: Oscillator tracks above signals on all bands.





Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the oscillator output as low as possible to avoid a-v-c action.

Calibration Scale on Indicator-Drive-Cord Drum.—The tuning dial is fastened in the cabinet and cannot be used for reference during alignment, therefore a calibration scale is attached to the rear of the indicator-drive-cord drum which is mounted on the front shaft of the gang condenser.

As the first step in r-f alignment, check the position of the drum, it should correspond to that shown in the Dial Indicator and Drive Mechanism drawing when the gang condenser plates are fully meshed. The drum is held to the shaft by means of two set screws, which must be tightened securely when the drum is in the correct position.

Pointer for Calibration Scale.—Improvise a pointer for the calibration scale by fastening a piece of wire to the gang condenser frame, and bend the wire so that it points to the "0"" mark on the calibration scale when the plates are fully meshed.

The setting of the gang condenser is read on this scale, which is calibrated in degrees. The correct setting of the gang in degrees, for each alignment frequency, is given in the alignment table.

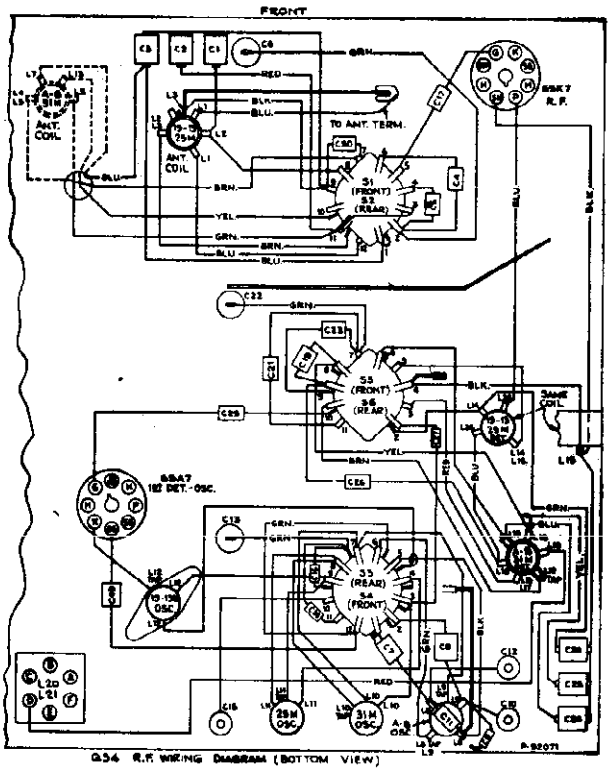
Receiver Dial with Calibration Scale.—To determine the corresponding frequency for any setting of the calibration scales, refer to the drawing.

Spread-Band Alignment.—The most satisfactory method of aligning or checking the spread-band ranges is on actual reception of short-wave stations of known frequency, by adjusting the magnetite-core oscillator coil for each band so that these stations come in at the correct points on the dial.

In exceptional cases, when the set is being serviced in a location where the noise level is high enough to prevent reception of short-wave stations, a test-oscillator may be used for alignment, but an extremely high degree of accuracy is required in the frequency settings of the test-oscillator, as a slight error will produce considerable inaccuracy on the spread-band dials. The frequency settings of the test-oscillator may be checked by one or both of the following methods:

1. Determine the exact dial settings of the test-oscillator (for frequencies at or close to the specified alignment frequencies) by zero-beating the test-oscillator against short-wave stations of known frequency.
2. Use harmonics of the standard-broadcast range of a test-oscillator, first checking the frequency settings on this range by means of a crystal calibrator, or by zero-beating against standard broadcast stations.

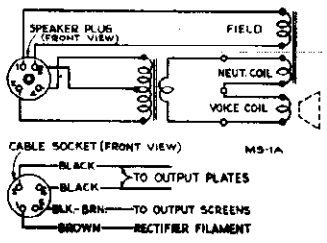
When a test oscillator is employed for spread-band alignment, a final check should be made on actual reception of short-wave stations of known frequency, and the magnetite-core oscillator coil for each band should be retouched so that the stations come in at the correct points on the dial.



Q34 R.F. WIRING DIAGRAM (BOTTOM VIEW)

RCA MFG. CO.

STOCK No.	DESCRIPTION
	CHASSIS ASSEMBLIES (RC 539E)
34502	Arm—Range switch actuating arm
37053	Board—"Antenna-Ground" board
39857	Bracket—L.H. bracket complete with drive cord pulley
39858	Bracket—R.H. bracket complete with drive cord pulley
37092	Calibrator—Drive drum calibrator
33014	Capacitor—Electrolytic, comprising three (3) sections of 10 mfd., 450 volts, and 1 section of 20 mfd., 25 volts (C47, C48, C52, C53)
37059	Capacitor—Mica trimmer, triple 2.5-10 mmf. (C1, C2, C3, C20, C24, C25)
33097	Capacitor—Ceramic, 4.7 mmf. (C27)
12714	Capacitor—Air trimmer, 2-12 mmf. (C10, C12, C15)
35646	Capacitor—Ceramic, 6 mmf. (C9)
39604	Capacitor—Mica, 10 mmf. (C19)
39041	Capacitor—Ceramic, 18 mmf. (C11)
35644	Capacitor—Ceramic, 47 mmf. (C16)
70582	Capacitor—Ceramic, 47 mmf. (C5, C23)
39622	Capacitor—Mica, 56 mmf. (C49, C50)
36072	Capacitor—Mica, 66 mmf. (C4, C21)
35645	Capacitor—Ceramic, 68 mmf. (C14)
39628	Capacitor—Mica, 100 mmf. (C30, C31)
39630	Capacitor—Mica, 120 mmf. (C33, C34)
39636	Capacitor—Mica, 220 mmf. (C17, C26, C29, C35, C42)
39626	Capacitor—Mica, 560 mmf. (C7)
70687	Capacitor—Mica, 3000 mmf. (C8)
70648	Capacitor—Tubular, .005 mfd., 1000 volts (C44, C45)
70606	Capacitor—Tubular, .005 mfd., 200 volts (C38)
70627	Capacitor—Tubular, .005 mfd., 600 volts (C40)
70610	Capacitor—Tubular, .01 mfd., 200 volts (C37)
70631	Capacitor—Tubular, .01 mfd., 600 volts (C43, C46)
70612	Capacitor—Tubular, .025 mfd., 200 volts (C39)
70615	Capacitor—Tubular, .05 mfd., 200 volts (C28)
70638	Capacitor—Tubular, .1 mfd., 600 volts (C18, C32)
37055	Coil—Antenna coil, A, B and 31 meter band (L4, L5, L7, L13)
37056	Coil—Antenna coil, 19-13 meter and 25 meter bands (L1, L2, L3)
37057	Coil—R-F coil, A, B and 31 meter bands (L16, L17, L18, L19)
37058	Coil—R-F coil, 19-13 meter and 25 meter bands (L14, L15, L26)
35624	Coil—Oscillator coil, 19-13 meter (L12)
35625	Coil—Oscillator coil, 25 meter band (L11)
35626	Coil—Oscillator coil, 31 meter band (L10)
37093	Coil—Oscillator coil, A & B band (L8, L9)
37151	Condenser—Variable tuning condenser (C6, C13, C22)
36109	Control—Tone control (R29)
37087	Control—Volume control and power switch (R9, S8)
32634	Cord—Drive cord (approx. 41 inches overall length)
32634	Cord—Indicator cord (approx. 42 inches overall length)
35788	Core—Adjustable core and stud for A & B band oscillator coil
12006	Core—Adjustable core and stud for I-F transformers
31259	Core—Adjustable core and stud for 19-13 meter, 25 meter and 31 meter band oscillator coils
37090	Drum—Drive drum
37094	Link—Link, arm and bushing assembly
5040	Plug—5 contact female plug for speaker cable
35641	Pulley—Drive cord pulley
36637	Receptacle—A-C power receptacle
30735	Resistor—560 ohms, 1 watt (R24)
30436	Resistor—12,000 ohms, ¼ watt (R10)
35595	Resistor—15,000 ohms, 3 watt (R20)
30492	Resistor—22,000 ohms, ¼ watt (R7)
30685	Resistor—33,000 ohms, ¼ watt (R3)
30650	Resistor—56,000 ohms, ½ watt (R21)
13734	Resistor—120,000 ohms, ¼ watt (R26)
30483	Resistor—150,000 ohms, ½ watt (R27)
30651	Resistor—270,000 ohms, ¼ watt (R8)
14983	Resistor—330,000 ohms, ¼ watt (R25)
30648	Resistor—470,000 ohms, ½ watt (R11, R23)
30652	Resistor—1 megohm, ¼ watt (R1, R2, R4)
30649	Resistor—2.2 megohms, ¼ watt (R5)
30992	Resistor—10 megohms, ¼ watt (R12)
14350	Screw—#8-32 square head set screw for Arm #34502 and link #37094
4669	Screw—#8-32 square head set screw for drive drum
37096	Shaft—Range indicator knob shaft
37095	Shaft—Range switch actuating shaft
37091	Shaft—Tuning knob shaft and flywheel
31364	Socket—Dial lamp socket
35787	Socket—Phono input socket
31251	Socket—Tube socket
34864	Socket—Tuning indicator tube socket
70576	Spring—Drive cord spring
31418	Spring—Indicator cord spring
12007	Spring—Retaining spring for I-F transformers' core and stud assemblies
31261	Spring—Retaining spring for 19-13 meter band and oscillator coil core and stud assemblies
33491	Switch—Radio-phono switch (S7)
37050	Switch—Range switch (S1, S2, S3, S4, S5, S6)
35636	Transformer—First I-F transformer (L20, L21, C30, C31)
36615	Transformer—Second I-F transformer (L22, L23, C33, C34 C35)
31733	Transformer—Power transformer, 105-125 volts, 50/60 cycle (T1)
31734	Transformer—Power transformer, 105-125 volts, 25/60 cycle (T1)
31735	Transformer—Power transformer, 105/130, 140/180, 200/250 volts, 50/60 cycle (T1)
* 34373	Washer—"C" washer for range switch actuating arm
2917	Washer—"C" washer for tuning knob shaft
	SPEAKER ASSEMBLY Stamped 92562-1]
70972	Cone—Cone and voice coil assembly
5039	Plug—4 prong male plug for speaker cable
70971	Speaker—7" x 9" EM speaker complete with cone and voice coil less output transformer and plug
70973	Transformer—Output transformer (T2)
	NOTE: If stamping on speaker in instrument does not agree with above speaker number, order replacement parts by referring to model number of instrument, number stamped on speaker and full description of part required.
	MISCELLANEOUS ASSEMBLIES
70589	Back—Cabinet back
70591	Board—Baffle board and grille cloth
70590	Bracket—Lamp bracket
30716	Clip—Tuning tube clip
39967	Crystal—Protective crystal for tuning tube
70579	Decal—Trade mark decal
39916	Dial—Glass dial scale
37922	Indicator—Station selector indicator
35652	Knob—Range indicator knob
35651	Knob—Range switch knob
35650	Knob—Tone control knob
34489	Knob—Volume control or tuning knob
11891	Lamp—Dial lamp
38859	Rail—Pointer rail
38641	Retainer—Retainer for tuning tube crystal
33438	Screw—Thumb screw for tube clip
14270	Spring—Retaining spring for tone control knob, volume control or tuning knob and for range switch knob
4982	Spring—Retaining spring for range indicator knob



Loudspeaker Connections

Frequency Ranges

Standard Broadcast ("A" Band)	540-1,720 kc (556-174 m)
Medium Wave ("B" Band)	3.0-9.5 mc (100-31.6 m)
31 Meter Spread Band	9.5-11.7 mc (31.6-25.6 m)
25 Meter Spread Band	11.7-15.1 mc (25.6-19.9 m)
19-13 Meter Spread Band	15.1-22.5 mc (19.9-13.3 m)

Intermediate Frequency ..... 455 kc

Power Output

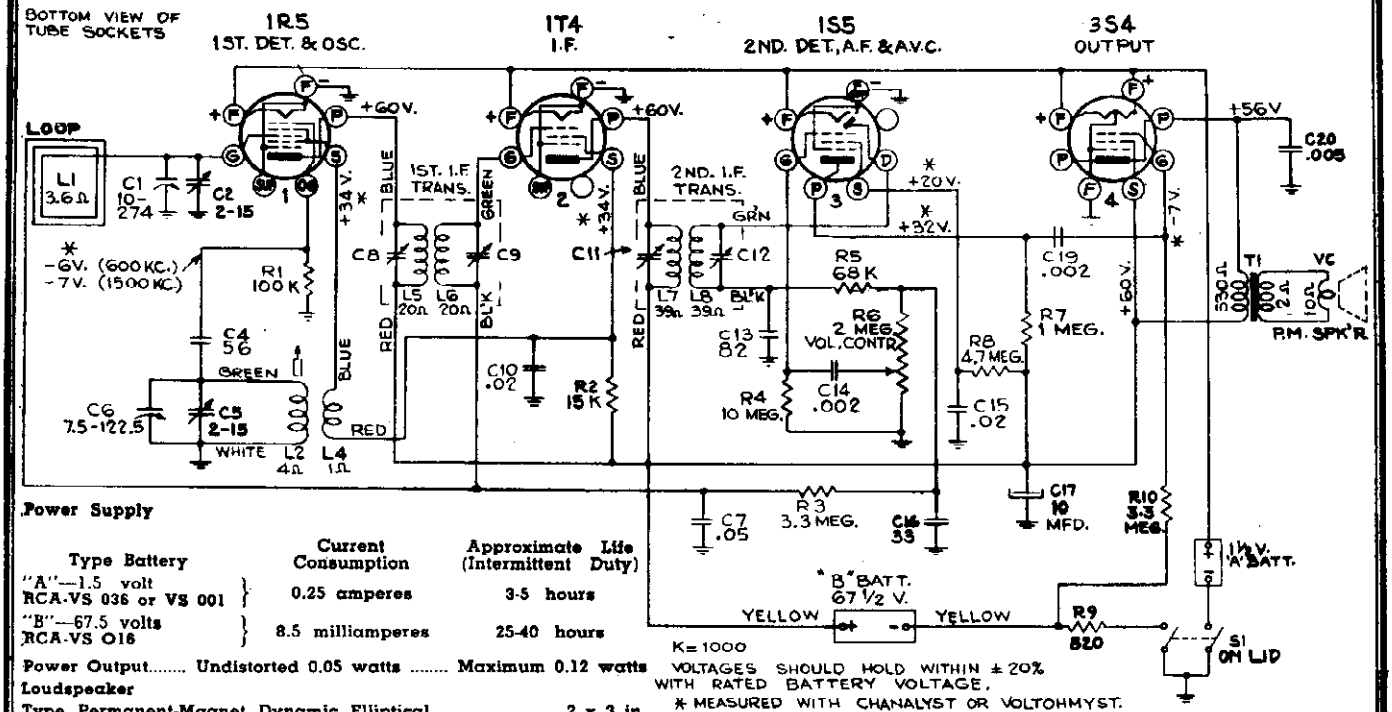
Undistorted	3.25 watts
Maximum	4.5 watts

Loudspeaker

Type	7" x 9" electrodynamic
V.C. Impedance	2.2 ohms at 400 cycles
Identification Number	92562-1]

MODELS 54B1, 54B1-N, 54B2, 54B3, Ch. RC-589

RCA MFG. CO.



K = 1000

VOLTAGES SHOULD HOLD WITHIN ± 20% WITH RATED BATTERY VOLTAGE.

* MEASURED WITH CHANALYST OR VOLTOHMYST.

ALL VOLTAGES ARE MEASURED WITH RESPECT TO CHASSIS GROUND.

P-92241 -1

Power Supply

Type Battery	Current Consumption	Approximate Life (Intermittent Duty)
"A"—1.5 volt RCA-VS 036 or VS 001	0.25 amperes	3-5 hours
"B"—67.5 volts RCA-VS 016	8.5 milliamperes	25-40 hours

Power Output..... Undistorted 0.05 watts ..... Maximum 0.12 watts

Loudspeaker

Type Permanent-Magnet Dynamic Elliptical ..... 2 x 3 in.

Voice Coil Impedance ..... 11¾ ohms at 500 cycles

Cabinet Dimensions (inches)..... 3-3/16 x 6½ x 4-3/16

Weight..... 3¼ lbs. (net) Tuning Drive Ratio .....1 to 1

Frequency Range ..... 550-1,600 kc

Intermediate Frequency ..... 455 kc

Test Oscillator.—Connect test oscillator as indicated in chart keeping the output as low as possible to avoid A V C action.

Output Meter.—Connect meter from top lug of TB1 (plate of 354) to ground. Turn volume control to maximum position.

Fig. 1 shows the modifications necessary to convert the center strip portion of a case into a convenient shield to be used as a substitute for the regular case center strip in the RF, Osc. alignment.

Steps	Connect the high side of test osc. to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. peak output—
1	Connection lug of C2, located on rear of gang in series with .01 mf.	455 kc	Quiet point near 1,600 kc	C11, C12 2nd I-F trans.
2		455 kc	Quiet point near 1,500 kc	C8, C9 1st I-F trans.
3	*Antenna coupling loop thru 200 mmf. capacitor	1,600 kc	1,600 kc	C5 (osc.)
4		1,500 kc	1,500 kc	C2 (ant.)
5		600 kc	600 kc	L2 (osc.)
6	Repeat steps 4 and 5 for final adjustments.			

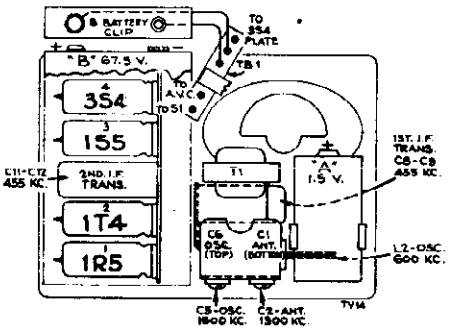
* Steps 3, 4 and 5 require a coupling loop from the signal generator to feed a signal into the receiver loop located in the lid. This loop should be approximately one turn of 6 x 3½ inches coupled to the signal generator through a 200 mmf. capacitor, and loosely coupled to the receiver loop antenna at about 1¾ inches distance, so as not to disturb the receiver loop inductance. Ground test oscillator through .1 mf. capacitor to receiver chassis.

Tools required:

1. One Phillips No. 1 screwdriver.
2. One small neutralizing alignment tool.

CRITICAL LEAD DRESS

1. Dress blue, green and black leads of second I-F transformer as direct as possible. If excess lead exists, dress down side of socket and flat against chassis to transformer opening.
2. Cross the green and the black leads inside the first I-F transformer can, keeping the green lead to the outside. Keep the blue and the green leads separated as far as possible throughout their length.
3. Dress audio coupling capacitor (C14; .002 mf.) and the lead to the volume control up and underneath the shelf supporting the output transformer.
4. Dress the three capacitors pyramided behind the speaker, parallel to the complete assembly and with enough room behind the battery holder to allow the holder to move when a battery is installed or removed.
5. Dress the "B" battery leads behind the gang frame and over the top of the output transformer.
6. Observe the outside foil connections on all paper capacitors, also the polarity of the electrolytic capacitor (C17).
7. Keep blue and red leads of output transformer above the mounting shelf.



Note: DO NOT install "A" battery without cardboard cover.

A rubber band should be placed around each tube for cushioning.

RCA MFG. CO.

Replacement of Component Parts

I. **To remove back cover:**

a. Depress locking spring clip through hole in top of case.

b. With spring clip depressed, pull cover carefully out and up off the locking lug in the bottom of the case.

II. **To replace batteries:**

a. Remove back cover.

b. Remove, either or both, the "A" and "B" battery as the case may warrant. The "B" battery snap fasteners can best be removed by inserting a screwdriver under the snap fastener strip and prying upward.

III. **To remove the case center strip:**

a. Remove one screw on the inside near the back cover.

b. Tilt case center strip and lift.

IV. **To replace tubes:**

a. Remove back cover.

b. Remove "B" battery.

c. Remove case center strip.

d. Remove and replace tubes as required.

V. **To remove the escutcheon plate (top cover):**

a. Remove the main dial knob, just pull.

b. Remove the four corner nuts (B), rear.

c. The plate may either be removed from the stay arm or folded into the lid.

VI. **To replace speaker:**

a. Remove escutcheon plate (see item V above).

b. Remove two Phillips screws, (C) on chassis front of panel assembly holding speaker.

c. Unsolder voice coil leads.

d. Slide forward away from hinge side.

VII. **To remove output transformer:**

a. Remove speaker (see item VI).

b. Remove rivet (when replacing use small brass bolt).

c. Unsolder mounting lug and leads.

d. Pull out transformer.

VIII. **To remove volume control:**

a. Remove speaker (item VI).

b. Unsolder (disconnect) lead to positive terminal of "A" battery holder.

c. Lift up the "A" battery holder by removing the one screw in its base. This holder has a hinge action and must be lifted up and back to remove.

d. Remove front plate (panel) as follows:

1. Unsolder two copper strips (E) (from end of tube shelf to front plate) located under tubes 1R5 3S4.
2. Remove two screws (F) holding tube shelf to front plate. These screws are located between tubes 1R5 and 1T4, also 3S4 and 1S5. Rubber shock mounts may stick on studs, pry loose.
3. Remove nut (G) beneath tube shelf below second I-F transformer.
4. Remove screw (G) beneath the negative terminal of "A" battery holder, near cover hinge and also screw (G) adjacent to volume control below "A" battery holder near release catch.
5. Unsolder three chassis leads to cover switch assembly or remove the switch assembly from the front cover plate.
6. Lay chassis on board or jig.
7. Remove front plate.
8. Unsolder volume control leads.
9. Remove volume control knob and spider.
10. Remove volume control assembly by bending back four lugs.

Caution: Do not close lid unless center screw of switch assembly is in place.

e. Reassemble in reverse order.

IX. **To remove oscillator coil:**

a. Same procedure and steps as covered in item VIII for removal of volume control plus the following.

b. Unsolder oscillator coil leads.

c. Remove coil by unsnapping spring mounting clips from angle bracket.

X. **To remove 1st I-F transformer:**

a. Remove speaker.

b. Unsolder four leads from 1st I-F transformer.

1. Blue to plate (screen used as plate) of 1R5 tube.
2. Green to grid of 1T4 tube.
3. Red to B+ terminal of 5 lug terminal board adjacent output transformer.
4. Black to AVC terminal of same strip as above.

c. Remove connections as required from two lug terminal board adjacent to 1st I-F transformer to permit this terminal board to be moved to a position free of the 1st I-F transformer.

d. Unsolder and bend mounting lugs straight on the I-F transformer can. These lugs are immediately below the 2nd I-F transformer on tube shelf.

e. Slip 1st I-F transformer forward toward volume control and out.

Note: It is possible to fold the 1st I-F transformer out the front of the chassis if the front plate is removed. This will eliminate the unsoldering of leads from the two lug terminal board.

XI. **To remove 2nd I-F transformer:**

a. Carefully remove the two 0.02 uf C10, C15 capacitors.

b. Carefully depress the two leads (B+ and A+) near the I-F transformer case mounting lugs and unsolder these lugs from the tube mounting shelf and bend out.

c. Unsolder the blue (plate of 1T4), green (grid of 1S5), red (B+ on terminal board), and black leads.

d. Remove 2nd I-F transformer.

XII. **To remove condenser tuning gang:**

a. Loosen oscillator coil.

b. Unsolder leads to tuning gang.

c. Unsolder grounding straps.

d. Remove three screws holding gang assembly to chassis.

e. Remove gang from rear of chassis.

XIII. **To remove loop assembly:**

a. Unsolder loop leads in chassis.

b. Remove screw holding fish paper insulating envelope to chassis switch.

c. Remove snap fasteners holding loop in cover.

70447	Loop—Antenna loop complete with connectors less lid—Model 54B1—Black
70985	Loop—Antenna loop complete with connectors less lid—Model 54B2—Brown
70449	Nameplate—"RCA" nameplate
70427	Nut—Retaining nut for lid support stud
70420	Panel—Chrome panel
70422	Plate—Backing plate for mounting hinge on lid—Model 54B1—Black (2 required)
70983	Plate—Backing plate for mounting hinge on lid—Model 54B2—Brown (2 required)
14076	Resistor—820 ohms, ¼ watt (R9)
36714	Resistor—15,000 ohms, ¼ watt (R2)
14138	Resistor—68,000 ohms, ¼ watt (R5)
3252	Resistor—100,000 ohms, ¼ watt (R1)
30652	Resistor—1 megohm, ¼ watt (R7)
12928	Resistor—3.3 megohms, ¼ watt (R3, R10)
30931	Resistor—4.7 megohms, ¼ watt (R8)
30992	Resistor—10 megohms, ¼ watt (R4)
70421	Screw—Case cover mounting screw (1 set)—Model 54B1
71150	Screw—Case cover mounting screw—Model 54B2
70446	Screw—#6-32 x ¼" long self-tapping screw to mount battery holder
70436	Socket—Tube socket
70423	Spacer—Rubber shock spacer
70428	Speaker—2" x 3" elliptical P.M. speaker
70425	Spring—Tuning knob spring clip
70426	Stud—Lid support stud
70451	Support—Lid support
70435	Support—Tube support less tube sockets and transformer
70430	Switch—Power switch (S1)
70442	Transformer—First I-F transformer (L5, L6, C8, C9)
70440	Transformer—Output transformer (T1)
70437	Transformer—Second I-F transformer (L7, L8, C11, C12)
70433	Washer—Spring washer for volume control knob
	MISCELLANEOUS ASSEMBLIES
70456	Bottom—Case bottom—54B1—Black
70988	Bottom—Case bottom—54B2—Brown
70457	Catch—Spring catch assembly
70455	Center—Case center—Model 54B1—Black
70987	Center—Case center—Model 54B2—Brown
70459	Handle—Carrying handle—Model 54B1—Black
70989	Handle—Carrying handle—Model 54B2—Brown
70461	Link—Handle link—Model 54B1—Black (2 required)
70990	Link—Handle link—Model 54B2—Brown (2 required)
70458	Nameplate—"His Master's Voice" nameplate
70460	Screw—#4-40 x ⅛" fillister head screw for case center strip

MODELS 55U, 55AU

STOCK No.	DESCRIPTION
	CHASSIS ASSEMBLY **(RC 1017)**
70389	Bearing—Tuning knob shaft bearing
70407	Button—Plug button (2 required)
70997	Capacitor—Ceramic, 5.6 mmf. (C24)
39650	Capacitor—Mica, 820 mmf. (C15)
70601	Capacitor—Tubular, .002 mfd., 400 volts (C5, C9)
70606	Capacitor—Tubular, .005 mfd., 400 volts (C1, C11)
70611	Capacitor—Tubular, .02 mfd., 400 volts (C8)
70612	Capacitor—Tubular, .025 mfd., 400 volts (C10)
70615	Capacitor—Tubular, .05 mfd., 400 volts (C2, C14)
70617	Capacitor—Tubular, 0.1 mfd., 400 volts (C3, C4)
70408	Capacitor—Electrolytic comprising 1 section of 30 mfd., 150 volts and 1 section of 50 mfd., 150 volts (C12, C13)
70403	Coil—Oscillator coil
70383	Condenser—Variable tuning condenser complete with drum (C18, C16)
70322	Control—Volume control, 0.5 megohms (R10)
32634	Cord—Drive cord (approx. 48" overall length)
70392	Cord—Power cord
70384	Drum—Drive drum
70397	Gear—Power or radio-phono switch gear
70395	Gear—Volume control gear and spring assembly
70404	Indicator—Station selector indicator
70391	Insulator—Bakelite insulator for phono input socket
11765	Lamp—Dial lamp
70393	Loop—Antenna Loop (L1, L2)
70382	Plate—Dial back plate complete with pulleys less dial
30868	Plug—2 contact female plug for AC cable
36230	Pulley—Drive cord pulley
30880	Resistor—150 ohms, ¼ watt (R7)
6134	Resistor—1200 ohms, 1 watt (R9)
30492	Resistor—22,000 ohms, ¼ watt (R2)
14583	Resistor—220,000 ohms, ¼ watt (R1, R5)
30648	Resistor—470,000 ohms, ¼ watt (R8)
12928	Resistor—3.3 megohm, ¼ watt (R4)
31455	Resistor—5.6 megohm, ¼ watt (R6)
14974	Screw—#8-32 x 3/16" long set screw for lower gear
70388	Shaft—Tuning knob shaft
34449	Socket—Lamp socket
35787	Socket—Phono input socket
37605	Socket—Tube socket—moulded
70390	Spring—Drive cord tension spring
70396	Spring—Volume control gear tension spring
70394	Switch—Power or radio phono switch (S1)
70386	Transformer—First I.F. transformer (L6, L7; C20, C21)
70387	Transformer—Second I.F. transformer (L8, L9; C22, C23; C6, C7)
70385	Transformer—Output transformer
33726	Washer—"C" washer for tuning knob shaft
70406	Washer—Spring washer for volume control
	SPEAKER ASSEMBLY 922279-1
70405	Speaker—4" x 6" P.M. speaker complete NOTE: If stamping on speaker in instrument does not agree with above speaker number, order replacement parts by referring to model number of instrument, number stamped on speaker and full description of part required.
	MISCELLANEOUS ASSEMBLIES
X1605	Board—Baffle board and grille
70398	Clamp—Dial clamp (1 set)
35392	Decal—Trademark decal (RCA Victor)
70575	Decal—Trademark decal (Dog)
70402	Dial—Dial scale
70707	Hinge—Cabinet lid hinge (2 required)
70401	Knob—Power or radio-phono switch knob
70400	Knob—Tuning knob
70399	Knob—Volume control knob
14270	Spring—Retaining spring for tuning knob and volume control knob
39545	Support—Lid support

POWER OUTPUT

Undistorted	1.5 watts
Maximum	2.4 watts

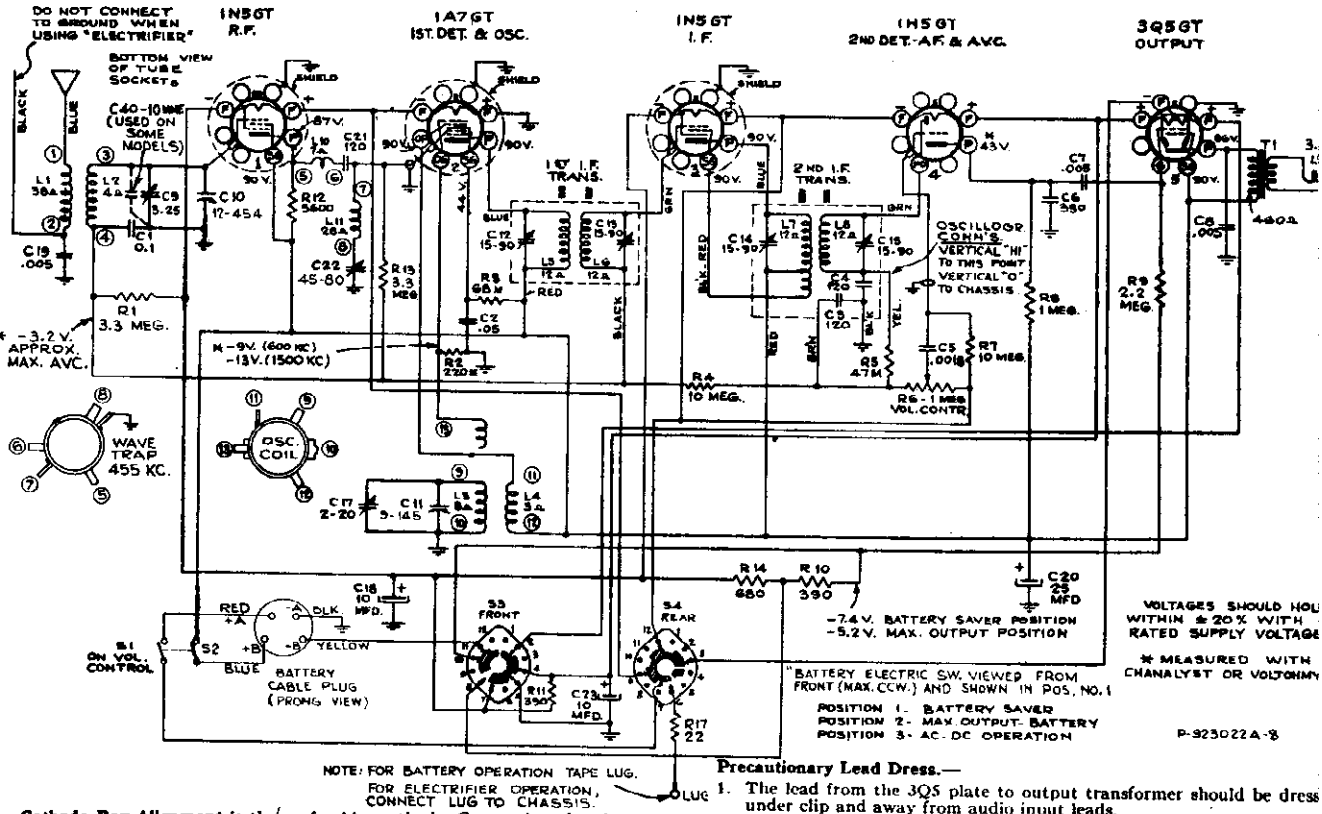
LOUDSPEAKER (M922279-1) "PM"

Size	4 x 6 inch elliptical
V.C. Impedance	3.4 ohms at 400 cycles
Some models may have	5 inch PM

PHONOGRAPH

Type	Automatic (T960015)
Record Capacity	Twelve 10-in., Ten 12-in.
Turntable Speed	78 r.p.m.
Type Pickup	Crystal
Motor Power Consumption	25 watts

RCA MFG. CO.



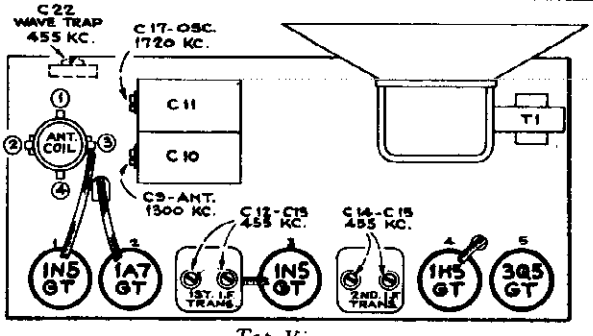
Cathode Ray Alignment is the preferable method. Connections for the oscillograph are shown in the diagram.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil and turn the receiver volume control to maximum.

Test Oscillator.—For all alignment operations, connect the low side of the test oscillator to the receiver chassis, and keep the output as low as possible to avoid AVC action.

Pre-Setting Dial.—With gang condenser in full mesh, the pointer should be set at the left-hand end dial calibration mark.

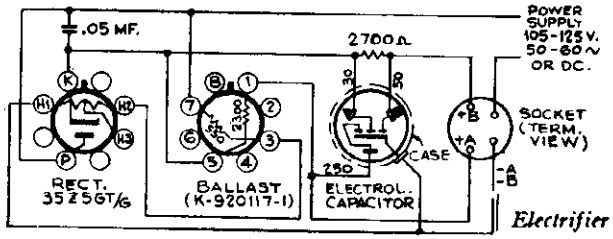
Step	Connect high side of the test oscillator to—	Tune test osc. to—	Turn radio dial to—	Adjust the following for maximum peak output
1	I-F grid in series with .01 mfd.	455 kc	Quiet point between 550 and 750 kc	C14, C15. (2nd I-F Trans.)
2	1A7GT grid in series with .01 mfd.			C12, C13 (1st I-F Trans.)
3	Antenna terminal in series with 200 mmfd.	1,720 kc	Tuning condenser rotor plates all out	C17 (osc.)
4		1,300 kc	1,300 kc signal	C9 (ant.)
5		455 kc	Quiet point between 550 and 750 kc	Adjust C22 for minimum output on strong 455 kc signal



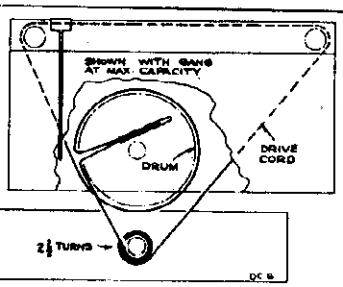
Top View

Precautionary Lead Dress.—

1. The lead from the 3Q5 plate to output transformer should be dress under clip and away from audio input leads.
2. All filament wires should be dressed close to chassis.
3. Keep AVC lead connecting C1, (0.1 mfd. filter) to antenna coil aw from the 1A7GT plate.
4. Keep blue plate leads coming from I.F. transformers short and clo to chassis.
5. Keep yellow leads connecting to oscillator coil away from trap co
6. Keep grid lead of 1N5GT RF tube away from 1A7GT grid.
7. Keep green lead from second I.F. transformer short and close to groun



Electrifier Schemat



FREQUENCY RANGE.... .540-1,720 k
INTERMEDIATE FREQUENCY.. ..455 k
MAXIMUM POWER OUTPUT... .3 wat

IMPORTANT

Remove any external ground connections when using the Electrifier.

CAUTION: Turn power switch off (counter-clockwise) when installing or replacing tubes or batteries.

RECEIVER IS SHIPPED READY FOR BATTERY OPERATION. FOR ELECTRIFIER OPERATION, REMOVE TAPE FROM LUG AT REAR OF CHASSIS AND CONNECT LUG TO CHASSIS.

On a DC power supply, if no reception is obtained, reverse the plug in the outlet and retune. On an AC supply, reversal of the plug may reduce hum. CAUTION! Do not touch Radio Chassis unless power plug is removed from socket.

X1606	Board—Baffle board and grille cloth
36462	Clamp—Dial clamp
35915	Escutcheon—Dial escutcheon less dial
36886	Knob—Power switch knob
36722	Knob—Tuning knob
71281	Knob—Volume control knob
30900	Spring—Retaining spring for knob
38679	Window—Glass window for dial scale
	CV-42 ELECTRIFIER
38702	Ballast—Plug-in ballast tube resistor
38701	Capacitor—Electrolytic, comprising 1 section of 50 mfd., 150 volts, 1 section of 30 mfd., 150 volts, and 1 section of 250 mfd., 10 volts
30847	Capacitor—.05 mfd., 400 volts
28451	Cover—Insulating cover for electrolytic capacitor
35069	Fastener—Push fastener for bottom cover
28452	Plate—Bakelite mounting plate for electrolytic capacitor
38702	Resistor—Ballast tube resistor
30730	Resistor—2,700 ohms, ½ watt
31027	Socket—Power output socket
31251	Socket—Tube or ballast resistor socket
38702	Tube—Ballast tube resistor

CIRCUIT DESCRIPTION.—Superheterodyne with one stage of radio frequency amplification, automatic volume control and class "A" beam power output. Battery operation, with optional AC-DC socket power attachment available. Model 55F can be operated on 105-125 volts AC, 50-60 cycles, or 105-125 DC, by means of an RCA CV-42 Electrifier.

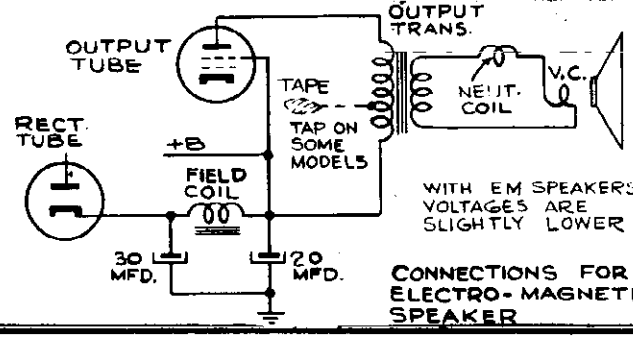
LOUDSPEAKER (5 inch) 92515-1
Voice coil impedance at 400 cycles.....3.4 ohms

POWER SUPPLY
Battery.....RCA VS022 or equivalent
Battery Drain
"A" 1½ volt section.....3 ampere
"B" 90 volt section.....10 m.a. (Switch in "Battery Saver Position")
14 m.a. (Maximum Output Position)

POWER CONSUMPTION
With CV-42 Electrifier Unit (switch in "Electric" position).....22.5 watts
Cabinet Dimensions (inches).....18 x 9½ x 10¾

Models 56X, 56X2, 56X3

Steps	Connect the high side of test-oscillator to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. peak output
1	Stator of C-12 in series with .01 mfd.	455 kc	Quiet-point 1,600 kc end of dial	C18 and C19 2nd I-F transformer
2				C16 and C17 1st I-F transformer
3	Ant. lead in series with 200 mmfd.	1,300 kc	1,300 kc	C14 (osc.) C13 (ant.)
4	Repeat step 3.			

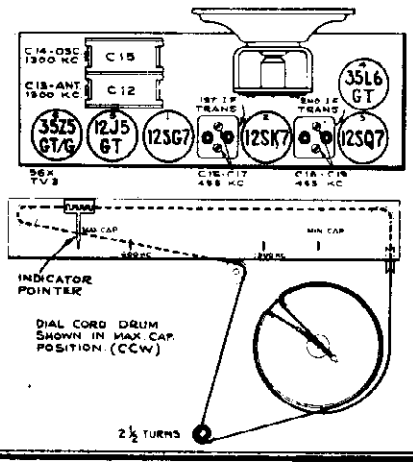


CONNECTIONS FOR ELECTRO-MAGNETIC SPEAKER

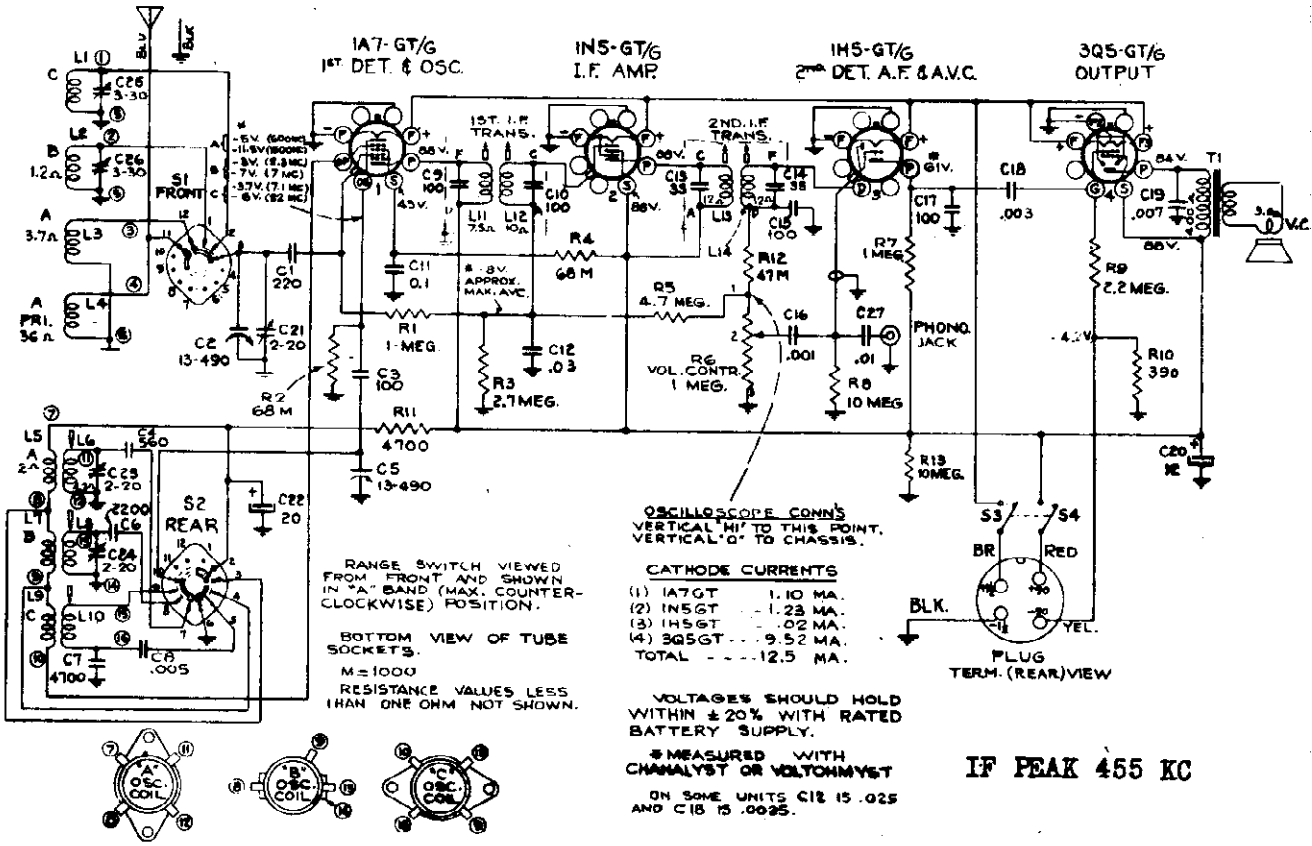
Test Oscillator. - Connect high side of test oscillator as shown in chart. Connect low side through a .01 mf capacitor to common "-B." Keep the output signal as low as possible to avoid AVC action.

Output Meter. - Connect leads between speaker voice coil and chassis. Turn volume control to maximum clockwise, tone control to maximum highs (clockwise).

Dial Pointer Adjustment. - Rotate tuning condenser fully counter-clockwise (plates closed). Adjust indicator pointer to left (max. Cap.) mark on dial back plate.



RCA MFG. CO.



IF PEAK 455 KC

STOCK No.	DESCRIPTION
	CHASSIS ASSEMBLIES (RC-563A)
32548	Capacitor—Electrolytic, comprising 1 section of 12 mfd., 150 volts, and 1 section of 20 mfd., 150 volts (C20, C22)
32830	Capacitor—Mica trimmer, dual, 2-20 mmf. (C23, C24)
31292	Capacitor—Mica trimmer, dual, 3-30 mmf. (C25, C26)
39616	Capacitor—Mica, 33 mmf. (C13, C14)
39628	Capacitor—Mica, 100 mmf. (C3, C9, C10, C15, C17)
39636	Capacitor—Mica, 220 mmf. (C1)
70667	Capacitor—Mica, 560 mmf. (C4)
39660	Capacitor—Mica, 2200 mmf. (C6)
39668	Capacitor—Mica, 4700 mmf. (C7)
70600	Capacitor—Tubular, .001 mfd., 200 volts (C16)
70603	Capacitor—Tubular, .003 mfd., 200 volts (C18)
70606	Capacitor—Tubular, .005 mfd., 200 volts (C8)
70608	Capacitor—Tubular, .007 mfd., 400 volts (C19)
70610	Capacitor—Tubular, .01 mfd., 200 volts (C27)
70613	Capacitor—Tubular, .03 mfd., 200 volts (C12)
70617	Capacitor—Tubular 0.1 mfd., 200 volts (C11)
32821	Coil—Antenna coil, "A," "B" and "C" bands (L1, L2, L3, L4)
32148	Coil—Oscillator coil, "A" band (L5, L6)
33784	Coil—Oscillator coil, "B" band (L7, L8)
38295	Coil—Oscillator coil, "C" band (L9, L10)
38287	Condenser—Variable tuning condenser (C2, C5, C21)
36080	Control—Volume control and power switch (R6, S3, S4)
32634	Cord—Drive cord (approx. 49 inches overall length)
36093	Core—Adjustable core and stud for "A" band oscillator coil
35788	Core—Adjustable core and stud for "B" band oscillator coil
38296	Core—Adjustable core and stud for "C" band oscillator coil
12006	Core—Adjustable core and stud for I-F transformers
38237	Drum—Drive drum
37068	Indicator—Station selector indicator
38288	Plate—Dial back plate complete with drive cord pulleys
30585	Plug—4 prong male plug for battery cable
36230	Pulley—Drive cord pulley
30652	Resistor—1 megohm, ¼ watt (R1, R7)
14752	Resistor—2.7 megohms, ¼ watt (R3)
30649	Resistor—2.2 megohms, ¼ watt (R9)
30931	Resistor—4.7 megohms, ¼ watt (R5)
30992	Resistor—10 megohms, ¼ watt (R8, R13)
30498	Resistor—390 ohms, ¼ watt (R10)
30494	Resistor—4700 ohms, ¼ watt (R11)
30787	Resistor—47,000 ohms, ¼ watt (R12)
14138	Resistor—68,000 ohms, ½ watt (R2, R4)
36887	Shaft—Tuning knob shaft
70377	Shield—Tube shield for IN5GT tube
33742	Socket—Phono input socket
31319	Socket—Tube socket, moulded
31251	Socket—Tube socket, wafer
31418	Spring—Drive cord spring
31261	Spring—Retaining spring for "A" and "C" band oscillator coil core and stud
12007	Spring—Retaining spring for "B" band oscillator coil core and stud and retaining spring for I-F transformers' core and stud assemblies
38297	Switch—Range switch (S1, S2)
35636	Transformer—First I-F transformer (L11, L12, C9, C10)
36122	Transformer—Second I-F transformer (L13, L14, C13, C14)
38300	Transformer—Output transformer (T1)
33726	Washer—"C" washer for tuning knob shaft
	SPEAKER ASSEMBLIES (92510-1)
70413	Speaker—5-inch P.M. speaker complete
	Note: If stamping on speaker in instrument does not agree with above speaker number, order replacement parts by referring to model number of instrument, number stamped on speaker and full description of part required.
	MISCELLANEOUS ASSEMBLIES
36890	Clamp—Dial clamp, left hand
36891	Clamp—Dial clamp, right hand
35480	Decal—Range switch decal
36103	Decal—Volume control and power switch decal
38328	Dial—Glass dial scale
38888	Knob—Range switch or volume control knob
36722	Knob—Tuning knob
30900	Spring—Retaining spring for control knob

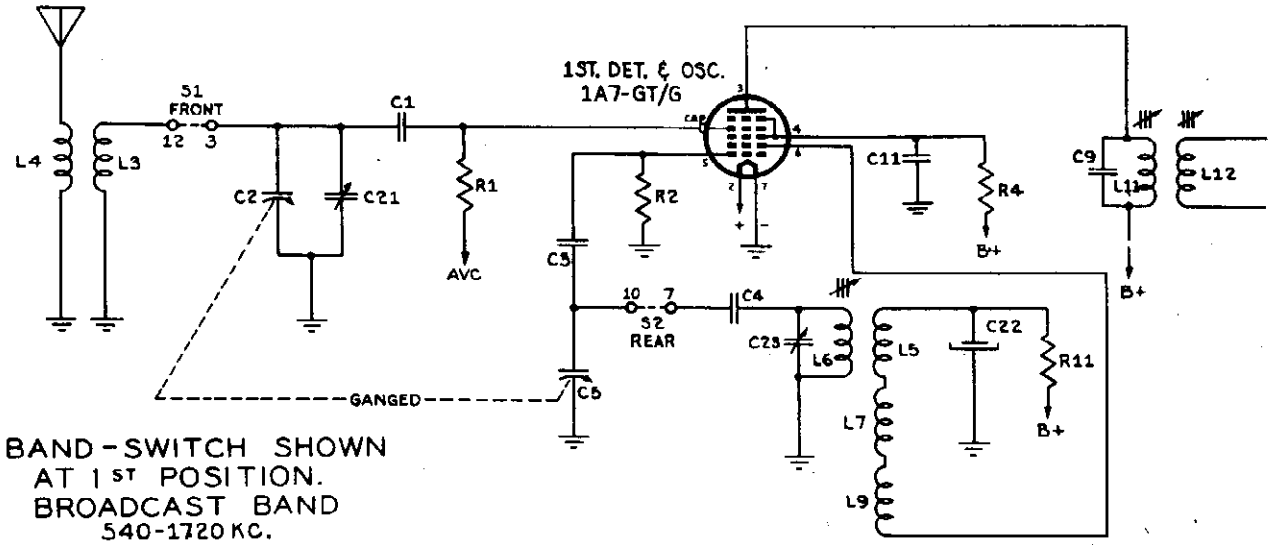
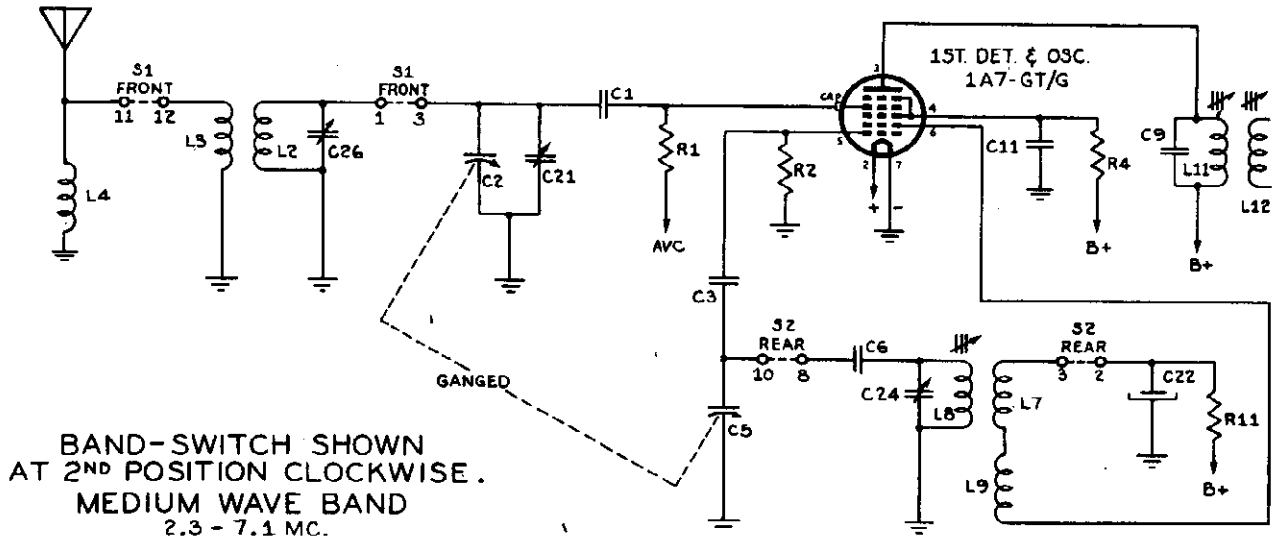
Ch.RC-563A

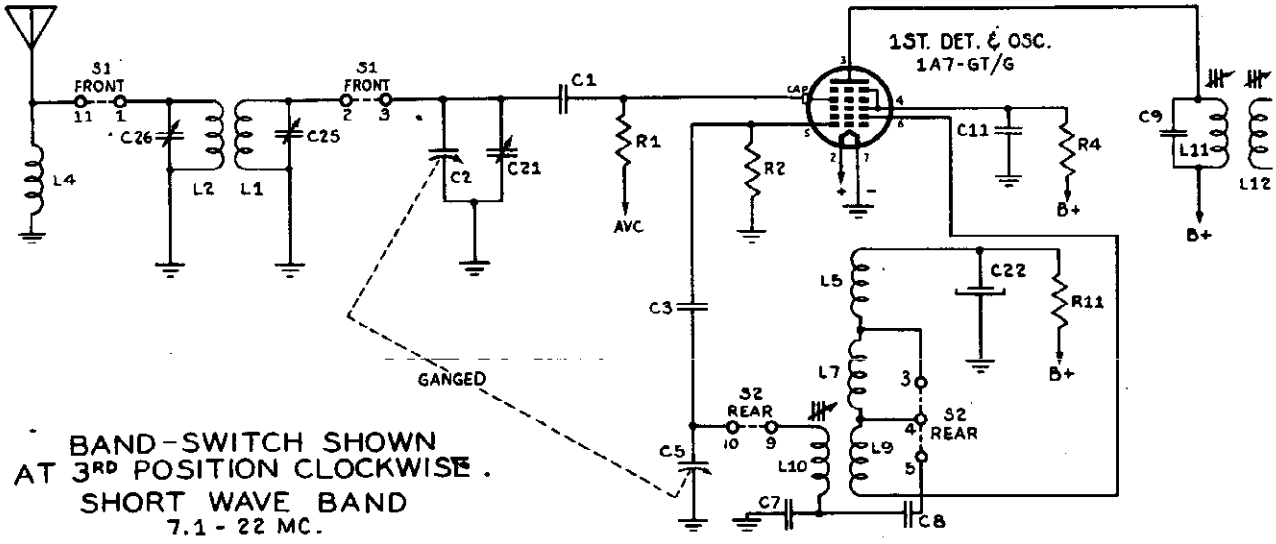
RCA MFG. CO.



BAND-SWITCH SHOWN
AT 1ST POSITION.
BROADCAST BAND
540-1720 KC.



BAND-SWITCH SHOWN
AT 2ND POSITION CLOCKWISE.
MEDIUM WAVE BAND
2.3 - 7.1 MC.



BAND-SWITCH SHOWN
AT 3RD POSITION CLOCKWISE.
SHORT WAVE BAND
7.1 - 22 MC.

RCA MFG. CO.

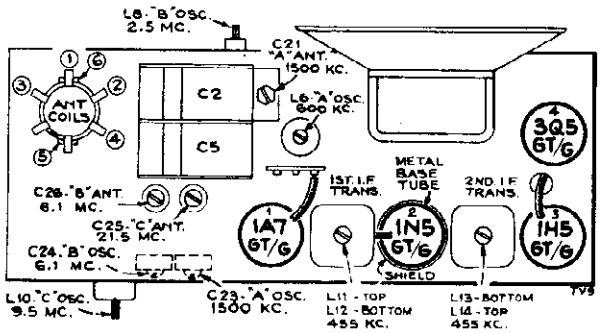
Cathode Ray Alignment is the preferable method. Connections for the oscilloscope are shown on the schematic diagram.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil and turn the receiver volume control to maximum.

Test Oscillator.—For all alignment operations, connect the low side of the test oscillator to the receiver chassis and keep the oscillator output as low as possible to avoid AVC action.

Calibration Scale.—The dial backing plate has 6 marks which correspond to the frequencies indicated on the "Dial Indicator and Drive Mechanism" drawing. These marks are used during alignment.

Before alignment, set the dial pointer so that, with the tuning condenser gang in full mesh, the pointer is 1/16 inch to the left of the left hand mark on the dial backing plate.



PRECAUTIONARY LEAD DRESS

1. The 220 mmf. condenser (C1) from the gang to the wiring panel on top of chassis to be dressed away from the chassis.
2. All oscillator plate leads to coils and switch to be as short and direct as possible.
3. The green lead from r-f section of the tuning condenser gang to terminal No. 3 on switch S1 to be dressed as near as possible to terminal No. 10 on switch S2 and to the green lead from oscillator section of the tuning condenser gang.
4. The black lead from terminal No. 9 on switch S2 to L10 to be dressed below and touching the black lead from terminal No. 2 on switch S1 to the C-band antenna trimmer (C25).
5. The red lead from the B-band oscillator trimmer (C24) to the B-band oscillator coil (L8) to be dressed above and touching the yellow lead from terminal No. 1 on switch S1 to the B-band antenna trimmer (C26).
6. The 100 mmf. mica capacitor (C3) from oscillator section of the condenser gang to terminal 5 of IA7GT/G socket dressed away from the chassis.

Steps	Connect high side of test osc. to—	Tune test osc. to—	Turn radio dial to—	Adjust following for max. peak output—
1	1N5GT/G IF grid cap in series with .01 mfd.	455 kc	"A" Band Quiet Point at High Freq. End	L14 and L13 (2nd I-F Trans.)
2	1A7GT/G 1st det. grid cap in series with .01 mfd.			L12 and L11† (1st I-F Trans.)
3	Antenna Lead in series with 200 mmf.	1,500 kc	1,500 kc mark	Peak C23 (osc.) and C21 (ant.)
4		600 kc	600 kc mark	L8 (osc.)**
5		Repeat steps 3 and 4.		
6	Antenna Lead in series with 300 ohms	6.1 mc	6.1 mc mark	Peak C24 (osc.)* and C26 (ant.)
7		2.5 mc	2.5 mc mark	L8 (osc.)**
8		Repeat steps 6 and 7.		
9		9.5 mc	9.5 mc mark	L10 (osc.)**
10		21.5 mc	21.5 mc mark	C25 (ant.)**

* Use minimum capacity peak if two peaks can be obtained.

** Rock gang slightly for peak output.

† Do not readjust L14 or L13 when test oscillator is applied to IA7-GT/G grid.

VICTROLA ATTACHMENT

A jack is provided on the rear of chassis for connecting a Victrola Attachment to the audio amplifying circuit. The cable from the attachment should be terminated in a Stock No. 31048 plug.

When Victrola is not in use its plug should be disconnected.

When Victrola is in use, the volume control on the radio should be at minimum, and, if necessary, tune set off frequency from any very strong station.

Frequency Ranges

Standard Broadcast ("A" Band) ...540-1,720 kc (555-174m)
Medium Wave ("B" Band) .....2.3-7.1 mc (130-42.2 m)
Short Wave ("C" Band) .....7.1-22 mc (42.2-13.6 m)

Intermediate Frequency .....455 kc

Batteries Required

1—RCA-VSO22 Battery Pack or equivalent
Or: 1—1½ Volt "A" Battery and 2—45 Volt "B" Batteries

Battery Drain

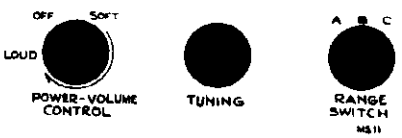
"A" ..... 0.25 amp.
"B" ..... 12.5 ma.

Power Output

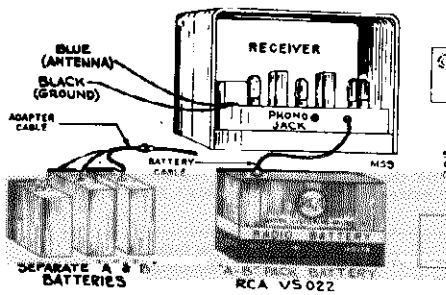
Undistorted ..... 0.20 watt
Maximum ..... 0.26 watt

Loudspeaker (92510-1)

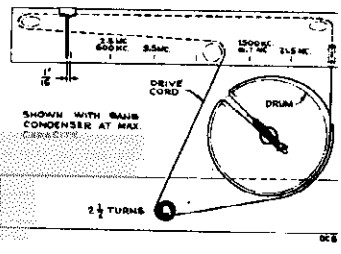
Type .....5-inch permanent-magnet dynamic
Voice-coil impedance .....4 ohms at 400 cycles



Dial Controls



Power Connections



Dial Indicator and Drive Mechanism

NOTES:

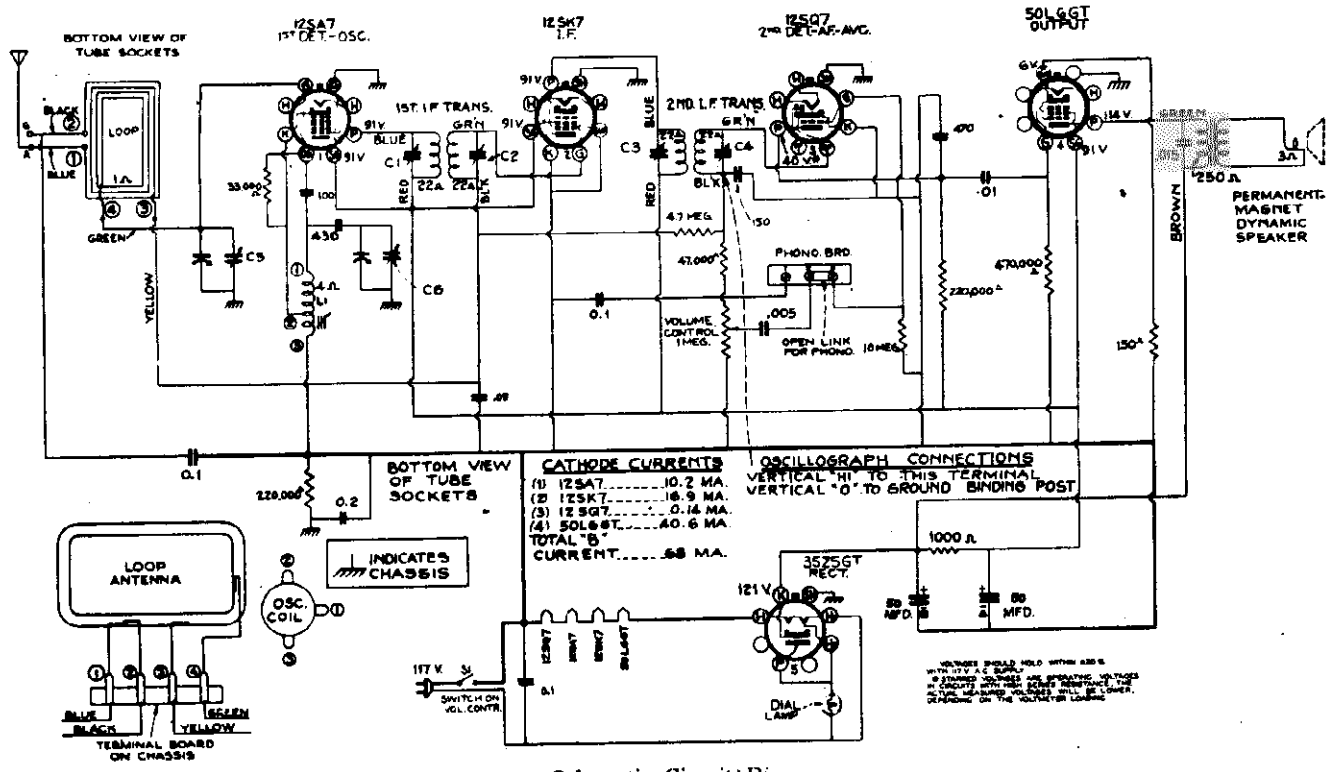
1. A four wire cable with plug is provided for making connection to the RCA-VSO22 battery pack or equivalent.
2. When separate batteries are used, an adapter extension cable is necessary.
3. A good ground connection is essential for best results.

Cabinet Dimensions (Inches)

Height ..... 7⅝ inches
Width ..... 12⅛ inches
Depth ..... 6¾ inches

MODEL X-55, Ch. RC-473A

RCA MFG. CO.



Schematic Circuit Diagram

FREQUENCY RANGE	540-1,720 kc
INTERMEDIATE FREQUENCY	455 kc
Number of Push Buttons	Six
DIAL LAMP (1)	Mazda No. 51, 7.5 volt, 0.2 amp.
POWER OUTPUT (125 volts, 60 cycle supply)	
Undistorted	0.8 watts
Maximum	1.4 watts

POWER SUPPLY RATINGS	
A-C Rating	105-125 volts, 50-60 cycles, 85 watts
D-C Rating	105-125 volts, direct current, 85 watts
LOUDSPEAKER (RL 85-2)	
Type	5-inch permanent magnet dynamic
Voice Coil Impedance	4.5 ohms at 400 cycles

Alignment Procedure

Cathode-Ray Alignment is the preferable method. Connections for the oscillograph are shown on the schematic drawing.

Output Meter Alignment.—If this method is used, connect the output meter across the voice coil, and turn the receiver volume control to maximum.

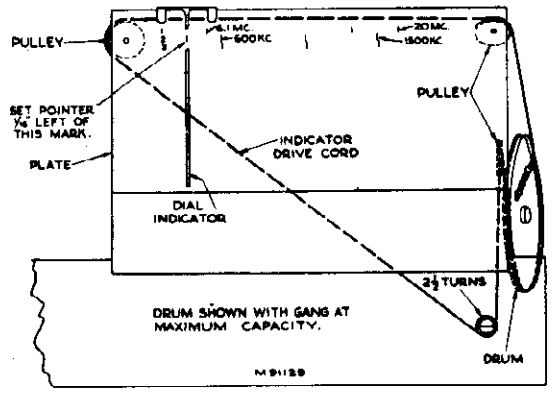
Test Oscillator.—For all alignment operations, connect the low side of the test oscillator to the receiver ground binding post, and keep the oscillator output as low as possible to avoid a-v-c action.

Calibration Marks.—The tuning dial is fastened in the cabinet and can not be used for reference during alignment. Therefore calibration marks have been stamped in the plate on the front of the chassis as shown in the accompanying drawing. These marks are used for reference during alignment.

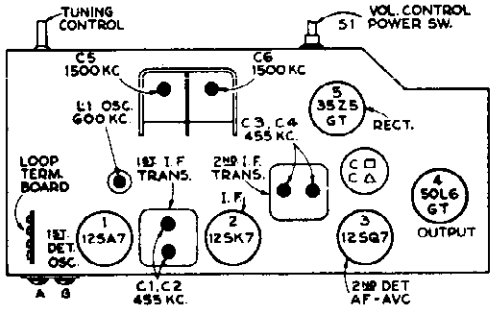
Dial Indicator Adjustment.—With the gang condenser in full mesh, the indicator should be set to the extreme left (low frequency) mark on the dial scale.

Steps	Connect the high side of the test-osc. to—	Tune test osc. to—	Turn radio dial to	Adjust the following for maximum peak output
1	Ant. terminal	455 kc	Quiet Point between 1,720-1,500 kc	C3 and C4 (2nd I-F trans.)
2	Ant. terminal			C1 and C2 (1st I-F trans.)
3	Ant. terminal in series with 200 mmfd.	1,500 kc	1,500 kc calibration mark	C6 (osc.) C5 (ant.)
4		600 kc	600 kc calibration mark	L1 (osc.) (Rock in)
5	Repeat step 3.			

After mounting chassis in cabinet, check the dial calibration on stations of known frequency. If calibration is not correct, move pointer to agree with dial calibration. **Note.**—Oscillator tracks above signal.



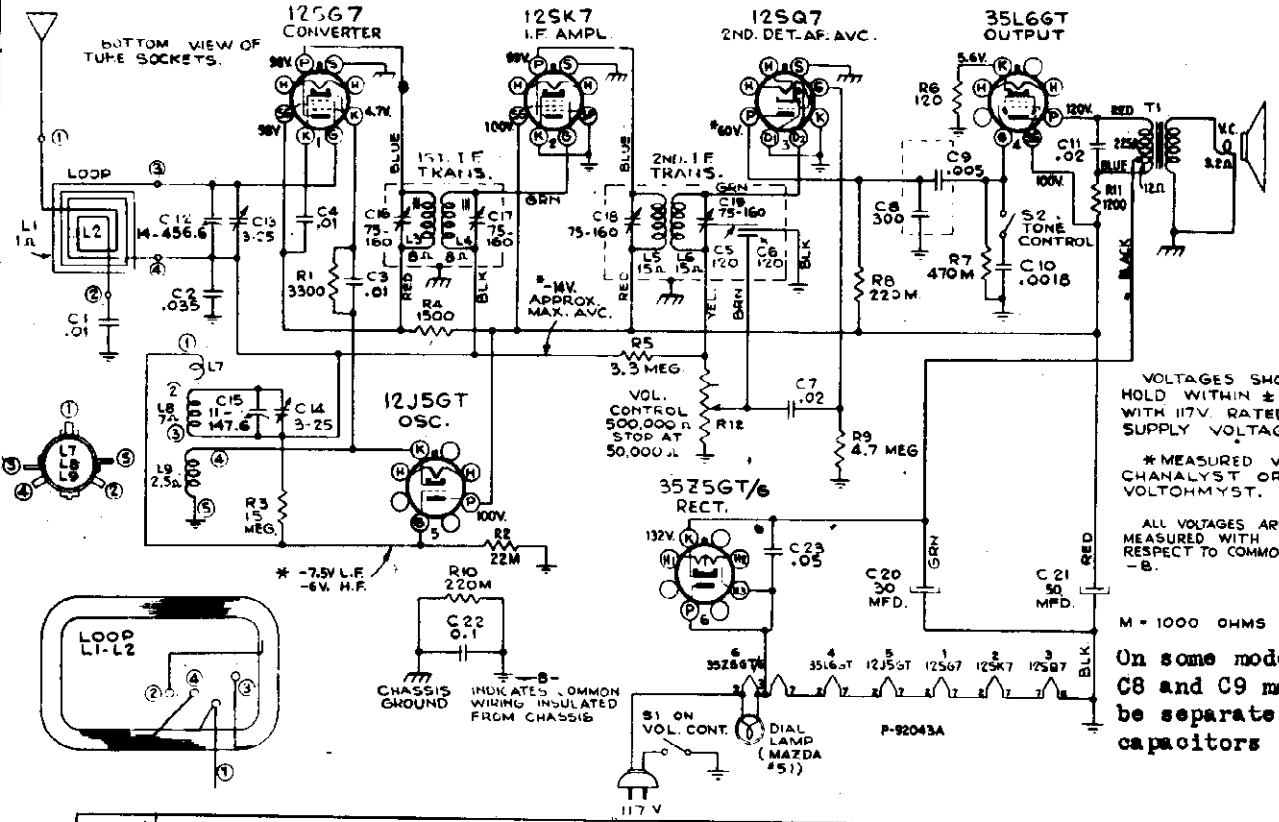
Dial-Indicator and Drive Mechanism



Tube and Trimmer Locations

For other data, see P. 15-3

RCA MFG. CO.



STOCK No.	DESCRIPTION
	CHASSIS ASSEMBLIES
	RC 1011
37359	Capacitor—Comprising 1 section of .0003 mfd. and 1 section of .005 mfd. (C-8, C-9)
70712	Capacitor—Paper .0018 mfd., 600 volts (C-10)
70652	Capacitor—Paper .01 mfd., 600 volts (C-1, C-3, C-4)
70711	Capacitor—Paper .02 mfd., 700 volts (C-7, C-11)
70635	Capacitor—Paper .035 mfd., 500 volts (C-2)
70615	Capacitor—Paper .05 mfd., 400 volts (C-23)
70617	Capacitor—Paper 0.1 mfd., 400 volts (C-22)
39152	Capacitor—Electrolytic, comprising 1 section of 30 mfd., 150 volts, and 1 section of 50 mfd., 150 volts (C-20, C-21)
39824	Coil—Oscillator coil (L-7, L-8, L-9)
36228	Condenser—Variable tuning condenser (C-12, C-13, C-14, C-15)
36242	Control—Volume control and power switch (R-12, S-1)
32834	Cord—Drive cord (approx. 49" long)
70392	Cord—Power cord
36237	Drum—Drive drum
36236	Indicator—Station selector indicator for 56X and 56X2
37068	Indicator—Station selector indicator for 56X3
39821	Loop—Antenna loop (L-1)
11785	Lamp—Dial lamp
36229	Plate—Dial back plate complete with pulleys less dial
36230	Pulley—Drive cord pulley
30189	Resistor—120 ohms, ¼ watt (R-6)
6134	Resistor—1200 ohms, 1 watt (R-11)
30654	Resistor—1500 ohms, ¼ watt (R-4)
30733	Resistor—3300 ohms, ¼ watt (R-1)
30482	Resistor—22,000 ohms, ¼ watt (R-2)
14583	Resistor—220,000 ohms, ¼ watt (R-9, R-10)
30648	Resistor—470,000 ohms, ¼ watt (R-7)
30785	Resistor—15 megohms, ¼ watt (R-3)
12928	Resistor—3.3 megohms, ½ watt (R-5)
30931	Resistor—4.7 megohms, ½ watt (R-8)
36897	Shaft—Tuning knob shaft

STOCK No.	DESCRIPTION
34449	Socket—Lamp socket
37805	Socket—Tube socket, moulded
31418	Spring—Drive cord tension spring
36228	Switch—Tone switch (S-2)
70411	Transformer—First I.F. transformer (L-3, L-4, C-16, C-17)
70412	Transformer—Second I.F. transformer (L-5, L-6, C-5, C-6, C-18, C-19)
38800	Transformer—Output transformer (T-1)
33726	Washer—"C" washer for tuning knob shaft
	SPEAKER ASSEMBLY
	92510-1
70413	Speaker—5-inch PM speaker, complete
	NOTE: If stamping on speaker in instrument does not agree with above speaker number, order replacement parts by referring to model number of instrument, number stamped on speaker and full description of part required.
	MISCELLANEOUS ASSEMBLIES
39853	Back—Cabinet back for 56X
70409	Back—Cabinet back for 56X2
70415	Back—Cabinet back for 56X3
X1604	Board—Baffle board and grille cloth
36890	Clamp—Dial clamp, left hand, for 56X and 56X2
36891	Clamp—Dial clamp, right hand, for 56X and 56X2
39954	Dial—Glass dial scale for 56X and 56X2
70410	Dial—Glass dial scale for 56X3
37831	Fastener—Push fastener (1 set) for cabinet backs on 56X and 56X2
33006	Feet—Rubber feet for cabinet (4 required)
70414	Knob—Control knob (ivory) for 56X2
36722	Knob—Control knob (walnut) for 56X and 56X3
30800	Spring—Retaining spring for knob

Crucial Lead Dress

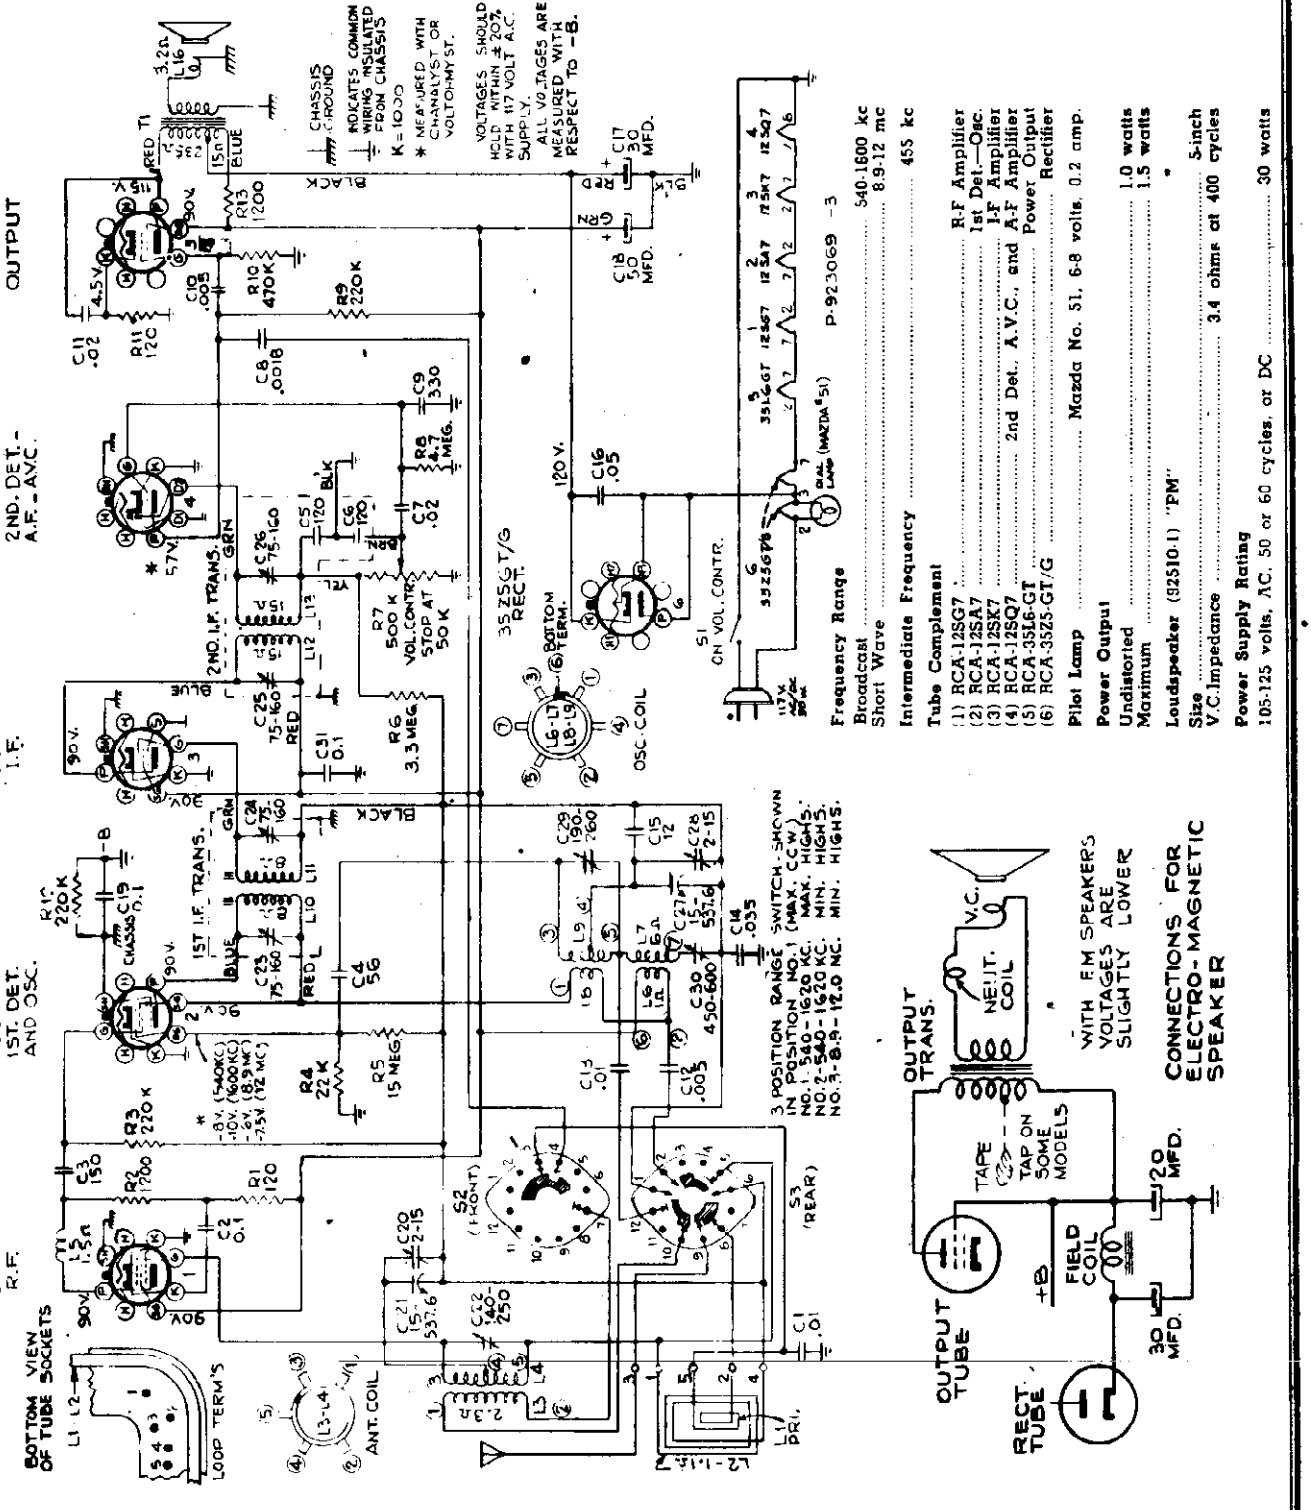
1. Dress output plate bypass capacitor (C-11 .02 mf) against chassis.
2. Dress 35L6GT plate lead (red) against chassis and away from volume control, leads and terminals.
3. Dress audio coupling capacitor (C-7 .02 mf) away from 35L6GT heater leads.
4. Dress tone control lead against front apron.
5. Dress 2nd I-F yellow and brown leads away from output plate bypass capacitor (C-11, .02 mf.) and away from all heater leads.
6. Dress lead to speaker voice coil away from tuning shaft "C" washer.
7. Dress tone control capacitor (C-10, .0018 mf.) away from oscillator coil.
9. Dress all uninsulated leads away from each other and away from chassis to prevent short circuits.
9. Dress blue and green leads of both IF transformers back in shields leaving exposed lengths as short as possible.

Frequency Range	540-1600 kc
Intermediate Frequency	455 kc
Power Output	
Undistorted	1.0 watt
Maximum	1.5 watts
Power Supply Rating	
105-125 volts, AC, 50 or 60 cycles, or DC	30 watts
Pilot Lamp	Mazda No. 51, 6-8 volts, 0.2 amp.
Tuning Drive Ratio	20:1
Loudspeaker (92510-1)	
Type	5-inch PM
V. C. Impedance	3.4 ohms at 400 cycles

For alignment and other data, see P.15-2

MODEL 56X6
Ch. RC-1023

RCA MFG. CO.



Frequency Range ..... P-9230069 -3
Broadcast ..... 540-1600 kc
Short Wave ..... 8.9-12 mc

Intermediate Frequency ..... 455 kc

Tube Complement

(1) RCA-12SG7 ..... R-F Amplifier
(2) RCA-12SA7 ..... 1st Det.—Osc.
(3) RCA-12SK7 ..... I-F Amplifier
(4) RCA-12SQ7 ..... 2nd Det. A.V.C., and A-F Amplifier
(5) RCA-35L6-GT ..... Power Output
(6) RCA-35Z5-GT/G ..... Rectifier

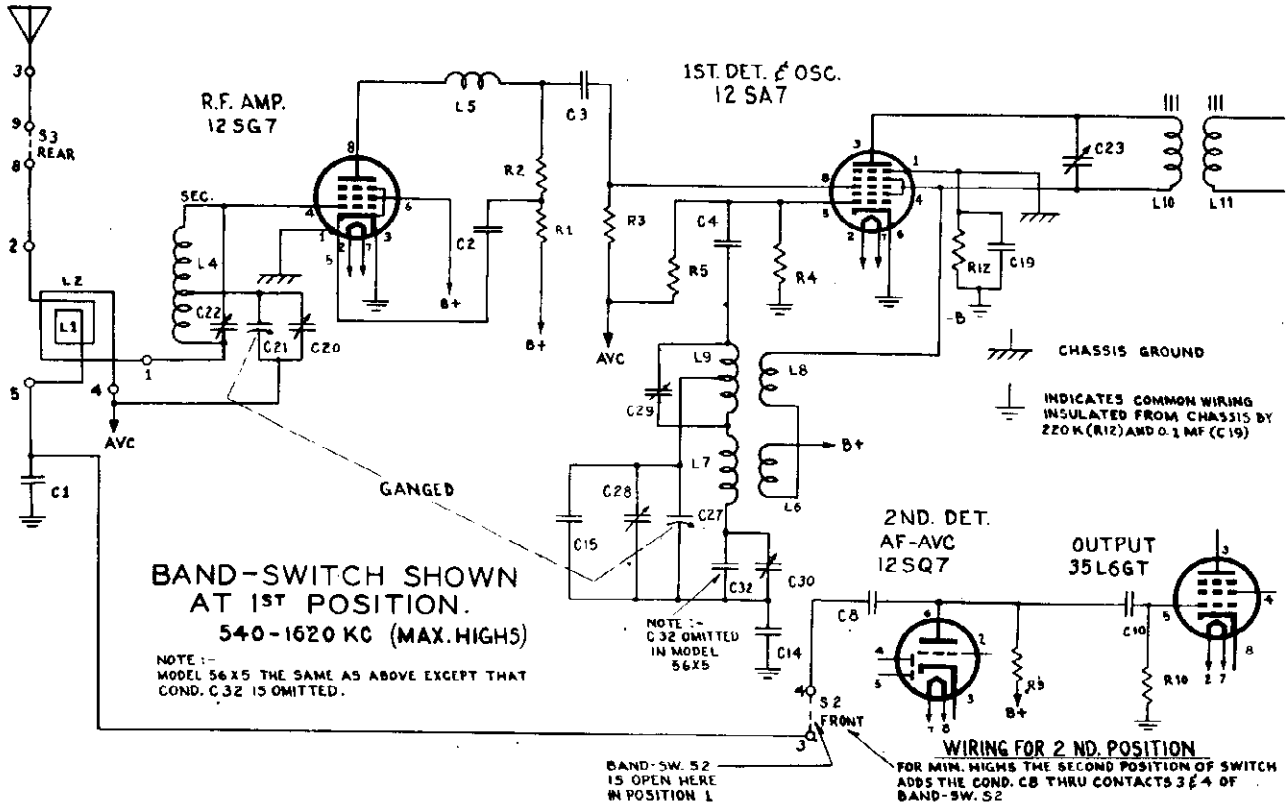
Pilot Lamp ..... Mazda No. 51, 6-8 volts, 0.2 amp.

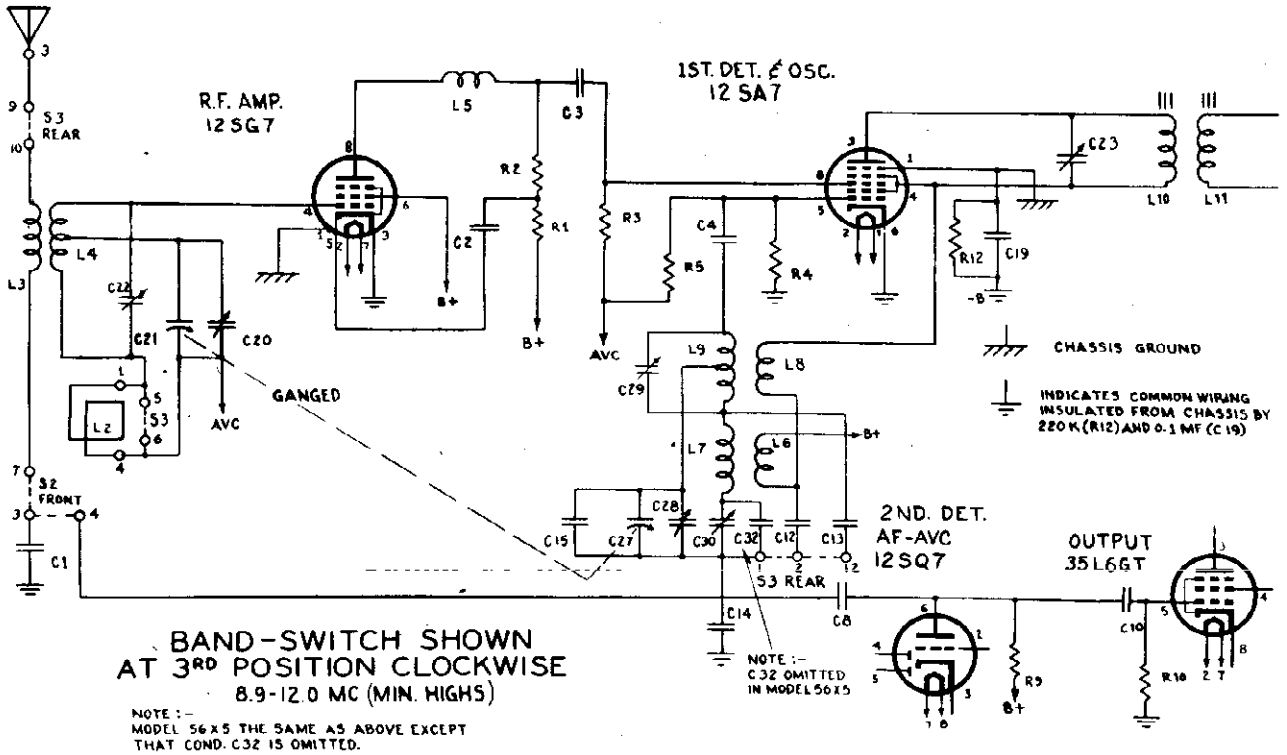
Power Output
Undistorted ..... 1.0 watts
Maximum ..... 1.5 watts

Loudspeaker (92510-1) "PM"
Size 5-inch
V.C. Impedance ..... 3.4 ohms at 400 cycles

Power Supply Rating
105-125 volts, AC, 50 or 60 cycles, or DC ..... 30 watts

RCA MFG. CO.





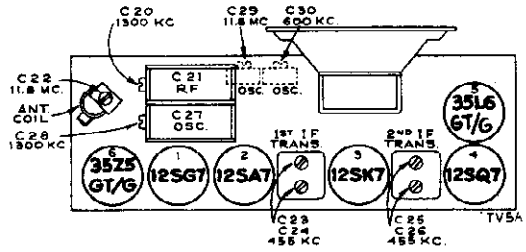
MODEL 56X5, Ch. RC-1023
MODEL 56X10, Ch. RC-1023B

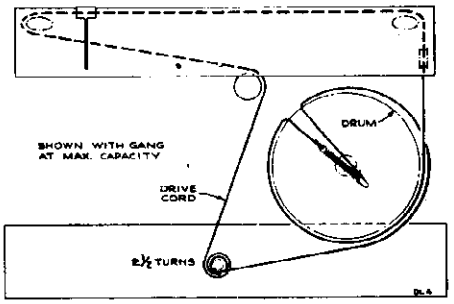
RCA MFG. CO.

Models 56X5 and 56X10

Critical Lead Dress

1. Dress blue and green leads of both I-F transformers back in shield cans, leaving them as short as possible
2. Dress R-F plate filter capacitor (C2, 0.1 mf.) back against rear chassis apron.
3. Dress yellow and brown leads from 2nd I-F away from all other leads.
4. Dress all heater leads next to chassis.
5. Dress capacitor (C13, .01 mf.) parallel to osc. coil and approximately 3/16 inch from coil.
6. Dress tone control lead and speaker field leads next to chassis and front apron.
7. Dress pilot lamp leads away from ant. coil.
8. Dress leads from loop ant. coil around rectifier tube towards end of chassis.
9. Dress output plate lead against chassis.





Test Oscillator.—Connect high side of test oscillator as shown in chart. Connect low side through a .01 mf. capacitor to common "—B." Keep the output signal as low as possible to avoid A.V.C. action.

Output Meter.—Connect meter across speaker voice coil. Turn volume control to maximum clockwise position, station selector switch to broadcast maximum high position (pos. 1), for broadcast alignment and to position 3 for high frequency band.

Dial Pointer Adjustment.—Rotate tuning condenser fully counter-clockwise (plates fully meshed). Adjust indicator pointer to left (max. cap.) mark on dial back plate.

Calibration Scale.—The glass tuning dial may be easily removed from the cabinet and temporarily attached to the dial backing plate.

Power Supply Polarity.—For operation on d-c, the power plug must be inserted in the outlet for correct polarity. If the set does not function, reverse the plug. On a-c, reversal of the plug may reduce hum.

Steps	Connect high side of the test oscillator to—	Tune test osc. to—	Turn radio dial to—	Adjust the following for maximum peak output
1	Pin #8 of 12SA7 in series with 0.1 mfd.	455 kc	Quiet Point at 1,600 kc end of dial	C25, C26 2nd I-F trans.
2				C23, C24† 1st I-F trans.
3	Ant. terminal in series with 220 mmf.	600 kc	600 kc "A" Band	C30 (osc.) Rock gang
4		1300 kc	1300 kc "A" Band	C28 (osc.) C20 (R-F)
5		Repeat 3 Rocking gang		
6		Repeat 3, 4 and 5 for exact cal.		
7	Ant. terminal in series with 0.1 mfd.	11.8 mc	11.8 mc	C29 (osc.)* Rock gang
8	Ant. terminal in series with 47 mmf.	11.8 mc	11.8 mc	C22 (R-F) Rock gang
9	Repeat steps 7 and 8			

* Use minimum capacity peak if two can be obtained. Check for selection of correct peak by tuning receiver to approximately 10.9 mc where a weaker signal should be received.

† Do not readjust C25 or C26

Critical Lead Dress

1. Dress all heater leads down to chassis.
2. Dress excess leads from I.F. transformers back into cans, also blue and green leads should be dressed near to chassis.
3. Lead from band switch, terminal four, to C-24, should be dressed toward front apron and just clear of oscillator coil.
4. C-29, on band switch, connected from terminal three to terminal four, should be dressed toward rear of switch assembly.
5. Excess dial lamp leads should be dressed on top of chassis.
6. C-11, output tone control condenser, should be dressed close to chassis to clear when entering cabinet.
7. Power cord should be dressed free, and not under any other leads.
8. C-4 should be dressed clear of any other components or wiring and away from chassis.
9. Lead from tone control condenser, C-8, to band switch terminal five, should be dressed over oscillator coil and oscillator padders C-24, C-25.
10. Lead from short-wave antenna coil to loop antenna should be to the right (outside) of 35Z5GT/G.
11. Leads to loop antenna should be dressed between I.F. transformer and 12SA7.
12. Yellow and brown leads from second I.F. transformer to volume control should be dressed up and away from chassis.

Alignment Procedure

Test Oscillator.—For all alignment operations, keep the output as low as possible to avoid a.v.c. action.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

Calibration Scale.—The glass tuning dial may be easily removed from the cabinet and temporarily attached to the dial backing plate for quick reference during alignment.

Power Supply Polarity.—For operation on d-c, the power plug must be inserted in the outlet for correct polarity. If the set does not function, reverse the plug. On a-c, reversal of the plug may reduce hum.

Steps	Connect high side of the test oscillator to—	Tune test osc. to—	Turn radio dial to—	Adjust the following for maximum peak output
1	I.F. grid in series with .01 mfd.	455 kc	'A' Band Quiet point at 1600 kc end of dial	C34, C35 2nd I-F trans.
2	12SA7 grid in series with .01 mfd.			C32, C33 1st I-F trans.
3	Antenna terminal on loop in series with 220 mmf.	600 kc	'A' Band rock gang near 600 kc	C25 (BC trimmer)
4		1600 kc	1600 kc	C28 (Osc.)
5		600 kc	Rock gang near 600 kc	Recheck C25
6		1300 kc	1300 kc	C22 (r.f.)
7	Antenna terminal on loop in series with 22 mmf.	15.2 mc.	'C' Band rock gang near 15.2 mc.	C20 (ant.) on top of S.W. ant. coil
8			15.2 mc. center of "M"—"19M"	C24 (Osc.)*
9		9.5 mc.	9.5 mc.	C23 (r.f.)
10		15.2 mc.	15.2 mc.	Recheck C20

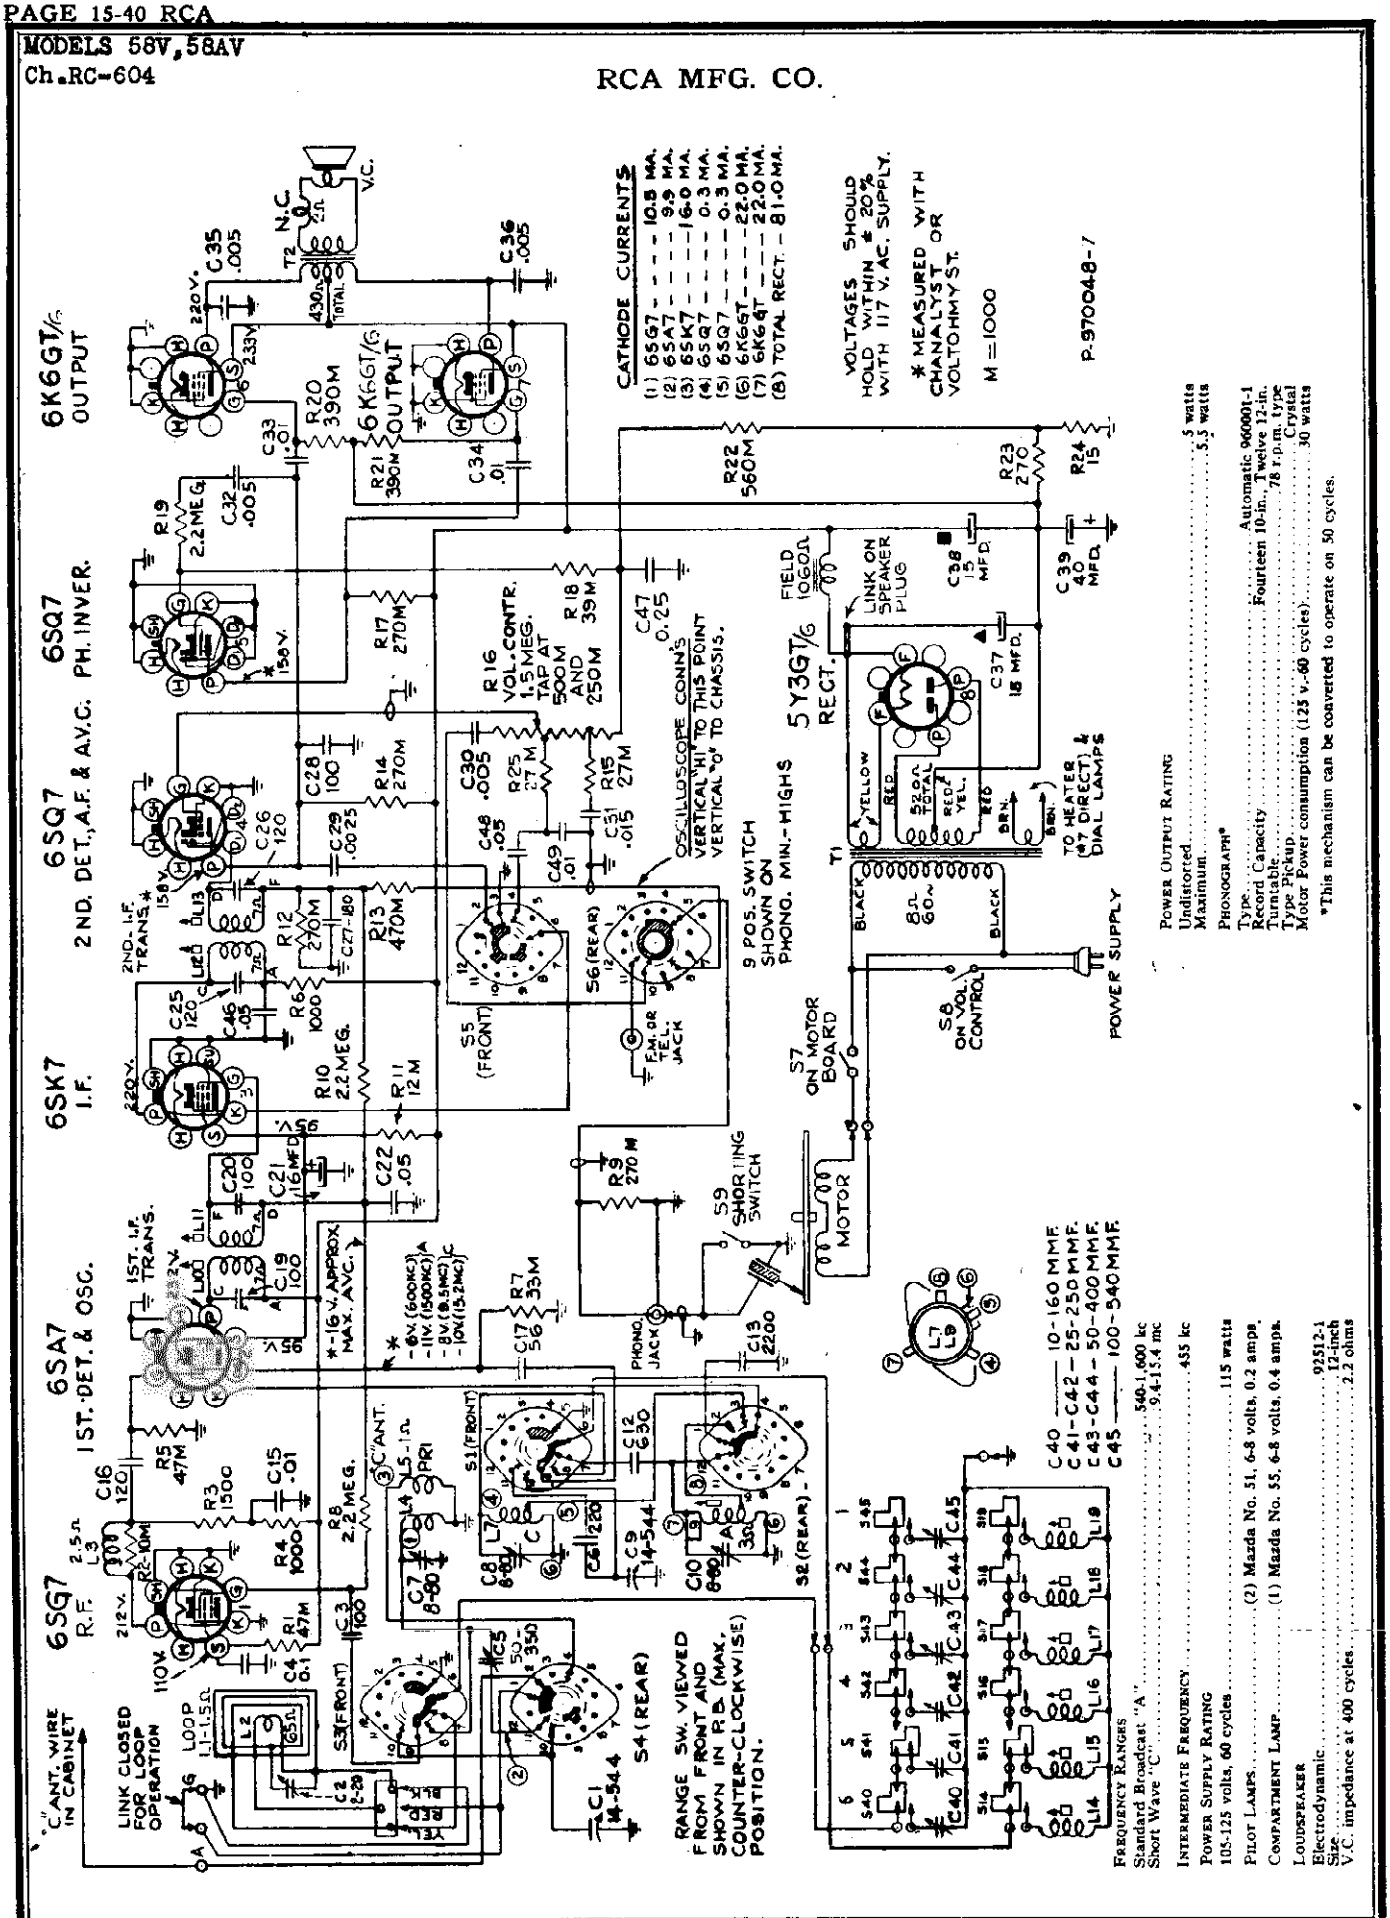
*Use minimum capacity peak, if two peaks can be obtained.

Note.—Oscillator tracks 455 kc above signal on both bands.

STOCK No.	DESCRIPTION
	CHASSIS ASSEMBLIES RC 1023A
32979	Capacitor—Mica trimmer, 15-150 mmf. (C20)
37388	Capacitor—Mica trimmer, 50-300 mmf. (C23)
70701	Capacitor—Mica trimmer, 1 section 500-750 mmf. and 1 section 10-50 mmf. (C24, C25)
39612	Capacitor—Mica, 22 mmf. (C26)
39622	Capacitor—Mica, 56 mmf. (C4)
39632	Capacitor—Mica, 150 mmf. (C3)
39640	Capacitor—Mica, 330 mmf. (C9)
71014	Capacitor—Silver mica, 220 mmf. (C29)
70712	Capacitor—Tubular, .0018 mfd., 800 volts (C8)
70627	Capacitor—Tubular, .005 mfd., 600 volts (C10)
70652	Capacitor—Tubular, .01 mfd., 800 volts (C1)
70711	Capacitor—Tubular, .02 mfd., 700 volts (C7, C11)
70635	Capacitor—Tubular, .035 mfd., 500 volts (C14)
70615	Capacitor—Tubular, .05 mfd., 400 volts (C16)
70617	Capacitor—Tubular, 0.1 mfd., 400 volts (C2, C19, C31)
36301	Capacitor—Electrolytic comprising 1 section of 30 mfd., 150 volts and 1 section of 50 mfd., 150 volts (C17, C18)
70842	Coil—Antenna coil (L3, L4)
70843	Coil—Oscillator coil (L6, L7, L8, L9)
39894	Coil—Peaking coil(L5)
70700	Condenser—Variable tuning condenser (C21, C22, C27, C28)
36242	Control—Volume control and power switch (R7, S1)
70302	Cord—Power cord
32634	Cord—Drive cord (approx. 49" overall length)
36237	Drum—Drive drum
37068	Indicator—Station selector indicator
11765	Lamp—Dial lamp
31193	Lead—Antenna lead
70841	Loop—Antenna loop (L1, L2)
36229	Plate—Dial back plate complete with pulleys
36230	Pulley—Drive cord pulley
30189	Resistor—120 ohms, ½ watt (R1, R11)
12267	Resistor—1200 ohms, ¼ watt (R2)
6134	Resistor—1200 ohms, 1 watt (R13)
30492	Resistor—22,000 ohms, ¼ watt (R4)
14583	Resistor—220,000 ohms, ¼ watt (R3, R9)
30648	Resistor—470,000 ohms, ½ watt (R10)
12928	Resistor—3.3 megohms, ½ watt (R6)
30271	Resistor—4.7 megohms, ½ watt (R8)
38785	Resistor—15 megohms, ½ watt (R5)
36897	Shaft—Tuning knob shaft
34449	Socket—Dial lamp socket
37605	Socket—Tube socket—moulded
31418	Spring—Drive cord spring
70696	Switch—Range switch (S2)
70697	Transformer—Audio transformer (T1)
70698	Transformer—First I.F. transformer (L10, L11, C32, C33)
70699	Transformer—Second I.F. transformer (C34, C35, L12, L13)
33726	Washer—"C" washer for tuning knob shaft
	SPEAKER ASSEMBLIES
	92510-1T 92510-1L 92510-1P 92510-1M
70413	Speaker—5" P.M. speaker complete with cone and voice coil
	NOTE: If stamping on speaker in instrument does not agree with above speaker number, order replacement parts by referring to model number of instrument, number stamped on speaker and full description of part required.
	MISCELLANEOUS ASSEMBLIES
39053	Back—Cabinet back
70702	Dial—Glass dial scale
36890	Clamp—Dial clamp—left hand
36891	Clamp—Dial clamp—right hand
37831	Fastener—Push fastener for cabinet back
36722	Knob—Control knob
30900	Spring—Retaining spring for knobs

MODELS 58V, 58AV
Ch. RC-604

RCA MFG. CO.



Frequency Ranges	
Standard Broadcast "A"	540-1,600 kc
Short Wave "C"	9.4-15.4 mc
Intermediate Frequency	455 kc
Power Supply Rating	
105-125 volts, 60 cycles	115 watts
Pilot Lamps	(2) Mazda No. 51, 6-8 volts, 0.2 amps.
Compartment Lamp	(1) Mazda No. 55, 6-8 volts, 0.4 amps.
Loudspeaker	
Electrodynamic	92512-1
Size	12-inch
V.C. impedance at 400 cycles	2.2 ohms
Power Output Rating	
Undistorted	5 watts
Maximum	5.5 watts
Phonograph*	
Type	Automatic 960001-1
Record Capacity	Fourteen 10-in., Twelve 12-in.
Turntable	78 r.p.m. type
Type Pickup	Crystal
Motor Power consumption (125 v.-60 cycles)	30 watts

*This mechanism can be converted to operate on 50 cycles.

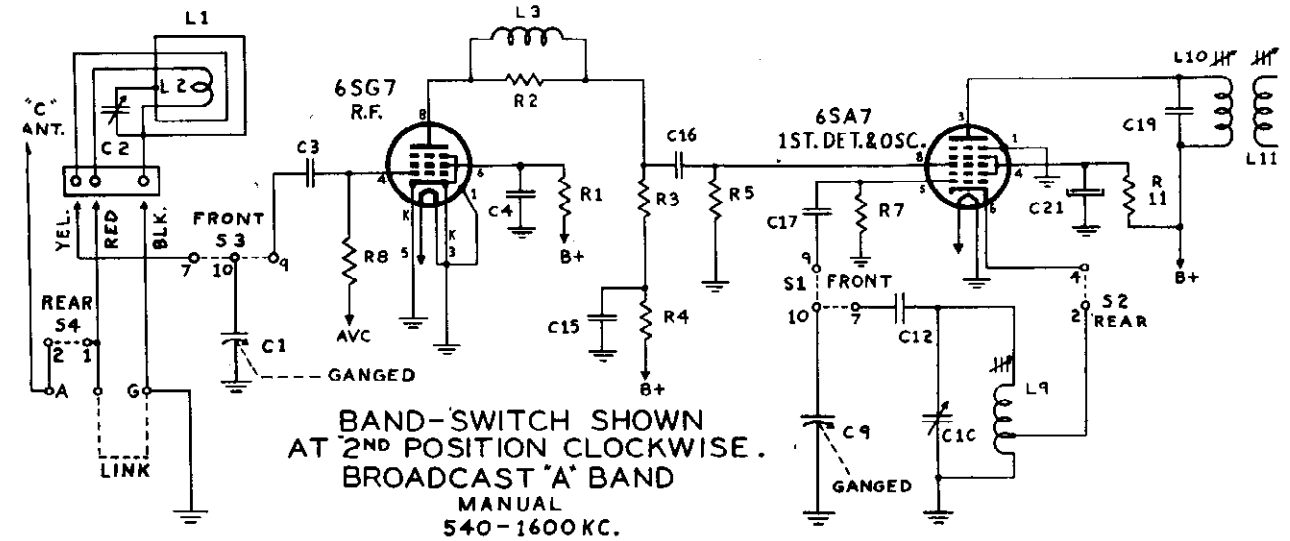
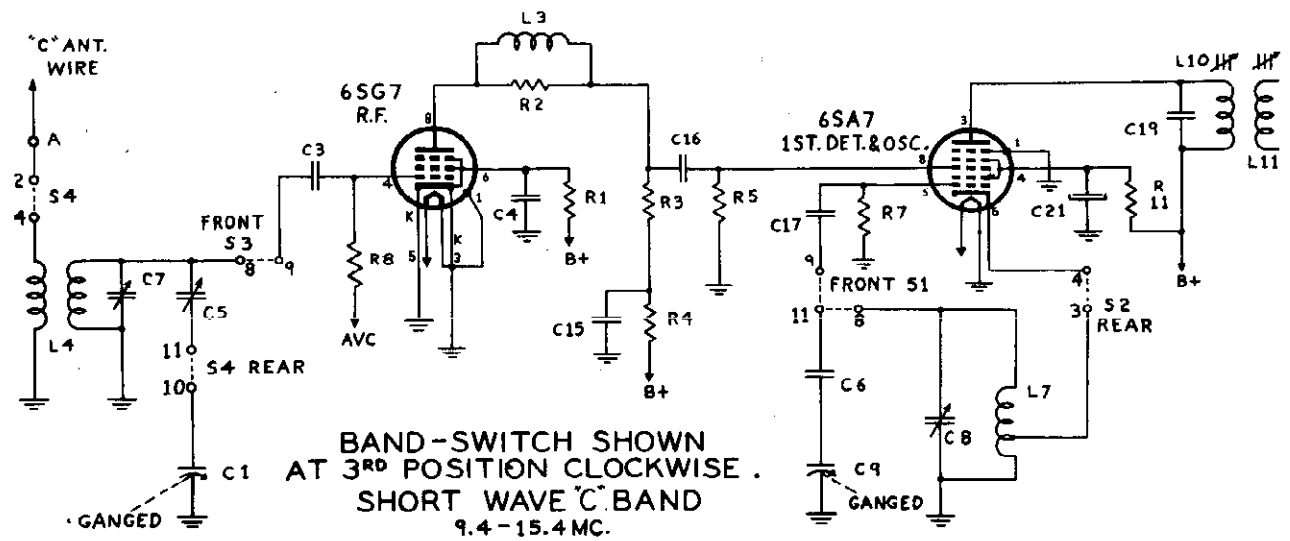
BAND-SWITCH SHOWN AT 1ST POSITION. PUSH BUTTON TUNING (NO. 5 BUTTON DEPRESSED) 740-1430 KC.



BAND-SWITCH SHOWN AT 2ND POSITION CLOCKWISE. BROADCAST "A" BAND MANUAL 540-1600 KC.



BAND-SWITCH SHOWN AT 3RD POSITION CLOCKWISE. SHORT WAVE "C" BAND 9.4-15.4 MC.

RCA MFG. CO.

Cathode-Ray Alignment is the preferable method. Connections for the oscilloscope are shown in the schematic diagram.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the oscillator output as low as possible to avoid a-v-c action.

Calibration Scale.—The glass tuning dial may be easily removed from the cabinet and temporarily attached to the chassis for quick reference during alignment. In the event that only the chassis is returned for service, and the cabinet with its tuning dial is left in the customer's home, the full size scale printed in this service note can be used for reference.

Using Tuning Dial.—

1. Remove glass dial from the cabinet.
2. With gang in full mesh, the dial pointer should be set to a point 1/8 inch to left of reference mark at left hand end of the dial backing plate.
3. Support the glass dial over the pointer with spacers so that the extreme left scale graduation coincides with the pointer. Use scotch tape to hold the glass dial in place.

"C" Band Reception.—For best reception on "C" band with an outside antenna, adjust the trimmer screw of C5 on the antenna coil. Turn screw carefully with an insulated screwdriver (RCA Stock No. 31031) while the receiver is tuned to a station in the 31-meter band. If returning to internal antenna at any time, close the link on the center terminal and readjust "C" band antenna trimmer (C5) for best reception on 31-meter band.

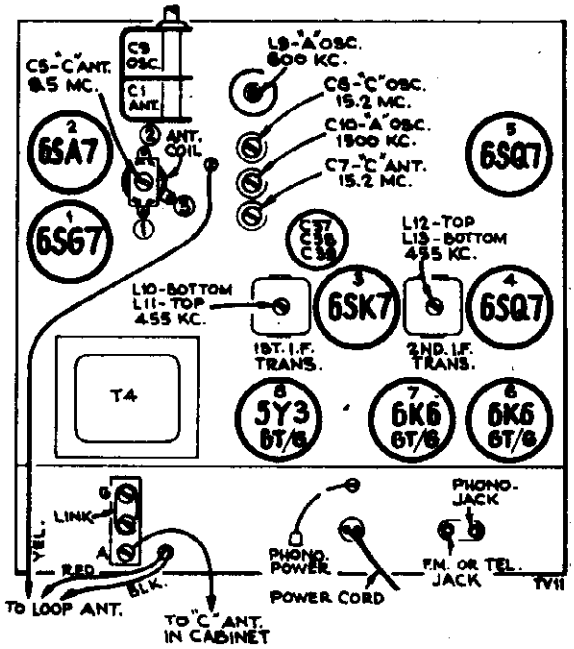
For additional information, refer to booklet "RCA Victor Receiver Alignment."

Steps	Connect test-osc. output to—	Tune test osc. to—	Turn radio dial to—	Adjust the following for maximum peak output—
1	I-F grid in series with .01 mfd.	455 kc	"A" band 540 kc	L13-L12 (2nd I-F trans.)
2	1st Det. grid in series with .01 mfd.			L11-L10 (1st I-F trans.)
3	A-Terminal in series with 47 mmfd. (link closed)	15.2 mc	"C" band 15.2 mc	C8 (osc.)* C7 (ant.)
4		9.5 mc	"C" band 9.5 mc	C5 (ant.) (Rock gang)
5		Repeat steps 3 and 4		
6	Yellow loop lead in series with 200 mmfd. (link closed)	1,500 kc	"A" band 1,500 kc	C10 (osc.)
7		600 kc	"A" band 600 kc	L9 (osc.)
8		Repeat steps 6 and 7		
9	Install and connect chassis in cabinet with antenna link closed. Tune in a radiated oscillator signal at 1,500 kc. and peak the "A" band trimmer C2 (on loop). Rock in L9 for peak output at 600 kc.			

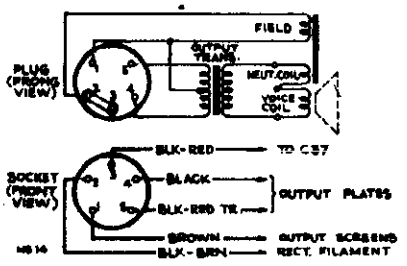
*Use minimum capacity peak if two peaks can be obtained. Oscillator tracks 455 kc. above signal on all bands.

Critical Lead Dress:

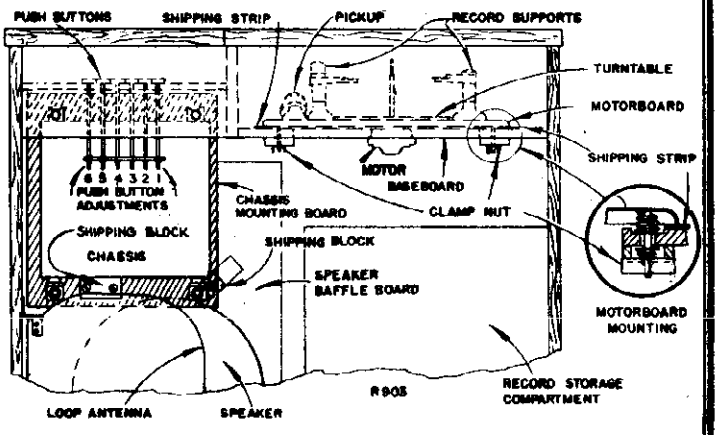
1. Bus from "C" oscillator coil to range switch must be held to length and dressed close to coil.
2. C30 (audio coupling capacitor to volume control) should be dressed close to front apron.
3. A.C. cord and motor leads must be dressed away from phono and F.M. jack.
4. Excess trans. leads to be dressed between trans. and rectifier socket.
5. Keep R5, C16 bus (in grid circuit of 6SA7 tube) as short as possible.
6. Dress C28 (in plate circuit of 1st A.F.) close to socket.
7. Keep R21 (grid resistor) and C34 (coupling capacitor of output tube) close to socket.
8. Keep R25, C48 (in tone compensating circuit) close to front apron.
9. Dress green lead from osc. coil to trimmer close to oscillator coil.
10. Dress red A.C. leads away from I.F. trans. and 6SQ7 socket.
11. RF choke in plate of 6SG7 must be dressed toward back apron.



TUBE AND TRIMMER LOCATIONS



SPEAKER CONNECTIONS



BACK VIEW

RCA MFG. CO.

PUSH BUTTON ADJUSTMENT.—

The push buttons connect to separate magnetite-core oscillator coils and separate ant. circuit trimmers which must be adjusted for the desired stations. Use an insulated screwdriver or alignment tool such as RCA Stock No. 31031. Allow about five minutes warm-up period before making adjustments.

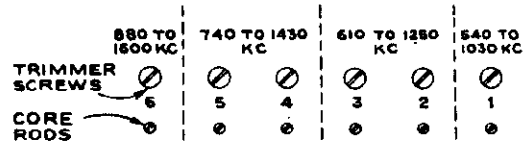
The procedure is as follows:

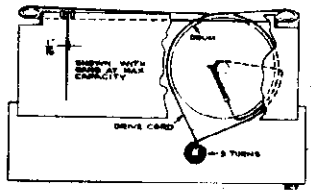
1. Make a list of the desired stations, arranged in order from low to high frequencies.
2. Turn the range switch to the broadcast position and manually tune in the first station on the list.
3. Turn range switch to push-button position and press in the left-hand button.
4. Adjust No. 1 oscillator core to receive the first station. To secure the best adjustment, rotate the antenna for least pickup, and adjust core for peak output.
5. Adjust No. 1 antenna trimmer capacitor for peak output on the first station.
6. Proceed in the same manner to adjust for the remaining stations.

On the 880 to 1,600 kc push-button, the higher frequency stations may be received with osc. core either in or out (oscillator frequency either 455 kc below or 455 kc above the station frequency). The adjustment with this core in its out position (oscillator frequency 455 kc above the station frequency) is the correct one.

NOTE:-Clockwise adjustment of cores and trimmers tunes the circuits to lower frequencies.

SERVICE HINT:—If unable to reach 550-540 KC on No. 1 push button —Connect a Stock No. 33111 Capacitor-Ceramic-33 mmf across L19 (between switch contact which connects to high side of L19, and switch frame).





STOCK No.	DESCRIPTION
	CHASSIS ASSEMBLIES RC-604
36342	Board—"Antenna-Ground" board
38368	Capacitor—Adjustable, 50-350 mmfd. (C5)
60954	Capacitor—Ceramic, 56 mmfd. (C17)
38801	Capacitor—Mica trimmer, comprising 3 sections of 8-80 mmfd. (C7, C8, C10)
39628	Capacitor—Mica, 100 mmfd. (C3, C19, C20, C28)
39630	Capacitor—Mica, 120 mmfd. (C16, C25, C26)
39634	Capacitor—Mica, 180 mmfd. (C27)
38858	Capacitor—Silver mica, 220 mmfd. (C6)
38831	Capacitor—Silver mica, 630 mmfd. (C12)
39660	Capacitor—Mica, 2200 mmfd. (C13)
70623	Capacitor—Tubular, .0025 mfd., 600 volts (C29)
70627	Capacitor—Tubular, .005 mfd., 600 volts (C30, C32)
70648	Capacitor—Tubular, .005 mfd., 1000 volts (C35, C36)
70631	Capacitor—Tubular, .01 mfd., 600 volts (C15, C33, C34, C49)
70572	Capacitor—Tubular, .015 mfd., 400 volts (C31)
70615	Capacitor—Tubular, .05 mfd., 400 volts (C22, C48)
70636	Capacitor—Tubular, .05 mfd., 600 volts (C-46)
70617	Capacitor—Tubular, 0.1 mfd., 400 volts (C4)
70618	Capacitor—Tubular, 0.25 mfd., 200 volts (C47)
37888	Capacitor—Electrolytic comprising 2 sections of 20 mfd., 450 volts and 1 section of 20 mfd., 25 volts replacement for (C37, C38, C39)
37877	Capacitor—Electrolytic, 16 mfd., 450 volts (C21)
38788	Coil—Antenna coil, "C" band (L4, L5)
38787	Coil—Oscillator coil (L7, L9)
38800	Condenser—Variable tuning condenser (C1, C9)
70342	Control—Volume control and power switch (R16, S8)
32634	Cord—Drive cord (approx. 43" overall length)
12006	Core—Adjustable core and stud assembly for I.F. transformer
35788	Core—Adjustable core and stud for oscillator coil
38359	Cup—Oscillator coil mounting cup
38790	Drum—Drive drum
35870	Indicator—Station selector pointer
28452	Plate—Bakelite mounting plate for electrolytic capacitor
36333	Plate—Dial back plate complete with pulleys
38832	Plug—Pin plug for loop lead
30868	Plug—2 contact female plug for motor cable
12493	Plug—5 contact female plug for speaker cable
32641	Plug—3 prong male plug for selector switch cable
32289	Pulley—Drive cord pulley
11565	Resistor—15 ohms, ½ watt (R24)
70542	Resistor—270 ohms, 4 watt (R23)
34766	Resistor—1000 ohms, ½ watt (R4, R6)
30654	Resistor—1500 ohms, ½ watt (R3)
38829	Resistor—Resistor and coil assembly, 10,000 ohms (R2, L3)
70541	Resistor—12,000 ohms, 4 watt (R11)
30409	Resistor—27,000 ohms, ½ watt (R15, R25)
30685	Resistor—33,000 ohms, ½ watt (R7)
30147	Resistor—39,000 ohms, ½ watt (R18)
30787	Resistor—47,000 ohms, ½ watt (R1, R5)
30651	Resistor—270,000 ohms, ½ watt (R9, R12, R14, R17)
11988	Resistor—390,000 ohms, ½ watt (R20, R21)
30648	Resistor—470,000 ohms, ½ watt (R13)
30653	Resistor—560,000 ohms, ½ watt (R22)
30649	Resistor—2.2 megohm, ½ watt (R8, R10, R19)
38803	Shaft—Tuning knob shaft
31364	Socket—Lamp socket
33514	Socket—Phono input socket
31251	Socket—Tube socket
31418	Spring—Drive cord tension spring
12007	Spring—Retaining spring for adjustable core and studs
38802	Switch—Radio-phono and tone control switch (S5, S6)
38805	Switch—Range switch (S1, S2, S3, S4)
31380	Transformer—Power transformer—105-125 volts, 50/60 cycle (T1)
35636	Transformer—First I.F. transformer (L10, L11, C19, C20)
35790	Transformer—Second I.F. transformer (L12, L13, C25, C26)
35969	Washer—"C" washer for tuning knob shaft
	SPEAKER ASSEMBLIES Stamped 92512-1K
70574	Cone—Cone and voice coil assembly
31539	Plug—5 prong male plug for speaker cable
70573	Speaker—12" E.M. speaker complete with cone and voice coil less plug and output transformer
37899	Transformer—Output transformer (T2)
	NOTE: If stamping on speaker in instruments does not agree with above speaker number, order replacement parts by referring to Model number of instrument, number stamped on speaker and full description of part required.
	MISCELLANEOUS ASSEMBLIES
36461	Button—Plug button
38375	Button—Push button
38684	Capacitor—Trimmer, 2-20 mmfd. (C2)
36424	Capacitor—Mica trimmer comprising 1 section of 10-160 mmfd., 2 sections of 25-250 mmfd., 2 sections of 50-400 mmfd., and 1 section of 100-540 mmfd. (C40, C41, C42, C43, C44, C45)
36462	Clamp—Dial clamp
X1609	Cloth—Grille cloth for Mahogany cabinet
X1610	Cloth—Grille cloth for Walnut cabinet
38579	Coil—Loop primary coil (L2)
38315	Coil—P.B. oscillator coil—high frequency side (L14, L15, L16)
37638	Coil—P.B. oscillator coil—low frequency side (L17, L18, L19)
35871	Core—Adjustable core and stud for P.B. oscillator coil
70547	Cover—Compartment lamp lead cover
39013	Decal—Control panel decal
35392	Decal—Trade mark decal (RCA Victor)
70575	Decal—Trade mark decal (Dog)
39011	Dial—Glass dial scale
36327	Escutcheon—Dial escutcheon—less dial
38376	Escutcheon—Push button escutcheon—less buttons
71003	Grille—Metal grille
39352	Hinge—Cabinet door hinge
30698	Hinge—Cabinet lid hinge
13103	Jewel—Pilot lamp cap
71002	Knob—Cabinet door knob
35814	Knob—Tone control, range switch, volume control, or tuning knob
5117	Lamp—Compartment lamp
11765	Lamp—Dial lamp
70544	Loop—Antenna loop complete (L1, L2, C2)
34317	Marker—Station marker
70546	Mounting—One (1) set of hardware for mounting record changer consisting of four (4) upper and four (4) lower springs and four (4) clamp nuts
37800	Shade—Lamp shade
36422	Socket—3 contact female for selector switch cable and loop leads
30900	Spring—Retaining spring for control knobs
34053	Spring—Retaining spring for push button
71001	Spring—Spring for L.H. cabinet lid support
70999	Spring—Spring for R.H. cabinet lid support
71000	Support—Cabinet lid support—L.H.
70998	Support—Cabinet lid support—R.H.
70545	Support—Loop support complete with mounting brackets and spring
38575	Switch—Selector switch (S14, S15, S16, S17, S18, S19, S40, S41, S42, S43, S44, S45)

Cathode-Ray Alignment is the preferable method. Connections for the oscillograph are shown in the schematic diagram.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the oscillator output as low as possible to avoid a-v-c action.

Calibration Scale.—The glass tuning dial may be easily removed from the cabinet and temporarily attached to the chassis for quick reference during alignment. In the event that only the chassis is returned for service, and the cabinet with its tuning dial is left in the customer's home, the full size calibration scale printed in this service note can be used for reference.

Using Tuning Dial.—

1. Remove the dial glass from the cabinet.
2. With gang at full mesh the pointer should be set to a point (1/16) inch to the left of the reference mark at the left hand end of the dial backing plate.
3. Place the glass dial under the pointer so that the extreme left scale graduations coincide with the pointer. Use scotch tape to hold the glass dial in place.

Using Dial Scale Printed In This Service Note.—

Follow the procedure above, substituting the dial scale printed in this service note for the glass dial in the cabinet.

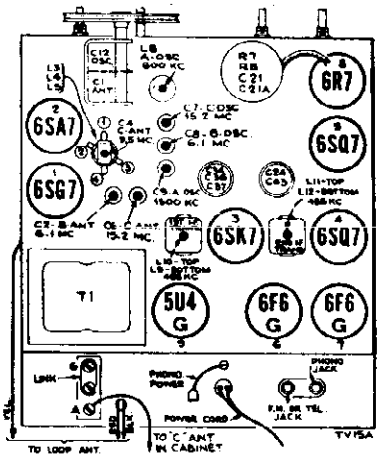
"C" Band Reception.—For best reception on "C" band with an outside antenna, adjust the trimmer screw of C4 on the antenna coil. Turn screw carefully with an insulated screwdriver (RCA Stock No. 31031) while the receiver is tuned to a station in the 31-meter band. If returning to internal antenna at any time, close the link on the center terminal and readjust "C" band antenna trimmer (C4) for best reception on 31-meter band.

For additional information, refer to booklet, "RCA Victor Receiver Alignment."

Steps	Connect high side of test osc. to—	Tune test osc. to—	Turn radio dial to—	Adjust the following for maximum peak output—
1	I-F grid in series with .01 mfd.	455 kc	"A" Band 540 kc	L12, L11 (2nd I-F Trans.)
2	1st Det. grid in series with .01 mfd.			L10, L9 (1st I-F Trans.)
3	Yellow loop lead in series with 200 mmf. (link closed)	1,500 kc	"A" Band 1,500 kc	C9 (osc.)
4		600 kc	"A" Band 600 kc	L8 (osc.)
5		Repeat steps 3 and 4		
6	Ant. terminal in series with 47 mmf. (link closed)	6.1 mc	"B" Band 6.1 mc	C8 (osc.)* C2 (ant.)
7		15.2 mc	"C" Band 15.2 mc	C7 (osc.)* C6 (ant.)
8		9.5 mc	"C" Band 9.5 mc	C4 (ant.)
9		Repeat steps 7 and 8		
10	Install and connect chassis in cabinet, with link closed. Tune in a radiated oscillator signal at 1,500 kc and peak the "A" band ant. trimmer C3 (on loop). Rock in L8 for peak output at 600 kc.			

*Use minimum capacity peak if two peaks can be obtained.

Oscillator tracks 455 kc above signal on all bands.

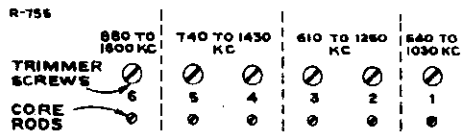


Top View Chassis

Critical Lead Dress

1. Push button, R.F. and oscillator leads should be separated as much as possible to reduce degeneration on push button reception.
2. R.F. choke in plate circuit of 6SG7 should be dressed towards the back apron.
3. Dress green push button lead under clamp and away from "C" band series capacitor.
4. Dress heater leads away from grids and diodes.
5. Dress phono. cables up and away from all wiring.
6. Dress all excess leads from transformer back towards transformer.
7. Keep output plate leads short and dressed close to chassis.
8. Dress green lead from 6SA7 screen to electrolytic down close to chassis.
9. Dress "C" band coil lead from oscillator coil to range switch down toward green lead.
10. Keep yellow loop lead clear of all wiring.
11. Dress ground bus of large electrolytic away from mounting lug.
12. Remove all excess slack from pilot light assembly and dress it close to chassis base away from volume control.
13. Dress oscillator grid capacitor (56 mmfd.) up and away from the screen and plate of 6SA7 socket.
14. A-C leads to "off-on" switch should be kept away from tone control cable to reduce hum.
15. Peaking coil should be dressed away from R-F grid resistor to reduce degeneration in R-F stage.
16. Dress oscillator push button lead in weld clamp on front apron away from 220 mmf. series condenser.
17. Keep all leads away from Phono.-FM jack to prevent audio oscillation and hum. Dress underneath the shield provided.

Push Button Adjustment



The push buttons connect to separate magnetite-core oscillator coils and separate loop circuit trimmers which must be adjusted for the desired stations. Use an insulated screwdriver or alignment tool such as RCA Stock No. 31031. Allow about five minutes warm-up period before making adjustments.

The procedure is as follows:

1. Make a list of the desired stations, arranged in order from low to high frequencies.
2. Turn the range switch to the broadcast position and manually tune in the first station on the list.
3. Turn range switch to push-button position and press in the left-hand button.
4. Adjust core rod No. 1 to receive the first station. To secure the best adjustment, rotate the loop for least pickup, and adjust core rod No. 1 for peak output.
5. Adjust trimmer screw No. 1 for peak output on the first station.
6. Proceed in the same manner to adjust for the remaining stations.
7. Repeat adjustments for best results.

On the 880 to 1,600 kc push-button, the higher frequency stations may be received with core rod No. 6 either in or out (oscillator frequency either 455 kc below or 455 kc above the station frequency). The adjustment with this core in its out position (oscillator frequency 455 kc above the station frequency) is the correct one.

NOTE: Clockwise adjustment of cores and trimmers tunes the circuits to lower frequencies.

SERVICE HINT:—If unable to reach 550-540 KC on No. 1 push button —Connect a Stock No. 33111 Capacitor-Ceramic-33 mmf across L19 (between switch contact which connects to high side of L19, and switch frame).

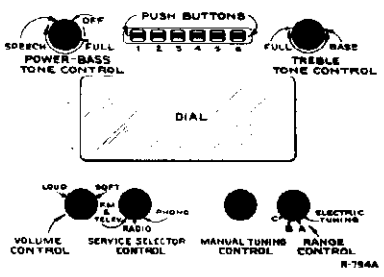
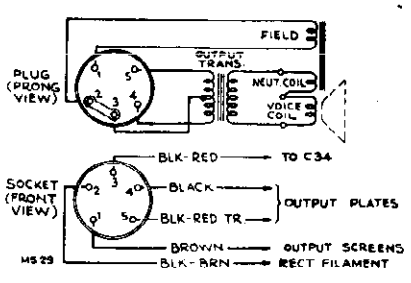
STOCK No.	DESCRIPTION
	CHASSIS ASSEMBLIES RC 605
36342	Board—"Antenna-Ground" board
60954	Capacitor—Ceramic, 56 mmf. (C16)
38852	Capacitor—Mica trimmer comprising two (2) sections of 8-80 mmf. (C2, C6)
38801	Capacitor—Mica trimmer comprising three (3) sections of 8-80 mmf. (C7, C8, C9)
39628	Capacitor—Mica, 100 mmf. (C17, C18, C33)
39630	Capacitor—Mica, 120 mmf. (C5, C13, C25, C28)
39634	Capacitor—Mica, 180 mmf. (C27)
38830	Capacitor—Silver mica, 226 mmf. (C11)
38638	Capacitor—Mica trimmer, 50-350 mmf. (C4)
39646	Capacitor—Mica, 560 mmf. (C39)
38831	Capacitor—Mica, 630 mmf. (C15)
39660	Capacitor—Mica, 2200 mmf. (C14)
71394	Capacitor—Paper, .0015 mfd., 600 volts (C21A)
70623	Capacitor—Paper, .0025 mfd., 600 volts (C30, C29A)
70646	Capacitor—Paper, .0035 mfd. (C41, C42)
70606	Capacitor—Paper, .005 mfd., 400 volts (C21, C38)
70627	Capacitor—Paper, .005 mfd., 600 volts (C23, C29)
70610	Capacitor—Paper, .01 mfd., 400 volts (C50)
70631	Capacitor—Paper, .01 mfd., 600 volts (C10, C35, C40, C25A, C27A)
70611	Capacitor—Paper, .02 mfd., 400 volts (C31)
70615	Capacitor—Paper, .05 mfd., 400 volts (C20)
70617	Capacitor—Paper, 0.1 mfd., 400 volts (C22, C6A)
70618	Capacitor—Paper, 0.25 mfd., 200 volts (C26, C32)
34889	Capacitor—Electrolytic, comprising two (2) sections of 15 mfd., 450 volts (C24, C43)
34533	Capacitor—Electrolytic, comprising one (1) section of 20 mfd., 450 volts; one (1) section of 15 mfd., 350 volts; and one (1) section of 40 mfd., 25 volts (C34, C36, C37)
38367	Coil—Antenna coil, "B" and "C" band (L3, L4, L5)
38358	Coil—Oscillator coil (L6, L7, L8)
38800	Condenser—Variable tuning condenser (C1, C12)
36447	Control—Volume control (R19)
32634	Cord—Drive cord
12006	Core—Adjustable core and stud for first and second I.F. transformers
35788	Core—Adjustable core and stud for oscillator coil
38359	Cup—Mounting cup for oscillator coil
38790	Drum—Drive drum
35870	Indicator—Station selector indicator
28452	Plate—Bakelite mounting plate for capacitor #34533
36333	Plate—Dial back plate complete with pulleys less dial
30868	Plug—Two (2) contact female plug for motor cable
31572	Plug—Three (3) contact female plug for power cable
12493	Plug—Five (5) contact female plug speaker cable
38832	Plug—Pin plug for loop lead
32641	Plug—Three (3) prong male plug for selector cable
39153	Plug—Four (4) prong male plug for tone control cable
32289	Pulley—Drive cord pulley
34766	Resistor—1000 ohms, ½ watt (R3, R10A)
30654	Resistor—1500 ohms, ½ watt (R2)
38808	Resistor—Voltage divider comprising one (1) section of 3000 ohms, 9 watt; one (1) section of 2500 ohms, 4.2 watt; one (1) section of 10 ohms, 0.2 watt; one (1) section of 25 ohms, 0.5 watt; and one (1) section of 145 ohms, 3 watt (R26, R27, R28, R31, R32)
35876	Resistor—Resistor and coil assembly, 10,000 ohms (R1, L13)
36714	Resistor—15,000 ohms, ½ watt (R12, R18)
30492	Resistor—22,000 ohms, ½ watt (R7)
30409	Resistor—27,000 ohms, ½ watt (R18A)
30147	Resistor—39,000 ohms, ½ watt (R21, R3A)
30787	Resistor—47,000 ohms, ½ watt (R4)
30650	Resistor—56,000 ohms, ½ watt (R5, R11)
14138	Resistor—68,000 ohms, ½ watt (R9)
3252	Resistor—100,000 ohms, ½ watt (R8)
30651	Resistor—270,000 ohms, ½ watt (R13, R14, R15, R20)
11988	Resistor—390,000 ohms, ½ watt (R24, R25)
30653	Resistor—560,000 ohms, ½ watt (R30)
30652	Resistor—1 megohm, ½ watt (R17, R29)
30649	Resistor—2.2 megohm, ½ watt (R6, R10, R23)
38803	Shaft—Tuning knob shaft
31364	Socket—Lamp socket
33514	Socket—Phone input socket
31251	Socket—Tube socket
31418	Spring—Drive cord tension spring
12007	Spring—Retaining spring for first I.F. and second I.F. transformers' core and stud and for oscillator's core, coil, and stud
38809	Switch—Radio-phono switch (S5, S6)
38807	Switch—Range switch (S1, S2, S3, S4)

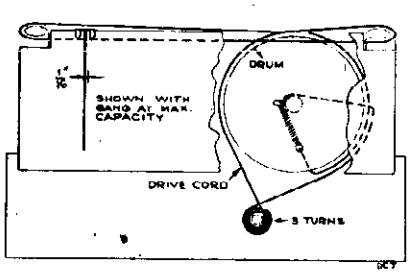
STOCK No.	DESCRIPTION
35636	Transformer—First I.F. transformer (L9, L10, C17, C18)
35790	Transformer—Second I.F. transformer (L11, L12, C25, C28)
34539	Transformer—Power transformer 105-115 volts 50-60 cycles (T1)
33726	Washer—"C" washer for tuning knob shaft
	SPEAKER ASSEMBLIES 92513-1K
70574	Cone—Cone and voice coil assembly
31539	Plug—Five (5) prong male plug for speaker
70548	Speaker—12" EM speaker complete with cone and voice coil less output transformer and plugs
37899	Transformer—Output transformer (T2)
	NOTE: If stamping on speaker in instrument does not agree with above speaker number, order replacement parts by referring to model number of instrument, number stamped on speaker and full description of part required.
	MISCELLANEOUS ASSEMBLIES
36327	Bezel—Dial bezel less dial scale
38376	Bezel—P.B. bezel less push buttons
36639	Bracket—Pilot lamp bracket
38375	Button—Push button
70556	Bumper—Rubber bumper for record changer tray (2 req'd)
38684	Capacitor—Trimmer, 2-20 mmf. (C3)
36424	Capacitor—Mica trimmer, comprising one (1) section of 10-160 mmf.; two (2) sections of 25-250 mmf.; two (2) sections of 50-400 mmf.; and one (1) section of 100-540 mmf. (C44, C45, C46, C47, C48, C49)
36462	Clamp—Dial clamp
31382	Clip—Mounting clip for P.B. coils
38579	Coil—Loop primary coil (L2)
38315	Coil—P.B. oscillator coil—high frequency (L14, L15, L16)
37638	Coil—P.B. oscillator coil—low frequency (L17, L18, L19)
38405	Control—H.F. tone control (R16)
38402	Control—L.F. tone control and power switch (R22, S-8)
35871	Core—Adjustable core and stud for P.B. oscillator coils
70550	Cushion—Shock absorbing cushion
39015	Decal—Control panel decal
37147	Decal—H.F. tone control decal
37148	Decal—L.F. tone control decal
35392	Decal—Trade mark decal (RCA Victor)
70575	Decal—Trade mark decal (Dog)
39014	Dial—Glass dial scale
X1607	Grille—Grille cloth for Mahogany cabinet
70996	Grille—Metal grille
X1608	Grille—Grille cloth for Walnut cabinet
39368	Guide—Carriage guide—L.H.
39367	Guide—Carriage guide—R.H.
39352	Hinge—Cabinet door hinge
13103	Jewel—Pilot lamp cap
70995	Knob—Record storage compartment door knob
35814	Knob—Tone control, radio-phono switch, range switch, tuning knob, or volume control
11765	Lamp—Dial lamp
70544	Loop—Antenna loop (L1, L2, C3)
34317	Marker—Station marker
70546	Mounting—One set of hardware to mount record changer consisting of four (4) upper and four (4) lower springs and four (4) clamp nuts
30868	Plug—Two (2) contact female plug for motor cable extension
30870	Plug—Two (2) prong male plug for motor cable extension
36422	Plug—Three (3) contact female plug for selector cable and loop leads
31572	Plug—Three (3) contact female plug for power switch cable
38853	Plug—Four (4) contact female plug for tone control cable
70994	Pull—Record changer compartment door pull
70551	Retainer—Tray roller retaining strip—L.H.
70552	Retainer—Tray roller retaining strip—R.H.
70554	Roller—Record changer tray roller
30900	Spring—Retaining spring for control knob
34053	Spring—Retaining spring for push button
70549	Stop—Mechanism tray stop
38575	Switch—Selector switch (S14, S15, S16, S17, S18, S19, S44, S45, S46, S47, S48, S49)
39360	Support—Door support for record changer compartment
70545	Support—Loop support complete with mounting brackets and spring
70555	Tire—Rubber tire for tray roller
70553	Tray—Record changer carrying tray less rollers
2917	Washer—Spring washer to hold roller



Front Panel Controls

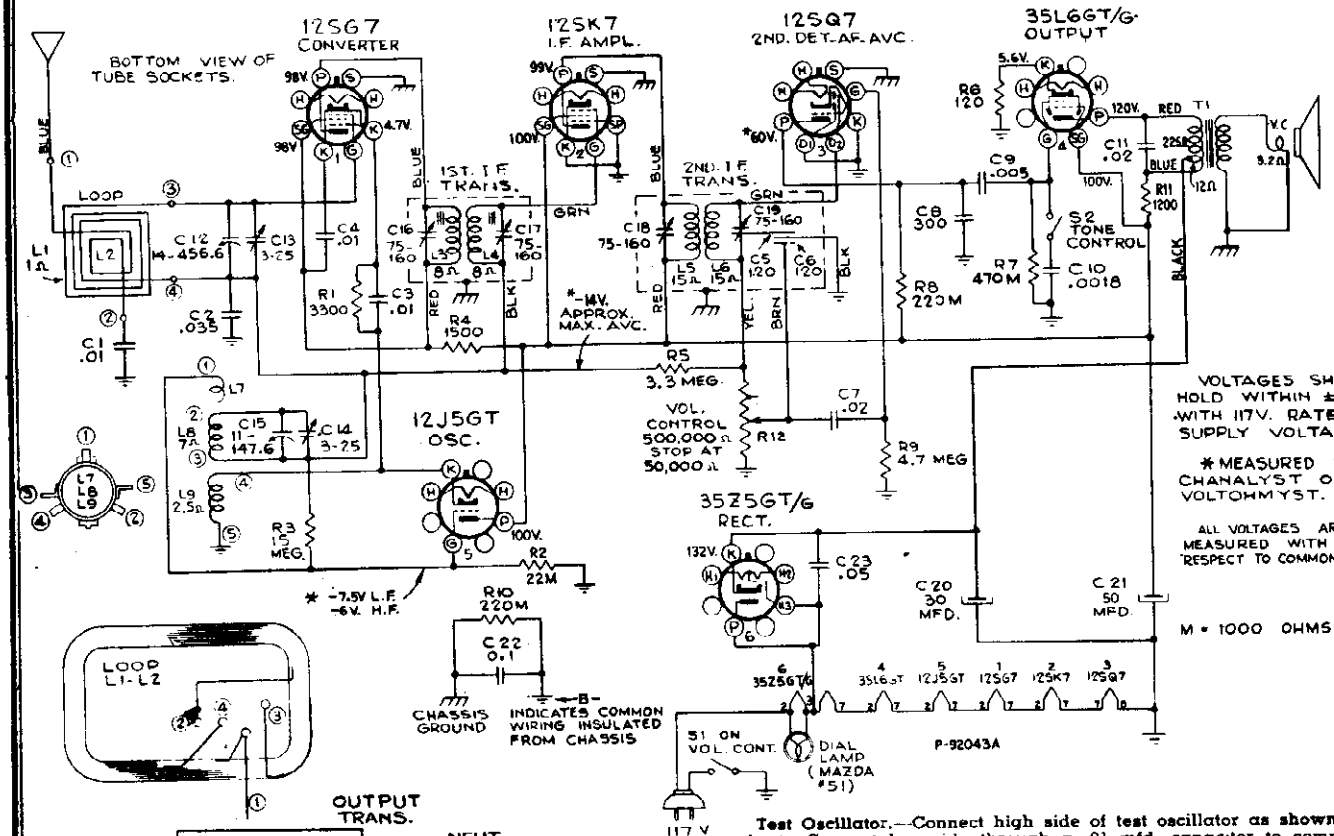


Speaker Connections



Dial Cord Drive

RCA MFG. CO.



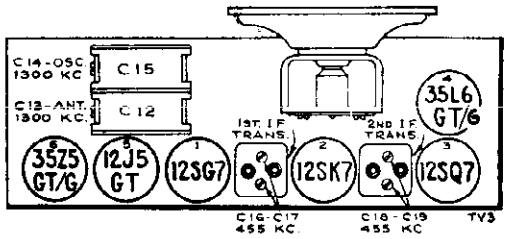
Test Oscillator.—Connect high side of test oscillator as shown i chart. Connect low side through a .01 mfd. capacitor to commo "B." Keep the oscillator output signal as low as possible t avoid AVC action.

Output Meter.—Connect leads across speaker voice coil. Tur volume control to maximum clockwise, tone control to maximu highs (clockwise).

Dial Pointer Adjustment.—Rotate tuning condenser fully counte clockwise (plates closed). Adjust indicator pointer to left (ma cap.) mark on dial backing plate.

Steps	Connect the high side of test-oscillator to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. peak output
1	Stator of C-12 in series with .01 mfd.	455 kc	Quiet-point 1,600 kc end of dial	C18 and C19 2nd I-F transformer
2				* C16 and C17 1st I-F transformer
3	Ant. lead in series with 200 mmfd.	1,300 kc	1,300 kc	C14 (osc.) C13 (ant.)
4	Repeat step 3.			

* Do not readjust C18 or C19.



Critical Lead Dress

1. Dress output plate bypass capacitor (C-11 .02 mfd.) against chassis.
2. Dress 35L6GT/G plate lead (red) against chassis and away from volume control, leads and terminals.
3. Dress audio coupling capacitor (C-7 .02 mfd.) away from 35L6GT/G heater leads.
4. Dress tone control lead against front apron.
5. Dress 2nd I-F yellow and brown leads away from output plate bypass capacitor (C-11, .02 mfd.) and away from all heater leads.
6. Dress lead to speaker voice coil away from tuning shaft "C" washer.
7. Dress tone control capacitor (C-10, .0018 mfd.) away from oscillator coil.
8. Dress all uninsulated leads away from each other and away from chassis to prevent short circuits.
9. Dress blue and green leads of both IF transformers back in shields leaving exposed lengths as short as possible.

Frequency Range ..... 540-1600 k
Intermediate Frequency ..... 455 k
Power Output
Undistorted ..... 1.0 wat
Maximum ..... 1.5 wat

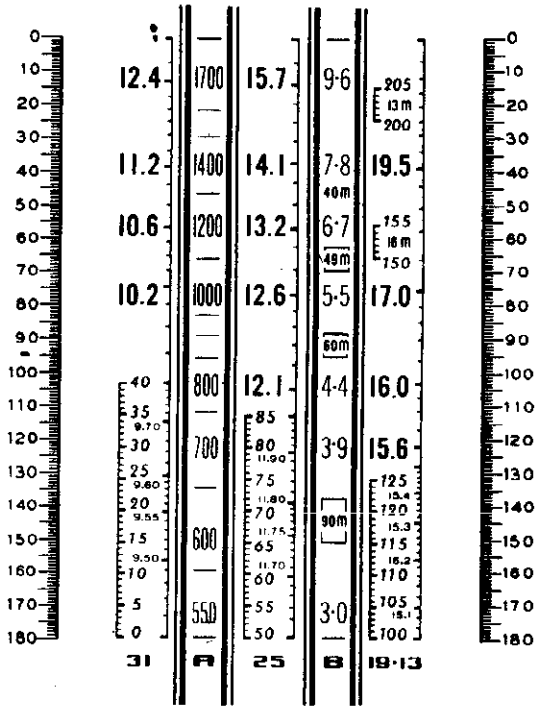
70409	Back—Cabinet back for Radiola 61-2
70415	Back—Cabinet back for Radiola 61-3
36890	Clamp—Dial clamp, left hand, for Radiola 61-1 and 61-2
36891	Clamp—Dial clamp, right hand, for Radiola 61-1 and 61-2
X1602	Cloth—Grille cloth for Radiola 61-3
71017	Decal—Control panel decal for Radiola 61-3
70704	Dial—Glass dial scale for Radiola 61-1 and 61-2
70705	Dial—Glass dial scale for Radiola 61-3
37631	Fastener—Push fastener (1 set) for cabinet backs on Radiola 61-1 and 61-2
33006	Feet—Rubber feet for cabinet (4 required)
71018	Knob—Control knob (walnut) for Radiola 61-1
70414	Knob—Control knob (ivory) for Radiola 61-2
36722	Knob—Control knob (walnut) for Radiola 61-3
30900	Spring—Retaining spring for knob

Power Supply Rating
105-125 volts, AC, 50 or 60 cycles, or DC ..... 30 watts
Pilot Lamp ..... Mazda No. 51, 6-8 volts, 0.2 amp.

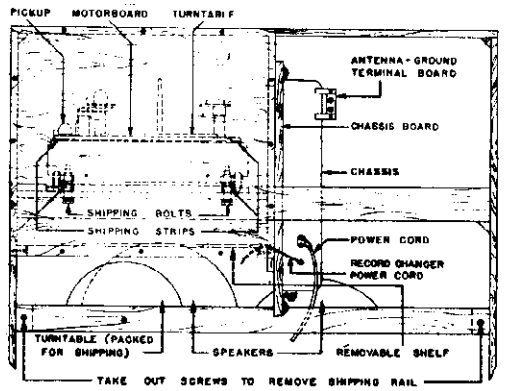
Tuning Drive Ratio 20:1

Loudspeaker (92510-1)
Type ..... 5-inch PM
V. C. Impedance ..... 3.4 ohms at 400 cycles

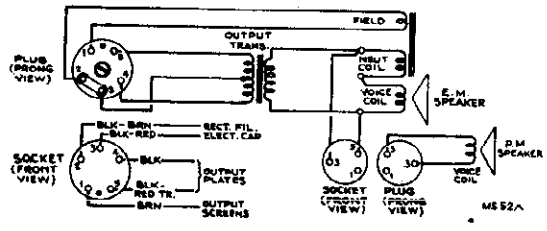
Model QU61



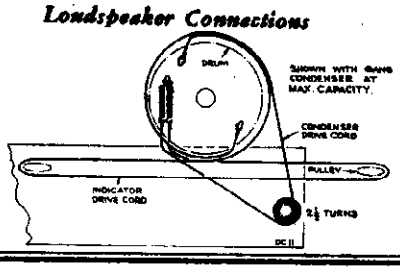
Receiver Dial with Calibration Scale



Cabinet Rear View

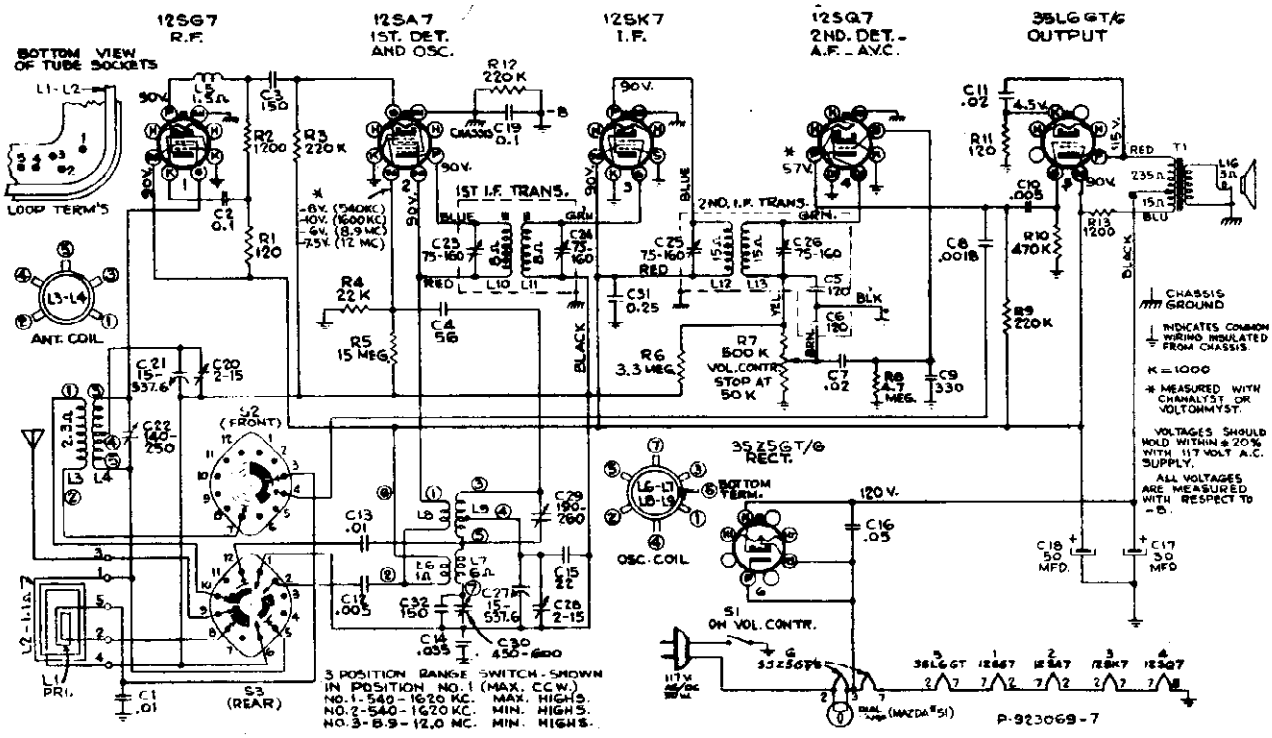


Loudspeaker Connections

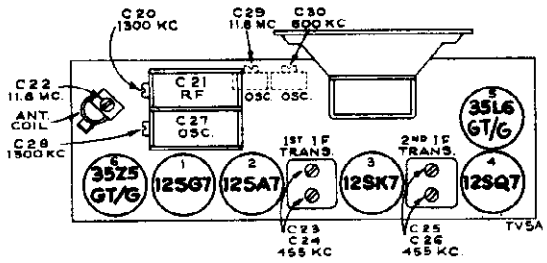


MODELS 61-5, Ch. RC-1023
61-10, Ch. 1023B

RCA MFG. CO.

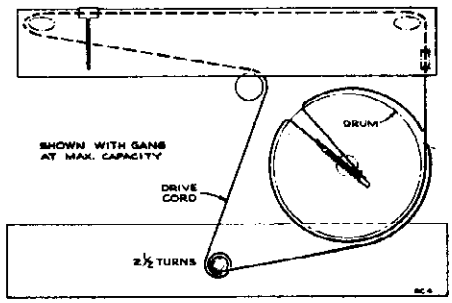


Note: On some sets C31 may be 0.1 mfd. or 0.2 mfd.



Dial Pointer Adjustment.—Rotate tuning condenser fully counter-clockwise (plates fully meshed). Adjust indicator pointer to left (max. cap.) mark on dial backing plate.

Calibration Scale.—The glass tuning dial may be removed from the cabinet and temporarily attached to the dial backing plate.



Critical Lead Dress

1. Dress blue and green leads of both I-F transformers back in shield cans, leaving them as short as possible.
2. Dress R-F plate filter capacitor (C2, 0.1 mfd.) back against rear chassis apron.
3. Dress yellow and brown leads from 2nd I-F away from all other leads.
4. Dress all heater leads next to chassis.
5. Dress capacitor (C13, .01 mfd.) parallel to osc. coil and approximately 3/16 inch from coil.
6. Dress tone control lead and speaker field leads next to chassis and front apron.
7. Dress pilot lamp leads away from ant. coil.
8. Dress leads from loop to ant. coil around rectifier tube towards end of chassis.
9. Dress output plate lead against chassis.

Test Oscillator.—Connect high side of test oscillator as shown in chart. Connect low side through a .01 mfd. capacitor to common "-B." Keep the oscillator output signal as low as possible to avoid A.V.C. action.

Output Meter.—Connect meter across speaker voice coil. Turn volume control to maximum clockwise position, station selector switch to broadcast maximum high position (pos. 1), for broadcast alignment and to position 3 for high frequency band.

Steps	Connect high side of the test oscillator to—	Tune test osc. to—	Turn radio dial to—	Adjust the following for maximum peak output
1	Pin #8 of 12SA7 in series with 0.1 mfd.	455 kc	Quiet Point at 1,600 kc end of dial	C25, C26 2nd I-F trans.
2				*C23, C24 1st I-F trans.
3	Ant. terminal in series with 220 mmf	600 kc	600 kc "A" Band	C30 (osc.) Rock gang
4		1300 kc	1300 kc "A" Band	C28 (osc.) C20 R-F)
5		Repeat 3 Rocking gang		
6		Repeat 3, 4 and 5 for exact cal.		
7	Ant. terminal in series with 0.1 mfd.	11.8 mc	11.8 mc	C29 (osc.)† Rock gang
8	Ant. terminal in series with 47 mmf.	11.8 mc	11.8 mc	C22 (R-F) Rock gang
9	Repeat steps 7 and 8			

† Use minimum capacity peak if two can be obtained. Check for selection of correct peak by tuning receiver to approximately 10.9 mc where a weaker signal should be received.

* Do not readjust C25 or C26.

Frequency Range

Broadcast	540-1600 kc
Short Wave	8.9-12 mc
Intermediate Frequency	455 kc

Power Output

Undistorted	1.0 watts
Maximum	1.5 watts

Loudspeaker (92510-1) "PM"

Size	5-inch
V.C. Impedance	3.4 ohms at 400 cycles

Power Supply Rating

105-125 volts, AC, 50 or 60 cycles, or DC ..... 30 watts

14583	Resistor—220,000 ohms, ¼ watt (R19)
30648	Resistor—470,000 ohms, ¼ watt (R8)
30649	Resistor—2.2 megohms, ¼ watt (R1)
12928	Resistor—3.3 megohms, ¼ watt (R2)
30992	Resistor—10 megohms, ¼ watt (R6)
70369	Shaft—Tuning knob shaft
37605	Socket—Tube socket, moulded
31418	Spring—Tension spring for drive cord
71384	Switch—Range switch (S1)
70361	Transformer—First I-F transformer (L8, L9, C8, C9)
70362	Transformer—Second I-F transformer (L10, L11, C12, C13, C14, C15)
71398	Transformer—Output transformer (T1)
33726	Washer—Retaining washer for tuning shaft
	SPEAKER ASSEMBLY
	92510-2
70372	Speaker—5-inch PM speaker complete NOTE: If stamping on speaker in instrument does not agree with above speaker number, order replacement parts by referring to model number of instrument, number stamped on speaker and full description of part required.
	MISCELLANEOUS ASSEMBLIES
37362	Clamp—Dial clamp (1 set)
71324	Decal—Trade mark decalcomania
71389	Dial—Dial scale
37831	Fastener—Push fastener for back cover (1 set)
35121	Knob—Range switch knob for Radiola 61-6
35123	Knob—Range switch knob for Radiola 61-7
36722	Knob—Volume control or tuning knob for Radiola 61-6
70414	Knob—Tuning or volume control knob for Radiola 61-7
35126	Spring—Retaining spring for range switch knob
30900	Spring—Retaining spring for volume control or tuning knob

PRECAUTIONARY LEAD DRESS

1. Dress output plate capacitor and output transformer leads down next to chassis.
2. Dress 12SQ7 grid resistor down next to chassis, and away from power ground wire to switch.
3. Dress lead from 2nd I-F transformer to volume control down to chassis and away from adjacent parts.
4. Keep grid end of R1 as short as possible.
5. Keep body of C1A slightly away from chassis.

POWER SUPPLY POLARITY.—For operation on d-c, the power plug must be inserted in the outlet for correct polarity. If the set does not function, reverse the plug. On a-c, reversal of the plug may reduce hum.

Tuning Drive Ratio ..... **18 to 1**

Power Supply Rating

105-125 volts ..... D.C. or 50-60 cycles A.C. ..... **30 watts**

30900	Spring—Retaining spring for knobs

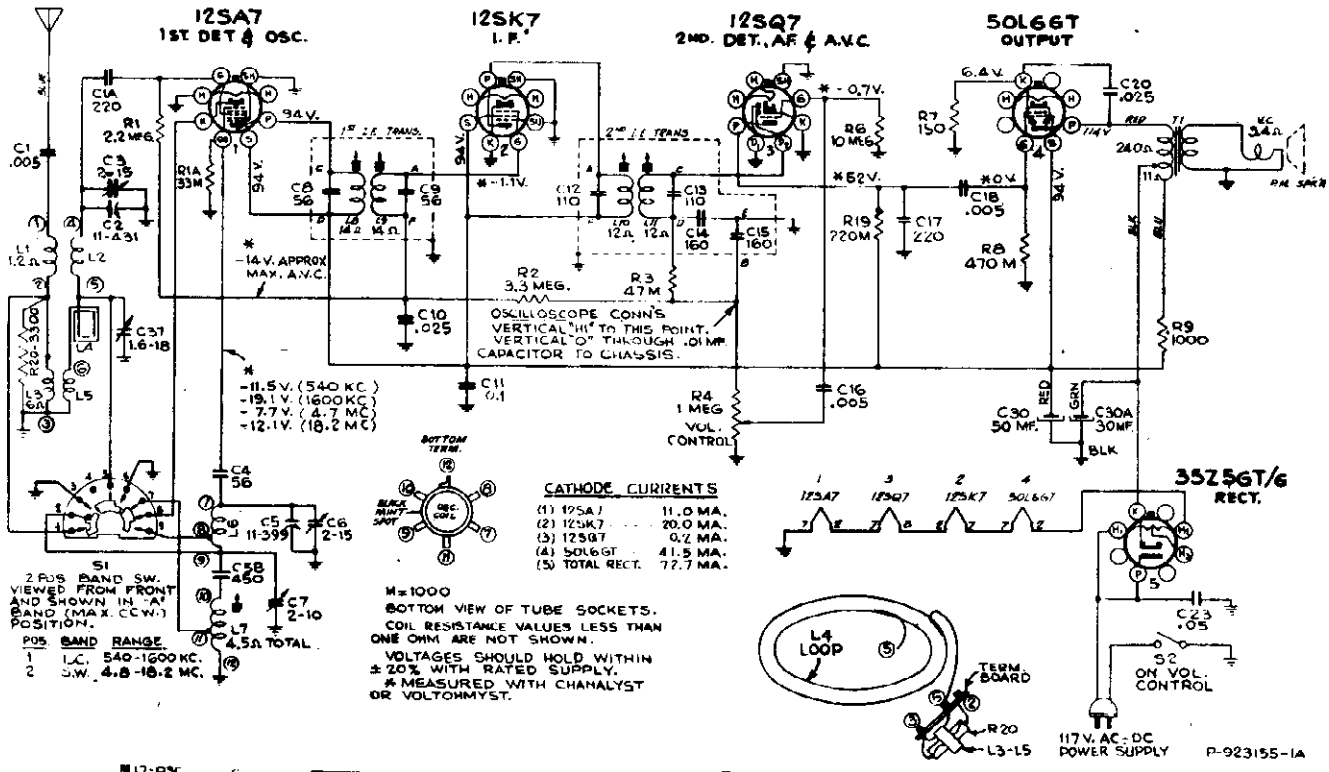
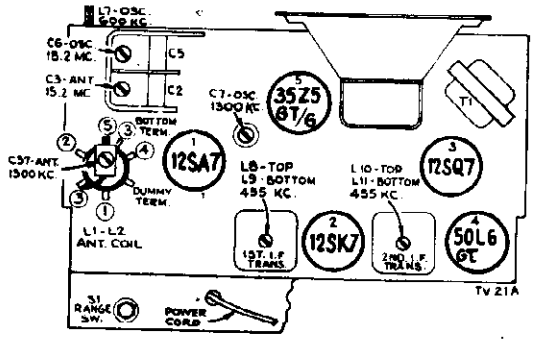
RCA MFG. CO.



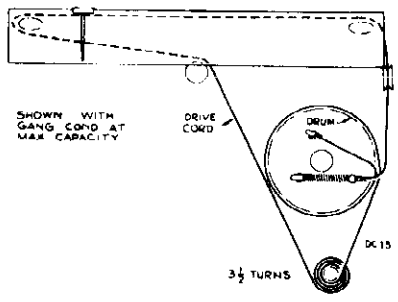


Cathode-Ray Alignment is the preferable method. Connections for the oscilloscope are shown in the schematic drawing.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

Calibration Scale.—The glass tuning dial may be removed from the cabinet and mounted above the pointer for easy reference during alignment. The extreme left hand mark of the Standard Broadcast scale must be in line with the left hand mark on the dial backing plate.

Dial Pointer.—With the gang condenser in full mesh the dial pointer should be set to the left hand mark of the Standard Broadcast scale.



Dial Indicator and Drive Mechanism

Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator through a .01 mfd. capacitor to the receiver chassis, and keep the oscillator output as low as possible to avoid a-v-c action.

Steps	Connect high side of test osc. to—	Tune test osc. to—	Turn radio dial to—	Adjust following for max. output—
1	12SK7 I-F grid through 0.1 mfd. capacitor	455 kc	B. C.; 1600 kc quiet point	L11-L10 (2nd I-F Trans.)
2	Stator of gang cond. C2 (rear) through 0.1 mfd.			L9-L8* (1st I-F Trans.)
3	Antenna lead through 300 ohm resistor	18.2 mc	S. W.; gang condenser open	C6 (osc.)**
4		15.2 mc	S. W.; maximum signal rock gang	C3 (ant.)***
5	Antenna lead through 200 mmf. capacitor	600 kc	B. C.; 600 kc	L7 (osc.)
6		1300 kc	B. C.; rock gang at 1300 kc	C37 (ant.) C7 (osc.)
7		600 kc	B. C.; rock gang at 600 kc	L7 (osc.)
8	Repeat steps 8 and 7			

* Do not readjust L10 or L11 when test oscillator is connected to C2.

** Use minimum capacity peak if two peaks can be obtained.

*** Image signal of lesser amplitude should occur at 14.3 mc.

NOTE.—Oscillator tracks above signals on both bands.

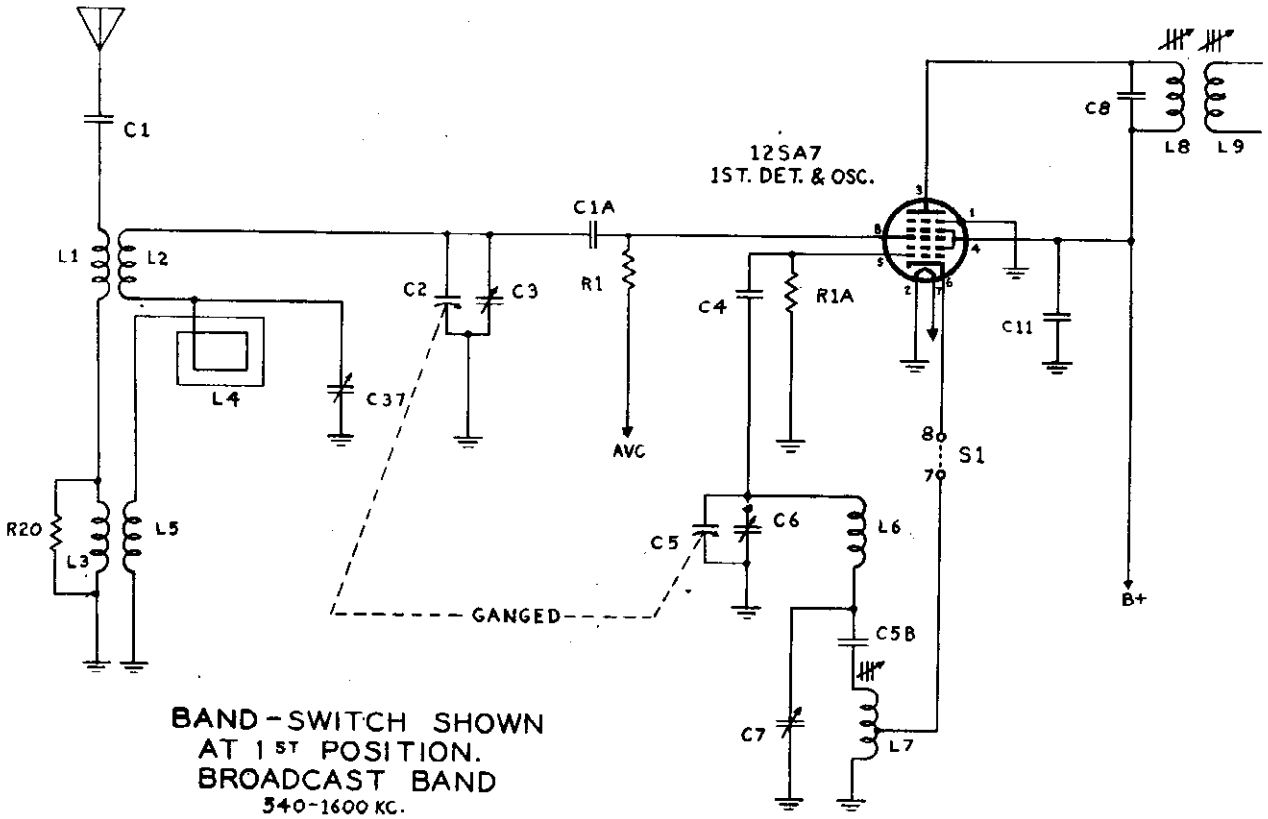
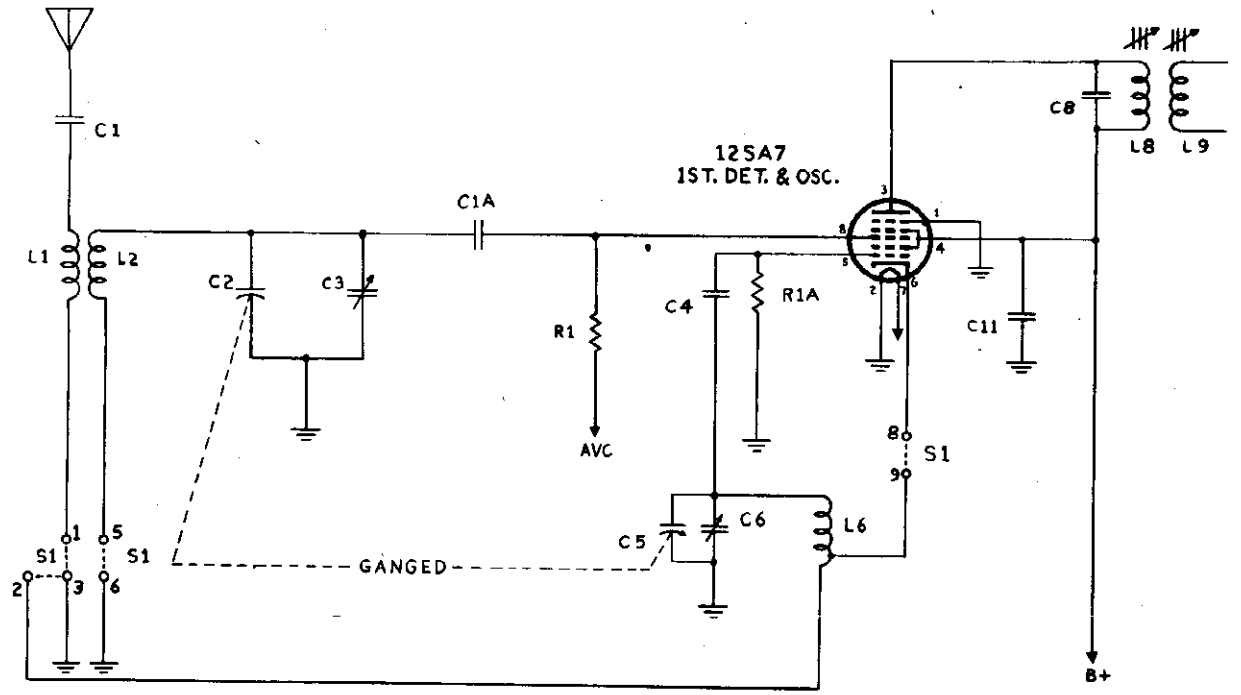
RCA MFG. CO.

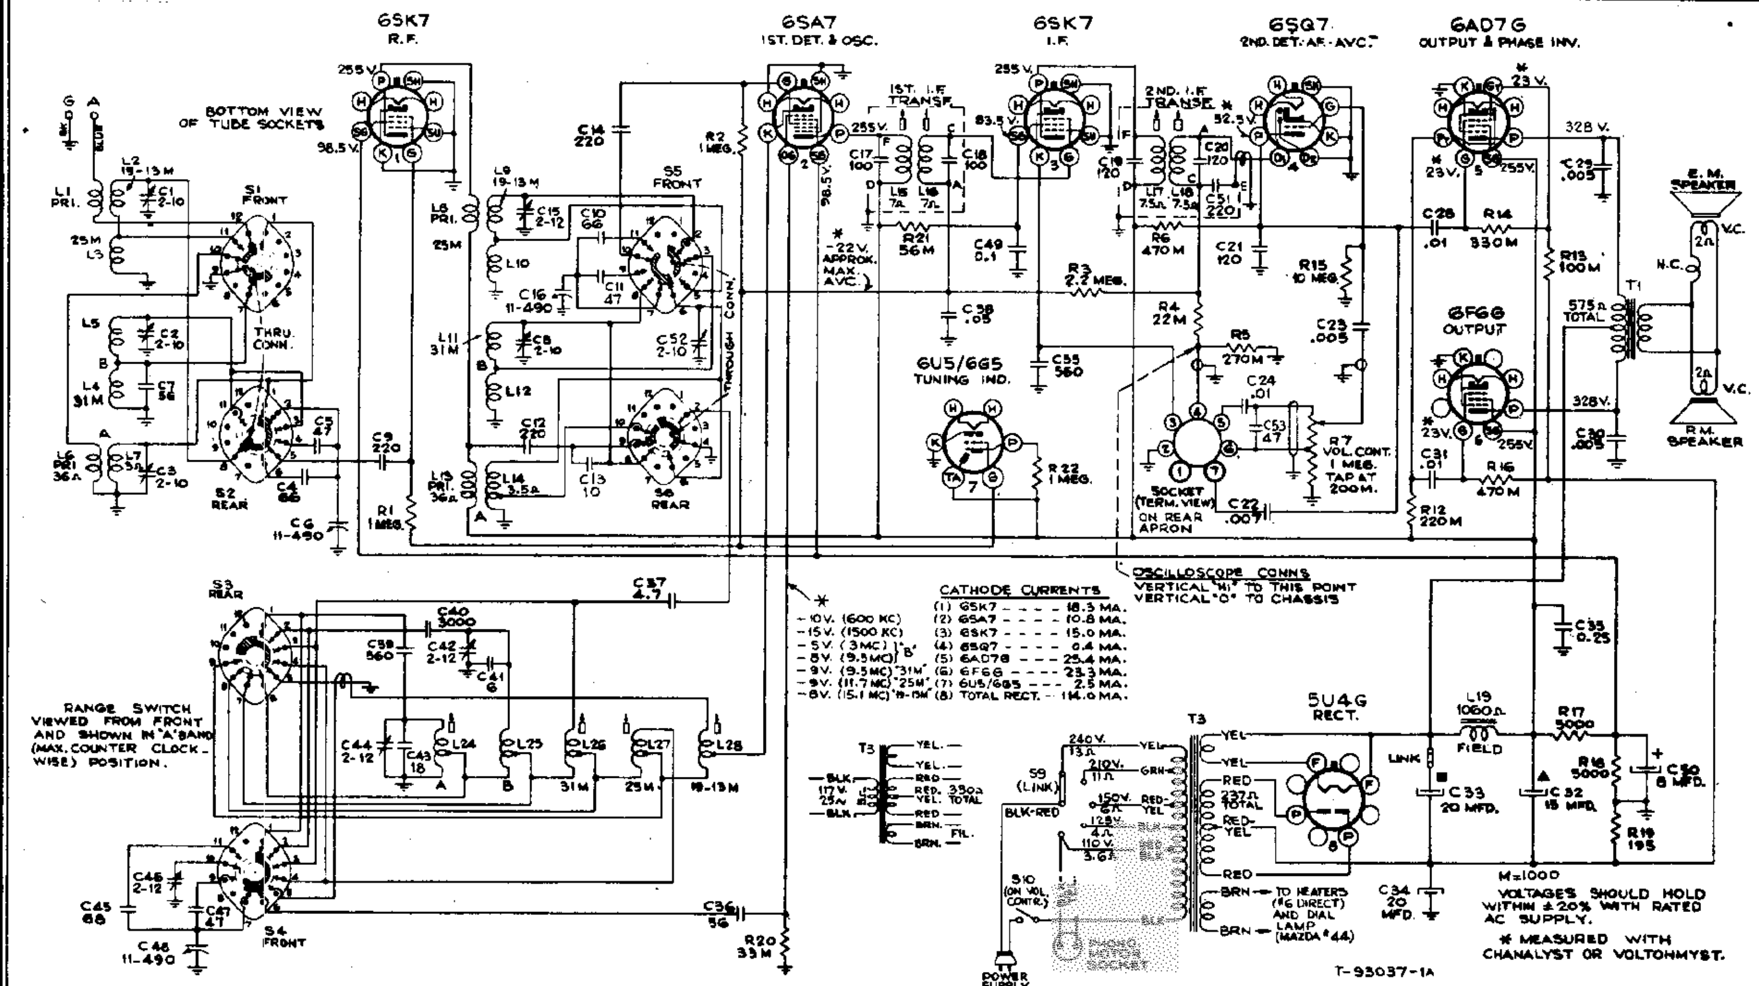


BAND-SWITCH SHOWN
AT 1ST POSITION.
BROADCAST BAND
540-1600 KC.



BAND-SWITCH SHOWN
AT 2ND POSITION CLOCKWISE.
SHORT WAVE BAND
4.8-18.2 MC.

RCA MFG. CO.



Precautionary Lead Dress.—

(1) Dress all spread band oscillator coil leads to clear each other by at least 1/4 inch.

(2) Dress toothpick capacitors and range switch leads away from shield plates.

(3) Twist leads from A and E of 2nd I-F transformer and dress close to chassis.

(4) Dress leads to converter socket so that they do not impair flexible mounting.

(5) Dress oscillator grid capacitor C36 and 1st det. grid capacitor C14 apart.

(6) Dress capacitor C23 away from front apron; dress capacitor C24 as close to rear apron as possible.

(7) Dress twisted a-c wiring to power switch away from volume control wiring and components.

(8) Dress excess power transformer leads between transformer bell and back apron.

Frequency Ranges

Standard Broadcast ("A" Band)	540-1,720 kc	(556-174 m)
Medium Wave ("B" Band)	3.0-9.5 mc	(100-31.6 m)
31 Meter Spread Band	9.5-11.7 mc	(31.6-25.6 m)
25 Meter Spread Band	11.7-15.1 mc	(25.6-19.9 m)
19-13 Meter Spread Band	15.1-22.5 mc	(199-133 m)

RCA MFG. CO.

Cathode-Ray Alignment is the preferable method. Connections for the oscilloscope are shown on the schematic circuit diagram.

Output Meter Alignment.—If this method is used, connect the meter across either voice coil, and turn the receiver volume control to maximum.

Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the oscillator output as low as possible to avoid a-v-c action.

Calibration Scale on Indicator-Drive-Cord Drum.—The tuning dial is fastened in the cabinet and cannot be used for reference during alignment, therefore a calibration scale is attached to the rear of the indicator-drive-cord drum which is mounted on the front shaft of the gang condenser.

As the first step in r-f alignment, check the position of the drum, it should correspond to that shown in the Dial Indicator and Drive Mechanism drawing when the gang condenser plates are fully meshed. The drum is held to the shaft by means of two set screws, which must be tightened securely when the drum is in the correct position.

Pointer for Calibration Scale.—Improvise a pointer for the calibration scale by fastening a piece of wire to the gang condenser frame, and bend the wire so that it points to the "180°" mark on the calibration scale when the plates are fully meshed.

The setting of the gang condenser is read on this scale, which is calibrated in degrees. The correct setting of the gang in degrees, for each alignment frequency, is given in the alignment table.

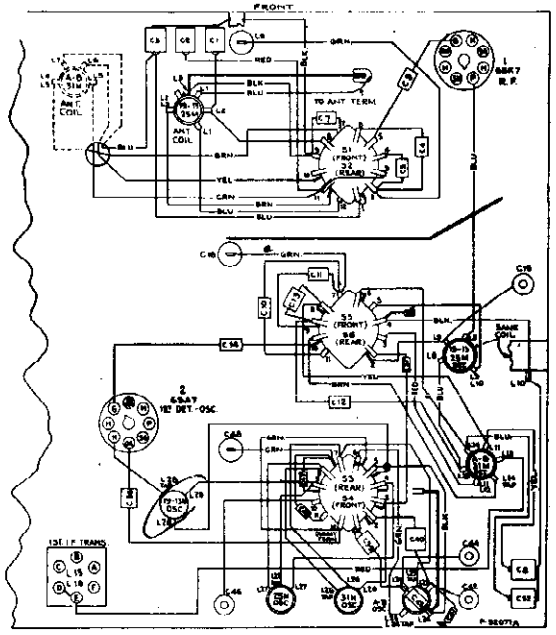
Receiver Dial with Calibration Scale.—To determine the corresponding frequency for any setting of the calibration scale, refer to the drawing.

Spread-Band Alignment.—The most satisfactory method of aligning or checking the spread-band ranges is on actual reception of short-wave stations of known frequency, by retouching the magnetite-core oscillator coil for each band so that these stations come in at the correct points on the dial.

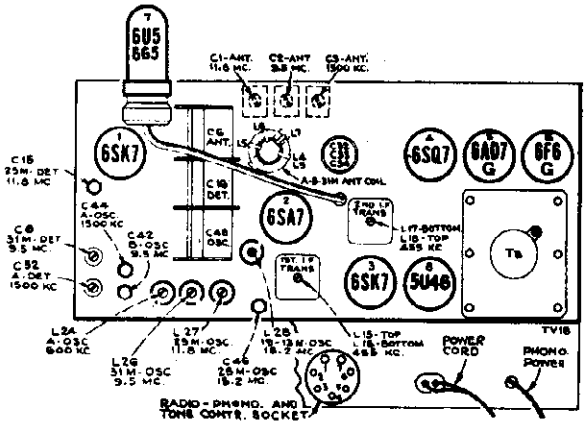
In exceptional cases, when the set is being serviced in a location where the noise level is high enough to prevent reception of short-wave stations, a test-oscillator may be used for alignment, but an extremely high degree of accuracy is required in the frequency settings of the test-oscillator, as a slight error will produce considerable inaccuracy on the spread-band dials. The frequency settings of the test-oscillator may be checked by one or both of the following methods:

1. Determine the exact dial settings of the test-oscillator (for frequencies at or close to the specified alignment frequencies) by zero-beating the test-oscillator against short-wave stations of known frequency.
2. Use harmonics of the standard-broadcast range of a test-oscillator, first checking the frequency settings on this range by means of a crystal calibrator, or by zero-beating against standard broadcast stations.

When a test oscillator is employed for spread-band alignment, a final check should be made on actual reception of short-wave stations of known frequency, and the magnetite-core oscillator coil for each band should be retouched so that the stations come in at the correct points on the dial.



R. F. Wiring Diagram (Bottom View)



Steps	Connect the high side of the test-osc. to—	Tune test-osc. to—	Range Switch	Turn Radio Dial to—	Adjust the following for max. peak output
1	6SK7 I-F grid in series with .01 mfd.	455 kc	"A" band	Quiet point 600 kc end of dial	L18-L17 2nd I-F transformer
2	6SA7 1st det. grid in series with .01 mfd.				L16-L15 1st I-F transformer
3	Antenna terminal in series with 300 ohms	11.8 mc	25 meter band	11.8 mc (138.5°)	L27 (osc.)** C1 (ant.) C15 (det.)***
4		15.2 mc		15.2 mc (18.5°)	C46 (osc.)*† Rock in
5	Repeat steps 3 and 4 until aligned.				
6	Antenna terminal in series with 300 ohms	15.2 mc	19-13 meter band	15.2 mc (156°)	L28 (osc.)**
7		9.5 mc	31 meter band	9.5 mc (156°)	L26 (osc.)** C2 (ant.) C8 (det.)***
8		9.5 mc	"B" band	9.5 mc (11.5°)	C42 (osc.)*
9	Antenna terminal in series with 200 mmfd.	1,500 kc	"A" band	1,500 kc (27°)	C44 (osc.) C3 (ant.) C52 (det.)
10		600 kc		600 kc (149.5°)	L24 (osc.) Rock in
11	Repeat steps 9 and 10.				

* Use minimum capacity peak if two can be obtained.

** If two peaks can be obtained, use the one obtained when the core screw is farthest out (counter-clockwise).

*** Use maximum capacity peak if two peaks can be obtained.

† Check image to determine that C46 has been adjusted to correct peak by tuning receiver to approximately 14.29 mc (29°) where a weaker signal should be received.

NOTE: Oscillator tracks above signals on all bands.

14983	Resistor—330,000 ohms, 1/4 watt (R14)
30648	Resistor—470,000 ohms, 1/2 watt (R6, R16)
30652	Resistor—1 megohm, 1/4 watt (R1, R2, R22)
30649	Resistor—2.2 megohms, 1/4 watt (R3)
30992	Resistor—10 megohms, 1/4 watt (R15)
14350	Screw—#8-32 square head set screw for drive drum
38842	Shaft—Tuning knob shaft and flywheel
36107	Socket—7 contact socket located on rear apron of chassis
31364	Socket—Dial lamp socket
31251	Socket—Tube socket
34864	Socket—Tuning tube socket
31261	Spring—Retaining spring for 19-13 meter band oscillator coil core and stud and for oscillator coils' core and stud assemblies
31418	Spring—Drive or indicator cord spring
12007	Spring—Retaining spring for I-F transformers' core and stud assemblies
37993	Switch—Range switch (S1, S2, S3, S4, S5, S6)
35636	Transformer—First I-F transformer (L15, L16, C17, C18)
36615	Transformer—Second I-F transformer (L17, L18, C19, C20, C51)
34183	Transformer—Power transformer, 110/125/150/210/240 volts, 50-60 cycle (T3) (For Specification Ratings A and C)
39786	Transformer—Power transformer, 105/120 volts, 25-60 cycle (T3) (For Specification Rating B)
2917	Washer—"C" washer for tuning knob shaft
	SPEAKER ASSEMBLIES 92520-1K
70574	Cone—Cone and voice coil assembly
5118	Plug—3 prong male plug for speaker
70686	Speaker—12" PM speaker complete with cone and voice coil less plug
	NOTE: If stamping on speaker in instrument does not agree with above speaker number, order replacement parts by referring to model number of instrument, number stamped on speaker and full description of part required.
	SPEAKER ASSEMBLIES 92516-2K
70574	Cone—Cone and voice coil assembly
5119	Plug—3 contact female plug for speaker
31539	Plug—5 prong male plug for speaker
70573	Speaker—12" E.M. speaker complete with cone and voice coil less output transformer and plugs
70688	Transformer—Output transformer (T1)
	NOTE: If stamping on speaker in instrument does not agree with above speaker number, order replacement parts by referring to model number of instrument, number stamped on speaker and full description of part required.
	MISCELLANEOUS ASSEMBLIES
X1601	Baffle—Baffle board and grille cloth
4287	Body—Phono-input cable connector body
36639	Bracket—Lamp bracket
70556	Bumper—Rubber bumper for tray
39630	Capacitor—Mica, 120 mmf. (C57)
70606	Capacitor—Tubular, .005 mfd., 200 volts (C54)
70610	Capacitor—Tubular, .01 mfd., 200 volts (C58)
70614	Capacitor—Tubular, .035 mfd., 200 volts (C25)
30716	Clip—Tuning tube clip
36109	Control—L.F. tone control (R11)
35629	Control—H.F. tone control (R10)
70694	Cushion—Rubber cushion
36156	Decal—HF. tone control decal
36155	Decal—L.F. tone control decal
36074	Decal—Radio-phono switch decal
37839	Decal—Range switch decal
70669	Decal—Trade mark decal
35387	Decal—Volume control and power switch decal
39923	Dial—Glass dial scale
4286	Ferrule—Phono-input cable ferrule and bushing
37998	Frame—Dial frame assembly less tube clip, indicator and dial
70691	Guide—Guide rail—L.H.
70692	Guide—Guide rail—R.H.
70690	Hinge—L.H. cabinet door hinge
70693	Hinge—R.H. cabinet door hinge
36593	Indicator—Station selector indicator
13103	Jewel—Pilot lamp cap
36038	Knob—Radio-phono or range switch knob
35814	Knob—Volume control, tone control or tuning knob
11891	Lamp—Dial lamp
70546	Mounting—One set of record changer mounting hardware consisting of four (4) upper and four (4) lower springs and four (4) clamp nuts.
30868	Plug—2 contact female plug for motor cable extension
30870	Plug—2 prong male plug for motor cable extension
36395	Plug—7 prong male plug for radio-phono cable
30436	Resistor—12,000 ohms, 1/4 watt (R8)
35714	Resistor—15,000 ohms, 1/4 watt (R31)
30409	Resistor—27,000 ohms, 1/4 watt (R32)
3252	Resistor—100,000 ohms, 1/4 watt (R30)
30648	Resistor—470,000 ohms, 1/4 watt (R9)
71151	Retainer—Tray roller retaining strip
71152	Retainer—Tray roller retaining strip
70554	Roller—Changer tray roller
4284	Spring—Phono-input cable connector spring
30900	Spring—Retaining spring for knob
70689	Stop—Mechanism tray stop
39360	Support—Drop support for record changer compartment door
39875	Switch—Radio-phono switch (S7)
70555	Tire—Rubber tire for tray roller
70553	Tray—Record changer carrying tray less rollers
4285	Washer—Phono-input cable insulating washer
2917	Washer—Retaining washer for tray roller
NOTE:	#37888 rating is 20-20-20 mfd., 450-450-25 volts.

30649	Resistor—2.2 megohms, ½ watt (R6)
31417	Resistor—3.3 megohms, ½ watt (R3)
30992	Resistor—10 megohms, ½ watt (R7, R8)
70467	Shaft—Tuning knob shaft
70377	Shield—Shield for 1A7GT/G tube
*71163	Socket—Battery shorting socket—3 contact female
37605	Socket—Tube socket
70390	Spring—Drive cord spring
*71403	Transformer—First I.F. transformer (T1)
*71400	Transformer—Second I.F. transformer (T2)
*71159	Transformer—Output transformer (T3)
33726	Washer—"C" washer for tuning knob shaft

STOCK No.	DESCRIPTION
	SPEAKER ASSEMBLY 922258-2
71058	Speaker—4" x 6" elliptical P.M. speaker complete with cone and voice coil
	NOTE: If stamping on speaker in instrument does not agree with above speaker number, order replacement parts by referring to model number of instrument, number stamped on speaker and full description of part required.
	MISCELLANEOUS
70471	Back—Cabinet back for 64F1
70472	Back—Cabinet back for 64F2
70475	Clamp—Dial clamps (1 set) for 64F1 and 64F2
70398	Clamp—Dial clamp for 64F3 (2 required)
70476	Dial—Glass dial scale for 64F1 and 64F2
*71166	Dial—Glass dial scale for 64F3
37831	Fastener—Push fastener for cabinet back (1 set)
70474	Knob—Tuning control knob—ivory—for 64F2
70473	Knob—Tuning knob—mottled walnut—for 64F1 and 64F3
*71165	Knob—Volume control knob ivory for 64F2
*71164	Knob—Volume control knob—mottled walnut—for 64F1 and 64F3
30900	Spring—Retaining spring for knobs
	POWER SUPPLY RS 1001
*71840	Capacitor—Electrolytic, 2000 mmf., 6 volts (C3, C4)
*71844	Capacitor—Electrolytic dual, 20 mfd., 150 volts (C1, C2)
35069	Fastener—Push fastener for bottom cover
*71838	Reactor—Filter Reactor
*71839	Rectifier—Rectifier complete with mounting bracket
12453	Resistor—27 ohms, ½ watt (R1)
30788	Resistor—4700 ohms, 1 watt (R2)
*71841	Socket—3 contact female socket
31027	Socket—4 contact female socket for battery cable
37605	Socket—Tube socket
*71837	Transformer—Power transformer, 117 volt, 60 cycle (T1)

*This is the first time this Stock No. has appeared in Service Data.

RCA MFG. CO.

64F1, 64F2, 64F3

Alignment Procedure

Cathode Ray Alignment is the preferable method. Connections for the oscillograph are shown in the diagram.

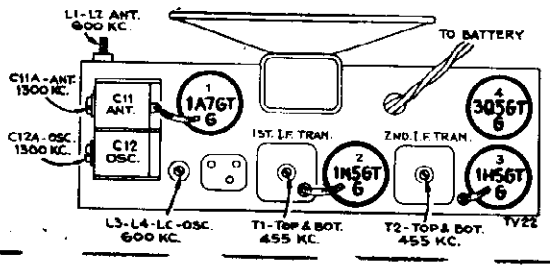
Output Meter Alignment.—If this method is used, connect the meter across the voice coil and turn the receiver volume control to maximum.

Test Oscillator.—For all alignment operations, connect the low side of the test oscillator to the receiver chassis, and keep the output as low as possible to avoid AVC action.

Pre-Setting Dial.—With gang condenser in full mesh, the pointer should be set at the left-hand end dial calibration mark.

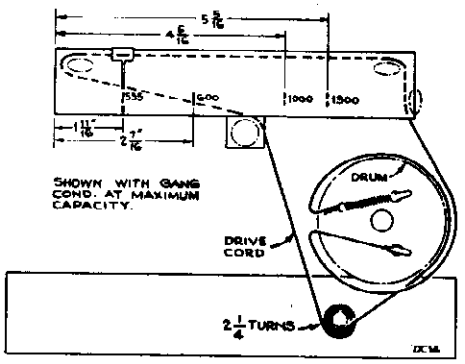
Steps	Connect high side of the test oscillator to—	Tune test osc. to—	Turn radio dial to—	Adjust following for maximum peak output
1	I.F. (IN5) grid in series with .1 mfd.	455 kc	Quiet point at the low freq. end of the dial	2nd I.F. trans.*
2	1A7 grid in series with .1 mfd.			1st I.F. trans.
3	Antenna lead (blue) in series with 200 mmf.	1300 kc	1300 kc	C12A (osc.) C11A (ant.)
4		600 kc	600 kc	(Osc.) and (ant.) slugs
5	Repeat steps 3 and 4 for exact alignment.			

*Do not repeat step 1.



Critical Lead Dress

1. Keep output plate capacitor dressed close to the chassis.
2. Keep lead from lug A of second IF transformer down and dressed close around the 1H5 tube socket.
3. Dress 1N5 plate lead close to chassis.
4. Dress C1 down and away from the antenna coil.
5. Dress C3 and C5 away from each other.
6. Dress the lead from 2nd IF transformer to the volume control in the open.



NOTE:—

When using the electrifier, remove the shorting plug on the chassis adjacent to the 1A7GT/G tube and replace it with a similar plug, attached to the electrifier. Also connect the remaining plug attached to the electrifier, in place of the normal battery plug. The receiver will operate in the normal manner, using the same control for turning the set on and off.

NOTE:—

Do not plug electrifier into a DC outlet.

65X1, 65X2

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver colume control to maximum.

Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the oscillator output as low as possible to avoid a-v-c action.

Calibration Scale.—The glass tuning dial may be removed from the cabinet and mounted above the pointer for reference during alignment. The extreme left hand mark of the Standard Broadcast scale must be in line with the left hand mark on the dial backing plate.

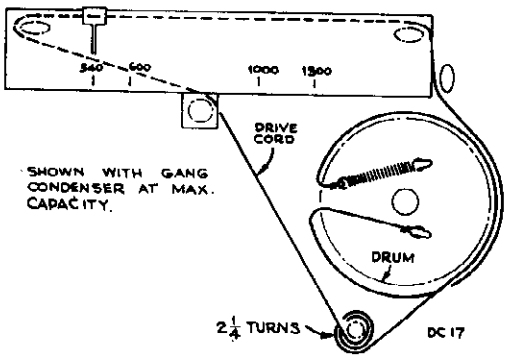
Dial Backing Plate.—In the event that only the chassis is returned for service, the marks on the dial backing plate may be used during alignment; refer to the Dial Indicator and Drive Mechanism drawing for corresponding frequencies.

Dial Pointer.—With the gang condenser in full mesh the dial pointer should be set to the left hand reference mark on the dial backing plate.

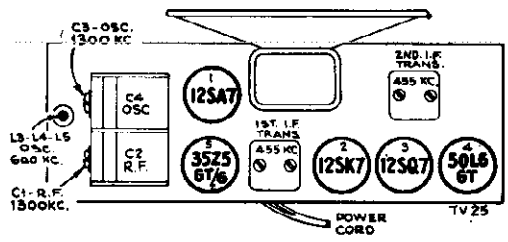
For additional information refer to booklet "RCA Victor Receiver Alignment."

Steps	Connect the high side of test-oscillator to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. peak output
1	12SK7 I-F grid through 0.1 mfd. capacitor	455 kc	Quiet-point 1,600 kc end of dial	C8 and C9 2nd I-F transformer
2	Stator of C2 through 0.1 mfd.			*C6 and C7 1st I-F transformer
3	Ant. lead in series with 200 mmfd.	1,300 kc	1,300 kc	C3 (osc.) C1 (ant.)
4		600 kc	600 kc "A" Band	L5 (osc.) Rock gang
5	Repeat steps 3 and 4			

* Do not readjust C8 or C9 when test oscillator is connected to C2.



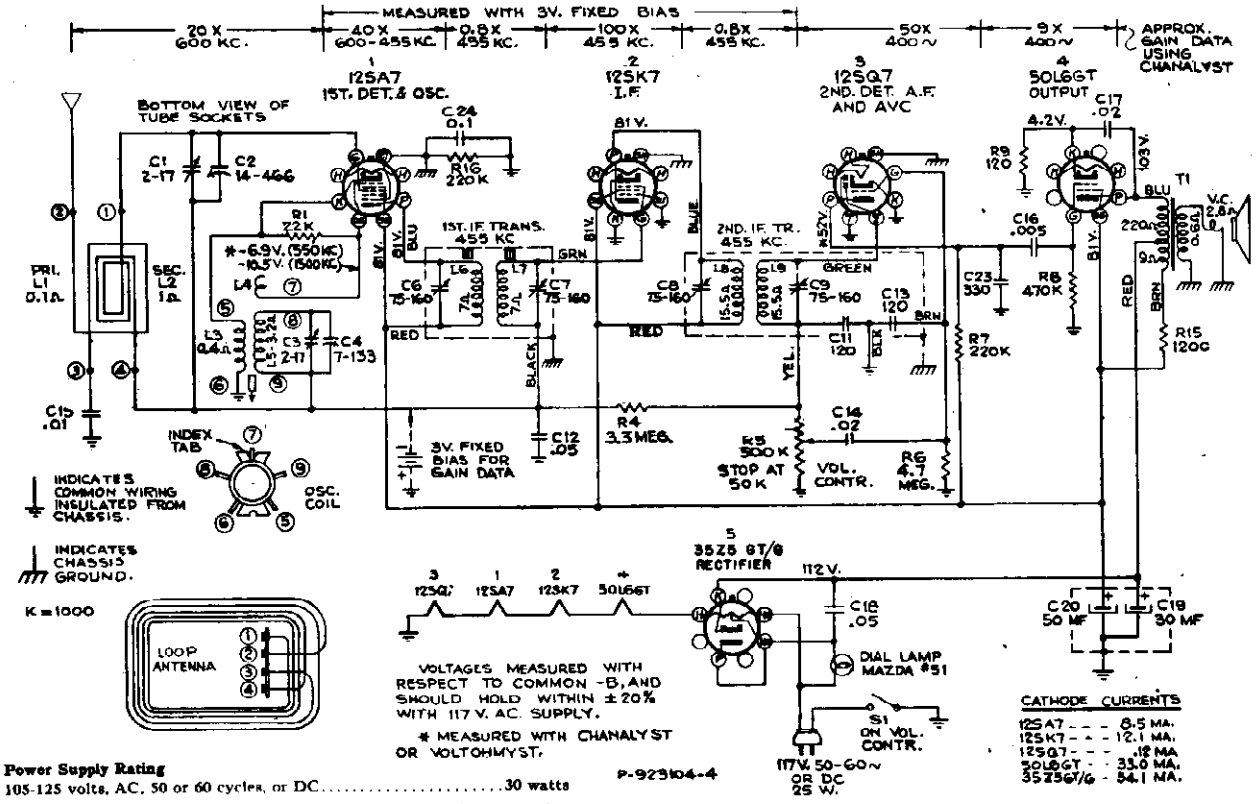
Dial-Indicator and Drive Mechanism



Tube and Trimmer Locations

MODELS 65X1, 65X2
Ch. RC-1034

RCA·MFG. CO.



Power Supply Rating
105-125 volts, AC, 50 or 60 cycles, or DC.....30 watts

POWER SUPPLY POLARITY.—For operation on d-c, the power plug must be inserted in the outlet for correct polarity. If the set does not function, reverse the plug. On a-c, reversal of the plug may reduce hum.

Critical Lead Dress

1. Dress blue and green leads of both I-F transformers back in shield cans, leaving them as short as possible.
2. Dress all heater leads next to chassis.
3. Dress power cord toward output transformer away from volume control and audio circuits.
4. Dress capacitor (C14) toward switch and parallel to chassis length.
5. Dress capacitor (C16) back against rear chassis apron.
6. Dress capacitor (C17) over and towards 50L6 socket perpendicular to capacitor (C14) and (C16).
7. Dress pilot lamp leads over second I-F transformer and away from tubes.

Frequency Range.....540-1600 kc
Intermediate Frequency.....455 kc

Power Output
Undistorted.....1.0 watt
Maximum.....1.5 watts

Tube Complement
(1) RCA-12SA7.....Converter
(2) RCA-12SK7.....I.F. Amplifier
(3) RCA-12SQ7.....2nd Det., A.V.C., and A.F. Amplifier
(4) RCA-50L6GT.....Power Output
(5) RCA-35Z5GT.....Rectifier

Pilot Lamp.....Mazda No. 51, 6-8 volts, 0.2 amp.

Loudspeaker (922258-1)
Type.....4" x 6" PM
V. C. Impedance.....3.4 ohms at 400 cycles

STOCK No.	DESCRIPTION
	CHASSIS ASSEMBLIES RC 1034
70389	Bearing—Tuning knob shaft bearing
39640	Capacitor—Mica, 330 mmf. (C23)
70606	Capacitor—Tubular, .005 mfd., 400 volts (C16)
70610	Capacitor—Tubular, .01 mfd., 200 volts (C15)
70611	Capacitor—Tubular, .02 mfd., 400 volts (C14, C17)

70617	Capacitor—Tubular, 0.1 mfd., 400 volts (C24)
70408	Capacitor—Electrolytic, comprising 1 section of 30 mfd., 150 volts and 1 section of 50 mfd., 150 volts (C19, C20)
*70477	Coil—Oscillator coil (L3, L4, L5)
*70463	Condenser—Variable tuning condenser complete with drum (C1, C2, C3, C4)
70322	Control—Volume control and power switch (R5, S1)
32634	Cord—Drive cord (approximately 58")
*70464	Drum—Drive drum
*70469	Indicator—Station selector indicator
11765	Lamp—Dial lamp—Mazda 51
*70468	Loop—Antenna loop (L1, L2)
*70462	Plate—Dial back plate complete with drive cord pulleys less dial
36230	Pulley—Drive cord pulley
30189	Resistor—120 ohms, ¼ watt (R9)
6134	Resistor—1200 ohms, 1 watt (R15)
30492	Resistor—22,000 ohms, ¼ watt (R1)
14583	Resistor—220,000 ohms, ¼ watt (R7, R16)
30648	Resistor—470,000 ohms, ¼ watt (R8)
31417	Resistor—3.3 megohms, ¼ watt (R4)
30931	Resistor—4.7 megohms, ¼ watt (R6)

STOCK No.	DESCRIPTION
*70467	Shaft—Tuning knob shaft
34449	Socket—Lamp socket
37605	Socket—Tube socket—moulded
70390	Spring—Drive cord tension spring
*70465	Transformer—First I.F. transformer (L6, L7, C6, C7)
*70466	Transformer—Second I.F. transformer (L8, L9, C8, C9, C11, C13)
70385	Transformer—Output transformer (T1)
33726	Washer—"C" washer for tuning knob shaft
	SPEAKER ASSEMBLY 922258-1
*70470	Speaker—
	NOTE: If stamping on speaker in instrument does not agree with above speaker number, order replacement parts by referring to model number of instrument, number stamped on speaker and full description of part required.
	MISCELLANEOUS ASSEMBLIES
*70471	Back—Cabinet back for 65X1
*70472	Back—Cabinet back for 65X2
*70475	Clamp—Dial clamps (1 set)
*70476	Dial—Glass dial scale
37831	Fastener—Push fastener (1 set) for cabinet back
*70474	Knob—Control knob—ivory—for 65X2
*70473	Knob—Control knob—mottled walnut—for 65X1
*71821	Knob—Control knob—maroon—for 65X1
30900	Spring—Retaining spring for knob

PARTS LIST, Type AR-77 Receiver MI-8302

Item	DESCRIPTION	Stock No.
C-1, C-2, C-3, C-4, C-5, C-6	Condenser — 3-gang, 6-section main tuning—less split gear, brass pinion, gear, and bearing assembly	34879
C-7, C-8, C-9, C-10, C-11, C-12, C-13, C-14, C-15	Capacitor — 3-gang, 9-section band-spread—less split gear, brass pinion gear, and bearing assembly	34880
C-16	Condenser—3.6 to 35 mmfd., 10-plate antenna adjuster	34892
C-17, C-18	Condenser — Air trimmer (medium)	12714
C-19, C-20, C-21, C-22, C-23, C-24, C-25, C-26		
C-27, C-28	Condenser — Air trimmer (small)	12807
C-29	Condenser—3 to 25 mmfd., 7-plate beat-frequency oscillator control	34893
C-30	Condenser—2.5 to 12 mmfd., 3-plate crystal phase adjusting condenser	34894
C-31	Capacitor—180 mmfd., 400 volts	13003
C-32, C-33, C-34	Capacitor—0.01 mfd., 400 volts	4858
C-35	Capacitor—68 mmfd., 400 volts	13057
C-36, C-37	Capacitor—Same as C-32	
C-38	Capacitor—10 mmfd., 400 volts	13200
C-39	Capacitor—0.1 mfd., 400 volts	4839
C-40	Capacitor — 1000 mmfd., 400 volts	12635
C-41	Capacitor—5.6 mmfd., 400 volts	12814
C-42	Capacitor—330 mmfd., 400 volts	12952
C-43	Capacitor—2700 mmfd., 400 volts	30057
C-44	Capacitor—Same as C-40	
C-45	Capacitor—0.05 mfd., 400 volts	4886
C-46	Condenser — Stabilizing condenser	34895
C-47	Capacitor — 120 mmfd., 400 volts	12724
C-48	Capacitor—Same as C-45	
C-49, C-50, C-51	Capacitor — 100 mmfd., 400 volts	12720
C-52	Capacitor—Same as C-32	
C-53, C-54, C-55	Capacitor—Same as C-45	
C-56, C-57	Capacitor — 220 mmfd., 400 volts	12694
C-58, C-59, C-60	Capacitor—Same as C-45	
C-61	Capacitor—Same as C-49	
C-62	Capacitor—56 mmfd., 400 volts	12723
C-63	Capacitor—12 mmfd., 400 volts	13002
C-64	Capacitor—47 mmfd., 400 volts	13141
C-65, C-66	Capacitor—Same as C-56	
C-67		
C-68	Capacitor — 1200 mmfd. 400 volts	13054
C-69	Capacitor—Same as C-45	
C-70	Capacitor—Same as C-49

TECHNICAL SUMMARY

All performance data were obtained on an average receiver. Slight variations above or below these values may be encountered due to practical manufacturing tolerances. A 300-ohm dummy antenna was used in series with the receiver input in making all measurements.

ELECTRICAL CHARACTERISTICS—

Frequency Range (total, 6 bands) ..... 540 to 31,000 kc
- Band 1 ..... 540 to 1,340 kc
- Band 2 ..... 1,340 to 3,300 kc
- Band 3 ..... 3,300 to 5,800 kc
- Band 4 ..... 5,800 to 10,200 kc
- Band 5 ..... 10,200 to 18,000 kc
- Band 6 ..... 18,000 to 31,000 kc

Frequency Stability:

Warm-up Shift, 1 minute to 1 hour, 68° F. Ambient (Average Humidity Conditions) ..... Less than 3.5 kc at 30 mc

Shift with Line Voltage Variation, 105 to 125 volts ..... Less than 1,300 cycles at 29 mc
Shift is proportionally less at lower frequencies

Sensitivity: Input (30% mod.) required for 0.05 watt output ..... Less than 2 microvolts

Signal-to-Noise and Image Ratios:

Band	Frequency KC	Microvolts Input for 2:1 Signal-to-Noise Ratio	Image Ratio
1	540	0.9	50,000
	1,340	1.7	3,900
2	1,340	1.7	5,000
	3,300	1.9	910
3	3,300	1.4	1,000
	5,800	1.2	320
4	5,800	1.4	550
	10,200	1.2	100
5	10,200	1.8	380
	18,000	1.6	88
6	18,000	1.7	60
	31,000	1.0	25

Maximum Undistorted Output (approximate) ..... 3 watts

Power Supply Requirements:

Line Rating—
- Model AR-77 ..... 105-125 volts, 50/60 cycles
- Model AR-77E* ..... 105-130/140-160/195-250 volts, 50/60 cycles

* See "EQUIPMENT" list below for special rack models and optional power packs available.

Power Consumption ..... 70 watts

MECHANICAL SPECIFICATIONS—

Dimensions ..... 20⅛ inches (width) x 10½ inches (height) x 11⅝ inches (depth)

Weight (net) ..... 48½ pounds

EQUIPMENT

Model AR-77: Domestic Model in Cabinet (see "Line Rating") MI-8302D
Model AR-77E: Export Model in Cabinet (see "Line Rating") MI-8302E
Model AR-77: Domestic Model in Cabinet (105-125 v., 25 cycles) MI-8302F
Model AR-77: Domestic Model on Standard 10-15/32-inch Panel (see "Line Rating") MI-8302G
Model AR-77E: Export Model on Standard 10-15/32-inch Panel (see "Line Rating") MI-8302H

Optional Equipment:
- Loudspeaker in Styled Cabinet to match Receiver MI-8303
- Loudspeaker on Standard 10-15/32-inch Panel MI-8303A
- Extended Range Loudspeaker in Console Cabinet MI-8314
- Extended Range Loudspeaker in Wall Type Cabinet MI-8314A
- Panel Kit for Rack Mounting of Model AR-77 (12-7/32-inch Panel) MI-8304
- Panel Kit for Rack Mounting of Loudspeaker (10-15/32-inch Panel) MI-8305
- Power Pack for Model AR-77 or AR-77E (105-125 volts d-c) MI-8307-2
- Power Pack for Model AR-77 or AR-77E (210-250 volts d-c) MI-8307-3
- Power Pack for Model AR-77 or AR-77E (6-volt battery) MI-8308
- Phone Plug MI-6216
- Headphones MI-5803
- A-F Coupling Transformer for 500-ohm line MI-4904

INSTALLATION

POWER SUPPLY—The power supply circuit is integral with the receiver in both the Model AR-77 and the Model AR-77E. At installation, the line voltage and frequency should be determined and checked for conformance to the nominal rating of the receiver. Reference should be made from the MI number on the instrument label on the top of the chassis to the corresponding rating shown in the "Equipment" list. Three power packs are available as accessory items to permit operation on special power supplies.

For connection of an external power pack, there are two terminals on the rear of the chassis connected by a link as shown in Figure 3A. This link should not be disturbed, except for the purpose intended. It is connected in the tube heater supply circuit.

In the Model AR-77E, MI-8302E and -8302H, the power transformer primary may be connected in any of three arrangements to accommodate a wide range of line voltages. Remove the small metal cap from the top of the power transformer and place the "U" shaped connector between the center terminal and that outside terminal marked with a value nearest to the actual line voltage. Thus, if the line voltage were 130 volts, the connector should be placed in the "125 V." position.

If the receiver is to be used for continuous service, especially when unattended, a 3-ampere fuse should be installed in series with the power source.

TUBES—Inspect the chassis before applying power to make certain that all tubes are firmly seated in their sockets and that the grid lead to the RCA-6K8 tube is in place.

ANTENNA—For general use it is recommended that an antenna of the doublet type, either single or double, be used. Connections to either type are shown in the accompanying diagram. Both types will give very good performance in any two amateur bands.

Any of the directive type antennas used for transmission may be satisfactorily employed for reception with this receiver. It will be found that very good results also may be obtained with a single wire antenna from 25 to 75 feet long.

In locations where the antenna transmission line is near power wiring or other sources of noise interference, it is recommended that a coupling transformer such as RCA Stock No. 9813 be connected between the receiver and the antenna transmission line. This transformer, however, is satisfactory only for the 160-, 40- and 20-meter bands. Transmission line such as RCA Stock No. 12430 or Stock No. 9882 is recommended for use with the doublet antennas, the latter being recommended for lengths in excess of 100 feet. The characteristics of these lines are:

Stock No. 12430 (90-foot length) or Stock No. 12429 (45-foot length)
Impedance 100 ohms

DB loss per 100 feet at 10 mc ..... 2 db dry
DB loss per 100 feet at 30 mc ..... 5 db dry
DB loss per 100 feet at 10 mc . 4 db 90% humidity
DB loss per 100 feet at 30 mc . 8 db 90% humidity

Stock No. 9882
Impedance 100 ohms

DB loss per 100 feet at 10 mc ..... 1 db dry
DB loss per 100 feet at 30 mc ..... 2.5 db dry
DB loss per 100 feet at 10 mc. 1.5 db 90% humidity
DB loss per 100 feet at 30 mc. 3.5 db 90% humidity

This transmission line, as well as other RCA antenna materials, may be purchased through RCA Parts Distributors.

The terminal board at the back of the chassis, near the center, contains the connecting terminals for the transmission line (or for the antenna lead-in) and ground. If an ordinary antenna is used, the adjacent transmission-line terminal should be connected to the ground terminal, and the antenna to the other transmission-line terminal.

SPEAKER OR PHONES—This receiver is designed for use with a permanent-magnet dynamic type speaker, having a voice-coil impedance of from 2 to 3 ohms. The RCA Stock No. MI-8303 speaker (see Figure 2) is designed and recommended for the purpose. The terminals for connection to the speaker are shown in Figure 3A.

The RCA Manufacturing Company also produces two deluxe extended range speakers. One, MI-8314, is housed in a walnut cabinet; the other, MI-8314A, is contained in a walnut cabinet for wall mounting.

A jack is provided on the right-hand side of the cabinet, near the front, for plugging in a pair of 600-ohm headphones. The speaker is automatically disconnected when the phones are plugged in.

INSTALLING SHOCK MOUNTS—The following series of operations should be adhered to when installing shock mounts on Communication Receiver, Model AR-77:

a. Remove all control knobs from the receiver panel.

b. Remove the rear cover grille from the receiver panel.

c. Take out the five screws and washers which are used to attach the receiver to the bottom of the case and withdraw the receiver from the case.

d. Remove the four rubber feet from the bottom of the cabinet by taking out the nuts and screws with which they are attached, enlarge (drill out) the four holes with a 7/64 inch drill.

e. Attach the shock mounts to the bottom of the receiver case using the four ½ inch screws with nuts and lock washers. These screws should be passed through the holes which were drilled out in the preceding operation. Four 1/32 inch spacers are provided, one of which should be placed on each mounting screw between the bottom of the case and the channel brackets of the shock mounts.

NOTE—In order to facilitate the replacement of these shock mounts, should it become necessary to remove them for receiver servicing at some future date, it is suggested that the position of the mounts be marked on the bottom of the cabinet by drawing the point of a scriber or other pointed implement along the edge of the channel bracket.

f. Replace the receiver in the case and mount it therein, using the five (new) 7/16 inch screws provided for this purpose.

g. Replace the back cover (grille) and the receiver control knob.

RACK PANEL MOUNTING OF RECEIVER—If it is desired to mount the receiver on a rack panel, the necessary panel and supports (MI-8304) are available for this type of mounting. This set of parts includes everything necessary to mount the standard receiver chassis to the rack panel.

The receiver chassis is first removed from the cabinet. For this purpose first remove all knobs from the control shafts. Next remove the perforated metal screen on the back of the cabinet by taking out the five self-tapping screws. Remove the five ¼ inch machine screws underneath the cabinet. Next disconnect the tuning meter on the front panel. The chassis is now ready to be removed from the cabinet. The chassis should be tipped up at the rear just before entirely removing to prevent hitting the two front brackets against the upper angle at the rear of the cabinet.

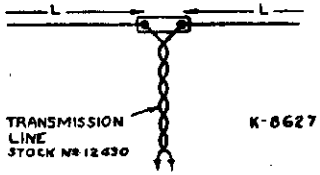
With the chassis removed, the dial window mask and window should then be assembled to the rack panel. The panel is fastened to the chassis by means of six machine screws. Spacers are placed between the panel and the chassis. The side brackets should then be attached.

One of the headphone jacks should be wired directly to the receiver output terminals. This jack will then allow the receiver output to be monitored in installations where the output of the receiver is connected to a line.

The other headphone jack should be connected exactly like the one on the side of the receiver chassis. This may be simplified in the following manner: It will be observed that the ground and output terminal connections are already connected to the first jack. Jumpers may then be placed between the two jacks for these connections. The remaining connection is to the output transformer primary. This lead should be removed from the jack on the side of the receiver and connected to the jack on the panel. The purpose of this second jack is to connect a pair of headphones and at the same time remove the receiver output from the line. Thus, in a diversity system, one receiver may be easily removed from the combined output and tuned or adjusted without disturbing the others.

A receiver, mounted on a 10 15/32 inch x 19 inch panel, ready to be installed on a rack, is also available. The Model AR-77, MI-8302G, is for use with a power supply of 105-125 volts, 50/60 cycles; and the Model AR-77E, MI-8302H, is for use with 105-130; 140-160; 195-250 volts, 50/60 cycles.

RACK PANEL MOUNTING OF LOUDSPEAKER—The loudspeaker, Stock No. MI-8303, may be converted for rack mounting by purchasing the panel kit, MI-8305, available for this purpose.



SINGLE-DOUBLET ANTENNA

L = 130 feet for 160-Meter (1,900 kc) Band
L = 65 " " 80- " (3,800 kc) "

Doublet Antenna Connections

OPERATION

Before attempting to operate the receiver, this entire section should be carefully studied so that the operator may obtain a general understanding of the various controls and their functions and adjustment. The symbols on the panel used to designate the various controls should be learned with respect to function as shown on Figure 1.

TUNING—In tuning this receiver, the various controls should be approximately set for the class of signal it is desired to receive. Select the frequency band desired by rotating control knob "R" until the proper scale appears in the slot at the upper left of the panel. Before proceeding, adjust the antenna trimmer to maximum for this band (see next paragraph—"Antenna Trimmer"). The frequency calibrations on the main dial scales are correct for tuning, when the bandspread dial is turned to its maximum frequency position only.

The bandspread dial is calibrated for the amateur bands of 10, 20, 40 and 80 meters only. To use the bandspread on these bands, set the main tuning dial at the highest frequency on that band, then tune with the bandspread dial. On the 160-meter band, the calibrations on the main dial are spread sufficiently so that it is not necessary to use the bandspread tuning. For an extremely accurate calibration, set the bandspread dial for a signal of known frequency, and then adjust the main dial until the station is tuned in. When this position has been obtained, note the setting of the arbitrary scale with its vernier index, on the main dial.

For commercial operation, or bands other than Amateur, the arbitrary scales should be used on the main tuning and bandspread dial. If the bandspread is not used, it should be left at the high frequency end of its range and then the main dial calibration is correct.

Curves may be plotted, giving arbitrary scale readings versus frequencies, on any band, by observing the readings on the arbitrary scales for a number of stations of known frequency on the same band, and working them on a suitable graph or chart.

ANTENNA TRIMMER—Before tuning on any frequency range, the antenna trimmer should be adjusted for maximum performance on that band. This control may be adjusted by tuning for maximum background noise. Occasionally it is desired to test a signal that seems out of place, to see whether or not it is a fundamental signal or an "image."

When adjusting the antenna trimmer, if the maximum signal point coincides with the point of maximum background noise, the signal is a fundamental. If the control does not affect the signal strength, or if it is maximum at some other point, the signal heard is an "image."

CRYSTAL SELECTIVITY SWITCH—For general operation while tuning, it is recommended that the crystal switch be in the "OFF" position. After the main tuning dial has been set at the desired point, the crystal may be placed in the circuit while tuning over the bandspread range. Crystal selectivity positions 1 and 2 should be used for phone or modulated signal reception and 3, 4 and 5 for CW telegraph reception.

It will be noticed that when tuning in a modulated signal with the crystal in, the speaker volume is greater on either side of the point which gives the maximum tuning meter indication. The reason for this is that the carrier voltage controls the gain of the receiver by means of the A.V.C. circuit, and if the carrier frequency is detuned slightly from resonance, the gain of the receiver increases so that part of the side band frequencies are amplified very much more than they are when the carrier is tuned to exact resonance. This is characteristic and normal for receivers with this degree of selectivity and provided with A.V.C. Care should be taken to tune the receiver for a maximum meter indication. Very much better results will be obtained. The background noise and adjacent channel interference will be materially reduced.

This receiver has been designed to have a selectivity characteristic which is slightly flat at resonance when the crystal is out, so that better fidelity of reception may be enjoyed when interfefence conditions permit. It is therefore likely that when the crystal is placed in the circuit, slight retuning may be necessary. This is due to the fact that exact tuning is much more necessary when using a sharp I-F circuit than when using a broad circuit.

CRYSTAL PHASING CONTROL—There is a normal or "neutral" position for this control, in which position it should be set for all normal reception. To locate this position, set the Crystal Selectivity Switch on position 3 or 4, and, using high gain with no incoming signal, adjust the phasing control for minimum noise. This control should be changed from this position only when a strong signal is producing a heterodyne action with the desired signal. In this case, the control should be adjusted for a minimum heterodyne effect.

VOLUME AND SENSITIVITY CONTROLS—For phone reception the sensitivity control should be set at maximum and the audio volume control used to obtain the desired volume. For CW telegraph reception the audio volume control should be set at three-fourths to maximum position and the desired volume obtained by adjustment of the sensitivity control.

NFB-AVC-BFO SWITCH—These letters stand for "NEGATIVE FEED-BACK," "AUTOMATIC VOLUME CONTROL," "BEAT FREQUENCY OSCILLATOR." The "NFB" position places the compensated negative feedback in the audio circuits, resulting in an increase in fidelity. This is useful for tests in voice transmissions and for entertainment use such as on broadcast reception. When using this position the volume control must be advanced slightly. This position is not recommended for other forms of reception.

The A.V.C. is in operation on both the "NFB" and "AVC" positions of this switch.

The A.V.C. is "OFF" when the switch is in the "BFO" position. This position connects the beat-frequency oscillator.

BFO FREQUENCY CONTROL—This control is provided to secure any desired audio beat frequency, for the reception of CW code signals. It should be set slightly off the central position, in normal use. The exact position may be found by experiment. With the crystal switch "OFF," the desired beat note may be obtained by tuning the receiver. However, in conditions of interference, when the crystal filter is used, the receiver must first be tuned to the desired signal, regardless of the beat frequency produced. If the beat note is not satisfactory, it may be changed with the BFO control. In other words, first tune for maximum signal strength, then adjust for the desired audio pitch.

When tuning in the same direction (that is, going from the high frequency to the low frequency end of the band, or vice versa), ALL signals will be changing in pitch in the same direction when resonance is reached. That is, the pitch will either be increasing or decreasing, depending on whether the BFO control is on one side or the other side of I-F resonance. It does not matter on which side the BFO control is placed, the CHANGE OF PITCH should be noted when tuning. If the change of pitch is opposite to that known to exist when passing through resonance, the signal is an audio image. Never try to receive an audio image. The signal can be made much stronger by tuning to the other side of zero beat.

NOISE LIMITER LEVEL CONTROL—When starting to tune the receiver, this control should be set in the "OUT" position, or advanced about one-quarter to three-quarters of the way in the counter-clockwise direction. Should external noise conditions interfere with reception, this control may be advanced as necessary, avoiding distortion of the signal. This control may be found especially helpful for reducing certain types of interference encountered on the 10-meter band. For CW reception with the noise-limiter, the sensitivity control should be advanced, and the volume control reduced until limiting action occurs.

TRANSMIT-RECEIVE SWITCH—This switch opens the plate circuits of the receiver on the transmit position and shorts the two terminals on the antenna terminal strip (shown in photograph Figure 3A), which may be connected to a relay for operation of the transmitter.

In addition, terminals J2 and J3 are provided so that, if desired, the plate circuit of the receiver may be opened by a transmitter switch. Note that these terminals are at plate potential.

TUNING OR "S" METER ADJUSTMENT—The "S" meter should normally give a low scale reading when no signal is being received. To adjust this meter, tune the receiver to a point free of signals, turn the sensitivity control to maximum, switch in A.V.C. switch crystal "OUT," have antenna trimmer turned off resonance, and then adjust the potentiometer R20 at the back of the receiver as shown in Figure 3A until the meter pointer just coincides with the mark at the low end of the scale. The meter will usually rise slightly when the antenna trimmer is tuned to resonance.

The calibration of this meter is arbitrary, since no standard has been set for conversion of the "S" units to microvolts. However, in this receiver, "S1" is equivalent to approximately 0.5 microvolt input to the receiver. Each unit above this is 6 db up to "S9" Thus, "S2" is equivalent to 1 microvolt, "S3" to 2 microvolts. Above "S9" the meter is calibrated to 40 db, which would be equivalent to 12,800 microvolts.

For CW telegraph reception, the "S" meter provides a visual indication of the position of the sensitivity control.

BREAK-IN OPERATION—Break-in operation may be obtained on CW telegraph operation by connecting a separate antenna to the receiver. A single wire antenna or a doublet tuned to a different band than that on which the transmitter is working is recommended. If a doublet antenna tuned to the transmitter frequency is used, sufficient voltage may be induced in the receiving antenna to damage the receiver.

DIVERSITY RECEPTION—Two or three of these receivers may be connected together for diversity reception of modulated signals, with no additional equipment necessary. Each receiver must be provided with a separate antenna in the usual manner. The A.V.C. terminal on the back of the receiver, shown in Figure 3, is connected inside the receiver to the A.V.C. circuits. This terminal must be connected to the corresponding terminals of the No. 2 and No. 3 receivers. The receiver outputs should all be connected in parallel. Note that one of the output terminals of this receiver is at ground potential.

FOR CONNECTION TO A TELEPHONE LINE—It is recommended that a transformer such as RCA type MI-4904 be used. The connections to the type MI-4904 transformer should be made as follows:

1. Connect the output terminals of one or more Model AR-77 receivers in parallel to terminals No. 4 and No. 41 of the transformer.
2. Connect the 500-ohm line to transformer terminals 1A and 3B.
3. Connect a jumper between transformer terminals 1B and 3A.
4. Connect a 500 to 600 ohm, ½ to 1-watt resistor across the 500-ohm line, or across terminals 1A and 3B.

Connecting a pair of headphones in the jack on each receiver will disconnect it from the combined output so that the tuning or other adjustments may be checked. Obviously, the audio volume control on each receiver should be set to approximately the same level. For CW telegraph diversity reception, it is recommended that a combining and tone-keyer unit be used.

MAINTENANCE

CIRCUIT DETAILS AND FEATURES—In reading the following discussion of the electrical circuit, reference should be made to the schematic diagram, Figure 5.

INPUT COUPLING—The antenna coupling system is designed to provide optimum coupling from transmission lines of 50 to 500 ohms, or from conventional antenna and ground systems. The coupling coils are balanced to ground and may be connected directly to a balanced transmission line. An antenna trimmer capacitor adjustment is provided on the front panel to insure first circuit resonance with any antenna system.

RADIO-FREQUENCY AMPLIFIER—The r-f amplifier is designed to provide as much selectivity as possible ahead of the first detector. The amplification is adjusted to provide optimum signal to noise ratio by making noise contributions of circuits following the first tube negligible in comparison with the noise contributed by the first r-f grid circuit. A uniform amplification is obtained over all frequency ranges. On the two highest frequency ranges the oscillator frequency is placed below the signal frequency. This gives better freedom from image signals in the higher frequency amateur bands.

BAND SPREAD—Band spreading is accomplished by means of a capacitor gang having sections of capacity suitable for each amateur band. The sections of this capacitor are connected by the band switch so that on each amateur band, proper size of capacitor is used to spread the band over the entire tuning dial. The dials are directly calibrated in frequency.

R-F HETERODYNE OSCILLATOR—The r-f oscillator circuit is of the tuned-grid type with plate circuit feedback. A voltage regulator is used to stabilize the plate voltage. Temperature changes are compensated for by a special capacitor. This capacitor is composed of a small bi-metal plate, which is adjusted to have a temperature coefficient which will compensate for all other circuit changes. This type of temperature compensation was found to be quite satisfactory since the circuit minimum and maximum capacities are the same on the higher frequency ranges. That is, the temperature coefficient of this compensating capacitor is adjusted at the factory for best results on the high frequency end of the highest frequency range. The compensation is then near optimum on the high frequency end of each band. As the receiver is tuned from the high frequency end to the low frequency end of each band more tuning capacity is added and less compensation is needed. Since the capacity of the compensating capacitor is small compared to the tuning capacitor, less compensation results. Thus, a fairly uniform temperature characteristic is obtained over a very wide frequency range.

INTERMEDIATE-FREQUENCY AMPLIFIER—As may be seen from the schematic diagram, two stages of i-f amplification are used. A crystal filter is placed between the first detector and the first intermediate amplifier. This filter is adjustable by means of a control on the front panel and provides five positions of selectivity. A crystal phasing control of the usual type is also provided on the front panel. The intermediate frequency is 455 kc.

BEAT-FREQUENCY OSCILLATOR—The BFO second heterodyne oscillator used for CW reception is a separate pentode. The coupling to the second detector is just sufficient to provide suitable heterodyne action. A panel control is provided for changing the frequency a small amount so that any desired audio beat-frequency may be obtained.

AUTOMATIC VOLUME CONTROL AND "S" METER—The A.V.C. circuit is a simple diode rectifier. Referring to the schematic diagram, Figure 5, the received signal carrier produces a voltage across R-38 which is filtered by R-36 and C-72 and applied to the control grids of the r-f and i-f amplifiers. The "S" meter is connected in the cathode circuit of the first i-f tube and thus records changes in plate current caused by changes of A.V.C. voltage applied to the grid. This type of "S" meter circuit provides the desired wide range and the greater portion of the scale is approximately linear with respect to db input.

NOISE LIMITER—A noise limiter is provided in the second detector circuit. The limiter is manually adjusted. This provides best limiter action since noise voltages cannot increase the limiter bias.

It has been found that noise such as that produced by the ignition systems of automobiles may have an effective value in excess of that of a weak signal. This is particularly true on the 10-meter band. In order to be effective, the limiter must have a bias or "gate opening" of not more than twice the signal carrier amplitude. If this "gate opening" is provided by the signal such as is done in present automatic noise circuits, the noise voltage, if it has a higher effective value than the signal, will open the "gate" to such a high value that the limiter circuit is ineffective. The action of the noise circuit in this receiver is such as to make signals readable which are below the effective noise voltage.

Referring to the schematic diagram, Figure 5, the signal and noise voltages appear across R-32 and the noise peaks alone appear across R-33, since the bias applied to R-31 by the potentiometer R-34 prevents this diode from operating with the signal voltage. The sum of these voltages (across R-32 and R-33) are applied to the audio amplifier. It is apparent that the noise peak voltage across R-32 is out of phase or opposed to that across R-33. The "balance" of this circuit is adjusted by potentiometer R-33. The potentiometer R-34 is the front panel bias control.

SERVICE—This receiver has been carefully adjusted and aligned by the manufacturer before shipment, and should maintain its adjustments over a considerable period of time. It is recommended that any major adjustments or repairs be made by a competent service man.

TUBES—In a receiver which is used quite consistently, the first trouble which is likely to occur is that of deficient vacuum tubes. Usually the symptom of deficient tubes is a noticeable decrease in the sensitivity of the receiver. If the receiver will operate on all bands, but with low sensitivity, the tubes should be removed and checked. The tube locations are shown on the label on the large metal shield on top of the chassis.

BAND CHANGE SWITCH—After a long period without being operated, the band change switch may become noisy or inoperative because of dust or oxide film on contacting surfaces. In some cases, normal operation may be restored by rotating the switch a number of times. If it is found impossible to clean the switch sufficiently by rotation, the defective switch section must be located and replaced. The receiver should be removed from the cabinet and operated in a position such that the switch sections are accessible.

With the switch in the defective position, a slight movement of each section with an insulated screwdriver will usually determine the defective section.

To remove a switch section it will first be necessary to remove the switch shaft. The antenna trimmer control shaft must also be removed in order to unsolder the leads on the tuning capacitor. After all leads are disconnected the entire coil and switch assembly may be removed by taking out the three screws holding the assembly to the chassis.

TEST OF CIRCUIT ALIGNMENT—Under normal operating conditions the r-f amplifier and oscillator circuits should remain in line. If, however, it is found desirable to check the alignment of these circuits, the following test should first be made. Disconnect the antenna or transmission line and connect a 50- to 300-ohm carbon resistor across the two antenna terminal posts. Connect an output voltmeter to the output of the receiver and connect a 20-ohm resistor across the meter. Turn the sensitivity and volume controls to maximum. The A.V.C. switch should be on the A.V.C. position. The output noise voltage should be at least 0.1 volt, with the antenna trimmer tuned to resonance. The maximum noise voltage is a direct measurement of the sensitivity of the receiver. If the test shows that this voltage is less than 0.1 volt, the circuits should be realigned. First be sure that the decreased sensitivity is not caused by poor tubes. It probably will not be necessary to align all bands; however, the correct procedure for all bands is given below.

ALIGNMENT OF I-F CIRCUITS—Remove the bottom cover plate of the receiver cabinet, tune in a steady outside signal on one of the lower frequency bands with the A.V.C. switch on the BFO position and the crystal filter switch in position 2 or 3. The signal should be tuned for a peak response at the crystal frequency. Do not use too strong a signal. The sensitivity control should be adjusted for approximately 1 volt output. Referring to Figure 5 adjust T-1, L-19, T-2, T-3 and T-4 for a maximum output voltage. The signal should now be detuned approximately 1,000 cycles and adjustments T-1, L-19 and T-2 retuned for a maximum output.

The T-2 adjustment on top of the chassis is sealed with polystyrene cement. Applying a soldering iron to the adjusting screw for a few seconds will soften the cement. The intermediate frequency is 455 kc.

ALIGNMENT OF R-F AND OSCILLATOR CIRCUITS—Under usual conditions, the oscillator frequency will not shift far enough to throw the frequency calibration off, therefore, unless it is found that the frequency calibration is incorrect, the oscillator adjustments should not be changed. In any case, the oscillator circuit should not be changed unless a frequency calibrated test oscillator is available. The following procedure is for the r-f alignment of band No. 1 (540 to 1,300 kc). Tune in a signal near the high-frequency end of the band. (Do not use too strong a signal.) Reduce the sensitivity control until the output is approximately 1 volt. Referring to Figure 6, adjust C-18 and the antenna trimmer control on the front panel for maximum output. Next, tune in a signal near the low frequency end of the band. Adjust L-1 and L-7 for a maximum signal output. The same procedure may be followed for all bands. Make sure that the bandspread tuning is at the high-frequency end of the scale. The bottom cover should be held over the oscillator trimmer capacitors while adjusting the high frequency end of each band, so that when the cover is replaced, the frequency will not shift. The adjustments for each particular band are shown in the table herewith.

Band	R-F Ind.	Det. Ind.	Det. Cap.	Osc. Ind.	Osc. Cap.
540- 1,340 ..	L-1	L-7	C-18	L-13	C-24
1,340- 3,300 ..	L-2	L-8	C-17	L-14	C-23
3,300- 5,800 ..	L-3	L-9	C-22	L-15	C-28
5,800-10,200 ..	L-4	L-10	C-21	L-16	C-27
10,200-18,000 ..	L-5	L-11	C-20	L-17	C-26
18,000-31,000 ..	L-6	L-12	C-19	L-18	C-25

DIAL SHUTTER ADJUSTMENT—If the dial shutters do not line up with the dial calibration, they may be adjusted by means of an idler pulley bracket which adjusts the tension of the cord. By loosening the two screws which clamp the idler pulley bracket to the chassis the bracket may be shifted until the shutter opening lines up with the dial scale.

Another adjustment may be made by loosening the two nuts on adjusting screw fastened to back of shutter. To raise or lower the shutter, adjust the nuts accordingly.

DIAL ADJUSTMENT—Should it become necessary to replace or to tighten the main dial, the reference line at the high-frequency end should be disregarded. The dial should be set so that a reading of 54 is obtained on the arbitrary scale. This should be read through the dial shutter opening, with the range switch on the highest frequency position and the tuning capacitor set at the low frequency end.

NOISE BALANCE ADJUSTMENT—This adjustment is the potentiometer mounted on the right flange of the chassis (R-33). The correct adjustment has been carefully made at the factory and should ordinarily require no further attention. However, in servicing the receiver, in the event that the adjustment is accidentally moved, it may be reset as follows: First tune in a strong modulated signal such as a broadcast station. Next turn the noise control on the front panel all the way clockwise. Now adjust the potentiometer for a minimum signal output. This point will be found to be very sharp. When properly

adjusted, the signal output will be quite low until the noise control on the front panel is turned back counterclockwise.

TUBE SOCKET VOLTAGES—If the receiver is found to be completely inoperative, it is likely that a resistor is open-circuited or a capacitor is short-circuited. The bottom cover plate of the receiver cabinet should be removed. The tube socket terminal voltages should be measured and should be approximately the values given in the table below. The tubes should remain in the sockets for this test. A voltmeter having a resistance of at least 50,000 ohms should be used. Place switch on BFO and turn Sensitivity Control to maximum.

TUBE SOCKET VOLTAGES

Tube	Symbol	Cathode to Ground	Screen Grid to Ground	Plate to Ground	Suppressor Grid to Ground	Oscillator Plate to Ground	Heater (A-C) Pin No. 2 to Pin No. 7

Item	DESCRIPTION	Stock No.
T-1	Transformer — First detector plate I-F transformer complete—includes C-47, R-12	34885
T-2	Transformer—I-F transformer complete — includes C-56, C-57, R-25	34887
T-3	Transformer—I-F link transformer complete — includes C-61, C-63, R-28	34884
T-4	Transformer—Diode I-F transformer complete — includes C-62, C-64	34888
T-5	Transformer — CW oscillator transformer complete — includes C-80, C-81, R-42	34886
T-6	Transformer — Output transformer	14355
T-7	Transformer—105-115 volts, 25-cycle power transformer (Used in MI-8302F only)	34693
T-7	Transformer — 110-125-150-210-240 volts, 50/50 cycle power transformer (Used in MI-8302E only)	37243
T-7	Transformer—105-125 volts, 50/60 cycle power transformer (Used in MI-8302D and MI-8302G only)	9551
X-1	Crystal—455 kc crystal filter and case	MI-7593
	MISCELLANEOUS	
	Bracket — Flywheel mounting bracket	34903
	Board—3-contact terminal board	12716
	Board—5-contact terminal board	34896
	Cord—Dial drive or range shutter control cord	32634
	Coupling—Range switch coupling with set screws	34937
	Detent—Range switch detent plate assembly	34936
	Dial—Translucent band spread dial complete with hub and set screws	34900
	Dial—Translucent main tuning dial complete with hub and set screws	34901
	Drum—Large dial drive drum complete	34908
	Flywheel — Tuning flywheel with set screws	34902
	Gear—Brass pinion gear and bearing assembly	34882
	Gear — Split main or band spread condenser drive gear	34881
	Guide, Band indicator shutter guide rods and strap assembly	34899
	Lamp — 6.3 volt dial lamp, Mazda No. 44	11891
	Pulley—Left-hand band indicator idler pulley and bracket	37241
	Pulley—Right-hand band indicator idler pulley and bracket	37242
	Pulley—Small dial drive pulley and hub with set screws	31271
	Scale — Calibrated stationary vernier scale—less support	34905
	Screw—No. 8-32 set screw for dial drive drum	14350
	Shaft—Dial drive flywheel shaft	34904
	Shaft—Range switch shaft—10¼ inches long	34935
	Shutter—Left-hand band indicating shutter and pilot lamp bracket assembly	37239
	Shutter—Right-hand band indicating shutter and pilot lamp bracket assembly	37240
	Socket—8-contact phenolic socket	18007
	Socket—6-contact wafer socket	33084
	Spring—Band indicator shutter lift spring	34898
	Spring—Dial drive cord tension spring	32481
	Spring—Triple loop spring used on rear end of band switch shaft	34944
	Support—Vernier scale support and hub assembly	34906
	Knob—Antenna adjuster control knob	34949
	Knob—Bar type control knob (8 used)	34950
	Knob—Main tuning or band spread control knob	34947
	Knob—Range switch control knob	34948
	Mask—Metal window mask plate	34953
	Nut—Clamping nut for air trimmers	14028
	Socket—Pilot lamp socket	34951
	Socket—Pilot lamp socket and clip	34909
	Window—Clear dial window sheet	34952

RCA MFG. CO.

Frequency Range..... 540-1,760 kc
Alignment Frequency..... 1,760 kc (ant., det.)

POWER SUPPLY RATINGS
A-C Rating..... 105-125 volts, 50-60 cycles, 50 watts
D-C Rating..... 105-125 volts, 50 watts

POWER OUTPUT (125-volt, 60-cycle supply)
Undistorted..... 1.0 watt
Maximum..... 1.5 watts

LOUDSPEAKER
Type..... 5-inch Electrodynamic
Voice-Coil Impedance..... 3 ohms at 400 cycles

Alignment Procedure

Reel up the antenna wire, and connect the high side of test-oscillator through an 80 mmfd. capacitor to the antenna terminal on the antenna transformer. Connect low side of oscillator to receiver chassis through a 0.1 mfd. capacitor. Turn gang condenser to minimum (full out), tune oscillator to 1,760 kc, connect an output meter across the voice coil, and turn volume control to maximum.

Keep antenna roll and lead clear of chassis during alignment.

Adjust the two trimmers (C3 and C6) on side of gang condenser for maximum output, using lowest possible output from test-oscillator.

Turn pointer, while holding tuning knob, so that the pointer is horizontal and pointing to low-frequency end when the gang condenser is at maximum. Check pointer adjustment on a station.

25-Cycle Operation

For 25-cycle operation, connect a 16 mfd., 150-volt dry electrolytic capacitor (Stock No. 31323) in parallel to C18.

Antenna.—The set is equipped with a 25-foot antenna. Do not connect the antenna to ground. If an outdoor antenna is used, it should not be longer than 100 feet, including lead-in. If it is longer, connect a 100 to 200 mmfd. capacitor in series with the lead-in.

Power-Supply Polarity.—For operation on d-c, the power plug must be inserted in the outlet for correct polarity. If the set does not function, reverse the plug. On a-c, reversal of the plug may reduce hum.

RECEIVER ASSEMBLIES

31198	Ballast—Ballast resistor tube type BK55B (R7, R8)
30883	Capacitor—300 mmf. (C9)
14393	Capacitor—.01 mfd. (C1, C8, C10)

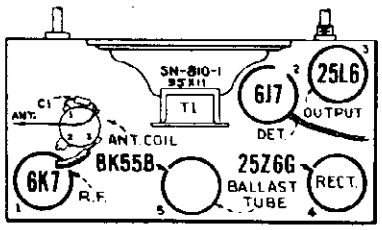
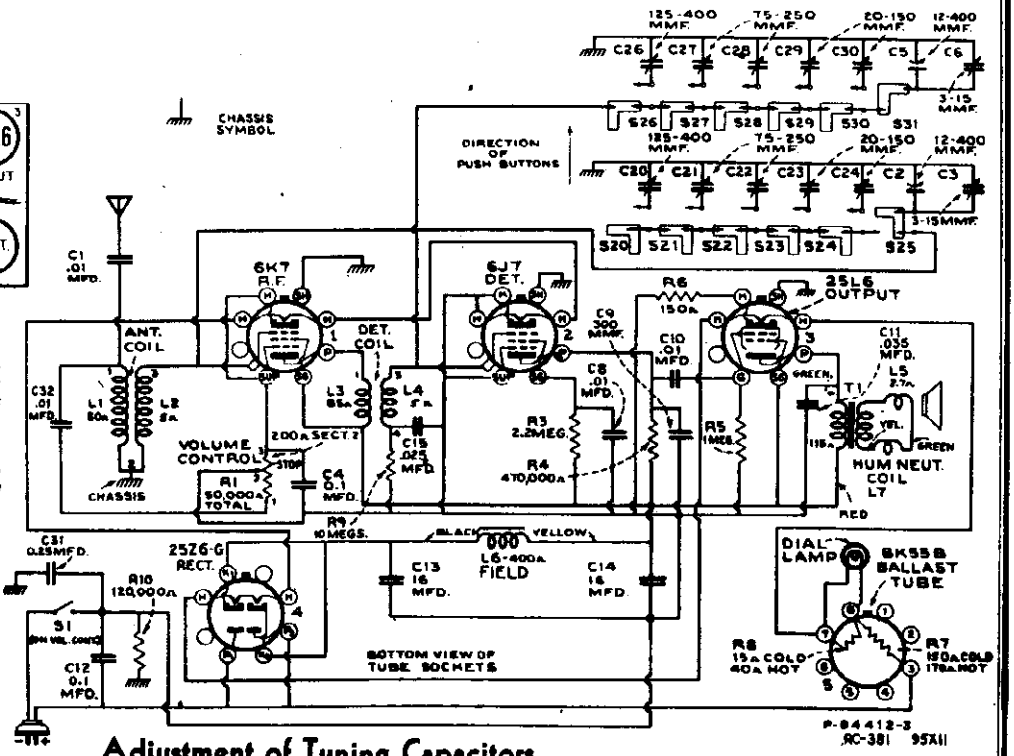
MISCELLANEOUS ASSEMBLIES

31205	Crystal—Station selector dial crystal
30863	Knob—Tuning or volume control knob
31079	Screw—Chassis mounting screws and washers
30900	Spring—Retaining spring for knob

MODEL 95X11

RCA MFG. CO.





Alignment Procedure

Remove chassis from cabinet.

Reel up the antenna wire, and connect the high side of test-oscillator through an 80-mmfd. capacitor to the antenna terminal on the antenna transformer. Connect low side of oscillator to receiver chassis through an .01-mfd. capacitor. Turn gang condenser to minimum (full out), push in the manual-tuning (right-hand) button, tune oscillator to 1,560 kc, connect an output meter across the voice coil, and turn volume control to maximum.

Keep antenna roll and lead clear of chassis during all adjustments.

Adjust the two trimmers (C3 and C6) on side of gang condenser for maximum output, using lowest possible output from test-oscillator.

Turn pointer, so that it is horizontal and pointing to low-frequency end when the gang condenser is at maximum. Check pointer adjustment on a station.

Adjustment of Tuning Capacitors

The preferable and quickest method of adjusting the tuning capacitors for five different stations, is to employ a test-oscillator, as described below:

1. Make a list of the desired five stations, arranged in order from low to high frequencies.
2. Determine the correct settings of the test-oscillator for these five frequencies. This is accomplished as follows: Tune in each of the five stations on any standard receiver; zero-beat the test-oscillator against each station, and note the exact setting of the oscillator in each case.
3. Reel up the antenna wire. Connect the high side of test-oscillator through an 80-mmfd. fixed capacitor to the end of the antenna wire. Clip the low side of the oscillator through a 0.1-mfd. capacitor to one of the chassis-mounting screws on the bottom of the cabinet. Tune the oscillator to the previously-determined point for the lowest-frequency station, and adjust for a strong output.
4. Turn the volume control of the push-button receiver full clockwise, and push in the left-hand end button. Using an insulated screwdriver, peak capacitors C20 and C26, at the same time reducing the output of the oscillator in order to secure a sharp peak. **(Clockwise adjustment of the capacitors tunes the circuits to lower frequencies, and counter-clockwise adjustment tunes the circuits to higher frequencies. The range of each trimmer is three full counter-clockwise turns from the tight position. Do not unscrew more than three turns.)**
5. Push in the second button from left, and adjust C21 and C27 for peak output with the oscillator tuned to the frequency of the second station.
6. Proceed in this manner to adjust each pair of capacitors for the desired frequencies.
7. Final adjustment may be made in actual reception of the stations.

Precautionary Lead Dress

1. **Dress Power cord away from detector coil, heater leads close to base, leads from electrolytic close to base and free of grid leads.**
2. **Dress blue lead from r-f plate to detector coil along front edge of push-button shaft holes. Dress all leads to prevent rubbing against push button shafts.**

25-Cycle Operation

For 25-cycle operation, connect a 16 mfd., 150-volt dry electrolytic capacitor (Stock No. 81823) from the cathode of the rectifier tube to chassis. (Positive to contact K1 of 25Z6-G, and negative to shell contact of 6K7 r-f socket.)

MODELS VA-22, VA-
MODELS UY-122E,
UY-124

RCA MFG. CO.

Specifications MODEL VA-22

Record Capacity..... Eight 10-inch or Seven 12-inch
MOTOR..... Constant-speed, self-starting
PICKUP..... Crystal
Pickup Impedance..... 0.1 meg., at 1,000 cycles
Average Output..... 1½ volts across 0.5 meg.

POWER SUPPLY RATINGS

A6..... 105-125 volts, 60 cycles, 25 watts
A5..... 105-125 volts, 50 cycles, 25 watts
B2..... 105-125 volts, 25 cycles, 25 watts

2nd Production:

The 2nd production of Model VA-22 uses mechanism similar to RP-139A and RP-145.* For replacement parts, refer to the Service Data on RP-139A and RP-145 as specified below:

Stock No.

PICKUP AND ARM ASSEMBLIES

Same as RP-145, except add:

33905 Crystal—Pickup crystal cartridge and needle screw for 25-cycle only....

OPERATING MECHANISM, MOTOR ASSEMBLIES, MOTORBOARD ASSEMBLIES

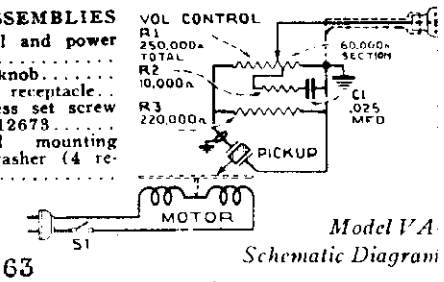
For 110-volt, 60-cycles, same as RP-145.
For 110-volt, 25-cycles, same as RP-139A.

MISCELLANEOUS ASSEMBLIES

31108 Control—Volume control and power switch.....
12673 Knob—Volume control knob.....
31564 Receptacle—Needle card receptacle..
4119 Screw—No. 8-32 headless set screw for knob, Stock No. 12673.....
31470 Springs—Motorboard mounting springs, screw and washer (4 required).....

*See Rider's "Automatic Record Changers" P.463

MODEL VA-24 IS A COMBINATION OF MODEL VA-22 AND OSC.22 WIRELESS OSCILLATOR, DATA FOR WHICH WILL BE FOUND ON RCA P.11-61 IN RIDER'S VOL.XI



Model VA Schematic Diagram

31564	Holder—Needle card holder.....
12673	Knob—Volume control knob.....
14559	Resistor—10,000 ohms, ½ watt (R2).....
12264	Resistor—220,000 ohms, ½ watt (R3).....
4119	Screw—Headless set screw for knob, No. 12673
31470	Springs—Motorboard mounting springs, screw, and washers (4 req'd).....
33594	Support—Cabinet lid support.....
31108	Volume control (R1).....

General Description

The circuit of Models UY-122E and UY-124 is the same as Model 97Y, except for the phonograph circuit which is shown at right. For other circuit details, refer to Service Data for Model 97Y, RCA P.9-109, RIDER'S VOL.IX

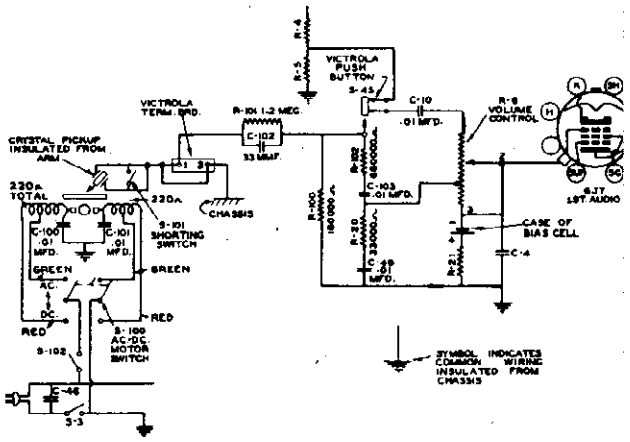
Alignment procedure, adjustments for electric tuning, voltages, and general service data, are the same as for Model 97Y.

Replacement parts for Models UY-122E and UY-124 are listed on the following page.

The phonograph motor has a switch to permit operation on 105-125 volts d.c., or 105-125 volts, 50-60 cycles a.c. The speed regulator screw should be adjusted for 78 r.p.m.

Lubrication should be maintained every six months, applying a few drops of light oil in each oil hole and at the spindle bearing.

The **turntable switch** should trip to the "off" position when the needle is 1¾ inches from the centerline of the turntable spindle.



Phonograph Circuit, Models UY-122E, UY-124.

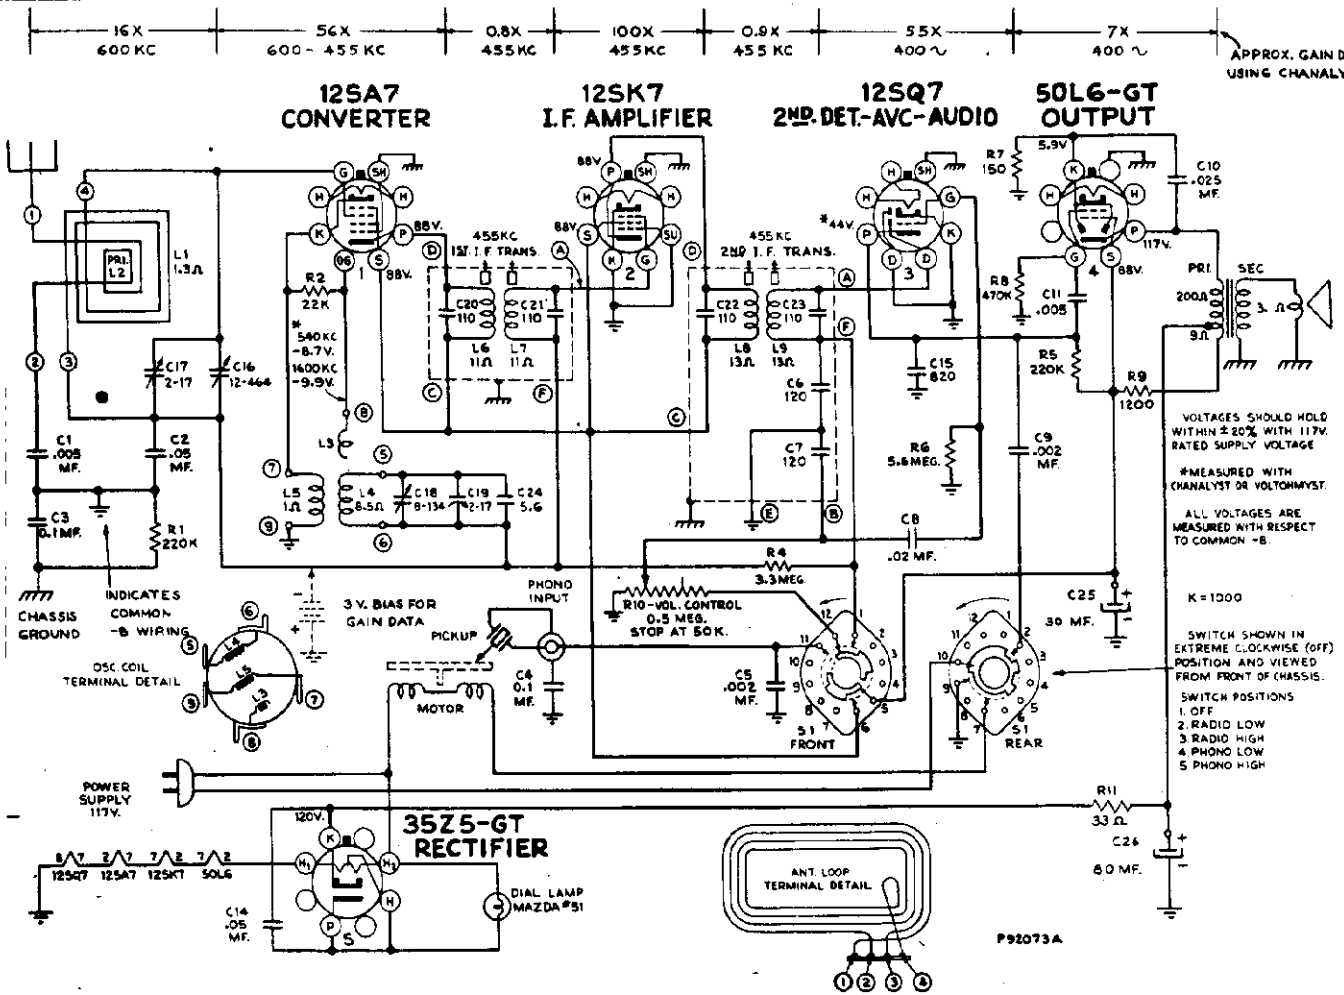
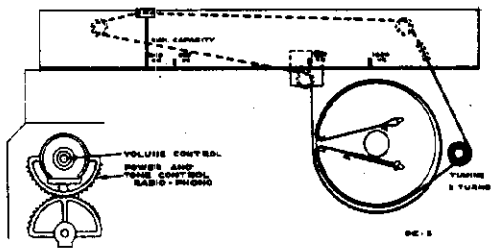
14887	Retainer—Retainer for drive cord pulley
4669	Screw—No. 8-32 square-head set screw for drum, Stock No. 31372
31368	Shaft—Station selector knob shaft and pulley
31199	Shield—Dial lamp shield
12110	Shield—Radiotron shield cap
31365	Socket—Dial lamp socket
31251	Socket—Tube socket
31313	Spring—Tension spring for station selector push button switch latch bar
31418	Spring—Indicator or drum drive cord tension spring
31370	Switch—Push button selector switch (S4, S5, S31, S32, S33, S34, S35, S36, S37, S38, S39, S40, S41, S42, S43, S44, S45)
31398	Switch—Range switch (S1, S2)
30902	Transformer—First i-f transformer (L10, L11, C5, C6)
30903	Transformer—Second i-f transformer (L12, L13, C7, C8)
30284	Tube—Ballast resistor tube (R22, R23)
	MOTOR ASSEMBLIES
32007	Escutcheon—Motor changeover switch escutcheon
32033	Field—Motor field coils and laminations
32034	Governor—Motor governor complete
32006	Motor—105-125 volts, 60 cycles A.C. and 105-125 volts D.C., complete with switch (M1)
31616	Screw—Motor rotor bearing screw and nut
31620	Screw—Motor speed regulator screw and nut
32035	Shaft—Motor turntable spindle shaft and gear
31823	Switch — D.P.S.T. motor changeover switch (S100)
31622	Washer—Motor spindle shaft thrust bearing washers (1 metal, 1 felt)
	MOTOR BOARD ASSEMBLIES
9848	Cup—Used needle cup and lid complete
31464	Damper—One rubber spindle cap and one metal damper plate
31465	Mounting—Pickup arm base mounting — one rubber washer, one lockwasher, one nut
30870	Plug—2-contact male plug for motor and switch leads
31158	Screw—Motor mounting screws, washers, and spacers (sufficient for one motor)
31155	Spring—Used needle cup lid spring
30100	Spring—Automatic switch springs — one long spring and one short spring
31466	Switch—Automatic motor switch and switch lever
31467	Switch—Switch only — for automatic switch (S102)
31463	Turntable

STOCK No.	DESCRIPTION
	PICKUP AND ARM ASSEMBLIES
32134	Bushing—Pickup needle insertion guide—mounts on top of crystal cartridge
31156	Crystal—Pickup crystal cartridge, needle screw and shorting switch, less bushing, Stock No. 32134 (S101)
32016	Pickup and arm complete
31160	Screw—Needle screw
31469	Shaft—Pickup pivot arm and shaft assembly complete with base
	SPEAKER ASSEMBLIES Model UY124 (Speaker RL 71 A-1)
31275	Cone—Speaker cone and voice coil (L14)
5118	Plug—3-contact male plug for speaker
31798	Speaker—Less output transformer
14628	Transformer—Output transformer (T1)
	SPEAKER ASSEMBLIES Model UY122E (Speaker RL 73-5)
31310	Cone—Speaker cone and voice coil (L14)
5118	Plug—3-contact male plug for speaker
31997	Speaker complete
14628	Transformer—Output transformer (T1)
	MISCELLANEOUS ASSEMBLIES
31397	Button—Station selector push button
31456	Cover—8 protective covers for push button markers
31591	Dial—Station selector dial scale—Model UY124
31406	Dial—Station selector dial scale—Model UY122E
31395	Escutcheon—Tuning dial escutcheon only less push buttons and dial scale
30698	Hinge—Cabinet lid hinge—Model UY124
31103	Hinge—Cabinet lid hinge—Model UY122E
31392	Indicator—Indicator pointer, carriage, and clip
31355	Knob—Range switch knob
14359	Knob—Station selector knob
31391	Knob—Tone control knob
30773	Knob—Volume control knob
31458	Marker—"Dial Tuning" marker for push button —Model UY122E
31460	Marker—"Dial Tuning" marker for push button —Model UY124
31457	Marker—"Record Player" marker for push button—Model UY122E
31459	Marker—"Record Player" marker for push button—Model UY124
31589	Marker—Station call letter markers — Model UY122E
31590	Marker—Station call letter markers — Model UY124
31393	Screen—Dial color screen
11210	Screw—Chassis mounting screws, washers, and lockwashers—Model UY124
31471	Screw—Chassis mounting screws, washers, and lockwashers—Model UY122E
31470	Springs—Motorboard suspension top spring, bottom spring, screw, and lockwasher (4 required)
4982	Spring—Retaining spring for knob, Stock No. 14359
14270	Spring—Retaining spring for knob, Stock Nos. 30773 and 31355
30330	Spring—Retaining spring for knob, Stock No. 31391
30946	Support—Cabinet lid support—Model UY122E
11831	Support—Cabinet lid support—Model UY124





Dial Pointer Adjustment.—Rotate tuning condenser fully counter-clockwise(plates fully meshed). Adjust indicator pointer to left (max. cap.)

Frequency Range	540-1,600 kc
Intermediate Frequency	455 kc
Power Output	
Undistorted	1.5 watts
Maximum	2.4 watts
Loudspeaker (922279-1) "PM"	
Size	4 x 6 inch elliptical
V.C. Impedance	3.4 ohms at 400 cycles
Power Supply Rating	
105-125 volts, AC, 60 cycles	60 watts

IMPORTANT—Do not plug chassis into a d-c power supply.

REFER TO SERVICE DATA FOR MODEL 960260-2 FOR INFORMA-

MODELS 65U, 65AU,
Chassis RC-1017A,
RC-1017B

RCA MFG. CO.

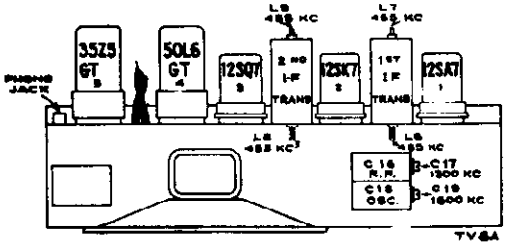
Alignment Procedure

CAUTION.—CLOSE TUNING CONDENSER PLATES COMPLETELY (C-C-W) BEFORE REMOVING CHASSIS FROM CABINET.

Take off both wooden strips on bottom of cabinet by removing wood-screws before loosening chassis bolts.

CRITICAL LEAD DRESS.—

1. All filament wires should be dressed close to chassis.
2. Dress lead from switch to phono jack close to chassis and away from power cord.
3. Dress capacitor between 12SQ7 grid and terminal board away from chassis and away from other parts.
4. Dress all exposed leads away from each other and away from chassis to prevent short circuits.
5. In instrument assembly the lead from the rear section of gang to loop shall be dressed away from chassis and other wires to loop.



Power Supply.—Although this model employs an ac-dc chassis, it is not suitable for use on d-c, as this would damage the motor.

Reversal of plug in outlet receptacle may reduce hum.

Test Oscillator.—Connect high side of test oscillator as shown in chart Connect low side through a .01 mf capacitor to common "—B". Keep the output signal as low as possible to avoid a-v-c action.

Output Meter.—Connect meter across speaker voice coil. Turn volume control clockwise to radio maximum high position (3) for alignment.

Steps	Connect the high side of test-oscillator to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. peak output
1	I.F. grid, in series with .01 mfd.	455 kc	Quiet point 1,630 kc end of dial	L8 and L9 2nd I.F. transformer
2	1st Det. grid in series with .01 mfd.			L6 and L7 1st I.F. transformer *
	NOTE.—ANTENNA LOOP AND RECORD CHANGER MUST BE IN CABINET			
3	Antenna terminal in series with 220 mmfd.	1600 kc	Gang at minimum	C19 (osc.)
4	Radiated signal 1300 kc		Signal Frequency	C17 (ant.)
5	Repeat steps 3 and 4.			

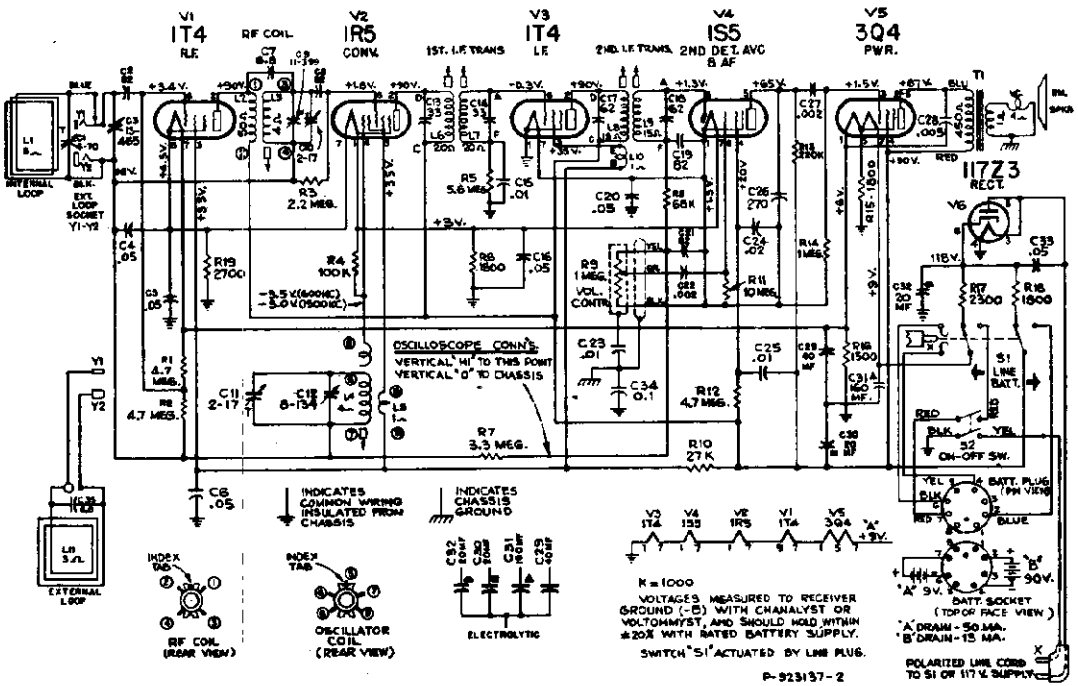
*Do not readjust L8 or L9 when test oscillator is connected to 1st Det.

Replacement Parts

STOCK No.	DESCRIPTION
	CHASSIS ASSEMBLIES RC 1017A RC 1017B
70389	Bearing—Tuning knob shaft bearing
70407	Button—Plug button (2 required)
70997	Capacitor—Mica, 5.6 mmf. (C24)
39650	Capacitor—Mica, 820 mmf. (C15)
70601	Capacitor—Tubular, .002 mfd., 400 volts (C5, C9)
70606	Capacitor—Tubular, .005 mfd., 400 volts (C1, C11)
70611	Capacitor—Tubular, .02 mfd., 400 volts (C8)
70612	Capacitor—Tubular, .025 mfd., 400 volts (C10)
70615	Capacitor—Tubular, .05 mfd., 400 volts (C2, C14)
70617	Capacitor—Tubular, 0.1 mfd., 400 volts (C3, C4)
*72312	Capacitor—Electrolytic, comprising 1 section of 30 mfd., 150 volts and 1 section of 80 mfd., 150 volts (C25, C26)
70403	Coil—Oscillator coil
70383	Condenser—Variable tuning condenser complete with drum
70322	Control—Volume control
32634	Cord—Drive cord (approx. 48" overall length)
70392	Cord—Power cord
70384	Drum—Drive drum
70397	Gear—Power or radio-phono switch gear
70395	Gear—Volume control gear and spring assembly
70404	Indicator—Station selector indicator
70391	Insulator—Bakelite insulator for phono input socket
11765	Lamp—Dial lamp
*72311	Loop—Antenna loop
70382	Plate—Dial back plate complete with pulleys less dial
30868	Plug—2 contact female plug for "AC" cable
36230	Pulley—Drive cord pulley
*72313	Resistor—33 ohms, 1 watt (R11)
30880	Resistor—150 ohms, ½ watt (R7)
6134	Resistor—1200 ohms, 1 watt (R9)
30492	Resistor—22,000 ohms, ½ watt (R2)
14583	Resistor—220,000 ohms, ½ watt (R1, R5)
30648	Resistor—470,000 ohms, ½ watt (R3)
12928	Resistor—3.3 megohms, ½ watt (R4)
31455	Resistor—5.6 megohms, ½ watt (R6)
14974	Screw—#8-32 x ¼" long set screw for lower gear
70388	Shaft—Tuning knob shaft
34449	Socket—Lamp socket
35787	Socket—Phono input socket
37605	Socket—Tube socket—moulded
70390	Spring—Drive cord tension spring
70396	Spring—Volume control gear tension spring
70394	Switch—Power or radio phono switch
70386	Transformer—First I.F. transformer
70387	Transformer—Second I.F. transformer
70385	Transformer—Output transformer
33726	Washer—"C" washer for tuning knob shaft
70406	Washer—Spring washer for volumie control
	SPEAKER ASSEMBLY 922279-1
70405	Speaker—4" x 6" P.M. speaker complete
	SPEAKER ASSEMBLY 922258-2
71058	Speaker—4" x 6" P.M. speaker complete
	SPEAKER ASSEMBLY 922258-1
70470	Speaker—4" x 6" P.M. elliptical speaker complete NOTE: If stamping on speaker in instrument does not agree with above speaker number, order replacement parts by referring to model number of instrument, number stamped on speaker and full description of part required.
	MISCELLANEOUS
70398	Clamp—Dial clamps (1 set)
71984	Decal—Trade mark decal (RCA Victor)
71966	Decal—Trade mark decal (Victrola)
70402	Dial—Glass dial
71505	Feet—Rubber feet (4 required)
X1630	Grille—Baffle board and grille cloth
70707	Hinge—Lid hinge (2 required)
70401	Knob—Power switch and radio-phono switch knob
70400	Knob—Tuning knob
70399	Knob—Volume control knob
71815	Mounting—One set of hardware consisting of four springs, two spring washers and two rubber washers to mount record changer.
14270	Spring—Retaining spring for knobs
71824	Stud—Stud and screw to mount lid hinge (1 set)
39545	Support—Lid support
X1386	Cabinet—Cabinet for Model 65U

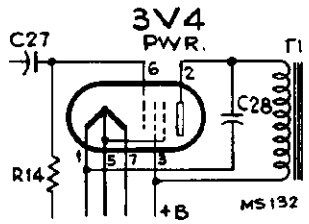
*THIS IS THE FIRST TIME THIS STOCK NUMBER HAS APPEARED IN PRINT.

APPLY TO YOUR RCA DISTRIBUTOR FOR PRICES OF REPLACEMENT PARTS

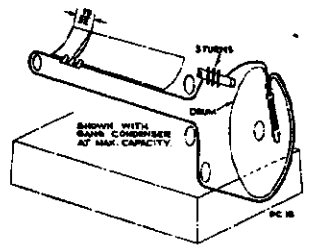


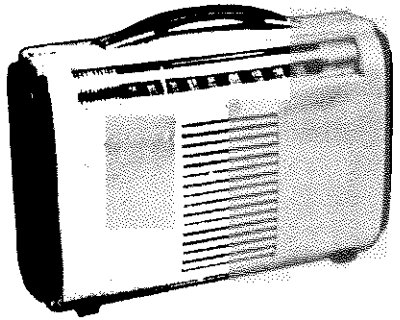
CAUTION.—

1. **Do not remove any tubes from the chassis with the set operating and the plug connected to the power line. Damage to tubes may result.**
2. **When cleaning the aluminum portion of the case use soap and water or cleaning fluid. Do not use abrasive cleansers.**



RC-1040A





NOTE—The Chassis marked RC-1040A have R-3 and C-8 omitted and have the power tube socket connected for a 3V4 tube.

Frequency Range ..... 540-1,600 kc

Intermediate Frequency ..... 455 kc

110 to 125 volts, AC 50 or 60 cycles, or DC ..... 14 watts

Batteries required ..... One RCA Battery Pack VS019 or equivalent

Tube Complement

(1) RCA—1T4 ..... R.F.
(2) RCA—1R5 ..... Converter
(3) RCA—1T4 ..... I.F.-Amplifier
(4) RCA—1S5 ..... 2nd Det. AVC. & A.F.-Amplifier
(5) RCA—3Q4—RC-1040 ..... Power Output
RCA—3V4—RC-1040A ..... Power Output
(6) RCA—117Z3 ..... Rectifier

Using External Loop.—

A loop antenna is housed inside the cabinet. Under normal conditions this will give satisfactory reception. If however the receiver is used in a location remote from broadcasting stations where signals are weak, or where interference is excessive, or in a shielded compartment such as an automobile, airplane or railroad train, an RCA external loop can be used.

This loop antenna has a strap connector cord with indentical two prong plugs on either end, this makes it convenient in connecting it to the circuit through the receptacle located in the left hand side of the chassis.

Open the case, plug the antenna cord into the socket (it will only go in one way), bring the strap out through the slot in the case and attach the Loop Antenna by means of the suction cup to any convenient vertical surface.

This loop antenna can be stored in the cabinet, in the compartment below the battery pack, and the cord in the small compartment in the

Current Consumption

Battery Operation ..... "A" 50 milliamperes, "B" 13 milliamperes
Total Rect. Current (117 volt, 60 cycle) ..... 61 mils.

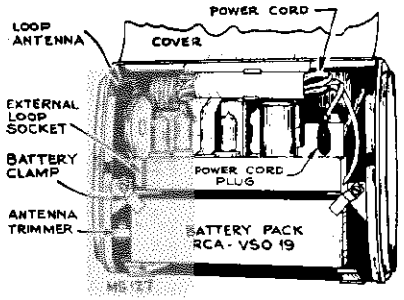
Power Output

Maximum ..... .23 watt

Loudspeaker ..... 4 x 6 in. elliptical P.M. 3.4 ohms at 400 cycles

CRITICAL LEAD DRESS.

1. Dress all filament leads next to chassis.
2. Keep the leads short on the ends of the three components which connect to the grid terminal (#6) of the r.f. socket. (R-1, R-2, C-2).
3. Separate leads to front and center sections of gang as far as possible and away from tubes.
4. Dress loop leads away from tuning drum and battery.
5. Dress output transformer leads away from rear section of gang.
6. Dress r.f. plate lead away from r.f. grid circuit.
7. Dress components and wiring near external loop socket to clear external loop pins.
8. Dress avc lead away from 2nd IF transformer and associated components.
9. Dress converter plate lead away from chassis and away from output twisted leads.
10. Dress twisted output leads up and away from other wiring.
11. Dress volume control cable, switch cable, and line receptacle leads away from rectifier tube and resistor case.
12. Dress 1st audio plate lead up and away from other wiring.



MODEL 66BX
Chassis RC-1040,
RC-1040A

RCA MFG. CO.

Alignment Procedure

Cathode Ray Alignment is the preferable method. Connections for the oscilloscope are shown on the schematic diagram.

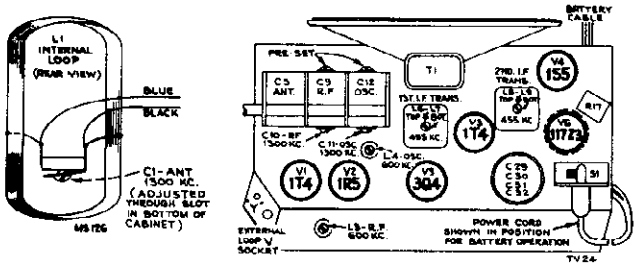
Output Meter Alignment.—If this method is used, connect the meter across the voice coil and turn the receiver volume control to maximum.

Test Oscillator.—For all alignment operations, connect the low side of the test oscillator to the receiver chassis and keep the oscillator output as low as possible to avoid AVC action.

Calibration Scale.—The calibrated dial scale is permanently connected to chassis. It can therefore be used directly as a reference for alignment.

With the gang at full mesh set the dial pointer so that the left hand edge of the pointer is 1/16 inches to the right of the point indicated in the dial cord drawing.

Steps	Connect the high side of test-oscillator to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. peak output
1	High side of loop (Blue lead) in series with 0.1 mfd.	455 kc	Gang at max. cap.	L8, L9 (2nd I.F. Trans.)* L6, L7 (1st I.F. Trans.)
2	High side of loop (Blue lead) in series with 0.1 mfd. (Bottom shield cover in place and chassis out of cabinet)	1300 kc	1300 kc	C11—(osc.) C10—(R.F.)
3		600 kc	600 kc	L4 (osc.) L3 (R.F.)
** 4	220 mmf. in series with a single turn loop 4x8 in., approx. 3 in. from receiver loop. (Chassis in cabinet C-1 connected and rear lid of cabinet closed)	1300 kc	1300 kc	C1 (loop)



*If two peaks are found with top slugs use the one with stud in the outer position.

**Adjust C-1 loop cap with back cover of case closed. Access to trimmer is made through small slot in case provided for cable of external loop.

AC-DC Operation.—

This receiver will operate on 105 to 125 volts, AC 50 or 60 cycles, or DC.

A power cord is stored in the fiber tube which is clamped above the chassis inside the cabinet. To open the cabinet, slide the two plastic feet in the rear of the cabinet toward each other, and raise the back cover upward on its hinges. Then pull the power cord plug out of the socket on the top of the chassis as shown, and take out and unroll the power cord. A slot in the bottom of the cabinet allows the closing of the cabinet with the power cord passing through. Close the cabinet with the cord extending through the slot and insert the plug into a convenient electrical outlet.

When returning to battery operation, be sure to replace the power plug in its socket inside the case with the cord stored in the fiber tube.

NOTE.—If reception is not obtained on DC, reverse plug in outlet receptacle. This may also reduce hum on AC operation.

STOCK No.	DESCRIPTION
	CHASSIS ASSEMBLIES RC 1040
*71056	Bracket—Drive cord pulley bracket complete with one (1) pulley
*71054	Bracket—Drive cord pulley bracket complete with two (2) pulleys
*71044	Bracket—Power switch bracket complete with actuating lever less power switch
*71042	Button—Plug button
31709	Capacitor—Ceramic, 6.8 mmf. (C7)
*71514	Capacitor—Ceramic, 82 mmf. (C2, C8, C19, C21)
*71540	Capacitor—Ceramic, 270 mmf. (C26)
*71552	Capacitor—Tubular, .002 mfd., 400 volts (C22, C27)
*71553	Capacitor—Tubular, .005 mfd., 400 volts (C28)
70610	Capacitor—Tubular, .01 mfd., 400 volts (C15, C23, C25)
70611	Capacitor—Tubular, .02 mfd., 400 volts (C24)
70615	Capacitor—Tubular, .05 mfd., 400 volts (C4, C6, C33)
71551	Capacitor—Tubular, .05 mfd., 200 volts (C5, C16, C20)
70617	Capacitor—Tubular, 0.1 mfd., 400 volts (C34)
*71043	Capacitor—Electrolytic comprising 2 sections of 20 mfd., 150 volts, 1 section of 160 mfd., 25 volts and 1 section of 40 mfd., 25 volts (C29, C30, C31, C32)
*71053	Clip—Spring clip for knob
*71401	Coil—Oscillator coil (L4, L5)
*71402	Coil—R.F. Coil (L2, L3)
*71035	Condenser—Variable tuning condenser (C3, C9, C10, C11, C12)
*71057	Control—Volume control (R9)
32634	Cord—Drive cord (approx. 37" overall length)
70392	Cord—Power cord
*71048	Dial—Dial scale and window assembly
*71036	Drum—Drive drum
*71031	Holder—Power cord holder
*71030	Indicator—Station selector indicator
*71032	Insulator—Rectangular bakelite insulator—between chassis base and dial support bracket (2 required)
*71052	Knob—Tuning knob and volume control knob
18469	Plate—Electrolytic capacitor mounting plate
*71041	Plug—4 prong male plug for battery cable
36230	Pulley—Drive cord pulley
30654	Resistor—1500 ohms, 1/4 watt (R16)
12194	Resistor—1800 ohms, 1/4 watt (R6, R15)

30652	Resistor—1 megohm, 1/4 watt (R14)
30649	Resistor—2.2 megohms, 1/4 watt (R3)
31417	Resistor—3.3 megohms, 1/4 watt (R7)
30931	Resistor—4.7 megohms, 1/4 watt (R1, R2, R12)
31455	Resistor—5.6 megohms, 1/4 watt (R5)
30992	Resistor—10 megohms, 1/4 watt (R11)
*71055	Shaft—Tuning knob shaft
*71050	Shield—L.H. end shield for dial
*71051	Shield—R.H. end shield for dial

STOCK No.	DESCRIPTION
*71040	Socket—2 contact female socket for external loop
*71037	Socket—Tube socket—miniature—7 prong—floating
*71827	Socket—Tube socket—miniature—7 prong—bottom mounted
70390	Spring—Drive cord spring
*71053	Spring—Retaining spring for knob
*71039	Switch—Line—battery change switch (S1)
*71045	Switch—Power switch (S2)
*71299	Transformer—First I.F. transformer (L6, L7, C13, C14)
*71400	Transformer—Second I.F. transformer (L8, L9, L10, C17, C18)
*71047	Transformer—Output transformer (T1)
*71081	Washer—"C" washer for tuning knob shaft
*71033	Washer—Insulating washer, extruded, for mounting dial support to chassis base (4 req'd.) and to mount base holder bracket
*71034	Washer—Insulating washer—flat, to mount base holder bracket
*71049	Window—Dial window
	SPEAKER ASSEMBLY 922258-2
*71059	Gasket—Speaker gasket (black tubing)
71058	Speaker—4" x 6" P.M. speaker complete with cone and voice coil
	NOTE: If stamping on speaker in instrument does not agree with above speaker number, order replacement parts by referring to model number of instrument, number stamped on speaker and full description of part required.
	MISCELLANEOUS
*71074	Arm—Shutter arm lever
*71617	Cable—Connecting cable for external loop
*71069	Capacitor—Adjustable trimmer, 3-35 mmf. (C1)
*71080	Clip—Case side spring clip and screw (2 req'd.)
*71619	Cup—Suction cup for mounting external loop
*71060	Back—Case back complete with center strip
*71061	Foot—Case foot (moulded) (2 req'd.)
*71068	Foot—Case foot (wood) (2 req'd.)
*71067	Front—Case front complete less shutter
*71618	Gasket—Gasket seal to hold loop together
*71063	Handle—Carrying handle
*71062	Latch—Case latch (2 req'd.)
*71065	Link—Carrying handle link (2 req'd.)
*71616	Loop—External antenna loop (L11, C35)
*71079	Loop—Antenna loop—internal (L1)
*71064	Retainer—Battery retainer spring bracket (2 required)
*71066	Screw—#8-32 x 1/4" long screw to fasten case together (2 required) for battery holders (2 required)
*71077	Screw—Screw complete with washer and nut to secure one side to case front or case latch
*71071	Shutter—Case shutter
*71076	Side—Case side—L.H.
*71075	Side—Case side—R.H. (loop side)—less capacitor assembly
*71072	Spring—Case shutter compression spring
31608	Washer—"C" washer for case shutter's shafts
*71078	Washer—Dampening washer for shutter shafts

*71110	Condenser—Variable tuning condenser (C22, C23, C24, C25).
38410	Control—Volume control and power switch (R6, S1)
34662	Cord—Drive cord (approx. 51" overall length)
70384	Drum—Drive drum
70391	Insulator—Insulator for phono jack
*71114	Indicator—Station selector indicator
*71116	Lamp—Dial lamp—Mazda 1490
*71117	Loop—Antenna loop (L15, L16)
*71108	Plate—Dial back plate complete with four (4) pulleys less dial
36230	Pulley—Drive cord pulley
30189	Resistor—120 ohms, ½ watt (R9)
30731	Resistor—1200 ohms, ½ watt (R11)
30694	Resistor—3900 ohms, ¼ watt (R1)
30436	Resistor—12,000 ohms, ¼ watt (R13)
30685	Resistor—33,000 ohms, ¼ watt (R3)
30787	Resistor—47,000 ohms, ¼ watt (R12)
14583	Resistor—220,000 ohms, ¼ watt (R2, R4, R8)
30648	Resistor—470,000 ohms, ¼ watt (R10)
31417	Resistor—3.3 megohms, ¼ watt (R5)
30931	Resistor—4.7 megohms, ¼ watt (R7)
*70467	Shaft—Tuning knob shaft
*71118	Shell—Protecting shell for loop spacing spring (2 required)
*71115	Socket—Lamp socket
37605	Socket—Tube socket
*71120	Spacer—Tubular spacer to mount antenna loop (2 required)
70390	Spring—Drive cord spring
*71119	Spring—Loop assembly spacing spring (2 required)
*71112	Switch—Range and tone switch (S2)
*71111	Transformer—Output transformer (L7, L8)
71558	Transformer—First I.F. transformer (L3, L4, C5, C6)
70387	Transformer—Second I.F. transformer (L5, L6, C8, C10, C11 C13)
33726	Washer—"C" washer for tuning knob shaft
	SPEAKER ASSEMBLY 922258-2
71058	Speaker—4" x 6" elliptical P.M. speaker complete with cone and voice coil
	NOTE: If stamping on speaker in instrument does not agree with above speaker number, order replacement parts by referring to model number of instrument, number stamped on speaker and full description of part required
	MISCELLANEOUS
*71835	Back—Cabinet back for Model 66X3
*71122	Baffle—Speaker baffle assembly for 66X1 and 66X2
*71124	Clamp—Dial clamp for 66X1 and 66X2 (2 required)
*71131	Clamp—Dial clamp for 66X3 and 66X4
*71132	Dial—Glass dial scale
*71127	Foot—Cabinet foot—walnut—for 66X1 (4 required)
*71128	Foot—Cabinet foot—ivory—for 66X2 (4 required)
70473	Knob—Control knob (mottled walnut) for 66X1, 66X3, 66X4
70474	Knob—Control knob (ivory) for 66X2
*71126	Nut—Speed nut to fasten screen (4 required)
*71125	Screen—Protective screen for hand grip for 66X1 and 66X2
30900	Spring—Retaining spring for control knobs
*71130	Spring—Retaining spring for front strip for 66X1 and 66X2
*71129	Strip—Finished strip for cabinet front for 66X1 and 66X2

Specifications

Frequency Range
Broadcast ..... 540-1600 kc
Short Wave ..... 9-12 mc

Intermediate Frequency ..... 455 kc

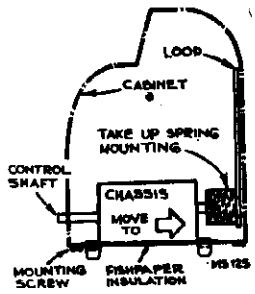
Tube Complement
(1) RCA-12SG7 ..... R-F Amplifier
(2) RCA-12SA7 ..... 1st Det.—Osc.
(3) RCA-12SK7 ..... I-F Amplifier
(4) RCA-12SQ7 ..... 2nd Det., A.V.C., and A-F Amplifier
(5) RCA-35L6-GT/G ..... Power Output
(6) RCA-35Z5-GT/G ..... Rectifier

Pilot Lamps ..... Mazda No. 1490, 3.2 volts

Power Output
Undistorted ..... 1.0 watts
Maximum ..... 1.5 watts

Loudspeaker (922258-2)
Size ..... 4 x 6" elliptical P.M.
V.C. Impedance ..... 3.4 ohms at 400 cycles

Power Supply Rating
105-125 volts, AC, 50 or 60 cycles, or DC ..... 27.6 watts



The construction of the cabinets for Models 66X1 and 2 makes it necessary to remove the chassis for replacing tubes. To do this, proceed as follows:

1. Remove the power plug from the service receptacle.
2. Remove control knobs.
3. Remove the six slotted screws around the edge of the metal base plate. (Do not remove the four feet from the base plate as this will separate the base plate from the chassis.)
4. Tilt the cabinet forward so that the bottom rear edge of the cabinet raises above base plate.
5. Hold the chassis with one hand while pushing the cabinet forward and upward to clear the control shafts.

Lead Dress

1. Dress all filament and power leads down to chassis and as far as possible from all audio grid and plate wiring.
2. Dress power cord back and away from C-14 (1st audio coupling condenser).
3. Dress C-14 toward 12SQ7 socket and away from the switch.
4. Dress C-16 (output by-pass condenser) down to chassis.
5. Dress blue lead from phono jack to volume control in air and away from output transformer.
7. Dress all leads and parts away from oscillator coils.
8. Dress C-2 (R.F. coupling condenser) back to chassis.
9. Avoid excessive lead lengths in C-27 (short wave fixed ... mmf.) and short wave antenna coil.
10. Dress pilot light leads (above chassis) toward dial support and away from the 35Z5 tube.

Alignment Procedure

Test Oscillator.—Connect high side of test oscillator as shown in char... Connect low side through a 0.1 mf. capacitor to common "—B." Keep th... output signal as low as possible to avoid A.V.C. action.

Output Meter.—Connect meter across speaker voice coil. Turn volum... control to maximum clockwise position, station selector switch to broadca... maximum high position (pos. 2), for broadcast alignment and to position ... for high frequency band.

Dial Pointer Adjustment.—Rotate tuning condenser fully counte... clockwise (plates fully meshed). Adjust indicator to 2 15/16 in. from end ... backplate as indicated in drawing.

On models 66X1 and 2 the dial indicator is accessible for adjustment b... removing the metal strip below the dial glass. (Lift and swing the to... forward).

Calibration Scale.—The glass tuning dial may be easily removed fro... the cabinet and temporarily attached to the dial back plate.

Power Supply Polarity.—For operation on d-c, the power plug must ... inserted in the outlet for correct polarity. If the set does not functio... reverse the plug. On a-c, reversal of the plug may reduce hum.

Steps	Connect high side of the rest oscillator to—	Tune test osc. to—	Turn radio dial to—	Adjust the following for maximum peak output
1	Pin #4 (signal grid) 12SK7 IF tube in series with 0.1 mfd.	455 kc	Quiet point at 1600 kc end of the dial	T2† 2nd I-F trans.
2	Pin #8 (signal grid) 12SA7 1st det. in series with 0.1 mfd.			T1 1st I-F trans.
3	Antenna in series with 200 mmf.			L2 for minimum output (Wave trap)
4		1300 kc	1300 kc	C22 (osc.) C24 (ant.)
5		600 kc	600 kc	L13 While rocking gang
6	Repeat steps 4 and 5.			
7	Antenna in series with 50 mmf.	9.5 mc.	9.5 mc.	C20 (Osc.)*
8		9.5 mc.	9.5 mc.	C26 Ant. while rocking gang
9		11.8 mc.	11.8 mc.	L10 (Osc.)**
10				L14 while rocking gang
11	Repeat steps 9 and 10.			

*If two peaks are obtained use minimum cap peak.
**If two peaks are obtained use minimum inductance peak.
†Do not repeat step No. 1.

OPERATION OF THE CRYSTAL FILTER

To operate the crystal filter for single signal reception, the white dot on the knob "D" should be set to the position corresponding to "S" and the knob "C" adjusted slightly to a position where background response is a minimum. When tuning for CW signals using the crystal filter the tuning should be done with dial number 2, and rotation should be slow due to the sharp resonance characteristic of the filter. In case comparative elimination of noises does not occur when the selectivity control "C" is adjusted from side to side, it is possible that the balancing condenser has become misaligned. In order to adjust this alignment to the null point, use an insulated trimmer screw driver and adjust the pressure screw on the small mica trimmer condenser located just behind and below the crystal filter compartment. This is accessible by raising the receiver cabinet cover and removing the shield box cover of the crystal filter compartment. With the receiver merely on the air or turned to station reception, this balance can be made by slightly turning the screw either way until minimum receiver response is obtained.

When phone stations are to be received the carrier may be tuned in and the selectivity control "C" adjusted to broaden the crystal response. Although the result will be mostly a low frequency audio output, sufficient articulation frequencies are passed to make phone reception intelligible. Of course, when the crystal is used for phone reception the apparent strength of the speaker output is reduced due to the fact that the crystal has eliminated most of the side bands of the modulated carrier and since these eliminated higher side band frequencies contain some of the sound energy going to the speaker, the net effect is a reduction in sound output. However, with CW reception, when the carrier to be received, is exactly tuned there is no reduction in the signal beat when the crystal is being used.

When the crystal is placed parallel in the filter circuit (knob "D" set to position B, diagram 40A) it tends to short circuit (series resonance) at its resonant frequency. This function is valuable for eliminating interfering heterodynes and its effect may be sharpened and broadened slightly in exactly the same way as the series operation of the filter. Its use in this manner is many times of invaluable service in connection with radio telephone reception.

THE MONITOR FOR MODULATION

On the rear of the chassis (Figure C) is a terminal marked "monitor feed wire terminal", which is used to connect a pick-up wire to the monitor curcuit. By pulling out the knob "B" the monitor circuit is connected and the radio amplifier circuits disconnected. The monitor is intended for the checking of modulation quality of a transmitter in the proximity of the receiver. For this purpose 10 feet or so, of wire lying on the floor, may be connected to the monitor terminal post. If more or less is needed that fact can be determined by noting the magnitude of the audio output. When using the monitor it is recommended that listening be done with headphones to prevent audio feed-back, especially when the transmitter modulation originates at a nearby microphone. If transcription equipment is used the receiver loud speaker may be used. Volume may be controlled by the rotation of knob "B" in the same manner asthe radio volume of the receiver is controlled.

The monitor switch is operated by pulling on the knob "B" and thus also becomes the SNED-RECEIVE switch, since it opens the plate supply to the radio and IF amplifiers. The monitoring of CW signals can be accomplished by leaving the knob "B" pushed in toward the panel in the regular radio receiving position and the manual volume control and beat oscillator knob "F" turned considerably toward the maximum clockwise position. The frequency of the transmitter must then be tuned to by the regular tuning controls and the beat note will be heard in the same manner as that of any received signal. It may be necessary in this connection to remove the regular antenna and substitute a shorter length in case the received signal is too strong. However, the manual volume control knob "F", when in the maximum clockwise position, reduces the receiver's sensitivity to a point which will accomodate most amateur transmitters.

SERVICE NOTES FOR THE RME-45 RECEIVER

If the owner has available an accurate signal generator he may, by following the steps outlined in succeeding paragraphs, realign and recalibrate the receiver. If a signal generator is not available he may take the receiver to a reputable service man to have the work done. In addition to the signal generator an insulated screw driver will be required.

NOTE: The "R" meter makes an excellent resonance indicating device. All adjustments are made with the AVC on.

I. F. ALIGNMENT

The I.F. frequency of the RME-45 is 455 KC. The bandswitch should be turned to Band I. The tuning dial should be turned to the low frequency end (.55Mc). The hot lead from the signal generator is clipped to the lug on the detector section (middle) of the tuning condenser. With the signal generator set to 455 KC., each padder on the 1st, 2nd and 3rd I.F. transformers (see Fig. 1) are carefully adjusted for maximum response as indicated on the meter.

NOTE: The frequency of the signal generator must be set accurately to that of the crystal. This is done in the following manner:

Turn the crystal selectivity switch to Position 5. Carefully adjust the signal generator frequency until the carrier meter rises sharply. The signal generator is now accurately on the crystal frequency. The crystal selectivity switch is turned to "OFF" and the three I.F. transformers are aligned as before.

BEAT OSCILLATOR ADJUSTMENT

With the signal generator connected as for aligning I.F. circuits, turn "B.O. SWITCH" on and set "B.O. PITCH" control pointer vertical. With an insulated screw driver adjust B.O. padder (See Fig. 1) until zero beat is obtained.

ALIGNMENT OF THE RADIO FREQUENCY SECTION

Alignment of the radio frequency section of the receiver will affect, principally, the calibration of the receiver. Within certain limits this, of course, will also affect the sensitivity. Small variations in frequency (up to 2%) will not materially reduce the sensitivity of the receiver, although they will, of course, show up as variations in the calibration as indicated by the setting of the MAIN TUNING DIAL. Correction of any variation of calibration can be made by following the suggestions outlined in the following paragraphs.

Band I includes frequencies between 540 and 1600 KC. For Band I there are two frequency adjustments for adjusting the dial to the proper calibration. The adjustments are made on the top of the chassis through the dust cover over the Band I and II coils. The proper holes for making the adjustments are indicated on the top sketch on Fig. 3. There are 6 sets of large and small holes each. The two sets toward the rear of the chassis are the oscillator adjustments. The set toward the front are the RF stage adjustments; and the center set are for the detector. Under the large hole is a padder for adjusting the high frequency coil and adjusts the low frequency end.

The next step is to choose a station or a signal of accurately known frequency on the low frequency end of the range (for example 600KC.) and set the main tuning scale to read this frequency. If the station is not tuned in which the scale indicates its frequency it may be brought in by adjusting the oscillator coil core. This may be done with a small screw driver through the small hole marked "BAND I OSC" on Fig. 3. Another station or signal is now selected near the high frequency end of the range (for example 1400 KC). If this signal is not heard when the dial is accurately set to its frequency it may be brought in by adjusting the padder under the large hole marked "BAND I OSC" by means of an insulated trimmer tool. When this signal is accurately brought in as indicated by a maximum reading on the carrier meter one should go back to the low frequency test point and readjust it if it has changed. It may be necessary to go back and forth several times until both frequencies are accurately calibrated.

The procedure in calibrating and aligning Band II is the same for Band I. On this band two frequencies, such as 1800 and 2800 KC may be used.

The four high frequency bands are calibrated and aligned by removing the bottom plate from the receiver. The screws holding the four rubber feet and the four small screws between them are removed. This allows the bottom plate to be removed. It will be found that an aluminum plate covers the coils. This plate has holes over the 12 padders and all adjustments should be made with this plate in position.

Since the inductance of the coils are accurately adjusted and set at the factory it is necessary only to calibrate one frequency on each band. The same applies to the alignment of the RF and detector padders. Suggested calibration points for each band are as follows:

Band III	5 MC.
Band IV	9 MC.
Band V	16 MC.
Band VI	30 MC.

From the bottom sketch on Fig. 3 the location of each of the 3 paddere for each band may be readily located. Note in particular the location of Band V and VI padders. Adjustments should be made with insulated screw driver type of trimmer tool.

High frequency beat is used on all bands. That is to say, that the oscillator is 455 KC higher in frequency than the signal received.

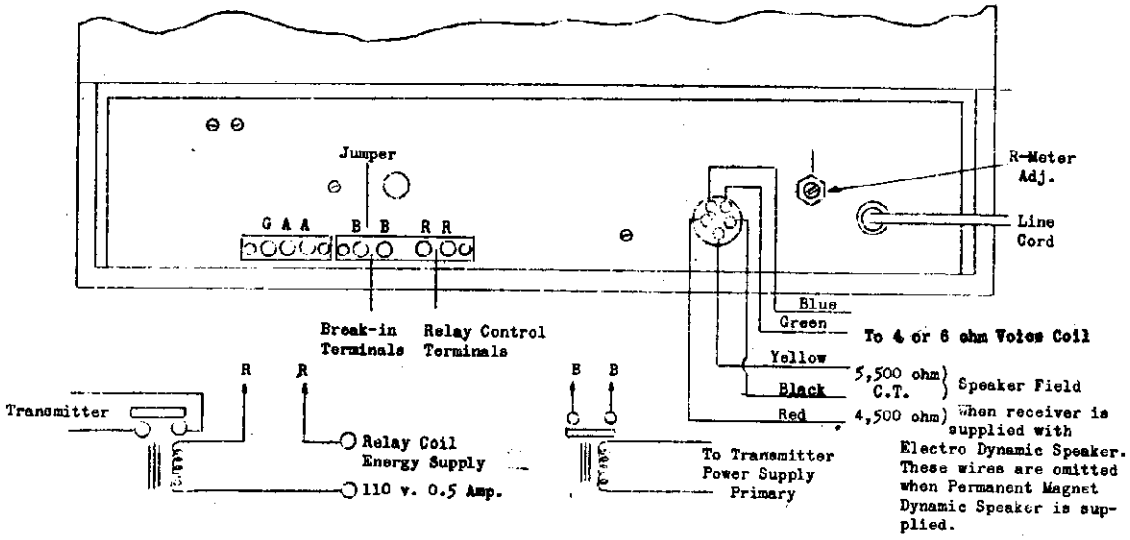
If sufficient input is used each signal can be received at two points, differing by 910 kilocycles. The other signal is the image or "low beat" signal. The higher frequency signal received, according to the receiver dial, is the proper one and the circuits should be aligned to it.

When using a signal generator or test oscillator to align the set a resistor of about 300 ohms should be inserted between the signal generator and the antenna connection. This will prevent misaligning of the RF stage caused by the connection of the low impedance of the signal generators output circuit across the receiver input.

In order that the full capabilities of the crystal filter in the Model 45 be realized the following procedure in tuning it is recommended:

On the top of the crystal filter box is a trimmer (Fig. 1). The easiest way to adjust this trimmer is to tune in a station in the broadcast band that is broadcasting music, preferably an orchestra. The XTAL SELECTIVITY switch should be turned to Position 5 and the signal tuned in accurately on the crystal. The XTAL PHASING control should be adjusted to give minimum background noise. The SELECTIVITY control is then turned to Position 1. The trimmer should then be carefully adjusted. As the trimmer is turned it will be found that the character of the music changes. The trimmer should be set to a point that sounds the most natural. If the adjustment is made carefully there will be a regular sharpening of the receiver as the SELECTIVITY switch is turned from "OFF" to Position 5.

RADIO MFG. ENG. INC.



Relay to Control transmitter typical circuit diagram for connecting of relay control. Connect to terminal pair marked "R" on receiver. Relay closes when Stand-by Switch is turned to "Trans".

Typical circuit for remote break-in control of receiver. Terminal pair marked "B" on receiver connect to "B - B". Circuit between "B" pair is closed when relay or remote switch is closed during transmitter stand-by periods. Break-in terminals must be shorted if above circuit is not used.

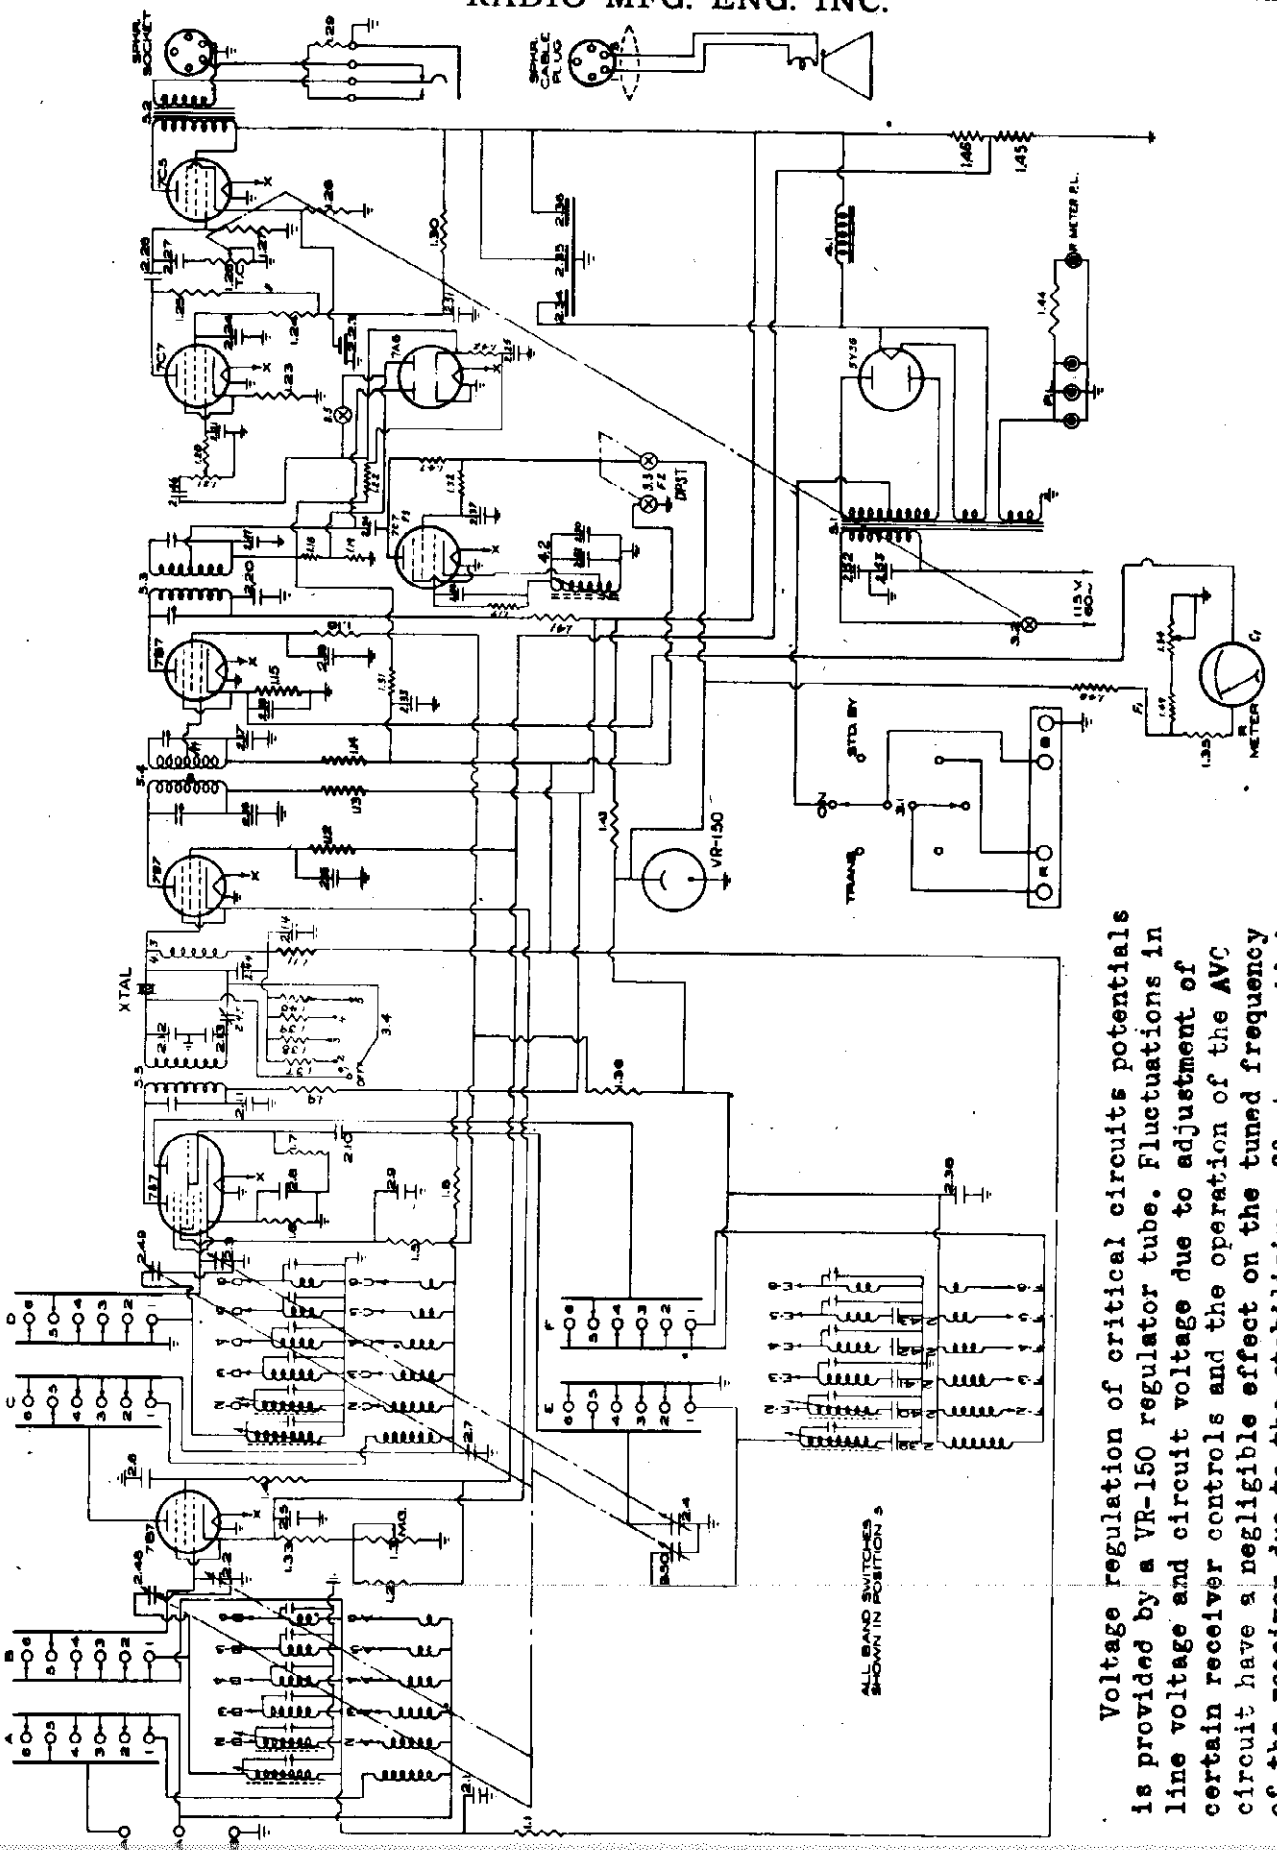
FIGURE 1

NOTE: In model 45-B a 7C7 is used as a Beat Freq. Osc. and a 5Y3G is used as the rectifier tube.

RADIO MFG. ENG. INC.



Voltage regulation of critical circuits potentials is provided by a VR-150 regulator tube. Fluctuations in line voltage and circuit voltage due to adjustment of certain receiver controls and the operation of the AVC circuit have a negligible effect on the tuned frequency of the receiver due to the stabilizing effects provided by this regulator.

For Clarified schematics see Pp.15-7 to 15-9 for Alignment

OPERATION

Each control on the RME-45 receiver has a definite function and the operator should familiarize himself with their purpose and operation in order to obtain the best results.

The Cal-O-Matic two speed tuning system is one of the important features of the RME-45.

The tuning mechanism uses a preloaded gear train which is entirely free from backlash. The smaller tuning knob rotates approximately five times while the larger one is turning once. This two speed tuning control enables the operator to cover a frequency band at the correct rate with the larger knob and to tune in a weak signal or one partially covered by other signals with the smaller one.

Elimination of the bandspread condenser lowers the losses in the RF circuit and therefor gives great gain and greater stability.

Five Amateur bands are directly calibrated on the bandspread dial, but the Cal-O-Matic tuning system also includes an easy and accurate method of logging any frequency between 550 kc and 33,000 kc.

The inner half circle on the megacycle scale is divided into five sections, 0 through 4, and the inner circumference of the bandspread dial is marked off in 100 equal divisions. While the red pointer is covering one of the megacycle scale sections the bandspread dial makes one complete revolution. After a station has been heard it can be logged accurately by using the two sets of figures.

For example, if a station is heard on band 5 with the pointer in section 3 of the megacycle scale and with the bandspread dial at 28, that station is definitely logged at 328 because it will always be found at 328 on band 5. Or, if a station is logged at 173 on band 3, it is always tuned in on band 3 by turning the knob until the red pointer is in section 1 of the megacycle scale and until 73 comes up on the bandspread dial.

This method of logging enables the operator to return to a station very quickly and since there is no other dial to pre-set the station is always found at the same place.

In order to receive a frequency in one of the Amateur bands it is necessary only to set the band-change switch on the proper band and to tune the receiver until the red pointer is opposite the approximate frequency on the megacycle scale. The Amateur frequency may then be read directly from the calibrated bandspread dial.

The BAND SELECTOR SWITCH selects the frequency range desired. The range of the receiver is divided into 6 bands. The range covered by each band is as follows

Band I	.540	to	1.6 MC	American Broadcast
Band II	1.6	to	2.9 MC	
Band III	2.9	to	5.4 MC	
Band IV	5.4	to	9.8 MC	
Band V	9.8	to	18.0 MC	
Band VI	18.0	to	33.0 MC	

Actually these figures do not represent the full range of each band since there is considerable overlap between the end of one band and the start of the next.

The LINE TONE control turns the receiver on and off. As the control is turned clockwise the line switch will close. Continued turning of the knob controls the audio response.

The STAND-BY SWITCH on the extreme right end of the control panel is used to make the receiver inoperative without turning off the line switch. When the control is in the center at "on" the receiver will operate, when it is turned to the right to "Standby" it will be dead. The third position labeled "Trans" also makes the receiver inoperative and, in addition, closes the relay circuit as mentioned previously.

The AUDIO GAIN Control to the left of the stand-by switch is used to adjust the audio volume to the desired level.

Below the control panel is a toggle switch labeled B.O. SWITCH turning on the beat oscillator. The beat oscillator is indispensible in the reception of CW signals and is an aid in locating weak phone carriers.

The pitch of the beat frequency may be varied by means of the control labeled B.O. Pitch.

The beat oscillator may be used either with or without the automatic volume control (AVC). It is usually more satisfactory to receive CW signals with the AVC less effective. This may be accomplished by turning the control labeled R.F. GAIN slightly counter clockwise. Continued counter clockwise rotation of this control reduces the gain of the receiver manually. Automatic control of the receiver gain is fully effective only when the R.F. GAIN control knob is rotated to and set at its maximum clockwise position (position approximately marked AVC). The position of this control is also intimately related to the proper operation of the CARRIER LEVEL or "R" meter. (See paragraph on CARRIER LEVEL meter).

Below the control panel on the left is a jack marked "PHONES". Any pair of good headphones may be plugged into this jack for headphone reception. When the phones are plugged in the speaker is automatically cut out.

The CARRIER LEVEL meter is supplied with the Model 45. This meter indicates the average value of the carrier being received. The meter is calibrated in db as well as in conventional numbers. As in previous RME models a signal difference of 1-R is equivalent to 6 db., and R-9 is equivalent to 100 microvolts input to the receiver. A signal should always be tuned so as to give a maximum reading on the meter. The meter should be adjusted to zero with the antenna disconnected by means of the screw on the rear of the chassis (See Fig. 2). It should be noted here that the accurate functioning of the CARRIER LEVEL meter depends on the setting of the R.F. GAIN control. The R.F. GAIN control should always be rotated to the maximum clockwise position and left there when it is desired to use the CARRIER LEVEL meter (this position is marked approximately by the designation AVC).

The CRYSTAL FILTER has two controls. The top control marked "XTAL SELECTIVITY" makes it possible to select the desired amount of selectivity for best results. Turning the control to "OFF" removes the crystal from the circuit. Rotating the control to the right changes the selectivity from a broad crystal characteristic at "1" suitable for phone reception to a razor-sharp characteristic at "5" for CW reception.

The CRYSTAL PHASING control should be adjusted to give minimum background noise. This setting will depend somewhat on particular conditions. This control may also be used to wipe out an interfering signal. Expert manipulation of the crystal filter usually comes only after a certain amount of practice.

An AUTOMATIC NOISE LIMITER is incorporated in the receiver circuit. No adjustment is required. The circuit is of a type that automatically adjusts itself to maximum effectiveness.

The action of the noise limiter is such that a slight amount of distortion is introduced on the signal. Therefore when it is desired to do so the noise limiter may be switched out of the circuit. This is accomplished by pulling "OUT" on the audio gain control. The shaft of this control floats and can be moved in and out with respect to the panel. When the knob is IN toward the panel the noise limiter is IN the circuit; when it is OUT from the panel the noise limiter is OUT of the circuit.

TEST VOLTAGES OBTAINED AT VARIOUS POINTS IN RECEIVER CIRCUIT

Measurements made with a voltmeter having internal resistance of 1000 ohms per volt. Instruments with lower internal resistance may give entirely different readings.
NOTE: Line voltage should be 115 volts. Stand-by switch on.

PLACE TEST PROBE BETWEEN	CORRECT VOLTAGE
Radio frequency amplifier plate and ground	290 volts
Radio frequency amplifier screen and ground	107.5 volts
Radio frequency amplifier cathode and ground	3 Volts
Converter plate (pentode section) and ground	310 volts
Converter screen (pentode section) and ground	107.5 volts
Oscillator supply and ground	150 volts
First I.F. amplifier plate and ground	290 volts
First I.F. amplifier screen and ground	107.5 volts
First I.F. amplifier cathode and ground	3 volts
(The same voltages apply to the 2nd I.F. stage)	
7C7 plate and ground	43 volts
7C7 screen and ground	112.5 volts
7C7 cathode and ground	3.1 volts
7C5 plate and ground	290 volts
7C5 screen and ground	305 volts
7C5 cathode and ground	13.5 volts
VR-150 plate to ground	150 volts
5Y3G rectifier filament and ground (B.O. turned On)	125 volts

These voltages are subject to a fluctuation of ±15% without indication of material difficulties

CONTINUITY CHECKS

Receiver turned off. No jumper between "A" and "G" on antenna terminal strip.

RADIO & TELEV. PAGE

MODEL BJ-68

RADIO & TELEVISION INC.

BRUNSWICK MODEL BJ6836

DWG NO. BRU-51-546

POWER SUPPLY: 110 to 115 volts, 60 cycle A.C. only.
POWER OUTPUT: 14 watts.
POWER CONSUMPTION: 105-140 watts.

Amplifier output: 10 watts undistorted, 14 watts peak.

Amplifier gain: 72 db from phono input jack.

Frequency range: 530 KC to 1750 KC (566 to 171.4 meters).

Amplifier frequency range: 30 to 11,000 cycles.

Bass and treble controls are provided in the inverse feedback network.

A Webster Type 56-8 automatic record changer using a crystal pickup is built into the cabinet.

Alignment: The intermediate frequency used in this receiver is 455 kilocycles Connect Vacuum Tube Voltmeter capable of reading 20 volts negative DC to the AVC bus. This connection may be made at the black lead coming from the input IF transformer (#14075). The ground side of the meter will connect to the chassis. Connect output of Signal Generator to grid of converter tube (Pin #8). Adjust Signal Generator to 455 kilocycles. Increase output of generator until some deflection is noted on the Vacuum Tube Voltmeter. Carefully adjust IF transformer tuning slugs (screws in sides of cans) starting at output transformer for maximum reading on voltmeter. Repeat this process for best alignment. Remove Signal Generator allowing Vacuum Tube Voltmeter to remain connected. Connect output of Signal Generator to receiver loop in the following manner: Connect ground side of Signal Generator to receiver chassis. Connect live side of generator output to the loop lead which is knotted through a condenser of 100 to 500mmf.

Set receiver dial and Signal Generator to 600 kilocycles. Adjust oscillator padder for maximum reading on the Vacuum Tube Voltmeter. The oscillator padder is situated on the side of the RF tuner chassis beneath the amplifier chassis and is reached with a screwdriver having a shank at least 9" long. Care should be used in making this adjustment not to short circuit amplifier wiring beneath the chassis.

Turn the receiver dial to 1500 kilocycles and reset the Signal Generator to the same frequency. Adjust the oscillator trimmer (mounted on the rear section of the variable condenser) for maximum AVC voltage as read on the Vacuum Tube Voltmeter.

Proceed without readjusting receiver tuning or Signal Generator frequency to trim the RF coil and antenna coil by adjusting trimmers mounted on front two sections of the variable condenser. Adjust these trimmers for maximum AVC voltage.

Instructions for Removing Radio Chassis, Record Changer and Speaker

To remove radio set from cabinet proceed as follows:

1. Unscrew and remove back of radio compartment.
2. Pull out speaker plug from back of chassis.
3. Pull out Phono pickup lead at rear of chassis.
4. Remove the four screws from underneath bottom of radio compartment.
5. Disconnect Phono motor plug located underneath chassis compartment.
6. Disconnect aerial from loop.
7. Remove all knobs in front of chassis.

To remove record changer (only after chassis has been removed), unscrew the three bolts holding changer on motor board, lift out and pull gently the motor and pick up lead lines through rear cut out in Phono compartment.

Caution: When making these adjustments, the voltage output of the Signal Generator should be reduced to the point where the AVC voltage generated does not exceed 5 or 6 volts. Using larger AVC voltages may result in inaccurate alignment due to saturation and consequent broad tuning.

Service Notes: If replacement of components becomes necessary, lead dress may be disturbed and oscillation may result. The following lead dress should be observed:

1. Green wire on second IF transformer. Dress any slack toward chassis side away from oscillator coil and as close to chassis as possible.
2. 50 mmf. in oscillator grid circuit. Dress away from shield partition as far as possible.

In case of failure of input electrolytic condensers in filter, equalizing resistors (1 meg.) should be checked for value and replaced if more than 20% from coded value. Faulty resistors will result in improper voltage distribution across the condensers.

Powdered iron core in antenna coil is preset at laboratory for proper inductance and should not be readjusted. This core may not be present in all production runs.

The following is a table of operating voltages taken with 1000 and 20,000 ohms per volt meters. The receiver should be tuned between stations so no signal is being received during measurement.

Tube	Pin #	1000 ohm volt	20,000 ohm volt
6SK7	6(S)	70.0	80
	8(P)	220	225
	5(K)	2.0	2.25
6SA7	4(S)	70	75
	3(P)	205	215
6SF7	4(S)	70	75
	6(P)	200	200
6J5	3(P)	100	110
	8(K)	4.0	4.3
6SN7	2(P)	70	80
	3(K)	1.9	2.5
	5(P)	80	90
	6(K)	3.4	4.0
6V6	4(S)	210	215
	3(P)	190	200
	8(K)	14	14
6V6	4(S)	210	215
	3(P)	200	210
	8(K)	13.8	14.0
5Y3	2(P)	300	305
	8(P)	300	305
	4(P)	305 AC	
	6(P)	305 AC	
6U5	4(?)	200	205
	3(G)	0.25	0.6

To remove speaker (only after radio chassis and phonograph have been removed):

1. Remove phono motor board.
2. Unscrew rear panel of speaker compartment.
3. Remove four speaker nuts.

ALIGNMENT PROCEDURE

I.F. Alignment:- Connect a signal generator to the 6A7 input, and connect an output meter to the speaker output. Using a weak 480 Kc. signal tune the two I.F. condensers on the composite coil and the single I.F. condenser on the output I.F. coil for maximum response.

Antenna and Oscillator Alignment:- Connect the signal generator set at 1400 Kc. to the antenna lead using a dummy antenna of 150 mmfd. Tune the set by means of the dial to 1400 Kc. position. Adjust oscillator trimmer for this frequency. Then trim antenna stage for maximum response. Repeat the align-ment to insure accuracy and increased sensitivity.

ALIGNMENT PROCEDURE

. Correct alignment is of extreme importance in all-wave receivers. The receivers are properly aligned at the factory with precision equipment and realignment should not be attempted by the service technician until all other causes of faulty operation are corrected.

In order to properly realign the receiver the following equipment is necessary:

1. A signal generator which will provide an accurately calibrated signal at any frequency from 456 kilocycles to 18 megacycles. The generator should have adjustable signal output.

2. An output audio voltmeter of the low voltage type to be connected across the moving coil of the speaker. This should be capable of providing a readable deflection for relatively low output levels to avoid the effects of overload.

3. An insulated or non-metallic screw driver for the adjustment of trimmers.

I F ALIGNMENT 456 KC

1. Connect the output meter (low scale) across the loud speaker voice coil. Turn the wave band switch to broadcast position. Turn the volume control to its maximum position.

2. Connect the test oscillator ground to chassis and the "hot" lead from the test oscillator to the grid of the 6L7 converter tube through a series .1 Mfd. condenser. Set test oscillator to 456 KC.

3. Turn selectivity control (second from the left) to its high selectivity position. This is the left hand or counter-clockwise position.

4. Adjust I. F. alignment screws C17 and C18 of the output transformer to maximum output reducing output of test oscillator to keep meter reading on scale as alignment proceeds.

5. Adjust alignment screws, C15 and C16, of input transformer to maximum output as described above.

6. Readjust all four alignment screws to insure accurate alignment. Always use the lowest possible output from the test oscillator to preclude the possibility of automatic volume control action confusing proper adjustment.

R. F. ALIGNMENT BROADCAST BAND

1. With test oscillator connected to the antenna post through .00025 Mfd., set signal generator to 1600 KC.

2. Set travelite indicator to end of scale (beyond 550 KC calibration) with gang condenser fully meshed at maximum capacitance.

3. Set dial to 1600 KC. Adjust broadcast oscillator trimming condenser, C9, for maximum output meter reading.

4. Adjust detector input trimmer, C14, to a maximum.

5. Adjust antenna stage trimmer, C6, to a maximum.

6. Set test oscillator to 600 KC and tune in the signal, then adjust broadcast oscillator padder, C10, for maximum output. Rock the main tuning adjustment back and forth a degree or two in order to obtain proper maximum.

7. Repeat adjustments described under 3, 4, and 5 for greater accuracy.

POLICE OR SECOND BAND

1. Turn the wave switch to second or police band. Leave oscillator connected as above but with the output set to 5000 KC and the .00025 Mfd. condenser replaced by a 400 ohm resistor. Set dial scale to 5 MC on the second band. Adjust oscillator trimming condenser C8 for maximum output, observing as before that the proper point occurs at the minimum or counter-clockwise position of the screw as two points are found.

2. Adjust detector input trimming condenser. C13, to maximum, while rocking the tuning condenser slightly for maximum response.

3. Adjust antenna stage trimmer, C5, for maximum output.

4. Set test oscillator to 2000 KC and tune in the signal. Adjust oscillator padding condenser, C11, for maximum output, while rocking the tuning condenser as described above.

5. Repeat operations 1, 2 and 3 to assure precise alignment.

FOREIGN OR THIRD BAND

1. With the test oscillator connected the same as above and set to 16000 KC (16MC) set the dial to 16MC on the third band.

2. Adjust oscillator trimming condenser, C7, for maximum response. Use lower capacity or counter-clockwise response point.

3. Adjust detector input trimmer, C12, to maximum, rocking tuning adjustment.

4. Adjust antenna trimmer, C4, for maximum response.

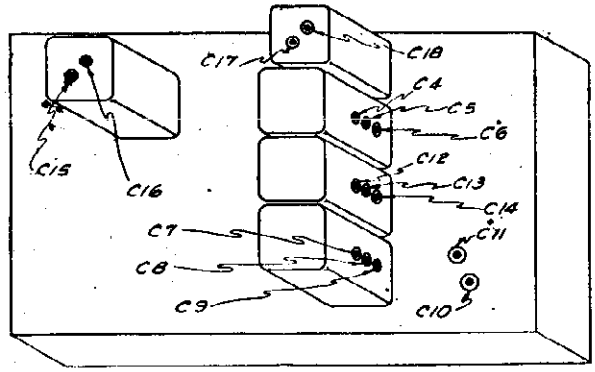

Fig. 2 Location of Trimmers

RADIO WIRE TELEVISION

Model MB5 is designed to operate on 105 to 125 volts, 50-60 cycles a. c. supply only.
Model MB5-A is designed to operate on 115, 220 or 250 volts, 40-60 cycles a. c. supply.

Prices subject to change without notice.

I. F. Alignment. Connect a signal generator set at 480kc to the 6A7 input and connect an output meter to the speaker output. Using a weak signal tune the two I. F. condensers on the composite coil and the single I. F. condenser on the output I. F. coil for maximum response.

Connect the signal generator set at 1400kc to the antenna lead using a dummy antenna of 150 mmf. Tune the set by means of the dial to 1400kc position. Adjust oscillator trimmer for this frequency. Then trim antenna stage for maximum response. Repeating the alignment may result in improved sensitivity.

RADIO WIRE TELEVISION

ALIGNMENT PROCEDURE

Be sure to follow procedure carefully and in the order given—otherwise the receiver will be insensitive and the dial calibration incorrect. For alignment procedure read tabulations from left to right. If more than one adjustment is required on any one band, make the adjustment marked (1) first, (2) next, (3) third.

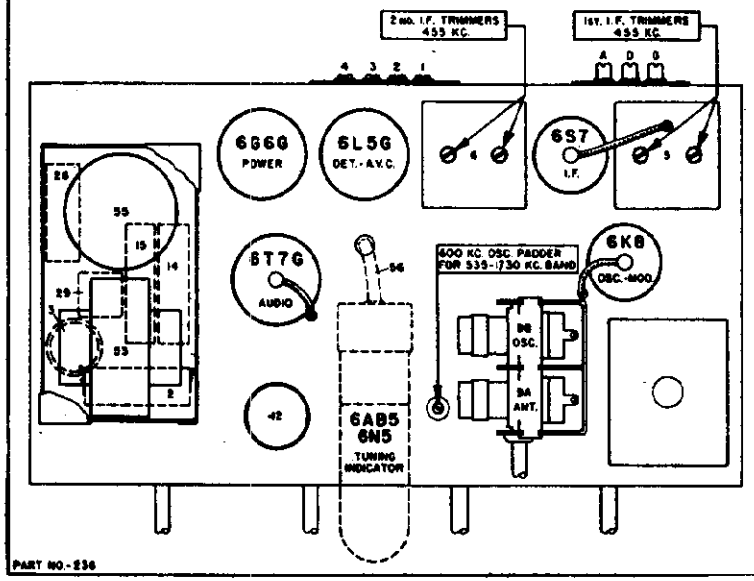
Before starting alignment:

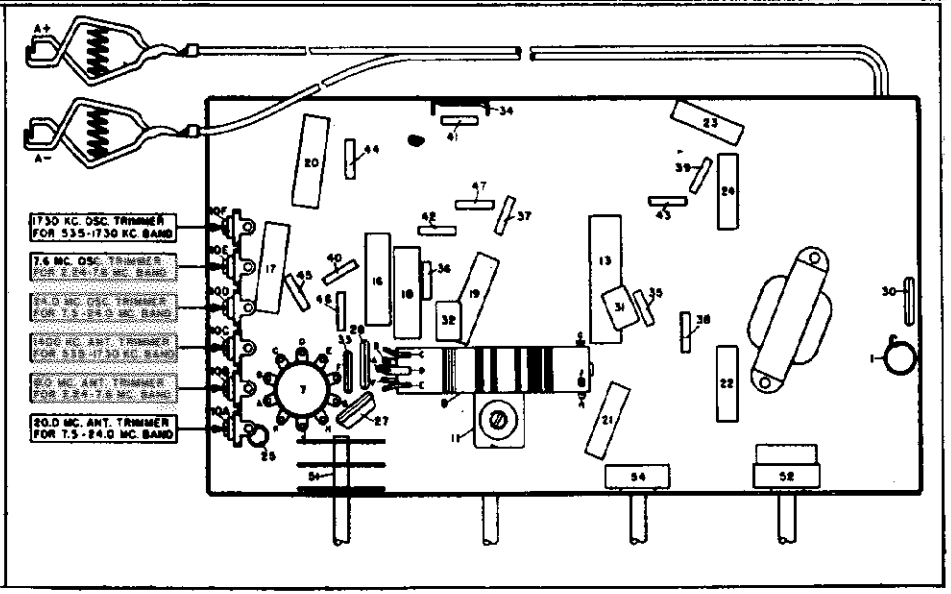
(a) Check tuning dial adjustment by turning gang condenser until plates touch maximum capacity stop (completely in mesh) at which point the dial needle must be exactly even with the last line at the low frequency end of the dial calibration. If dial needle does not point exactly to last line move needle to correct position.

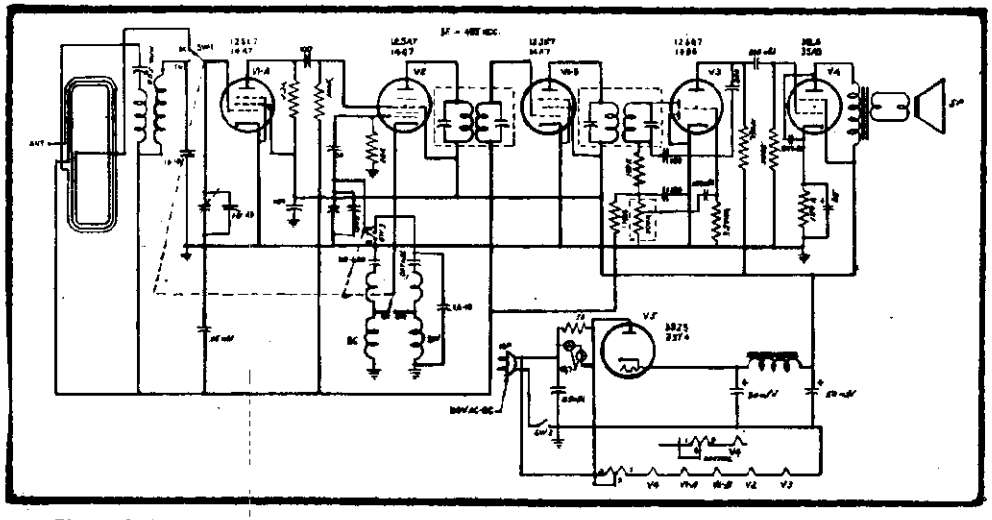
(b) Use an accurately calibrated test oscillator with some type of output measuring device.

(c) Have ground lead of test oscillator attached to chassis.

Place band switch for operation on:	Set receiver dial to:	TEST OSCILLATOR: Adjust test oscillator frequency to:	TEST OSCILLATOR: Use dummy antenna in series with output of test oscillator: consisting of:	TEST OSCILLATOR: Attach output of test oscillator to:	Refer to parts layout diagram for location of trimmers mentioned below:
I. F. alignment use any band position.	Any point where no interfering signal is received.	Exactly 455 K.C.	.02 Mfd. condenser	High side to grid cap of 6K8 tube. Do not remove cap.	Adjust each of the second I.F. transformer trimmers for maximum output—then adjust each of the first I.F. transformer trimmers for maximum output.
1730 to 540 K.C. Band	1 Exactly 1730 K.C.	Exactly 1730 K.C.	.00025 Mfd. condenser	Receiver antenna "A" post	Adjust 1730 K.C. oscillator trimmer for maximum output.
	2 Approx. 1400 K.C.	Approx. 1400 K.C.	.00025 Mfd. condenser	Receiver antenna "A" post	While rocking gang condenser adjust 1400 K.C. antenna trimmer for maximum output.
	3 Approx. 600 K.C.	Approx. 600 K.C.	.00025 Mfd. condenser	Receiver antenna "A" post	While rocking gang condenser adjust 600 K.C. oscillator padder for maximum output.
2.24 to 7.6 M.C. Band	1 Exactly 7.6 M.C.	Exactly 7.6 M.C.	400 Ohm carbon resistor	Receiver antenna "A" post	Adjust 7.6 M.C. oscillator trimmer for maximum output.
	2 Approx. 6. M.C.	Exactly 6. M.C.	400 Ohm carbon resistor	Receiver antenna "A" post	While rocking gang condenser adjust 6 M.C. antenna trimmer for maximum output.
7.5 to 24 M.C. Band	1 Exactly 24 M.C.	Exactly 24 M.C.	400 Ohm carbon resistor	Receiver antenna "A" post	Adjust 24 M.C. oscillator trimmer for maximum output—be sure to use proper peak. If more than one peak is noticed, back off trimmer to minimum capacity, then screw down trimmer (add capacity) until the second peak—which is the proper one to use is tuned in.
	2 Approx. 20 M.C.	Approx. 20 M.C.	400 Ohm carbon resistor	Receiver antenna "A" post	While rocking gang condenser adjust 20 M.C. antenna trimmer for maximum output.







This 6-tube superheterodyne is designed to operate on 115 volts, 40 to 60 cycles, alternating current (AC) or 115 volts direct current (DC).

The tuning ranges, 533 to 1660 kilocycles (KC) and 5.3 to 18.3 megacycles (MC), cover all major Domestic and Foreign Short Wave Broadcast, Police, Aircraft and Amateur Bands.

For portable use, or where it is desirable to move the receiver from place to place frequently, the Built-in Loop Antenna furnishes excellent noise-free reception. This applies to the Broadcast Band Only. Where a permanent installation is made and it is desired to take full advantage of the performance capabilities built into this receiver, with particular reference to Short Wave reception, the use of a separate, outside Antenna is recommended. An antenna connection for this purpose is at the rear of the receiver.

The two control knobs are: Left, Volume Control and ON-Off Switch — Right, Vernier Tuning for both bands. The short wave band switch is located on the back of the receiver.

DIRECTIONS: Turn the receiver on and wait for tubes to reach operating heat. Adjust wave-band switch at the rear of the receiver to desired band. The upper half of the dial scale covers the Broadcast-Band — the Short Wave Band is on the lower half. Turn the vernier tuning knob until the desired station (see dial pointer) is heard. Adjust volume to a satisfactory level, first making sure that the station is tuned in correctly. Tuning on the Short Wave is critical; use greater care or many worthwhile programs might be passed over unnoticed.

If the receiver fails to operate on DC current, reverse the power cord plug. On AC a hum may be heard in the background of the program. This may, in some cases, be eliminated or reduced by reversing the power cord plug.

One 6-8 volt 150 MA lamp is used to illuminate the dial. A similar lamp should be used for replacement or damage may result.

ALIGNMENT PROCEDURE

Volume Control-Maximum All Adjustments.

Allow Chassis and Signal Generator to "Heat Up" for several minutes.

The equipment in column at right is required for Aligning:

Signal Generator which will provide an accurately calibrated signal at test frequencies as listed.

Output Indicating Meter; Non-Metallic Screwdriver.

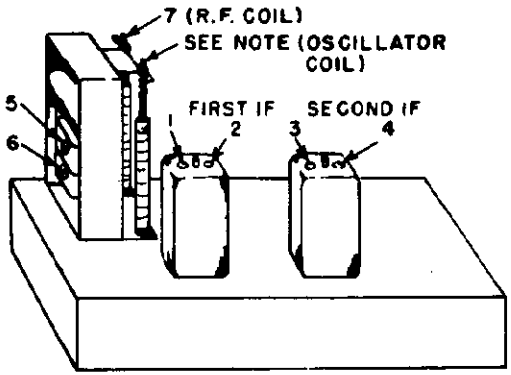
Dummy Antennas-.01 mf., and 400 ohms.

SIGNAL GENERATOR FREQUENCY SETTING	ANTENNA CONNECTION	COUPLING	DUMMY ANTENNA	TUNER SETTING	TRIMMER ADJUSTMENT (SEE DIAGRAM)	NOTES
I.F. 455 KC	Grid of RF tube 12SK7	Ground generator to chassis	0.01 mfd	Out	Adjust for Max. 1, 2, 3 and 4	No signal will be heard unless trimmer condenser under chassis is unscrewed and reduced from original setting
I.F. 455 KC	Grid of RF tube 12SK7	Ground generator to chassis	0.01 mfd	Out	Trim condenser under chassis for Min. output.	If it is found that regeneration prevails when the loop antenna is put in its normal position close to the tubes, then the under chassis trimmer is incorrectly set, and should be adjusted to prevent the regenerative condition.
1620 KC	Inductive Coupling to Loop	Loop coupling with leads brought out	400 ohms in series with Antenna & Gnd.leads	Out	Adjust Osc. #5 per Max. signal	
1400 KC	Inductive Coupling to Loop	Loop coupling with leads brought out	400 ohms in series with Antenna & Gnd.leads	Dial set for 1400KC	Adjust RF trimmer #6 per Max. Signal.	
700 KC	Inductive Coupling to Loop	Loop Coupling with leads brought out	400 ohms in series with Antenna & Gnd.leads	Dial set for 700KC	Adjust RF tuning core #7 for Max. (care should be taken not to disturb carriage position of tuner)	If more than one turn is required, the trimming 1400 KC should be repeated and the 700 KC padding of the tuning core also repeated until correct alignment has been reached

SPECIFICATIONS

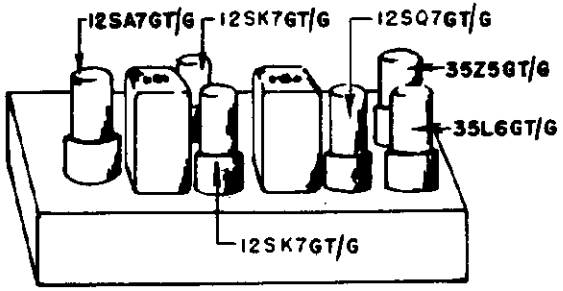
Power consumption..... 35 Watts
(At 117 volts AC Supply)
Power Output- 1.1 Watts 10% Distortion

Selectivity----49 KC Broad at 1000 times Signal
Intermediate Frequency..... 455 KC
Speaker..... 5" PM Dynamic
Tuning Frequency Range..540 to 1620 KC
Sensitivity (For .05 Watt output-external Antenna) 20 microvolts average



CAUTION - If a dial lamp burns out, it should be replaced at once.

Use ONLY a No. 47 dial lamp. Replace through bottom of cabinet.



ALIGNMENT NOTES

A. MECHANICAL ALIGNMENT:- The following mechanical adjustments should be made before alignment:

1. Rotate shaft of tuning unit until carriage is against top stop position.
2. Space oscillator coil slug 1-5/32" out from top of oscillator coil form.
3. Space R.F. coil slug 1-29/64" out from top end of R.F.coil winding. (Note:-The distance 1 and 2 should be measured from mounted end of the slug)
4. Adjust screw on trimmer of wave trap towards open position so that condenser plates are open at least 1/32".

B. I.F. ALIGNMENT PROCEDURE

1. Feed I.F. frequency from the signal generator through a 0.01 mfd condenser to the control grid of the R. F. tube.
2. No signal will be heard unless trimmer condenser under chassis is unscrewed and reduced from original setting.
3. Turn volume control full on.
4. Make preliminary I.F.adjustment with signal level approximately 50 Mv.
5. Tune I.F. trimmers for maximum signal, reducing I.F. signal input to coupling loop to keep output voltage less than 0.5 V.
6. When maximum output has been secured, adjust trimmer condenser in the I.F. trap (under chassis) by turning clockwise to the minimum signal.

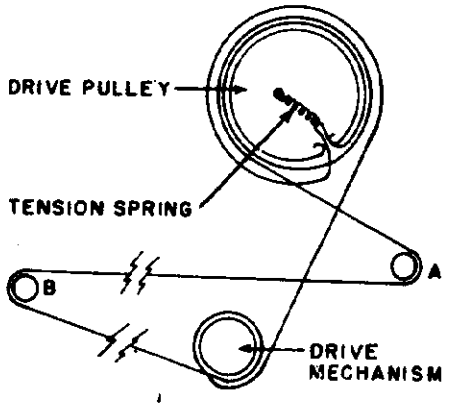
C. R.F. ALIGNMENT PROCEDURE

1. Volume control full on.
2. Adjust tuning unit to top stop position.
3. Feed 1620 kc signal into external loop. Hold audio output below 0.5 V. Adjust the oscillator trimmer condenser to maximum output.
4. Move slugs in by means of tuning dial so that pointer is approximately 1" from the stop end, and a signal received from the external loop on a frequency of 1400 kc. Adjust lower trimmer (R.F. trimmer) to maximum output. Reduce R.F.input to keep signal output voltage below 0.5 V.
5. Rotate tuning shaft until pointer is approximately 1" from the other end of the scale. Feed to the external loop a test signal at 700 kc. Adjust the R. F. coil slug by rotation to maximum output.

NOTE: If more than one complete turn of the slug is required to obtain maximum signal, return tuner to 1400 kc. position and repeat steps 4 and 5.

If less than one turn is required to obtain the maximum 700 kc. audio output, the R.F. alignment may be considered complete.

CAUTION: Extreme care should be taken in the 700 kc. position to make sure that the tuner carriage is not moved by the adjusting tools or hand pressure on the slug screw. Carriage should not be held against the frame, but should be allowed to assume its normal position when adjusting the R.F. coil slug.



DRIVE CORD REPLACEMENT

Turn the tuner to the fully open position. Use a new cord 50" long and tie one end to the tension spring. Fasten the other end of the tension spring to the drive pulley. Pass cord through slot in pulley ring; add spring tension and continue one and one-half turns counterclockwise over top of pulley Then pass cord around idler pulley A, starting over top and going around clockwise. Pass cord over idler pulley B, starting over top and going around counter clockwise. Wind one full turn counterclockwise around drive mechanism. Then wind one full turn counterclockwise around drive pulley, pass through slot in pulley and tie string to tension spring. Cut off excess string.

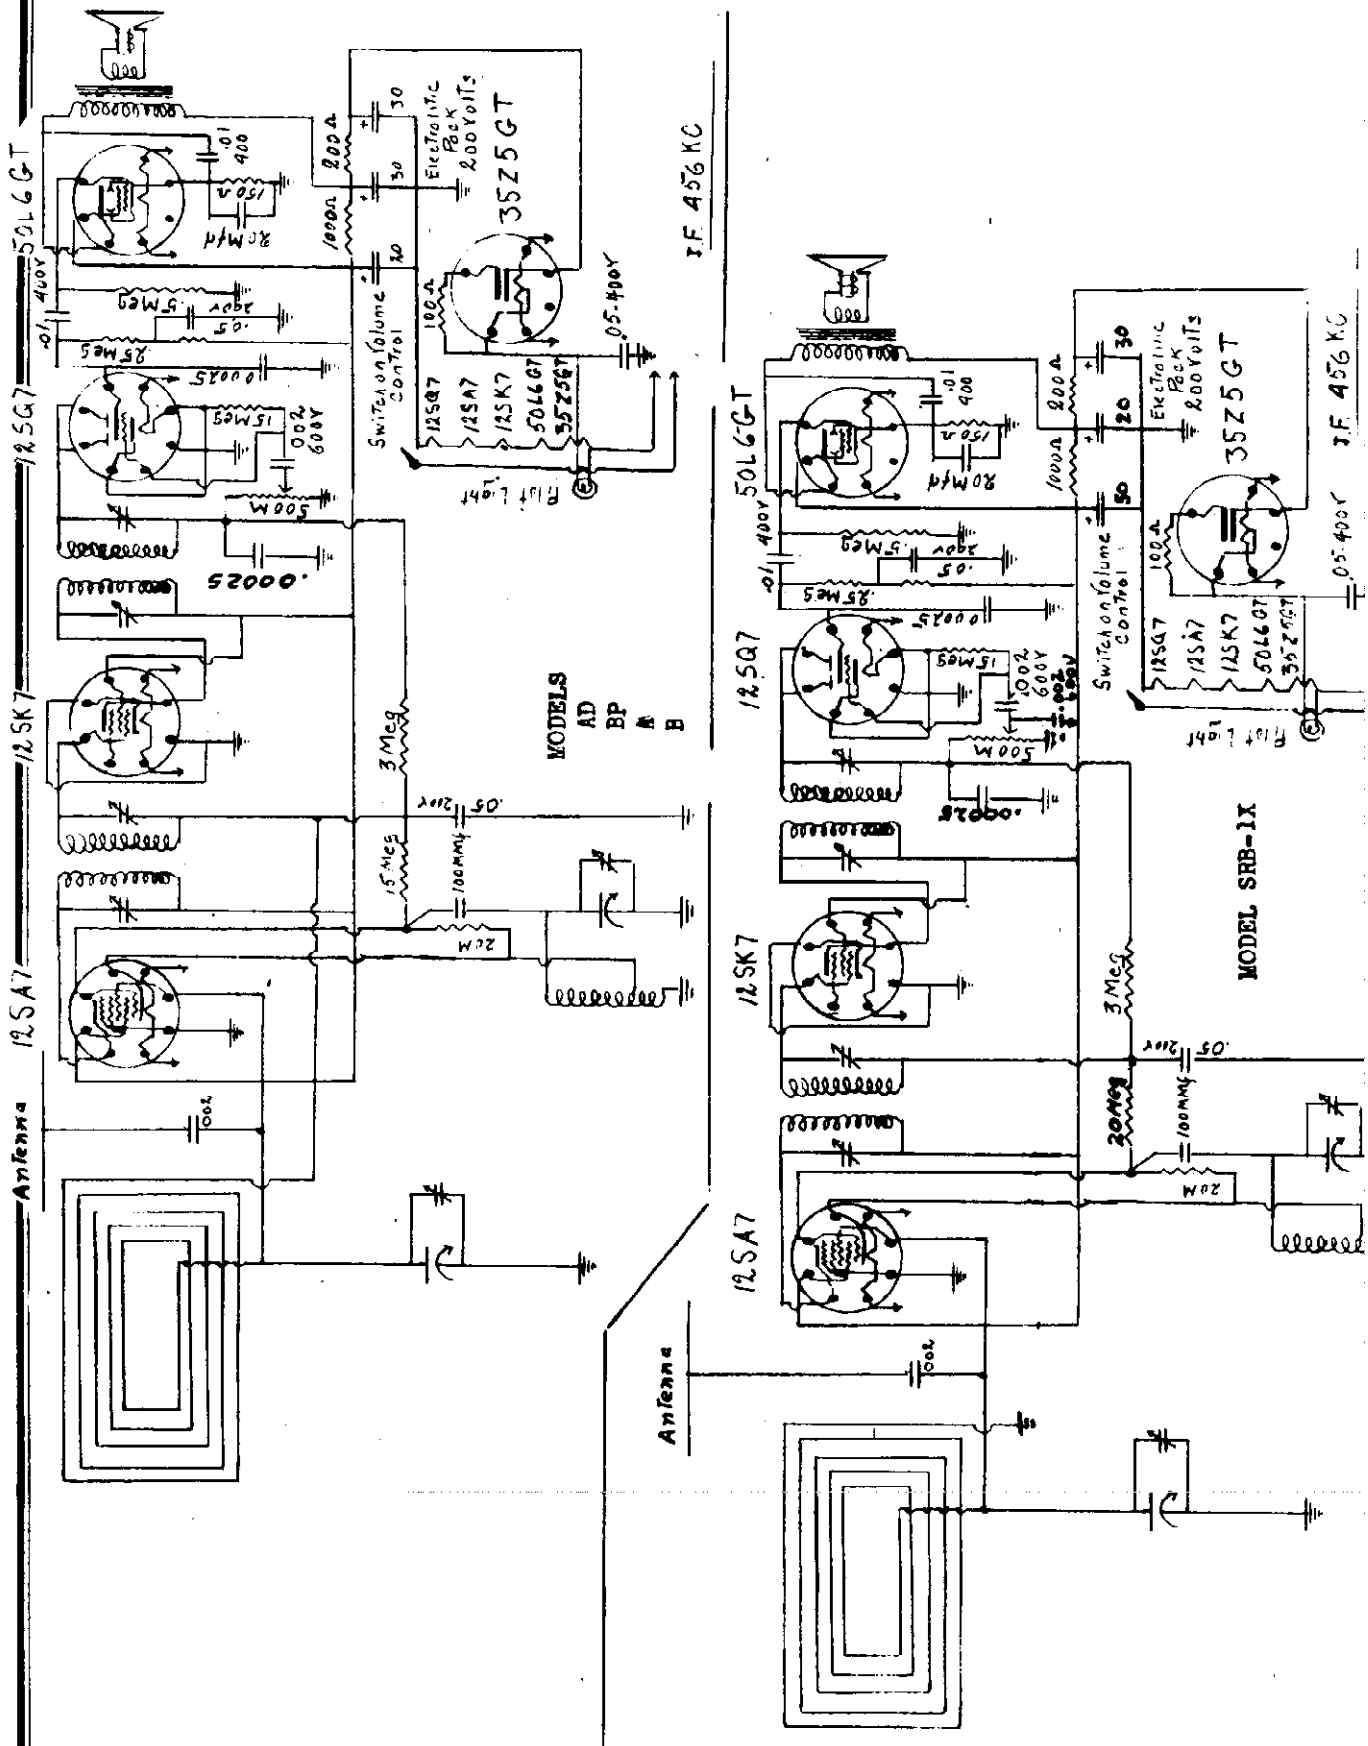
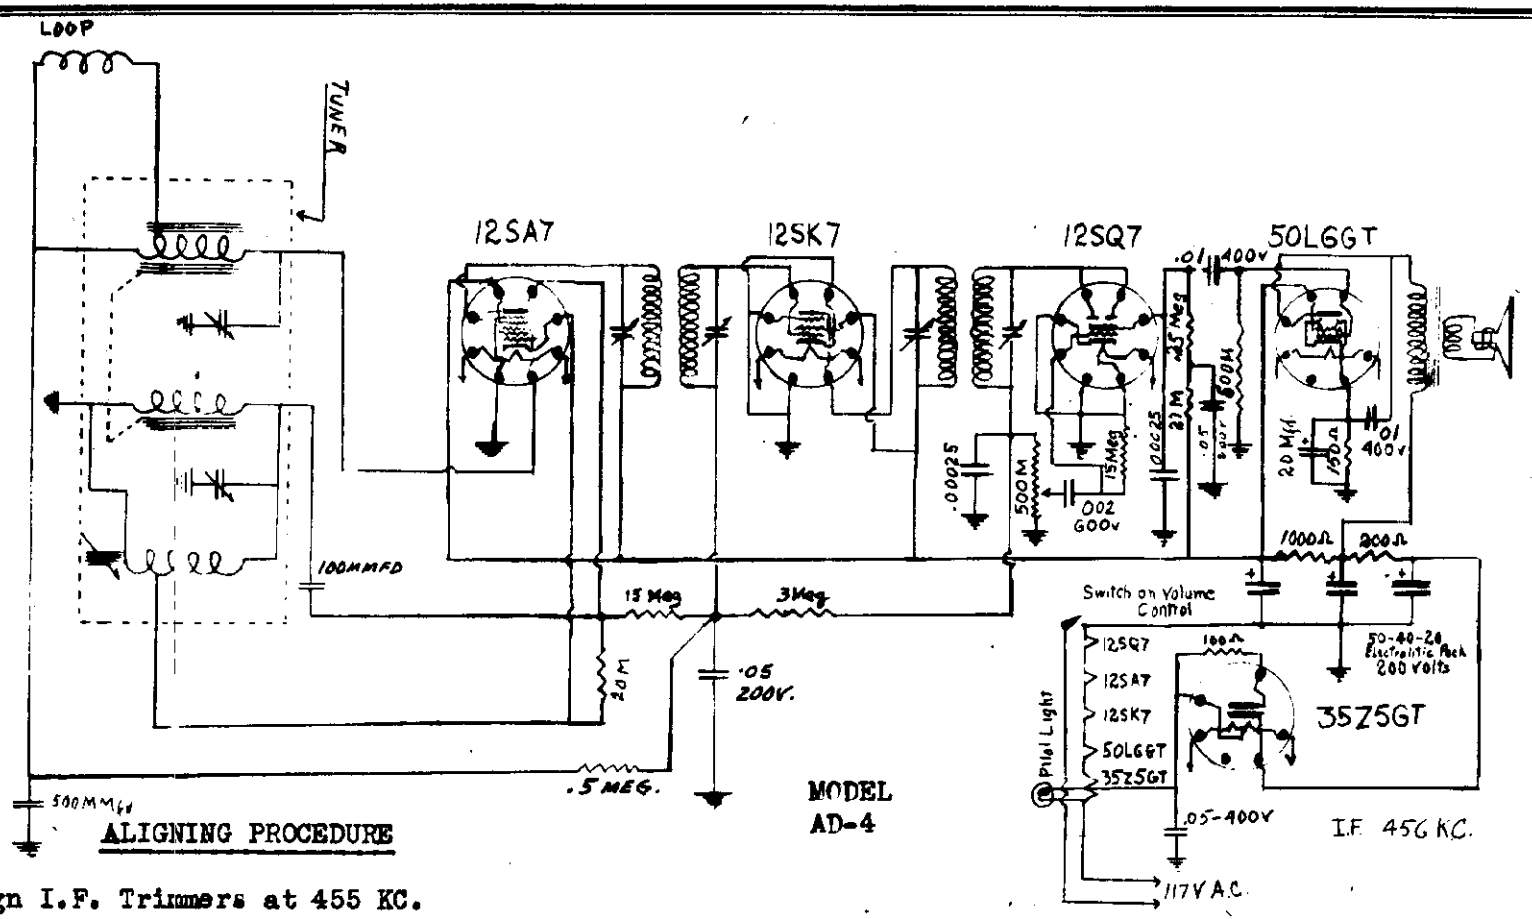
MODEL SRB-1X





ALIGNING PROCEDURE

Align I.F. Trimmers at 455 KC.

1. Turn dial to extreme high frequency end.
2. Set signal generator to 1650 kc.
3. Adjust osc. trim. to secure signal.
4. Adjust R.F. trim. to secure maximum sig.
5. Set signal generator to 1400 kc.
6. Turn dial to secure signal.
7. Check R.F. saddle to see output at maximum.
8. Adjust saddle to secure max. output, if necessary.
9. Recheck alignment at 1650, re-adjust R.F. trim.if necessary.
10. Set signal generator to 600 kc.
11. Adjust dial to secure signal.
12. Rock dial while adj. shunt pad for max signal.
13. Realign osc. and R.F. trimmers at 1650.
14. Recheck 1400 kc to 600 kc points for alignment.
15. Repeat procedure from step 5 on if 1400 and 600 are out much.
16. Set signal generator to 1000 kc.
17. Tune in signal.
18. Install pointer "Set to 100" on dial.

SERVICE DATA

UNDERSCORED FIGURES ON THE DIAGRAM ARE AVERAGE VOLTAGES FROM THAT PARTICULAR POINT OF THE CIRCUIT TO THE CHASSIS. THESE VOLTAGES ARE FOR A 117 VOLT LINE, AND WITH THE SET TUNED TO NO STATION.

REMLER
CO. LTD.

MODEL MP5-5-3
RADIO RECEIVER
110-120 VOLTS 50-60 CYCLES
50 WATTS

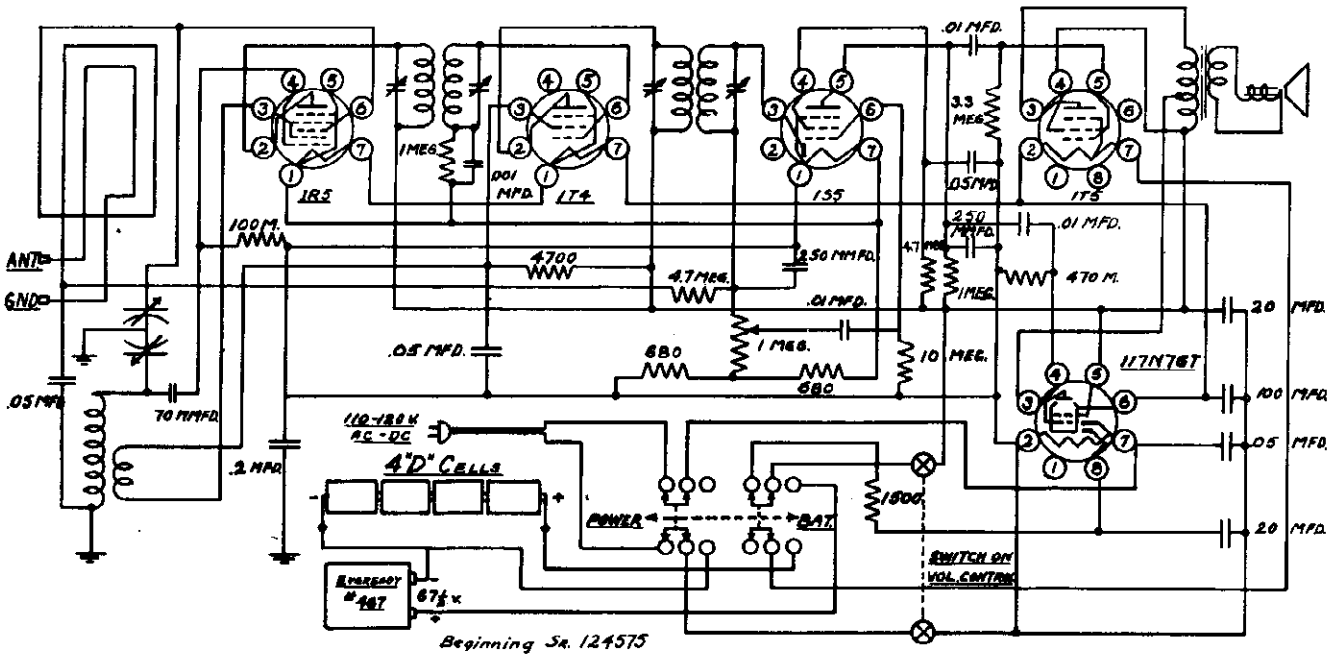
IF PEAK 450 KC

THE INTERMEDIATE FREQUENCY IS 450 KC. OTHER ALIGNMENT FREQUENCIES ARE INDICATED ON THE DIAGRAM. THE FREQUENCY RANGE OF THE RADIO IS 540-1730 KILOCYCLES.

A FUSED PLUG IS ATTACHED TO THE POWER CORD OF SOME SETS. FUSES MAY BE REMOVED BY INSERTING A SMALL DIAMETER INSTRUMENT (PENCIL, STIFF WIRE, ETC.) IN THE PRONG END OF THE PLUG. IN NO CASE SHOULD A FUSE OF GREATER CAPACITY THAN 3 AMPERE BE USED. LOWER CAPACITY FUSES SUCH AS 1 AMPERE MAY BE USED. LOWER CAPACITY FUSES SUCH AS 1 AMPERE MAY BE USED, BUT LOWER CAPACITY TYPES MAY BURN OUT MORE FREQUENTLY ON CURRENT SURGES NORMALLY ENCOUNTERED WHEN THE SET IS TURNED ON

MODEL 440

REMLER CO. LTD.



The chassis may be removed from the cabinet by removing the knobs and taking out the three binding head screws in the bottom of the cabinet. The oscillator trimmer is located on the front section of the variable condenser, while the converter, or loop, trimmer is on the rear section. I. F. trimmers are accessible in the tops of the I. F. transformers. The I. F. frequency is 455 KC. Standard alignment procedure is applicable.

TUBES

A combination of battery-type and power tubes is used. The battery type output tube is not in use when the set is operated from a power source.

The receiver is equipped with:

1S5-diode detector and A. F. amplifier
1T5Gt-output tube for battery operation
117N7GT-output and rectifier for power operation
1R5-converter
1T4-I. F. amplifier

The following voltage readings are taken with a 1000 ohm per volt meter.

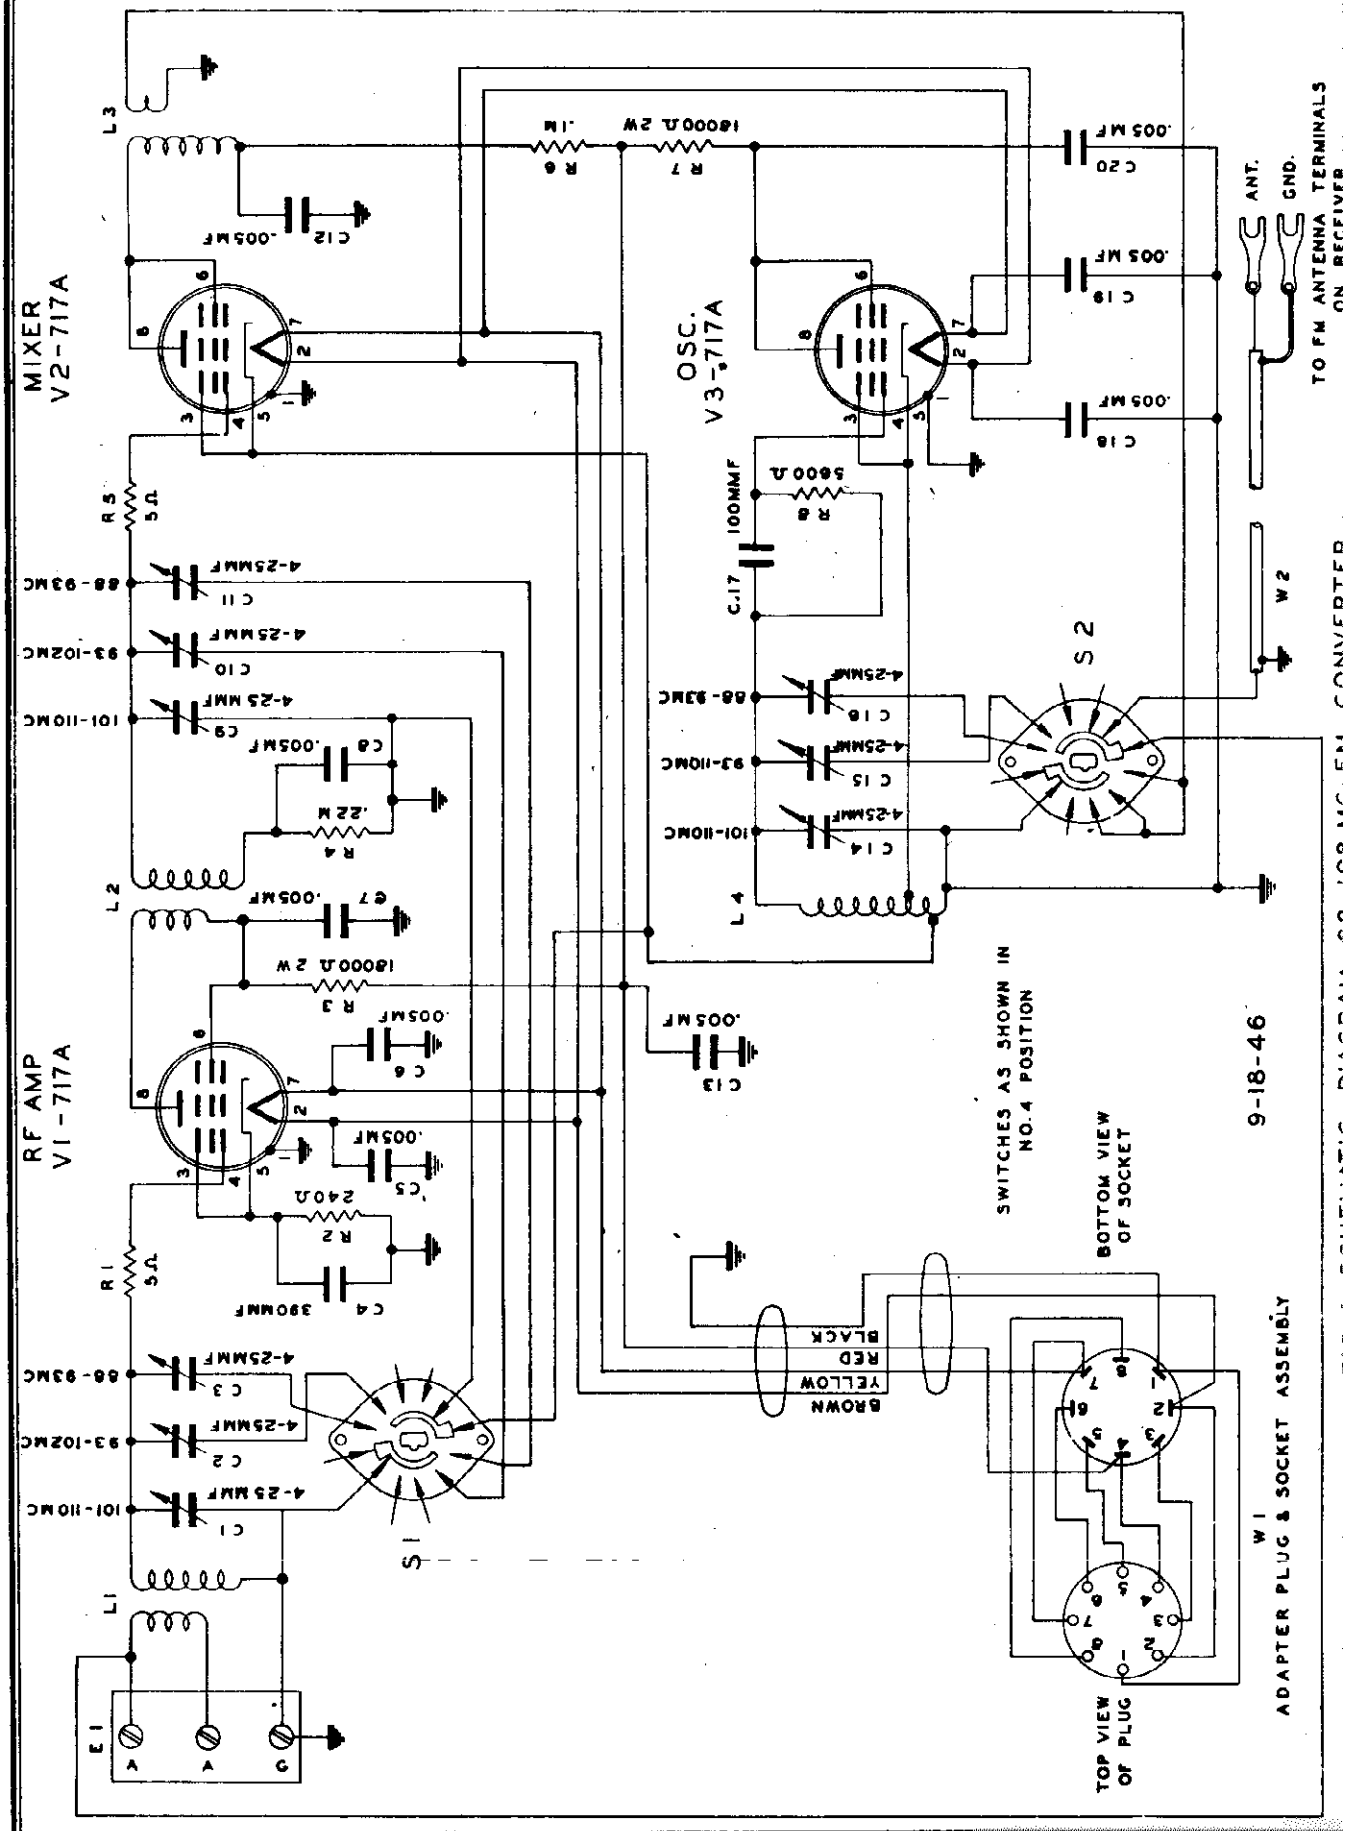
MODEL F-M Converte



MODEL F-M Converter

SCOTT RADIO LABS. INC.

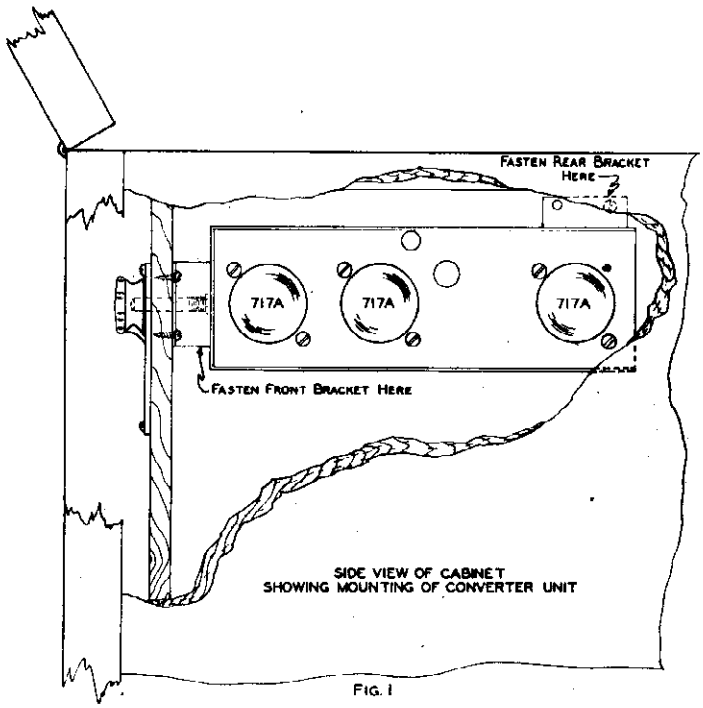


FIG. 1

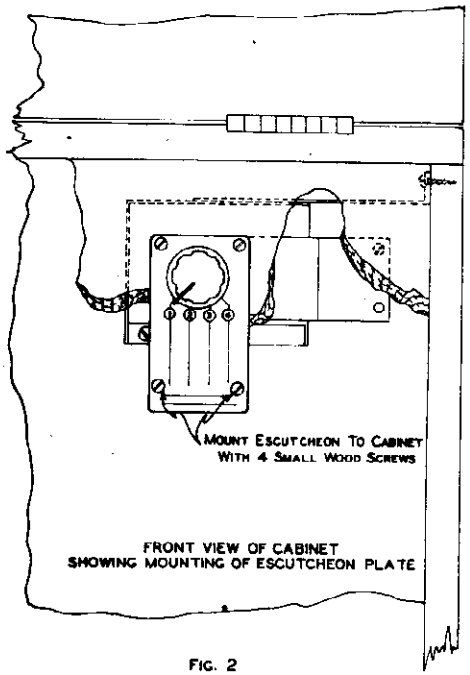

FIG. 2

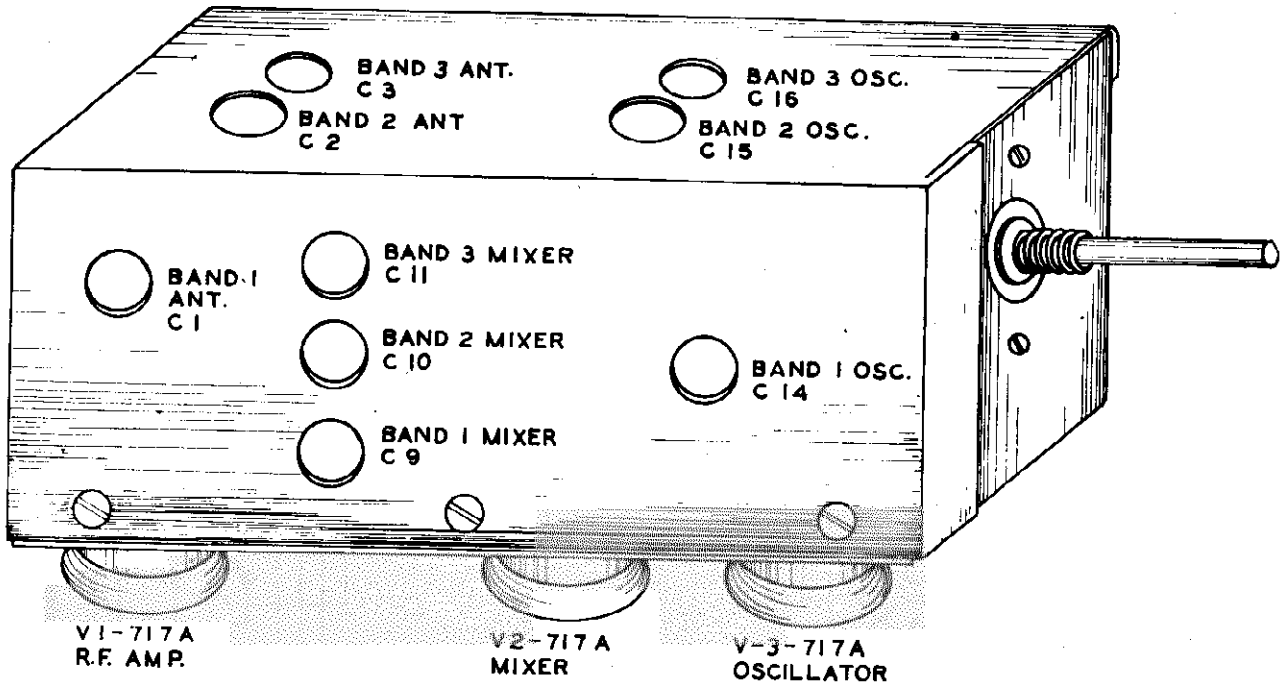

TRIMMER LOCATIONS. F M CONVERTER

FIG. 3

SCOTT FM CONVERTER

Description

The Scott FM Converter is provided to enable the listener, with an FM Receiver having the old FM band of 41-50 megacycles, to tune in stations on the new FM band of 88-108 megacycles. The FM Converter is provided with a single control consisting of a four position switch which should be located on the front of the cabinet as outlined under INSTALLATION. The first three positions of this control are used for tuning in FM stations on the 88-108 megacycle band while the fourth position is used for tuning on the 41-50 megacycle band.

The FM Converter utilizes three type 717A high frequency pentode vacuum tubes in a circuit which consists of a tuned RF amplifier, mixer and H.F. oscillator.

An adapter plug is provided with the converter in order that power for the tubes can be obtained without having to make connections inside the receiver. One of the power output tubes of the receiver is removed and the adapter plugged into this socket, the tube is then inserted into the adapter.

Terminals are provided on the FM Converter for connection of an antenna, and a shielded high frequency cable is provided for connection of the converter to the FM antenna terminals of the receiver.

The FM Converter unit is 7 3/4 inches long with a 1/4 inch diameter shaft extending 2 inches at the front end. The unit is 4 3/4 inches wide and 2 3/4 inches deep. The power adapter cable extends approximately 4 1/2 feet from the unit while the antenna cable extends 3 feet from the unit.

Installation

The FM Converter Kit contains all the items necessary for complete installation of the converter in the cabinet housing the radio receiver. The installation should be made as follows:

1. Select the location in which the converter is to be mounted, in most cabinets the upper right hand corner will be found most convenient, but any location which is accessible will do. Any number of mounting arrangements can be worked out with the two brackets furnished using the two sets of mounting holes and the switch shaft bushing. The arrangement shown in Figures 1 & 2 can be used in most installations. Screws are furnished, in the kit, for fastening the brackets to the converter and wood screws are furnished to fasten the brackets to the cabinet.

2. After selecting the position in which the converter is to be mounted, mark the location of the hole for the switch shaft and carefully drill a 1/2 inch clearance hole. Then fasten the brackets to the cabinet letting the switch shaft extend approximately 1/2 inch out of the front of the cabinet.

3. Faster the escutcheon plate to the front of the cabinet using the four small block screws provided and fasten the knob on the switch shaft so that the pointer is set at No. 4 position when the switch is set in the extreme counter-clockwise position.

4. Remove one of the power output tubes (6V6G or 6L6G) and insert this tube into the converter adapter socket. Then insert the adapter plug into the socket of the receiver from which this tube was removed.

5. Remove the antenna lead-in from the FM antenna terminal strip of the receiver, connect the center terminal of this strip to the ground terminal with a short piece of wire and then connect the insulated center wire of the converter antenna cable to the open antenna terminal and the shield braid of this cable to the ground terminal of the receiver FM antenna strip.

Antenna Installation

In order to obtain the best results when using this converter on the 88-108 megacycle band, a dipole antenna cut to the proper length with a 300 ohm low-loss lead-in should be used. This antenna may be one of several designs as follows:

a. When the receiver is located 30 or more miles from the transmitter it is recommended that a dipole antenna with reflector be installed outside and as high as possible. The Scott Type 1B887 FM Dipole Antenna Kit will fulfill all requirements for such an installation. It is supplied with antenna and reflector elements cut to the proper length for the 88-108 megacycle band, a molded bakelite block for mounting these elements, a steel support mast with universal mounting bracket and 75 feet of 300 ohm high frequency lead-in cable. This antenna should be installed with the elements broadside to the transmitter with the reflector element in back of the dipole elements.

b. For installations within a 30 mile radius of the transmitter a straight dipole antenna without the reflector can be used, however if an outside dipole antenna is to be used the dipole antenna with reflector will give best reception.

c. For installations where an outside antenna cannot be installed a very simple antenna, that will give good results when the receiver is located within a 30 mile radius of the transmitter, can be constructed from 300 ohm twin-lead. This antenna can be mounted on the rafters of the attic or fastened around the back of the receiver cabinet. This antenna is constructed as follows:

   1. Cut a piece of 300 ohm twin-lead 59 inches long, skin back the wires at both ends approximately 3/8 inch and solder the two wires together at each end. You will then have a flat piece of cable approximately 58¼ inches long shorted at both ends.

   2. Measure off the exact center of the cable and cut through one of the wires only. Skin back the two wires approximately 1/4 inch, then solder on a length of 300 ohm twin-lead long enough to reach from the antenna to the receiver. This lead-in may be any length depending upon where the antenna proper is to be installed.

SCOTT RADIO LABS. INC.

3. After the antenna has been installed the two wires of the lead-in should be connected to the two terminals of the strip at the rear of the converter marked "ANT.". The ground terminal need not be used.

Operation

Since power will be applied to the converter at all times when the receiver is turned ON, all that is necessary to put the converter in operation is to set the receiver controls for FM reception. With the converter control set at Position 4 the receiver will tune in FM stations between 41-50 megacycles as it normally would. To tune in any FM station on the 88-108 megacycle band, set the converter control to the position under which the frequency of the station is listed and then tune the dial of the receiver to the frequencies listed under column 4. For example: If it is desired to tune in a station at 98.9 megacycles the converter control should be set at position 2 since this frequency lies between 96 and 99 megacycles, the receiver dial should then be tuned between 46 and 47 megacycles as indicated in column 4. If the station desired operates on 102.5 megacycles the converter control should be set at position 1 and the receiver dial tuned between 42 and 43 megacycles as indicated in column 4. It will be found very helpful if a chart is made listing the reading on the dial logging scale for each FM station in the location where the converter is being operated.

Maintenance and Repairs

Since there are no moving parts in the FM Converter outside of the switch control, it will require little maintenance. Tube replacement is minimized by using the same type of tube in all three positions.

The schematic circuit diagram, Figure 4 and the list of replaceable parts, Table 1 will help in making any repairs necessary.

Alignment

The following alignment instructions are provided in order that the FM Converter may be correctly realigned in case it is necessary to replace any part that will affect alignment.

Before realigning the FM Converter the calibration of the 41-50 megacycle band on the receiver must be checked since the accuracy of this calibration will affect the calibration of the FM Converter as listed on the converter control escutcheon.

Align the FM Converter as follows:

Connect a signal generator, capable of covering the 88-108 megacycle band, to the antenna and ground terminals of the FM Converter using a 50 ohm composition resistor in series with the high potential lead of the signal generator and connect an output meter across the voice coil of the speaker to be used as an indicator.

CAUTION: The trimmer adjustments must be aligned in the sequence outlined below as trimmer capacitors C1, C9 and C14 are used as part of the capacity required for alignment on positions 2 and 3.

1. Set the controls on the receiver for FM reception with the tuning dial set at 47 megacycles.

2. With the signal generator adjusted to 107 megacycles, set the switch control of the FM Converter to position No. 1 and adjust trimmer capacitor C14 until the signal is tuned to resonance, then adjust trimmer capacitor C9 and C1 for maximum indication on the output meter.

3. Set the signal generator to 99 megacycles and the converter control to position No. 2. Adjust trimmer capacitor C15 for resonance; then adjust trimmer capacitors C10 and C2 for maximum indication on the output meter.

4. Set the signal generator to 90 megacycles and the converter control to position No. 3. Adjust trimmer capacitor C16 for resonance; then adjust trimmer capacitors C11 and C3 for maximum indication on the output meter.

NOTE: When making the above adjustments the receiver dial must be set at 47 megacycles at all times.

Do not readjust trimmer capacitors C1, C9 and C14 after positions No. 2 and 3 have been aligned as the initial setting of these trimmers will affect the alignment of these two positions.

Symbol Desig.	Function	Description	Part Number
L4	FM converter oscillator coil	RF coil, 7T #24 E wire spacewound tapped at 1½T and ½T from bottom Form: ½" dia. x 2 1/8" long	20F2282
R1	V1 grid series resistor	Resistor, composition, 5 ohms 10%, ½ watt, wire leads	70B960
R2	V1 cathode bias	Resistor, composition, 240 ohms, 5%, ½ watt, wire leads	70A45
R3	V1 screen filter	Resistor, composition, 18000 ohms, 10%, 2 watt, wire leads	70A66
R4	V2 grid leak	Resistor, composition, .22 megs, 10%, ½ watt, wire leads	70A59
R5	V2 grid series	Same as R1	
R6	V2 plate filter	Resistor, composition, 0.1 meg, 10%, ½ watt, wire leads	70A65
R7	V3 plate load	Same as R5	
R8	V3 grid leak	Resistor, composition, 5600 ohms, 10%, ½ watt, wire leads	70A50
S1	Antenna and mixer band selector switch section	Switch section, 2 pole, 4 position, rotary type, wafer section	6WE1898-1
S2	Oscillator and output selector switch section	Same as S1	
V1	RF amplifier tube	Vacuum tube, 717A, high frequency pentode, octal base. Heater: 6.3 V @ .15 amp.	98E1480
V2	Mixer tube	Same as V1	
V3	Omsillator tube	Same as V1	
W1	Adapter plug and cable assembly	Cable, 4 wire, 5 ft. long, attached to octal socket and octal plug adapter	96F2286
W2	Antenna output cable	Cable, single conductor, shielded, type RG59/u - 5 feet long	96F2357
X1	Socket for V1	Socket, 8 contact octal, ceramic, tapped mounting plate, key 45° left of mounting centers	88E1721
X2	Socket for V2	Same as X1	
X3	Socket for V3	Socket, 8 contact octal, ceramic, tapped mounting plate, key 90° off mounting center	88E1708

ELECTRICAL DESCRIPTION OF THE CIRCUIT

R.F. SECTION

The antenna input circuit is arranged so that when operating on the two short-wave bands and broadcast band, the signal picked up on the flat top portion of the doublet antenna is transferred to the R.F. tube grid by means of the special shielded ring coupling system, achieving a high degree of noise reduction. Noise reduction is also achieved on all bands due to the use of a special filter at the antenna. On the police band the signal is fed directly into the primary coil to minimize circuit loss. The first tuned circuit resonates and amplifies the desired signals. On shortwave and police the second tuned circuit operates directly from the plate of the R.F. tube and feeds directly into the converter grid reducing losses to a minimum. A 6U7G tube, having high mutual conductance is used in the R.F. stage which gives high sensitivity on all bands.

CONVERTER SECTION

The amplified signal from the R.F. amplifier is applied to the 6L7G converter control grid and the oscillator output is coupled to grid No. 3 These two input signals now both modulate the converter cathode emission and the result will be a difference in frequency component in the plate circuit of the converter which represents the I.F. frequency.

OSCILLATOR SECTION

The proper combination of series padders, shunt trimmers, and coils in the oscillator circuit provide a signal frequency 455 Kc. higher than that to which the R.F. section is tuned. (in special cases individual I.F. frequencies are used.) The efficient 6J5G type oscillator tube is used in an electron coupled circuit. Oscillator potentials are carefully by-passed and filtered, and the circuit is made extremely stable by the use of Silver Cap condensers and a special metalized resistor.

I.F. SECTION

The I.F. amplifier consists of three stages employing two 6K7G tubes and one 6B8G tube. the I.F. transformers are wound in single pi sections in both primary and secondary coils, and are permanently tuned by a combination Silver cap fixed condenser and an iron core giving a micrometer adjustment. In addition, each stage is arranged with resistance capacity filters for each circuit. The I.F. system is arranged for three degrees of selectivity by means of a small tapped coil connected to the grid return of the I.F. secondary and closely coupled to the primary in the 2nd and 3rd stage. The degree of coupling is then controlled by varying the selectivity switch. The signal developed in the converter plate circuit is highly amplified in the I.F. amplifier at 455 Kc. and is passed to the second detector.

R.F. and I.F. AVC-SYSTEMS

The Scott Phantom Deluxe employs two separate AVC systems. In the R.F AVC circuit the control grid of the 6B8G tube is capacitively coupled to the plate of the 6L7G converter tube I.F. and signal frequency are amplified and rectified by this tube and applied as control on the 1st R.F. grid and converter tube. This prevents overload in the R.F. stage and helps to reduce the effects of noise and distortion when tuned to powerful locals and also protects the first tube from these effects when the set is tuned to a weak distant station that is near in frequency to a powerful local. This AVC action operates only when the input signals exceeds about 1,000 microvolts.

In the I F. AVC circuit the 6B8G tube acts as I.F. amplifier and diode detector and supplies AVC voltage for control on the 1st and 2nd I F. tube grids and prevents overload and distortion in this part of the circiut.

Just below the Selectivity Control is the sensitivity Control which will decrease the maximum sensitivity of the receiver, when to extreme left, by increasing the minimum bias of the I.F. tubes. This provides silent tuning between stations but in no way effects the normel AVC action on the stations which are well above the noise level.

DETECTOR

As mentioned above, the 6S8G tube acts as a second detector in addition to its other functions, and handles high percentage modulation signals with a minimum of distortion

RECORD SCRATCH SUPPRESSION

The Scott Phantom DeLuxe employs the feature of automatic scratch suppression using a 6B8G and a 6J7G in a special circuit which attenuates the higher audio frequencies (corresponding to record scratvh) when they are very weak, but passes unattenuated the stronger high frequencies (corresponding to useful high fidelity reproduction).

The 6S8G tube operates as an amplifier and diods to supply rectified bias voltages (proportional to input signal amplitude for frequencies above 1,500 cycles) to the control grid of a 6J7G tube The circuit is arranged so that the effective capacity of a 35 mmd. condenser, amplified to a maximum of approximately 3,000 mmf. by the gain of the 6J7G tube, is in shunt with the first A.F. 6K7G tube grid at audio frequencies.

When the higher audio frequencies are weak no rectified bias is developed by the 6B8G tube allowing the 6J7G tube to operate at maximum gain, shunting a high capacity from the grid of the first AF tube to ground, thus practically eliminating record scratch. However, when the higher audio frequencies are strong, considerable rectified bias is developed in the 6B8G tube and applied to greatly reduce the gain of the 6J7G tube, thus reducing the effective capacity, shunting the input to the first A.F. tube and allowing all frequencies to pass unattenuated.

AUDIO AMPLIFIER

When the selectivity switch is set to position "P" the input to the three stage audio system is automatically connected to the phonograph input terminals on the rear of the chassis. The volume control regulates the input to the 6K7G first audio tube and in the plate circuit of this tube the variable bass and treble control circuits are connected. The bass circuit utilizes a high "Q" resonator choke system and provides a boost of about 15 db. at 75 cycles in the maximum position.

The first audio tube is followed by the 6J5G phase inverter tube. This circuit is self balancing and couples into the grids of the 6J5G pushpull 2nd audio tubes which operates into the balanced primary of a special driver transformer, the secondaries of which in turn apply the signal to the 6L6G beam power output stage.

The power output stage incorporates inverse feed-backwhich helps to flatten loudspeaker response and improves reproduction.

NOISE LIMITER CIRCUIT

A 6F6G tube is utilized as a noise limiter device so that peaks of local electrical interference may be "chopped" off resulting in reduction of peak noises of continuous amplitude. You will find this especially effective when the receiver is tuned to a weak signal on shortwaves.

POWER SUPPLY

The power supply used is of the heavy duty type employing two of the new 5U4G rectifier tubes. The primary of the power transformer is arranged for standard 117 volts on the domestic model. On the foreign model it is designed to accomodate either 117 volts or 230 volts AC by proper placement of the fuses. This is clearly shown on the schematic diagram. The rectified plate voltages are filtered by the use of three high capacity electrolytics, a choke and the speaker field employed as another choke. In addition, the bias voltage is further filtered by the use of a 100 mfd. condenser at 50 volts.

LOUD SPEAKER

The loud speaker employed is arranged to provide connections for an external speaker. It is necessary to disconnect the jumper wire between terminals V.C. and 38, and connect it between V.C. and 19 instead Now connect a 38 ohm speaker to the terminals marked 19 and G. "I" pads may be added by reference to the diagram showing these connections.

TESTING THE SCOTT PHANTOM DELUXE

In order to properly align and service the Scott Phantom DeLuxe receiver, the serviceman must have the following equipment.

Signal Generator (90 Kc. to 60 Megacycles)
Output Meter (such as Weston or Triplett)
Voltmeter and Ohmmeter (Sensitivity 1,000 ohms per volt or better.).
Microammeter (Weston model 600)
Tuning Wand (Alladdin)
Audio Oscillator (30 to 10,000 cycles)

HUM TESTS ON RECEIVER

Make certain that there are no soldering irons near the chassis and that the power transformer end of the amplifier is as far away as possible. Connect a good output meter, having a resistance of 3,000 ohms or more to the 6L6 plates (No. 3 prong) and have a 1 to 2 mfd. condenser in series with one lead to another.

With bass full on, treble full, and volume off, the hum should not exceed .1 of a volt. To make overall tests, remove the 2nd audio 6J5G tubes. The hum should now drop to less than 0.1 volt. If it does not, the amount of hum read on the meter is the hum in the amplifier itself. Leave the tubes just removed out and change the 6L6 tubes in the amplifier, at the same time adjusting the hum control on the amplifier until the hum is reduced to a minimum. There may be a filament short also. Check the circuit and connections to get the hum out of the amplifier before proceeding with the rest of the test.

NOTE: It is highly important, in minimizing hum to use the Spiral Heater type 6K7G and 6J5G tubes in the audio system since while considerable bass boost is available, tubes are the sole source of hum, there being no hum pickup whatsoever in chokes, transformers, etc.

After the amplifier is found to be OK replace the 2nd audio tubes and remove the inverter and 1st audio, substituting a new tube for the 2nd audio tube to heat up properly. Next try the inverter tube in the same manner and follow with the 1st audio 6K7J; also, the dial light circuit may be shorted against the dial frame. All these points should be checked along with the trying of new tubes.

AUDIO GAIN TESTS

With an audio input signal of 0 5 volt at 400 cycles an output reading of between 22-24 volts should be obtained on the output meter which is connected across the voice coil. Make this test with volume full, bass control full, selectivity in phono position. If this gain is low it may be due to defective tubes, wrong voltages, shorts or open circuits, either in the set or power amplifier. Both should be checked.

AUDIO FIDELITY TESTS

For correct high fidelity reproduction it is important that the electrical frequency response of the audio system, from the phono posts to a 38 or 40 ohm dummy voice coil resistor approximate 2 2.4 volts at 75 cycles and a 3-3.5 volts at 6,250 cycles with the bass and fidelity controls on full, after the output has been carefully adjusted, by means of the volume control, to 1 volt at 400 cycles with an input of 1 volt at each frequency. Failure of the system to approximate this response (if you are certain that your meters are accurate and that no series meter condenser which would "cut" low frequencies, is being used) should lead to analysis of the low or high frequency circuit involved to determine and eliminate the trouble.

HOW TO ADJUST THE AUTOMATIC RECORD SCRATCH SUPPRESSION CIRCUIT ON THE SCOTT PHANTOM DELUXE

Connect an output meter across the voice coil circuit (V.C. to G.) Connect an audio oscillator and a sensitive output meter to the phono posts, and turn the selectivity to position "P" (all way to right). With the bass control set to minimum treble control full on, and scratch suppressor switch off, apply 0.2 volt at 3,500 cycles to the phono posts. The scratch suppressor switch is ganged with the sensitivity control. Set the volume control so that 1 volt is obtained on the output meter across the voice coil. Turn on (to right) the suppressor switch and the 1 volt reading should just start to drop (say to .9v.). Now turn the suppressor switch off and reduce the audio oscillator input to 0.05 volts, reset the volume control to obtain a 1 volt reading again on the voice coil output meter and now turn on the suppressor switch. The 1 volt reading should now drop to a level of 0.3 of a volt or slightly under. This gives a reduction ratio of 5 to 1 and this is the proper ratio to maintain. If this 5 to 1 reduction is not obtained the 6 volt bias should be reduced slightly by varying the small slider arm in the C divider network. If too much control is obtained, the 6 volt bias may be raised by adjusting the slider arm.

The 6S8G tube determines the level at which the circuit starts to cut high frequencies and the 6J7G tube determines the amount of this cut.

ALIGNMENT OF I.F. SECTION

Connect a good signal generator to the input of the I.F. system. Turn the wave band switch to the broadcast band; have sensitivity control to maximum position (to right); turn tuning dial pointer to hi-freq. end of dial. Ground the I.F. AVC line by connecting a jumper wire from it to Gnd. Now set the the selectivity switch in the sharp position (all the way to the left).

Connect the negative terminal of a 20,000 ohm per volt DC voltmeter using the 25 volt scale, (or a sensitive microammetew with a 0.5 meg. resistor connected in series with its negative terminal) to the "I.F. Diode Output Point", and connect the positive terminal to the chassis.

Apply an unmodulated 455 Kc. signal of sufficient strength to produce a diode output voltage reading of approximately 10 v. (or 20 microamperes for the microammeter) and very carefully adjust the 1st, 2nd, 3rd, I.F. transformer and I.F. diode trimmers for maximum meter reading, reducing the input, if necessary, to avoid exceeding the above figures.

Adjust the R.F. diode transformer for maximum output after the I.F. stages are aligned. Remove the 1 meg. resistor from ground that is connected to the R.F. diode output point (10,000 Ohm) and put the high resistance DC meter in series with the 1 meg resistor to groond, the positive side of the meter going to ground. If there is sufficient signal from the generator it will be OK to merely connect the negative terminal of the microammeter to the R.F. diode output point. Put in a strong signal until a variation is noticed and adjust the R.F. diode for maximum output. Adjust the diode trimmers very carefully. Also shunt out the coil you are not adjusting, with a 10,000 ohm resistor while trimming the other circuit; namely, put 10,000ohms from B. to the 6S8G plate then trim the secondary. Shift the resistor to diode plates and 10,000 ohm diode output point and trim the primaries.

ALIGNMENT OF R.F SECTIONS

Before starting on this portion of the set, it is important to understand how the tuning wand works. One end of this device has a core of material such as polyiron while the other end is brass. When the inductance of a coil is high, insertion of the brass end will decrease it to the proper resonant value; whereas, insertion of the other end will increase the effective inductance.

This gives a very conveinient means of determining whether or not it is necessary to add or remove turns from the coil. In the following instructions only a slight adjustment of trimmers and padders should be necessary where original coils are used. Full instructions however, are given to cover the case where new coils are to be used

BROADCAST BAND ALIGNMENT

First turn the dial pointer completely to the low frequency dial stop and see that the pointer reaches 1/16" beyond the lowest frequency mark. Turn the wave band switch to the broadcast "A" position, set the bass control to minimum, treble control to maximum and sensitivity control to minimum and connect an output meter across the voice

coil. Adjust oscillator trimmer C1, until a 1,400 Kc. signal is set on the dial is tuned in from the generator. Rotate the dial to 600 Kc. and tune in a 600 Kc. signal from the generator by adjusting the padding condenser C3. Check the dial at 950 Kc. and if it tunes high in frequecny spread turns on the oscillator secondary, if it is low in frequency push the turns together and then readjust trimmer condenser C1, and padder condenser C3 as before.

With the oscillator circuit correctly spotted, tune in a signal from the generator at 1,400 Kc. and use the output meter as indicated.

Have as weak a signal as possible and adjust trimmers C4 and C6 for maximum output Turn the dial to 600 Kc. and check the alignment of the R.F. antenna and preselector stages with a tuning wand, spreading turns on the coil where less inductance is needed and pushing turns together if more inductance is required. Readjust the trimmer condenser C4 and C6 for maximum at 1,400 Kc. Turn the dial to 950 Kc. and check the alignment of the R.F. and antenna stages.

POLICE BAND

Set the wave band switch to the police "B" band position and turn the dial to 3 7 megacycles. Tune in a signal from the generator by adjusting trimmer C2, then turn the dial to 1.8 megacycles and tune in a signal from the generator by adjusting the padder C10. Check the alignment at 2.5 megacycles and if off, either push together or spread turns on the oscillator secondary as described under "Broadcast Band Alignment". Readjust trimmer C2 and padder C10 until correctly aligned. Tune in a signal at 3.7 megacycles and adjust trimmers C5 and C7 to maximum output. Now check the alignment on 1.8 megacycles with a tuning wand and make any necessary corrections by pushing or spreading turns on the coils and readjusting trimmers C5 and C7. Re check the alignment at 2.5 megacycles.

FOREIGN S.W. C (SW 1)

Set the wave band switch to the "C" position and tune in a signal at 9 megacycles by adjusting trimmer condenser C9. Turn the dial to 5 megacycles and if necessary to correct the calibration do so by spreading or pushing turns on the coil and readjusting the trimmer condenser C9. Check the calibration at 6.0 megacycles.

With the oscillator calibrated, tune in a signal at 9 megacycles and adjust trimmer condensers C12 and C14 for maximum output. Check the alignment at 5 and 9 megacycles and make any necessary corrections by pushing or spreading turns on the coils and readjusting trimmers C12 and C14

FOREIGN S.W. -D- (SW 2)

Set the wave band switch to "D" position and tune in a signal at 20 megacycles by adjusting trimmers C8. Check and if necessary correct the calibration at 12 megacycles by pushing or spreading the turns on the oscillator coil Check the calibration at 15 megacycles.

With the oscillator correctly aligned tune in a signal at 20 megacycles and adjust trimmers C1 and C13 for maximum output. Check the alignment at 12 and 15 megacycles and make necessary corrections by pushing or spreading turns on the coils. Now, re adjust trimmers C11 and C13.

FOREIGN S.W. D- (SW 2)

ULTRA SHORT WAVE AND TELEVISION BAND

Set the wave band switch to "P" position and tune in a signal at 48 megacycles by adjusting trimmers C15 Check and if necessary correct the calibration at 32 megacycles by pushing or spreading the turns on the oscillator coil. Check the calibration at 32 and 48 megacycles

With the oscillator correctly aligned tune in a signal at 32 and 48 megacycles and adjust trimmers C16 and C17 for maximum output. Check the alignment at 32 and 48 megacycles and make necessary corrections by pushing or spreading turns on the coils. Now, readjust trimmers C16 and C17.

The trimmer is used at the high frequency side of the band at 48 megacycles. The coil is pushed or spread for 32 megacycles for the low frequency side of the band

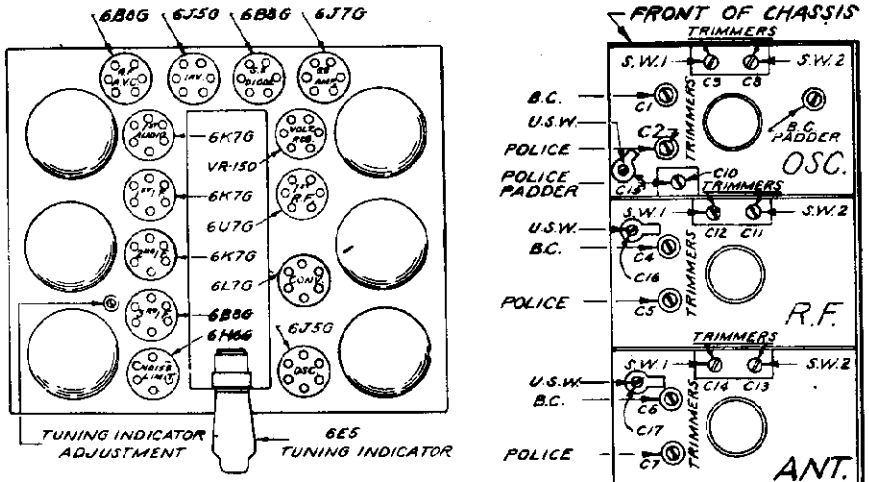

Fig. 1 TUBE LOCATIONS

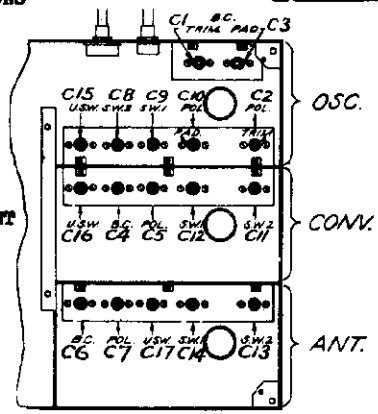
OLD TRIMMER ARRANGEMENT

NEW TRIMMER ARRANGEMENT



CONNECTING EXTRA SPEAKER

The new type high fidelity Scott permanent magnet 38 ohm voice coil speaker maybe readily connected to a Scott Receiver with the optional "T" pad inserted in the voice coil leads where separate control of the extension speaker volume is desired. In case the extension speaker is disconnected the jumper might be changed to connect terminals "V.C" and "38" together.

WAVE CHANGE SWITCH TROUBLE

Poor contact in the wave change switch can generally be corrected by slightly bending the contacts involved. However, in case a switch section is accidentally damaged beyond repair, this section can be replaced by removing the two screws which support the wave change detent plate and very carefully pulling out the wave change switch shaft. The damaged section can then be unsoldered, removed, and replaced with a new unit which should be obtained from the Scott Laboratories in Chicago before the change is made in order to assure exact duplication of switch position and connections. Note particularly that the small notch near the center of the switch rotor must be in the same position in each switch section.

SCOTT SPECIAL FIFTEEN AMPLIFIER

Adjustment of Beat Frequency Oscillator

You will find on the back of the chassis at the right hand end looking at it from the rear, a small hole thru which can be seen a hexagon shaped nut. See Fig. 22. This can be adjusted either with a screw driver or a No. 6 spintite wrench.

To adjust, tune in a short wave station, then press in the small black button on the front of the panel just below the Wave Change Switch, and hold it in this position. Now adjust the small nut in the rear of the chassis by turning to the right or left until a whistle is heard with the station to which you have the receiver tuned. After you hear the whistle turn the nut slightly first one way then the other until the pitch of the note suits your ear.

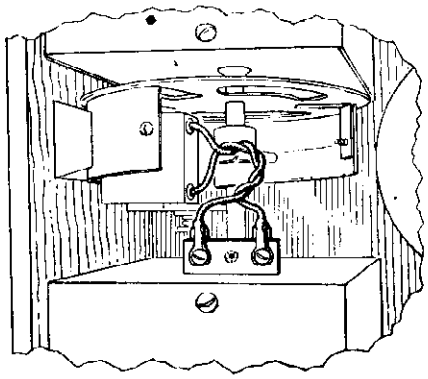

Fig. 19

How to Change Visual Tuning Meter

If the visual tuning meter stops indicating on the face of dial, lightly tap the top of meter noting if the needle releases and comes into view. If it does not, or if needle simply stays in one position on dial and does not move when tuning in stations, follow instructions given on Page 14, under heading "Tuning Meter Sticks Or Indicator Fails To Show On Dial." If these instructions have been followed with no result, the tuning meter is possibly defective.

Figure 19 shows tuning meter connected to terminal block on end of small shield can. Disconnect meter wires by loosening the two screws holding the lugs on the wires leading to meter. Now connect a short piece of wire between the two screws, as shown in Fig. 19. This will remove the visual tuner from the circuit and receiver can now be operated. *Leave tuning meter in place* and advise us at once, and a new tuning meter will be sent to replace the defective one. To remove the old meter, loosen screw holding tuning meter bracket to base of chassis, then it can be lifted out.

To install new meter, first fasten tuning meter bracket to base, making sure that it is centrally located in front of the dial strip, then replace dial light,

The connecting wire should now be removed and the two lugs on wires from tuning meter should be fastened to the terminal strip, making sure that red wire is connected to the red wire leading up from chassis, and black wire to the black wire.

Switch on receiver and with no signal tuned in, the shadow from the needle should just appear on white side of dial. If needle does not show, slide tuning meter bracket over until needle shows. Be careful not to push it over so far that it hits dial.

Final adjustment can be made by moving dial light to left or right in rubber socket.

How to Change Fuse in Power Amplifier

Your receiver is protected from serious damage by a 4 amp. automobile type fuse which is located under the base of the amplifier. This fuse should last indefinitely. However, if the fuse should burn out and the tubes refuse to light, the trouble will probably be due to a defective 5Z3 tube. In this case, of course, it will be necessary to put a new 5Z3 tube and a new fuse in your receiver and it will then be ready to operate again.

If your fuse should burn out from any other reason it will undoubtedly be due to one of the other tubes being defective or short circuited, a defective filter or bypass condenser or a broken wire or short circuit in some part of the set. In a case like this the condensers should all be checked for short circuits. After this any other trouble will be found by inspecting the wiring of the receiver.

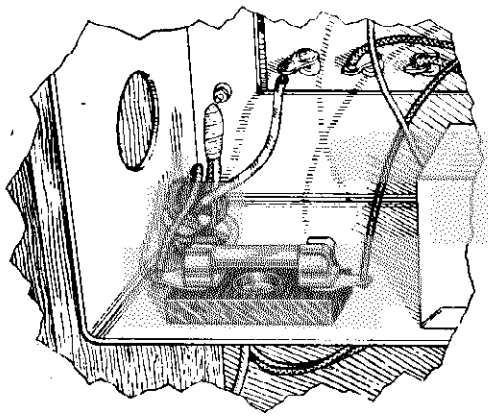

Fig. 20. Fuse Block Located Under Amplifier.

Do not, on any account, replace this fuse with a solid connection such as a piece of tin foil or the various expedients tried by amateur electricians to get things going again, for if you do, serious damage will be caused and if repairs are necessary you will be charged for them under these circumstances. If you do not have a spare fuse exactly like the one supplied, then you can temporarily use one of 3 amps. but we will be glad if you will write us immediately, to send you some additional fuses, free of charge.

How to Change Dial Light

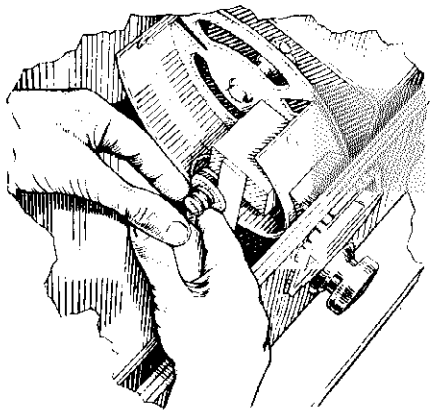

Fig. 21. Changing Dial Light.

When changing the dial light, first turn the tuning dial to meg-kil, slip dial light socket and rubber bushing out of notch in tuning meter bracket. See Fig. 21.

NOTE: When removing the dial light you first slip down the spring clip that holds it in place. The clip is used principally to keep dial light in place during shipment, and need not be replaced, as rubber socket has sufficient grip.

Bring the dial light socket under the shaft of the tuning condenser and up in back of the shaft. The dial light bulb can then be easily screwed out of the socket and another replaced. The entire socket assembly can then be placed back under the tuning condenser shaft and slipped back into place.

After changing the dial light the pointer of the visual tuning meter may be too far to the right so that it cannot be seen unless a station is tuned in. In this case, the dial light socket should be slipped back and forth in the rubber bushing until the shadow of the tuning meter just shows on the right hand side of the dial when no station is tuned in.

Phonograph Pick-Up

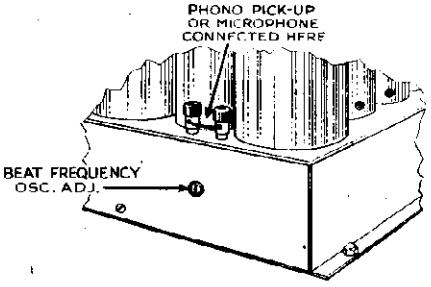

Fig. 22

The SCOTT ALLWAVE FIFTEEN RECEIVER is equipped with two binding posts on the rear of the chassis located on the right end, looking at the chassis from the rear. See Fig. 22. When shipped these two posts are connected together with a short piece of wire. When it is desired to hook up the receiver to a phonograph, remove this wire and connect the two wires from the phonograph pick-up

Section IV CIRCUIT DESCRIPTION

4.1 General

The schematic diagram of the receiver chassis is shown in Figures 25 and 26 and the schematic diagram of the power supply chassis is shown in Figures 27 and 28. For purposes of illustration it will be assumed that the circuits are set up for reception on the Broadcast (BC) Band for AM reception.

4.2 AM-RF and Mixer Circuits

Signal input to the receiver through AM antenna connector strip E1 is connected to the primary winding of BC band antenna primary coil L1 through switch SW2A. An electrostatic shield, at ground potential, separates the secondary winding from the primary. The secondary coil L2, together with variable air capacitor C5A1 constitutes the first tuned circuit. Transfer of RF signal at the resonant frequency of this tuned circuit, from the antenna to the control grid of RF amplifier tube V1, is accomplished by inductive coupling through the antenna transformer L1, L2. Variable capacitor C5 is a three unit capacitor, each unit being split into two sections. The larger sections C5A1, C5B1 and C5C1 being used for tuning the AM-RF and oscillator circuits and the small sections C5A2, C5B2 and C5C2 being used for tuning the FM-RF and oscillator circuits. The secondary winding L2 is provided with an adjustable powdered iron core E3 for inductance trimming and a shunt connected variable capacity trimmer C1. These trimmers allow accurate alignment of the tuned circuit at both ends of the frequency band and are accessible for adjustment at the bottom of the receiver as shown in Figure 14. The high potential end of the tuned circuit is connected to the control grid of RF amplifier tube V1 through switch SW2A, switch SW1 and through coupling capacitor C3. The low potential end of the circuit is returned to chassis ground. The DC bias return from the control grid of RF amplifier tube V1 to the AVC line is closed through resistor R1. Switch SW1 located at the rear of the receiver chassis is provided so that a loop antenna, connected through loop receptacle J7, may be used in place of an outside antenna as outlined under Antenna Requirements, Paragraph 1.5.

Plate potential from the high voltage DC line is applied to the plate of RF amplifier tube V1 through filter resistor R11, bypassed to ground by capacitor C18A. One section of switch SW3A is used to cut off DC voltage from the plate and screen of RF amplifier tube V1 and the screen of mixer tube V3 when the Selectivity control is set at PHONO or TELEVISION positions in order to keep any RF signal from leaking through when using the audio amplifier of the receiver for record player reproduction or television sound broadcasts.

Screen potential is applied to RF amplifier tube V1 through filter resistor R4 bypassed to ground by capacitor C4B. Resistor R3 is connected from screen to ground to provide more stable screen potential with fluctuations in AVC voltage, this providing better AVC characteristics on strong signals. The suppressor of V1 is connected to ground. Initial grid bias is obtained by means of cathode resistor R2 bypassed by capacitor C4A. Grid bias on V1 can be increased when full sensitivity is not required, by means of Sensitivity control R5 which also controls the bias on first IF amplifier tube V4. One side of the heater circuit of V1 is grounded at the socket.

The amplified signal from the plate of RF amplifier tube V1, is transferred to the signal grid of mixer tube V3 through RF transformer L7. The primary of L7 is untuned. The secondary winding together with variable capacitor C5C1 constitutes the second and final tuned circuit operating at signal frequency. The high potential end of the tuned circuit is connected to the signal grid of mixer tube V3 by switch SW2C, through coupling capacitor C17. The low potential end of the tuned circuit connects to ground. Adjustable iron core E7 and parallel connected trimmer capacitor C15 are provided for circuit alignment. The DC bias return from the control grid of mixer tube V3 to the AVC line is closed through resistor R8. Screen potential from the high voltage DC line is applied through resistor R12 bypassed to ground by capacitor C18B. The suppressor is internally connected to the shell of the tube. Initial bias is obtained by cathode resistor R10 bypassed by C18C.

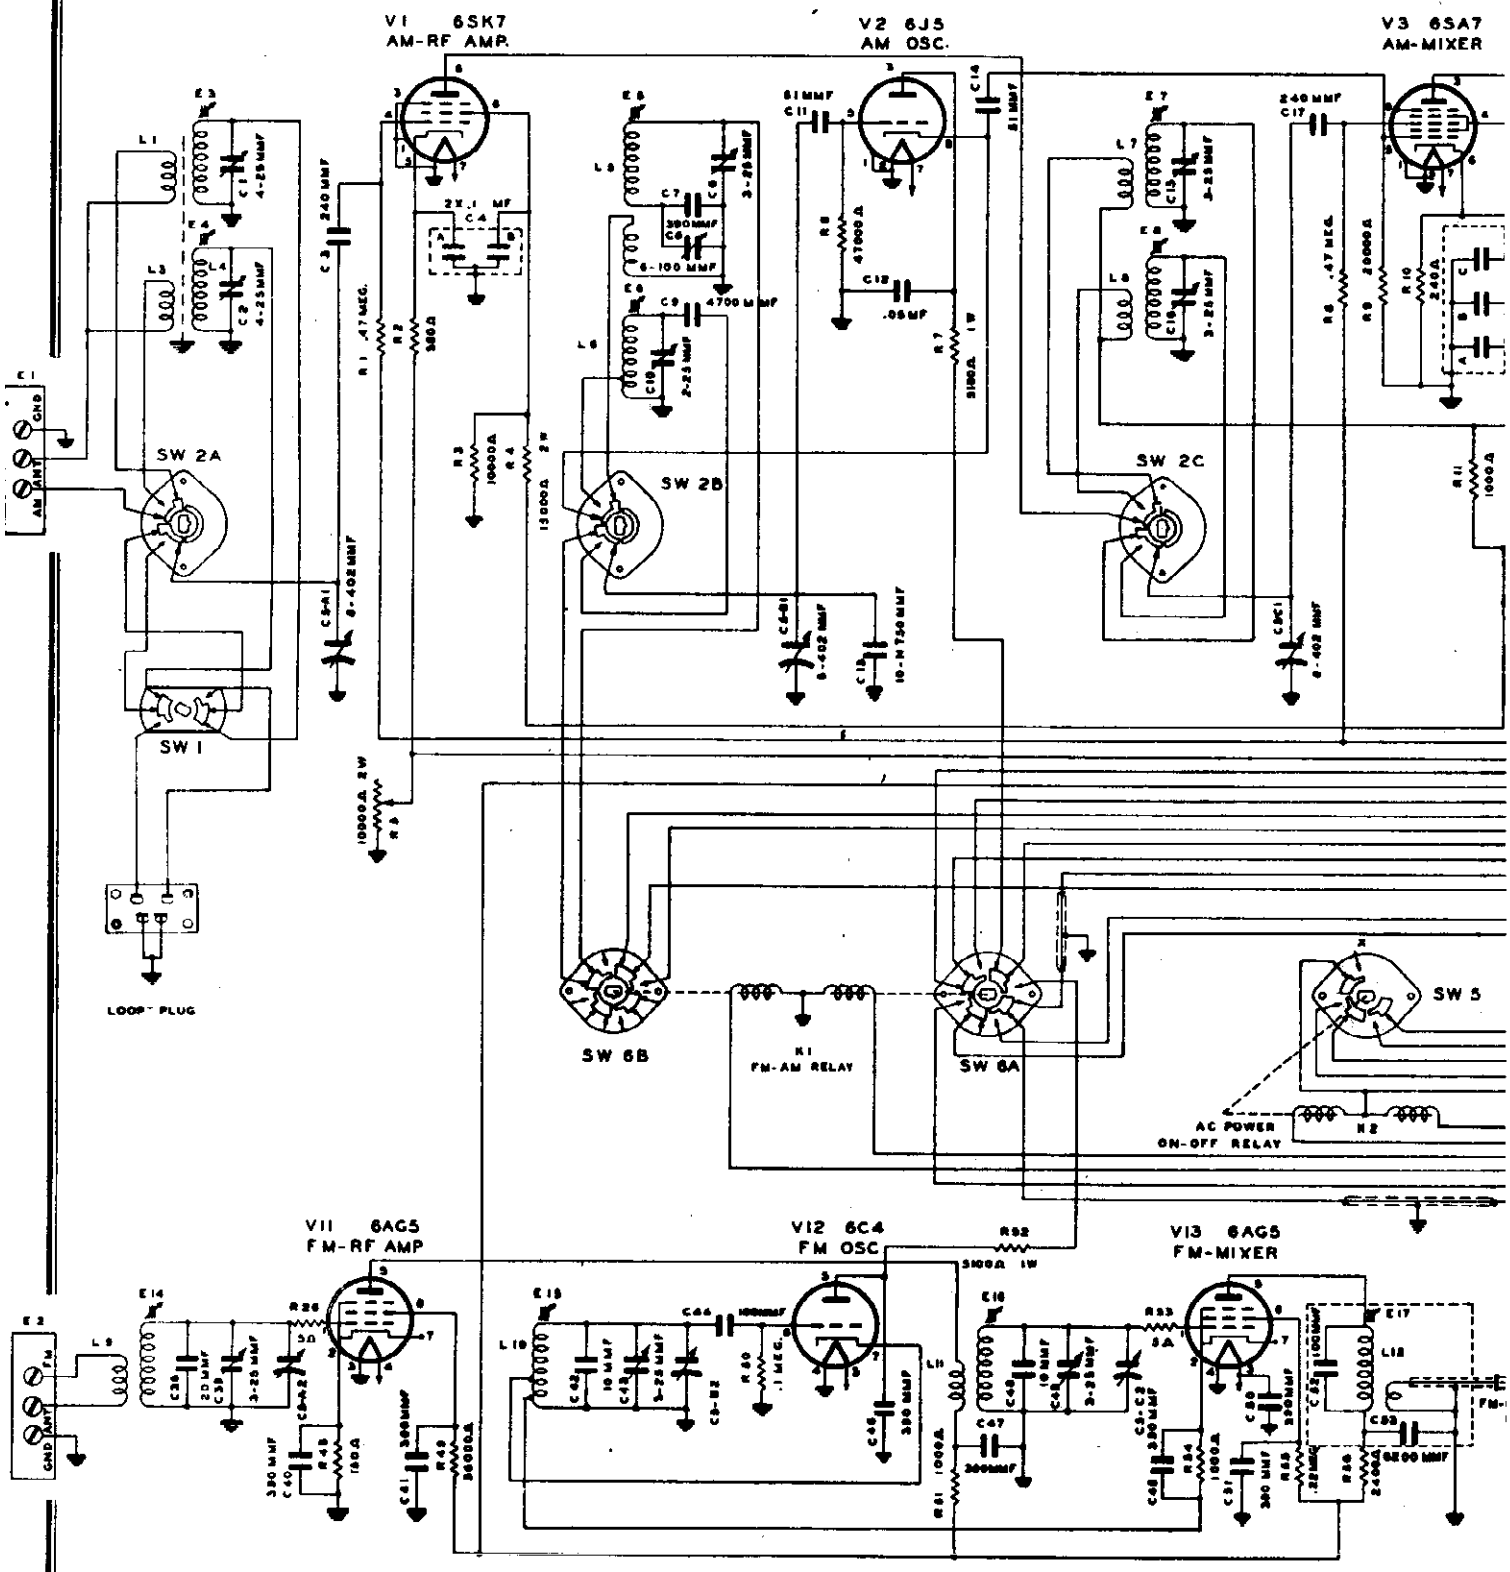
4.3 AM-Oscillator Circuit

The AM-oscillator circuit is of the electron coupled type. The tuned circuit consists of tapped inductor L5 shunted with variable trimmer capacitor C6 and is tuned by variable capacitor C5B1 which is shunted by fixed capacitor C13 provided to increase the fixed minimum capacity of the circuit. The inductor L5 is provided with a variable iron core for inductance adjustment. Fixed capacitor C7 shunted by variable padder capacitor C8 is provided to modify the tuning of the oscillator circuit so that it will maintain a fixed frequency difference of 455 kilocycles with respect to the signal frequency circuits when the main tuning capacitor C5A1, C5B1 and C5C1 are varied from minimum to maximum capacity. On both the BC and SW-AM bands the oscillator frequency is maintained 455 kilocycles higher in frequency than the signal frequency.

The high potential end of the tuned circuit is connected to the control grid of AM oscillator tube V2, through switch SW6B mounted on the FM-AM relay K1, and through switch SW2B and fixed capacity C11. The low potential end of the coil returns to ground. The grid of V2 is returned to ground through resistor R6. The cathode of V2 is connected to the tap on inductor L5 through switch SW2B and through capacitor C14 to oscillator injector grid (Pin #5) of mixer tube V3. This grid is returned to ground through resistor R9. The plate of the oscillator tube V2 is connected to the 150 volt regulated high voltage DC line through resistor R7, bypassed by capacitor C12, and through switch SW6A on the FM-AM relay K1. This switch removes voltage from the plate of oscillator tube V2 when the receiver is adjusted for FM reception. One side of the heater of V2 is grounded at the socket.

4.4 AM-IF Amplifier Circuits - 455 Kilocycles

The signal frequency arriving at the control grid of mixer tube V3 and the oscillator frequency fed to the injector grid of this tube or mixed (or heterodyned) and the resultant difference frequency (455 kilocycles) is fed to the input of the IF amplifier.



Tuning Range - AM ..... 540 KC to 1600 KC

Figure 28 Revised Schematic Diagram Model 800-B Power Supply

Transfer of IF signal from the plate of the mixer tube V3 to second detector tube V9 is accomplished by inductive coupling through IF transformers T1, T2 and T3 and amplified by tube V4 and V5. The first IF transformer T1 consists of two tuned circuits, primary and secondary with the secondary circuit operating in conjunction with switch SW3A and a tapped tertiary winding to provide three degrees of selectivity by changing the co-efficient of coupling with the primary circuit. The primary and secondary windings are each tuned to 455 kilocycles by fixed capacitors C20 and C21 and adjustable iron cores E9 and E10. These iron cores are accessible for adjustment through the top of the shield can for E10 and at the bottom of the receiver for E9. The high potential end of the primary tuned circuit connects to the plate of mixer tube V3 through a shielded conductor while the low potential end connects to the high voltage DC line through resistor R13 bypassed to ground by C19. The high potential end of the secondary tuned circuit is connected to the grid of first IF amplifier tube V4 while the low potential end is connected to the AVC line through switch SW3A and resistor R16, bypassed to ground by C22. DC potential from the high voltage DC line is applied to the screen of V4 through resistor R18 bypassed to ground by C23B. Plate potential is applied through the primary tuned circuit of second IF transformer T2 and through resistor R19 bypassed to ground by C23C. Initial grid bias is obtained through resistor R17, bypassed to ground by capacitor C23A. Resistor R17 is returned to ground through sensitivity control R5 so that the bias on V4 may be increased when maximum sensitivity is not desired.

Second IF transformer T2 is similar to first IF transformer T1 in respect to design, construction and operating characteristics. Therefore except for differences in symbol designations the circuit description of first IF transformer T1 is applicable to this transformer. The low potential end of the secondary tuned circuit of T1 is returned to ground through switch SW3B. Grid bias for second IF amplifier tube V5 is obtained through resistor R22, bypassed to ground by C26A. Screen potential is applied through resistor R23, bypassed by C26B. Plate potential is applied through the primary winding of third IF transformer T3 and resistor R24, bypassed to ground by C26C.

Third IF transformer T3 consists of a tuned primary circuit and an untuned secondary. The primary circuit consists of the primary winding shunted by fixed capacitor C27 and adjustable iron core E13 which is accessible for adjustment at the bottom of the receiver. The high potential end of the secondary winding feeds the second detector diode, while the low potential end returns to ground through diode load resistors R31 and R32.

4.5 AM Second Detector Circuits

The second detector tube V6 is a twin diode tube, one section being used as a second detector diode the plate of which is connected to the high potential end of the secondary winding of T3. The cathode is connected to ground, thus the tube acts as a half wave rectifier. The voltage developed across diode load resistors R31 and R32 is filtered by resistor R34 and capacitor C29B to remove all audio components, and the resultant direct current AVC voltage is used to control the gain of amplifier tube V1, V3 and V4; the degree of control being dependent on the strength of the incoming signal.

The second section of the twin diode tube V6 is utilized as a peak noise limiter which is effective only on the AM shortwave band where interference from ignition or similar peak noise may be encountered. The audio voltage appearing at the junction of R31 and R32 as a result of the demodulating action of the second detector diode, is normally coupled to the input of the audio amplifier. When the Sensitivity control is advanced to maximum rotation, switch SW4 connects the audio input to the cathode of V6 and the noise limiter circuit is in operation.

DC potential from the AVC line is further filtered by resistor R35 and capacitor C29C and applied to the control grid of tuning eye tube V7-6E5. This DC voltage regulates the shadow angle of the tube to indicate when the receiver is tuned to resonance with the received signal.

4.6 Audio Amplifier Circuits

The 1st and 2nd audio amplifier circuits are located on the receiver chassis while the phase inverter and output amplifier are on the power supply chassis. The audio voltage developed across the diode load resistors R31 and R32 is applied to the control grid of first AF amplifier tube V9-6J5, through capacitor C30 and volume control R37.

Switch section SW6A on the FM-AM relay actuates to connect the output of either the AM detector or the FM discriminator to the audio input switch section SW3C. This switch connects the input circuit of 1st audio amplifier V9-6J5 to radio input. Phono input or television sound input, depending on the setting of the Selectivity control.

Initial bias for 1st audio amplifier V9-6J5 is obtained through resistor R38 bypassed by C31. Plate potential is applied through filter resistor R40, bypassed by 1 section of dual capacitor C33, and through load resistor R39.

Audio signal from the plate of V9 is fed through capacitor C32 to the grid of 2nd audio amplifier tube V10-6J5. The grid of V10 is returned to ground through resistor R41 and R47. Initial bias is obtained through resistor R42 bypassed by C34. Plate potential is applied through filter resistor R44, bypassed by the second section of C33; and through load resistor R43.

Signal from the plate of V10 is coupled to the grid of 3rd audio amplifier tube V19-6SL7GT, located on the power supply chassis, through capacitor C35, to terminal #3 of audio plug P2, through terminal 3 of audio receptacle J4 and through audio compensating network R80, C87.

The tone control circuit consisting of treble control R45 and associated capacitor C36; bass control R46 and associated audio choke L14, and capacitor C37. Both R45 and R46 are centertapped controls and when the controls are both set at the position of the tap the audio response curve is flat. By tuning the treble control clockwise the high frequency response is boosted and when turned counterclockwise the high frequency response is cut. When the bass control is turned clockwise the low frequency response is boosted and when turned counter clockwise it is cut; thus the frequency response of the audio amplifier can be controlled over a wide range.

The grid of 3rd audio amplifier V19A which is one section of a dual triode tube 6SL7GT, is returned to ground through R81. Capacitor C97 is used in conjunction with audio compensating network R80, C87 which is provided to compensate for loss of high frequency response in the long connecting lead from the plate of V10 to the grid of V19A. Initial bias for both sections of V19 is obtained through resistor R82 bypassed by capacitor C88. Plate potential is applied to V19A through R84 and to V19B through R83.

Audio signal from the plate of V19A is fed to the grid of audio output amplifier V20, through capacitor C89; this grid is returned to ground through R85 and R87.

Audio signal from the plate of V19B is fed to the grid of audio output amplifier V21 through capacitor C90; this grid is returned to ground through R86 and R87.

Audio voltage appearing at the junction of resistors R85, R86 and R87 is fed to the grid of V19B. Since this voltage is 180 degrees out of phase with that appearing at the grid of V19A the audio voltages appearing at the plates of V19A and V19B will be 180 degrees out of phase, thus providing push pull amplification.

Initial grid bias for V20 and V21 is obtained through resistor R88 bypassed by C91. Screen potential for V20 and V21 is applied direct from the power supply. Plate potential is applied through the centertapped primary of output transformer T8. Capacitor C92 and resistor R90 are connected in series across the plates of V20 and V21 to prevent parasitic oscillation in the output amplifier circuit.

4.7 FM-RF Oscillator and Mixer Circuits

The FM-RF amplifier, mixer and oscillator circuits are located on the receiver chassis, the FM-IF amplifier and discriminator circuits are located on the power supply chassis. Input signal from the antenna is fed through FM-antenna terminal strip E2, located at the rear of the receiver, through antenna coil L9 to the grid of FM-RF amplifier V11-6AG5 which is a miniature type tube. The secondary of antenna coil L9 is connected to the grid of V11 through a parasitic suppressor R26, the low potential end of the coil being grounded. It is tuned by variable air capacitor C5-A2. Variable trimmer capacitor C39 and adjustable iron core E14 are provided as trimmer adjustments. Shunt connected capacitor C38 is provided to increase the minimum capacity of the tuned circuit. Initial grid bias is obtained through R48 bypassed by C40. Screen potential is applied through resistor R49 bypassed by C41. Plate potential is applied through the primary of mixer coil L11 and resistor R51 which is bypassed by C47.

Signal from the plate of V11 is fed to the grid of FM-mixer tube V13-6AG5, through mixer coil L11 and parasitic suppressor R53. The secondary tuned circuit of L11 is tuned by variable air capacitor C5 and C2. Air trimmer C49 and adjustable iron core E16 are provided as trimmer adjustments while fixed capacitor C48 is provided to increase the minimum capacity of the tuned circuit. Initial bias for V13 is obtained through R54 bypassed by C45. This circuit is returned to ground through a small portion of the secondary winding of FM oscillator coil L10. This impressing a voltage on the cathode of V13 at the frequency to which the oscillator circuit is tuned. This signal which is always 10.7 megacycles lower in frequency than the signal frequency, is heterodyned or mixed with the signal frequency appearing on the grid of mixer tube V13 and the resultant frequency 10.7 megacycles appears at the plate of FM mixer tube V13.

Screen potential is applied to V13 through R55 bypassed by C51. Plate potential is applied through IF primary coil L12 and resistor R56 bypassed by C53. One side of the heater of V13 is bypassed to ground by C50.

FM oscillator tube V12-6C4 is a miniature type triode. The tuned circuit consists of FM oscillator coil L10 and variable air capacitor C5B2; variable trimmer capacitor C43 and adjustable iron core E15 are provided as trimmer adjustments. Fixed capacitor C42 is provided to increase the minimum capacity of the tuned circuit. The high potential end of L10 connects to the grid of V12 through coupling capacitor C44. The grid is returned to ground through R50. The cathode of V12 is connected to a tap on coil L10. Plate potential is applied through R52 bypassed by C46.

4.8 FM-IF Circuits

The IF signal appearing at the plate of FM mixer tube V12 is fed to the primary of 1st FM-IF transformer L12. This coil is tuned to 10.7 megacycles by capacitor C52 and adjustable iron core E17. The primary winding is then link coupled to the secondary winding, located on the power supply chassis, through FM-IF input plug P3 and jack J5 and through another small winding coupled to the secondary coil L13. The 1st FM-IF secondary coil L13 is tuned to 10.7 megacycles by capacitor C54 and adjustable iron core E20 and is connected to the grid of 1st FM-IF amplifier V14-6AC7 through parasitic suppressor R57.

Bias is obtained through R58, bypassed by C55. Screen potential is applied through R59 bypassed by C57. Plate potential is applied through the primary winding of 2nd FM-IF transformer T4 and resistor R60 bypassed by C58. One side of the heater of V14 is bypassed to ground by C56.

The primary of T4 is tuned to 10.7 megacycles by capacitor C59 and adjustable iron core E21. The primary is inductively coupled to the secondary which is tuned by capacitor C60 and iron core E22. The high potential end of the secondary connects to grid of 2nd FM-IF amplifier V15-6AC7 through capacitor C61 and parasitic suppressor R62. The low potential end returns to ground. The grid of V15 returns to ground through R61. Through the use of coupling capacitor C61 and grid leak R61 second FM-IF amplifier tube V15 will act as a limiter on extremely strong signals.

Second FM-IF amplifier V15-6AC7 is identical to first FM-IF amplifier tube; therefore except for symbol designations the circuit description is the same.

Third and fourth FM-IF transformer T5 and T6 are similar to second FM-IF transformer T4 and except for symbol designations the circuit description is the same.

The third and fourth FM-IF tubes are used as limiter amplifiers. By employing the proper plate and screen voltages and correct values of grid leak and coupling capacitors these tubes will reach full limiting action with approximately 10 microvolts input signal, effectively shunting any amplitude signals such as ignition noise or impulse interference signals. The values of grid leak and coupling capacitor used were chosen to insure fast limiting action on noises possessing a steep wave front.

4.9 FM Discriminator Circuit

The fifth FM-IF transformer or discriminator transformer is provided to couple the second limiter tube V17 to the discriminator diode V18. A phase bridge type of discriminator circuit is used with both primary and secondary circuits being tuned by air dielectric trimmers C80 and C82. The primary and secondary windings are inductively coupled so that the peaks of the discriminator are approximately 300 kilocycles apart. The discriminator is linear up to plus or minus 100 kilocycles from the IF frequency of 10.7 megacycles, in order that over-modulation beyond plus or minus 75 KC at the transmitter will not cause distortion in the receiver.

The balanced detector action of the discriminator tube diode acts to cancel any amplitude modulation present on weak signals. Signal voltage appearing across the primary of T7 is induced into the secondary of this transformer which reacts with the voltage coupled from the primary through capacitor C81 to produce frequency discriminating action. When the frequency of the signal flowing through T7 is exactly 10.7 megacycles the voltage across resistors R77 and R78 are equal and opposite. A change in the frequency in one direction produces a positive difference between the voltages across R77 and R78; a frequency change in the opposite direction produces a negative voltage difference. In this way frequency modulation of the carrier signal produces a similar audio frequency voltage across resistors R77 and R78. This audio voltage is fed to the audio amplifier input through a de-emphasis network consisting of resistor R7 and capacitor C85. RF choke L16 and capacitor C86 are provided to filter out any RF components which may be picked up in the audio input lead.

4.10 Rectifier Power Supply Circuits

The rectifier power supply of the Model 800-B Radio-Phonograph is designed to operate from a 115-120 volt 50-60 cycle AC source. The power supply chassis is provided with a 6 foot two conductor cord with plug for connection to the AC source.

One side of the primary circuit of power transformer T9 is fused with a 3 amp fuse and one side of the primary circuit of the pushbutton tuning transformer T10 is fused with a 1 amp fuse. The primary of T10 is connected across the AC line at all times so that voltage is always available to operate the AC-ON-OFF relay.

The primary circuit of the power transformer T9 is closed when the power ON-OFF relay K2 is thrown to the ON position by pushing the ON button at the front panel. One side of this primary circuit connects to terminal 10 of speaker receptacle J2. When the speaker plug P4 is inserted into the receptacle, the jumper wire between terminals 9 and 10 of the speaker plug completes the AC circuit to terminal 1 of the receiver receptacle J3 through the switch on relay K2 then back through terminal 4 of receiver receptacle J3 to the power transformer. The AC power circuit is fed through the speaker receptacle J2 so that if the speaker plug is removed when the power is on, the primary circuit is automatically broken and no damage can be done to the high voltage rectifiers. Capacitor C96 is provided to filter out any noise entering through the primary circuit of the power transformer. Receptacle J1 is provided for connection of the AC plug on the record changer. This receptacle is connected across the primary circuit of the power transformer and is active only when the receiver is turned ON.

One secondary of the power transformer furnishes high voltage for the full wave rectifier plates. Another winding furnishes filament voltage for the rectifier tubes V23 and V24. A third winding furnishes heater voltage for all tubes in the power supply chassis except the rectifiers. A fourth winding furnishes heater voltage for all tubes on the receiver chassis.

The rectified voltage from the rectifier tubes V23 and V24 is filtered by a two section filter and fed to the plate of the power output tubes V20 and V21 through the primary of output transformer T8. This voltage is also fed through terminal 2 of speaker receptacle J2 and plug P4 to the 675 ohm field of the loudspeaker; from the field it feeds back through the speaker plug and receptacle terminal 4 and fed to the plates of V19A and V19B and the screens of V20 and V21. From this point a dropping resistor R92 reduces the voltage to the proper potential for all other tubes in the receiver.

The voltage regulator tube V22-0D3 (VR-150) is included in the power supply circuit to provide stabalized voltage for the AM and FM oscillator tubes so that variations in line voltage will not affect the frequency setting of the oscillator circuits.

4.11 Loudspeaker Circuits

The loudspeaker used with the Model 800-B Radio-Phonograph may be either a coaxial type or an extended range single speaker. Both speakers have the same field characteristics. A 675 ohm series field connected to terminals 2 and 4 of speaker plug P4 and a 9000 ohm shunt field connected to terminals 4 and 6. The coaxial speaker consists of a 15 inch low frequency speaker with a 5 inch FM tweeter mounted in the center. A network is used with the high frequency tweeter so that it will reproduce only the higher frequencies. The voice coil impedance of the coaxial speaker is 8 ohms and is connected to terminals 3 and 5 of speaker plug P4. One side of the tweeter circuit is connected to terminals 7 and 8 of the speaker plug which feed through the speaker receptacle J2 to terminals 8 and 11 of the receiver power receptacle J3; then through the cable to switch SW6A on the FM-AM relay. When the switch is thrown to FM position this circuit is closed and the tweeter is effective but when the relay is thrown to AM position the tweeter circuit is open and only the 15 inch low frequency is effective. Since the low frequency speaker will reproduce all frequencies desired for AM broadcasts or record reproduction the tweeter is not used to prevent reproduction of undesirable back ground noise. The 15 inch extended range single speaker has a voice coil impedance of 16 ohms and is connected to terminals 1 and 5 of speaker plug P4, since no tweeter is used, terminals 7 and 8 are open.

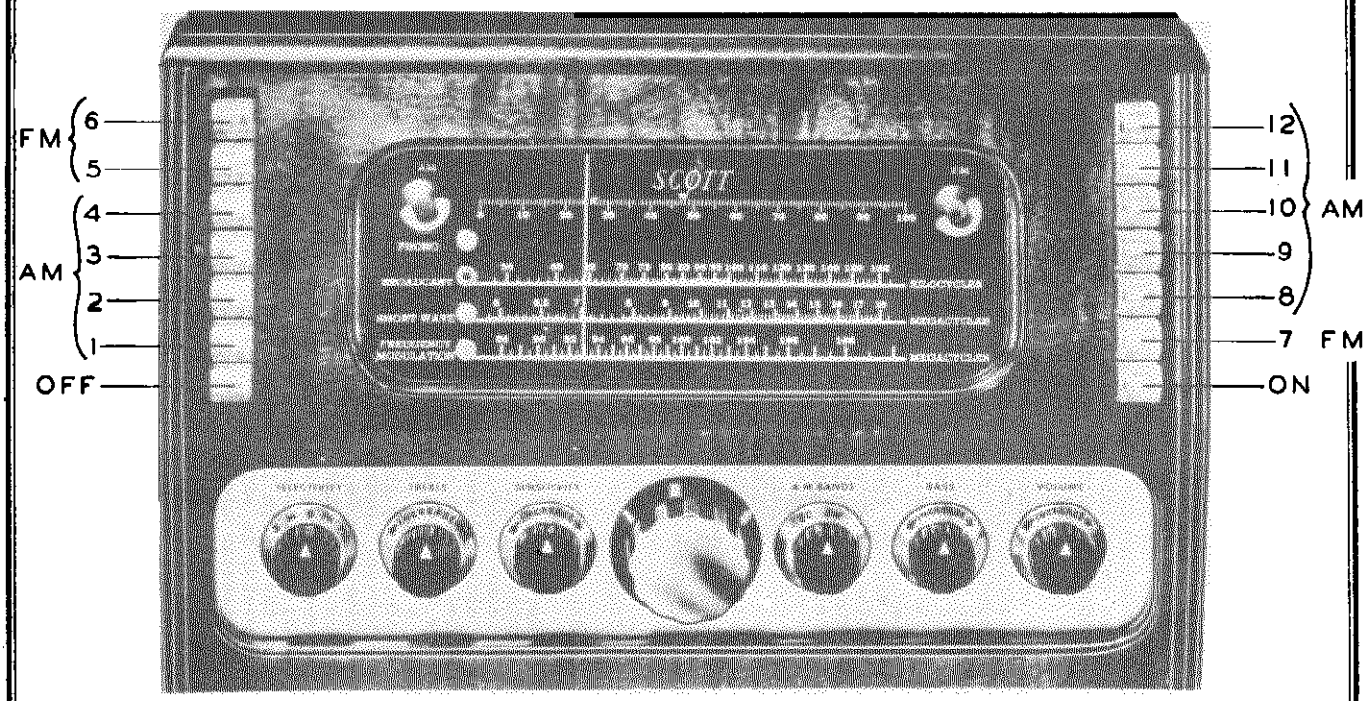

Figure 9 Front View 800-B Receiver Showing Pushbutton Sequence

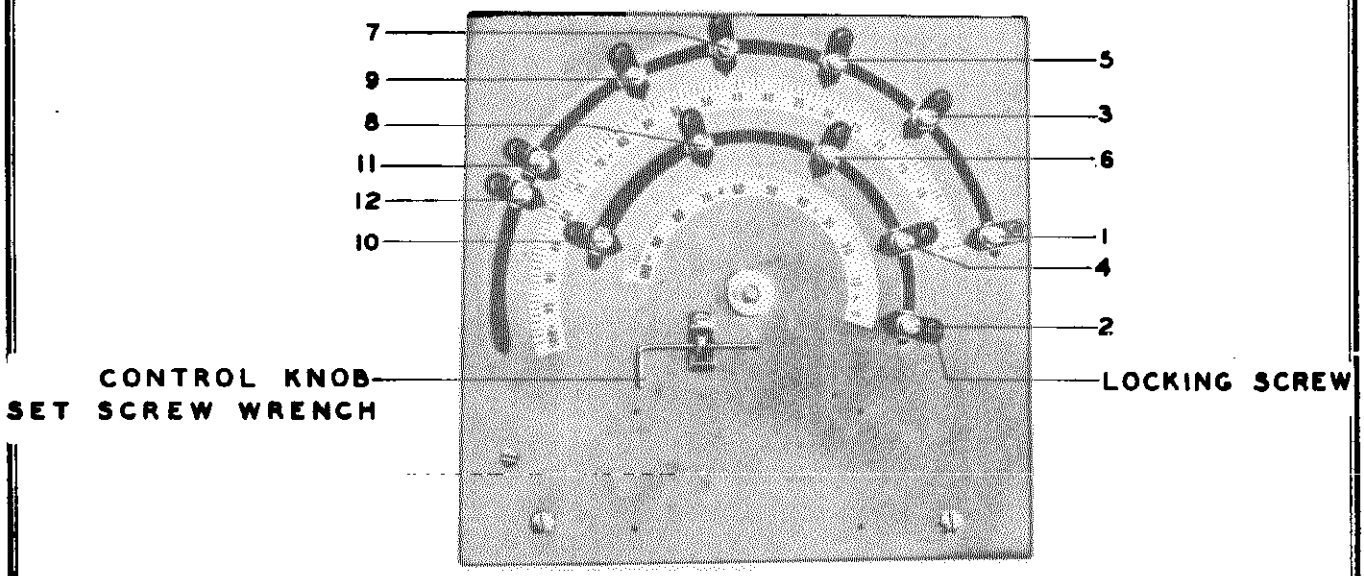

Figure 10 Back View of Pushbutton Tuning System Backplate

4.12 Pushbutton Tuning System Circuits

The pushbutton tuning system in the Model 800-B Radio-Phonograph utilizes 14 pushbuttons, 12 of which are used for station selection and 2 being used to turn the receiver ON and OFF. Figures 29 and 30 depict the circuit diagrams of the systems used in the early models and the present models. The switches used are all single pole single throw, momentary contact pushbutton type. Seven switches are used in each gang located at the right and left side of the panel. Details on setting up and adjusting the pushbutton system are explained in Section V - Adjustments.

Each of the twelve pushbutton switches is connected by a color-coded lead to a terminal board E27 mounted on the under side of the receiver chassis. This terminal board is used as a common tie-point for wires leading to the switches, the backplate contacts and the remote box receptacle.

The backplate is the nerve center of the pushbutton tuning system. It consists of two semi-circular disks insulated from each other by a bakelite strip which has a narrow protrusion rising above the contact surfaces of the disks. The two disks are connected to the two windings of a reversible type motor which is coupled directly to the tuning shaft of the dial. The two disks which form the backplate rotor are coupled directly to the shaft of the main tuning capacitor. On the stator of the backplate are mounted twelve contact fingers with numbered, adjustable knobs. Each of these contacts are connected to a switch on the front panel as shown in Figure 9. On the early Model 800-B Receiver the backplate operates as follows, taking contact No.1 as an example. When pushbutton No. 1 is pushed the switch contacts close and potential from the 36 volt tap of pushbutton tuning transformer T10 is fed through the coil of muting relay K3 to terminal 3 of receiver power receptacle J3, then through receiver plug P1, terminal 3 to switch SW5 on the power ON-OFF relay, then to switch section SW2D of the band change control, to switch section SW3D of the selectivity control, then through lead No. 1 to the common terminal of the tuning motor. The voltage could then flow through either winding of the motor but since contact No. 1 is on the left side of the backplate rotor the voltage will be applied only to that side of the rotor through contact No. 1 to switch No. 1 then through lead No.5 and through coil L18 of the FM-AM relay to chassis ground. It is then returned to the other side of the 36 volt winding of the transformer through chassis ground. When the circuit is energized by closing a pushbutton switch as above the voltage across the coil L22 of muting relay K3 will energize the relay, closing the contacts and muting the audio circuit so that signals are not audible as the dial tunes across them. The voltage flowing through the motor winding causes it to rotate, actuating the dial mechanism and turning the backplate rotor, until the insulated segment rides under the active contact, at this instant the voltage in the circuit is interrupted and the motor stops running releasing the contacts on the muting relay. Since pushbutton No. 1 is connected to the AM common lead, the AM coil of the FM-AM relay would be energized when the circuit was closed thereby switching the AM circuits ON and making the FM circuits ineffective. If pushbutton switches 5, 6 or 7 or any switch which may be connected to the FM common lead were energized, the relay would automatically switch over as the FM coil of the relay would then be energized.

Figure 30 depicts the pushbutton tuning system used in the later model 800-B Receivers. The pushbutton switches are provided with two rows of dummy lugs, one row connected to the AM common lead, the other row connected to the FM common lead, and all that is necessary to use any pushbutton for FM or AM is to connect that switch to the corresponding common lead. It will be observed that the numbers opposite the pushbuttons have been rearranged so that they are in sequence - 1 to 12. Pushbuttons 5, 6 and 7 are still wired for FM when the receivers leave the factory as most of the FM stations are located in the center of the tuning scale but in locations where a frequency at some other part of the dial has been allocated, another pushbutton may be used by disconnecting the jumper wire of that particular switch from the AM common lead and connecting it to the FM common lead. The next item to be observed is the addition of two relays in series with the backplate rotor disk. When either of these relays are energized by voltage applied through the rotor disk, switches SW10 or SW11 are closed completing the motor circuit and turning the dial mechanism. By means of this arrangement very little current is required to pass through the backplate movable contacts thus prolonging their life. It will be noted also that the 36 volt tap of the pushbutton tuning transformer T10 is no longer required, all necessary potential being supplied from the 24 volt tap.

The pushbutton system drive motor is a 24 volt reversible type motor geared directly to the dial drive mechanism.

The power ON-OFF relay is a double solenoid relay with 1 rotary type switch section. When one of the solenoid coils is energized by pushing the ON pushbutton the relay actuates the switch to close the AC primary circuit of the power transformer and also closes the 24 volt circuit to the drive motor. When the other solenoid coil is energized by closing the OFF pushbutton, both of the above circuits are opened. Both solenoid coils operate at 24 volts AC.

The FM-AM relay is a double solenoid relay with 2 rotary type switch sections that operate 6 circuits. When one coil is energized by closing any AM pushbutton switch all circuits close to operate for AM reception, when the other solenoid coil is energized by closing any FM pushbutton switch, the circuits close to operate for FM reception. Both solenoid coils operate at 10 volts AC on the early model receivers and on all late model receivers with the relays in the drive motor circuit. The solenoid coils of the FM-AM relay operate at 22 volts AC.

The muting relay used in the 800-B Receiver is actuated by the voltage used to run the drive motor. The switch is a S.P.S.T. with contacts normally open. The coil operates on 2.4 volts AC.

The drive motor relays are identical in electrical characteristics to the muting relay although in some receivers the mechanical construction will be different.

The remote keyboard receptacle J6 is a 21 contact receptacle provided for the connection of a remote keyboard when it is desired to tune the receiver from a remote position. By means of this remote keyboard it is possible to tune in up to 12 stations, control the volume and turn the receiver ON and OFF. When the remote keyboard is to be used, a motorized volume control with the necessary connections is installed in the 800-B Receiver.

Section V ADJUSTMENTS

5.1 Setting up Pushbutton Tuning System

The pushbutton tuning system in the 800-B Receiver has been designed to provide maximum flexibility in order to permit setting up for 6 or more AM stations and 1 to 6 FM stations, the only limitations being the spacing of the stations on the tuning dial or the setting for an AM station falling on the same spot as that for an FM station. At the factory the receivers are wired so that 4 buttons on the left side of the panel and the 5 top buttons on the right side are wired for AM stations and the lower button on the right side with the two top buttons on the left side are wired for FM stations as shown in Figure 9. No attempt should be made to set up the pushbutton tuning system for weak distant stations as poor results will be obtained because of background noise.

The switch over from AM to FM reception is done automatically in the receiver, that is, with the receiver adjusted for pushbutton tuning, when any AM button is pushed the receiver is automatically set for AM reception and when any FM button is pushed the receiver is automatically switched for FM reception.

The pushbutton tuning drive unit is located at the rear of the receiver chassis. This unit has 12 adjustable knobs which are numbered 1 to 12. These knobs are set to the desired position by turning them clockwise or counter-clockwise with a rotary motion. They are locked in position by means of a small screw, adjacent to the knob. These small lock screws should never be tightened more than one turn past the point where the screw touches the backplate. If tightened more the setting of the knob will be changed. Two calibrated scales located below the two rows of knobs, are provided to enable setting the knobs in conjunction with the logging scale at the top of the front dial scale. Each of the pushbuttons on the front panel is wired to the corresponding knob on the backplate in the sequence shown in Figure 9. The following procedure should be followed in setting up the pushbutton tuning system.

1. Set the Selectivity control to "M" position and the AM-Band control to "BC" position.

2. Select the lowest frequency AM station to be set up and insert the tab for this station in pushbutton No. 1.

3. Tune in the desired station manually and note the setting of the dial pointer on the logging scale at the top of the dial.

4. Set knob No. 1 on the backplate to the corresponding number noted on the logging scale, and lock the knob in place by means of the small screw directly above it. CAUTION: Never tighten the small locking screw more than one turn past the point where it touches the backplate; if tightened more the setting of the knob will be changed.

5. As a check to ascertain that the knob is set correctly, manually set the dial pointer to a higher frequency, then push button No. 1 until the pointer stops and check this setting against the original reading on the log scale. Repeat this operation after setting the dial to a lower frequency. If the both readings are higher or both readings lower than the original log scale reading for this station then the No. 1 knob must be moved slightly to correct for the error in reading. If the two readings are spaced equally one-half a division or less on both sides of the original station setting, as read on the log scale, the adjustment has been correctly made.

6. The above operation should be repeated for each pushbutton to be set up, starting with button No. 1 for the lowest frequency station and working up consecutively to button No. 12 for the highest frequency station. Pushbuttons 5, 6 and 7 can be used only for FM reception and when any of these buttons are pushed the receiver will automatically switch over to FM reception.

NOTE: The pushbutton tuning system will work only when the Selectivity control is set at "M" or "B" positions and the AM-Band control is set at "BC" position. If the pushbutton system does not work when the controls are set as above, replace the 1 amp fuse in the power supply. Refer to Figure 21 for location.

5.2 Connecting Pushbutton Switches for AM or FM Operation

When more than 3 FM stations or more than 9 AM stations are desired, by connecting the pushbutton switches as outlined below, any of the 12 pushbuttons may be set up for either an AM or FM station.

On the first Model 800-B Radio-Phonographs produced, the pushbutton switches were connected as shown in Figure 11. It will be noted that on the left hand switch gang, one side of switches 1-2-3-4-8-9 are all connected to the black AM common lead, therefore, all these switches will operate on AM stations. If it is desired to connect one or more of the switches on the left hand side for FM stations, it will be necessary to disconnect the switch or switches required from the black AM common lead and connect them over to the white FM common lead on the right hand switch.

On the right hand switch gang, one side of switches 5-6-7 are connected to the white FM common lead, therefore, these three switches are used to set up FM stations. One side of switches 10-11-12 are connected to the white-red dot AM common lead and are used to set up AM stations. In order to use anyone of these switches for an FM station, disconnect that switch from the AM common lead and connect it to the FM common lead. In this manner any one of the twelve pushbutton switches may be connected for operation on either AM or FM.

On the later Model 800-B Radio-Phonograph, the switch gangs have been provided with 2 dummy lugs on each section; one row of dummy lugs are connected to the AM common lead, the other row of dummy lugs are connected to the FM common lead and all that is necessary to connect any pushbutton for operation on AM, is to connect that switch to the AM common lug and for FM operation connect it to the FM lug. It will be noted by observing Figure 12 that the pushbuttons are now numbered in sequence 1 to 12 starting at the bottom pushbutton on the left side of the panel.

Table 1 Trouble Location Chart

Symptom	Cause	Remedy
Set fails to switch ON or OFF	Blown 1 amp or 3 amp fuse	Replace defective fuse
	Defective switch contacts on ON-OFF relay	Adjust contacts on switch or replace switch section
	AC ON-OFF relay inoperative	Check relay connections
		Put drop of light oil on rotor shaft bearing
Set operates but pushbutton system fails to operate	Blown 1 amp fuse	Replace defective fuse
	Defective switch contacts on ON-OFF relay	Adjust contacts on switch or replace switch section
Set weak or dead on all bands	Blown 3 amp fuse	Replace defective fuse
	Defective tube in audio amplifier or rectifier	Replace with good tube
	Defective speaker	Check continuity of voice coil
		Check continuity of field coils
		Check components and connections of network on coaxial speakers
	Socket voltages wrong	Check associated bypass capacitors
		Check associated resistors
		Check continuity of associated wiring
	Defective switch contact	Clean and adjust defective switch or replace switch section
Set weak or dead on one band only	No signal	Check all coils on specific band
		Check switch contacts on specific band
		Check all tubes used for specific band
		Check FM-AM relay

Table 1 Trouble Location Chart (Continued)

Symptom	Cause	Remedy
Noisy reception	Defective tube	Tap all tubes lightly and replace any that are noisy
	Defective component	Tap all components lightly with insulated rod. Check carefully suspected parts
	Defective antenna	Check antenna installation, lead-in and connections
Oscillation	Defective tube	Replace tubes one at a time
	Open bypass capacitor	Connect good capacitor across suspected unit temporarily Replace defective unit
Hum	Defective tube	Replace tubes one at a time
	Defective electrolytic filter capacitor	Replace defective unit
	Defective bypass capacitor	
	Transformer lamination buzz	Tighten screws on power transformer and 46 volt transformer
		Insulate 46 volt transformer from bottom cover plate with tape
		Mount power supply on rubber or felt

Section VI MAINTENANCE AND REPAIRS

Lubrication

There are very few moving parts on the Model 800-B Radio-Phonograph that will require lubrication more often than once a year with the possible exception of the record changer and this will depend on the amount of use the record changer receives. The manufacturers recommendations on lubrication as outlined in the instruction book packed with each record changer should be followed. A drop or two of #10 oil on the receiver slide rails and record changer compartment once a year will keep these parts working smoothly. In addition a drop of #10 oil should be applied to the dial tuning shaft bearing and the FM-AM relay and power ON-OFF relay bearings.

6.4 Pushbutton Tuning System Maintenance

Although there are very few moving parts in the pushbutton tuning system which will require frequent adjustment or maintenance the following information is outlined to assist in keeping the system in good working condition.

1. Pushbutton switches

A little carbon-tetrachloride, applied with a clean cloth or a small brush while the switch is worked back and forth, will keep the contacts clean.

2. Drive motor and remote volume motor

The clutch release spring on the back of these motors at the end of the rotor shaft may need adjusting to keep the clutch from chattering. A pair of long nose pliers should be used for this adjustment. If the clutch chatters when the motor is driving the dial, apply more pressure by bending the spring in toward the motor frame. If the clutch fails to release soon enough when the backplate insulator segment reaches the contact, the disk may override the contact and start to reverse. To remedy this fault pressure on the clutch release spring should be loosened by bending the spring out slightly. These same adjustments apply to the remote volume control motor on receivers which have this motor installed.

3. FM-AM relay and power ON-OFF relay

The switch contacts on these relays should be cleaned by applying carbon-tetrachloride with a clean cloth or small brush. The contacts may need slight adjustment at times for if they are too loose, poor contact will result and some of the circuits will not work or if they are too tight the relay may stick and refuse to throw to the proper position. Caution should be exercised when adjusting these contacts in order to maintain proper contact.

4. Muting relay and motor control relays

Since these relays are of very simple construction no adjustment should ever be necessary on them, however the switch contacts may need cleaning at times and the best method of doing this is to use a narrow strip of clean cloth with a little carbon-tetrachloride, burnishing the contacts with a back and forth motion.

5. Backplate contacts and rotor disk

The backplate contacts and rotor disk will be subjected to more wear than any other part of the tuning system. Maintenance will consist essentially in keeping the contacts and rotor disk surfaces clean and maintaining proper contact between the rotor disk and the movable contacts.

In order to clean or adjust the backplate contacts it is necessary to remove the backplate and the rotor disk from the receiver as follows:

1. Remove the horseshoe clamp washer from the end of the rotor disk shaft.
2. Remove the two screws holding the bottom of the backplate to the chassis and the two screws holding the brackets of the backplate to the top of the chassis base.
3. Loosen the two set screws which hold the rotor disk to the flexible coupling.
4. Pull the backplate away from the receiver chassis and remove the rotor disk.
5. The contacts and rotor disk can be cleaned by wiping them with a clean cloth using carbon-tetrachloride. The contacts should then be adjusted so that the tip of the contact is 11/16" from the inside surface of the backplate.

   If the insulating segment is badly worn it can be easily replaced by removing the segment at the end of the insulating strip marked with the Figure 1 and replacing with a new segment.
6. The rotor disk can now be reinserted into the backplate bearing and the flexible coupling, and the backplate fastened back onto the receiver chassis. Then insert the clamp washer back onto the rotor shaft.
7. In order to properly position the rotor disk so that the original setting of the contact knobs will still be the same, proceed as follows:
   1. Set the No. 1 contact knob at the extreme end of the top slot in the backplate.
   2. Set the dial at approximately 600 kilocycles or 20 on the logging scale.
   3. Set the rotor disk so that the end with the insulated segment marked 1 is slightly above center and tighten down one of the set screws in the flexible coupling.
   4. With the receiver turned ON, press pushbutton No. 1 and run until the backplate rotor disk stops.
   5. Loosen up the set screw in the coupling being careful not to change the position of the rotor disk, then while holding the rotor disk firmly so that it will not move, turn the dial tuning knob until the dial pointer is at the extreme left side of the scale.
   6. Tighten down both set screws in the flexible coupling. The backplate will now be in the original position as set at the factory and if the contacts have not been moved all the previous contact knob settings should remain the same.

6.5 Record Changer Maintenance

For information on adjustments and lubrication the instruction manual furnished with the record changer should be consulted.

On most of the pickup cartridges furnished with the record changers, the needle is held in place by means of a set screw. If this set screw becomes loose the needle may turn sideways in the cartridge and will not seat properly in the needle groove or will sound distorted. The needle furnished is of the precious metal, long life type and if it is found necessary to replace it or if it becomes loose in the cartridge, remove the two screws holding the cartridge in the pickup arm and drop the cartridge out of the arm. The set screw can be loosened and the needle either replaced or set at the proper position again. The bent shank portion of the needle should face straight out from the pickup cartridge. Caution should be used in replacing the needle not to apply too much pressure on the set screw as this may cut through the plastic shank of the needle and ruin the reproduction.

6.6 Voltage and resistance tests

Table 2 lists the tube socket voltages for various settings of the controls. All voltages are measured between the chassis and socket terminals. Voltage measurements listed are made with a DC voltmeter of 1000 ohms per volt using the highest range scale that can be easily read. The receiver should be connected for normal operation and the controls adjusted as listed in Table 2. Line voltage should be 115 volts 50-60 cycles. Resistance measurements are listed in Table 3. All resistance measurements are made between chassis and terminals listed. The most suitable scale for the measurement being taken should be used. The receiver should be disconnected from the power source with controls adjusted as follows: Selectivity - sharp, Treble - max., Sensitivity - as listed, AM Band-as listed, Bass - max., Volume - as listed.

Section VII ALIGNMENT DATA

7.1 General

Should realignment of the receiver become necessary the following data should be carefully studied before making any circuit adjustments so that correct alignment may be made quickly and accurately.

The complete alignment of the radio receiver may be divided into the following steps. The circuits should be checked in the order listed.

Amplitude Modulation Channel

1. AM-IF amplifier alignment
2. AM oscillator alignment
3. AM-RF amplifier alignment

Frequency Modulation Channel

1. FM-IF amplifier alignment
2. FM discriminator alignment
3. FM oscillator alignment
4. FM-RF amplifier alignment

The receiver must be removed from the cabinet and connected as for normal operation on the power source specified for the receiver. The bottom plates must be removed from the receiver and power supply chassis and for realignment of the FM-RF circuits, the cover over the main tuning capacitor must be removed.

7.2 AM Circuit Alignment

For alignment of the AM circuits the controls should be adjusted as follows:

1. Selectivity control set at "S" Sharp position.
2. Sensitivity control advanced to maximum point just beiore the noise limiter switch throws.
3. Band change control set to "BC" or "SW" band as noted.
4. Bass and treble controls set at maximum position.
5. Volume control set as noted.

7.21 AM-IF Amplifier Alignment

The intermediate frequency of the AM-IF channel is 455 kilocycles.

Tuning adjustments are provided in each transformer. These adjustments consist of adjustable powdered iron cores and are designated on the circuit diagram by symbols E9 to E13 inclusive. All adjustments for the AM-IF channel are on the receiver chassis.

An output meter must be connected across the voice coil leads of the speaker on terminals 3 and 5 of the speaker receptacle in the power supply chassis when the 15 inch Jensen coaxial speaker is used or across terminals 1 and 5 when the 15 inch Tru-sonic single speaker is used. This connection is changed for different speakers because of the difference in voice coil impedance which is 8 ohms for the Jensen coaxial speaker and 16 ohms for the Tru-sonic speaker.

The high potential lead of the signal generator should be connected to the control grid (terminal #8) of the AM mixer, tube V3-6SA7 through a .005 to .05 mfd capacitor and the ground lead of the signal generator connected to any metal part of the chassis. The volume control should be advanced to a point where the noise level of the receiver starts to indicate on the output meter.

The frequency of the signal generator should be carefully adjusted to 455 kilocycles, modulated 30% at 400 or 1000 cycles and the signal input to the mixer tube adjusted to provide a reading on the output meter. The signal input should be kept at a low level so as not to overload the second detector or audio circuits and to keep the AVC voltage as low as possible. If a high signal level is used the AVC voltage developed by the second detector may become so high as to cause the trimmer adjustments on the IF transformer to appear very broad in tuning and a false indication of true resonance will result.

Starting with the 3rd IF transformer the adjustments should be set for maximum output in the following order E13, E12, E11, E10 and E9.

The sensitivity of the IF amplifier can be checked against the following figures to ascertain that each stage is in proper working order.

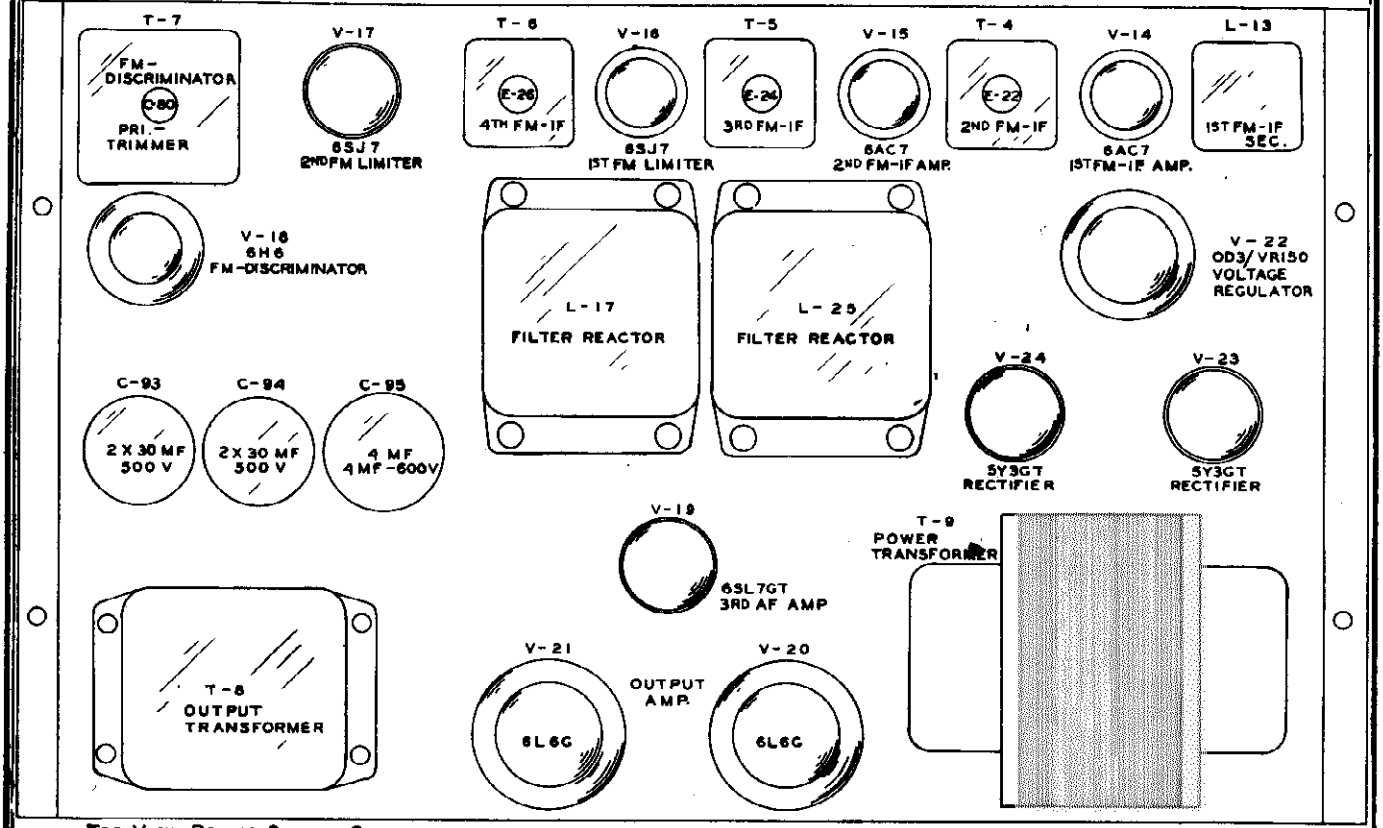
Input Terminal	Signal Input Microvolts	Output Mod. On	Output Mod. Off
2nd IF V5 Grid	6000	1 volt	.1 volt or less
1st IF V4 Grid	200	1 volt	.1 volt or less
Mixer V3 Grid	35	1 volt	.1 volt or less

The above measurements are made at a 10 db signal to noise ratio with the output voltage shown measured across an 8 ohm voice coil. If the speaker has a 16 ohm voice coil the voltage with Mod. ON will be 1.4 volts and with Mod. OFF .14 volts.

The selectivity control should be set at "S" (Sharp) position, Sensitivity control at maximum with noise limiter switch off and Volume control at maximum. The oscillator tube V2-6J5 should be removed.

MODEL 800-B

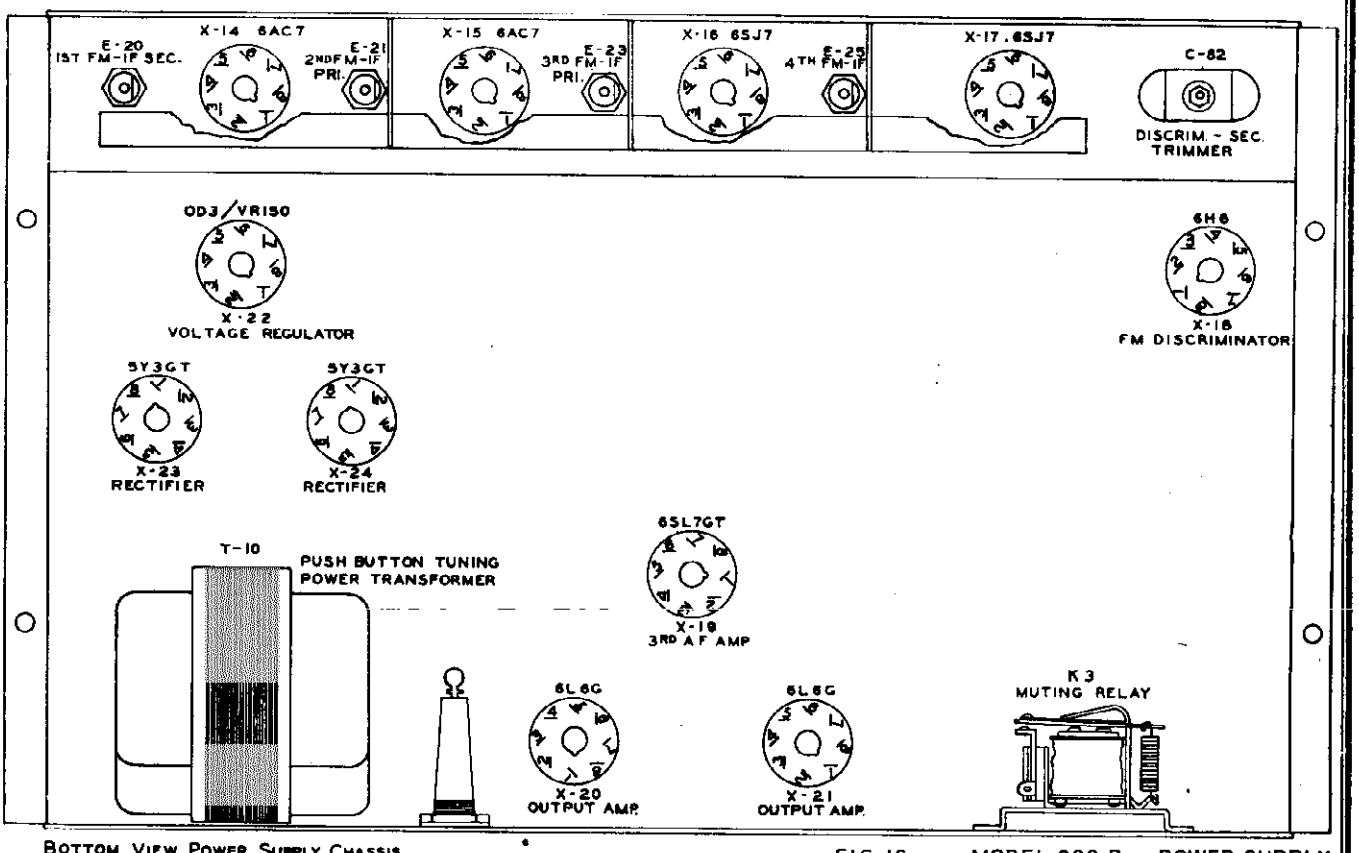
SCOTT RADIO LABS. INC.



TOP VIEW POWER SUPPLY CHASSIS

FIG. 15

MODEL 800 B - POWER SUPPLY TUBE AND TRIMMER LOCATION



BOTTOM VIEW POWER SUPPLY CHASSIS

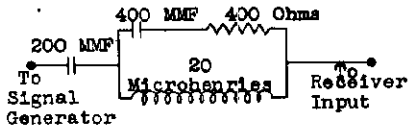
FIG. 16

MODEL 800 B - POWER SUPPLY SOCKET & TRIMMER LOCATION

7.22 AM-RF and Oscillator Alignment

Caution: Readjustment of the oscillator circuit trimmers should not be attempted until after the need for such readjustment has been positively established. The following table gives the alignment frequency, trimmer adjustments and nominal sensitivity for the "BC" and "SW" bands. Sensitivity measurements are for a 6 db signal to noise ratio.

Band	Freq.	Adjustment			Signal Input	Output Mod.ON	Output Mod. OFF
		Osc.	Mixer	Ant.			
BC	1500 KC	C6	C15	C1	5 uv	1 Volt	.5 V or less
	1000 KC	E5			5 uv	1 Volt	.5 V or less
	600 KC	C8	E7	E3	5 uv	1 Volt	.5 V or less
SW	16 MC	C10	C16	C2	8 uv	1 Volt	.5 V or less
	6.5 MC	E6	E8	E4	8 uv	1 Volt	.5 V or less



The signal generator should be connected through a standard RMA dummy antenna to the AM antenna input terminal E1. The center terminal of E1 should be connected to the ground terminal with a short jumper wire. The controls should be set as follows:

1. Selectivity control set to "S" (Sharp) position.
2. Sensitivity control set at maximum position with noise limiter switch off.
3. Bass and treble controls set at maximum.
4. AM Band control set to band desired.
5. Volume control set as noted.

It is important that the oscillator circuits operate on the high frequency side of the signal circuits, particularly on the SW Band where the trimmer will allow the oscillator circuit to be resonated on either the high or low side of the signal circuits. When properly aligned the image will appear 910 KC lower in frequency than the signal being received and it will be considerably weaker than the signal, therefore, it will be necessary to increase the output of the signal generator in order to check the image.

The following general procedure should be employed in the alignment of the AM oscillator and RF amplifier circuits.

1. Turn dial to extreme left side of scale and make certain that the pointer lines up with the zero designation on the top logging scale
2. Set the signal generator to the high frequency alignment point of the desired band.
3. Set the dial pointer of the receiver to the high frequency alignment point of the desired band.
4. Adjust the oscillator trimmer capacitor until the signal is tuned in to resonance, then adjust the mixer and antenna circuit trimmer capacitors for maximum reading on the output meter.
5. Set the signal generator and receiver dial pointer to the low frequency alignment point.
6. Set the low frequency oscillator trimmer adjustments outlined in chart ~~on Page 42~~ until the signal is tuned to resonance, then adjust the mixer and antenna adjustments for maximum output.
7. Repeat this entire alignment procedure as a final adjustment.

On the BC band an adjustment E5 is provided for alignment of the oscillator circuit at 1000 KC. This adjustment should not be altered unless the calibration of the BC Band is still off frequency after the trimmer adjustments for the high and low frequency ends of the band have been adjusted.

7.3 Frequency Modulation Circuit Alignment

7.31 FM-IF Circuit Alignment

For alignment of the FM circuits the controls should be adjusted as follows:

1. Turn receiver on and push one of the FM pushbuttons to switch the receiver over to FM reception.
2. Set bass and treble controls at maximum position.
3. Adjust volume control as noted.

7.32 FM-IF Amplifier Alignment

The intermediate frequency of the FM channel is 10.7 megacycles. Tuning adjustments are provided in each IF transformer. These adjustments consist of powdered iron cores in the IF transformer and variable air capacitors in the discriminator transformer. These adjustments are designated by symbols E17 to E26 inclusive for the IF transformers and C80 and C82 for the discriminator transformer. The 1st FM-IF transformer primary adjustment E17 is located on the receiver chassis. The other adjustments are located on the power supply chassis.

The high potential lead of the signal generator should be connected to the control grid (Pin #4) of FM mixer tube V13-6AQ5 through a .01 mfd capacitor, and the ground lead connected to the chassis frame. A high resistance DC voltmeter such as the RCA Volt-ohmyst should be connected across the second limiter filter resistor R72.

Set the signal generator to 10.7 megacycles and feed in a signal with modulation OFF until the meter reads 1.5 volts.

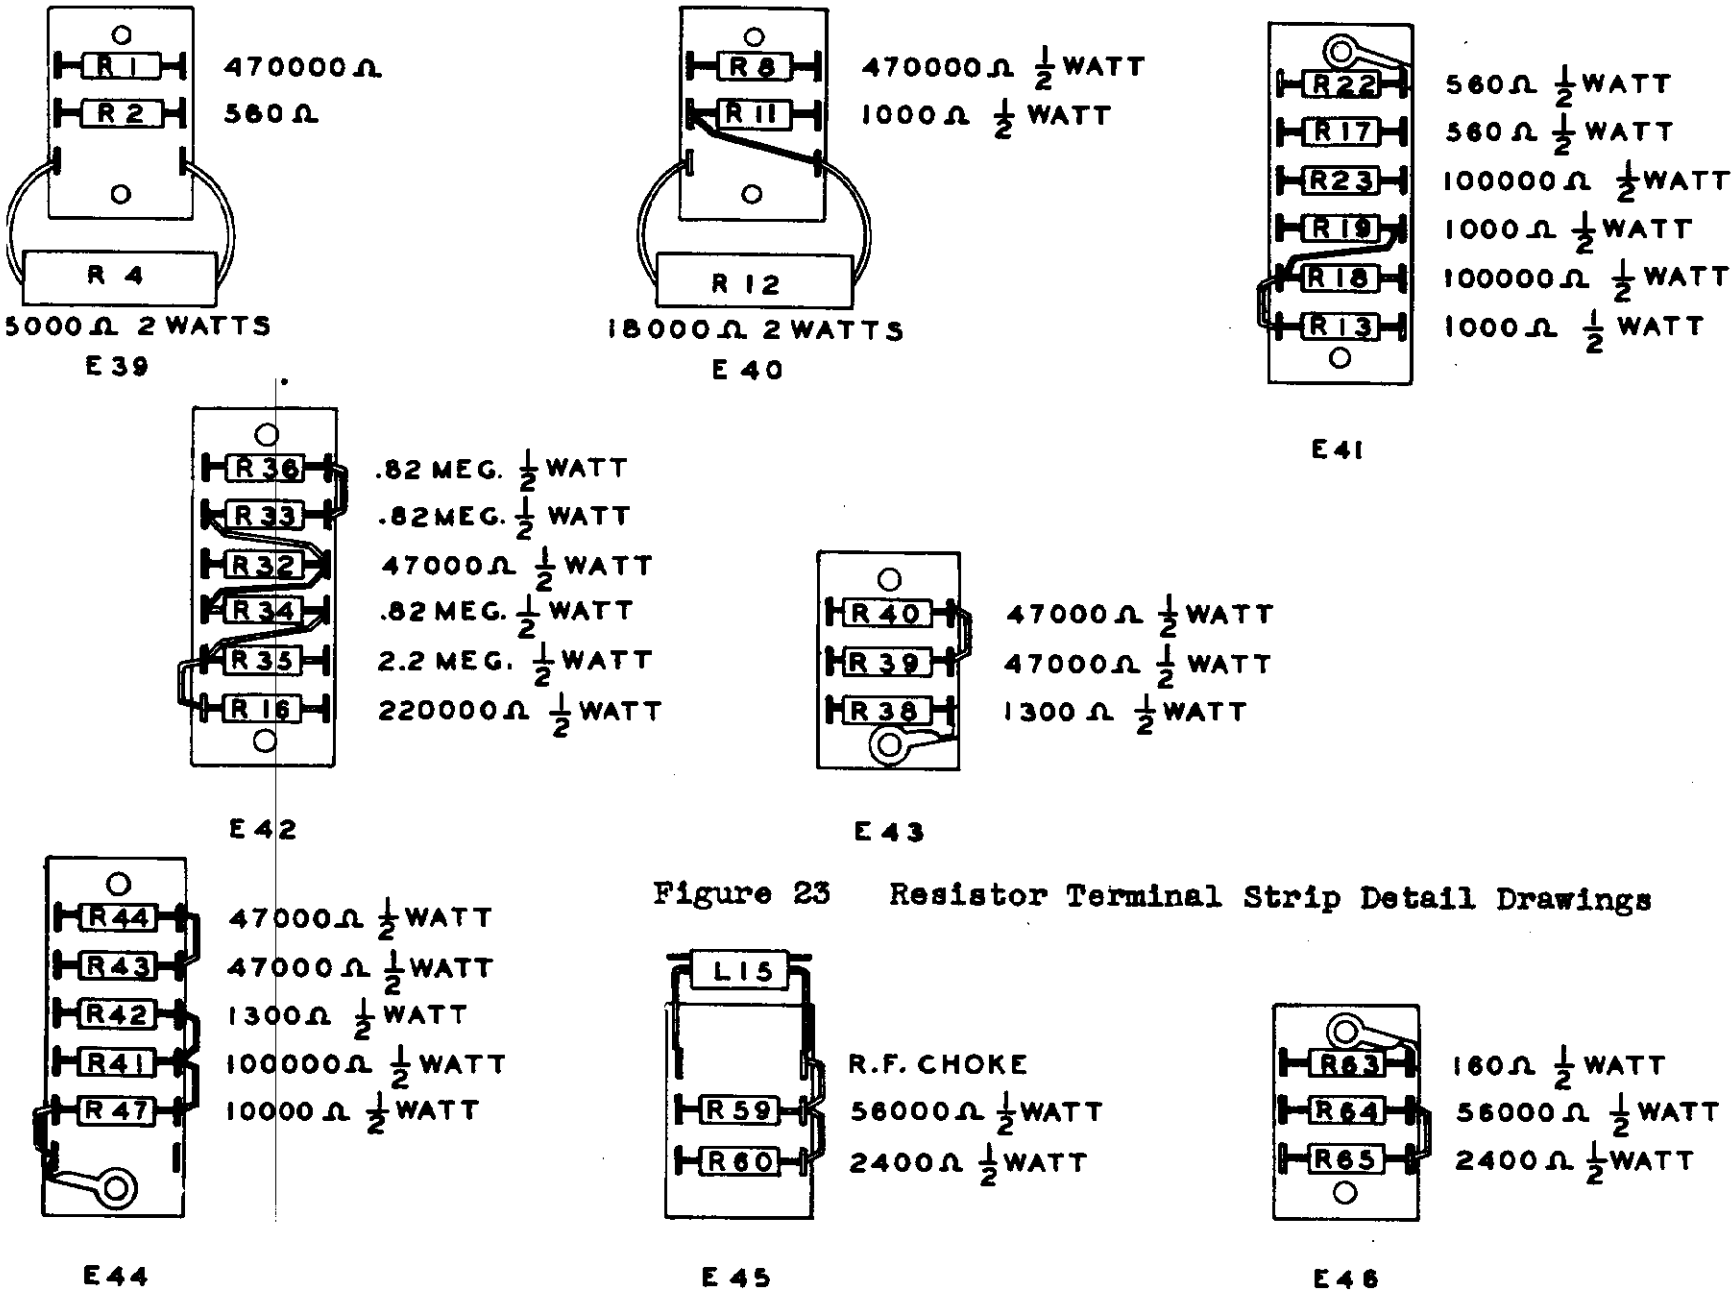


Figure 23 Resistor Terminal Strip Detail Drawings

SCOTT RADIO LABS. INC.

Starting with the 4th IF transformer T6, adjust the trimmers in the following order: E26, E25, E24, E23, E22, E21, E20 and E17. Each trimmer should be adjusted for maximum meter reading, keeping the input from the signal generator at a point where not more than 1.5 volts output is obtained on the meter. It is important to keep the signal input down so that meter does not read more than 1.5 volts as above this the limiters start to level off and the IF adjustments will act very broad and cannot be set to the true resonant position.

7.33 FM Discriminator Circuit Alignment

Set the signal generator at 10.7 megacycles and connect to the grid (Pin #4) of mixer tube V13-6AG5 through a .01 mfd capacitor. Connect the Volt-ohmyst or equivalent meter to the discriminator diode output at the junction of R78 and C84 to ground. If a volt-ohmyst or equivalent meter with polarity reversing switch is not available a zero center 50-0-50 microammeter can be used.

If the discriminator is correctly aligned the meter will read zero when the signal generator is set to 10.7 megacycles. If the meter reads either plus or minus realignment is necessary. The secondary trimmer C82 at the bottom of the discriminator transformer should be detuned so that the meter reads either plus or minus. The primary trimmer C80 at the top of the transformer should then be realigned for maximum output. The secondary trimmer C82 should now be carefully adjusted for zero reading on the meter.

Next adjust the signal generator 75 KC higher in frequency or 10.775 MC and record the reading of the meter. Then set the signal generator 75 KC lower in frequency or 10.625 MC and record this reading of the meter. These two readings should be identical, if they are not a slight readjustment of the primary trimmer C80 should be made to coincide these readings at plus and minus 75 KC from 10.7 megacycles. The zero voltage setting of the secondary trimmer C82 should then be rechecked for if this adjustment is not correctly made distortion on FM signals will result.

7.34 FM-RF and Oscillator Circuit Alignment

All the trimmer adjustments for the FM-RF and oscillator circuits are located on the top of the receiver chassis and it is necessary to remove the cover over the main tuning capacitor for access to these trimmer adjustments.

The signal generator should be connected to the FM antenna terminal E2 with a 50 ohm carbon resistor in series with the high potential lead of the generator and the center antenna terminal of E2 shorted to the ground terminal.

The FM oscillator circuit operates on the low side of the signal circuits and no trouble with aligning the oscillator circuit on the image should be encountered since it will be twice the IF frequency or 21.4 megacycles away from the signal frequency and the trimmer capacitor will not allow this much variation. The following chart lists the trimmer adjustments.

The high resistance DC voltmeter should be connected across the second limiter grid filter resistor R72. The sensitivity measurement given in the chart below is for 1.8 volts output as read on the high resistance DC voltmeter.

Band	Freq. MC	Adjustment			Sensitivity
		Osc.	Mixer	Ant.	
FM	106	C43	C49	C39	15 microvolts for 1.8 volts
	90	E15	E16	E14	Across limiter resistor R72

INSTALLATION AND SERVICE DATA ON REMOTE CONTROL
KEYBOARD FOR USE WITH MODEL 800-BR RADIO-PHONOGRAPH

Remote Keyboard

The remote control keyboard is provided in order that the Model 800-BR Radio-Phonograph may be controlled from remote points in the same room or in other rooms of the house. It is provided with 16 pushbuttons, 12 of which are used to tune in stations exactly the same as the push-buttons on the front panel of the receiver. Two buttons are used to turn the receiver ON and OFF and the two remaining pushbuttons are used to raise and lower the volume of the receiver as shown in Figure 1.

The remote keyboard was designed for use with the Model 800-BR Receiver which is the same as the Model 800-B with the addition of a motor driven volume control. The keyboard will however, work with the standard Model 800-B Receiver chassis without any changes having to be made in wiring. However, the volume cannot be controlled from a remote point. The receiver cannot be turned ON or OFF from the keyboard and the indicator lamp in the keyboard will not light.

The keyboard is provided with 20 feet of flat cable and a 21 contact plug which inserts into the 21 contact receptacle at the rear of the receiver. Any length of cable can be furnished upon request.

For installations where the keyboard is to be located in one or more positions remote from the room where the radio-phonograph is placed, an outlet box with a 21 contact receptacle should be mounted in the wall behind the radio-phonograph. This receptacle can then be connected to one or more receptacles located in different parts of the house by means of a round multi-conductor cable, all receptacles being wired in parallel. If more than one remote outlet box is used, a junction box should be used to terminate the cables from all outlets to facilitate wiring and servicing. A short piece of flat cable with 21 contact plugs on both ends is then inserted between the receptacle on the chassis and the receptacle in the wall at the rear of the radio-phonograph. A keyboard may then be inserted in any of these receptacles and the receiver operated from any point.

The pictorial diagram of the keyboard is shown in Figure 2 which shows the contact layout with the connections numbered to correspond with the numbers of the connections on the 21 contact plug. The schematic diagram of the keyboard is shown in Figure 3.

The keyboards are wired at the factory so that buttons 5, 6 and 7 are used to select FM stations while buttons 1, 2, 3, 4, 8, 9, 10, 11 and 12 are used to select AM stations. Any of the buttons now wired for FM may be used for AM station selection by disconnecting the jumper wire for that particular button from the FM common lead No. 15 and connecting the jumper wire to the AM common lead No. 13 and by reversing this procedure any of the buttons now used for AM can be used for FM. If the pushbuttons on the receiver have been changed so that more AM or FM stations can be tuned in, after the set has been received from the factory, it will be necessary to make the same changes on the keyboard pushbuttons as the receiver will not operate properly, for example:

If button No. 5 has been changed to tune in an AM station on the receiver push-button switch gang, when the keyboard is plugged in and button No. 5 is pushed the set will switch over to FM reception and if no FM station happens to be located at the point on the dial scale where button No. 5 contact is set nothing will be heard but background noise, therefore, it is necessary to change the wiring of No. 5 switch in the keyboard from the FM common lead over to the AM common lead, then button No. 5 on the keyboard will tune in exactly the same station as button No. 5 on the receiver chassis.

The two buttons marked ON and OFF are provided to control the volume of the receiver without having to go all the way back to where the receiver is located. The two buttons on either side of the lamp bezel are used to turn the receiver ON and OFF. The button on the right side turns the set ON while the button on the left side turns it OFF. When the receiver is turned ON, the indicator in the keyboard will glow.

The lamp used for the indicator is a standard 30 volt switchboard lamp which has a very long life. It can easily be replaced when necessary by removing the four screws on the bottom of the keyboard, removing the bottom plate then sliding out the old lamp and inserting the new one.

REMOTE VOLUME CONTROL MOTOR

The remote volume control motor consists of a reversible type motor operating on 24 volts 60 cycle AC. This motor drives the volume control through a gear train and a clutch. The shaft of the intermediate gear is extended in order that the volume control may be manually operated at the front of the receiver. The clutch is provided in order that damage will not be incurred if the motor is kept running momentarily after the volume control has reached the end of its travel.

The schematic diagram shown in Figure 4 and the pictorial diagram shown in Figure 5 depict the changes in wiring necessary when the remote volume control motor is added to the standard 800-B Radio Receiver chassis.

INSTRUCTIONS FOR INSTALLING REMOTE VOLUME CONTROL
MOTOR IN 800-B RADIO RECEIVER CHASSIS

By utilizing the following instructions and the pictorial diagram of Figure 5 the remote volume control may be easily installed in a standard Model 800-B Receiver chassis. It is necessary to remove the panel and knob escutcheon plate before proceding with the installation.

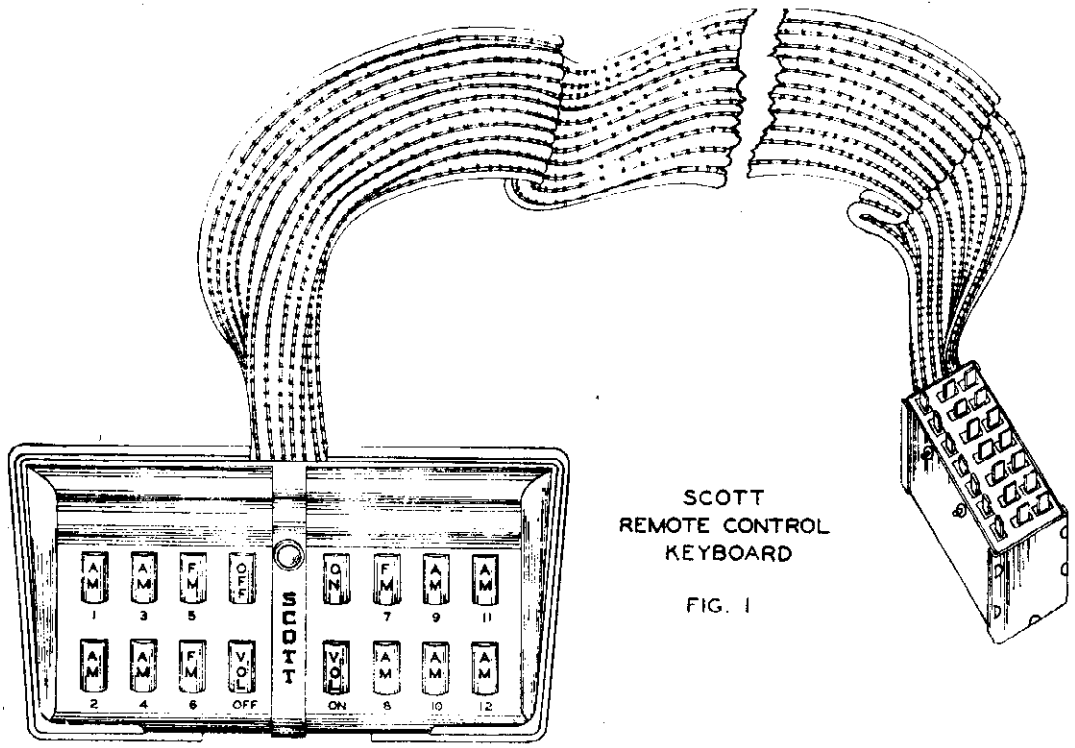
1. Remove the angle cover plate over the cutout used for mounting the volume control motor.

2. Disconnect the three leads from the volume control and remove it from the chassis.

3. Fasten the volume control bearing plate on the inside of the chassis using two 6-32 x 5/16 screws and two nuts. Center the 1/4 inch hole in the bearing plate in the 3/8 inch hole used to mount the old volume control.

4. Remove the screws fastening capacitor C37 and resistor strip R43 to the side of the chassis and push these two items toward the rear of the chassis as far as the connecting leads will allow.

SCOTT RADIO LABS. INC.



SCOTT
REMOTE CONTROL
KEYBOARD

FIG. 1

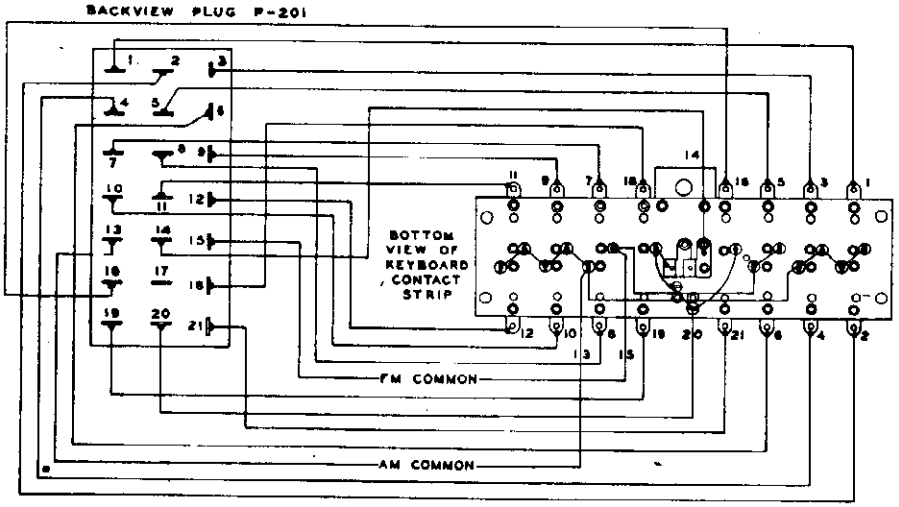


FIG. 2 PICTORIAL DIAGRAM OF KEYBOARD WIRING

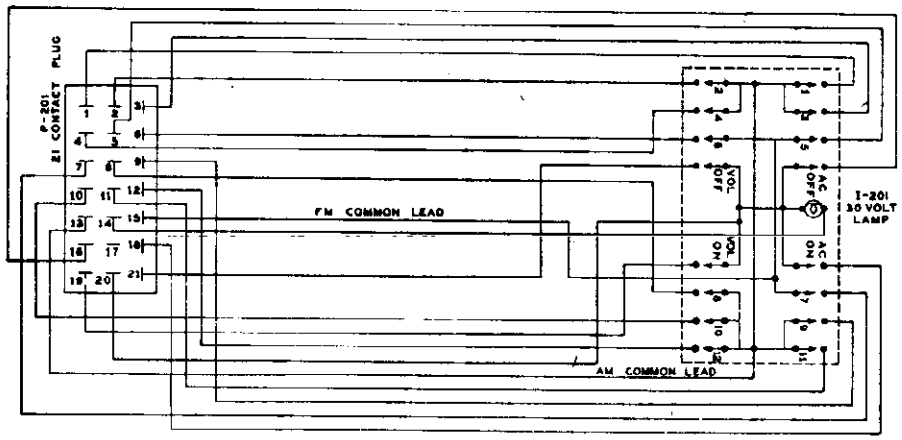

FIG. 3
SCHEMATIC DIAGRAM KEYBOARD ASSEMBLY 28945

5. Insert the tuning motor assembly in place and fasten down with two 5-40 x 1/4 BH screws and two 6-32 x 1/4 BH screws as shown in Figure 5. The two 5-40 x 1/4 BH screws are used to mount the motor assembly spacers to the chassis while the two 6-32 x 1/4 BH screws are used to mount the motor assembly bracket to the chassis. Make certain that the manual drive shaft rotates freely in the bearing plate. If not, loosen the bearing plate mounting screws and center it properly over the shaft, then tighten down again.

6. Reconnect the volume control leads as shown in Figure 5 using the tie point mounted on the motor frame for connecting the shield braids of the two shielded leads. The off terminal of the volume control should then be connected to this tie point by a short piece of wire.

7. Connect wire W201 as shown in Figure 5 from contact No. 16 of the 21 contact receptacle J6 to one terminal of the AC relay coil L21.

8. Connect wire W202 from contact No. 18 of receptacle J6 to one terminal of AC relay coil L20.

9. Connect wire W203 from contact No. 19 of receptacle J6 to terminal No. 1 of the volume control motor as shown in Figure 5.

10. Connect wire W204 from contact No. 21 of receptacle J6 to terminal No. 2 of the volume control motor.

11. Connect wire W205 from terminal X of AC relay switch SW5 to terminal No. 3 of volume control motor as shown in Figure 5.

12. Connect resistor R201 between contact No. 14 of receptacle J6 and contact X of AC relay switch SW5 as shown in Figure 5.

13. Check the wiring of the common terminal of the pushbutton system transformer in the power supply. In the older sets this terminal was grounded to a soldering lug fastened under one of the transformer mounting screws. It will be necessary to remove this short lead and run a wire from the common terminal of the transformer over to No. 10 contact of the 12 contact receptacle J3. This change is necessary in order to eliminate hum when operating the volume control motor.

14. When connecting in the wires outlined above, they should be run in under the present cables in order to hold them in place and present a neater appearance.

After the wiring has been completed, connect the set for normal operation, plug in the keyboard and with the controls on the receiver set the same as for pushbutton tuning operation, operate all the buttons on the keyboard to make sure the installation has been correctly made. Then reassemble the knob escutcheon plate and panel. It will be noted that when the volume control is now operated manually that seven complete revolutions will be necessary to turn it from minimum to maximum.

If the motor clutch chatters while running or if the clutch does not release immediately when either of the volume control pushbuttons are released, it will be necessary to adjust the clutch release spring on the back of the motor. If the clutch chatters, release pressure on the spring and if the clutch fails to release immediately apply more pressure on the spring.

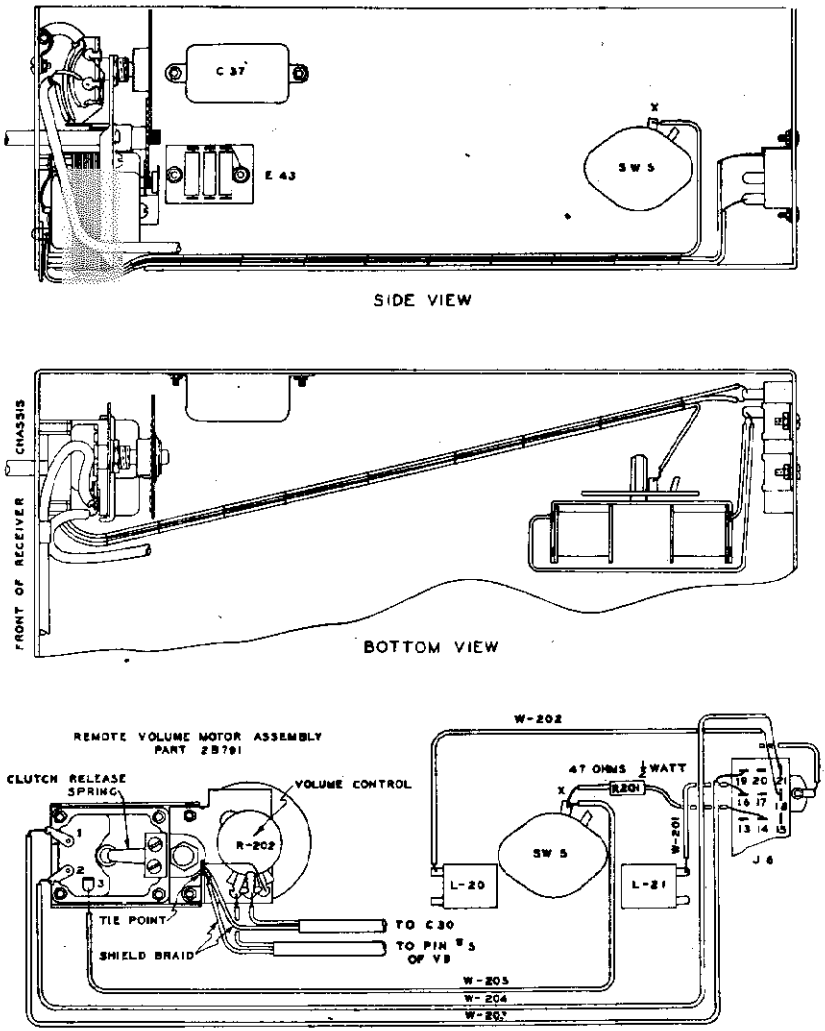

FIG. 5 PICTORIAL DIAGRAM OF CHANGES NECESSARY TO ADD REMOTE VOLUME CONTROL IN STANDARD 800 B RECEIVER CHASSIS

MODEL 800-B

Parts List by Symbol Designation For
Model 800-BR Remote Volume Control Kit

Symbol Desig.	Function	Description	Part Number
		Miscellaneous Electrical Parts	
E-201	Remote volume motor assembly	Motor assembly with gears, drive shaft clutch and volume control	2B791
E-202	Volume control drive motor	Motor, shaded pole reversible type operates on 24 volts 60 cycles, Part of E-201 assembly	58B446
E-203	Clutch assembly	Clutch for remote volume control drive complete with gear, bushing and set screw. Part of E-201 assembly	2B2332
E-204	Drive shaft assembly	Manual drive shaft for volume control motor consists of shaft with gears attached. Part of E-201 assembly	2B2333
		Resistors	
R-201	Pilot lamp current limiting resistor	Resistor, composition, 47 ohms 10% ½ watt, wire leads	70A420
R-202	Remote volume control	Potentiometer, composition, 1 meg 20% .4 watt clockwise audio taper, shaft: 1/4" dia. x 1" long	70B571
		Wire	
W-201	Relay coil L-21 to Pin 16 of J6 connecting lead	Wire- #20 stranded, tinned copper, cotton braid covered, yellow tracer 9 1/4" long, stripped 3/8" each end	96B743
W-202	Relay coil L-20 to Pin 18 of J6 connecting lead	Wire- #20 stranded, tinned copper, cotton braid covered, orange tracer 6" long, stripped 3/8" each end	96B741
W-203	Drive motor to Pin 19 of J6 connecting lead	Wire- #20 stranded, tinned copper, cotton braid covered, brown tracer 18" long, stripped 3/8" each end	96B740
W-204	Drive motor to Pin 21 of J6 connecting lead	Wire- #20 stranded, tinned copper, cotton braid covered, brown tracer, 17 3/4" long, stripped 3/8" each end	96B740
W-205	Common of drive motor to SW5 connecting lead	Wire- #20 stranded, tinned copper, cotton braid covered, blue tracer, 14" long, stripped 3/8" each end	96B678

Technical Data

Power Requirements	117 volts AC 60 Cycles Current Consumption 197 Watts Normal-310 Watts Maximum
Audio Power Output	25 watts undistorted 40 watts maximum
Audio Frequency Range	35 to 20,000 cycles
Overall Frequency Range - AM	35 to 8,500 cycles
Overall Frequency Range - FM	35 to 15,000 cycles
Tuning Range - AM	540 KC to 1600 KC 5.9 MC to 18.2 MC
Tuning Range - FM	88 to 108 MC

Installing Loudspeaker

The loudspeaker baffle is provided with four small holes provided as pilot holes for the wood screws used to fasten the speaker to the baffle. The loudspeaker may easily be located over the baffle opening by first centering the speaker over the opening with connecting cable at the bottom. The speaker should then be fastened down with the wood screws provided. The speaker should be fastened down firmly but DO NOT tighten the screws so as to warp or pull the edge of the speaker frame as this will throw the voice coil out of alignment and cause the speaker to distort.

Installing Power Supply Chassis

The power supply chassis should be fastened to the lower shelf of the cabinet by means of four wood screws provided. It should be fastened down in a position where the fuse receptacles and connecting cable receptacles are readily accessible.

Installing Receiver Chassis

The receiver chassis has been designed so that it can be rolled in or out of the front of the cabinet with a spring latch arrangement which holds the receiver at a position where the front of the panel extrudes out approximately 2 inches for ease in tuning. By releasing the spring latches on both sides of the panel the receiver may be rolled out approximately 10 inches for inspection of the receiver or tube replacement.

The receiver should be installed in the cabinet using the following procedure:

1. The front panel is mounted on the chassis as shown in Figure 1 using the hardware furnished.

2. Next mount the latch springs on the sides of the receiver chassis as shown in Figure 1. The retaining screw which is used to center the latch spring in the slot on the side of the panel should be screwed in far enough to bring the latch spring flush with the outside of the panel. It may be necessary to adjust the screw on the latch spring further in to make the latch catch smoothly when the set is pulled out. However, DO NOT leave the latch adjustment screws sticking out beyond the sides of the panel as they may catch in the latch spring plate when the set is pushed into the cabinet.

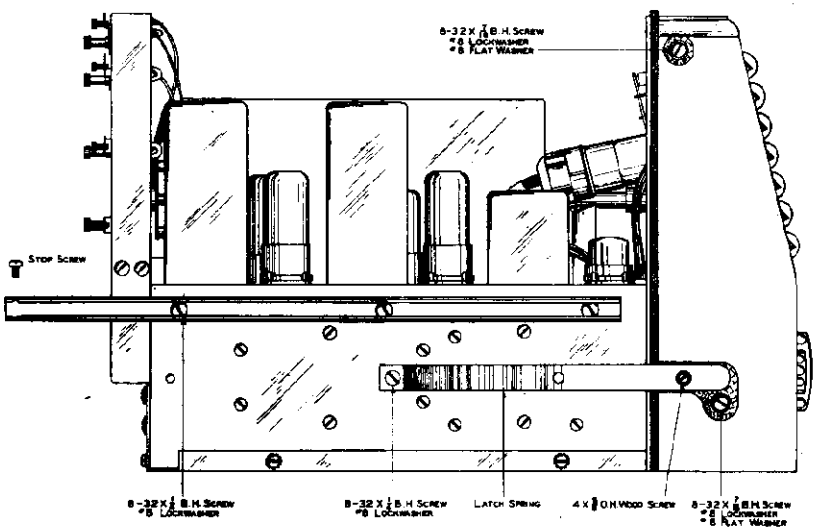

Figure 1 800-B Radio Receiver - Side View

3. Mount the slide rails on the sides of the receiver chassis as shown in Figure 1 using the hardware provided for this purpose. Remove the stop screws from the ends of the rails as shown.

4. Open the door of the cabinet and slide it back inside as far as it will go.

5. Fasten the slide rail hanger brackets, which are packed with the receiver, onto the support brackets which are mounted in the cabinet using the rubber grommets, screws and flat washers furnished with the receiver, as shown in detail drawing Figure 2.

6. Insert the rails on the receiver into the slides which are mounted in the cabinet and slide the receiver back into the cabinet.

7. Insert the stop screws in the ends of the slide rails.

8. Open the cable hole clamp at the back of the cabinet and lay the cables in the slot provided. The cables may then be inserted in their respective receptacles in the power supply. DO NOT force the plugs as they are polarized and will enter the receptacle in only one position.

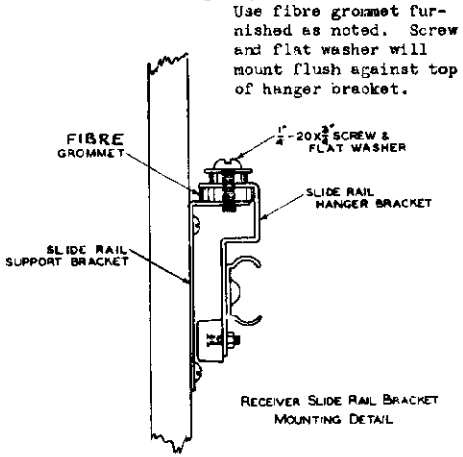

Figure 2

9. Insert the screw eye furnished, under the top at the rear of the cabinet in the center of the receiver compartment and tie the connecting cables to the screw eye leaving enough slack so that the receiver will pull all the way out without pulling the cables tight. This will allow the cables to loop when the receiver is run in and out of the cabinet.

Installing the Record Changer

The record changer furnished with the receiver is designed for floating spring mounting. Although it is not necessary to remove the drawer to install the changer, it will be much more convenient to do so. The back of the compartment should be removed; then remove the slide rail stop screws, the drawer can then be removed from the cabinet.

Remove the spindle and turntable. Then mount the changer with the hardware provided, following the method shown in Figure 3.

CAUTION: DO NOT LIFT THE RECORD CHANGER BY THE PICKUP ARM OR THE OVER-ARM AS UNDUE STRAIN ON THESE PARTS WILL PUT THE CHANGER OUT OF WORKING ORDER.

The drawer can now be reinserted in the cabinet, feeding the record changer power cord and pickup leads through the hole in the center of the shelf. Put the stop screws back in the slide rails and fasten the back of the cabinet on.

The power cord for the record changer should be inserted in the power receptacle which is fastensd to the power chassis by a short cord, and the pickup cord connected to the PHONO-GND terminals at the rear of the receiver; connect the shield braid to the GND terminal, and the insulated conductor to the PHONO terminal as shown in Figure 4.

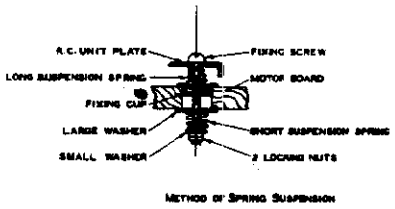

Figure 3

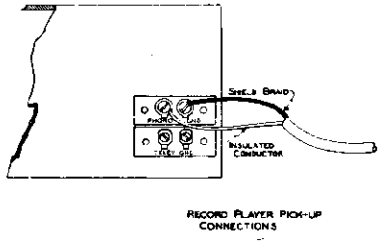

Figure 4

Antenna Connections

The Model 800-B Radio Receiver is designed to be used with either a straight antenna with single conductor lead-in or a doublet type antenna with 2 conductor lead-in. Separate connections are provided for antenna on AM and FM bands and for best reception a doublet type antenna should be used on the AM bands with a separate dipole antenna for the FM band as shown in Figure 5.

A double doublet antenna with pretuned matching transformer such as the SCOTT Double Doublet Antenna system will give maximum transfer of signal energy with greatest noise reduction on both broadcast and shortwave bands and a horizontal dipole with the flat top legs cut to the correct length for operation in the 88-108 megacycle band used with a two conductor lead-in with low-loss properties will give maximum results on the FM band.

In installations where it is not possible to install a doublet antenna system, a single wire antenna with the flat top 60 to 75 ft long and the lead-in as short and direct as possible, should be used. For FM reception a small mica capacitor of 51 MMF may be connected between the AM antenna connection and the FM antenna connection as shown in Figure 7.

A four contact receptacle is provided, at the rear of the receiver chassis for using a loop antenna on the "BC" and "SW" bands in metropolitan areas where a number of powerful stations may be located. It is not recommended that a loop antenna be used for receiving distant stations. Directions for installing the loop antenna are furnished with each antenna.

A two position switch with a screwdriver slot located at the left of the loop receptacle is provided so that the input circuits of the receiver may be connected to the loop antenna or an outside antenna. This switch should be set in the counter-clockwise position for use with an outside antenna and set to the clockwise position for use with the loop antenna.

TUNING THE RECEIVER

After the receiver has been installed in the cabinet and the antenna connections, record changer connections and power line connections are made, the receiver is ready for operation. Push the "ON" button to turn the receiver on, then for initial operation set the controls as follows:

Pushbutton Operation

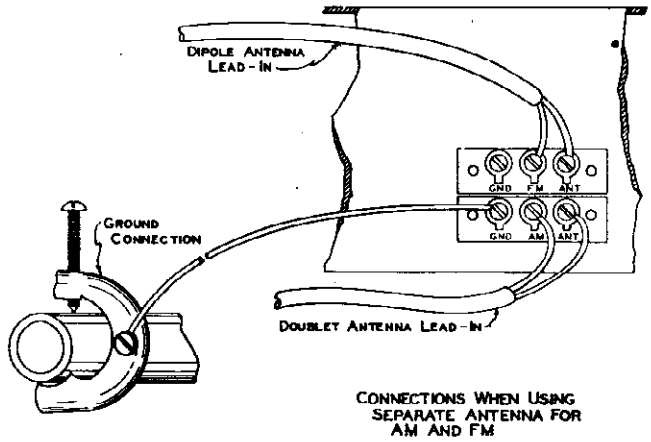
1. Set SELECTIVITY control to "M" or "B" position.
2. Set AM-BAND control to "BC" position.
3. The SENSITIVITY control should be set at approximately vertical position or half rotation but it can be adjusted to suit receiving conditions, however, it is effective only on the "BC" and "SW" bands.
4. Press the button which is marked with the desired station call letters, holding the button down until the dial mechanism stops.
5. Adjust the VOLUME control to the desired level and the BASS and TREBLE controls for the tone quality desired.

In order to change from AM reception to FM reception the SELECTIVITY control must be set at "M" or "B" position and the AM BAND control set at "BC" position then by pushing any AM button the set automatically switches to AM reception and if any FM button is pushed the receiver automatically switches to FM reception. The indicator lamps behind the colored dots at the end of the frequency scale are also automatically switched with the above procedure.

Manual Operation in the AM-Broadcast Band

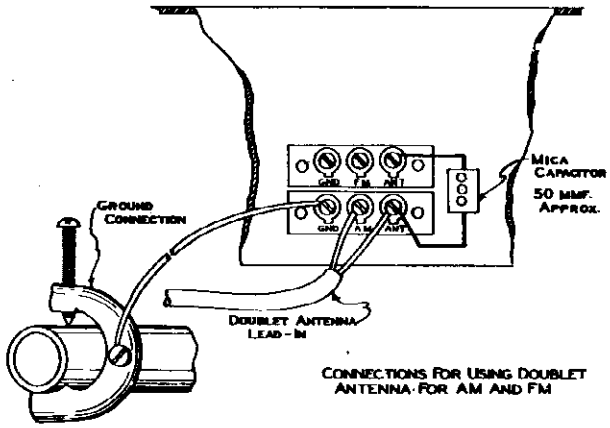
1. Set receiver for AM reception as outlined above.
2. Set SELECTIVITY control to "S" (sharp) position.
3. Set TREBLE control to approximately vertical position.
4. Set SENSITIVITY control to approximately vertical position.

SCOTT RADIO LABS. INC.



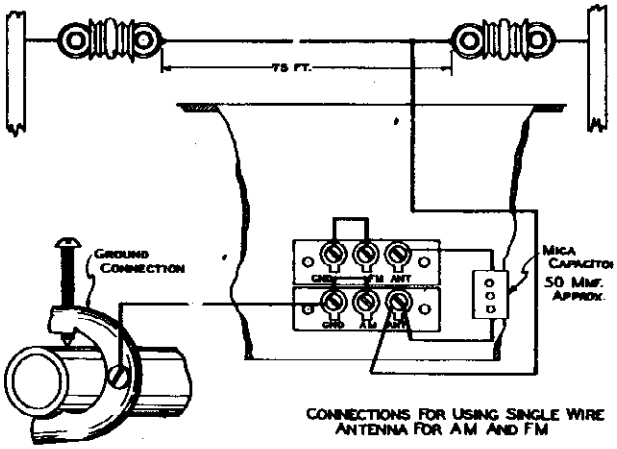
CONNECTIONS WHEN USING SEPARATE ANTENNA FOR AM AND FM

Figure 5



CONNECTIONS FOR USING DOUBLET ANTENNA FOR AM AND FM

Figure 6



CONNECTIONS FOR USING SINGLE WIRE ANTENNA FOR AM AND FM

Figure 7

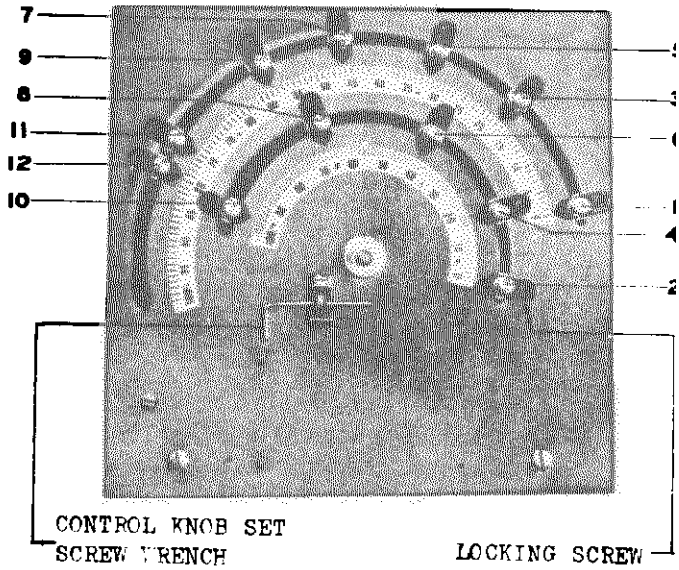


Figure 9 Pushbutton Tuning Backplate

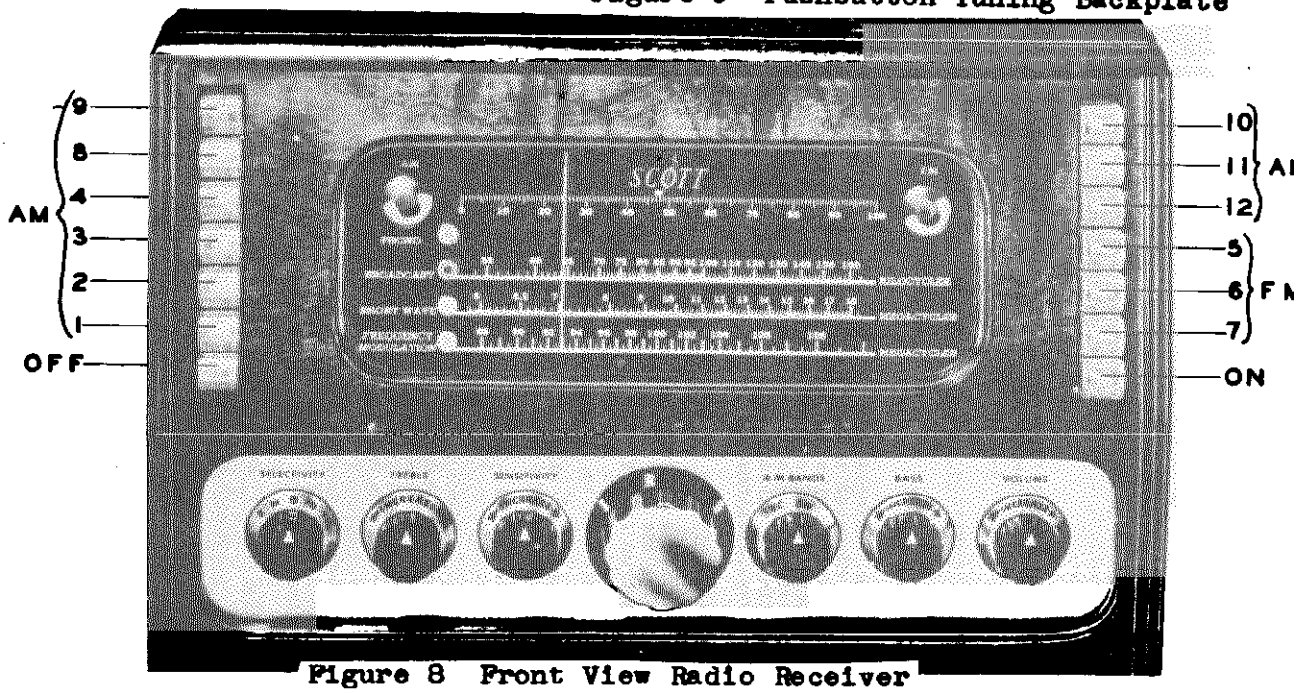

Figure 8 Front View Radio Receiver

5. Set AM BAND control to "BC" position.

6. Set BASS control to approximately vertical position.

7. Tune in a station with the MAIN TUNING control using the AM tuning eye to indicate when the set is properly tuned, then adjust the VOLUME control for desired volume level.

8. Advance SELECTIVITY control to "M" or "B" position for desired fidelity, then adjust the TREBLE and BASS controls for desired tone.

9. When tuning for weak distant stations, advance the SENSITIVITY control and when tuning strong local stations turn back the control to eliminate noise between stations.

Manual Operation in the AM-Shortwave Band

1. Set controls as above except the AM-BAND control set to "SW" position.

2. When tuning on the Shortwave Band the SENSITIVITY control should be advanced to near maximum position. If automobile ignition noise or other noise with decided peaks is encountered, the SENSITIVITY control should be advanced to maximum until the switch mounted on this control clicks. This will put the noise limiter circuit into operation and will reduce the noise so that weak stations can be heard.

Manual Operation on the FM Band

1. With the SELECTIVITY control set at "M" position and AM-BAND control set at "BC" position, push any of the pushbuttons which are set up for FM reception. The set will automatically switch to FM reception and the lamp behind the colored dot marking the FM Band will be illuminated.

2. Tune in an FM station noting carefully that the dial is tuned to the point where maximum closure is obtained on the FM tuning eye.

OPERATION OF CONTROLS

All operating positions of the controls of the Model 800-B Radio Receiver, with the exception of the Main Tuning Control, are marked, and indicator markings on the knobs are provided so that adjustment of the controls for various operating conditions is easily accomplished.

Six variable controls plus the main tuning control are provided so that maximum efficiency may be obtained at any operating condition. The functions and settings of the operating controls are listed below.

1. SELECTIVITY Control

The SELECTIVITY control located at the left side of the panel has five positions marked S-M-B-PH-Tel. The S-M-B positions are effective only for AM (amplitude modulation) reception on the "BC" and "SW" Bands. They designate the "Sharp", "Medium" and "Broad" condition of the AM-IF amplifier. The "S" position should be used at all times when manually tuning in stations as the IF amplifier is so broad in the "M" and "B" positions that a true resonant point cannot be obtained with the tuning eye. After the station has been tuned in properly in the "S" position the control may be advanced to the "M" or "B" position to obtain better fidelity.

When the SELECTIVITY control is set at "PH" position it connects the record changer pickup into the audio circuit of the receiver and provides for record reproduction.

With the SELECTIVITY control set at "TEL" position, the audio amplifier of the receiver is connected to the television input terminals at the rear of the receiver. These terminals are provided so that a television tuner may be connected to the 800-B Receiver and the audio amplifier of the receiver used for reproduction of television sound broadcasts, while the picture will be reproduced at the television tuner.

2. TREBLE Control

The TREBLE control is located at the right of the selectivity control and is provided in order that the high frequency response of the audio amplifier in the receiver may be changed to suit operating conditions and program material. Maximum high frequency response is obtained with this control set at maximum clockwise position.

3. SENSITIVITY Control

The SENSITIVITY control is located at the right of the treble control. This control is effective only on the AM broadcast and shortwave bands and is provided to vary the sensitivity of the receiver. When manually tuning the receiver the control should be set to the position where the AM tuning eye shadow just closes or on weak stations to the point where maximum closure of the tuning eye is obtained. For maximum sensitivity when tuning in weak distant stations the control should be advanced to the point where the switch incorporated on this control just starts to throw. The switch mentioned above which is incorporated in the SENSITIVITY control is provided to switch the Noise Limiter Circuit on and off. When the control is advanced to maximum clockwise rotation, the switch will throw on. The Noise Limiter Circuit with which this switch is associated, is effective on noises which have definite peaks, such as automobile ignition, it will have very little effect on noise which is of constant amplitude. Although the switch may be turned on or off when the set is tuned to any frequency band, it is effective only on the AM shortwave band.

4. MAIN TUNING Control

The MAIN TUNING control is the large knob in the center of the panel. This control is provided for tuning the receiver to the station frequency desired.

5. AM-BAND SELECTOR Control

The AM-Band switch is located at the right of the main tuning control. This control is provided in order that either the broadcast or shortwave bands may be selected for AM reception. This control is effective only for AM reception.

6. BASS Control

The BASS control is located at the right of the AM-Band control. This control is provided to enable the listener to raise or lower the bass response of the receiver to suit operating conditions and program material. Maximum bass response is obtained when this control is rotated to maximum clockwise position. Turning the control counter-clockwise will reduce the bass response.

7. VOLUME Control

The VOLUME control is located at the right side of the panel. This control is provided to regulate the audio output or "Volume" of the receiver. Maximum volume is obtained when this control is rotated to maximum clockwise position; zero output is obtained when the control is rotated to maximum counter-clockwise rotation. On standard 800-B Receivers this control will operate from minimum to maximum through an arc of 270 degrees. On receivers where remote volume control has been incorporated, the control will rotate seven complete revolutions from minimum to maximum since this control is driven by a motor controlled from the remote position, therefore when manually tuning the set it will be necessary to turn the control considerably more than is the case on the standard receiver.

8. PUSHBUTTON OPERATION

Fourteen pushbuttons are provided on the panel of the receiver. The bottom button on the right side is provided to turn the receiver "ON" when this button is pushed in. The bottom button on the left side shuts the receiver "OFF" when pushed in. The other twelve buttons are provided for selecting stations. These twelve station selector buttons are effective only when the SELECTIVITY control is set at "M" or "B" positions and the AM band controls set at "BC" position. A set of insert tabs listing all North American stations is included with each receiver. The sequence in which the inserts should be placed and the method of setting up the tuning system for pushbutton control is described above.

After the pushbutton tuning system has been set up for operation , when any pushbutton which has been set for an AM station is pushed the receiver will automatically switch over for reception of AM broadcast stations. When any pushbutton which has been set up for an FM station is pushed, the receiver will automatically switch over for reception of FM stations. When manually tuning the receiver, in order to switch from AM to FM or vice-versa, it is only necessary to push any AM or FM button momentarily and the circuits will be switched automatically.

9. TUNING INDICATORS

In the upper right and left hand corners of the dial scale are located two tuning indicators which are provided to enable the operator to properly tune the receiver to resonance with the station when manually tuning. The indicator in the left hand corner is marked AM and is used only when tuning in stations on the broadcast or short-wave bands. The indicator in the right hand corner is marked FM and is used only when tuning in stations on the FM band. A control, with a screwdriver adjustment slot, located on the top of the chassis directly under the FM tuning eye, is provided so that the tuning eye shadow may be made to close on the strongest FM signal for the particular location. This adjustment will then enable the listener to accurately tune the receiver to all FM stations by watching for maximum closure of the FM tuning eye.

10. TUNING DIAL

The three frequency bands are individually calibrated on the edge lighted glass scale. The BC band is calibrated in kilocycles with the last zero omitted on the numeral markings because of space limitations.

The SW band is calibrated in megacycles and the important bands are marked off for ease in tuning.

The FM band is calibrated in megacycles and divided in one-half megacycle divisions for help in tuning.

A scale marked off in 100 divisions located at the top of the dial face, is provided to enable the listener to log stations which may be tuned in on any of the three frequency bands and also permits setting up the pushbutton system.

At the left side of the dial face are located four colored dots which are provided to indicate which frequency band the receiver is operating on and when the receiver is adjusted for record player reproduction. Each dot is illuminated by a small lamp located at the back of the dial mechanism and are automatically turned on with the setting of the controls for changing frequency bands.

TUBE REPLACEMENT

The tube complement of the Model 800-B Radio Receiver is as follows:

Symbol	Type	Application
V1	6SK7	AM-RF Amplifier
V2	6J5	AM Oscillator
V3	6SA7	AM Mixer
V4	6SK7	AM-1st IF Amplifier
V5	6SK7	AM-2nd IF Amplifier
V6	6H6	AM-2nd Detector
V7	6E5	AM-Indicator
V8	6E5	FM-Indicator
V9	6J5	1st Audio Amplifier
V10	6J5	2nd Audio Amplifier
V11	6AG5	FM-RF Amplifier
V12	6C4	FM Oscillator
V13	6AG5	FM Mixer
V14	6AC7	FM-1st IF Amplifier
V15	6AC7	FM-2nd IF Amplifier
V16	6SJ7	FM-1st Limiter
V17	6SJ7	FM-2nd Limiter
V18	6H6	FM-Discriminator
V19	6SL7GT	3rd Audio Amplifier
V20	6L6G	Audio Power Output
V21	6L6G	Audio Power Output
V22	OD3	Voltage Regulator
V23	5Y3GT	Rectifier
V24	5Y3GT	Rectifier

When it is found necessary to replace any tube, by referring to Figures 10 and 11 the location and tube type can very easily be identified.

INSTRUCTIONS FOR INSTALLING LOOP ANTENNA

SYSTEM IN MODEL 800-B RADIO-PHONOGRAPH

The loop antenna system is provided for installations in locations where it is found impossible to erect an outside antenna for AM and FM reception. It consists of separate loops for the broadcast and shortwave bands for AM reception, these two loops being coupled to the antenna input circuit of the receiver through a matching transformer which has adjustments for each band in order to insure maximum signal input. A separate folded dipole antenna is provided for FM reception, this antenna being connected directly to the FM antenna terminals.

Figure 1 depicts the manner in which the loop antennas are fastened in the radio-phonograph cabinet, and by using the following instructions, step by step, the installation and adjustment of the antennas may be easily made and maximum results obtained.

1. First install the FM antenna which is a two wire flat cable which has been cut to the proper length and terminals attached. This antenna should be installed around the inside of the receiver compartment of the cabinet, at the rear, as follows:

   a. Place the junction of the antenna proper and the lead-in approximately 2 inches to the left of center and at the extreme outer edge of the back of the compartment with the lead-in facing toward the receiver chassis. Tack the antenna down with the staples furnished, following the contour of the cabinet, inserting a staple at each bend, the ends of the antenna will terminate approximately 8 inches apart at the top inside of the cabinet.

2. The broadcast band loop is installed around the bottom of the cabinet shelf on the Chippendale and Modern style cabinets as shown in Figure 1. On the Regency cabinet it is necessary to install it around the left side of the speaker compartment and under the shelf of the receiver compartment as shown in Figure 2. Although this loop can be installed in other ways, it is best to install it as shown in order to prevent the loop from being too directional. This loop consists of a 5 wire flat cable cut to the correct length, with a two wire flat lead-in attached. To install the BC band loop in the Chippendale and Modern Cabinets, place the junction of the loop and the lead-in under the shelf approximately ½ inch in from the back and 2 inches to the right of the center of the radio compartment, with the lead-in cable facing out from the cabinet. Tack the loop down at this point with the staples furnished and follow around the inside of the cabinet with the rest of the loop fastening it to the bottom side of the shelf. When going around the corner of the cabinet it will be necessary to fold over the loop in orde to keep the corners flat as shown in Figure 1. Loop the lead-in up over the edge of the shelf and fasten down at one point to relieve any strain on the junction point of the loop and lead-in. To install the BC band loop in the Regency cabinet, start by fastening the junction of the loop and lead-in the same as in the Chippendale or Modern cabinets but since the Regency cabinets have a record storage compartment it is necessary to fasten the loop around the left side of the cabinet and under the shelf of the radio compartment only, with a small section in back of the record storage compartment as shown in Figure 2. This will apply to any cabinet with a record storage compartment.

3. The shortwave loop consists of a formed copper tubing fastened to the loop coupler coil shield can. This unit is assembled at the factory ready to mount to the chassis. This assembly is mounted under the two screws used to hold the backplate to the chassis as shown in Figure 1. The procedure is as follows:

   a. Remove the screw on the right side of the backplate and loosen the screw on the left side sufficient to allow the long mounting bracket of the loop coupler to slide under. Then reinsert the screw on the right side through the short bracket of the coupler and tighten down both screws.

   b. Insert the loop coupler plug P-301 into the loop receptacle at the rear of the chassis. This plug is polarized and can be inserted only one way.

   c. Connect the broadcast band loop lead-in as shown in the detail in Figure 1.

4. Connect the FM loop antenna to the two terminals marked ANT on the FM antenna terminal strip as shown in the detail of Figure 1.

5. Turn the loop selector switch SW1, which is located directly under the loop coupler on the rear of the receiver chassis, to the clockwise position. The slot will then be in the position shown in Figure 1.

6. After the loop has been installed and connected the receiver should be put in operation and the loop coupler adjusted for maximum signal on the broadcast and shortwave bands. The FM band loop requires no adjustment.

   If a fairly strong signal can be tuned in so that the tuning eye will show deflection at approximately 1500 K C and 600 KC on the broadcast band or 16 MC and 6.5 MC on the shortwave band, the adjustments on the coupler can be made using these signals with the tuning eye as an indicator as follows:

   a. Remove the AM tuning eye from the bracket and face the front of the tube toward the rear of the set so that it can be easily seen when adjusting the loop coupler.

   b. Set the receiver for operation in the AM band and with the selectivity control in the "Sharp" position, make the adjustments outlined below, setting each adjustment for maximum closure of the tuning eye. Figure 3 shows the location of the four adjustments on the loop coupler.

Band	Freq.	Adj.
BC	1500 KC	C-301
BC	600 KC	E-301
SW	16 MC	C-302
SW	6.5 MC	E-302

SCOTT RADIO LABS. INC.

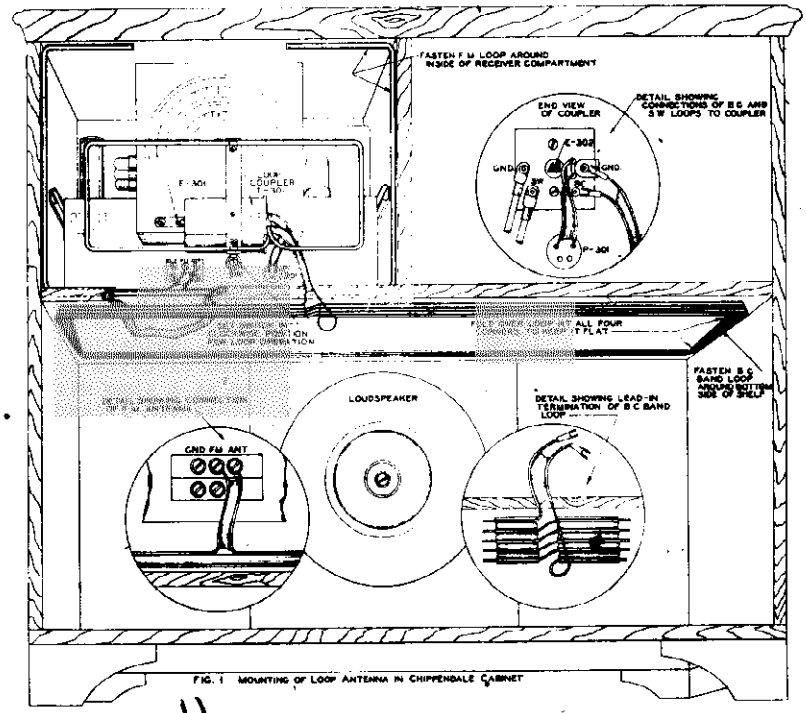

FIG. 1 MOUNTING OF LOOP ANTENNA IN CHIPPENDALE CABINET

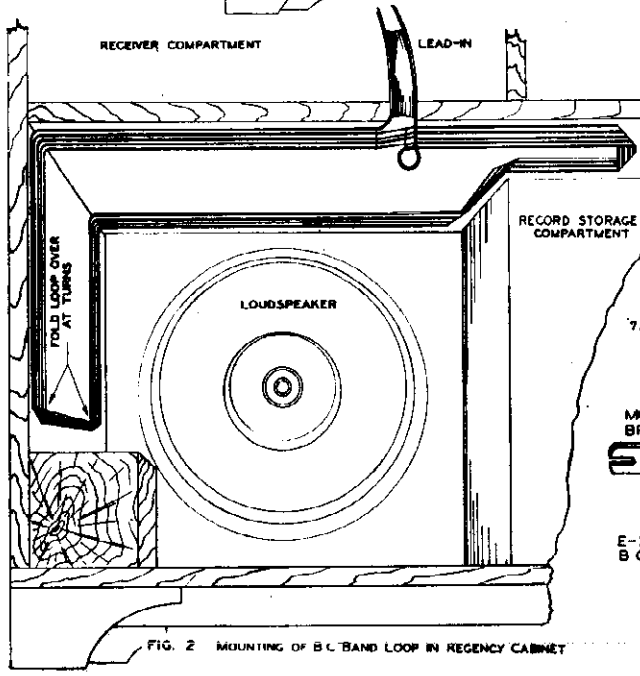

FIG. 2 MOUNTING OF B C BAND LOOP IN REGENCY CABINET

If a strong steady signal is not available for setting the adjustments on the coupler a signal generator must be used with either the tuning eye or an output meter as a signal indicator. The signal generator output terminals are connected to a single turn loop of wire placed adjacent to the loop in the set, the adjustments are made as in the table above keeping the output of the signal generator as low as possible and still maintain a clear signal. In noisy locations it may be necessary to set up a screened booth to do this alignment although this is seldom necessary as the adjustments on the coupler are not critical and with a signal generator a sufficiently strong signal to override the noise level can be obtained so that the adjustments can be made to obtain maximum signal input to the receiver.

7. In the Regency cabinet caution should be taken to mount the power supply chassis as far away from the BC band loop as possible to prevent detuning the loop.

MODEL 800-B

SCOTT RADIO LABS. INC.

In a high fidelity instrument such as the Model 800-B a very wide range of audio frequencies are reproduced and the hum problem is of special significance. Any hum voltages which reach the loudspeaker will be reproduced to a considerably greater degree than in the case of ordinary receivers having only a limited bass response. Thus, it becomes quite important that every effort be made to keep this hum at an absolute minimum. The several possibilities for hum pickup are treated in these notes. When customer complaints of an excessive hum level are experienced the following corrective measures are suggested. If the service man does not have an adequate stock of parts to make the changes which may be required, the additional parts may be procured from the Service Department, Scott Radio Laboratories, Inc., 4541 N. Ravenswood Avenue, Chicago Ill.

Before taking any corrective measures check the wiring of the power supply, particularly the receiver receptacle J-8, to make sure that it conforms fully with the circuit diagram.

CONDITIONS FOR ELECTRICAL HUM AND SUGGESTED MEASURES

A. Hum present when receiver is switched on but Volume Control is adjusted for minimum output.

Elimination of Defective Components

The first step in locating the cause of hum under these conditions is to remove the 3rd audio amplifier tube V-19 (6SL7GT, located in the power supply chassis). If the hum disappears or is greatly reduced the indicated fault lies in or ahead of this tube. If ahead of this tube it is, undoubtedly, caused by the 1st or 2nd audio amplifier tubes, V-9 (6J5) or V-10 (6J5), or their associated circuits located on the receiver chassis. If this source of hum is indicated, replace these tubes one at a time with a tube of known good quality, preferably one with a reversed coil heater which has the lowest hum pickup. If these tube replacements do not reduce the hum the 6L6 output tubes should also be replaced. If none of these tube replacements affect the hum the electrolytic capacitor C-33 which is used as a filter for the plate supply of the 1st and 2nd audio stages should be checked. It may be checked in a simple manner by bridging it temporarily with an other 20 mfd. 300 to 450 volt rated capacitor, making certain that the correct polarity is observed.

If the hum is still present when the 3rd audio amplifier tube, V-19 (6SL7GT), is removed the fault may lie in a defective electrolytic filter capacitor in the high voltage supply, that is C-93 or C-94. By shunting each capacitor with another unit of the same capacity and voltage rating, the defective unit can be easily located.

Also check the d.c. potential on each audio grid to determine whether it is excessive. A high d.c. voltage at any grid point indicates a leaky coupling condenser.

IMPROVEMENT OF FILTERING ACTION IN POWER SUPPLY

If the occasion arises where the above measures fail to improve the hum situation sufficiently to satisfy the customer, the only alternative is to provide additional filtering in the power supply. Such filtering may be essential in those localities where the A.C. power supply has a bad waveform. If the 60 cycle supply is distorted, the higher harmonics will appear particularly objectionable and may demand a greater degree of filtering. The circuit is arranged so that the additional choke serves to filter the entire supply and therfore, reduces hum from the output tubes as well as the other points of the audio amplifier. In the new arrangement two chokes part no. 17B492 are used instead of one as used in earlier layout. This additional filtering may be installed by relocating L-17 on the power supply chassis and mounting the second choke adjacent to it. The suggested arrangement and wiring diagram are shown on an attached sheet.

The following additional components are required for making this installation:

1 - Insulated wire - 4 1/4" long
1 - Single lug terminal - Part No. 90B711
1 - Filter choke - Part No. 17B492
4 - Screws - 8/32 x 3/8" long - Part No. 77A382
4 - Lockwashers - #8 - Part No. 95A251
4 - Nuts - #8 - Part No. 59A178
1 - Screw - 6/32 x 1/8" long - Part No. 77A202

The following steps may be taken for ease of installation: (Refer to Diagrams on Wiring and Schematic for Installation of Additional Filter Reactor - Model 800-B).

1. Remove 6/32 mounting screws of C-88 and R-82.
2. Remount terminal strip holding C-87 and R-80 under mounting foot of C-89.
3. Unsolder leads of L-17 and remove choke.
4. Remove one of the red leads of C-94 from #2 terminal point and connect this lead to the new single terminal point #3.
5. Drill 11 holes.
   - 8 - Clearance holes, #22 drill, for choke mtg.
   - 1 - Tapped hole for 6/32 screw.
   - 2 - 3/8" clearance holes for choke leads.
6. Mount chokes (L-17 and additional one).
7. Mount C-88 using 1/8" 6/32 screw and one of the old 6/32 screws, securing the ground lug under the unit.

SCOTT RADIO LABS. INC.

8. Wire new yellow cathode lead from point #4, (the positive terminal) on C-88 to #6 pin on 6SL7 tube socket.
9. Wire short lead from 1st choke to #2 pin on 5Y3 socket. Wire long lead on 1st choke to #3 lug - also short lead from 2nd choke to #3 lug
10. Wire long lead from 2 nd choke to #2 terminal lug.

B. Excessive hum with Volume Control in an advanced position and receiver switched into "Phono" or "Television" position.

A considerable improvement in the higher pitched hum level will be realized by rearranging the wiring of t "phono" and "television" input circuits and the high-level audio lead running to the volume control. Thes leads are placed in cables in the wiring of earlier receivers, and have to be routed separately and genera isolated from other circuits to achieve the desired result. However, to avoid excessive dismantling of th receiver in the field the leads now running in the cables should be cut off and may be left in the cable while additional isolated leads are connected between the points concerned.

The following additional components are required for making this installation:

3 - Cable Clamps	- Part No.	18A312
3 - Shielded leads	- Part No.	96B962
1 - Screw - 6/32 x 1/8" long	- Part No.	77A202
3 - Lockwashers - #6	- Part No.	95A255
2 - Screws - 6/32 x 5/16" long	- Part No.	77A374
2 - Spacers - 1 1/8"	- Part No.	84A211
2 - Screws - 5/40 x 1 3/4" long	- Part No.	77B957
1 - Single lug terminal	- Part No.	90B711
2 - Nuts - 6/32	- Part No.	59A177

The following steps should be taken:

1. Disconnect ground braids and wires leading to the "phono" and "television" terminals.
2. Disconnect the other ends of these two shielded leads from switch C-8.
3. Disconnect shielded lead from C-80 coupling condenser.
4. Disconnect shielded lead from the high potential terminal of the volume control.
5. Remove short spacers from switch C-3 and substitute long spacers and screws. Reassemble using all washers and lockwashers which were used previously.
6. Add terminal #1 to chassis, mounting it under one foot of condenser C-80, or if possible drill #22 hole under C-80 as this will make wiring simpler as per diagram.
7. Add shielded lead to connect from volume control to C-30, connecting shields together at the volum control. Route lead across chassis toward the bottom edge which adjoins the bottom plates. Faste lead under new cables clamps instead of the ones used previously. Insert one cable clamp with a short mounting screw on the left side of the chassis near the treble control.
8. Do not ground shield braid at terminal of C-80. Connect it to the added ground terminal mounted under one foot of C-30. Use this point also for connecting shields of leads coming from "phono" and "television" terminals.
9. Add new shielded leads from "phono and "television" terminals. Connect shield braids of these leads to the "ground" terminals at these points, but do not make a connection between either of th "ground" terminals and the chassis. Route leads along the lower edge of the chassis to switch C-8 using a cable clamp, fastened under one foot of the bathtub condenser C-29 to secure the cable.

C. Hum present only when a station carrier is tuned in and volume advanced.

Hum present under these conditions is generally caused by a defective tube. The most common fault being found in the second detector V-6 (6H6) when AM signals are being received or the discriminator V-18 (6H6) when FM signals are being received. The fault can be easily corrected by replacing these tubes with tubes of known good quality preferably of the metal type.

In some cases hum may be induced into the receiver from the power line. This form of pickup can usually be eliminated by employing a good ground connection between the receiver chassis and a cold water pipe or a pipe driven into the ground. Do not attempt to use the house wiring conduit or BX as a ground connectio Such an arrangement usually results in increased noise or hum pickup.

CONDITIONS FOR VIBRATIONAL OR MECHANICAL HUM AND SUGGESTED REMEDIES

A. Receiver hums when power is switched off.

In the 800-B, push-button tuning is accomplished by means of a motor driven mechanism. The transformer supplying the power for the drive motor, FM-AM changeover relay and the "power on-off" relay, is connected to the power circuit at all times. Therefore, a mechanical vibration may be heard even though the receive is switched off. This form of hum is caused by transformer laminations vibrating against the bottom cover plate of the power amplifier.

To remedy this condition, remove the bottom plate of the power supply and apply strips of masking or adhes ive tape along the bottom edge of the transformer so that the bottom plate cannot make metal to metal contact with the transformer case. In some extreme cases it may be necessary to mount the power supply on sp rubber strips or felt bumpers in order to entirely eliminate this trouble.

SERVICE NOTES FOR MODEL 800-B

CONTINUED NOTES ON REDUCTION OF HUM OUTPUT AND AUDIO NOISES

(a) Add a 5600 ohm resistor (our Part No. 70A50, or equivalent) to the bass control circuit between the yellow leads and their terminal of the control R46. This resistor may be supported by a single lug terminal strip (our Part No. 90B711 or equivalent.) which can be mounted by a screw and nut already available near the bass control. The new resistor will be designated by the symbol R94.

(b) Remove the direct ground lug connection from contact #2 of the 1st audio socket X9 and add a "4" insulated wire between the common connection of pins #1 and #2 on the 1st audio socket and the same points on the 2nd audio socket X10. This change simply grounds the 1st audio shield and filament at the 2nd audio socket instead of at the 1st audio socket.

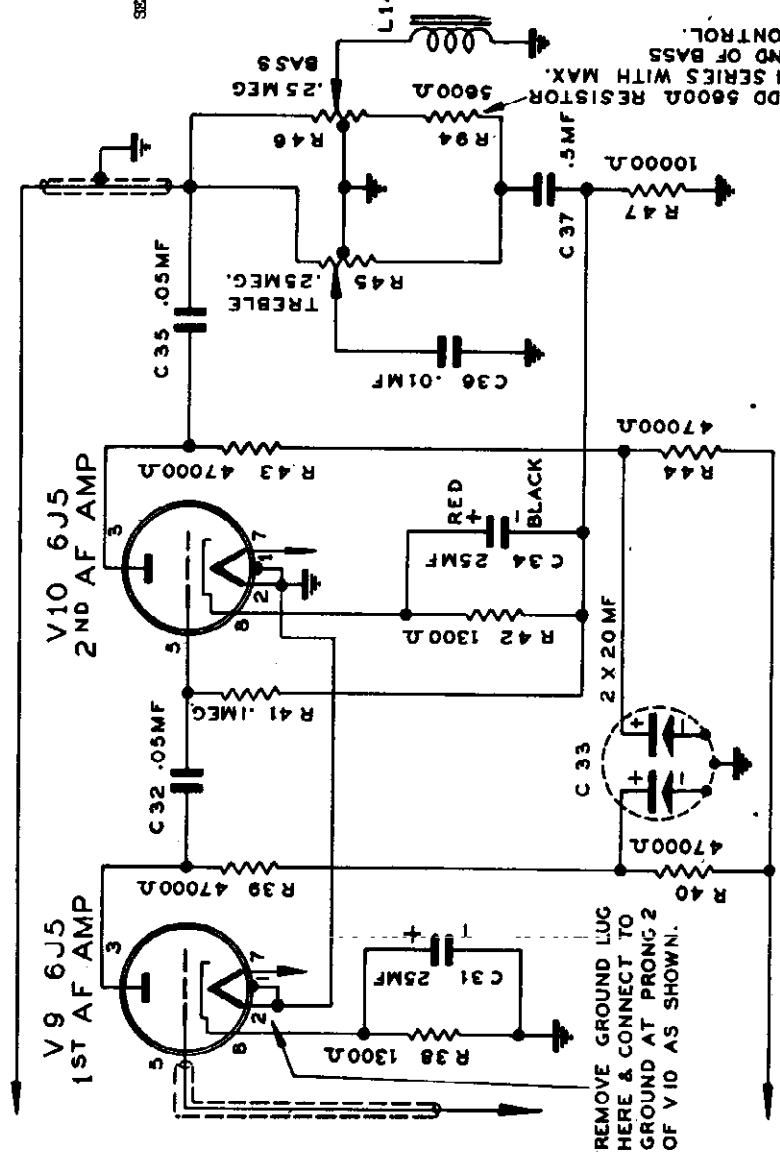
(c) The 1st audio shielded grid lead may be shortened from 10½" to 7" and run directly across the sockets to the volume control, instead of routing it around the chassis.

(d) Dress R80 and C87 as far as possible from heater pin #7 of the 6SL7 socket to prevent hum pickup in these components.

(3) Check the wiring of capacitor (C34), 25 mfd 25 volt electrolytic condenser, to determine whether it is connected correctly. The positive end of this capacitor should be connected to the cathode of the 6J5 and the negative end to the junction of R42 and R47. Some sets may have gone through our inspection with this capacitor wired backwards. An incorrect connection will not show initially on electrical tests, but some hum and noise may develop from it after a period of a few weeks operation.

Items Nos. 1 and 2 will be incorporated in sets numbering Serial 3,000 up to eliminate possible trouble from these sources.

AUGUST 9, 1946



MODEL 800B RADIO-PHONOGRAPH

CIRCUIT REVISION OF CHANGES OUTLINED IN SERVICE NOTES DATED AUGUST 9 1946

Further investigations of hum problems have revealed that additional steps can be taken if satisfactory hum level is not accomplished by changes recommended in previous Service Notes.

We wish to repeat that tubes are often the cause of hum. Here at the Laboratory individual tubes have developed excessive hum output after the sets passed all our tests. Therefore, be sure to select tubes having the lowest hum level by trying several 6J5 and 6SL7 tubes. Carry spare tubes with you when installing the set as some may go bad from jolting received during delivery. If the receiver has incorporated the changes covered in previous Service Notes the following additional steps may be taken:

(1) Check to determine whether the lead from muting relay K5 is connected to the 6SL7 grid pin No. 1 or the 6L6-V20 grid. If it is connected to the 6SL7 input grid, move it to the 6L6-V20 input grid. This change prevents hum in the relay lead from being amplified by the 6SL7 tube.

(2) To reduce hum to the lowest possible level the following steps may be taken:

C79A	V17 screen bypass	MFD, 20% 600 V DC wkg.,	
C79B	V17 plate filter	bathtub can, 2 lugs, can common	
C80	T7 primary trimmer	Same as C6	
C81	T7 primary to secondary coupling	Same as C42	

* 470 MMF Part 15A32 after Serial 1500

SCOTT RADIO LABS. INC.

Table 5
Parts List By Symbol Designation

Symbol Desig.	Function	Description	Part Number
	CAPACITORS (Continued)		
C82	T7 secondary trimmer	Same as C6	
C83	Discriminator diode filter	Same as C27	
C84	Discriminator diode filter	Same as C27	
C85	Discriminator output de-emphasis network	Capacitor, silver mica, 1300 MMF 5%, 500 V DC wkg., CM30 case, wire leads	15A415
C86	Audio input bypass at power supply	Same as C3	
C87	Audio compensating network at V19A grid	Same as C40	
C88	V19 cathode bypass	Capacitor, electrolytic, 25 MFD, 25 V DC wkg., bathtub can, 2 lugs, black negative	15A15
C89	V19A plate to V20 grid coupling	Same as C35	
C90	V19B plate to V21 grid coupling	Same as C35	
C91	V20, V21 cathode bypass	Capacitor, electrolytic, 25 MFD, 50 V DC wkg., paper tubular case, wire leads	15B638
C92	Audio output shunt	Capacitor, mica, 5000 MMF 20%, 1000 V DC wkg., bakelite case, tab terminals	15B763
C93	High voltage output filter	Capacitor, electrolytic, 30/30 MFD 450 V DC wkg., bakelite case 1 3/8" dia. x 3 1/2" long, 3 wire leads, black common, mounts by 5/4-16 threaded bushing	15B744
C94	Filter reactor output bypass	Same as C93	
C95	Filter reactor input bypass	Capacitor, paper, 4 MFD, 600 V DC wkg., metal can 1¼" dia. x 4¼" long, mounts by 3/4-16 threaded bushing, 2 lugs	15B481
C96	AC power input bypass	Same as C75	
C97	V19A input compensating	Capacitor, mica, 1000 MMF 10%, 500 V DC wkg., CM30 case, wire leads	15A35
	MISCELLANEOUS ELECTRICAL PARTS		
E1	AM-antenna terminal strip	Terminal strip, 3 terminals mounted on 3/4" W x 2" L bakelite strip, marked AM-ANT-GND	87B644
E2	FM-antenna terminal strip	Terminal strip, 3 terminals mounted on 3/4" W x 2" L bakelite strip, marked FM-ANT-GND	87B643
E3	BC Band ant. sec., L2 inductance adj.	Powdered iron core 5/16" dia. x 1/2" L, adj. screw 6-32 x 1" L slotted at end	24A99
E4	SW Band ant. sec., L4 inductance adj.	Powdered iron core 5/16" dia. x 1/2"L, adj. screw 6-32 x 1¼" L, slotted at end	24A96
E5	BC Band oscillator, L5 inductance adj.	Same as E3	
E6	SW Band oscillator, L6 inductance adj.	Same as E3	
E7	BC Band mixer, L7 inductance adj.	Same as E4	
E8	SW Band mixer, L8 inductance adj.	Same as E3	
E9	1st AM-IF primary inductance adj.	Same as E4	
E10	1st AM-IF secondary inductance adj.	Same as E4	
E11	2nd AM-IF primary inductance adj.	Same as E4	
E12	2nd AM-IF secondary inductance adj.	Same as E4	
E13	3rd AM-IF primary inductance adj.	Same as E4	
E14	FM antenna secondary inductance adj.	Powdered iron core .274"dia. x 9/16" L, adj. screw 6-32 x 1¼"L slotted at end, iron core insulated from screw	24B756
E15	FM oscillator inductance adj.	Same as E14	
E16	FM mixer secondary inductance adj.	Same as E14	
E17	1st FM-IF primary inductance adj.	Same as E3	
E18	Phono-input terminal strip	Terminal strip, 2 terminals mounted on 3/4" W x 2 1/8"L bakelite strip, marked PHONO-GND	87A220
E19	Television input terminal strip	Terminal strip, 2 terminals mounted on 3/4"W x 2 1/8" L bakelite strip, marked TELEV-GND	87B642
E20	1st FM-IF secondary inductance adj.	Same as E3	

Table 5
Parts List By Symbol Designation

Symbol Desig.	Function	Description	Part Number
	MISCELLANEOUS ELECTRICAL PARTS (Continued)		
E21	2nd FM-IF primary inductance adj.	Same as E4	
E22	2nd FM-IF secondary inductance adj.	Same as E4	
E23	3rd FM-IF primary inductance adj.	Same as E4	
E24	3rd FM-IF secondary inductance adj.	Same as E4	
E25	4th FM-IF primary inductance adj.	Same as E4	
E26	4th FM-IF secondary inductance adj.	Same as E4	
E27	Pushbutton switch cable terminal board	Terminal strip with 12 solder lugs, 1" W x2 17/32" long bakelite strip	87B646A
E28	Dial drive motor	Motor, reversible type shaded pole, operates on 24 volts 50-60 CPS	58B447
E29	Dial pointer assembly	Dial indicator pointer with guide	29B749
E30	Dial calibration scale	Calibration scale on glass plate 4¼" x 11 7/32"	29B637
E31	Control knob	Plastic knob 1 1/8" dia. black with red arrow 1/4" bushing, 8-32 set screw	47B669
E32	Main tuning knob	Plastic knob 2" dia. Polished chrome finish ¼" bushing - 8-32 set screw	47B660
E33	Pushbutton	Clear plastic pushbutton 11/16" sq. with slot for station indicator tab, fits .050 x .312 flat shaft	10B735
E34	Knob set screw wrench	Wrench for #8 hollow head set screws 5/64" hex x 1 7/8" long	94B910
E35	Backplate rotor disk insulator strip	Strip, bakelite 27/32" x 9/16" x 3/16" with .040 W x .088 H, rib in center	87B660
E36	Backplate rotor disk assembly	Rotor disk assembly for pushbutton tuning system backplate	28B90
E37	Backplate contact assembly (long bracket)	Contact assembly for pushbutton tuning system backplate - long bracket	93B03A
E38	Backplate contact assembly(short bracket)	Contact assembly for pushbutton tuning system backplate - short bracket	93B04A
E39	AM-RF resistor strip assembly	Strip, bakelite 6 lugs with resistors R1, R2 and R4	87B647B
E40	Converter channel resistor strip assembly	Strip, bakelite 6 lugs with resistors R8, R11 and R12	87B647C
E41	AM-IF resistor strip assembly	Strip, bakelite 12 lugs with resistors R22, R17, R23, R19, R18 and R13	87B646C
E42	AM diode resistor strip assembly	Strip, bakelite 12 lugs with resistors R36, R33, R32, R34, R35 and R16	87B646B
E43	1st audio amp. resistor strip assembly	Strip, bakelite 6 lug with resistors R40, R39 and R38	87B647D
E44	2nd audio amp. resistor strip assembly	Strip, bakelite 12 lugs with resistors R44, R43, R42, R41 and R47	87B646D
E45	1st FM-IF resistor strip assembly	Strip, bakelite 6 lugs with resistors R59, R6 and R F choke L15	87B647E
E46	2nd FM-IF resistor strip assembly	Strip, bakelite 6 lugs with resistors R63, R64 and R66	87B647F
	FUSES		
F1	Power transformer primary fuse	Fuse, miniature cartridge, 3A, 250 V, 1/4" dia. x 1¼"L Type 3AG	37A162
F2	Pushbutton tuning transformer primary fuse	Fuse, miniature cartridge, 1A, 250 V, ¼" dia. x 1¼" L Type 3AG	37B656
	DIAL LAMPS		
I1	Dial lighting lamp	Lamp, miniature bayonet base, 6-8 V @ .150 amp. #47, brown bead	49A166
I2	Dial lighting lamp	Same as I1	
I3	Phono indicator lamp	Same as I1	
I4	BC Band indicator lamp	Same as I1	
I5	SW Band indicator lamp	Same as I1	
I6	FM Band indicator lamp	Same as I1	
	JACKS & RECEPTACLES		
J1	Record changer power receptacle	2 contact female plug with metal shield cap and cable clamp	65B640
J2	Speaker receptacle	10 contact female receptacle, 11/16" W x 1 9/16"L H.B.Jones type S-310-AB	67B642
J3	Receiver power receptacle	12 contact female receptacle, 15/16" W x 1¼" L, H.B.Jones type S-312-AB	67B641

SCOTT RADIO LABS. INC.

Table 5
Parts List By Symbol Designation

Symbol Desig.	Function	Description	Part Number
	JACKS & RECEPTACLES (Continued)		
J4	Audio input receptacle	4 contact female receptacle 11/16" W x 3/4" L, H. B. Jones type S-304-AB	67B543
J5	FM-IF input receptacle	Single contact female receptacle, mounts in 5/8"dia. hole, Amphenol type 80C Used on early model sets	67B634
J5	FM-IF input receptacle	Receptacle, 2 contact female mounts in 5/8" dia. hole, type PC2F. Used on late model sets	67B960
J6	Remote keyboard receptacle	21 contact female receptacle 1" W x 2¼" L, H.B. Jones type S-321-AB	67B786
J7	Loop antenna receptacle	4 contact female receptacle 13/16" W x 1½" L	67B645
	RELAYS		
K1	FM-AM changeover relay	Relay, 2 position with 2 rotary type wafer switches SW6A and SW6B, 2 coils L18 and L19, operates on 10 V AC. Used before Serial 2000	69B733
K1	FM-AM changeover relay	Relay, 2 position with 2 rotary type wafer switches SW6A and SW6B, 2 coils L18 and L19, operates on 24 V AC. Used after Serial 2000	69B983
K2	AC power ON-OFF relay	Relay, 2 position with 1 rotary switch section SW5, 2 coils L20 and L21, operates on 24 V AC. Used before Serial 2000	69B734
K2	AC power ON-OFF relay	Relay, 2 position with 1 rotary switch section SW5, 2 coils L20 and L21, operates on 22 V AC. Used after Serial 2000	69B984
K3	Audio muting relay	Relay, S.P.S.T. contacts normally open operates on 2.4 V AC	69B507
K4	Relay for dial drive motor	Same as K3. Added after Serial 2000	
K5	Relay for dial drive motor	Same as K3. Added after Serial 2000	
	INDUCTORS & CHOKES		
L1	BC Band antenna primary coil	RF inductor, universal wound on 1" dia. x 7/8" L form	20B604
L2	BC Band antenna secondary coil	RF inductor, universal progressive wound on 1" dia. x 1⅛" L form, adjustable iron core	20B605
L3	SW Band antenna primary coil	RF inductor, solenoid wound on 3/4" dia. x 7/8"L form	20B608
L4	SW Band antenna secondary coil	RF inductor, solenoid wound on 3/4" dia. x 1⅛" L form, adjustable iron core	20B609
L5	BC Band oscillator coil	RF inductor, solenoid wound on 1" dia. x 2¼" L form, adjustable iron core	20B607
L6	SW Band oscillator coil	RF inductor, solenoid wound on 3/4" dia. x 2¼" L form, adjustable iron core	20B611
L7	BC Band mixer coil	RF transformer, primary universal wound, secondary progressive universal wound on 1" dia. x 2¼" L form, adjustable iron core	20B606
L8	SW Band mixer coil	RF transformer, primary and secondary solenoid wound on 3/4" dia. x 2¼" L form, adjustable iron core	20B610
L9	FM antenna coil	RF transformer, primary and secondary solenoid wound on ½" dia. x 2 1/8" L form, adjustable iron core	20B612
L10	FM oscillator coil	RF inductor, solenoid wound on ½" dia. x 2 1/8" L form, adjustable iron core	20B614
L11	FM mixer coil	RF transformer, primary and secondary solenoid wound on ½" dia. x 2 1/8" L form, adjustable iron core	20B613
L12	1st FM-IF primary coil	RF inductor, solenoid wound on ½" dia. x 2 1/8" L form, adjustable iron core	20B618
L13	1st FM-IF secondary coil	RF inductor, solenoid wound on 7/16" dia. x 1 3/8" L form, adjustable iron core	20B619
L14	Bass boost choke	Audio reactor, 11 H @ 1000 CPS, no DC, laminated iron core, potted	17B691
L15	V14 plate filter choke	RF choke, 40 T #26 SSE wire on 9/32" dia. x 7/8" L form wire leads	17B761

Table 5
Parts List By Symbol Designation

Symbol Desig.	Function	Description	Part Number
	INDUCTORS AND CHOKES (Continued)		
L16	FM discriminator audio filter	Same as L15	
L17	High voltage filter choke	Filter reactor, 5 H @ 200 MA DC, laminated iron core, potted in chrome plated case	17B492
L18	FM-AM relay coil	Relay coil, wound on insulated copper sleeve, two terminals, 425 T #24 E wire DC resistance 2 ohm or 350 T #22 E wire, DC resistance 1 ohm, operates on 10 volts 60 CPS. Used on receivers before Serial 2000	20B707
L19	FM-AM relay coil	Same as L18	20B707
*L18	FM-AM relay coil	Relay coil, wound on insulated copper sleeve, two terminals, 800 T #30 E wire DC resistance 13 ohms, operates on 24 volts 60 CPS Used on receivers after Serial 2000	20B982
*L19	FM-AM relay coil	Same as L18	20B982
L20	AC power ON-OFF relay coil	Relay coil wound on insulated copper sleeve, two terminals, 1200 T #28 E wire, DC resistance 20 ohms or 1100 T #29 E wire, DC resistance 16 ohms, operates on 24 volts 60 CPS. Used on receivers before Serial 2000	20B719
L21	AC power ON-OFF relay coil	Same as L20	20B719
*L20	AC power ON-OFF relay coil	Relay coil wound on insulated copper sleeve, two terminals, 900 T #32 E wire, DC resistance 23 ohms operates on 24 volts, 60 CPS. Used on receivers after Serial 2000	20B977
*L21	AC power ON-OFF relay coil	Same as L20	20B977
L22	Muting relay coil	Audio muting relay coil, part of K3 assembly, operates on 2.4 volts 60 CPS	
L23	Drive motor relay coil	Same as L22. See relay K4	
L24	Drive motor relay coil	Same as L22. See relay K5	
L25	High voltage filter choke	Same as L17	
	LOUDSPEAKERS		
LS1	Loudspeaker for 800-B	Loudspeaker, coaxial type, 15 inch low frequency with 5 inch PM tweeter mounted axially, complete with crossover network and cable with 10 contact plug P-310-CCT. Field for 15 inch speaker 675 ohms series and 9000 ohms shunt. Input impedance 8 ohms	85B490
LS2	Loudspeaker for 800-B	Loudspeaker, 15" dynamic extended range. Field 675 ohm series and 9000 ohms shunt. Input impedance 16 ohms	85B909
	PLUGS		
P1	Receiver chassis power plug	Plug, 12 contact, male, metal cover with cable clamp, Type P-312-CCT	65A184
P2	Receiver chassis audio plug	Plug, 4 contact, male, metal cover with cable clamp, Type P-304-CCT complete with 4 wire cable	96B677
P3	FM-IF input plug	Plug, single contact, male Type 80M. Used on early model sets	65B656
P3	FM-IF input plug	Plug, 2 contact, male, Type MC2M. Used on later model sets	65B959
P4	Loudspeaker plug	Plug, 10 contact, male, metal cover with cable clamp, Type P-310-CCT	65A186
P5	AC power input plug	Plug, 2 contact, male, plastic shell	65B679
	RESISTORS		
R1	V1 - AM-RF grid return	Resistor, composition, .47 meg 10%, ½ watt, wire leads	70A61
R2	V1 - cathode bias	Resistor, composition, 560 ohms 10%, ½ watt, wire leads	70A46
R3	V1 - screen bleeder	Resistor, composition, 10,000 ohms 10%, ½ watt, wire leads	70A419

* These coils used on FM-AM and AC relays after Serial 2000.

SCOTT RADIO LABS. INC.

Table 5
Parts List By Symbol Designation

Symbol Desig.	Function	Description	Part Number
	RESISTORS (Continued)		
R4	V1 - Screen filter	Resistor, composition, 15,000 ohms 10%, 2 watt, wire leads	70B618
R5	Sensitivity control	Potentiometer, wire wound, 10,000 ohms 10%, 2 watt, linear taper, shaft: ¼" dia. x 3" L, complete with SPDT switch SW4 for N.L. circuit	70B569
R6	V2 - AM osc. grid leak	Resistor, composition, 47,000 ohms 10% ½ watt, wire leads	70A54
R7	V2 plate filter	Resistor, composition, 5100 ohms 10%, 1 watt, wire leads	70B648
R8	V3 - AM mixer grid return	Same as R1	
R9	V3 - injector grid return	Resistor, composition, 20,000 ohms 5%, ½ watt, wire leads	70A52
R10	V3 cathode bias	Resistor, composition, 240 ohms 5%, ½ watt, wire leads	70A45
R11	V1 - RF amp. plate filter	Resistor, composition, 1000 ohms 10%, ½ watt, wire leads	70A47
R12	V3 screen filter	Resistor, composition, 18,000 ohms 10%, 2 watt, wire leads	70A58
R13	V3 plate filter	Same as R11	
R14	1st AM-IF secondary series	Resistor, composition, 47 ohms 10%,½ watt, wire leads	70A420
R15	1st AM-IF secondary series	Resistor, composition, 10 ohms 10%,½ watt, wire leads	70A42
R16	V4 - 1st AM-IF amp. grid return	Resistor, composition, .22 meg 10%, ½ watt, wire leads	70A59
R17	V4 cathode bias	Same as R2	
R18	V4 screen filter	Resistor, composition, .1 meg 10%, ½ watt, wire leads	70A56
R19	V4 plate filter	Same as R11	
R20	2nd AM-IF secondary series	Same as R14	
R21	2nd AM-IF secondary series	Same as R14	
R22	V5 - 2nd AM-IF amp. cathode bias	Same as R2	
R23	V5 screen filter	Same as R18	
R24	V5 plate filter	Same as R11	
R25	AM tuning eye target series	Resistor, composition, 1 meg 20%, ½ watt, wire leads	70A63
R26	V11 - FM-RF amp. grid series	Resistor, composition, 5 ohms 10%,½ watt, wire leads	70B660
R27	Not used		
R28	V8 FM tuning eye grid return	Same as R1	
R29	V8 FM tuning eye adj.	Potentiometer, composition, 1 meg 20%, .4 watt, shaft: ¼" dia. x 11/32" L, screwdriver slot adj. linear taper	70B568
R30	V8 FM tuning eye target series	Same as R25	
R31	AM diode load	Same as R6	
R32	AM diode filter	Same as R6	
R33	V6 noise limiter cathode filter	Resistor, composition, .82 meg 10%,½ watt, wire leads	70B649
R34	AVC line filter	Same as R33	
R35	V7 AM tuning eye filter	Resistor, composition, 2.2 meg 20%,½ watt,wire leads	70A64
R36	V6 noise limiter cathode bias	Same as R33	
R37	Volume control	Potentiometer, composition, 1 meg 20%, .4 watt, clockwise audio taper, shaft: ¼" dia. x 3" long	70B570
R38	V9 1st AF amp. cathode bias	Resistor, composition, 1300 ohms 5%, ½ watt, wire leads	70B650
R39	V9 plate load	Same as R6	
R40	V9 plate filter	Same as R6	
R41	V10 2nd AF amp. grid return	Same as R18	
R42	V10 cathode bias	Same as R38	
R43	V10 plate load	Same as R6	
R44	V10 plate filter	Same as R6	
R45	Treble control	Potentiometer, composition, .25 meg 20%, .4 watt,clockwise audio taper, tapped at .135 meg 20%, shaft: ¼" dia. x 3" L.	70B540
R46	Bass control	Same as R45	
R47	Tone control circuit return	Same as R3	
R48	V11 FM-RF amp. cathode bias	Resistor, composition, 150 ohms 10%, ½ watt,wire leads	70A44
R49	V11 screen filter	Resistor, composition, 56,000 ohms 10%, ½ watt, wire leads	70A55
R50	V12 FM oscillator grid return	Same as R18	
R51	V11 plate filter	Same as R11	
R52	V12 plate filter	Same as R7	

Table 5
Parts List By Symbol Designation

Symbol Desig.	Function	Description	Part Number
	RESISTORS (Continued)		
R53	V13 FM mixer grid series	Same as R26	
R54	V13 cathode bias	Same as R11	
R55	V13 screen filter	Same as R16	
R56	V13 plate filter	Resistor, composition, 2400 ohms 5%, ½ watt, wire leads	70A49
R57	V14 1st FM-IF amp. grid series	Resistor, composition, 56 ohms 10%,½ watt, wire leads	70A43
R58	V14 cathode bias	Resistor, composition, 160 ohms 5%, ½ watt, wire leads	70B654
R59	V14 screen filter	Same as R49	
R60	V14 plate filter	Same as R56	
R61	T4 secondary shunt	Resistor, composition, 27,000 ohms 10%, ½ watt, wire leads	70A418
R62	V15 2nd FM-IF amp. grid series	Same as R57	
R63	V15 cathode bias	Same as R58	
R64	V15 screen filter	Same as R49	
R65	V15 plate filter	Same as R56	
R66	T5 secondary shunt	Same as R6	
R67	V16 1st FM limiter grid series	Resistor, composition, 27 ohms 10%,½ watt, wire leads	70B666
R68	V16 plate and screen filter	Resistor, composition, 39,000 ohms 10%, 1 watt, wire leads	70B653
R69	V8 FM tuning eye grid filter	Same as R35	
R70	V17 2nd FM limiter grid series	Same as R67	
R71	V17 grid leak	Same as R61	
R72	V17 grid return filter	Resistor, composition, 15,000 ohms 10%, ½ watt, wire leads	70A51
R73	V17 screen bleeder	Resistor, composition, 15,000 ohms 10%, 1 watt, wire leads	70B683
R74	V17 screen filter	Same as R68	
R75	V17 plate filter	Same as R18	
R76	V18 FM discriminator filter	Same as R49	
R77	V18 diode load	Same as R18	
R78	V18 diode load	Same as R18	
R79	FM de-emphasis network	Same as R6	
R80	V19A grid series	Same as R1	
R81	V19A grid return	Same as R6	
R82	V19A, V19B cathode bias	Resistor, composition, 1500 ohms 10%,½ watt,wire leads	70A48
R83	V19B plate load	Same as R16	
R84	V19A plate load	Same as R16	
R85	V20 grid return	Same as R16	
R86	V21 grid return	Same as R16	
R87	V19B grid return	Same as R16	
R88	V20,V21 cathode bias	Resistor, wirewound, 250 ohms 5%, 10 watt, vitreous enamel, wire leads	70A70
R89	V20 plate to V19A plate feedback	Same as R25	
R90	Audio output filter	Resistor, wirewound, 10,000 ohms 10%, 10 watt, vitreous enamel, wire leads	70B760
R91	V22 anode, dropping resistor	Resistor, wirewound, 3000 ohms 10%, 10 watt, vitreous enamel, wire leads	70B681
R92	Receiver high voltage dropping resistor	Resistor, wirewound, 300 ohms 10%, 10 watt, vitreous enamel, wire leads	70B682
R93	Speaker series field dropping resistor	Same as R91	
	SWITCHES		
SW1	Loop antenna switch	Switch, rotary, D.P.D.T., shaft: ¼" dia. x 11/32"long screwdriver slot	89B528
SW2	AM Band change switch	Switch, 4 section rotary, 2 position indent, front shaft ¼" x 2 13/16" long, shaft at rear 10½" long, ¼" dia. flat on 2 sides	89B508
SW2A	Antenna channel switch section	Switch section, 2 pole, 2 position, bakelite wafer, rotary type	89B508-2
SW2B	Oscillator channel switch section	Same as SW2A	
SW2C	Mixer channel switch section	Same as SW2A	
SW2D	Indicator lamp switch section	Switch section, 3 pole, 2 position, bakelite wafer, rotary type	89B508-1
SW3	Selectivity switch	Switch, 4 section rotary, 5 position indent, front shaft ¼" dia. x 2 13/16" long, shaft at rear 11½" long, ¼" dia. flat on two sides	89B509
SW3A	1st AM-IF Switch section	Switch section, 2 pole, 5 position, rotary type, bakelite wafer	89B509-1
SW3B	2nd AM-IF switch section	Same as SW3A	

SCOTT RADIO LABS. INC.

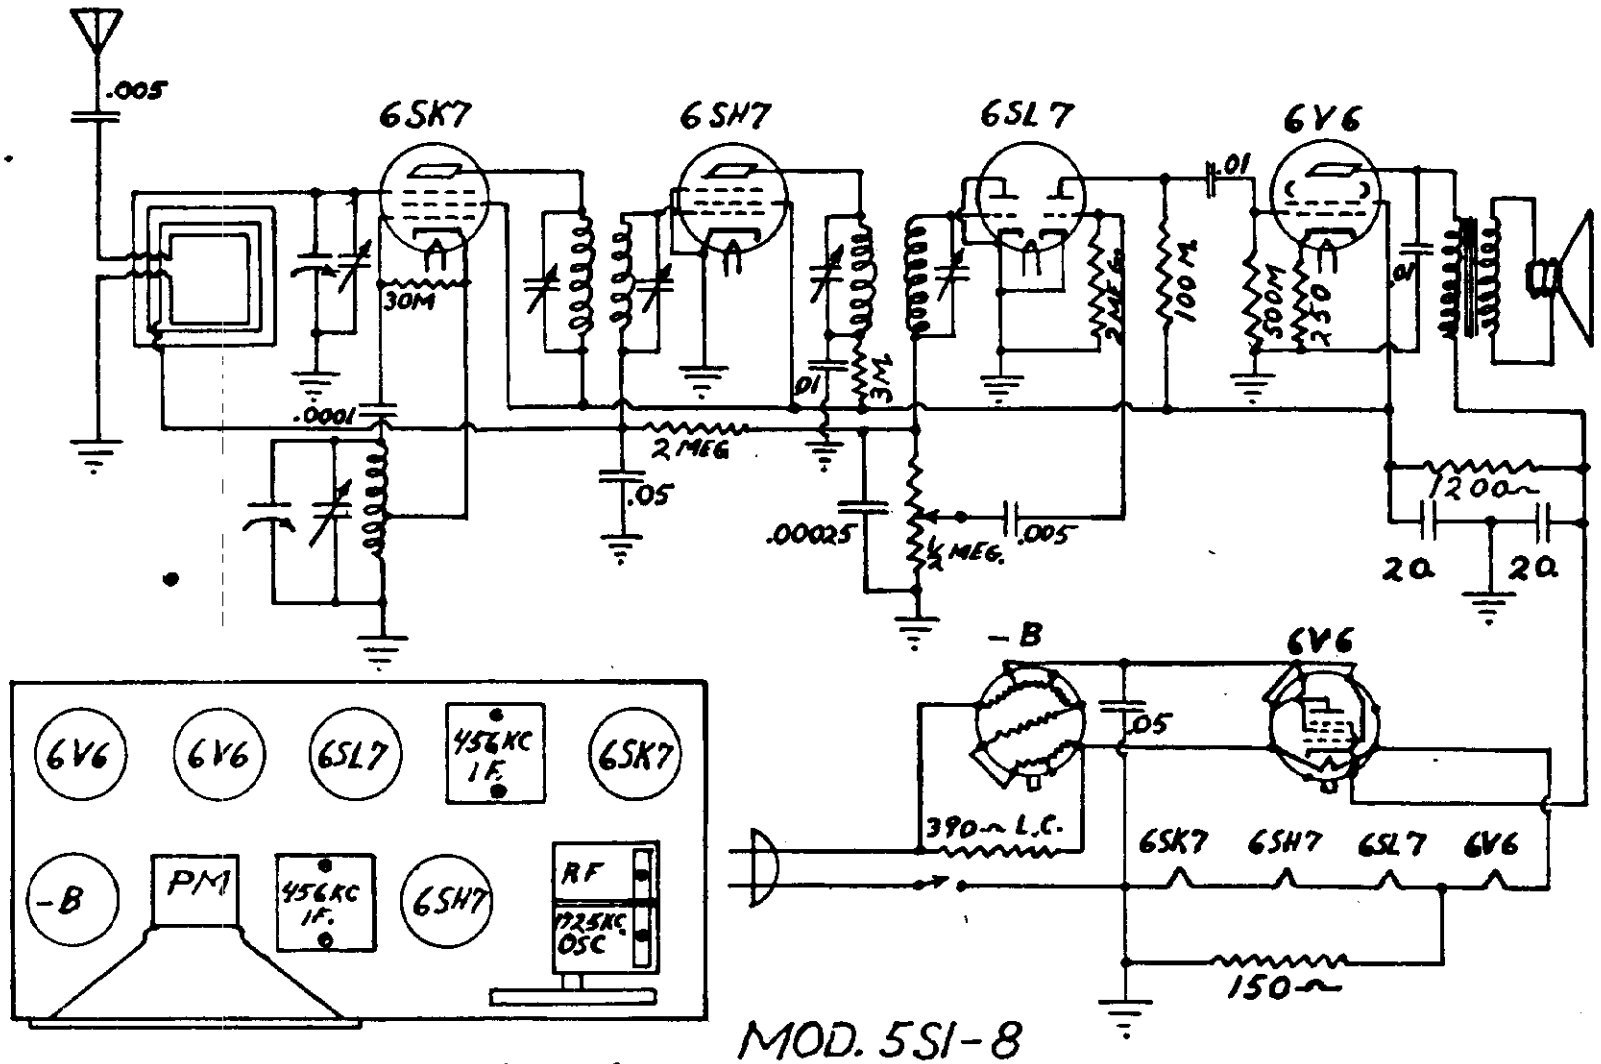
Parts List By Symbol Designation

Symbol Desig.	Function	Description	Part Number
	SWITCHES (Continued)		
SW3C	Phono-Radio switch section	Same as SW3A	
SW3D	Indicator lamp switch section	Same as SW3A	
SW4	Noise limiter switch	Switch, S.P.D.T. mounted on rear of sensitivity control R5, throws at maximum rotation of control	
SW5	AC power relay switch section	Switch section, 3 pole, 2 position, rotary type, bakelite wafer	89B626-1
SW6A	FM-AM relay switch top section	Switch section, 4 pole, 2 position, rotary type, bakelite wafer	89B625-1
SW6B	FM-AM relay switch bottom section	Switch section, 2 pole, 2 position, rotary type, bakelite wafer	89B625-2
SW7	Muting relay switch	Switch, S.P.S.T. mounted on relay K3	
SW8	Pushbutton switch gang	Switch, gang consisting of 7, S.P.S.T. momentary contact switches actuated by push levers	89B478
SW9	Pushbutton switch gang	Same as SW8	
SW10	Drive motor relay switch	Same as SW7. See relay K4	
SW11	Drive motor relay switch	Same as SW7. See relay K5	
	TRANSFORMERS, RF, AUDIO, POWER		
T1	1st AM-IF transformer	IF transformer, 455 KC, adjustable iron cores on primary and secondary	20B615
T2	2nd AM-IF transformer	IF transformer, 455 KC, adjustable iron cores on primary and secondary	20B616
T3	3rd AM-IF transformer	IF transformer, 455 KC, adjustable iron core on primary, secondary untuned	20B617
T4	2nd FM-IF transformer	IF transformer, 10.7 MC adjustable iron cores on primary and secondary	20B620
T5	3rd FM-IF transformer	IF transformer, 10.7 MC adjustable iron cores on primary and secondary	20B621
T6	4th FM-IF transformer	IF transformer, 10.7 MC adjustable iron cores on primary and secondary	20B622
T7	FM discriminator transformer	IF transformer, 10.7 MC, primary and secondary tuned by variable air trimmers	20B623
T8	Audio output transformer	Output transformer, primary 9000 ohms @ 1000 CPS, 100 MA DC, secondary 16 ohms tapped at 8 ohms, 25 watts	91B664
T9	Power transformer	Transformer, primary 120 V 50-60 CPS. Sec. 1-5 V @ 4A. Sec.-2-390-390 V @ 210 MA. Sec. 3-6.3 V @ 4 A. Sec. 4 6.6 V @ 4.6 A. Electrostatic shield between primary and secondaries	91B429
T10	Pushbutton tuning system transformer	Transformer, primary 117 volts 50-60 CPS. Sec. 46 V @ 2.5 A, tapped at 36 V and 24 V, primary designed for intermittent duty	91B694
	VACUUM TUBES		
V1	AM-RF amplifier	Vacuum tube, 6SK7, octal base, remote cutoff pentode Heater: 6.3 V @ .3 amp	92A226
V2	AM oscillator	Vacuum tube, 6J5, octal base triode, Heater: 6.3 V @ .3 amp	92A228
V3	AM mixer	Vacuum tube, 6SA7, octal base, pentagrid converter, Heater: 6.3 V @ .3 amp	92A227
V4	1st AM-IF amp.	Same as V1	
V5	2nd AM-IF amp.	Same as V1	
V6	AM 2nd detector AVC, noise limiter	Vacuum tube, 6H6, octal base, twin diode, Heater: 6.3 V @ .3 amp.	92A229
V7	AM tuning indicator	Vacuum tube, 6E5, 6 prong base, cathode ray indicator, Heater: 6.3 V @.3 amp	92B479
V8	FM tuning indicator	Same as V7	
V9	1st audio amp.	Same as V2	
V10	2nd audio amp.	Same as V2	
V11	FM-RF amp.	Vacuum tube, 6AQ5, miniature type, RF amplifier pentode, Heater: 6.3 V @ .3 amp	92B598
V12	FM oscillator	Vacuum tube, 6C4, miniature type, H.F. triode, Heater: 6.3 V @ .15 amp	92B597
V13	FM mixer	Same as V11	

Table 5
Parts List By Symbol Designation

Symbol Desig.	Function	Description	Part Number
	VACUUM TUBES (Continued)		
V14	1st FM-IF amp.	Vacuum tube, 6AC7, octal base, amplifier pentode, Heater: 6.3 V @ .45 amp	92A235
V15	2nd FM-IF amp.	Same as V14	
V16	1st FM-IF limiter	Vacuum tube, 6SJ7, octal base, sharp cutoff pentode, Heater: 6.3 V @ .3 amp	92A236
V17	2nd FM-IF limiter	Same as V16	
V18	FM discriminator	Same as V6	
V19	3rd audio amp. Phase inverter	Vacuum tube, 6SL7GT, octal base, twin triode, Heater: 6.3 V @ .3 amp	92B669
V20	Power output audio amp.	Vacuum tube, 6L6G, octal base, beam power amp., Heater: 6.3 V @ .9 amp	92A233
V21	Power output audio amp.	Same as V20	
V22	Voltage regulator	Vacuum tube, OD3-VR150/30, octal base, glow discharge voltage regulator	92A237
V23	High voltage rectifier	Vacuum tube, 5Y3GT, octal base, full wave high vacuum rectifier, filament 5 V @ 2 amp	92B480
V24	High voltage rectifier	Same as V23	
	WIRES AND CABLES		
W1	FM-IF lead	Shielded lead consisting of 7 ft RG58/u concentric line with single contact plug P3 type 80M attached. Used on early model sets.	65B658A
W1	FM-IF lead	Same as W1 above except plug is 2 contact type MC2M	65B959A
W2	Receiver power cable	Cable, 12 conductor, 2 shielded, with 12 contact plug P-312-CCT attached	96B676
W3	Audio connecting cable	Cable, 4 conductor, 2 shielded, with 4 contact P-304-CCT plug attached	96B677
	SOCKETS		
X1	Socket for V1	Socket, 8 contact octal, black bakelite type MIP-8, marked 6SK7	82B431
X2	Socket for V2	Socket, 8 contact octal, black bakelite type MIP-8, marked 6J5	82B433
X3	Socket for V3	Socket, 8 contact octal, black bakelite type MIP-8, marked 6SA7	82B432
X4	Socket for V4	Same as X1	
X5	Socket for V5	Same as X1	
X6	Socket for V6	Socket, 8 contact octal, black bakelite type MIP-8, marked 6H6	82B434
X7	Socket for V7	Socket, 6 contact, black bakelite PF-6 with metal cap	82B708
X8	Socket for V8	Same as X7	
X9	Socket for V9	Same as X2	
X10	Socket for V10	Same as X2	
X11	Socket for V11	Socket, 7 contact, miniature type with tube shield	82B663
X12	Socket for V12	Same as X11	
X13	Socket for V13	Same as X11	
X14	Socket for V14	Socket, 8 contact octal, black bakelite type MIP-8, marked 6AC7	82B438
X15	Socket for V15	Same as X14	
X16	Socket for V16	Socket, 8 contact octal, black bakelite type MIP-8, marked 6SJ7	82B439
X17	Socket for V17	Same as X16	
X18	Socket for V18	Same as X6	
X19	Socket for V19	Socket, 8 contact octal, black bakelite type MIP-8, marked 6SL7GT	82B687
X20	Socket for V20	Socket, 8 contact octal, black bakelite type MIP-8, marked 6L6G	82B436
X21	Socket for V21	Same as X2	
X22	Socket for V22	Socket, 8 contact octal, black bakelite type MIP-8, marked VR-150	82B440
X23	Socket for V23	Socket, 8 contact octal, black bakelite type MIP-8 marked 5Y3-GT	82B437
X24	Socket for V24	Same as X23	



MOD. 5SI-8

CLIPPER

This apparatus uses inventions of United States patents licensed by Radio Corporation of America. Patent numbers supplied upon request.

This apparatus is licensed under the patent rights of Hazeltine Corporation.

SEARLE PAGE 1
MODEL 5SI-8

SEARLE AERO INDUSTRIES INC.

LIST OF MOST COMMON TROUBLES - SEARLE MOD.5S1-8 CLIPPER

A - SET DEAD

1. Tubes don't light up right.

IF nothing lights up - 6V6 Line Cord or Switch is open.

IF 150 OHM Resistor is too hot - 6SK7, 6SH7 or 6SL7 is open.

IF Tubes glow dull Red inside cathodes - Ballast is open or line cord resistor is open.

IF Tubes light too bright - Ballast or Line Cord is low.

2. If Tubes light up properly.

IF Voltage at V5 #8 is below 90 and Voltage is over 15 volt lower DN V4 #4 Circuit is shorted probably if trans or filter condenser.

IF Voltage is below 90 at V5 #8 and Voltage at V4 #4 is nearly same 6V6 rectifier is bad.

IF Voltage is low with hum Filter condenser is bad.

IF Voltages to above points are OK Check to V1 #6 and #8 V2 #6 and #8 - Low V on #6 pins - bad solder, Low V on #8 pins - bad IF Trans.

IF Set hums when finger is touched to hot side of pot Audio is OK.

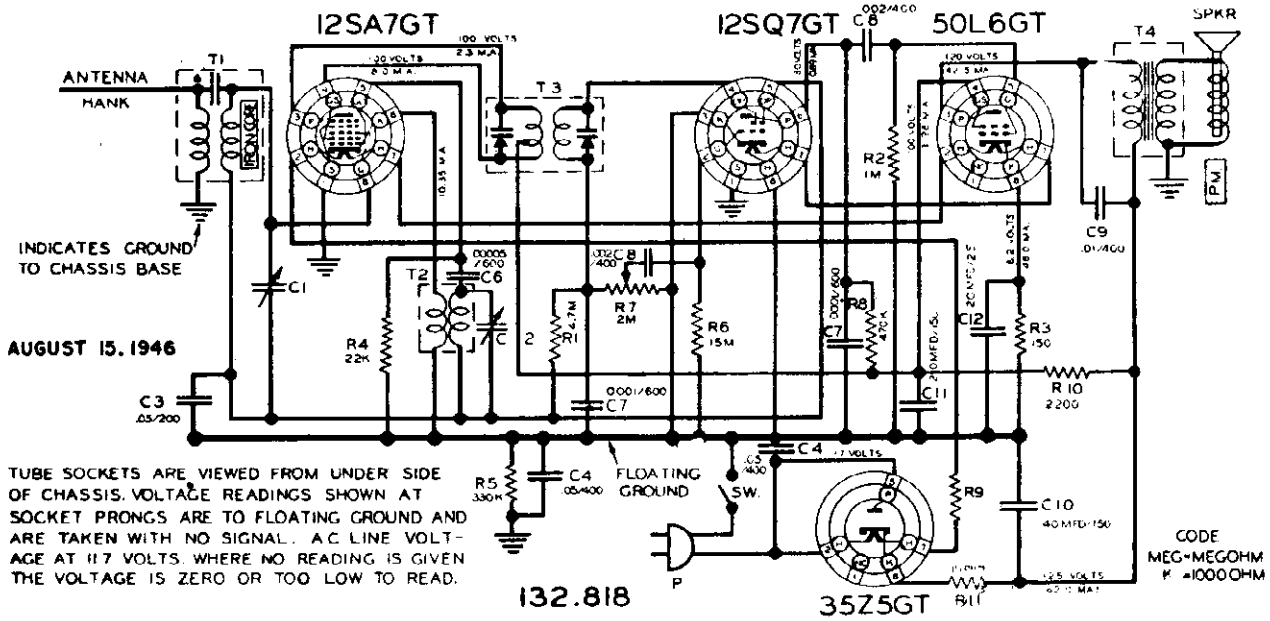
IF Set is still dead, try new 6SL7 and 6SH7 then K7.

IF 456 KC comes through with tuning cond. open but not when closed - condenser is shorted.

IF A.V.C. is shorted to ground 1st IF trans. is shorted.

IF Set plays good, test OKsbut hums little try new 6SL7.

SEARS ROEBUCK & CO.



PRELIMINARY:

Output meter connection	Across loud speaker voice coil
Output meter reading to indicate 200 milliwatts	.8 volts
Connection of generator ground lead	Floating ground
Generator Modulation	30%, 400 cycles
Position of Volume Control	Fully clockwise
Position of Dial Pointer with Variable fully closed	54 on dial

POSITION OF VARIABLE	FREQUENCY GENERATOR	DUMMY ANTENNA	GENERATOR CONNECTION (high)	TRIMMERS ADJUSTED (In order shown)	TRIMMER FUNCTION
Open	455 kc.	.05 mfd.	12SA7GT grid	Top of T3	IF
1400 kc.	1400 kc.	.00005 mfd.	**Ant.	*C2	Osc.
600 kc.	600 kc.	.00005 mfd.	**Ant.	Check point	----

IMPORTANT ALIGNMENT NOTES

*Since the antenna stator section of the variable has no trimmer, the rotor is rocked back and forth while adjusting oscillator trimmer, to obtain maximum output.

Check the sensitivity at 600 kc, if weak adjust antenna section plates for maximum output at 600 kc, tracking is accomplished by adjusting plates of rotor.

**Unsolder 20' antenna lead from lug on antenna coil, and connect signal generator lead to lug through .00005 uuf Dummy Antenna.

Approximate stage by stage sensitivities are: Mixer - 455 kc - 2600 uv; Mixer 1000 kc - 2600 uv; Antenna - 1000 kc - 180 uv.

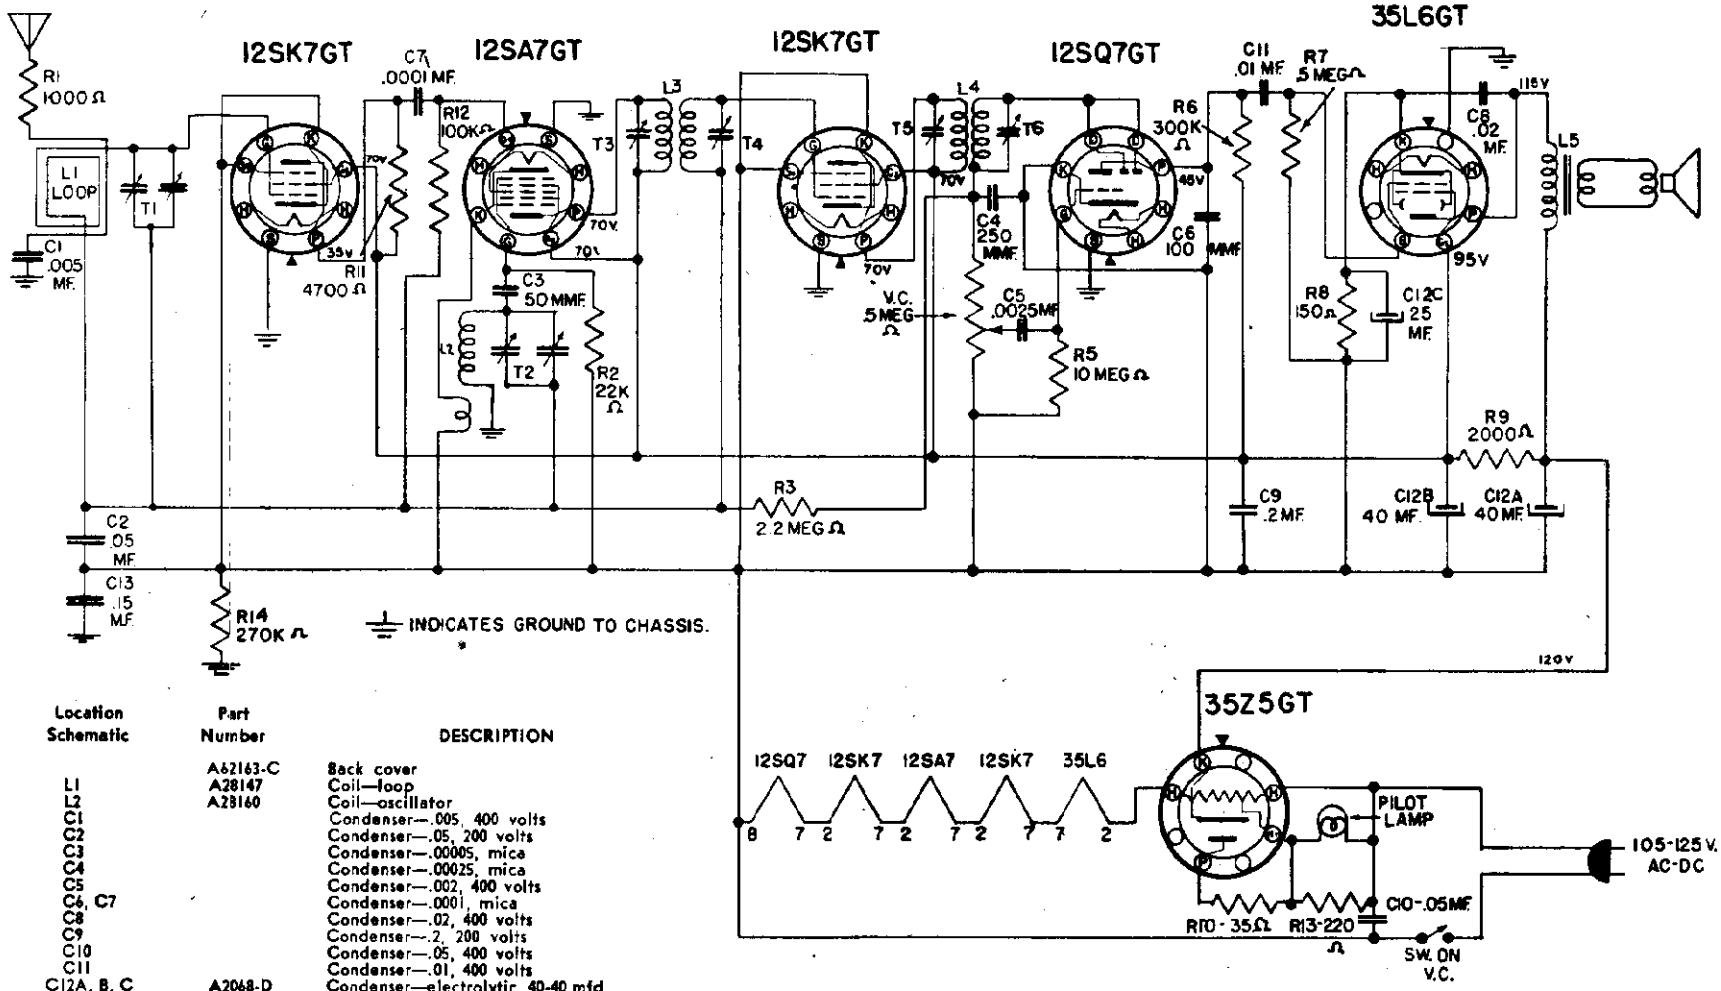
Power Supply -- 105-125 Volts AC-DC, 35 Watts
Power Output
Undistorted .8 Watts, Maximum - 2.5 Watts

Tuning Range Broadcast Band 540-1600 Kc
Speaker
Voice Coil Impedance 3.2 Ohms

GENERAL INFORMATION & SERVICE HINTS

Due to a wide variation in characteristics of 12SA7 tubes the set may have a tendency to oscillate when tube replacements are made. A 1 megohm resistor placed across the I F coil from B- to plate will usually correct this condition. Some sets already have this resistor installed.



IF PEAK 455 KC

See Note Below

IMPORTANT ALIGNMENT NOTES

It is advisable to repeat the entire alignment procedure in the original order to insure greater accuracy.

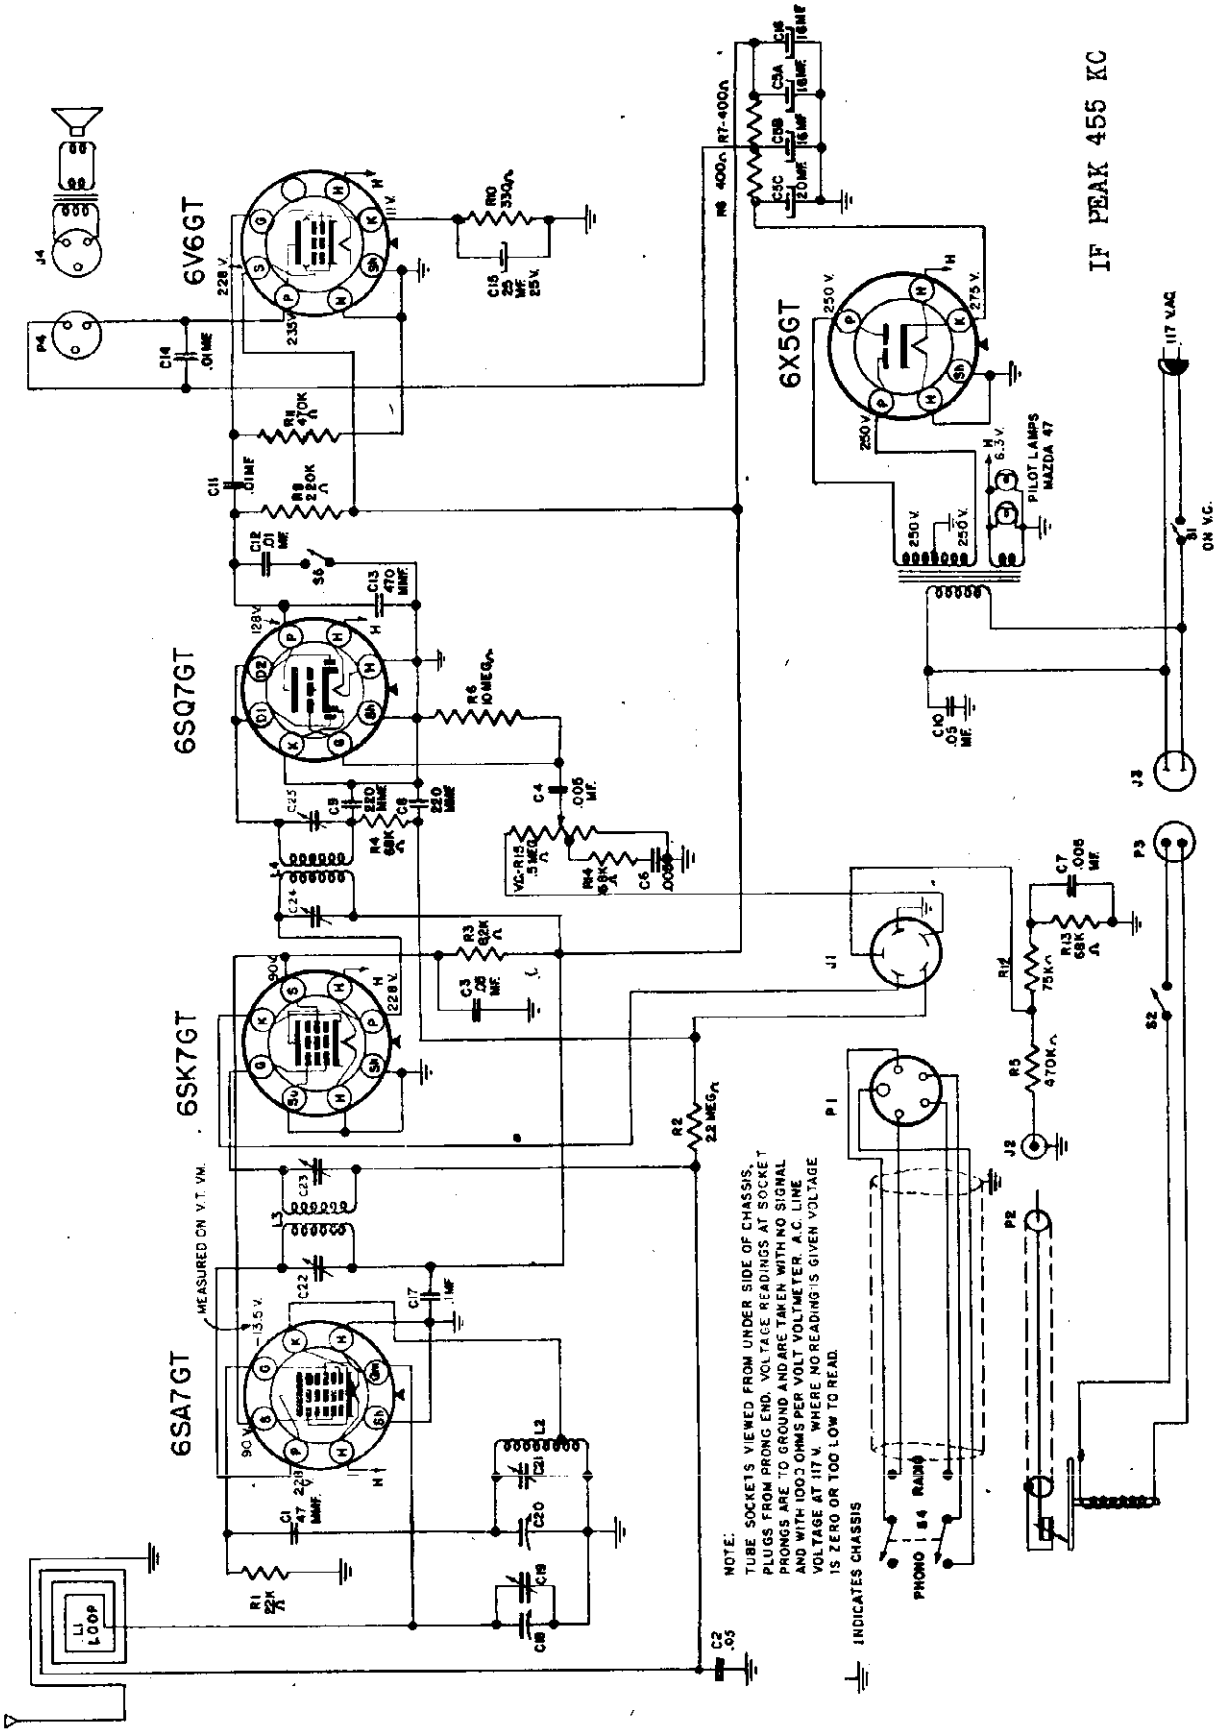
Always keep the output from the test oscillator at its lowest possible value. As the sensitivity is increased by alignment, the generator output should be reduced correspondingly.

***Run a wire from the output terminal of the generator near the receiver. However, no connection is made between the signal generator and the receiver.

DIAL LAMP:

A six volt bayonet dial lamp No. 47 is used in this receiver. The dial lamp may be removed for replacement by gently squeezing the dial lamp socket mounting bracket and withdrawing from the dial assembly. Replace the lamp with another of the same type. DISCONNECT THE RECEIVER FROM THE ELECTRICAL OUTLET BEFORE REPLACING THE LAMP.

SEARS ROEBUCK & CO.



ALIGNMENT PROCEDURE

Output meter connections.....Across voice coil (3.2 ohms)
Output meter reading for 1/2 watt output.....1.25 volts
Connection of generator ground.....to chassis
Generator modulation.....Approx. 30% at 400 cycles
Position of volume control.....Full clockwise
Position of tone control.....High (In)
Position of dial pointer with variable cond. fully closed.....First mark to left of "55" on dial scale

POSITION OF DIAL POINTER	GENERATOR FREQUENCY	GENERATOR CONNECTION	DUMMY ANTENNA	TRIMMERS ADJUSTED IN ORDER SHOWN	TRIMMER FUNCTION
540 kc	455 kc	6SA7GT Grid	.1 μfd	C25, C24, C23, C22	I.F.
High end of scale	1720 kc	Radiated Signal		C21	Osc.
1500 kc	1500 kc	Radiated Signal		C19	Ant.

The alignment procedure should be repeated stage by stage to obtain greatest accuracy. Always keep the output from the test oscillator at its lowest possible value. As the sensitivity is increased by alignment, the generator output should be reduced correspondingly so as to minimize the effect of the automatic volume control.

TUBE SOCKETS ARE VIEWED FROM UNDER SIDE OF CHASSIS. VOLTAGE READINGS SHOWN AT SOCKET PRONGS ARE TO CHASSIS, AND ARE TAKEN WITH NO SIGNAL. LINE VOLTAGE AT 117 VOLTS. WHERE NO READING IS GIVEN THE VOLTAGE IS ZERO OR TOO LOW TO READ.

ALIGNMENT PROCEDURE

PRELIMINARY:

Output meter connection.....Across loudspeaker voice coil
Output meter reading to indicate 500 milliwatts.....1.25 volts
Dummy antenna value to be in series with generator output.....See chart below
Connection of generator output lead.....See chart below
Connection of generator ground lead.....Receiver chassis
Generator modulation.....30%, 400 cycles
Position of Volume Control.....Fully clockwise
Position of Tone Control.....Counterclockwise (HI)
Position of Dial Pointer with variable fully closed.....On mark below 540 Kc Calibration mark

POSITION OF VARIABLE	GENERATOR FREQUENCY	DUMMY ANTENNA	GENERATOR CONNECTION	ADJUSTMENTS (IN ORDER SHOWN)	FUNCTION
Closed	455 Kc	.1 mfd.	6SA7 Grid	T2, T1	I.F.
Fully open	1620 Kc	.00005 mfd.	Ant. Clip	C4	Oscillator
1410 Kc	1410 Kc	.00005 mfd.	Ant. Clip	C1	Translator
600 Kc (rock)	600 Kc	.00005 mfd.	Ant. Clip	L2	Padder
Fully open	1620 Kc	.00005 mfd.	Ant. Clip	C4	Oscillator

IMPORTANT ALIGNMENT NOTES

Where indicated by the word "Rock", the variable should be rocked back and forth a degree or two while making the adjustment.

The alignment procedure should be repeated stage by stage, in the original order for greatest accuracy. Always keep the output from the test oscillator at its lowest possible value to make the AVC action of the receiver ineffective.

POWER OUTPUT — Undistorted.....2.5 watts — Maximum.....6 watts

ALIGNMENT PROCEDURE

PRELIMINARY:

Output meter connection.....Across loud speaker voice coil
Output meter reading to indicate 50 milliwatts (standard output).....0.4 Volts
Generator ground lead connection.....Receiver chassis
Dummy antenna value to be in series with generator output.....See chart below
Connection of generator output lead.....See chart below
Generator Modulation.....30%, 400 cycles
Position of Volume Control.....Fully on (Clockwise)
Position of Tone Control.....Hi (Counter-clockwise)
Position of dial pointer with tuner fully closed.....Last line to the left of the 540 Kc. calibration mark

Last line to the right of the 1700 Kc. calibration mark shall be considered 1725 Kc.

BAND SWITCH POSITION	POSITION OF TUNER	GENERATOR FREQUENCY	DUMMY ANTENNA	GENERATOR CONNECTION	ADJUSTMENTS (IN ORDER SHOWN)	FUNCTION

9 Mc	9.6	9.6 Mc	400 ohms	Ant. Terminal	C3, C10	Ant., RF

IMPORTANT ALIGNMENT NOTES

Before attempting short-wave alignment the L5 core should be adjusted to a dimension of approximately 1-21/32" from the top core to the top turn of the winding. This should be done with the tuner in the 1725 Kc. position.

During alignment of the Antenna and RF trimmers on the shortwave spread bands the tuner should be rocked through resonance to assure alignment.

The alignment must be done in the order given. Adjust all trimmers and cores for maximum output.

The antenna alignment procedure should be repeated step by step in the original order for greatest accuracy.

Always keep the output power rrom the generator at its lowest possible value to prevent the AVC action of the receiver from interfering with accurate alignment.

Power Output — Undistorted 0.125 Watts — Maximum 0.250 Watts

SEARS ROEBUCK & CO.

Power Shifter

"A" SUPPLY

The "A" supply is obtained from a full wave copper sulphide rectifier filtered by a condenser input filter consisting of three condensers and two low resistance chokes. A tap on the power transformer allows the voltage on the rectifier to be changed giving two "A" load voltages. Terminal voltages for various loads are indicated on the wiring diagram.

"B" SUPPLY

The "B" supply employs a 6J5GT tube operated as a half wave rectifier operating into a condenser input filter of one choke followed by another condenser.

The "A" and "B" circuits are not common to each other or to the chassis. Different tube biasing methods make this necessary.

POWER DRAIN

When the "A" voltage is excessively low the rectifier, condensers or transformer may be defective. To check the transformer remove one lead of transformer winding from the rectifier and measure for A.C. voltage indicated on the wiring diagram. To check the rectifier remove the plus lead from the choke L2 and condenser C2. Also disconnect one side of jumper wire and measure D.C. voltage across the rectifier. This should be 1.4 to 1.5 volts with the tap changer tie block in the 4-5 tube position.

"B" SUPPLY FAILS

The 6J5GT tube should be tested with a standard tube tester. The transformer may be tested by measuring the A.C. voltage across the secondary plate winding with the tube removed.

EXCESSIVE HUM

When excessive hum is noticed in the radio it may be due to the "A" supply or the "B" supply. The hum will be very loud when the input condenser C2 opens in service and this open condenser will cause the output voltage to drop to 1.35 volts without load (4-5 tube position). The hum will be somewhat less in volume if the second section or output condenser has opened and this will not change the output voltage.

When the hum is caused by the "B" supply, the condensers of this filter circuit have probably opened. If the input condenser has opened the output voltage will drop to approximately 110 volts without load. Less hum is caused when the output condenser opens and the output voltage is not changed.

To determine whether the hum is introduced by the "A" supply or the "B" supply, batteries may be substituted for each separate supply while one circuit is being tested.

IMPORTANT - READ CAREFULLY

The "A" supply of this power unit is supplied through a dry disc rectifier. If the radio ceases to operate or drops off in performance, it may be due to a chemical change in this rectifier. This may cause the "A" voltage to drop low enough to affect the performance of the receiver.

To reactivate the rectifier it is only necessary to short (connect together) the "A" plus and "A" minus of plug or terminals of socket for a period of 4 minutes. The high temperature developed in the rectifier during this period has the tendency to restore the discs to their normal rectifying capacity. The unit will not be harmed by this process.

This deactivated condition is more likely to occur in the rectifier when the power unit has been out of service for some length of time (4 months or more).

	"A" OUTPUT	"B" OUTPUT
4-5 Tube	1.50 V at 200 Ma. 1.35 V at 250 Ma.	90 V at 13 Ma. 101 V at 8.5Ma.
6 Tube	1.55 V at 300 Ma. 1.35 V at 350 Ma.	138 V at 0 Ma.

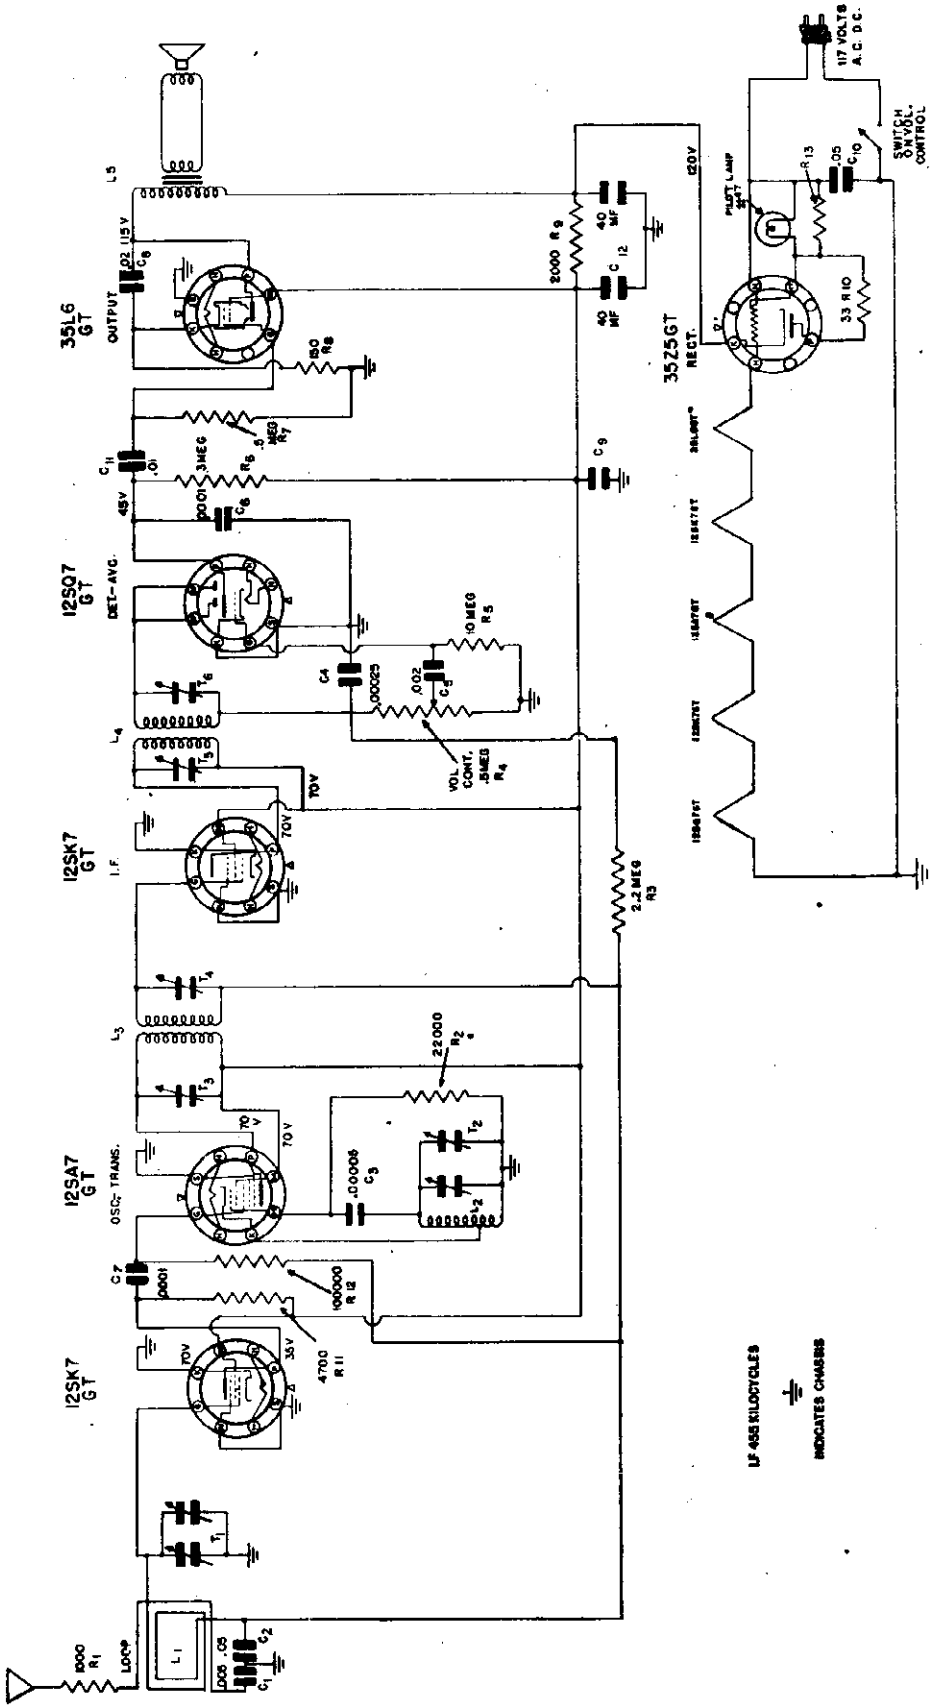
CHASSIS 110.451

SEARS ROEBUCK & CO.



DIAL LAMP:

A six volt bayonet dial lamp **No. 47** is used in this receiver. The dial lamp may be removed for replacement by gently squeezing the dial lamp socket mounting bracket and withdrawing from the dial assembly. Replace the lamp with another of the same type. DISCONNECT THE RECEIVER FROM THE ELECTRICAL OUTLET BEFORE REPLACING THE LAMP.

Output meter connections .... Across primary output transformer

Connection of generator ground .... Chassis

Generator modulation .... App. 30% @ 400 cycles

Position of volume control .... Fully Clockwise

POSITION OF DIAL POINTER	GENERATOR FREQUENCY	GENERATOR CONNECTION	TRIMMERS ADJUSTED	TRIMMER FUNCTION
540 kc	455 kc	12SA7GT	T3, T4, T5, T6	I. F.
1500 kc	1500 kc	* * *	T2, T1	Osc., R. F.

It is advisable to repeat the entire alignment procedure in the original order to insure greater accuracy.

Always keep the output from the test oscillator at its lowest possible value. As the sensitivity is increased by alignment, the generator output should be reduced correspondingly.

***Run a wire from the output terminal of the generator near the receiver. However, no connection is made between the signal generator and the receiver.

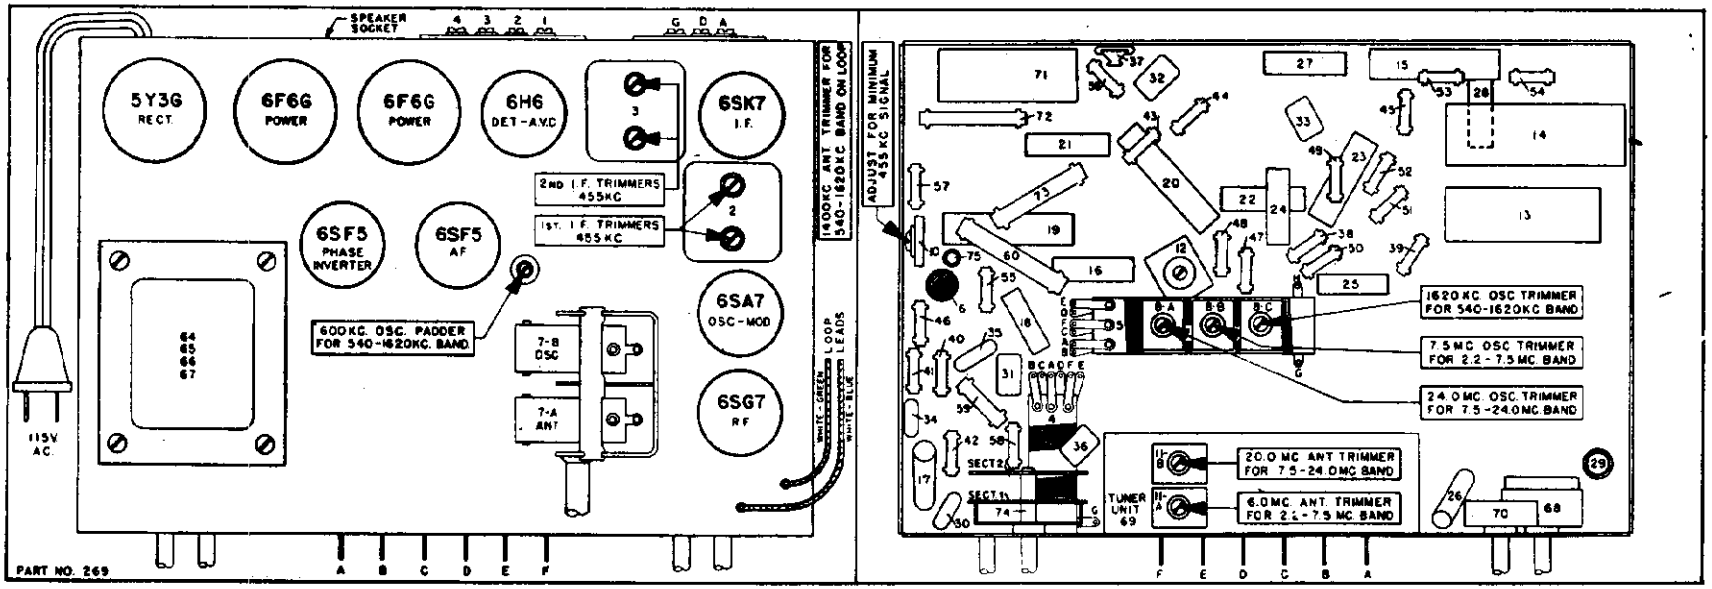
ALIGNMENT PROCEDURE

For alignment procedure read tabulations from left to right. If more than one adjustment is required on any one band, make the adjustment marked (1) first, (2) next, (3) third. IMPORTANT: BEFORE ALIGNING, PLACE LOOP ANTENNA IN THE SAME POSITION IT WILL BE IN WHEN THE SET IS IN THE CABINET.

When adjusting 1620 kilocycle oscillator trimmer 600 K.C. padder, 455 K.C. R.F. trimmer and 1400 kilocycle antenna trimmer, do not connect test oscillator to loop. Couple test oscillator to receiver loop by: (a) Make a loop consisting of five to ten turns of No. 20 to 30 size wire wound on a three inch form and attach across output of test oscillator. (b) Place test oscillator loop near set loop—BE SURE THAT NEITHER MOVES WHILE ALIGNING.

Place band switch for operation on:	Set receiver dial to:	TEST OSCILLATOR: Adjust test oscillator frequency to:	TEST OSCILLATOR: Use dummy antenna in series with output of test oscillator consisting of:	TEST OSCILLATOR: Attach output of test oscillator to:	Refer to parts layout diagram for location of trimmers mentioned below:
I. F. alignment use any band position.	Any point where no interfering signal is received	Exactly 455 K.C.	0.2 Mfd. condenser	High side to grid of 6SA7 tube. Low side to frame of gang condenser.	Adjust each of the second I.F. transformer trimmers for maximum output, then adjust each of the first I.F. transformer trimmers for maximum output.
1620 to 540 K.C. Band	1 Rotate gang condenser to Maximum Capacity	Exactly 455 K.C.	None	Use Small Loop to couple test oscillator to receiver loop. Low side to frame of condenser.	Adjust R.F. coil for minimum 455 K.C. signal.
	2 Exactly 1620 K.C.	Exactly 1620 K.C.	None	Use Small Loop to couple test oscillator to receiver loop. Low side to frame of condenser.	Adjust 1620 K. C. oscillator trimmer for maximum output.
	3 Approx. 1400 K.C.	Approx. 1400 K.C.	None	Use Small Loop to couple test oscillator to receiver loop. Low side to frame of condenser.	While rocking gang condenser adjust 1400 K. C. loop trimmer for maximum output.
	4 Approx. 600 K.C.	Approx. 600 K.C.	None	Use Small Loop to couple test oscillator to receiver loop. Low side to frame of condenser.	While rocking gang condenser adjust 600 K. C. oscillator padder for maximum output.
2.2 to 7.5 M.C. Band	1 Exactly 7.5 M.C.	Exactly 7.5 M.C.	400 Ohm carbon resistor	Receiver antenna "A" post	Adjust 7.5 M. C. oscillator trimmer for maximum output.
	2 Approx. 6. M.C.	Approx. 6. M.C.	400 Ohm carbon resistor	Receiver antenna "A" post	While rocking gang condenser adjust 6 M. C. antenna trimmer for maximum output.
7.5 to 24 M.C. Band	1 Exactly 24 M.C.	Exactly 24 M.C.	400 Ohm carbon resistor	Receiver antenna "A" post	Adjust 24 M. C. oscillator trimmer for maximum output.
	2 Approx. 20 M.C.	Approx. 20 M.C.	400 Ohm carbon resistor	Receiver antenna "A" post	While rocking gang condenser adjust 20 M. C. antenna trimmer for maximum output.



The loop aerial cannot be used for short wave reception. WHEN TUNING FOR SHORT WAVE 2.2-7.5 AND 7.5-24 M.C. BAND STATIONS, CONNECT A 25-50 FOOT OUTDOOR AERIAL TO THE RADIO.

THERE ARE THREE AERIAL & GROUND POSTS marked "A," "D," and "G" on the rear of the chassis. When the receiver is shipped from the factory a flexible wire is connected to post "D" and "G." When a straight aerial is used this wire should be left in this position and the aerial lead-in connected to the post marked "A."

When a doublet type antenna is used, remove the small piece of wire connecting "G" and "D" posts together and attach one of the doublet antenna lead-ins to "A" post and the other to "D" post.

The metal arm on loop need not be moved to "Ant" position as arm is inoperative when band selector switch is in 2.2-7.5 and 7.5-24 M.C. bands position.

REGARDLESS OF THE TYPE OF AERIAL USED ALWAYS HAVE A GOOD GROUND ATTACHED TO THE POST MARKED "G" ON REAR OF CHASSIS. A cold water pipe, steam radiator or an iron rod driven 3 or 4 feet into moist ground will provide a suitable ground.

PUSH BUTTON TUNING

SIX STATIONS OPERATING IN THE 1620-540 K.C. BAND MAY BE "AUTOMATIC PUSH BUTTON" TUNED BY PROPERLY SETTING THE 6 SETS OF TRIMMER SCREWS LOCATED UNDERNEATH PUSH BUTTON ESCUTCHEON ON FRONT OF CABINET.

As the push buttons are not preset at the factory for any definite stations, be sure to set them by:

(a) It is important to have the aerial, if an outdoor antenna is to be used, attached to the radio when adjusting the trimmers.

(b) BE SURE TO OPERATE THE RADIO AT LEAST ONE-HALF HOUR BEFORE ADJUSTING TRIMMERS. If set is not thoroughly warmed up when trimmers are adjusted, the trimmers may shift position after they do become warm, resulting in poor tone, weak signals and excessive background noise.

(c) Obtain the transmitter frequency—number of kilocycles—and call letters of the six stations you wish to "Push Button" tune. FOR BEST RESULTS SET PUSH BUTTONS FOR LOCAL OR STRONG NEAR-BY STATIONS ONLY.

(d) Remove push button escutcheon from front of cabinet by unscrewing small wood screws that hold this in place.

(e) Rotate band switch to the next to the maximum right hand position.

(f) Using manual tuning knob, carefully tune in to the point of clearest tone, one of the selected stations whose transmitter frequency is somewhere between 540 and 900 kilocycles.

(g) Rotate band switch knob to the maximum right hand position.

(h) Press in either one of the two push buttons indicated on label adjacent to trimmers marked 540 to 900 K.C. Note: Station signal will disappear, or may be distorted and in some instances another station may be heard.

(i) Using a screwdriver ADJUST THE LARGE 540 to 900 KILOCYCLE ADJUSTING SCREW, LOCATED ABOVE THE PUSH BUTTON THAT IS PUSHED IN—until the 540 to 900 kilocycle station that had been previously tuned in with the manual tuning knob, is heard with maximum volume and clearest tone. AFTER ADJUSTING THE LARGE SCREW CAREFULLY ADJUST THE SMALL SCREW DIRECTLY BELOW THE LARGE ONE FOR CLEAREST TONE AND MAXIMUM VOLUME.

(j) Remove the printed tab, having the call letters of the station tuned in, from the paper call letter sheet. Press this into the depression in the push button escutcheon that will be adjacent to the push button just adjusted when the escutcheon is remounted in place on the cabinet.

(k) Set other trimmers for selected stations operating between the frequency range of the trimmers, as indicated on the label.

IMPORTANT: THE WAVE SWITCH KNOB MUST BE IN THE MAXIMUM RIGHT HAND POSITION FOR PUSH BUTTON TUNING.

In some instances it may be necessary, after the set is operated for a period of time, to reset the trimmers as they may drift due to heat, humidity, etc.

THE FOLLOWING PARTS LIST, WIRING DIAGRAM AND ALIGNMENT CHARTS ARE INTENDED FOR USE BY PROFESSIONAL SERVICE MEN

If your radio should ever require attention, show this data to your service man . . . it will help him to make a faster and better adjustment.

VOLTAGE TABLE
(BOTTOM VIEW OF CHASSIS)

P.—3-46—

For alignment procedure read tabulations from left to right, and make the adjustment marked (1) first, (2) next, (3) third.

Before starting alignment:

(a) Check tuning dial adjustment by tuning gang condenser until plates touch maximum capacity stop (completely in mesh) at which point the dial needle must be exactly even with the last line at the low frequency end of the dial calibration. If dial needle does not point exactly to last line move to correct position.

(b) Use an accurately calibrated test oscillator with some type of output measuring device.

(c) PLACE LOOP ANTENNA IN THE SAME POSITION IT WILL BE IN WHEN THE SET IS IN THE CABINET.

Steps	Set receiver dial to:	TEST OSCILLATOR			Refer to parts layout diagram for location of trimmers mentioned below:
		Adjust test oscillator frequency to:	Use dummy antenna in series with output of test oscillator consisting of:	Attach output of test oscillator to:	
1	Any point where no interfering signal is received.	455 K. C.	.02 MFD. condenser	High side to rear stator plates of tuning condenser. Low side to frame of condenser through a .02 Mfd. blocking condenser.	Adjust each of the second I. F. transformer trimmers for maximum output—then adjust each of the first I. F. trimmers for maximum output.
2	Exactly 1730 K. C.	Exactly 1730 K. C.	.00025 MFD. condenser	Receiver blue antenna lead Receiver black ground lead	Adjust 1730 K. C. oscillator trimmer for maximum output.
3	Approx. 1400 K. C.	Exactly 1400 K. C.	.00025 MFD. condenser	Receiver blue antenna lead Receiver black ground lead	While rocking gang condenser adjust 1400 K. C. antenna trimmer for maximum output.

20E43	Pilot Lamp Socket	Pilot Lamp Socket Assembly
40E1	Pilot Lamp	6-8 Volt .150 Amp. Type 47 Lamp

*NOTE: First production run of this model used Oscillator Coil Part Number 20E13, Illus. No. 4, with the 47 Ohm Resistor, Illus. No. 41, and the value of the 12SA7 grid leak Resistor, Illus. No. 23, was 47,000 Ohms.
In later production, Part Number 20E13, Oscillator Coil, was replaced with Part Number 20E162; also the 47 Ohm Resistor, Illus. No. 41, was eliminated and the value of Resistor, Illus. No. 23, was changed to 22,000 Ohms.
BECAUSE PERFORMANCE OF THE SET WILL BE SOMEWHAT IMPROVED BY USING OSCILLATOR COIL Part Number 20E162, WE RECOMMEND THAT WHENEVER IT IS NECESSARY TO REPLACE THE OSCILLATOR COIL, THAT ONLY Part Number 20E162 BE USED FOR THIS PURPOSE.

MODEL 289-T

PARTS LIST

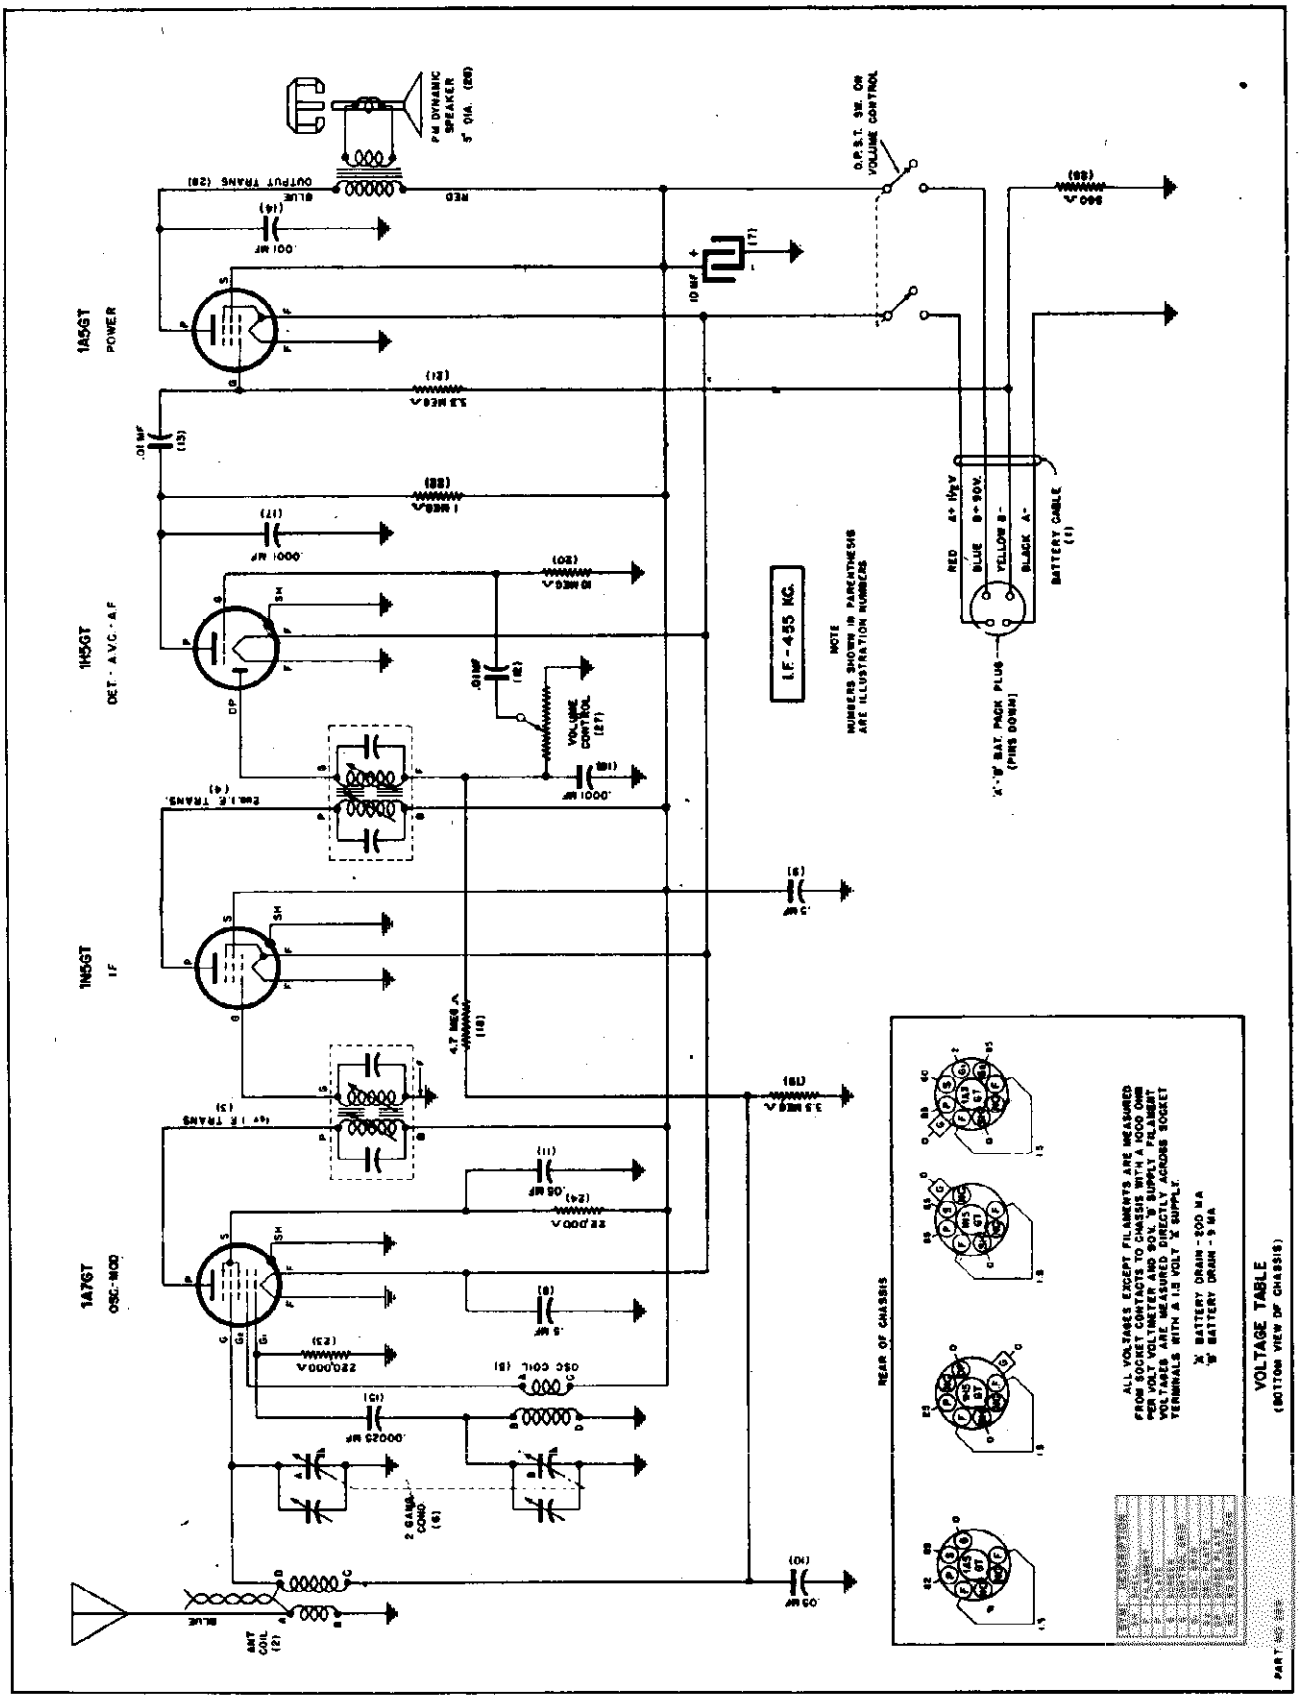
17E3-4	Plug	4-Prong Battery Plug
46E1-1	Throw Arm	Operates On-Off Indicator

SENTINEL RADIO CORP.



For Parts list. see P.1

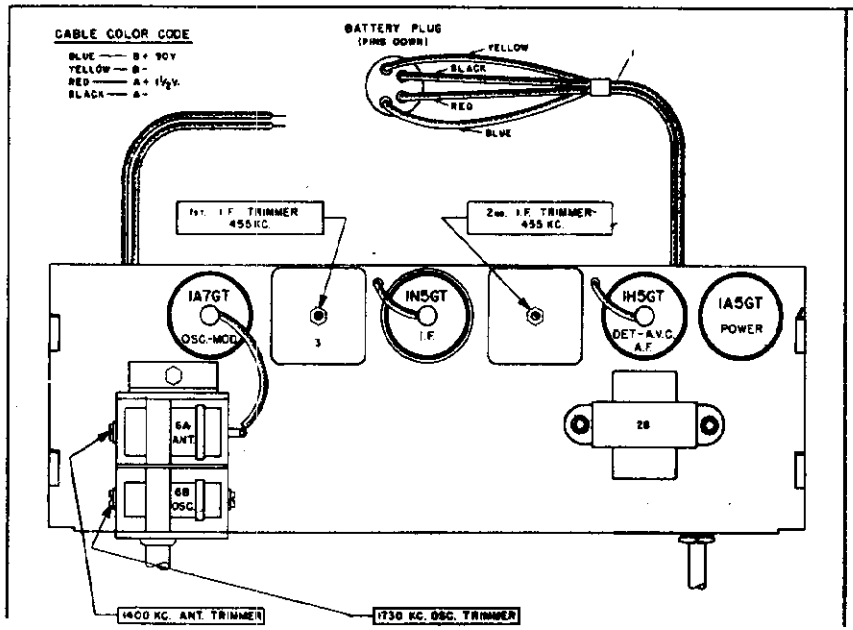
Be sure to **follow procedure carefully** and in the order given—otherwise the receiver will be insensitive and the dial calibration incorrect. For alignment procedure read tabulations from left to right. If more than one adjustment is required on any one band, make the adjustment marked (1) first, (2) next, etc.

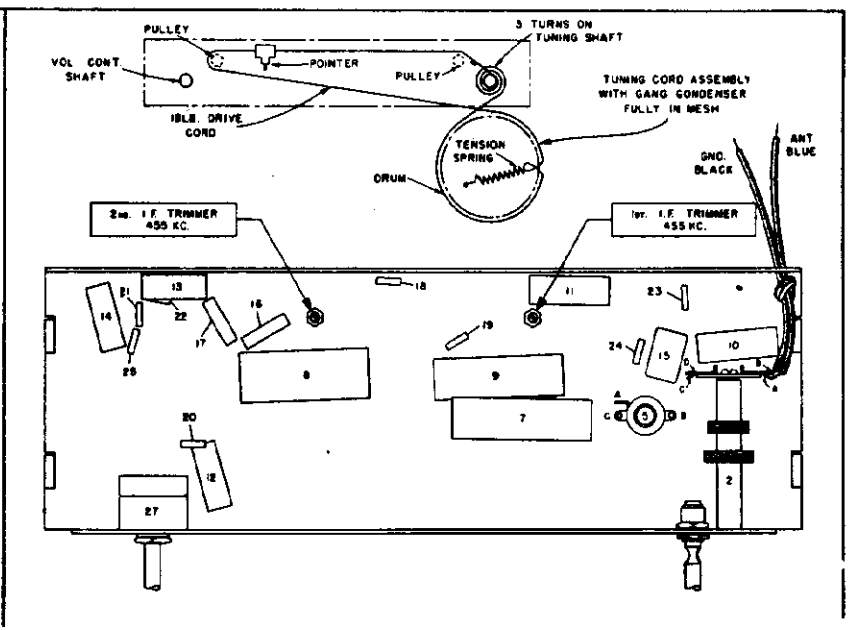
Before starting **alignment:**

(a) Check tuning dial adjustment by tuning gang condenser until plates touch maximum capacity stop (completely in mesh) at which point the dial needle must be exactly even with the last line at the low frequency end of the dial calibration. If dial needle does not point exactly to last line move to correct position.

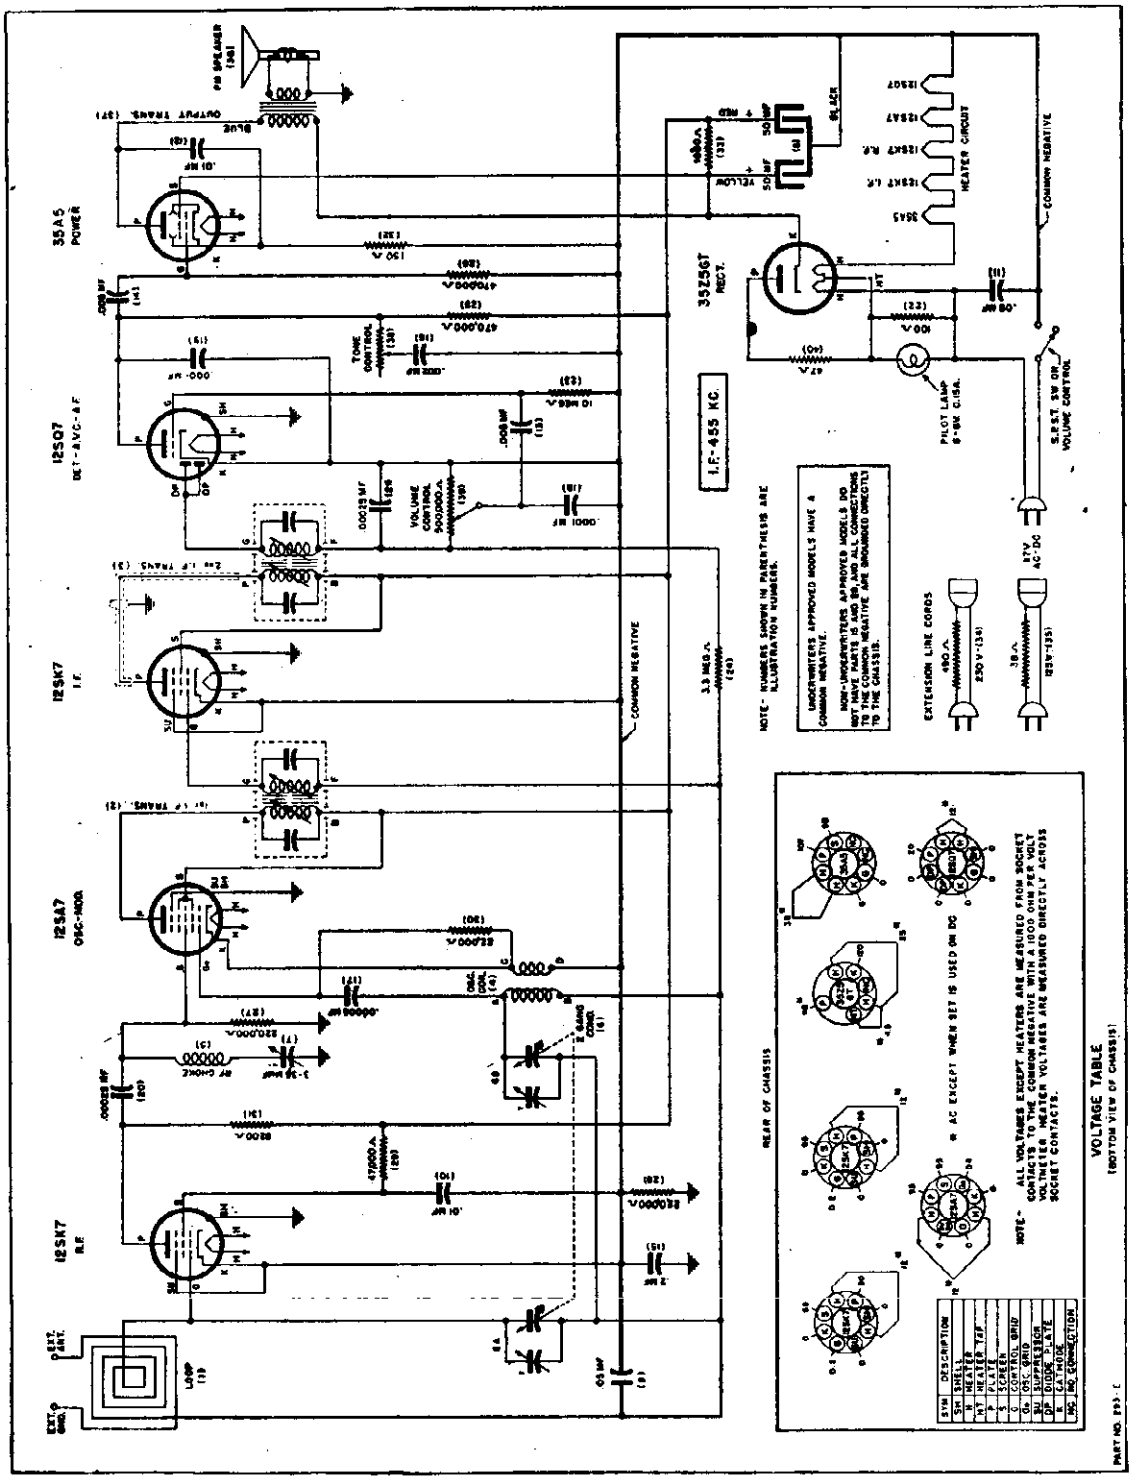
(b) Use an accurately calibrated test oscillator with some type of output measuring device.

Steps	Set receiver dial to:	TEST OSCILLATOR			Refer to parts layout diagram for location of trimmers mentioned below:
		Adjust test oscillator frequency to:	Use dummy antenna in series with output of test oscillator consisting of:	Attach output of test oscillator to:	
1	I.F. Any point where no interfering signal is received	455 K. C.	.02 MFD. condenser	High side to grid terminal of 1A7GT tube DO NOT REMOVE CAP. Low side to receiver black ground lead.	Adjust each of the second I. F. transformer trimmers for maximum output—then adjust each of the first I. F. trimmers for maximum output.
2	Exactly 1730 K. C.	Exactly 1730 K. C.	.00025 MFD. condenser	Receiver blue antenna lead Receiver black ground lead	Adjust 1730 K. C. oscillator trimmer for maximum output.
3	Exactly 1400 K. C.	Exactly 1400 K. C.	.00025 MFD. condenser	Receiver blue antenna lead Receiver black ground lead	While rocking gang condenser adjust 1400 K. C. antenna trimmer for maximum output.





SENTINEL RADIO CORP. MODELS 293W,293I,293T
1U-293W,1U-293I,1U-29



For Alignment procedure read tabulations from left to right, and make the adjustment marked (1) first, (2) next, (3) third.
IMPORTANT: BEFORE ALIGNING, PLACE LOOP ANTENNA IN THE SAME POSITION IT WILL BE IN WHEN THE SET IS IN THE CABINET. BE SURE THAT IT DOES NOT MOVE WHILE ALIGNING.

When adjusting 1650 kilocycle oscillator trimmer, 455 K.C. R.F. trimmer and 1400 kilocycle antenna trimmer, connect test oscillator to loop external antenna and ground connections with a .0002 Mfd. capacitor in series with antenna lead.

Steps	Set receiver dial to:	TEST OSCILLATOR: Adjust test oscillator frequency to:	TEST OSCILLATOR: Use dummy antenna in series with output of test oscillator consisting of:	TEST OSCILLATOR: Attach output of test oscillator to	Refer to parts layout diagram for location of trimmers mentioned below:
	Any point where no interfering signal is received	Exactly 455 K. C.	0.2 Mfd. Condenser	High side to grid of 12SA7 tube, Low side to chassis (if non-Underwriter Approved) or Common Negative (if Underwriter Approved).	Adjust each of the 2nd I.F. transformer trimmer adjustment screws for maximum output, then adjust each of the 1st I.F. transformer trimmer adjustment screws for maximum output.
1	Rotate gang condenser to maximum capacity	Exactly 455 K. C.	.0002 Mfd. Condenser	To loop external antenna and ground connections	Adjust R. F. coil trimmer for **minimum** 455 K. C. signal.
2	Rotate gang condenser to minimum capacity	Exactly 1650 K. C.	.0002 Mfd. Condenser	To loop external antenna and ground connections	Adjust 1650 K. C. oscillator trimmer for maximum output.
3	Approximately 1400 K. C.	Approx. 1400 K. C.	.0002 Mfd. Condenser	To loop external antenna and ground connections	Adjust 1400 K. C. antenna trimmer for maximum output.

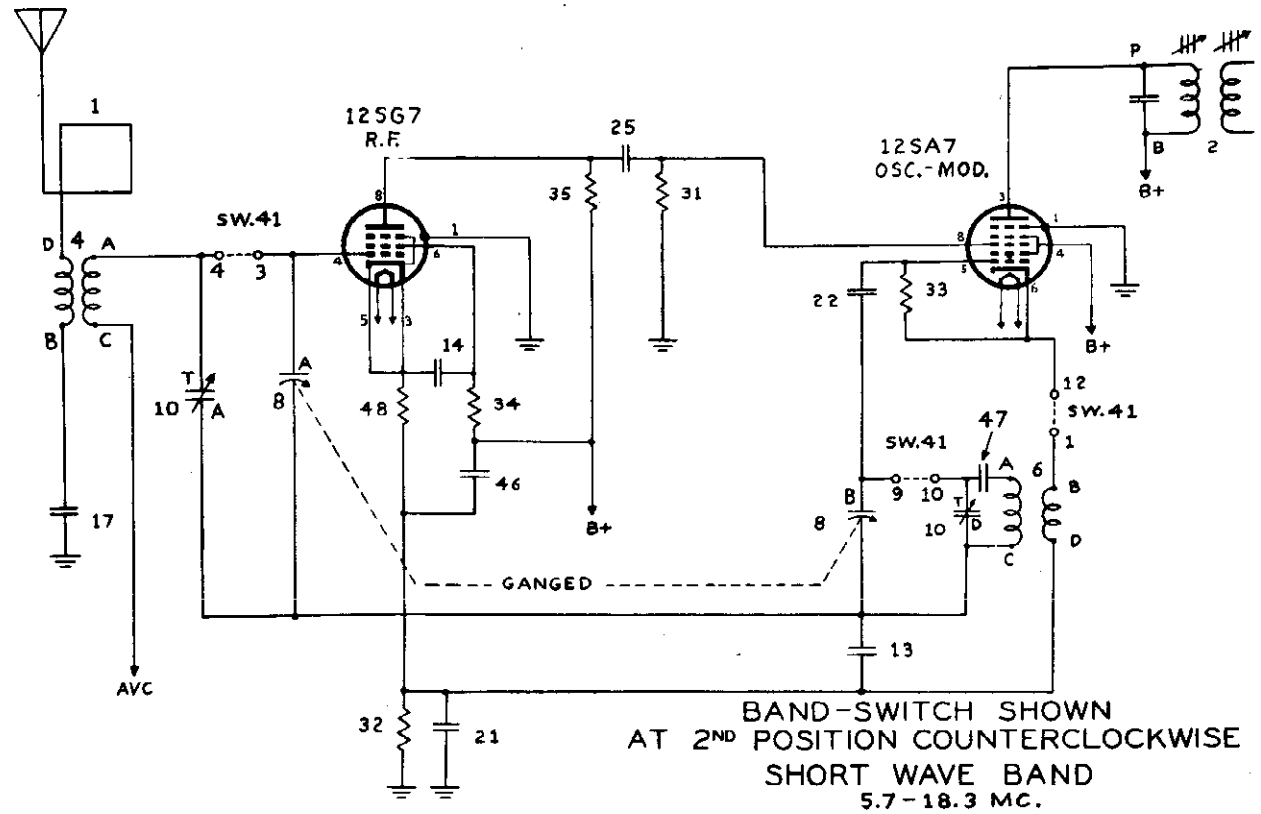
BROADCAST BAND
538-1620 KC.



BAND-SWITCH SHOWN
AT 2ND POSITION COUNTERCLOCKWISE
SHORT WAVE BAND
5.7-18.3 MC.

Be sure to follow procedure carefully and in the order given—otherwise the receiver will be insensitive and the dial calibration incorrect. For alignment procedure read tabulations from left to right. Make the adjustment marked (1) first, (2) next, (3) third, etc.

Before starting alignment:

(a) Check tuning dial adjustment by tuning gang condenser until plates touch maximum capacity stop (completely in mesh) at which point the dial needle must be exactly even with the last line at the low frequency end of the dial calibration. If dial needle does not point exactly to last line move to correct position.

(b) Use an accurately calibrated test oscillator with some type of output measuring device.

(c) Place loop antenna in the same position it will be in when set is in the cabinet.

Steps	Place band switch for operation on:	Set receiver dial to:	TEST OSCILLATOR: Adjust test oscillator frequency to:	TEST OSCILLATOR: Use dummy antenna in series with output of test oscillator consisting of	TEST OSCILLATOR: Attach output of test oscillator to:	Refer to parts layout diagram for location of trimmers mentioned below:
1	I.F. alignment use any band position.	Any point where no interfering signal is received	Exactly 455 K.C.	0.2 Mfd. condenser	High side to rear stator plates of tuning condenser. Low side to frame of condenser through .01 Mfd. condenser	Adjust each of the second I.F. transformer trimmers for maximum output, then adjust each of the first I.F. transformer trimmers for maximum output.
2	1620 to 538 K.C. Band	Rotate gang condenser to Maximum Capacity	Exactly 455 K.C.	.00025 Condenser	High side to BLUE Antenna Lead. Low side to chassis through a .01 mfd. condenser.	Adjust R.F. coil trimmer for minimum 455 K.C. signal.
		Exactly 1620 K.C.	Exactly 1620 K.C.			Adjust 1620 K.C. oscillator trimmer for maximum output.
		Approx. 1400 K.C.	Approx. 1400 K.C.			While rocking gang condenser adjust 1400 K.C. loop trimmer for maximum output.

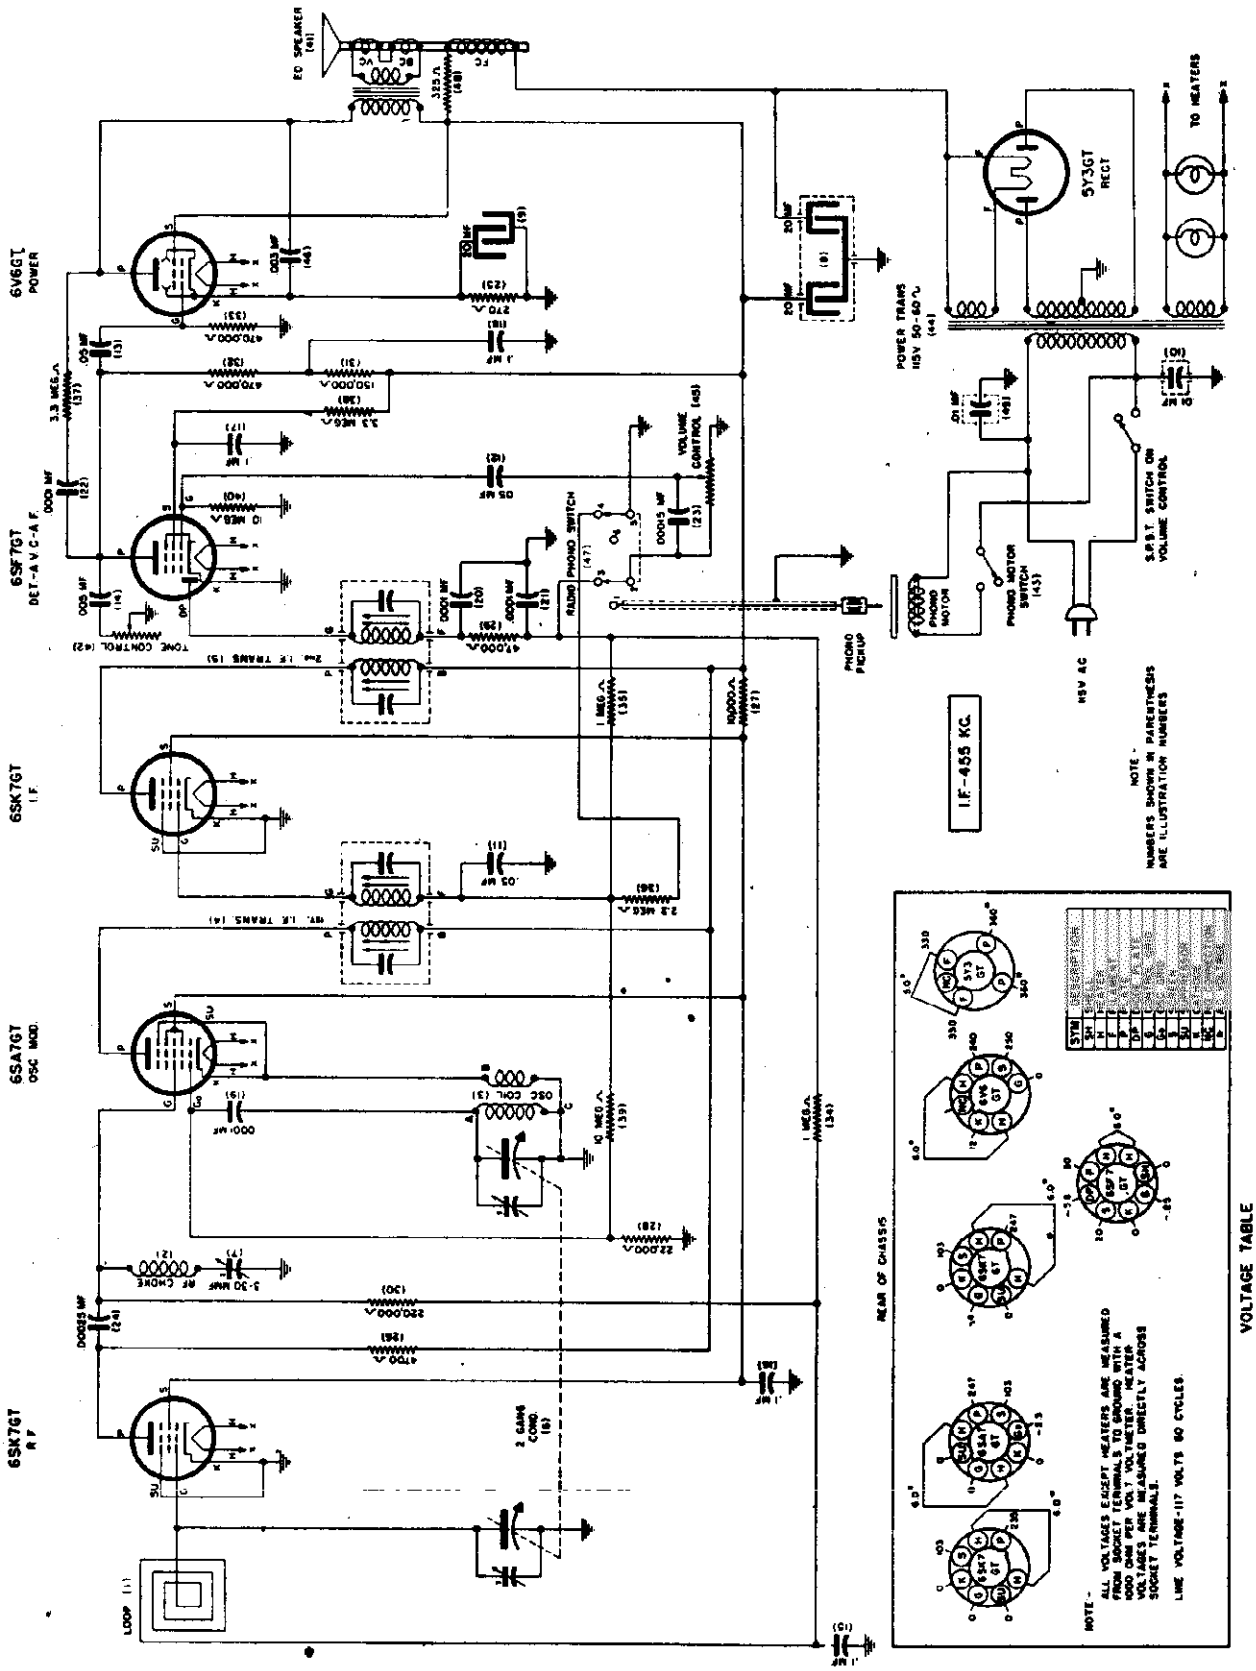
NOTE - PARTS 21 AND 34 ARE OMITTED ON NON-UNDERWRITERS APPROVED MODELS, SEE WIRING DIAGRAM.

SENTINEL RADIO CORP.



Record Changer: General Instrument Model 2

ALIGNMENT PROCEDURE

For Alignment procedure read tabulations from left to right, and make the adjustment marked (1) first, (2) next, (3) third.
IMPORTANT: BEFORE ALIGNING, HAVE LOOP ANTENNA IN THE SAME POSITION IT WILL BE IN WHEN THE SET IS IN THE CABINET. BE SURE THAT IT DOES NOT MOVE WHILE ALIGNING.

When adjusting 1650 kilocycle oscillator trimmer, 455 K.C. R.F. trimmer and 1400 kilocycle antenna trimmer, connect test oscillator to loop external antenna and ground connections with a .0002 Mfd. capacitor in series with antenna lead.

Steps	Set receiver dial to:	TEST OSCILLATOR: Adjust test oscillator frequency to:	TEST OSCILLATOR: Use dummy antenna in series with output of test oscillator consisting of:	TEST OSCILLATOR: Attach output of test oscillator to	Refer to parts layout diagram for location of trimmers mentioned below:
	Any point where no interfering signal is received	Exactly 455 K. C.	0.1 Mfd. Condenser	High side to grid of 6SA7 Tube. Low side to chassis.	Adjust each of the 2nd I.F. transformer trimmer adjustment screws for maximum output, then adjust each of the 1st I.F. transformer trimmer adjustment screws for maximum output.
1	Rotate gang condenser to maximum capacity	Exactly 455 K. C.	.0002 Mfd. Condenser	To loop external antenna and ground connections	Adjust R.F. coil trimmer for **minimum** 455 K. C. signal.
2	Rotate gang condenser to minimum capacity	Exactly 1650 K. C.	.0002 Mfd. Condenser	To loop external antenna and ground connections	Adjust 1650 K. C. oscillator trimmer for maximum output.
3	Approximately 1400 K. C.	Approx. 1400 K. C.	.0002 Mfd. Condenser	To loop external antenna and ground connections	Adjust 1400 K. C. antenna trimmer for maximum output.

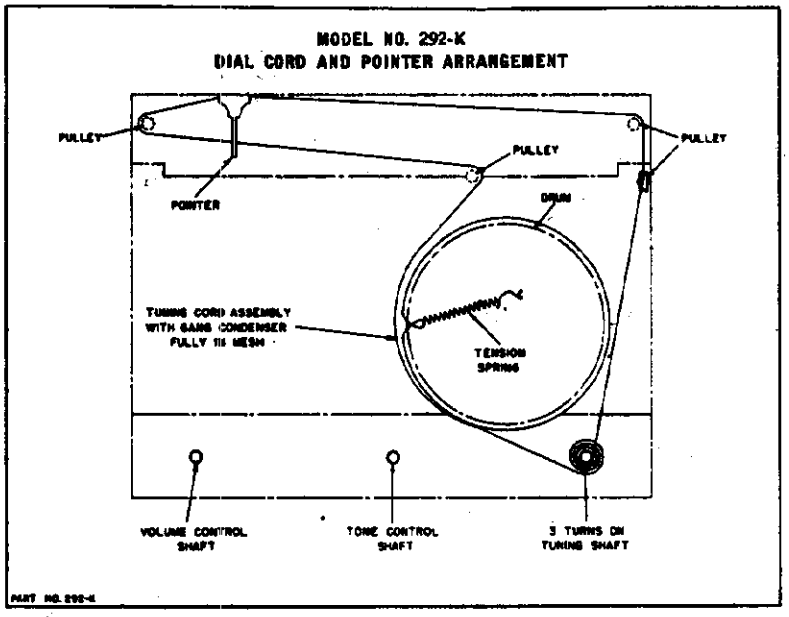
17E7	Plug	4 Prong for Phono



VOLTAGE RATING

THIS RADIO IS DESIGNED FOR USE ON 110-120 VOLT 60 CYCLE ALTERNATING CURRENT (AC).

OUTSIDE AERIAL

If the radio is used in shielded areas or located a great distance from broadcast stations, the volume of some or all stations may not be ample, in which case it would be necessary to ATTACH a 25-50 ft. OUTDOOR AERIAL TO THE BLUE LEAD COMING OUT OF THE REAR OF THE CHASSIS.

GROUND

When a regular aerial is used, best results will be obtained with a ground attached to the black lead coming out of the rear of the chassis.

FUNCTION OF CONTROLS ON RADIO

THE LEFT HAND KNOB controls the volume control and Off-On switch.

THE CENTER KNOB is the tone control.

THE RIGHT HAND KNOB is the station selector.

ALIGNMENT PROCEDURE

GENERAL DATA. The alignment of this receiver requires the use of a test oscillator that will cover the frequencies of 455, 600, 1400 and 1620 KC and an output meter to be connected across the primary or secondary of the output transformer. If possible, all alignments should be made with the volume control on maximum and the test oscillator output as low as possible to prevent the AVC from operating and giving false readings.

CORRECT ALIGNMENT PROCEDURE. The intermediate frequency (I.F.) stages should be aligned properly as the first step. After the I.F. transformers have been properly adjusted and peaked, the broadcast band should be adjusted.

I. F. ALIGNMENT. Remove the chassis and loop antenna from the cabinet and set them up on the bench so that they occupy exactly the same respective position on the bench as they did in the cabinet. Care should be taken to have no iron or other metal near the loop. Do not make this set-up on a metal bench. With the gang condenser set at minimum, adjust the test oscillator to 455 KC and connect the output to the grid of the first detector tube (12SA7) through a .05 or .1 mfd. condenser. The ground on the test oscillator should be connected to the ground buss, indicated on the circuit diagram. Align all three I.F. trimmers to peak or maximum reading on the output meter.

BROADCAST BAND ALIGNMENT. Connect the test oscillator to the antenna of the set through a 100 mmfd. (.0001) condenser. With the gang condenser set at minimum capacity, set the test oscillator at 1620 KC, and adjust the oscillator (or 1620 KC trimmer) on the gang condenser. Next—set the test oscillator at 1400 KC, and tune in the signal on the gang condenser. Adjust the antenna trimmer (or 1400 KC trimmer) for maximum signal. Next set the test oscillator at 600 KC, and tune in signal on condenser to check alignment of coils.

Lack of sensitivity and poor tone quality may be due to any one or a combination of causes such as weak or defective tubes or speaker, open or grounded bias resistor, bypass condenser, etc. Never attempt to realign set until all other possible sources of trouble have been first thoroughly investigated and definitely proved not to be the cause.

NOTE: IT IS ABSOLUTELY NECESSARY THAT AN ACCURATELY CALIBRATED TEST OSCILLATOR WITH SOME TYPE OF OUTPUT MEASURING DEVICE BE USED WHEN ALIGNING THE RECEIVER AND THAT THE PROCEDURE BE CAREFULLY FOLLOWED. OTHERWISE THE RECEIVER WILL BE INSENSITIVE AND THE DIAL CALIBRATION WILL BE INCORRECT. THE TRIMMERS WILL BE REFERRED TO BY THEIR FUNCTION AS INDICATED ON THE PARTS DIAGRAM.

ALIGNMENT PROCEDURE

GENERAL DATA. The alignment of this receiver requires the use of a test oscillator that will cover the frequencies of 455, 600, 1400 and 1520 KC and an output meter to be connected across the primary or secondary of the output transformer. If possible, all alignments should be made with the volume control on maximum and the test oscillator output as low as possible to prevent the AVC from operating and giving false readings.

CORRECT ALIGNMENT PROCEDURE. The intermediate frequency (I.F.) stages should be aligned properly as the first step. After the I.F. transformers have been properly adjusted and peaked, the broadcast band should be adjusted.

I. F. ALIGNMENT. Remove the chassis and loop antenna from the cabinet and set them up on the bench so that they occupy exactly the same respective positions on the bench as they did in the cabinet. Care should be taken to have no iron or other meal near the loop. Do not make this set-up on a metal bench. With the gang condenser set at minimum, adjust the test oscillator to 455 KC and connect the output to the grid of the first detector tube (12SA7) through a .05 or .1 mfd. condenser. The ground on the test oscillator should be connected to the ground buss, indicated on the circuit diagram. Align all four I.F. trimmers to peak or maximum reading on the output meter.

BROADCAST BAND ALIGNMENT. Connect the test oscillator to the antenna of the set through a 100 mmfd. (.0001) condenser. With the gang condenser set at minimum capacity, set the test oscillator at 1620 KC, and adjust the oscillator (or 1620 KC trimmer) on gang condenser. Next—set the test oscillator at 1400 KC, and tune in the signal on the gang condenser. Adjust the antenna trimmer (or 1400 KC trimmer) for maximum signal. Next set the test oscillator at 600 KC, and tune in signal on condenser to check alignment of coils.

ALIGNMENT PROCEDURE

GENERAL DATA. The alignment of this receiver requires the use of a test oscillator that will cover the frequencies of 455, 600, 1400 and 1620 KC and an output meter to be connected across the primary or secondary of the output transformer. If possible, all alignments should be made with the volume control on maximum and the test oscillator output as low as possible to prevent the AVC from operating and giving false readings.

CORRECT ALIGNMENT PROCEDURE. The intermediate frequency (I.F.) stages should be aligned properly as the first step. After the I.F. transformers have been properly adjusted and peaked, the broadcast band should be adjusted.

I. F. ALIGNMENT. Remove the chassis and speaker from the cabinet and connect output meter across primary or secondary of output transformer. With the gang condenser set at minimum, adjust the test oscillator to 455 KC, connect its output to the grid of the first detector tube (1A7GT) through a .05 or .1 mfd. condenser. The ground on the test oscillator should be connected to the chassis ground. Align all three I.F. trimmers to peak or maximum reading on the output meter.

BROADCAST BAND ALIGNMENT. Connect the test oscillator to the antenna lead through a 200 mmfd. (.0002) condenser. With the gang condenser set at minimum capacity, set the test oscillator at 1620 KC, and adjust the oscillator (or 1620 KC trimmer) on gang condenser. Next—set the test oscillator at 1400 KC, and tune in the signal on the gang condenser. Adjust the antenna trimmer (or 1400 KC trimmer) for maximum signal. Next set the test oscillator at 600 KC, and tune in signal on condenser to check alignment of coils.

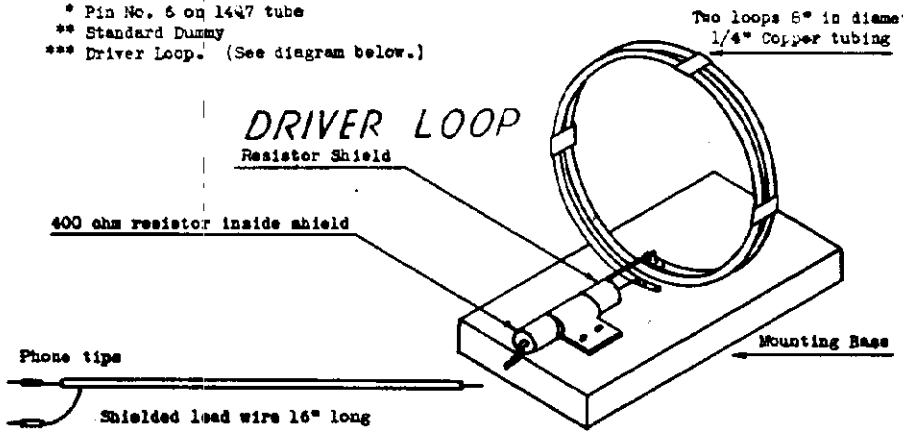
*** Driver Loop. (See diagram below.)



SPECIFICATIONS

Two loops of 1/4" copper tubing 8" in diameter spaced 1/4" apart with 400 ohms resistor in series. Connecting cable and resistor must be shielded.
The loop should be spaced twice the diameter of the loop from the receiver being aligned to prevent an over modulated signal and poor alignment of the receiver.

Special Note: The first 4,000 units will be assembled using C1 as PB40402 and L4 as AB43015-1. After first 4,000 units C1 will be PB40406 mounted on a special bracket PB41913 and using L4 as AB43024-1. On part No. PB40402 trimmers C1A and C1B are located on top of the tuning condenser, while on PB40406 condenser C1A and C1B are on the bottom of the condenser and must be adjusted from chassis bottom side.

MODEL "F" COMPACT

Operates any 2 Volt—4, 5, 6 or 7 tube battery radio from 115 v. 60 cy. source.

For use in receivers employing 1A4, 1C7, 1D5, 1E5 1F5, 1F7, 1H4G, etc., tubes to change radio into an all-electric set giving maximum performance at all times. Inexpensive to operate. Excellent to use when AC current is available and save batteries for occasions when used as portable.

TECHNICAL DATA

Primary
115 Volts A.C. @ 60 cycles.

Specifications
6 foot cord and plug—switch in cord.
Size: 2⅜" x 4½" x 8¼".
Weight packed—5½ pounds.

"A" Supply Output
7 tubes . . . . . 2V. @ 480ma
6 tubes . . . . . 2V. @ 420ma
4-5 tubes (average) . . . . . 2V. @ 325ma

"B" Supply Output
67, 90, 112, 135 Volts D.C. @ 18ma.

MODEL "P" COMPACT

Operates any 1.4 volt—4, 5 or 6 tube battery radio from 115 v. 60 cy. source.

Designed for sets using 1A7, 1E4, 1N5G, 1Q5G, etc., tubes to convert battery radio to an efficient AC receiver with low operating cost. Fits in battery compartment of most radios. Ideal for use in home, hotel, camp or any place where normal AC is available.

TECHNICAL DATA

"A" Supply Output
5-6 tubes (average) . 1.4V. @ 275m
4 tubes . . . . . 1.4V. @ 250m

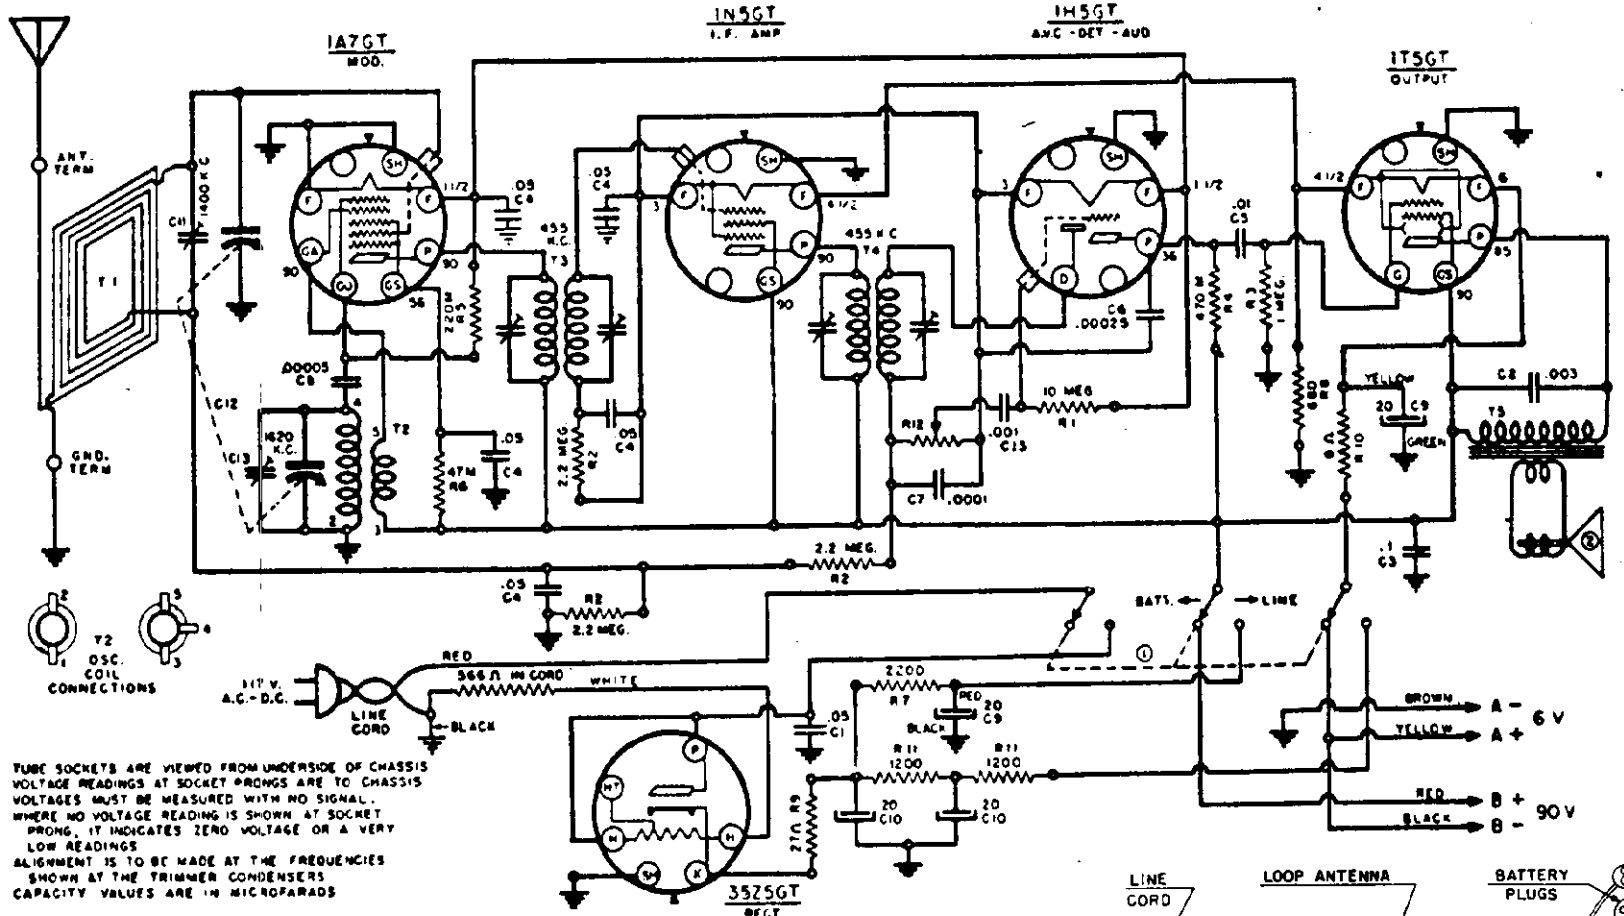
ALIGNMENT PROCEDURE

With an output meter connected across the voice coil of the speaker, the output meter reading for 50 milliwatts is .4 volts using a signal which is modulated 30% at 400 c.p.s. Follow through the procedure as outlined below for proper alignment.

Connect the signal generator to the grid cap of the 1A7 GT Tube through a .1 MFD. Condenser. Connect the ground lead of the generator to the chassis. Adjust the signal generator to 455 K.C. and set the variable condenser of the receiver to minimum capacity (fully opened). With the volume control full on and minimum output from the signal generator adjust the two trimmers on top of the first and second I.F. transformers for maximum output.

Now connect the signal generator to the antenna connection of the receiver through a .00025 condenser. Adjust the signal generator frequency to 1725 K. C. and set the variable condenser to minimum capacity (fully opened), and adjust the oscillator trimmer (C1B) for maximum output. Set signal generator to 1500 K. C. and tune receiver to signal. Adjust the antenna trimmer (C1A) on the variable condenser for maximum output.



TUBE SOCKETS ARE VIEWED FROM UNDERSIDE OF CHASSIS
VOLTAGE READINGS AT SOCKET PRONGS ARE TO CHASSIS
VOLTAGES MUST BE MEASURED WITH NO SIGNAL.
WHERE NO VOLTAGE READING IS SHOWN AT SOCKET PRONG, IT INDICATES ZERO VOLTAGE OR A VERY LOW READING
ALIGNMENT IS TO BE MADE AT THE FREQUENCIES SHOWN AT THE TRIMMER CONDENSERS
CAPACITY VALUES ARE IN MICROFARADS

ALIGNMENT PROCEDURE

CAUTION: This is an A.C./D. C. receiver and when aligning the set it is necessary to isolate the Signal Generator or the receiver from the line by use of a transformer, or place a .2 MFD. condenser in both test leads of the Signal Generator.

Connect the Signal Generator through a .1 MFD. condenser to the variable condenser side of the loop. Connect the ground side of the Signal Generator to the chassis. Adjust the Signal Generator to 455 Kilocycles and set the variable condenser of the receiver to minimum capacity (fully opened). With volume control full on and minimum output from the Signal Generator adjust the two trimmers on top of the 1st and 2nd I.F. transformers (T3-T4) for maximum output. Now connect the Signal Generator through a .00025 condenser to the external antenna connection on the back of the loop. Connect ground side of Signal Generator to terminal marked "G" on back of loop. Adjust frequency to 1630 K. C., set variable condenser at minimum capacity (fully opened) and adjust the oscillator trimmer (C11) for maximum output. Set Signal Generator to 1400 K.C., tune receiver to signal and adjust the Antenna trimmer (C12) on top of the variable condenser for maximum output.

ALIGNMENT AND SERVICE DATA

(For Professional Service Men Only)

Remove chassis from cabinet for alignment.

A signal generator is required having the following frequencies: 456KC, 1400KC, 1720KC.

First Step: Connect the generator lead through a .1 mfd. condenser to the terminal lug next to the Antenna trimmer on top of the tuning condenser. The ground lead from the generator may be connected to any convenient spot on the metal chassis. Adjust generator to 456KC and adjust IF trimmer screws until a maximum reading is noted on the output meter which has been connected across the speaker. The tuning condenser should be turned out to complete minimum capacity when aligning the IF. With generator lead still connected to antenna trimmer terminal, adjust generator frequency to 1720KC, and with tuning condenser still at minimum, adjust oscillator trimmer till the 1720KC signal is tuned in. Next, remove generator leads from set and connect both to a transmitting loop. This loop can be made with 2 turns of wire about 6 inches in diameter and placed about one foot away from the loop antenna of the receiver. Adjust generator frequency to 1400KC. Turn tuning condenser until the signal is tuned in and adjust antenna trimmer until a maximum reading is noted. No further adjustment should be necessary, unless the set has been damaged, as the coils and condenser in this receiver have been specially handled at the factory so as to insure proper alignment at the lower frequency end of the dial.

ALIGNMENT AND SERVICE DATA

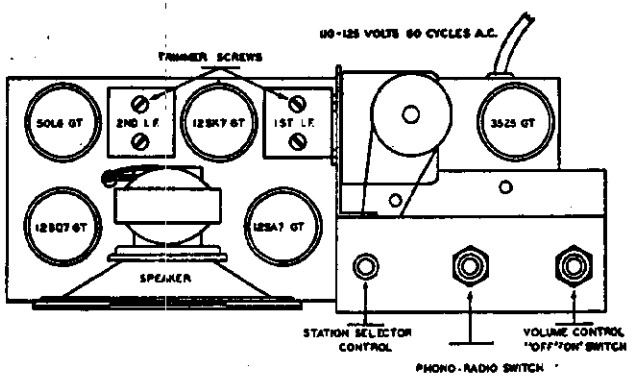
(For Professional Service Men Only)

Remove chassis from cabinet for alignment.

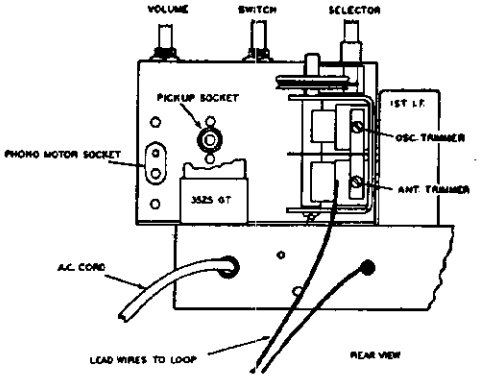
A signal generator is required having the following frequencies: 456KC, 1400KC, 1720KC.

First Step: Connect the generator lead through a .1 mfd. condenser to the terminal lug next to the Antenna trimmer on top of the tuning condenser. The ground lead from the generator may be connected to any convenient spot on the metal chassis. Adjust generator to 456KC and adjust IF trimmer screws until a maximum reading is noted on the output meter which has been connected across the speaker. The tuning condenser should be turned out to complete minimum capacity when aligning the IF. With generator lead still connected to antenna trimmer terminal, adjust generator frequency to 1720KC, and with tuning condenser still at minimum, adjust oscillator trimmer till the 1720KC signal is tuned in. Next, remove generator leads from set and connect both to a transmitting loop. This loop can be made with 2 turns of wire about 6 inches in diameter. Adjust generator frequency to 1400KC. Turn tuning condenser until the signal is tuned in and adjust antenna trimmer until a maximum reading is noted. No further adjustment should be necessary, unless the set has been damaged, as the coils and condenser in this receiver have been specially handled at the factory so as to insure proper alignment at the lower frequency end of the dial.

TUBE AND TRIMMER LOCATION



TRIMMER AND CONNECTOR SOCKET LOCATION



MODELS TK-504, TK-514

Remove the chassis from the cabinet for alignment.

A signal generator is required having the following frequencies: 456KC, 1400KC, 1720KC, 6MC, 16MC, 18.3MC. An output meter should be connected across the speaker.

I. F. Alignment: Connect the generator lead through a .1MFD condenser to the terminal lug on the "Antenna" section of the gang condenser. The ground lead from the generator should be connected to the chassis base. Set the generator at 456KC. Adjust the trimmer screws in the 1st and 2nd I. F. cans (see Fig. No. 1) until a maximum reading is noted on the output meter.

The receiver volume control should be turned to maximum during the I F and all subsequent alignments, to keep the AVC from working and giving false readings. Keep the generator output as low as possible to prevent overloading.

BC or Broadcast Alignment: With the generator leads still connected as in I. F. Alignment, rotate the tuning condenser to complete minimum capacity. Set the generator to 1720KC. Adjust the BC oscillator trimmer until the signal is tuned in. Next, remove the generator leads and connect them to the antenna lead of the loop antenna, through a 100 MMFD condenser. Set the generator to 1400KC and rotate the tuning condenser until the signal is tuned in. Adjust the BC antenna trimmer until a maximum reading is noted on the output meter. Set the generator to 600KC and turn the tuning condenser until the signal is tuned in. Rock the tuning control back and forth slowly until a maximum reading is noted on the output meter. It is advisable to return to the 1720KC adjustment and recheck that setting to make sure it has not changed while padding at 600KC.

SW or Short Wave Alignment: Set the generator at 18.3MC. Turn the receiver band switch to short wave position. Turn the tuning condenser to complete minimum capacity. The generator leads should be connected to the antenna lead of the loop through a 400 Ohm resistor. Adjust the S. W. oscillator trimmer slowly until the 18.3MC signal is tuned in. At this point, it will be well to make sure that the fundamental signal is tuned in. Turn up the generator output and tune the receiver to approximately 17.3MC. At this point, the 18.3MC signal will be heard again but much weaker. This is the image frequency. If the image is not heard, then turn the tuning condenser back to complete minimum and readjust the SW oscillator trimmer. Remember the image must always be heard (at 2 times the IF frequency in KC) lower in frequency than the fundamental signal. After the oscillator has been properly set, tune the signal generator to 16MC and rotate the tuning control until the signal is tuned in. Adjust the SW antenna trimmer until a maximum reading is noted on the output meter. It is advisable to rock the gang slowly while adjusting the antenna trimmer. Set the generator to 6MC and tune the signal in on the receiver. Check the alignment at this frequency. No adjustment should be necessary, as the coils have been carefully checked before leaving the factory. A fixed oscillator padding condenser is used at 6MC.

ALIGNMENT PROCEDURE

The following equipment is necessary to properly align this chassis:

1. A signal generator which will provide an accurately calibrated signal at the frequencies listed.
2. An output meter.
3. A non-metallic screwdriver.
4. Dummy antenna: — .1 mfd. — 200 mmf. — 400 ohms

CONNECT TEST OSCILLATOR TO	DUMMY ANTENNA	INPUT SIGNAL FREQUENCY	BAND	SET DIAL AT	TRIMMERS	PURPOSE

ALIGNMENT PROCEDURE

The following equipment is necessary to properly align this chassis:

1. A signal generator which will provide an accurately calibrated signal at the frequencies listed.
2. An output meter.
3. A non-metallic screwdriver.
4. Dummy antenna: — .1 mfd., — RMA loop.

NOTE: Intermediate Frequency and Oscillator adjustments may be made with the loop disconnected provided a resistor of 10,000 to 50,000 ohms is substituted to close the 12SA7GT grid circuit. The loop alignment must be done with the loop and chassis mounted in operating position in the cabinet. A single turn loosely coupled to loop may be substituted for RMA loop.

SPIEGEL

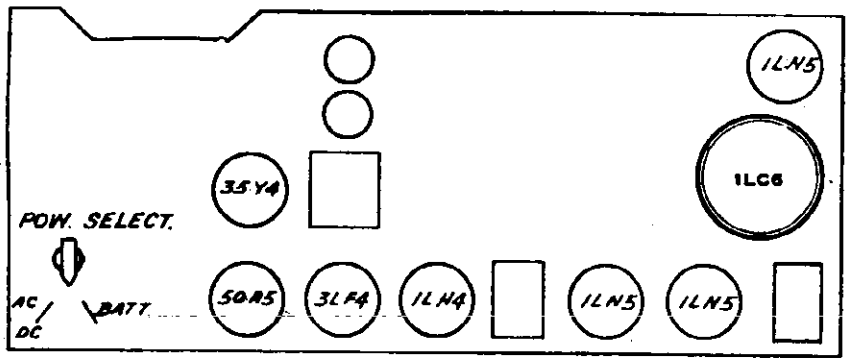
Batteries:

Two six (6) volt "A" batteries and two forty five (45) volt batteries are required for self-contained operation. These batteries are located under the chassis and may be inserted or replaced by removing the machine screw on either side of the cabinet holding the battery plate in place. The "A" batteries will provide approximately 30 hours of normal operation allowing the batteries to recuperate after several hours use. The "B" batteries will normally outlast two sets of "A" batteries. Batteries should be removed if radio set is to be stored for more than sixty (60) days.

Tube Location:



Batteries:

Suitable batteries for use with this Receiver are:
"A" Batteries: 6 Volt; Length, $3\frac{15}{16}$"; Width, $2\frac{3}{4}$"; Height, $5\frac{1}{2}$"; such as: Ever-Ready #718 or equivalent.
"B" Batteries: 45 Volt; Length, $4\frac{3}{16}$"; Width, $2\frac{19}{32}$"; Height, $5\frac{3}{8}$": such as: Ever-Ready #762-S, Burgess #5308, or equivalent.

PL2—Plug, line cord

Operate on:

(a) 105-125 Volts A.C., 60 cycle.
(b) 105-125 Volts D.C.
(c) Self contained batteries.

The instrument provides for commercial broadcast and short wave reception in the following frequency ranges:

(a) .54-1.7 M.C.
(b) 3.5-8.5 M.C.
(c) 8.5-19.5 M.C.

Electric Operation:

Set the power selector switch mounted on the rear left hand side of the chassis to "A.C.-D.C." for electric operation.

Battery Operation:

For battery operation, the power selector switch is set to the position marked "Batt". This switch is easily accessible through a door in the rear of the cabinet.

Unwind the hank antenna, connect to Antenna Binding Post and extend to full length along floor or window ledge.

Rotate control marked "ON-OFF-VOLUME in a clockwise position. This control turns the set on and permits the operator to adjust the output to the desired volume.

Select the desired frequency range by means of the control marked "Band Switch". Tuning is accomplished by rotating the control marked "Station Selector".

In locations where weak signals prevail, reception may be improved by connecting an additional outside antenna to the binding post marked "Ant". Where a ground is used, it must be connected to the binding post marked "Gnd" and NOT to the chassis directly.

Failure of the Radio Receiver to operate may be due to:

1. Incorrect setting of power selector switch.
2. Weak batteries or no current at power outlet.
3. With D.C. power — reverse position of power plug in power outlet.
4. Tubes not firmly locked in socket.
5. Defective tubes.
6. Weak reception in particular location (use longer aerial).

60-301		GANG CONDENSER

JULY 5, 1941

To properly align receiver, it should be removed from the cabinet.

A signal generator is required, having the following frequencies: 456KC, 1400KC, 1720KC. An output meter of some kind is also necessary. (See figure No. 1 for trimmer locations).

All adjustments in aligning this receiver should be made with the volume control fully turned on, so as to prevent the A. V. C. from working and giving false readings. It is also advisable to keep the gang condenser turned all the way out to complete minimum capacity and keep the signal from the generator down as low as possible so as to prevent false peaks when aligning the I. F. transformers.

FIRST STEP: Connect the generator lead through a .1 condenser to the No. 8 pin at the 12SA7GT socket base (this is the control grid) and connect the generator ground lead to some point on the floating ground, above the .25 MFD floating ground condenser. Adjust the signal generator to 456KC and adjust the I. F. trimmer screws till a maximum reading is noted on the output meter which has been connected across the speaker leads. With the generator leads still connected to the 12SA7GT grid, adjust the generator frequency to 1720KC and adjust the oscillator trimmer till the signal is tuned in, with the gang condenser still at complete minimum.

SECOND STEP: Disconnect the generator leads from the receiver and connect both to a transmitting loop which may be made with two turns of wire about six inches in diameter and placed about one foot from the receiver loop. Adjust the generator frequency to 1400KC and turn the tuning condenser till this signal is tuned in. Adjust the antenna trimmer on the gang till a maximum

	M	CRYSTAL MICROPHONE

Remove chassis from cabinet for alignment.
A signal generator is required having the following frequencies: 456KC, 1400KC, 1720KC. Also an output meter of some type.

First Step: Connect the generator lead through a .1 mfd. condenser to the terminal lug next to the Antenna trimmer on top of the tuning condenser. The ground lead from the generator, must be connected to the floating ground buss underneath the chassis. Adjust generator to 456KC and adjust IF trimmer screws until a maximum reading is noted on the output meter which has been connected across the speaker. The tuning condenser should be turned out to complete minimum capacity when aligning the IF. With generator lead still connected to antenna trimmer terminal, adjust generator frequency to 1720KC, and with tuning condenser still at minimum, adjust oscillator trimmer till the 1720KC signal is tuned in. Next remove generator leads from set and connect both to a transmitting loop. This loop can be made with 2 turns of wire about 6 inches in diameter and placed about one foot away from the loop antenna of the receiver. Adjust generator frequency to 1400KC. Turn tuning condenser until the signal is tuned in and adjust antenna trimmer until a maximum reading is noted. No further adjustment should be necessary, unless the set has been damaged, as the coils and condenser in this receiver have been specially handled at the factory so as to insure proper alignment at the lower frequency end of the dial.

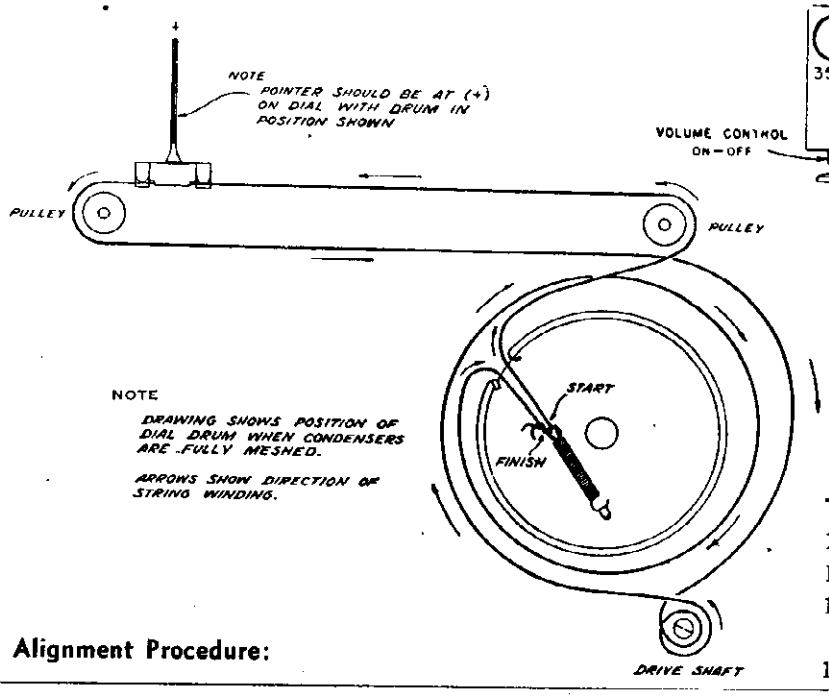
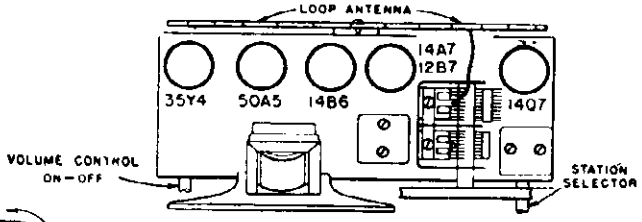
NOTE:
(1) WIRE A-B IS OMITTED IN PHONO-COMBINATION MODELS.
(2) DOTTED LINES INCLOSE CUIT USED IN PHONOGRAPH COMBINATION MODELS ONLY.

Nylon cord of the tuning and dial system may be replaced by following the diagram below.





Note: Trimmers may be located on either long or short side of variable condenser.

Tube Complement:

1 Type 14Q7—Oscillator—Converter.
1 Type 14A7—I. F. Amplifier.
1 Type 14B6—Det. A.V.C. and Amp.
1 Type 50A5—Power Amp.
1 Type 35Y4—Rectifier.

Alignment Procedure:

Steps	Connect output of oscillator to	Tune osc. to	Tune radio dial to	Adjust the following for max. peak output
1.	Tuning condenser stator (ant.) in series with .01 mfd.	455	Quiet point at high frequency end of dial.	1st and 2nd I. F. Transformers
2.	Antenna term. of Ant. loop in series with 100 mmf.	1720	Full clockwise (out of mesh)	Osc. trimmer
3.	Antenna term. of Ant. loop in series with 100 mmf.	1500	1500	Ant. trimmer

Output meter is connected across voice coil. Receiver volume is turned to maximum.

Remove chassis from cabinet for alignment.

A Signal Generator is required having the following frequencies: 455 KC, 1400 KC, 1720 KC. An output meter should be connected across the speaker.

The receiver volume control should be turned to maximum during the I.F. and all subsequent alignments to keep the AVC from working and giving false readings. Keep the generator output as low as possible to prevent overloading.

FIRST STEP: Connect the hot lead from the generator to the ANT. section of the gang condenser, through a .1 MFD condenser. The ground lead from the generator must be connected to the metal frame of the gang condenser. Turn the gang condenser to complete minimum capacity. Adjust the generator to 455 KC and adjust the trimmers of the 1st and 2nd I.F. transformers until a maximum reading is noted on the output meter.

SECOND STEP: With the leads from the generator still connected in the same manner, adjust the Signal Generator to 1720 KC. The OSC. trimmer is located on the front of the chassis between the volume and tuning controls. Adjust this trimmer until the 1720 KC signal is tuned in.

THIRD STEP: Remove the hot lead of the generator from the ANT. section of the gang condenser. Connect this lead to the antenna lead wire that projects from the back of the loop antenna through a 200 MMFD condenser. Adjust the Signal Generator to 1400 KC. Rotate the tuning control until this signal is tuned in. The ANT. trimmer is located on the back of the loop antenna. Adjust this trimmer until a maximum reading is noted on the output meter. No further adjustment should be necessary, unless the set has been damaged, as the coils and condenser in this receiver have been specially handled at the factory to insure proper alignment at the lower frequencies.

ALIGNMENT PROCEDURE FOR 17-8E & 17-8E-Z CHASSIS

1. Connect the output meter in the conventional manner.
2. Connect the ground lead of the signal generator to the receiver chassis through a .25 mfd. condenser.
3. Turn the volume control to maximum volume position and turn both tone controls to the position giving highest tone.
4. PUSH THE MANUAL BUTTON IN AND KEEP IT PUSHED IN. Turn the BAND SWITCH to the BROADCAST position.
5. Connect the loop as shown under "LOOP CONNECTIONS". Try to keep the loop in the same relative position to the chassis as when in the cabinet.
6. Connect the signal generator antenna lead to the lug on the middle section of the gang condenser, using a .1 mfd. condenser in series with the lead.
7. Set the signal generator to 455 KC. and adjust trimmers 1, 2, 3 and 4 for maximum output.
8. Connect the signal generator antenna lead through a 400 ohm carbon resistor to the blue wire coming from the chassis, and turn the BAND SWITCH to the SHORT WAVE position.
9. With the signal generator and receiver dial set to 16 MC. adjust trimmer 5 to bring in signal. Check to see if image appears at 15.1 MC. on receiver dial, if it does not, realign at 16 MC with trimmer screw farther out. Recheck image.
10. Adjust trimmer 6 for maximum output at 16 MC. Try to increase output by detuning trimmer and retuning receiver dial until maximum output is obtained.
11. Place the signal generator antenna lead near the loop and turn the BAND SWITCH to the BROADCAST position.
12. With signal generator and receiver dial set at 1500 KC. adjust trimmer 7 for maximum output.
13. Now install the chassis in the cabinet.
14. Adjust trimmers 8 and 9 for maximum output at 1500 KC. as before.
15. Set signal generator to 600 KC and tune rec3iver dial to 600 KC signal. Adjust trimmer 10 for maximum output. Try to increase output by detuning the trimmer and retuning the receiver dial until maximum output is obtained.

STEWART WARNER CORP.

ALIGNMENT PROCEDURE

1. Turn the tuning control knob clockwise as far as it will go (tuner mechanism is now in maximum open position with tuning slugs almost completely withdrawn from coils). Dial pointer should then point to 1600 Kc mark on scale. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.
2. Remove chassis and loop from cabinet by taking out two screws which hold chassis to bottom of cabinet. Solder approximately 8" of insulated wire to any B— connection (see voltage chart on opposite side for convenient B— location).
3. During the alignment of this receiver it will be necessary to set the dial pointer to the following frequencies: 1500 Kc., 1400 Kc. In order to avoid replacing the chassis in the cabinet each time a dial setting is required, it will be found more convenient to mark the required frequency points on the white dial background plate before starting the alignment.
4. Connect ground lead of signal generator to B— lead through a 0.25Mfd. condenser.
5. Connect output meter across the speaker voice coil (terminals at back of speaker) or from plate of 50L6GT tube to B—through a 0.1 Mfd. condenser.
6. Set volume control at maximum volume position and use a weak signal from the signal generator.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF GENERATOR TO	SIGNAL GENERATOR FREQUENCY	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
Set tuner mechanism to maximum open position by turning the tuning knob clockwise as far as it will go. Then check whether the positions of the tuning slugs correspond to the positions shown in Fig. 1 below. If settings are incorrect, rotate the individual core and threaded stem until desired position is reached. Note that threaded stem is prevented from moving by a dab of speaker cement at top and that this seal must be removed before stem can be rotated.						
200 MMFD. Mica Condenser	Control Grid of 12SA7	455 KC	Any point where it does not affect the signal.	1-2	2nd I.F.	Adjust for maximum output. Then repeat adjustment.

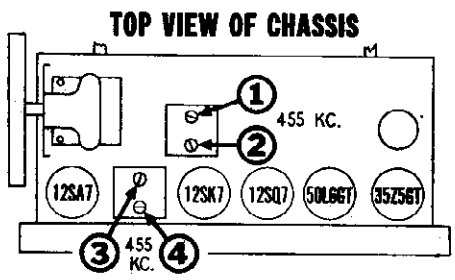

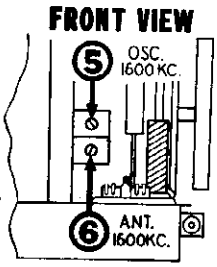

FIG. 2—TRIMMER LOCATIONS

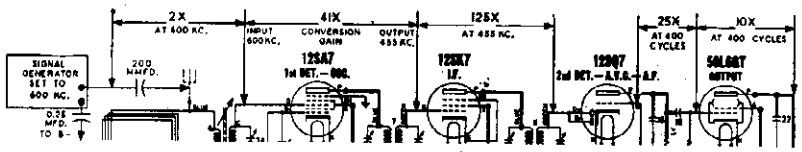
APPROXIMATE STAGE GAIN DATA

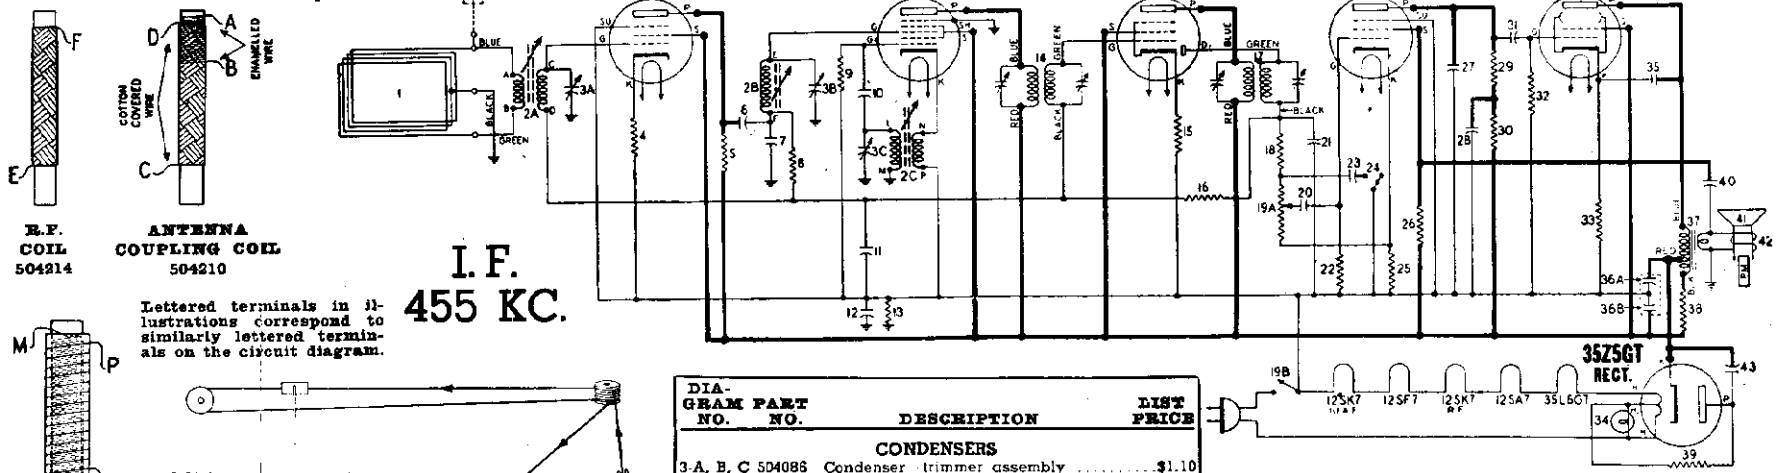
Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe following precautions:

1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes.)
2. For R.F. and I.F. measurements connect negative terminal of a 3 volt battery (two 1½ volt cells in series) to A.V.C. lead at terminal "D" of antenna coil; then connect positive battery lead to B—. This provides a definite operating point.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
4. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 3 volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.



SOCKET VOLTAGES

Measured with voltmeter having sensitivity of 1000 ohms per volt except where indicated by (*).

ALIGNMENT PROCEDURE

1. Remove chassis and loop from cabinet. Solder approximately 8" of insulated wire to any B + connection (see voltage chart on opposite side for convenient B— location). Then reinstall chassis and loop in cabinet. The B + lead should extend from under the chassis at the back.
2. Connect ground lead of signal generator to B— lead.
3. Connect output meter across the speaker voice coil (terminals at back of speaker.)
4. Turn the tuning control knob clockwise as far as it will go (tuner mechanism is now in maximum open position with tuning slugs almost completely withdrawn from coils). Dial pointer should then point to 1600 Kc mark on scale. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.
5. Set volume control at maximum volume position and use a weak signal from the signal generator.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF GENERATOR TO	SIGNAL GENERATOR FREQUENCY	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
Set tuner mechanism to maximum open position by turning the tuning control knob clockwise as far as it will go (Dial pointer at 1600 Kc). Then check whether the positions of the tuning slugs correspond to the positions shown in Fig. 1 below. If settings are incorrect, rotate the individual core and threaded stem until desired position is reached. Note that threaded stem is prevented from moving by a dab of speaker cement at top.

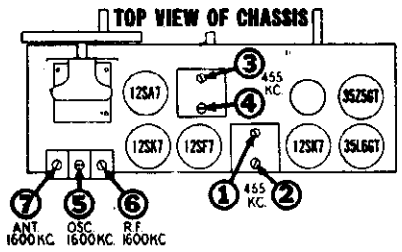

FIG. 2

AUDIO OSCILLATION

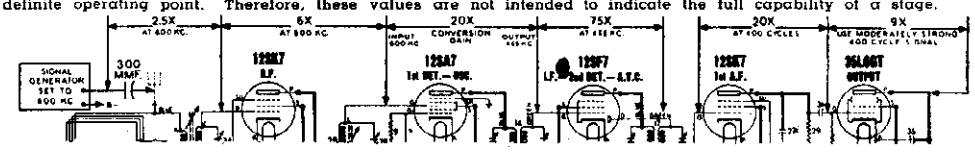
The audio system of this receiver utilizes a two stage type of inverse feed-back arrangement and, should it ever be necessary to replace the speaker or output transformer, it is important to maintain a definite phase relationship in the feed-back circuit. If the connections to the output transformer are reversed or if the feed-back connection is made to the wrong side of the output transformer secondary, the system will become regenerative instead of degenerative. Under those conditions audio oscillation may result. If that occurs, oscillation may be prevented by reversing the connections to the secondary of the output transformer.

APPROXIMATE STAGE GAIN DATA

Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe following precautions:

1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes.)
2. For R.F. and I.F. measurements connect negative terminal of a 3 volt battery (two 1½ volt cells in series) to A.V.C. lead and positive terminal to B—. This provides a definite operating point. IMPORTANT: Disconnect battery when measuring audio stage gains.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
4. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 3 volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.

STEWART WARNER CORP.

ALIGNMENT PROCEDURE

1. Remove chassis and loop antenna (cabinet back) from cabinet. Reconnect loop to chassis and space it approximately same distance from chassis as when installed in cabinet.
2. With the gang condenser fully meshed, the dial pointer should be in the position indicated by the last mark below 55 on the dial. If it is set incorrectly, release the pointer clip on the dial cord and reposition pointer.
3. Connect an output meter across the speaker voice coil or from the plate of the 6V6GT tube to chassis through a .1 Mfd. condenser.
4. Connect the ground lead of signal generator to the receiver chassis.
5. Set volume control at maximum volume position and use a weak signal from the signal generator.

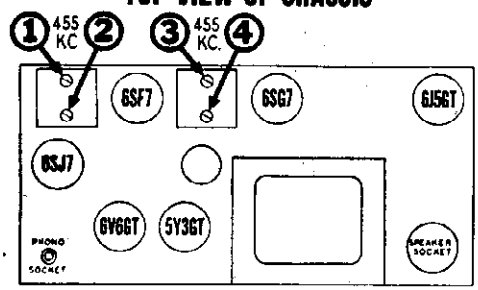
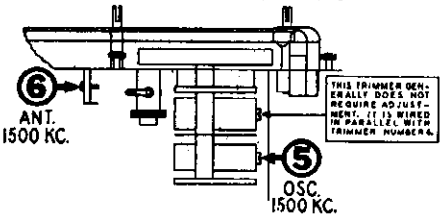
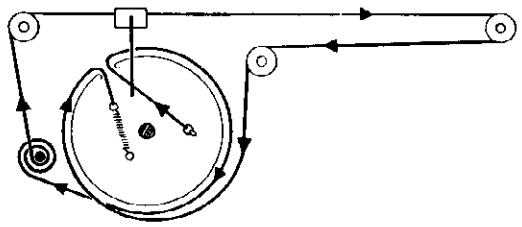
TOP VIEW OF CHASSIS



SIDE VIEW OF CHASSIS





DIAL AND POINTER DRIVE CORD ARRANGEMENT

Top view
Dial plate removed

To string dial cord, set gang condenser to fully meshed position and use following parts:

114955 Clip on end of cord
117057 Cord (4 feet)
119087 Ring for dial cord
161384 Tension Spring

IMPORTANCE OF MAINTAINING FIXED POSITIONS FOR LEADS AT TOP OF CHASSIS

The shielded leads which are routed to the "Radio-Phono" switch and volume control should be tied to the upright bracket which supports the dial assembly. Grounded shields on these leads must not be allowed to contact electrolytic condenser case. If case of condenser is grounded it will short out bias voltage for 6V6GT tube.

AUDIO OSCILLATION

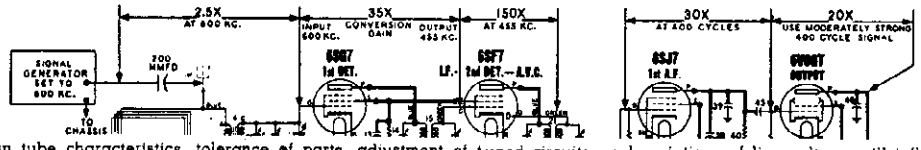
The audio system of this receiver utilizes a two stage type of inverse feed-back arrangement and should it ever be necessary to replace the speaker or output transformer it is important to maintain a definite phase relationship in the feed-back circuit. If the connections to the output transformer are reversed or if the feed-back connection is made to the wrong side of the output transformer secondary, the system will become regenerative instead of degenerative. Under those conditions audio oscillation may result. If that occurs, oscillation may be prevented by reversing the connections to the primary of the output transformer.

APPROXIMATE STAGE GAIN DATA

Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe following precautions:

1. For all gain measurements connect signal generator as shown. Use 600 K.C. signal with 400 cycle modulation (use nearby frequency if local station interferes.)
2. For R.F. and I.F. measurements connect negative terminal of a 3 volt battery (two 1½ volt cells in series) to A.V.C. lead at terminal "D" of antenna coil; then connect positive battery lead to chassis. This provides a definite operating point. IMPORTANT: Disconnect battery when measuring audio stage gains.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
4. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 3 volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.

*—Measured with vacuum tube voltmeter.

NOTE:—The 6K6GT grid bias of —19 volts can be measured across resistor No. 65.

For Dial Cord data.see P.15-15

MODELS 62T16, 62TC16, 62TC26, 62TC36

STEWART WARNER CORP.

ALIGNMENT PROCEDURE

1. Remove chassis and loop antenna from cabinet (do not remove loop of wire stapled to cabinet). After chassis has been removed, replace loop antenna in cabinet. Stand the chassis on one end and space it approximately same distance from loop as when installed in cabinet. Then reconnect all leads to loop antenna and to loop of wire stapled on cabinet.
2. Turn the tuning control knob clockwise as far as it will go (tuner mechanism is now in maximum open position with tuning slugs almost completely withdrawn from coils). Dial pointer should then point to 1600 KC mark on scale. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.
3. Connect output meter across speaker voice coil or from 6K6GT plate to chassis through a .1 Mfd. condenser.
4. Connect the ground lead of the signal generator to the receiver chassis.
5. Set volume control at maximum volume position and use a weak signal from the signal generator.
6. Push in the manual button and leave it in that position throughout the alignment procedure.

IMPORTANT:—Align this receiver in exactly the order shown below.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF SIGNAL GENERATOR TO	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
Set tuner mechanism to maximum open position by turning the tuning control knob clockwise as far as it will go (Dial pointer at 1600 KC). Then check whether the positions of the tuning slugs correspond to the positions shown in Fig. 2. If settings are incorrect, rotate the individual core and threaded stem until desired position is reached. Note that threaded stem is prevented from moving by a dab of speaker cement on top and this seal must be removed before stem can be rotated.							
.1 MFD. Condenser	Terminal "N" on Tuner Unit (See Fig. 2).	455 KC	Broadcast (Clockwise)	Any point where it does not affect the signal.	1-2	2nd I.F.	Adjust for maximum output. Then repeat adjustment.
					3-4	1st I.F.	
500 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1600 KC	Broadcast (Clockwise)	1600 Kc.	5	Broadcast Oscillator	Adjust for maximum output.
				Tune to 1600 Kc. generator signal.	6	Broadcast R.F.	Adjust for maximum output.
					7	Broadcast Ant.	Adjust for maximum output.
500 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1400 KC	Broadcast (Clockwise)	Set pointer to 1400 Kc. mark on dial scale. Do not attempt to tune to generator signal.	BC. Osc. coil tuning slug		Adjust position of slug for maximum output.
					BC. R.F. coil tuning slug		Adjust position of slug for maximum output.
					BC. Ant. coil tuning slug		Adjust position of slug for maximum output.
500 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1600 KC	Broadcast (Clockwise)	Set pointer to 1600 Kc. mark on dial scale. Do not attempt to tune to generator signal.	5	Broadcast Oscillator	Adjust for maximum output.
				Tune to 1600 Kc. generator signal.	6	Broadcast R.F.	Adjust for maximum output.
					7	Broadcast Antenna	Adjust for maximum output.
500 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1400 KC	Broadcast (Clockwise)	Tune to 1400 Kc. generator signal.	BC. R.F. coil tuning slug		Adjust position of slug for maximum output.
					BC. Ant. coil tuning slug		Adjust position of slug for maximum output.
400 OHM Carbon Resistor	External Antenna Clip on Loop Frame	9.6 MC	Short wave (Counter-Clockwise)	9.6 Mc.	8	S.W. Oscillator	Adjust for maximum output. Check to see if proper peak was obtained by setting the signal generator to 10.5 Mc. and then tune radio in vicinity of 9.6 Mc. If image signal is not heard, realign at 9.6 Mc. with trimmer screw farther out. Recheck image.
400 OHM Carbon Resistor	External Antenna Clip on Loop Frame	9.6 MC	Short wave (Counter-Clockwise)	Tune to 9.6 Mc. generator signal.	9	S.W. Antenna	Adjust for maximum output. Try to increase output by detuning trimmer and retuning receiver dial until maximum output is obtained.

Apply a coating of speaker cement at top of each tuning core stem to prevent movement.

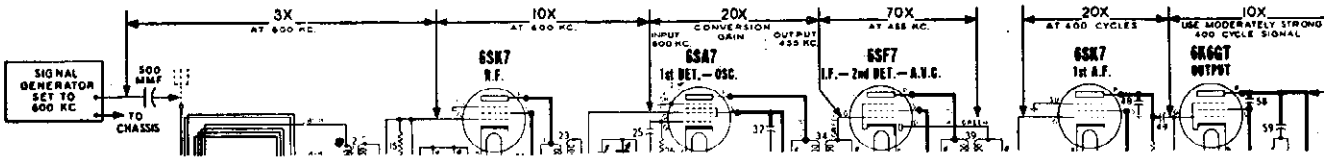
APPROXIMATE STAGE GAIN DATA

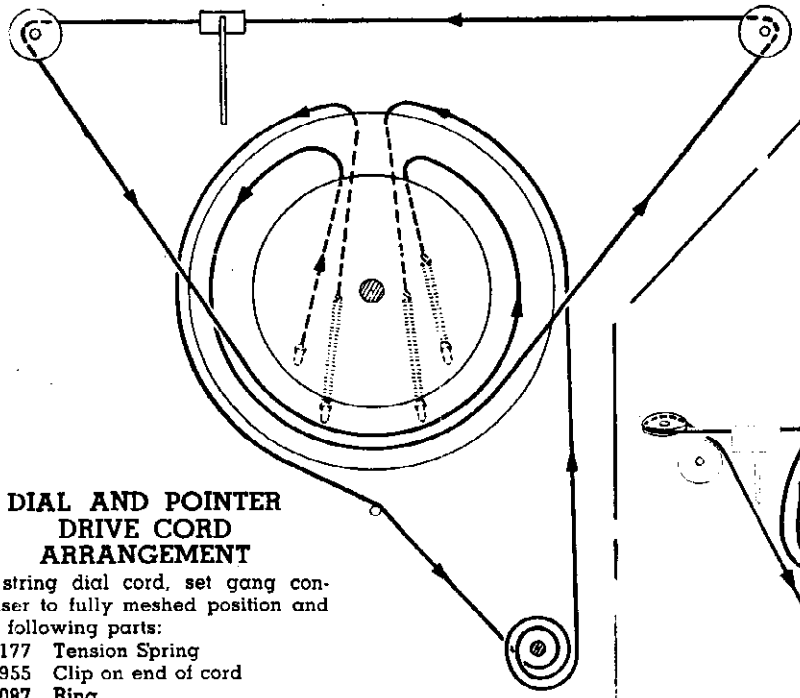
A vacuum tube voltmeter may be used for audio gain measurements. R.F. gains can be measured with a "channel" type instrume containing a tuned and calibrated R.F. amplifier. Observe following precautions:

1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes.)
2. For R.F. and I.F. measurements connect negative terminal of a 3 volt battery (two 1½ volt cells in series) to A.V.C. lead and positive terminal to chassis. This provides a definite operating point. IMPORTANT: Disconnect battery when measuring audio stage gains.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
4. When using "channel" type strument careful tune it for maximu output at desir frequency befo making measur ments.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 3 volts fixed bias order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence sta gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your t equipment. These factors may create considerable variation in gain measurements.



DIAL AND POINTER DRIVE CORD ARRANGEMENT

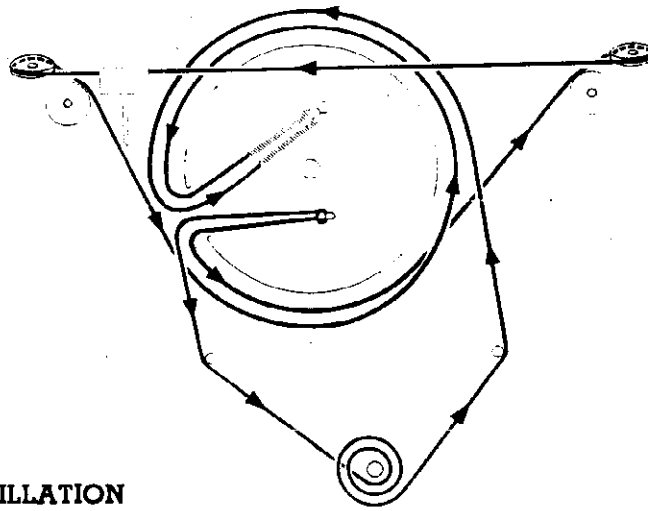
To string dial cord, set gang condenser to fully meshed position and use following parts:

113177 Tension Spring
114955 Clip on end of cord
119087 Ring
117057 Cord (61 inches)
34 inches for pointer drive
27 inches for tuning drive

(MODELS 62T16, 62TC16, 62TC26, 62TC36) DIAL AND POINTER DRIVE CORD ARRANGEMENT

To string dial cord, turn the main drive drum to maximum counter-clockwise position and use following parts:

114955 Clip on end of cord
117057 Cord (40 inches)
119087 Ring for dial cord
161384 Tension Spring



AUDIO OSCILLATION

The audio system of this receiver utilizes a two stage type of inverse feed-back arrangement and should it ever be necessary to repla the speaker or output transformer it is important to maintain a definite phase relationship in the feedback circuit. If the connections the output transformer are reversed or if the feed-back connection is made to the wrong side of the output transformer secondary, t system will become regenerative instead of degenerative. Under those conditions audio oscillation may result. If that occurs, osc lation may be prevented by reversing the connections to the primary of the output transformer.

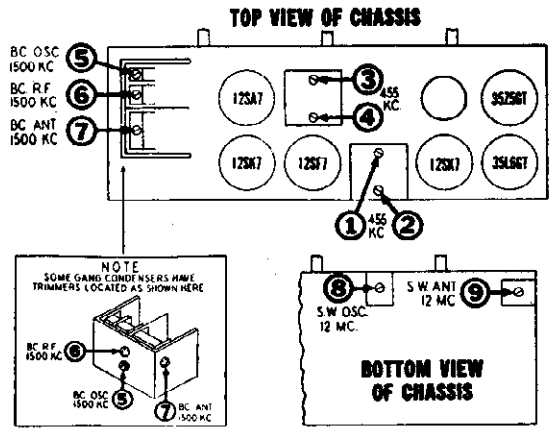
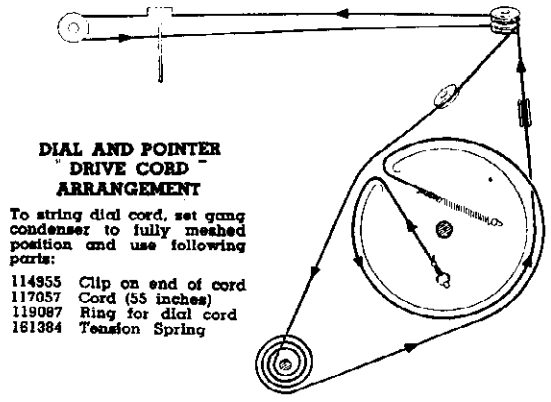
ALIGNMENT PROCEDURE

1. **Remove chassis and loop antenna from cabinet. Reconnect loop to chassis and space it approximately same distance from chassis as when installed in cabinet.**
2. Note that there are four calibrating lines stamped into the metal dial frame. When gang condenser is fully meshed, dial pointer should be in the position indicated by first line at the left. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.
3. Connect an output meter across the speaker voice coil or from plate of 35L6GT tube to B— through a .1 Mfd. condenser (see voltage chart for convenient B— connection).
4. Connect ground lead from signal generator to B— through a .25 Mfd. condenser.
5. Set volume control at maximum volume position and use a weak signal from the signal generator.

IMPORTANT:—Align this receiver in exactly the order shown below. Broadcast band must be aligned before short wave band.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF GENERATOR TO	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
200 MMFD. Mica Condenser	Control Grid of 12SA7	455 KC	Broadcast	Any point where it does not affect the signal	1-2	2nd I.F.	Adjust for maximum output. Then repeat adjustment.
					3-4	1st I.F.	
200 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1500 KC	Broadcast	Set pointer to 1500 KC reference line stamped into metal dial plate (first line at the right)	5	Broadcast Oscillator (Shunt)	Adjust for maximum output.
200 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1500 KC	Broadcast	Tune to 1500 KC generator signal	6	Broadcast R.F.	Adjust for maximum output.
200 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1500 KC	Broadcast	Tune to 1500 KC generator signal	7	Broadcast Antenna	Adjust for maximum output.
400 OHM Resistor	External Antenna Clip on Loop Frame	12 MC	Short Wave	Set pointer to 12 MC. Reference line stamped into metal dial plate (second line from the right)	8	Short Wave Oscillator	Adjust to bring in signal. Check to see if proper peak was obtained by tuning in image at approx. 11.1 MC. If image does not appear, realign at 12 MC. with trimmer screw farther out. Recheck image.
400 OHM Resistor	External Antenna Clip on Loop Frame	12 MC	Short Wave	Tune to 12 MC generator signal	9	Short Wave Antenna	Adjust for maximum output. Try to increase output by detuning trimmer and retuning receiver dial until maximum output is obtained.



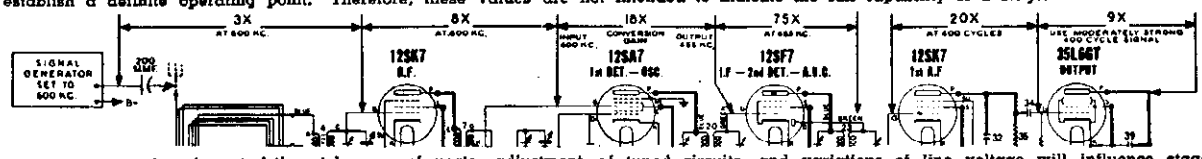


APPROXIMATE STAGE GAIN DATA

Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe following precautions:

1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes.)
2. For R.F. and I.F. measurements connect negative terminal of a 3 volt battery (two 1½ volt cells in series) to A.V.C. lead and positive terminal to B—. This provides a definite operating point. **IMPORTANT:** Disconnect battery when measuring audio stage gains.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
4. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 3 volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.

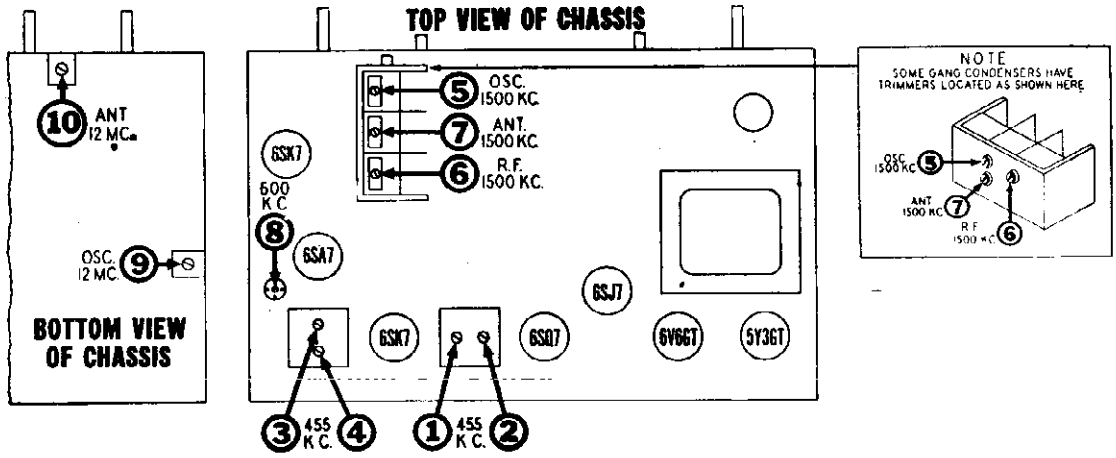
ALIGNMENT PROCEDURE

1. Remove chassis and loop antenna from cabinet (do not remove loop of wire stapled to cabinet). Wind one turn of insulated wire around frame of antenna so as to provide a means of coupling it to the signal generator. Stand chassis on one end and space it approximately same distance from loop as when installed in cabinet. Connect plug on loop antenna cable to socket at rear of chassis. Brown lead in antenna cable (which was connected to loop of wire stapled to cabinet) should now be connected to one end of new coupling turn on frame of loop.
2. Connect the ground lead of the signal generator to the receiver chassis.
3. With the gang condenser fully meshed, dial pointer should be in the position indicated by the last division below 55 on the dial. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.
4. Connect output meter across speaker voice coil or from plate of 6V6GT to chassis through a .1 Mfd. condenser.
5. Set volume control at maximum volume position and use a weak signal from the signal generator.
6. Push in the manual button and leave it in that position throughout the alignment procedure.

IMPORTANT:—Align this receiver in exactly the order shown below. Broadcast band must be aligned before short wave band.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF SIGNAL GENERATOR TO	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
.1 MFD. Condenser	Trimmer on rear section of gang	455 KC	Broadcast (counter-clockwise)	Any point where it does not affect the signal.	1-2	2nd I.F.	Adjust for maximum output. Then repeat adjustment.
					3-4	1st I.F.	
500 MMFD. Mica Condenser	Coupling turn on Loop Frame	1500 KC	Broadcast (counter-clockwise)	1500 KC	5	Broadcast Oscillator (Shunt)	Adjust for maximum output.
500 MMFD. Mica Condenser	Coupling turn on Loop Frame	1500 KC	Broadcast (counter-clockwise)	Tune to 1500 Kc. generator signal.	6	Broadcast R.F.	Adjust for maximum output.
500 MMFD. Mica Condenser	Coupling turn on Loop Frame	1500 KC	Broadcast (counter-clockwise)	Tune to 1500 Kc. generator signal.	7	Broadcast Antenna	Adjust for maximum output.
500 MMFD. Mica Condenser	Coupling turn on Loop Frame	600 KC	Broadcast (counter-clockwise)	Tune to 600 Kc. generator signal.	8	Adjustable core of Broadcast Oscillator Coil	Adjust for maximum output. Try to increase output by rotating core in and out and retuning receiver dial until maximum output is obtained.
500 MFD. Mica Condenser	Coupling turn on Loop Frame	Repeat adjustment of trimmers 5, 6 and 7 at 1500 Kc. Then re-check adjustment of trimmer 8 at 600 Kc.					
400 OHM Carbon Resistor	Coupling turn on Loop Frame	12 MC	Short wave (Clockwise)	12 MC	9	S.W. Oscillator	Adjust for maximum output. Check to see if proper peak was obtained by tuning in image at approx. 11.1 MC. If image does not appear, realign at 12 MC, with trimmer screw farther out. Recheck image.
400 OHM Carbon Resistor	Coupling turn on Loop Frame	12 MC	Short wave (Clockwise)	Tune to 12 MC. generator signal.	10	S.W. Antenna	Adjust for maximum output. Try to increase output by detuning trimmer and retuning receiver dial until maximum output is obtained.



AUDIO OSCILLATION

The audio system of this receiver utilizes a two stage type of inverse feed-back arrangement and should it ever be necessary to replace the speaker or output transformer it is important to maintain a definite phase relationship in the feed-back circuit. If the connections to the output transformer are reversed or if the feed-back connection is made to the wrong side of the output transformer secondary, the system will become regenerative instead of degenerative. Under those conditions audio oscillation may result. If that occurs, oscillation may be prevented by reversing the connections to the primary of the output transformer.

MODEL 9000-B

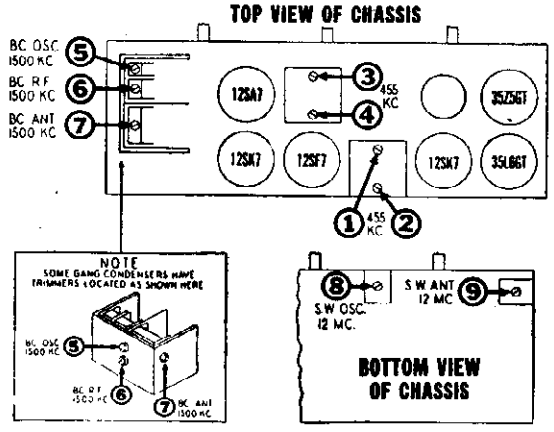
STEWART WARNER CORP.

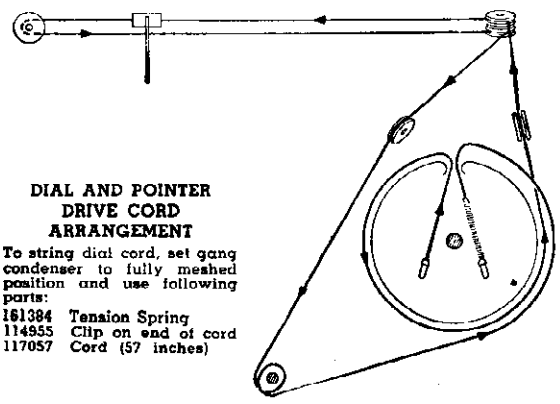
ALIGNMENT PROCEDURE

1. Remove chassis and loop antenna from cabinet (do not remove loop of wire stapled to cabinet). After chassis has been removed, replace loop antenna in cabinet. Stand the chassis on one end and space it approximately same distance from loop as when installed in cabinet. Then reconnect all leads to loop antenna and to loop of wire stapled on cabinet.
2. Note that there are four calibrating lines stamped into the metal dial frame. When gang condenser is fully meshed, dial pointer should be in the position indicated by first line at the left. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.
3. Connect an output meter across the speaker voice coil or from plate of 35L6GT tube to B— through a .1 Mfd. condenser (see voltage chart for convenient B— connection).
4. Connect ground lead from signal generator to B— through a .25 Mfd. condenser.
5. Set volume control at maximum volume position and use a weak signal from the signal generator.

IMPORTANT:—Align this receiver in exactly the order shown below. Broadcast band must be aligned before short wave band.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF GENERATOR TO	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
200 MMFD. Mica Condenser	Control Grid of 12SA7	455 KC	Broadcast	Any point where it does not affect the signal	1-2	2nd I.F.	Adjust for maximum output. Then repeat adjustment.
					3-4	1st I.F.	
200 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1500 KC	Broadcast	Set pointer to 1500 KC reference line stamped into metal dial plate (first line at the right)	5	Broadcast Oscillator (Shunt)	Adjust for maximum output.
200 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1500 KC	Broadcast	Tune to 1500 KC generator signal	6	Broadcast R.F.	Adjust for maximum output.
200 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1500 KC	Broadcast	Tune to 1500 KC generator signal	7	Broadcast Antenna	Adjust for maximum output.
400 OHM Resistor	External Antenna Clip on Loop Frame	12 MC	Short Wave	Set pointer to 12 MC. Reference line stamped into metal dial plate (second line from the right)	8	Short Wave Oscillator	Adjust to bring in signal. Check to see if proper peak was obtained by tuning in image at approx. 11.1 MC. If image does not appear, realign at 12 MC. with trimmer screw farther out. Recheck image.
400 OHM Resistor	External Antenna Clip on Loop Frame	12 MC	Short Wave	Tune to 12 MC generator signal	9	Short Wave Antenna	Adjust for maximum output. Try to increase output by detuning trimmer and retuning receiver dial until maximum output is obtained.





DIAL AND POINTER DRIVE CORD ARRANGEMENT

To string dial cord, set gang condenser to fully meshed position and use following parts:

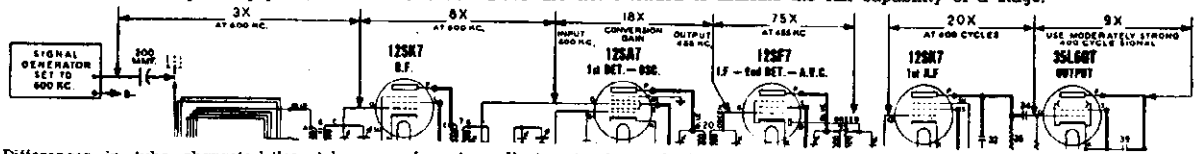
161384 Tension Spring
114955 Clip on end of cord
117057 Cord (57 inches)

APPROXIMATE STAGE GAIN DATA

Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe following precautions:

1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes.)
2. For R.F. and I.F. measurements connect negative terminal of a 3 volt battery (two 1½ volt cells in series) to A.V.C. lead and positive terminal to B—. This provides a definite operating point. IMPORTANT: Disconnect battery when measuring audio stage gains.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
4. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 3 volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.

ALIGNMENT PROCEDURE

1. Remove chassis and loop antenna from cabinet (do not remove loop of wire stapled to cabinet). After chassis has been removed, replace loop antenna in cabinet. Stand the chassis on one end and space it approximately same distance from loop as when installed in cabinet. Then reconnect all leads to loop antenna and to loop of wire stapled on cabinet.
2. With the gang condenser fully meshed, dial pointer should be in the position indicated by the last division below 55 on the dial. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.
3. Connect output meter across speaker voice coil or from plate to chassis through a .1 Mfd. condenser.
4. Connect the ground lead of the signal generator to the receiver chassis.
5. Set volume control at maximum volume position and use a weak signal from the signal generator.
6. Push in the manual button and leave it in that position throughout the alignment procedure.

IMPORTANT:—Align this receiver in exactly the order shown below. Broadcast band must be aligned before short wave band.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF SIGNAL GENERATOR TO	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
.1 MFD. Condenser	Trimmer on rear section of gang	455 KC	Broadcast (Clockwise)	Any point where it does not affect the signal.	1-2	2nd I.F.	Adjust for maximum output. Then repeat adjustment.
					3-4	1st I.F.	
500 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1500 KC	Broadcast (Clockwise)	1500 KC	5	Broadcast Oscillator (Shunt)	Adjust for maximum output.

STEWART WARNER CORP.

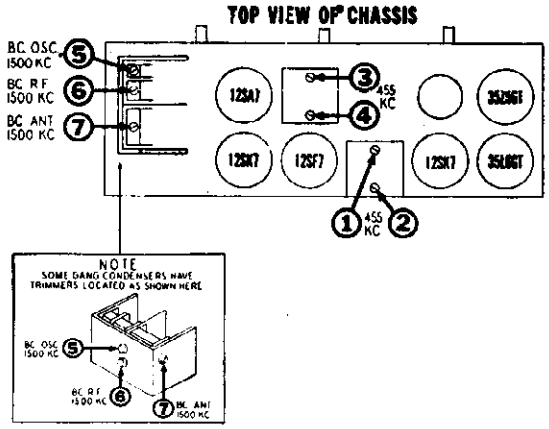
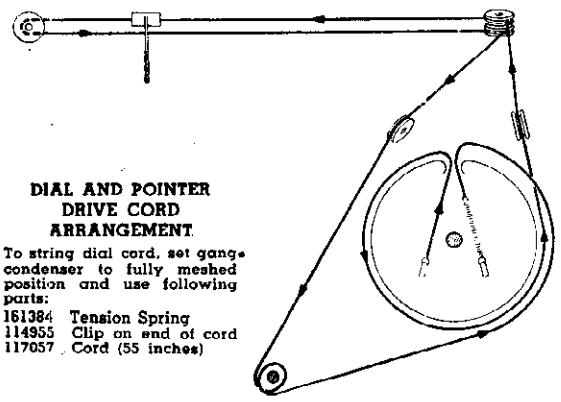
ALIGNMENT PROCEDURE

1. Remove chassis and loop antenna from cabinet. Reconnect loop to chassis and space it approximately same distance from chassis as when installed in cabinet.
2. Note that there are four calibrating lines stamped into the metal dial frame. When gang condenser is fully meshed, dial pointer should be in the position indicated by first line at the left. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.
3. Connect an output meter across the speaker voice coil or from plate of 35L6GT tube to B— through a .1 Mfd. condenser (see voltage chart for convenient B— connection).
4. Connect ground lead from signal generator to B— through a .25 Mfd. condenser.
5. Set volume control at maximum volume position and use a weak signal from the signal generator.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECTION OF SIG. GENERATOR OUTPUT TO RECEIVER	SIGNAL GENERATOR FREQUENCY	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
200 MMFD. Mica Condenser	Control Grid of 12SA7	455 KC	Any point where it does not affect the signal	1-2	2nd I.F.	Adjust for maximum output. Then repeat adjustment.
				3-4	1st I.F.	
200 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1500 KC	Set pointer to 1500 KC reference line stamped into metal dial plate (first line at the right)	5	Broadcast Oscillator (Shunt)	Adjust for maximum output.
200 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1500 KC	Tune to 1500 KC generator signal	6	Broadcast R.F.	Adjust for maximum output.
200 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1500 KC	Tune to 1500 KC generator signal	7	Broadcast Antenna	Adjust for maximum output.





DIAL AND POINTER DRIVE CORD ARRANGEMENT

To string dial cord, set gang condenser to fully meshed position and use following parts:

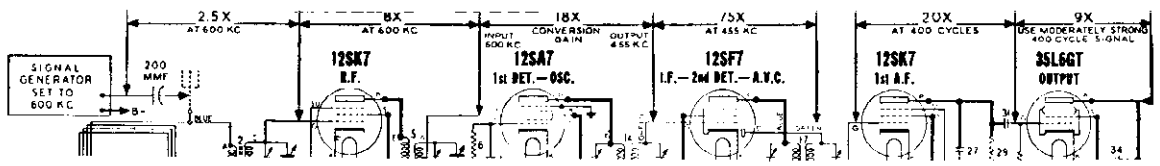
161384 Tension Spring
114955 Clip on end of cord
117057 Cord (55 inches)

APPROXIMATE STAGE GAIN DATA

A vacuum tube voltmeter may be used for audio gain measurements. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. Observe following precautions:

1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes.)
2. For R.F. and I.F. measurements connect negative terminal of a 3 volt battery (two 1½ volt cells in series) to A.V.C. lead and positive terminal to B—. This provides a definite operating point. IMPORTANT: Disconnect battery when measuring audio stage gains.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
4. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 3 volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.

MODEL 9003-B

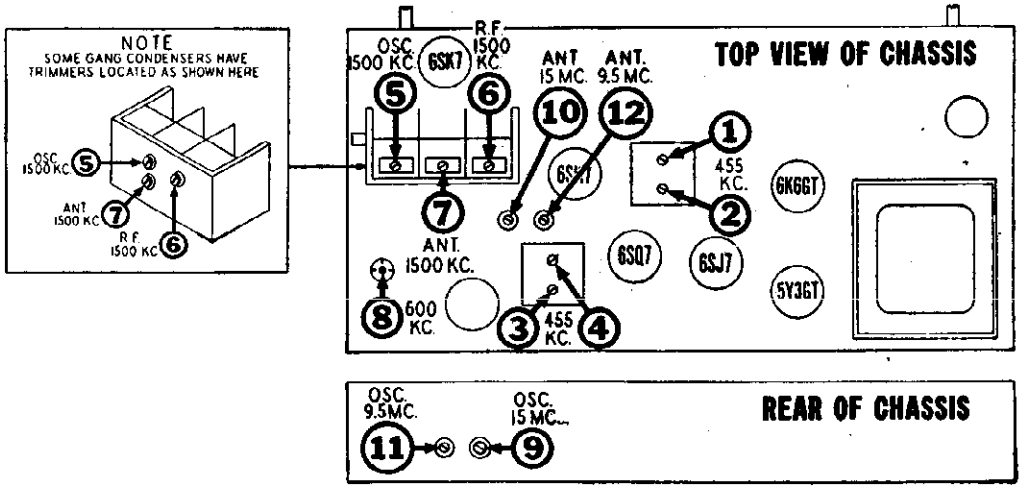
STEWART WARNER CORP.

ALIGNMENT PROCEDURE

1. The chassis and loop antenna should remain in their normal position in the cabinet throughout the following procedure.
2. Check arrangement of leads to push-button switch as shown in illustration on following page.
3. With the gang condenser fully meshed, dial pointer should be in the position indicated by the last division below 55 on the dial. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.
4. Connect output meter across speaker voice coil.
5. Connect the ground lead of the signal generator to the receiver chassis.
6. Set volume control at maximum volume position and use a weak signal from the signal generator.
7. Push in the manual button and leave it in that position throughout the alignment procedure.

IMPORTANT:—Align this receiver in exactly the order shown below. Broadcast band must be aligned before short wave bands.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF SIGNAL GENERATOR TO	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
.1 MFD. Condenser	Trimmer on rear section of gang	455 KC	Broadcast (counter-clockwise)	Any point where it does not affect the signal.	1-2	2nd I.F.	Adjust for maximum output. Then repeat adjustment.
					3-4	1st I.F.	
.003 MFD. Condenser	External Antenna Clip on Loop Frame	1500 KC	Broadcast (counter-clockwise)	1500 KC	5	Broadcast Oscillator (Shunt)	Adjust for maximum output.
.003 MFD. Condenser	External Antenna Clip on Loop Frame	1500 KC	Broadcast (counter-clockwise)	Tune to 1500 KC Generator Signal	6	Broadcast R.F.	Adjust for maximum output.
.003 MFD. Condenser	External Antenna Clip on Loop Frame	1500 KC	Broadcast (counter-clockwise)	Tune to 1500 KC Generator Signal	7	Broadcast Antenna	Adjust for maximum output.
.003 MFD. Condenser	External Antenna Clip on Loop Frame	600 KC	Broadcast (counter-clockwise)	Tune to 600 KC Generator Signal	8	Adjustable core of Broadcast Oscillator Coil.	Adjust for maximum output. Try to increase output by rotating core in and out and retuning receiver dial until maximum output is obtained.
.003 MFD. Condenser	External Antenna Clip on Loop Frame	Repeat adjustments of trimmers 5, 6 and 7 at 1500 Kc. Then re-check adjustment of trimmer 8 at 600 Kc.					
400 OHM Carbon Resistor	External Antenna Clip on Loop Frame	15 MC	Short wave	15 MC	9	S.W. Oscillator	Adjust for maximum output. Check to see if proper peak was obtained by tuning in image at approx. 14.1 MC. If image does not appear, realign at 15 MC, with trimmer screw farther out. Recheck image.
400 OHM Carbon Resistor	External Antenna Clip on Loop Frame	15 MC	Short wave	Tune to 15 MC Generator Signal	10	S.W. Antenna	Adjust for maximum output. Try to increase output by detuning trimmer and retuning receiver dial until maximum output is obtained.
400 OHM Carbon Resistor	External Antenna Clip on Loop Frame	9.5 MC	31 M (Clockwise)	9.5 MC	11	31 M Oscillator	Adjust for maximum output. Check to see if proper peak was obtained by tuning in image at approx. 8.6 MC. If image does not appear, realign at 9.5 MC, with trimmer screw farther out. Recheck image.
400 OHM Carbon Resistor	External Antenna Clip on Loop Frame	9.5 MC	31 M (Clockwise)	Tune to 9.5 MC Generator Signal	12	31 M Antenna	Adjust for maximum output. Try to increase output by detuning trimmer and retuning receiver dial until maximum output is obtained.



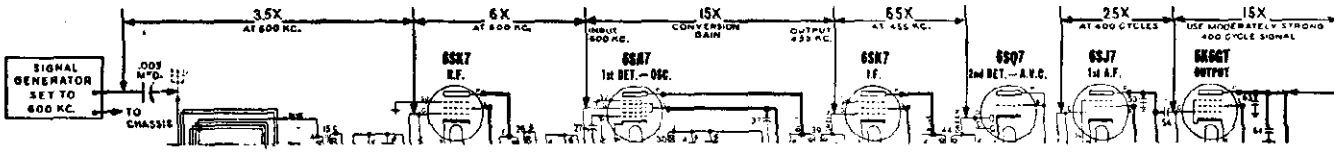
STEWART WARNER CORP.

APPROXIMATE STAGE GAIN DATA

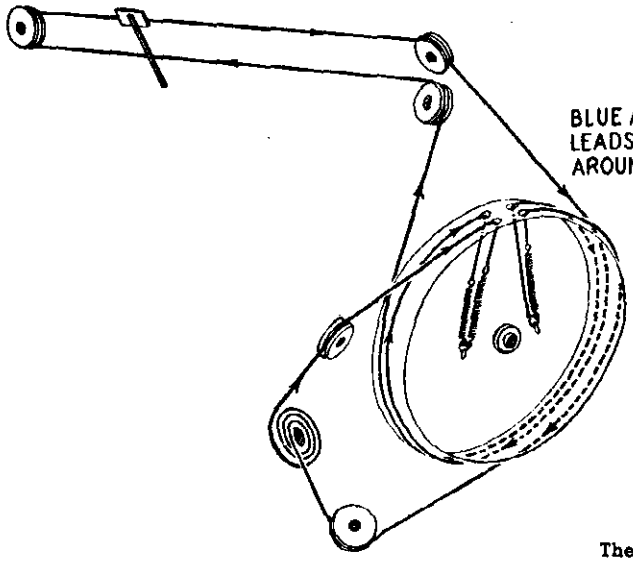
Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" typ instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurement Observe following precautions:

1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes.)
2. For R.F. and I.F. measurements connect negative terminal of a 3 volt battery (two 1½ volt cells in series) to A.V.C. lead and positive terminal to chassis. This provides a definite operating point. IMPORTANT: Disconnect battery when measuring audio stage gains.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
4. When using "channel" type i strument carefull tune it for maximu output at desire frequency befor making measur ments.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 3 volts fixed bias i order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



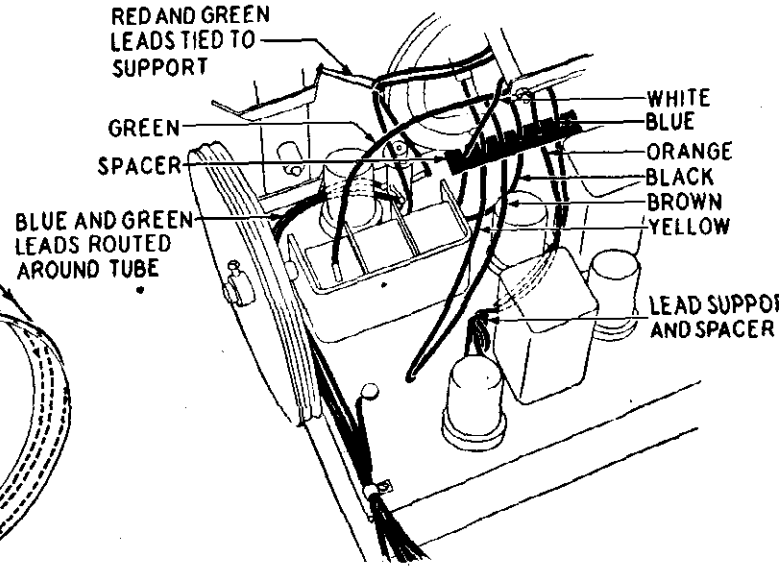
Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stag gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your te equipment. These factors may create considerable variation in gain measurements.



DIAL AND POINTER DRIVE CORD ARRANGEMENT

To string dial cord, set gang condenser to fully meshed position and use following parts:

113177 Tension Spring
114955 Clip on end of cord
119087 Ring for dial cord
117057 Cord (102 inches)
Pointer drive 72 inches
Gang drive 30 inches



IMPORTANCE OF MAINTAINING FIXED POSITIONS FOR LEADS AT TOP OF CHASSIS

The wires shown in the above illustration are associated with tunec circuits which carry radio frequency currents. Therefore, care must be exercised to insure that they are properly routed and spaced. Anchoring and fixing spacing of wires minimizes freedom of movement and is utilized to maintain a stable arrangement.

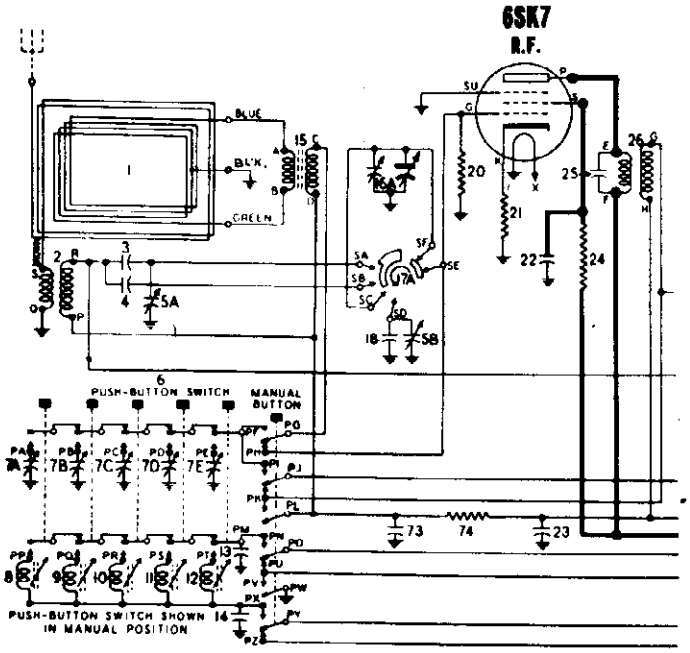
Since the relative positions of these wires may affect tuned circuits it is important to avoid any change in arrangement after the receiver has been aligned. If the position of the wires has been disturbed, it is ad visable to re-check alignment (see previous page for alignment procedure)

AUDIO OSCILLATION

The audio system of this receiver utilizes a two stage type of inverse feed-back arrangement and should it ever be necessary to replace the speaker or output transformer it is important to maintain a definite phase relationship in the feedback circuit. If the connections to the output transformer are reversed or if the feed-back connection is made to the wrong side of the output transformer secondary, the system will become regenerative instead of degenerative. Under those conditions audio oscillation may result. If that occurs, oscil lation may be prevented by reversing the connections to the primary of the output transformer.

MODEL 9003-B
2nd Revision

STEWART WARNER CORP.



When the model 9003-B is operated on push-button tuning it is possible for a "wide tolerance" 6SA7 tube to cause considerable reduction in sensitivity which may be particularly noticeable when comparison is made to the sensitivity obtained for "manual" tuning. This loss of sensitivity has been traced to a wide variation in one of the characteristics of the 6SA7 tube which permits the flow of a larger than normal grid current. Loss of sensitivity results from the loading effect of grid current flowing through the associated tuned circuit.

Correction of this condition may be accomplished by utilizing one or both of the following remedies.

REMEDY #1: Try replacing the 6SA7 tube; use several different tubes, preferably of different brands, and check the performance of the set with each tube. In event a replacement tube is not available or if changing the tube does not make any improvement, apply remedy #2.

REMEDY #2: The application of this remedy requires that the chassis be removed from the cabinet. After this has been done, you can then make the following changes. These changes make it possible to use the same 6SA7 tube that was supplied with the set and still obtain a considerable improvement in sensitivity when using push-button tuning.

CIRCUIT CHANGES

1. Remove ground connection at terminal "D" of Broadcast Antenna Coil and terminal "P" of Short Wave Antenna Coil and reconnect both coil terminals to the A.V.C. system as indicated in the diagram on next page.
2. Add resistor #74 (470,000 ohms 1/2 watt) and condenser #73 (.05 mfd. 200 volt) by connecting them into the circuit as shown.
3. Check alignment of receiver by adjusting antenna circuit trimmers for maximum output. Broadcast band trimmer (16A) must be adjusted before attempting to peak Short Wave band trimmer (5A).

STEWART WARNER CORP.

ALIGNMENT PROCEDURE

1. Remove chassis and loop antenna from cabinet (do not remove loop of wire stapled to cabinet). Wind one turn of insulated wire around frame of antenna so as to provide a means of coupling it to the signal generator. Stand chassis on one end and space it approximately same distance from loop as when installed in cabinet. Connect plug on loop antenna cable to socket at rear of chassis. Brown lead in antenna cable (which was connected to loop of wire stapled to cabinet) should now be connected to one end of new coupling turn on frame of loop.
2. Connect the ground lead of the signal generator to the receiver chassis.
3. With the gang condenser fully meshed, dial pointer should be in the position indicated by the last division below 55 on the dial. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.
4. Connect output meter across speaker voice coil or from plate of 6V6GT to chassis through a .1 Mfd. condenser.
5. Set volume control at maximum volume position and use a weak signal from the signal generator.
6. Push in the manual button and leave it in that position throughout the alignment procedure.

IMPORTANT:—Align this receiver in exactly the order shown below. Broadcast band must be aligned before short wave band.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF SIGNAL GENERATOR TO	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
.1 MFD. Condenser	Trimmer on rear section of gang	455 KC	Broadcast (counter-clockwise)	Any point where it does not affect the signal.	1-2	2nd I.F.	Adjust for maximum output. Then repeat adjustment.
					3-4	1st I.F.	
500 MMFD. Mica Condenser	Coupling turn on Loop Frame	1500 KC	Broadcast (counter-clockwise)	1500 KC	5	Broadcast Oscillator (Shunt)	Adjust for maximum output.
500 MMFD. Mica Condenser	Coupling turn on Loop Frame	1500 KC	Broadcast (counter-clockwise)	Tune to 1500 Kc. generator signal.	6	Broadcast R.F.	Adjust for maximum output.
500 MMFD. Mica Condenser	Coupling turn on Loop Frame	1500 KC	Broadcast (counter-clockwise)	Tune to 1500 Kc. generator signal.	7	Broadcast Antenna	Adjust for maximum output.
500 MMFD. Mica Condenser	Coupling turn on Loop Frame	600 KC	Broadcast (counter-clockwise)	Tune to 600 Kc. generator signal.	8	Adjustable core of Broadcast Oscillator Coil	Adjust for maximum output. Try to increase output by rotating core in and out and retuning receiver dial until maximum output is obtained.
500 MFD. Mica Condenser	Coupling turn on Loop Frame	Repeat adjustment of trimmers 5, 6 and 7 at 1500 Kc. Then re-check adjustment of trimmer 8 at 600 Kc.					
400 OHM Carbon Resistor	Coupling turn on Loop Frame	12 MC	Short wave (Clockwise)	12 MC	9	S.W. Oscillator	Adjust for maximum output. Check to see if proper peak was obtained by tuning in image at approx. 11.1 MC. If image does not appear, realign at 12 MC. with trimmer screw farther out. Recheck image.
400 OHM Carbon Resistor	Coupling turn on Loop Frame	12 MC	Short wave (Clockwise)	Tune to 12 MC. generator signal.	10	S.W. Antenna	Adjust for maximum output. Try to increase output by detuning trimmer and retuning receiver dial until maximum output is obtained.

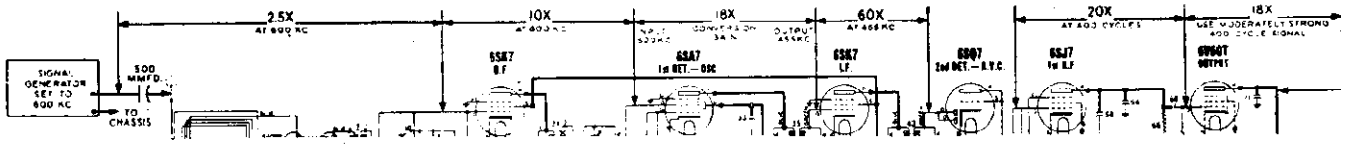
MODELS 9004-B, 9004-F, 9004-G

APPROXIMATE STAGE GAIN DATA

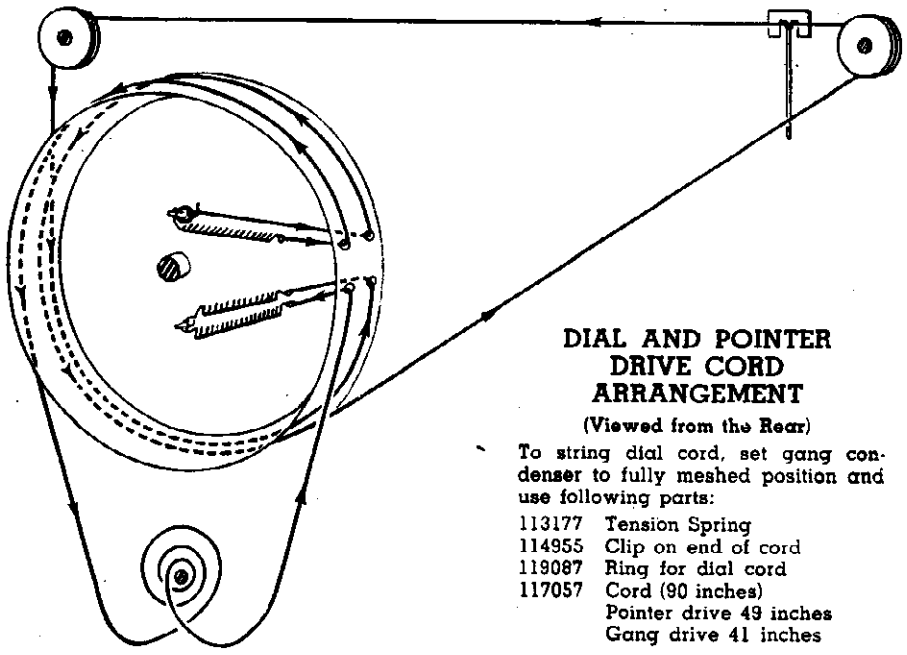
Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe following precautions:

1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes.)
2. For R.F. and I.F. measurements connect negative terminal of a 3 volt battery (two 1½ volt cells in series) to A.V.C. lead and positive terminal to chassis. This provides a definite operating point. IMPORTANT: Disconnect battery when measuring audio stage gains.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
4. When using "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 3 volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.



DIAL AND POINTER DRIVE CORD ARRANGEMENT

(Viewed from the Rear)

To string dial cord, set gang condenser to fully meshed position and use following parts:

113177	Tension Spring
114955	Clip on end of cord
119087	Ring for dial cord
117057	Cord (90 inches)
	Pointer drive 49 inches
	Gang drive 41 inches

AUDIO OSCILLATION

The audio system of this receiver utilizes a two stage type of inverse feed-back arrangement and should it ever be necessary to replace the speaker or output transformer it is important to maintain a definite phase relationship in the feed-back circuit. If the connections to the output transformer are reversed or if the feed-back connection is made to the wrong side of the output transformer secondary, the system will become regenerative instead of degenerative. Under those conditions audio oscillation may result. If that occurs, oscillation may be prevented by reversing the connections to the primary of the output transformer.

ALIGNMENT PROCEDURE

1. When gang condenser is fully meshed, dial pointer should be in the position indicated by the 54 mark on the dial. If it is set incorrectly, release the pointer clip on the dial cord and reposition pointer.

2. Connect an output meter across speaker voice coil or from the plate of the 1A5GT tube to chassis through a 0.1 Mfd. condenser.

3. Connect the ground lead of the signal generator to the receiver ground lead (black) or to the chassis.

4. Set volume control to maximum volume position and use a weak signal from the signal generator.

ALIGNMENT PROCEDURE

1. Slide chassis partially out of cabinet by removing staples at each side of wood shelf and pulling entire shelf back about 2 inches. Do not disturb connections to loop antenna.
2. Connect an output meter across the voice coil of the speaker or between the plate of the 3Q5GT output tube and chassis through a .1 mfd. condenser.
3. Connect the ground lead of the signal generator to chassis through a .25 mfd. condenser.
4. Set the volume control in the maximum position and use a weak signal from the generator.
5. Set "AC-DC—BAT.—CHARGE" Switch in "AC-DC" position.

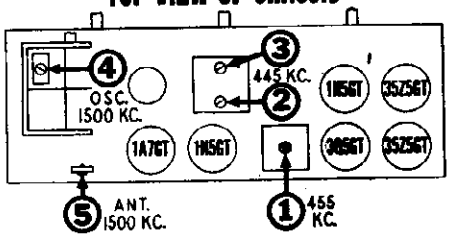
TOP VIEW OF CHASSIS



INDICATOR LAMP

The flashing neon lamp on the dial face indicates condition of batteries. This lamp is included in an oscillating (R-C) circuit which is designed to oscillate at approximately 3 pulses per second when batteries are in a fully charged condition. As the battery voltage decreases with use, number of pulses per second decreases.

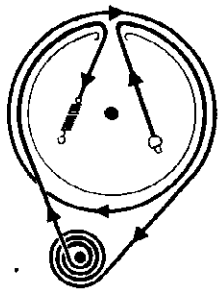
This lamp will only show the true condition of the batteries when the Selector Switch is in the "Battery" position. Lamp flashes more rapidly during charging or "AC-DC" operation.

When battery voltage is low (approximately 72 volts) the lamp flashes more slowly (about once per second). The set should not be operated from battery power after this point is reached and batteries should be recharged immediately. Charge for at least twice the time they were used and as soon as possible after they are run down. As batteries age it is necessary to charge for a longer period. For longest battery life, charge immediately after using.

IMPORTANT:
1. Completely dead batteries cannot be recharged.
2. When set is connected to a DC line, check for correct polarity by operating it before attempting to charge the batteries.
3. Batteries will be discharged if ON-OFF switch is left ON when power cord is not connected to wall outlet.

CHARGING CIRCUIT

The battery charging circuit consists of a 35Z5GT rectifier and a suitable resistor voltage dividing network. This circuit provides a very low charging current when the receiver is operated on AC-DC and is just enough to maintain the batteries but will not charge them. A separate charging position is provided for the regular charging operation. A charging rate of approximately ⅓ the discharge rate is used to give best results.



DIAL DRIVE CORD ARRANGEMENT

To string dial cord, set gang condenser to fully meshed position and use following parts:

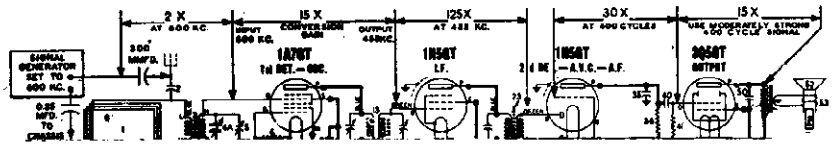
114955	Clip on end of cord
117057	Cord (28 inches)
119087	Ring for dial cord
161384	Tension Spring

APPROXIMATE STAGE GAIN DATA

Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements.

1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes).
2. For R.F. and I.F. measurements connect negative terminal of a 1½-volt battery to A.V.C. lead and positive terminal to chassis. This provides a definite operating point.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning).
4. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 1½ volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.

DIAL AND POINTER DRIVE CORD ARRANGEMENT

Top view
Dial plate removed

To string dial cord, set gang condenser to fully meshed position and use following parts:

114955 Clip on end of cord
117057 Cord (40 inches)
119087 Ring for dial cord
161384 Tension Spring

IMPORTANCE OF MAINTAINING FIXED POSITIONS FOR LEADS AT TOP OF CHASSIS

The shielded leads which are routed to the "Radio-Phono" switch and volume control should be tied to the upright bracket which supports the dial assembly. Grounded shields on these leads must not be allowed to contact electrolytic condenser case. If case of condenser is grounded it will short out bias voltage for 6V6GT tube.

AUDIO OSCILLATION

The audio system of this receiver utilizes a two stage type of inverse feed-back arrangement and should it ever be necessary to replace the speaker or output transformer it is important to maintain a definite phase relationship in the feed-back circuit. If the connections to the output transformer are reversed or if the feed-back connection is made to the wrong side of the output transformer secondary, the system will become regenerative instead of degenerative. Under those conditions audio oscillation may result. If that occurs, oscillation may be prevented by reversing the connections to the primary of the output transformer.

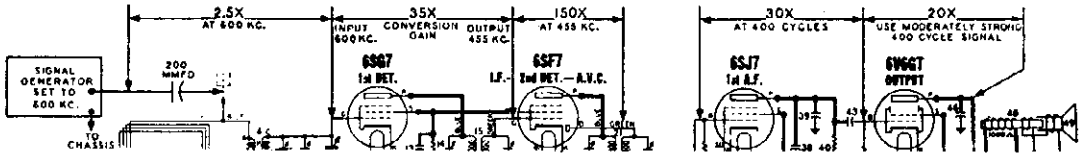
APPROXIMATE STAGE GAIN DATA

Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe following precautions

1. For all gain measurements connect signal generator as shown. Use 600 K.C. signal with 400 cycle modulation (use nearby frequency if local station interferes.)
2. For R.F. and I.F. measurements connect negative terminal of a 3 volt battery (two 1½ volt cells in series) to A.V.C. lead at terminal "D" of antenna coil; then connect positive battery lead to chassis. This provides a definite operating point. IMPORTANT: Disconnect battery when measuring audio stage gains.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
4. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 3 volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.

Remove chassis and loop antenna (cabinet back) from cabinet. Reconnect loop to chassis and space it approximately same distance from chassis as when installed in cabinet.

With the gang condenser fully meshed, the dial pointer should be in the position indicated by the last mark below 55 on the dial. If it is set incorrectly, release the pointer clip on the dial cord and reposition pointer.

Connect an output meter across the speaker voice coil or from the plate of the 6V6GT tube to chassis through a .1 Mfd. condenser.

Connect the ground lead of signal generator to the receiver chassis.

Set volume control at maximum volume position and use a weak signal from the signal generator.

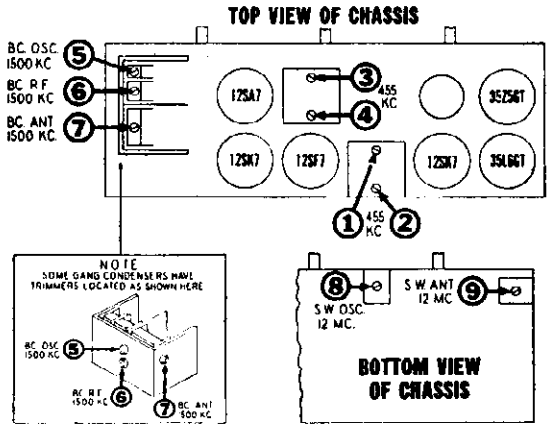
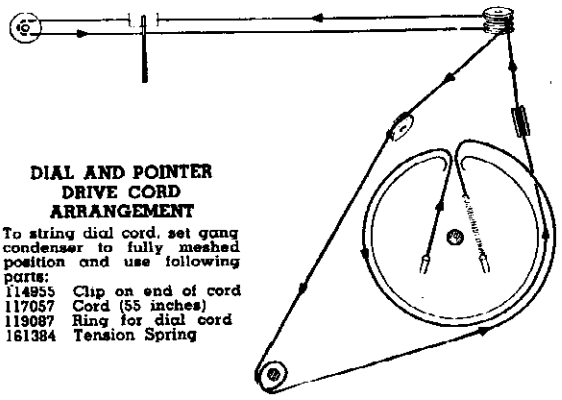
ALIGNMENT PROCEDURE

1. Remove chassis and loop antenna from cabinet. Reconnect loop to chassis and space it approximately same distance from chassis as when installed in cabinet.
2. Note that there are four calibrating lines stamped into the metal dial frame. When gang condenser is fully meshed, dial pointer should be in the position indicated by first line at the left. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.
3. Connect an output meter across the speaker voice coil or from plate of 35L6GT tube to B— through a .1 Mfd. condenser (see voltage chart for convenient B— connection).
4. Connect ground lead from signal generator to B— through a .25 Mfd. condenser.
5. Set volume control at maximum volume position and use a weak signal from the signal generator.

IMPORTANT:—Align this receiver in exactly the order shown below. Broadcast band must be aligned before short wave band.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF GENERATOR TO	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
200 MMFD. Mica Condenser	Control Grid of 12SA7	455 KC	Broadcast	Any point where it does not affect the signal	1-2	2nd I.F.	Adjust for maximum output. Then repeat adjustment.
					3-4	1st I.F.	
200 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1500 KC	Broadcast	Set pointer to 1500 KC reference line stamped into metal dial plate (first line at the right)	5	Broadcast Oscillator (Shunt)	Adjust for maximum output.
200 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1500 KC	Broadcast	Tune to 1500 KC generator signal	6	Broadcast R.F.	Adjust for maximum output.
200 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1500 KC	Broadcast	Tune to 1500 KC generator signal	7	Broadcast Antenna	Adjust for maximum output.
400 OHM Resistor	External Antenna Clip on Loop Frame	12 MC	Short Wave	Set pointer to 12 MC. Reference line stamped into metal dial plate (second line from the right)	8	Short Wave Oscillator	Adjust to bring in signal. Check to see if proper peak was obtained by tuning in image at approx. 11.1 MC. If image does not appear, realign at 12 MC. with trimmer screw farther out. Recheck image.
400 OHM Resistor	External Antenna Clip on Loop Frame	12 MC	Short Wave	Tune to 12 MC generator signal	9	Short Wave Antenna	Adjust for maximum output. Try to increase output by detuning trimmer and retuning receiver dial until maximum output is obtained.





DIAL AND POINTER DRIVE CORD ARRANGEMENT

To string dial cord, set gang condenser to fully meshed position and use following parts:

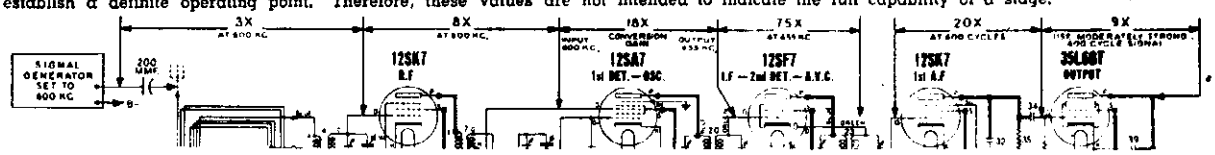
114955 Clip on end of cord
117057 Cord (55 inches)
119087 Ring for dial cord
161384 Tension Spring

APPROXIMATE STAGE GAIN DATA

Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe following precautions:

1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes.)
2. For R.F. and I.F. measurements connect negative terminal of a 3 volt battery (two 1½ volt cells in series) to A.V.C. lead and positive terminal to B—. This provides a definite operating point. IMPORTANT: Disconnect battery when measuring audio stage gains.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
4. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 3 volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.

ALIGNMENT PROCEDURE

1. With the gang condenser fully meshed, the dial pointer should be in the position indicated by the last mark below 55 on the dial. If it is set incorrectly, release the pointer clip on the dial cord and reposition pointer.
2. During the alignment of this receiver it will be necessary to set the dial pointer to the following frequencies: 1500 Kc., 600 Kc., 6 Mc., 5.1 Mc., 20 Mc., and 19.1 Mc. In order to avoid replacing the chassis in the cabinet each time a dial setting is required, it will be found more convenient to mark the required frequency points on the white dial background plate before starting the alignment.
3. Connect an output meter across the speaker voice coil or from plate of 35L6GT tube to B— lug through a .1 Mfd. condenser (see voltage chart for convenient B— connection).
4. Connect ground lead of signal generator to B— lug.
   CAUTION: If your test oscillator is designed with an AC-DC power supply, connect ground lead of signal generator to B— lug through a .25 mfd. condenser.
5. Set volume control at maximum volume position and use a weak signal from the signal generator.

IMPORTANT: Align this receiver in exactly the order shown below. Broadcast band should be aligned before short wave bands.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF SIGNAL GENERATOR TO	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT

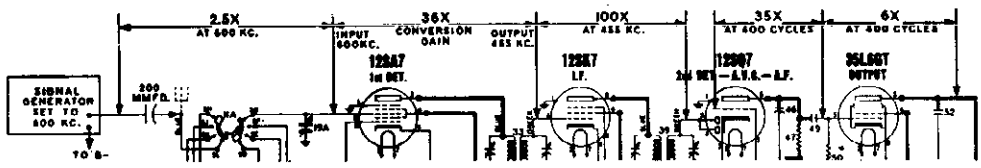
APPROXIMATE STAGE GAIN DATA

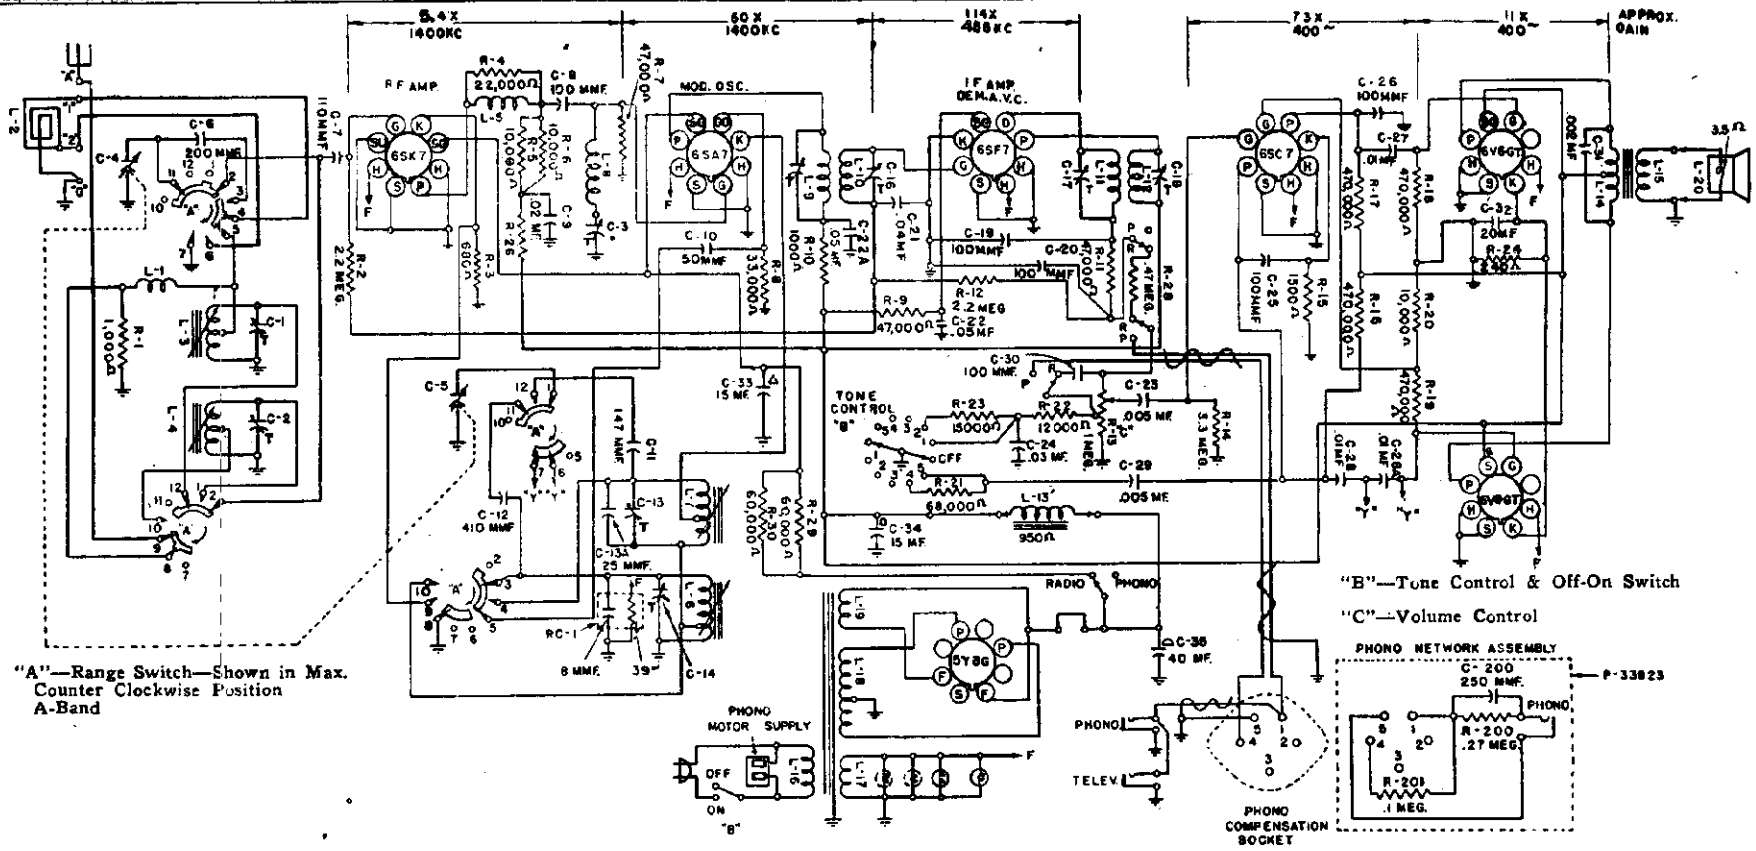
Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe following precautions:

1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes.)
2. For R.F. and I.F. measurements connect negative terminal of a 3 volt battery (two 1½ volt cells in series) to A.V.C. lead at terminal "H" of Intermediate band antenna coil (15); then connect positive battery lead to chassis. This provides a definite operating point.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
4. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 3 volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.



SPECIFICATIONS

Voltage Rating ..... A.C. 105 to 130 Volts
Type of Circuit ..... Superheterodyne with Push Button Tuning
Tuning Ranges ..... A—540 to 1600 Kc., C—8.8 to 12 Mc.
Number and Type of Tubes—7

1—6SK7 R. F. Amplifier
1—6SA7 Modulator and Oscillator
1—6SF7 I. F. Amplifier, Demodulator and A. V. C.
1—6SC7 Audio Amplifier and Inverter
2—6V6GT Output
1—5Y3G Rectifier

Input Power Rating ..... 96-115 Watts
Intermediate Frequency ..... 455 Kilocycles
Speaker Voice Coil Impedance at 400 Cycles Approximately 3.5 Ohms
Speaker Field Coil Resistance ..... 950 Ohms
Power Output ..... 10 Watts 10% Distortion, 12 Watts Maximum

NORMAL VOLTAGE READINGS

Take all readings with chassis operating and tuned to 1000 kc.—No signal.
Use a line voltage of 117 ±5 volts or make allowance for the variations.
Voltages on location chart are taken with a 1000 ohm per voltmeter.
Voltages on table listed below are taken with an electronic voltmeter.
Read from indicated terminals to chassis base.

VOLTAGE TABLE FOR ELECTRONIC VOLTMETER

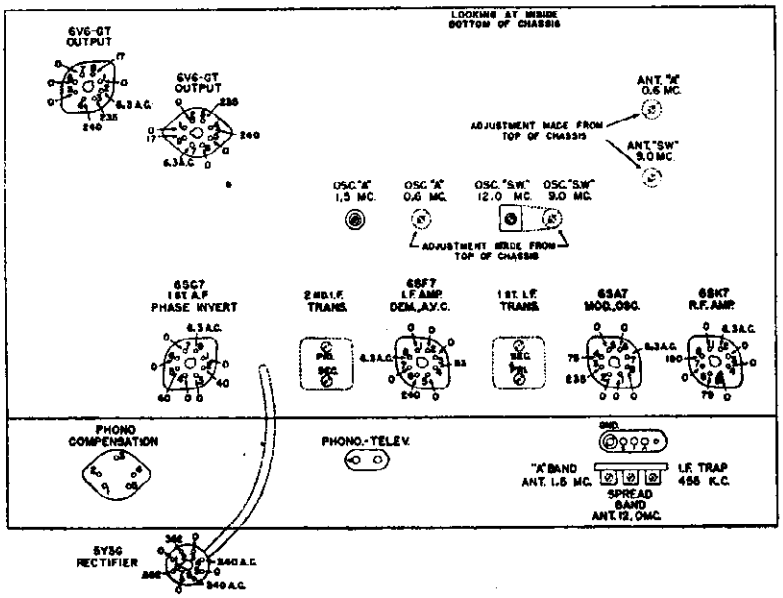
LOCATION CHART



ALIGNING INFORMATION

Never re-align unless absolutely necessary.

Use a good modulated signal generator (test oscillator with variable output voltage and a sensitive output meter across the voice coil of the speaker).

Always align using the smallest possible input from the signal generator. A strong signal makes adjustments inaccurate.

Always have the volume control "full on".

ALIGNING PROCEDURE (follow this order exactly).

I. Intermediate Frequency Adjustments.

1. Set range switch to Standard Broadcast position (loop).
2. Turn the tuning control to extreme low frequency end of dial.
3. Connect the ground terminal of the signal generator to the ground terminal of the chassis.
4. Introduce a modulated signal of 455 kilocycles to the grid of the 6SA7 Modulator and Oscillator tube (terminal No. 8) using a 0.1 microfarad capacitor in series with the output lead of the signal generator.
5. Adjust the I. F. aligners for maximum output in the following order:
   A. Secondary of second I. F. Transformer.
   B. Primary of second I. F. Transformer.
   C. Secondary of first I. F. Transformer.
   D. Primary of first I. F. Transformer.

II. Dial Pointer Adjustment.

With the plates of the gang tuning capacitor fully engaged, check to be sure that the dial pointer is in a vertical position directly on the calibration marks located at the low frequency end of the dial scale. Adjust the dial pointer if necessary.

III. Radio Frequency Adjustments.

Short Wave Range

1. Remove the output lead of the signal generator and the 0.1 microfarad capacitor from the grid of the 6SA7 tube.
2. Disconnect the output lead from the signal generator and replace with a few turns of wire connected to the signal generator output terminals.
3. Place the signal generator two or three feet from the receiver's loop.
4. Set the range switch to the short-wave range position.
5. Set the signal generator frequency and the receiver tuning dial to 9 megacycles.
6. Adjust the 9 megacycle oscillator and loop aligners (iron cores) for maximum signal.
7. Set the signal generator frequency and the receiver tuning dial to 12 megacycles.
8. Adjust the 12 megacycle oscillator aligning capacitors for maximum signal. Then rock the tuning gang capacitor slowly through resonance and adjust the 12 megacycle antennae aligning capacitor for maximum signal.
9. Repeat operations 5 and 6.
10. Repeat operations 7 and 8.

Standard Broadcast Range

1. Set the range switch to the "Loop" position.
2. Set the signal generator frequency and the receiver tuning dial to 600 kilocycles.
3. Adjust the 600 K. C. oscillator and antennae aligner (iron cores) for maximum signal.
4. Set the signal generator frequency and the receiver tuning dial to 1400 kilocycles.
5. Adjust the 1400 K. C. oscillator and antennae aligning capacitors for maximum signal.
6. Repeat operations 2 and 3.
7. Repeat operations 4 and 5.

IV. Wave Trap Adjustment.

1. Tune the receiver to 1000 kc.
2. Set the signal generator frequency to 455 kc. Increase signal generator output until audible in speaker.
3. Adjust the wave trap aligning capacitor for minimum signal.

NORMAL VOLTAGE READINGS

Use a good voltmeter having a resistance of at least 1000 ohms per volt. See chart below if electronic voltmeter is used.

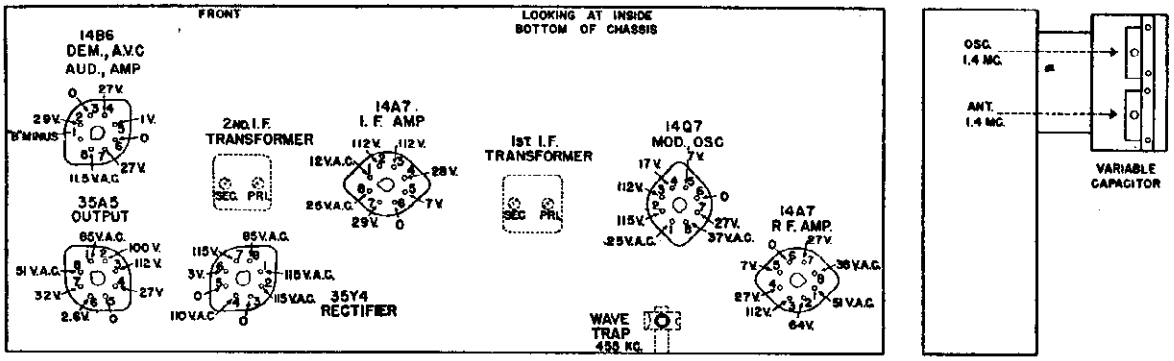
Take all readings with chassis operating and tuned to approximately 1000 Kc.—no input signal.

Use a line voltage of 117 volts or make allowance for the variation.

Read from indicated socket terminals to B minus. A convenient point is terminal No. 1 of the 14B6 Dem. A.V.C. Socket.

See Location Chart for position of terminals.

A. C. Voltages are indicated as A. C.; when the receiver is operated from a D. C. power supply, D. C. voltages will be obtained in place of A. C. voltages shown.



ALIGNING INFORMATION

Never realign unless absolutely necessary.

Use a good modulated signal generator (test oscillator) with variable output voltage and a sensitive output meter across the voice coil of the speaker.

Always align using the smallest possible input from the signal generator. A strong signal makes adjustments inaccurate.

Always have the volume control "full on".

Important: Be sure the metal plate is fastened in place on the bottom of the chassis before alignment is attempted.

ALIGNING PROCEDURE (follow this order exactly).

I. **Intermediate Frequency Adjustments.**

1. Turn the tuning control to the extreme low frequency position. (Variable capacitor plates all the way in.)
2. Connect the ground terminal of the signal generator to the chassis base.
3. Introduce a modulated signal of 455 kilocycles using a .01 mfd. capacitor in series with the lead from the signal generator to the antenna connection located at rear of the pickup loop.
4. Adjust the I. F. aligners for maximum output in the following order:
   - A. Secondary of second I. F. Transformer.
   - B. Primary of second I. F. Transformer.
   - C. Secondary of first I. F. Transformer.
   - D. Primary of first I. F. Transformer.

II. **Dial Pointer Adjustment.**

With the plates of the gang tuning capacitor fully engaged set the dial pointer in a horizontal position directly on the upper edge of the calibration mark located at 550 Kc. on the dial scale.

III. **Radio Frequency Adjustments.**

1. Replace the .01 mfd. capacitor in series with the output lead of the signal generator with a 200 mmf. capacitor and connect to the antenna terminal located on the back of the loop assembly.
2. Set the signal generator's frequency and the receiver's tuning dial to 1.4 megacycles.
3. Adjust the oscillator and antenna aligning capacitors for maximum signal.
4. Set both the signal generator's frequency and the receiver's tuning dial to 0.6 megacycles and check calibration.
   NOTE: If the calibration is too far off at 0.6 megacycles, operations 2 and 3 may be repeated until the best results are obtained.

Wave Trap Adjustment.

(Leave the receiver connected in the same manner as when making the Radio Frequency Adjustments.)

1. Tune set to 1000 K. C.
2. Set the signal generator frequency to 455 K. C. and introduce a fairly strong modulated signal to the receiver.
3. Adjust the wave trap aligner for minimum signal.

TOP VIEW SHOWING TUBE LOCATION & TRIMMERS

ALIGNING

Never realign unless absolutely necessary

Use a good signal generator modulated at 400 or 1000 cycles with variable output voltage and a sensitive output meter across the voice coil of the speaker.

Always align using the smallest possible input from the signal generator. *A strong signal makes adjustments approximate.*

Always have the volume control "full on."

Aligning Procedure *(follow this order exactly)*

Intermediate Frequency Adjustments

1. Turn the tuning control to the extreme low frequency position. (Variable capacitor plates all the way in).
2. Connect the ground terminal of the signal generator to the common buss. (Black and White wire).
3. Introduce a modulated signal of 455 kilocycles using a .01 mfd. capacitor in series with the lead from the signal generator to the modulator grid, terminal No. 8, of the 12SA7 tube.
4. Adjust the I.F. Aligners for maximum output in the following order:
   - A. Secondary of second I.F. Transformer.
   - B. Primary of second I.F. Transformer.
   - C. Secondary of first I.F. Transformer.
   - D. Primary of first I.F. Transformer.

Dial Pointer Adjustments

1. Disconnect the .01 mfd. capacitor in series with the signal generator, disconnect signal generator ground from black and white buss. Connect both signal generator lead and ground lead to an 8 inch radiating loop. *(1 turn).* Place the radiating loop close to the antenna of the receiver.
2. Turn the plates of the gang tuning capacitor full out *(complete clockwise rotation).*
3. Set signal generator to 1580 kilocycles and adjust oscillator trimmer for maximum output. Now set signal generator to 1400 kilocycles and tune set to receive 1400 kilocycle signal. Adjust pointer to center of 1400 kilocycles calibration on dial.

Radio Frequency Adjustments

1. Leave signal generator loop connected in same position as for dial pointer adjustment.
2. Set signal generator and receiver tuning dial to 1400 kilocycles.
3. Adjust the oscillator, radio frequency and antenna trimmers for maximum output.
4. Set both the signal generator's frequency and the receiver's tuning dial to a 600 kilocycles and check calibration.

Note: If the calibration is too far off at 600 kilocycles, operations 2 and 3 may be repeated until the best results are obtained.

ALIGNING

Never realign unless absolutely necessary.

Refer to "Location Chart" for alignment adjusters. Allow set to warm up 10 to 15 minutes before attempting tc align.

Always align using the smallest possible input from the signal generator. *A strong signal makes adjustments approximate.*

Always have volume full on.

The alignment of this receiver does not require special equipment or information; however, it is well to adhere to the standard procedure as outlined.

The required equipment is: 1 Electronic Voltmeter, 1 Output Meter, 1 Standard Signal Generator, 1 High Frequency Signal Generator, 1 No. 80777 Aligning Tool.

Aligning Procedure *(follow this order exactly)*

Intermediate Frequency Adjustments
Amplitude Modulation

The I.F. aligners that are used to adjust the amplitude modulation (AM) channel are found on the top side of the chassis. They consist of 6 adjustable iron cores used to tune the inductance of the 1st, 2nd & 3rd I.F. transformers (161202, 161200, 161201). These cores are found inside the plastic tubes protruding from the top of the I.F. transformers and are equipped with small screwdriver slots.

Caution: These cores are made of high quality R.F. iron and are fragile; therefore care must be used in adjusting them.

1. Connect the signal generator to the modulator grid, terminal number 8 of the 6SB7 converter tube which is connected to the wave band switch, and is identified by a blue dot.
2. Connect the output meter across the voice coil of the speaker (green and black wires from cable).
3. Adjust the signal generator to 455 KC. Use 30% modulation at 400 cycles.
4. Adjust volume control full on.
5. Adjust tone control to maximum high (counter clockwise).
6. Adjust range switch to standard broadcast band, (second position clockwise.)
7. Adjust the tuning selector to approximately 600 KC.
8. Adjust I.F. cores for maximum output with a reduced signal Input.

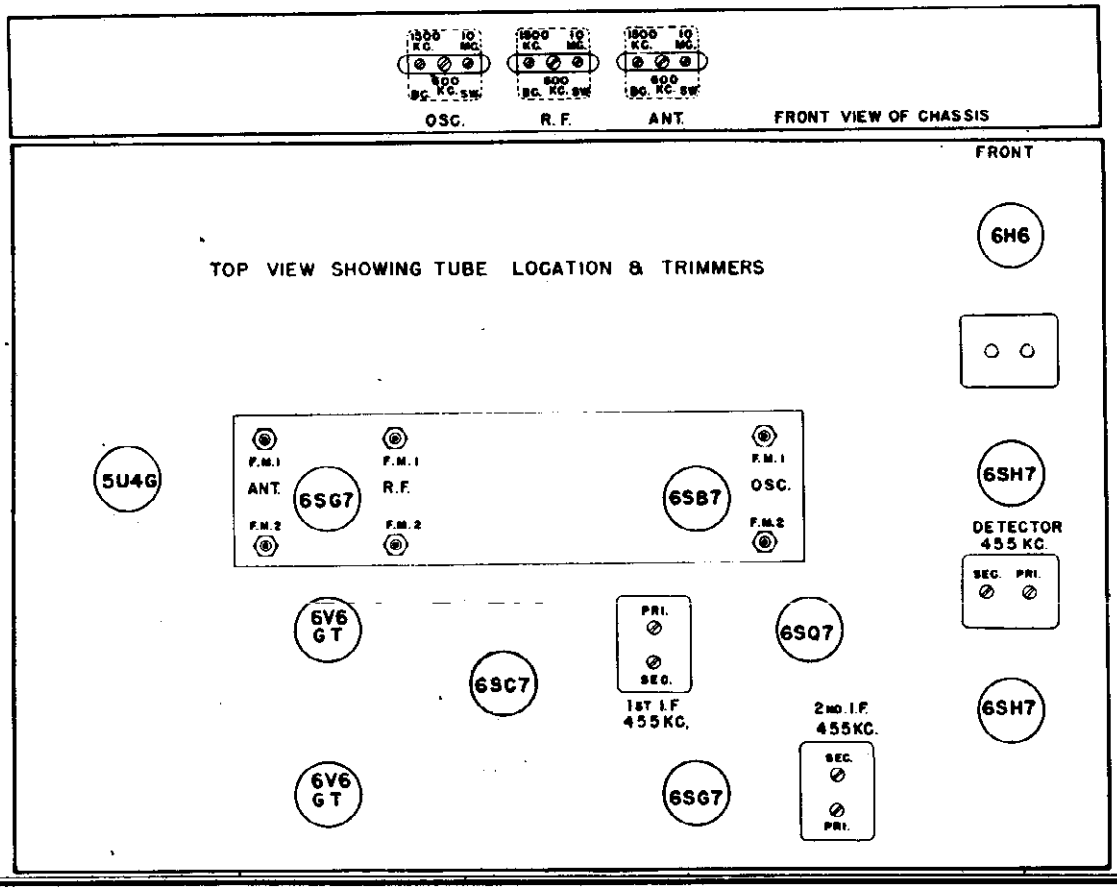
Frequency Modulation

The I.F. Aligners may be found from the underside of the chassis. The adjusters are 6 Iron cores used to tune the inductance of the high frequency coils.

1. Connect the signal generator to the modulator grid, terminal number 8 of the 6SB7 converter tube, which is connected to the wave band switch, and is identified by a blue dot.

LOCATION CHARTS

TUBES, TRIMMERS AND VOLTAGE



STROMBERG CARLSON CO.

2. Connect the electronic voltmeter to the junction of the 22,000 and the 4,700 ohm resistors in the limiter grid circuit, identified by a green dot.
3. Adjust the voltmeter to the lowest negative voltage scale.
4. Turn the range switch to the 2nd F.M. band (fourth position clockwise).
5. Adjust the tuning selector to approximately 21 on this band.
6. Adjust the signal generator to 10.7 megacycles. No modulation is required.
7. Adjust the cores for maximum output of the voltmeter. Reduce the input signal and readjust until the maximum output is secured for minimum input.

Discriminator Alignment (FM)

1. Connect the signal generator to the grid of the second I.F. tube, terminal No. 4 of the 6SH7.
2. Connect the electronic voltmeter to the center of the diode load resistors at the point indicated by the orange dot.
3. Adjust the primary for maximum output with the signal generator set at 10.7 megacycles.
4. Switch the electronic voltmeter to the high side of the diode load resistors, identified by a red dot.
5. Adjust the secondary for zero output.
6. Swing generator to 75 KC higher and 75 KC lower in frequency and note the plus and minus voltage. If these voltage values are not approximately equal, repeat operations 3, 4 and 5.

Dial Pointer Adjustment

Check dial pointer to see that it is aligned through the center of the 2 in the number 201 of FM Band (1) when the variable capacitor plates are completely engaged.

R.F. Adjustment — Amplitude Modulation

The Broadcast band should be adjusted first.

The built-in loop should remain connected to the antenna and ground terminals.

1. Connect the signal generator to the antenna terminal, using a 200 mmf. capacitor. Use 30% modulation at 400 cycles.
2. Adjust the signal generator to 1500 KC.
3. Adjust station selector to 1500 KC.
4. Adjust range switch to AM Broadcast. (Second position clockwise.)
5. Adjust the oscillator, R.F. and antenna trimmer for maximum output.
6. Reduce the input signal and readjust the trimmers until the maximum output is secured for minimum input.
7. Adjust station selector to 600 KC.
8. Set signal generator to 600 KC.
9. Adjust iron cores in oscillator, R.F. and antenna coils for maximum output.
10. Repeat 1500 KC and 600 KC alignments until no further change is required.

R.F. Adjustment — Short Wave

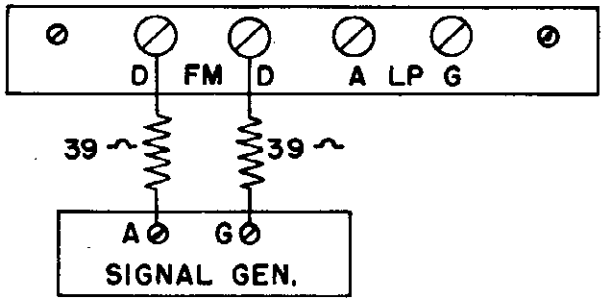
The built-in loop should remain connected to the antenna and ground terminals.

1. Connect the signal generator to the antenna and ground terminals of the receiver using a 400 ohm resistor.
2. Set the dial pointer to 9.5 megacycles.
3. Adjust signal generator to 9.5 megacycles.
4. Adjust range switch to Short Wave (first position clockwise).
5. Adjust oscillator, R.F., and antenna trimmer for maximum output. (No further alignment is required on this band.)

R.F. Adjustments — Frequency Modulation

Align the FM (2) Band first.

1. Set the dial pointer to 61.
2. Connect the signal generator to FM dipole terminals using 39 ohm resistors as indicated. (Disconnect dipole antenna.) *Connect Signal Generator ground to chassis ground.*
3. Set signal generator to 46.1 megacycles.
4. Adjust range switch to FM (2) (fourth position clockwise).
5. Connect the electronic voltmeter to the junction of the 22,000 and 4,700 ohm resistors in the limiter grid circuit. (Identified by green dot.)
6. Adjust oscillator R.F. and antenna trimmers for maximum output on electronic voltmeter.



FM (1) Band

Adjust the same as the FM (2) band using 100.1 megacycles, setting the dial pointer to 261. Connect the generator to the dipole input using 39 ohm resistors as indicated. *Connect Signal Generator ground to chassis ground. Note reversed Signal Generator connection.*

Alignment: No attempt should be made to realign this receiver until it has bee determined that a poor tube, or some local condition is not responsible for faulty reception An output meter may be clipped directly across the voice coil lugs.

The Signal Generator may be connected through a 0.01 mf capacitor (used as dumm antenna) to the lug on RF section (B) of tuning capacitor. Connect ground clip of gene ator directly to chassis. Align the I. F. trimmers to 455 kc, using least possible input from Signa Generator to avoid developing A.V.C. voltage which would make the tuning adjustments ver broad.

To align RF trimmers, remove the 0.01 mf capacitor and connect the Signal Generato leads or two or three turns of heavy wire, forming a self-supporting loop of about 7 or inches diameter, placed about a foot away from the receiver's loop antenna. Again, use th least possible input from the Signal Generator. With the tuning capacitor plates completel out of mesh, and pointer at extreme left end of travel, adjust the oscillator trimmer (A) (o front section of tuning capacitor) to 1700 kc. Readjust both Signal Generator and tuning capac itor to 1550 kc and adjust the RF trimmer (B) (on rear section) for maximum response. Wit tuning capacitor plates fully meshed, the receiver should tune to 535 kc; however, no adjus ment is required at this point. For checking purposes, four fine marks are engraved on th dial plate. These represent, in order, the pointer settings for 1550, 1000, 600 kc, and th pointer position with capacitor plates fully meshed.

V-6	No. 51	Dial Lamp	

Operation: The set operates on 110 to 120 volts, 50 or 60 cycles A. C. and 110 to 120 volts D. C. Power drain is approximately 25 watts.

When operated on direct current (D. C.), if no reception is obtained after approximately one minute of warm-up time, reverse the line plug in the power outlet.

Range: Model E-510 covers the broadcast band from 540 to 1600 kilocycles. Since the scale is calibrated 54 to 160, the actual frequency of the station received is obtained by adding a zero to the dial calibration.

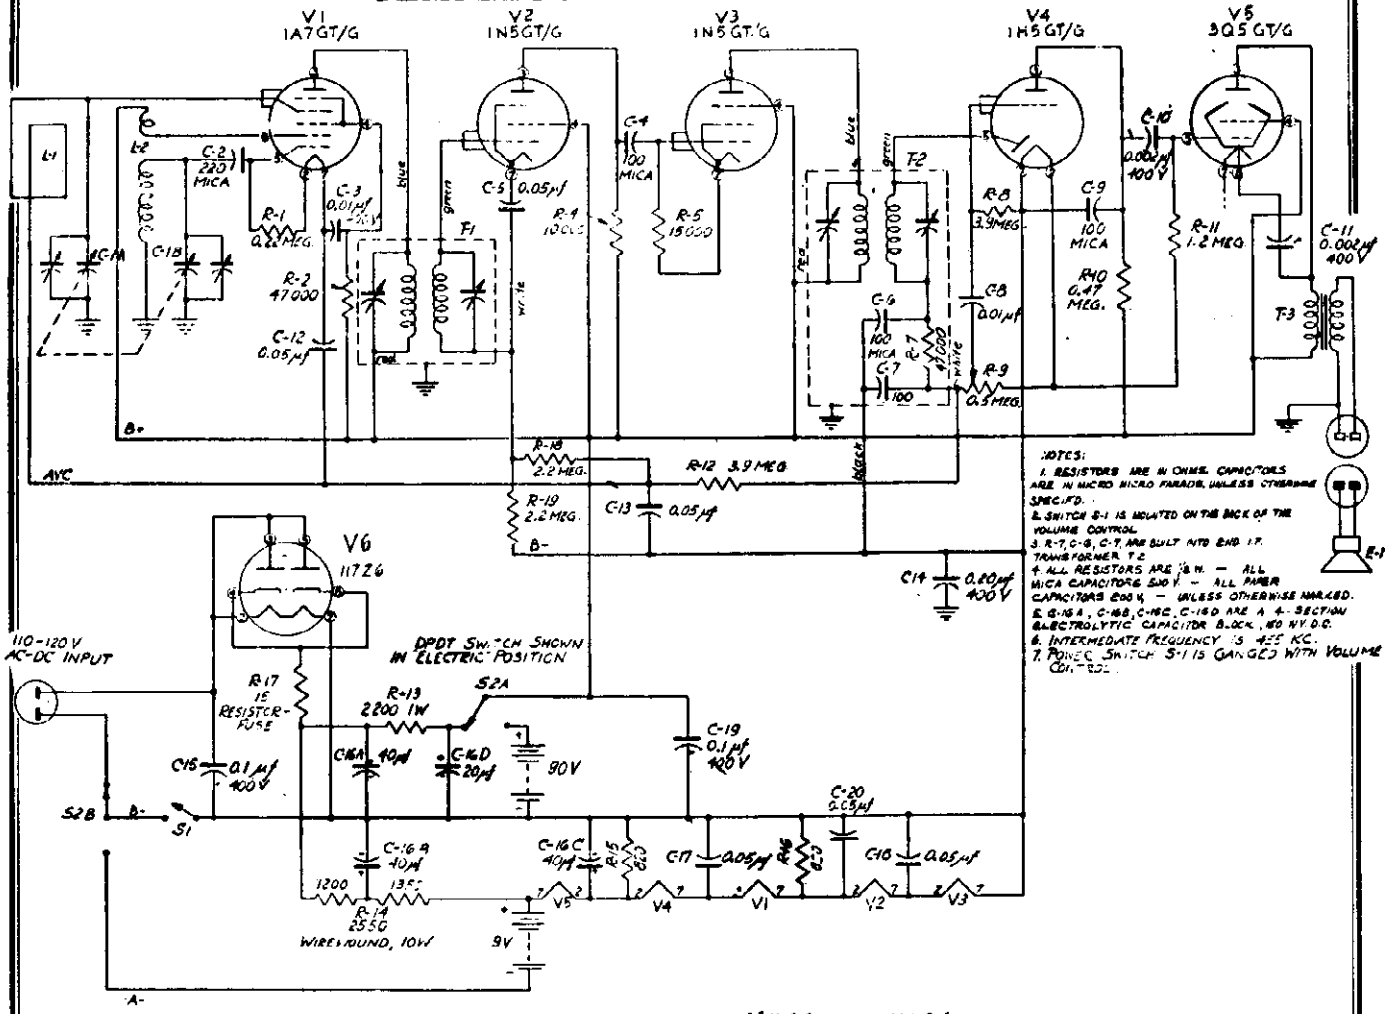
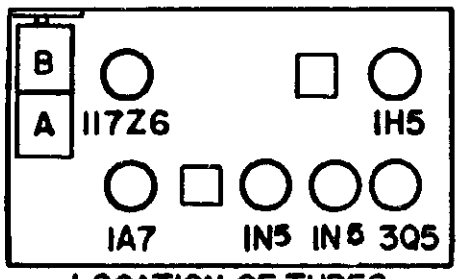
NOTES:

1. Resistors are in ohms; Capacitors are in mmf.
2. Volume control R-4 is 0.5 megohms, with switch S-1 mounted on rear.
3. In some production runs C-12D is a seperate 20 mmf. 25V capacitor and C-12A is 6mf., C12B is 40 mf., C12C is 20mf.
4. Phonograph volume control R-12A is 0.5 megohms, with switch S-3 mounted on rear.

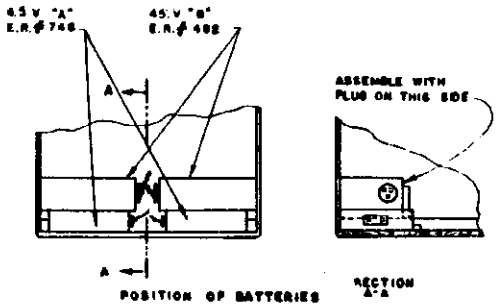
MODEL F-611

TEMPLETONE RADIO MFG. CORP.





LOCATION OF TUBES

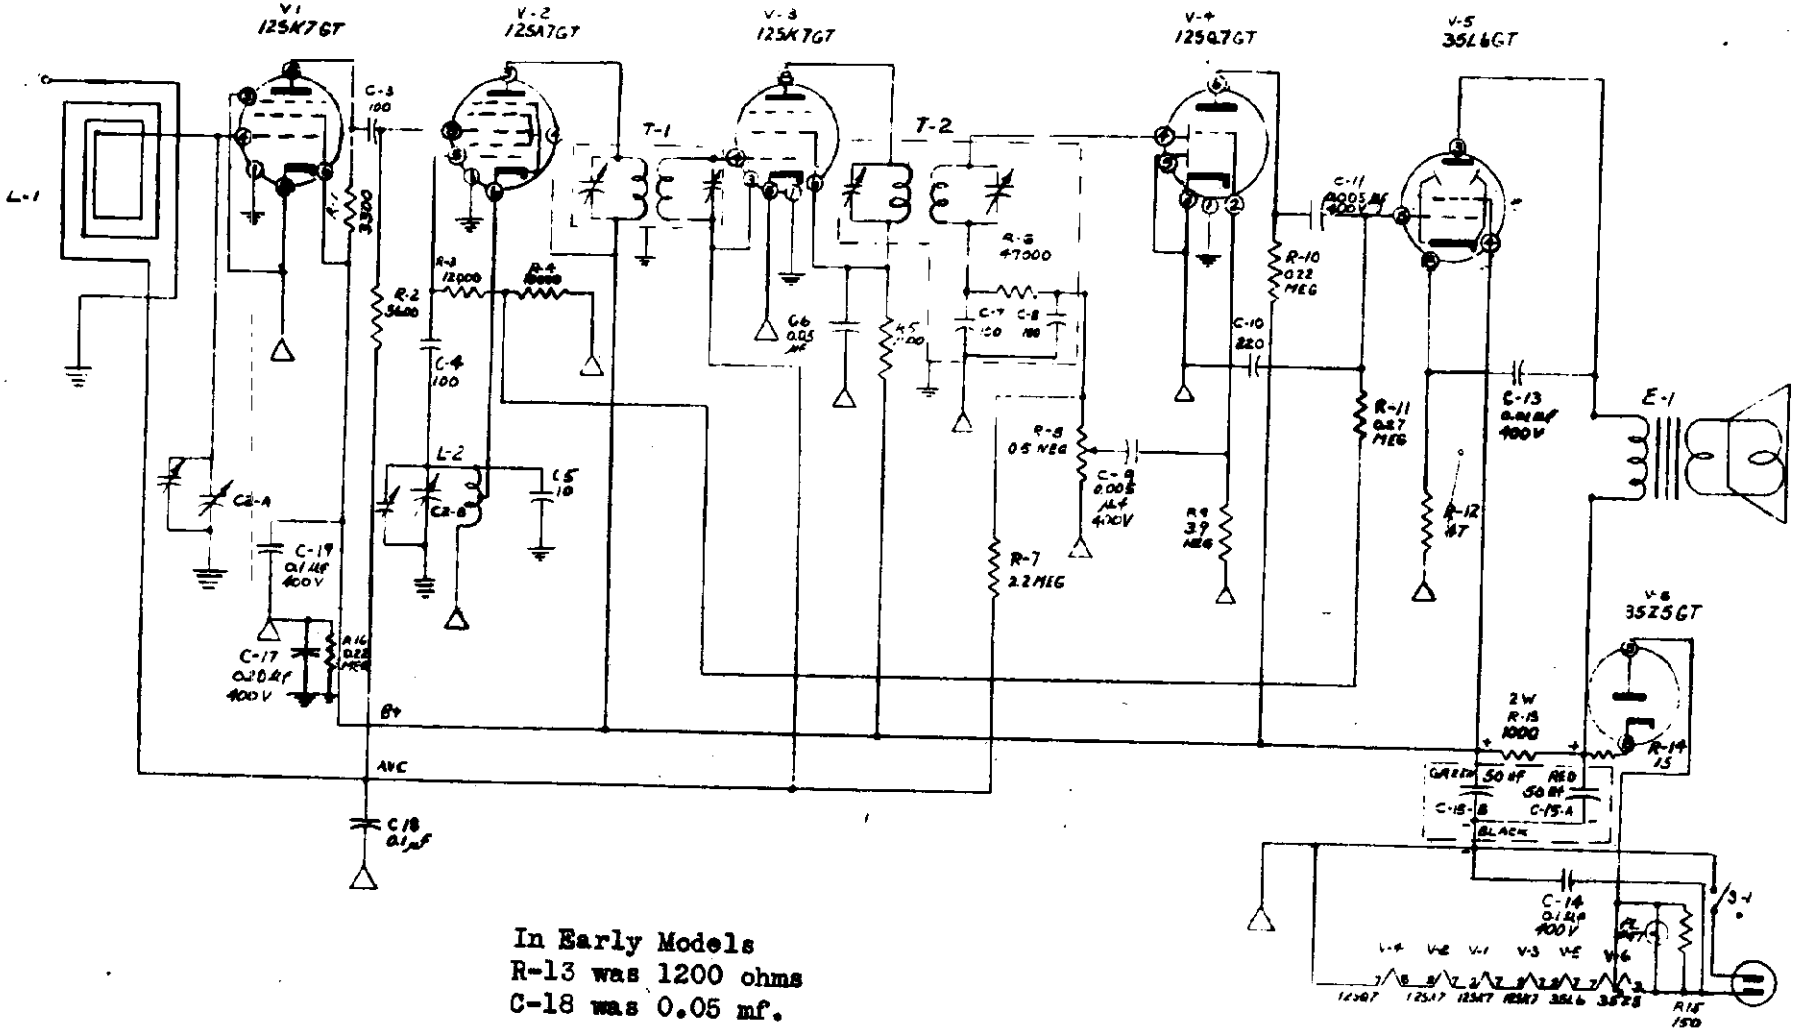


Alignment: No attempt should be made to realign this receiver until it has been determined that a poor tube, or some local condition is not responsible for faulty reception.

The Signal Generator may be connected through a 0.01 mf capacitor (used as dummy antenna) to the lug on RF section A of tuning capacitor. Connect ground clip of generator to a convenient B-minus point (such as the case of the electrolytic capacitor, or one of the switch terminals on the back of the volume control). An output meter may be clipped directly across the voice coil lugs. Align the I.F. trimmers to 455 kc, using least possible input from Signal Generator to avoid developing A.V.C. voltage which would make the tuning adjustments very broad.

To align RF trimmers, remove the 0.01 mf capacitor and connect the Signal Generator leads to two or three turns of heavy wire, forming a self-supporting loop of about 7 or 8 inches diameter, placed about a foot away from the receiver's loop antenna. Again, use the least possible input from the Signal Generator. With the tuning capacitor plates completely out of mesh, and pointer at extreme right end of travel, adjust the oscillator trimmer (B) (on front section of tuning capacitor) to 1700 kc. Readjust both Signal Generator and tuning capacitor to 1550 kc and adjust the RF trimmer (A) (on rear section) for maximum response.

For Parts list, see P.15-6



In Early Models
R-13 was 1200 ohms
C-18 was 0.05 mf.

NOTES
1 ALL RESISTORS 1/2 WATT ALL CAPACITORS 200V UNLESS OTHERWISE SPECIFIED
2. POWER SWITCH S-1 IS GANGED WITH VOLUME CONTROL R-8
3. I.F. FREQUENCY 455 KC

C-16 and ground connection have been removed frpm this model.

IF PEAK 455 KC

ALIGNMENT AND SERVICE DATA

Remove chassis from cabinet for alignment.

A Signal Generator is required having the following frequencies: 455 KC, 1400 KC, 1720 KC. An output meter should be connected across the speaker.

FIRST STEP: Connect the hot lead from the generator to the ANT. section of the gang condenser, through a .1 MFD condenser. The ground lead from the generator must be connected to the metal frame of the gang condenser. Turn the gang condenser to complete minimum capacity. Adjust the generator to 455KC and adjust the trimmers of the 1st and 2nd I.F. transformers until a maximum reading is noted on the output meter.

SECOND STEP: With the leads from the generator still connected in the same manner, adjust the Signal Generator to 1720 KC. The OSC. trimmer is located on the front of the chassis between the volume and tuning controls. Adjust this trimmer until the 1720 KC signal is tuned in.

THIRD STEP: Remove the hot lead of the generator from the ANT section of the gang condenser. Connect this lead to the antenna lead wire that projects from the back of the loop antenna through a 200 MMFD condenser. Adjust the Signal Generator to 1400 KC. Rotate the tuning control until this signal is tuned in. The ANT trimmer is located on the back of the loop antenna. Adjust this trimmer until a maximum reading is noted on the output meter. No further adjustment should be necessary, unless the set has been damaged, as the coils and condenser in this receiver have been specially handled at the factory to insure proper alignment at the lower frequencies.

Remove the chassis from the cabinet for alignment.

A signal generator is required, having the following frequencies: 455 KC, 1400 KC, 1730 KC. An output meter should be connected across the speaker.

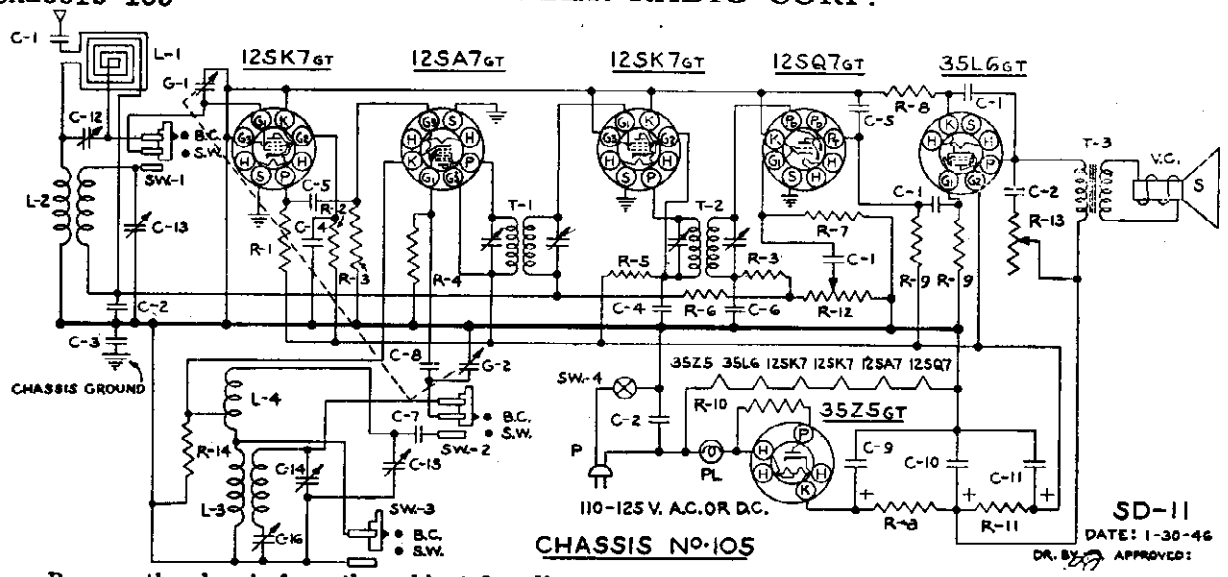
I. F. ALIGNMENT: — Connect the generator lead through a .1 MFD Condenser to the terminal lug on the "Antenna" section of the gang condenser. The ground lead from the generator should be connected to the gang frame. Set the generator at 455 KC. Adjust the trimmer screws in the 1st and 2nd I. F. cans (See Fig. 1) until a maximum reading is noted on the output meter.

The receiver volume control should be turned to maximum during the I. F. and all subsequent alignments, to keep the AVC from working and giving false readings. Keep the generator output as low as possible to prevent overloading.

BC. OR BROADCAST ALIGNMENT: — With the generator leads still connected as in I. F. Alignment, rotate the tuning condenser to complete minimum capacity. Set the generator to 1730 KC. Adjust the BC. oscillator trimmer until the signal is tuned in. Next remove the hot lead of the generator from the "Ant" section of the gang condenser. Connect this lead to the antenna lead wire that projects from the back of the loop antenna through a 200 MMFD condenser. Set the generator to 1400 KC and rotate the tuning condenser until the signal is tuned in. Adjust the BC. antenna trimmer until a maximum reading is noted on the output meter. Set the generator to 600 KC and turn the tuning control until the signal is tuned in. Rock the tuning control back and forth slowly and at the same time adjust the 600 KC pad, slowly to the right or left until a maximum reading is noted on the output meter. It is advisable to return to the 1730 KC adjustment and re-check that setting to make sure it has not changed while padding at 600 KC.

MODELS 5010, 5011, 5012
Chassis 105

TRAV-LER RADIO CORP.



Remove the chassis from the cabinet for alignment.

A signal generator is required, having the following frequencies: 455 KC, 1400 KC, 1730 KC. 6 MC, 16 MC, and 18.3 MC. An output meter should be connected across the speaker.

I. F. ALIGNMENT: — Connect the generator lead through a .1 MFD Condenser to the terminal lug on the "Antenna" section of the gang condenser. The ground lead from the generator should be connected to the gang frame. Set the generator at 455 KC. Adjust the trimmer screws in the 1st and 2nd I. F. cans (See Fig. 1) until a maximum reading is noted on the output meter.

The receiver volume control should be turned to maximum during the I. F. and all subsequent alignments, to keep the AVC from working and giving false readings. Keep the generator output as low as possible to prevent overloading.

BC. OR BROADCAST ALIGNMENT: — With the generator leads still connected as in I. F. Alignment, rotate the tuning condenser to complete minimum capacity. Set the generator to 1730 KC. Adjust the BC. oscillator trimmer until the signal is tuned in. Next remove the hot lead of the generator from the "Ant" section of the gang condenser. Connect this lead to the antenna lead wire that projects from the back of the loop antenna through a 200 MMFD condenser. Set the generator to 1400 KC and rotate the tuning condenser until the signal is tuned in. Adjust the BC. antenna trimmer until a maximum reading is noted on the output meter. Set the generator to 600 KC and turn the tuning control until the signal is tuned in. Rock the tuning control back and forth slowly and at the same time adjust the 600 KC pad, slowly to the right or left until a maximum reading is noted on the output meter. It is advisable to return to the 1730 KC adjustment and re-check that setting to make sure it has not changed while padding at 600 KC.

S. W. OR SHORT WAVE ALIGNMENT: — Set the generator at 18.3 MC. Turn the receiver band switch to short band position. Turn the tuning condenser to complete minimum capacity. The generator leads should be connected to the antenna lead wire that projects from the back of the loop antenna through a 400 Ohm resistor. Adjust the S. W. oscillator trimmer slowly until the 18.3 MC signal is tuned in. At this point, it will be well to make sure that the fundamental signal is turned in. Turn up the generator output and tune the receiver to approximately 17.3 MC. At this point the 18.3 MC signal will be heard again but much weaker. This is the image frequency. If the image is not heard, then turn the tuning condenser back to complete minimum and readjust the S. W. oscillator trimmer. Remember, the image must always be heard (at 2 times the I. F. frequency in KC) lower the frequency than the fundamental signal. After the oscillator has been properly set, tune the signal generator to 16 MC and rotate the tuning control until the signal is tuned in. Adjust the S.W. antenna trimmer until a maximum reading is noted on the output meter. It is advisable to rock the gang slowly while adjusting the antenna trimmer. Set the generator to 6 MC and tune the signal in on the receiver. Check the alignment at this frequency. No adjustment should be necessary as the coils have been carefully checked before leaving the factory. A fixed oscillator padding condenser is used at 6 MC.

DATE: 7-9-46 APPROVED:

Remove chassis from cabinet for alignment.

A Signal Generator is required having the following frequencies: 455 KC, 1400 KC, 1720 KC. An output meter should be connected across the speaker.

FIRST STEP: Connect the hot lead from the generator to the ANT. section of the gang condenser, through a .1 MFD condenser. The ground lead from the generator must be connected to the metal frame of the gang condenser. Turn the gang condenser to complete minimum capacity. Adjust the generator to 455KC and adjust the trimmers of the 1st and 2nd I.F. transformers until a maximum reading is noted on the output meter.

SECOND STEP: With the leads from the generator still connected in the same manner, adjust the Signal Generator to 1720 KC. The OSC. trimmer is located on the top of the oscillator section of the gang condenser. Adjust this trimmer until the 1720 KC signal is tuned in.

THIRD STEP: Remove the hot lead of the generator from the ANT section of the gang condenser. Connect this lead to the antenna lead wire that projects from the back of the loop antenna through a 200 MMFD condenser. Adjust the Signal Generator to 1400 KC. Rotate the tuning control until this signal is tuned in. The ANT trimmer is located on the back of the loop antenna. Adjust this trimmer until a maximum reading is noted on the output meter. No further adjustment should be necessary, unless the set has been damaged, as the coils and condenser in this receiver have been specially handled at the factory to insure proper alignment at the lower frequencies.

ALIGNMENT PROCEDURE

The following equipment is necessary to properly align this chassis:

1. A signal generator which will provide an accurately calibrated signal at the frequencies listed.
2. An output meter.
3. A non-metallic screwdriver.
4. Dummy antenna: — .1 mfd. — 200 mmf. — 400 ohms

ALIGNMENT PROCEDURE

The following equipment is necessary to properly align this chassis:

1. A signal generator which will provide an accurately calibrated signal at the frequencies listed.
2. An output meter.
3. A non-metallic screwdriver.
4. Dummy antenna: — .1 mfd., — RMA loop.

NOTE: Intermediate Frequency and Oscillator adjustments may be made with the loop disconnected provided a resistor of 10,000 to 50,000 ohms is substituted to close the 12SA7GT grid circuit. The loop alignment must be done with the loop and chassis mounted in operating position in the cabinet. A single turn loosely coupled to loop may be substituted for RMA loop.

GENERATOR	CONNECTION AT RADIO	DUMMY ANTENNA	DIAL	TO TUNE TRIMMERS	REMARKS

ALIGNMENT PROCEDURE

CAUTION: This is an A.C./D. C. receiver and when aligning the set it is necessary to isolate the Signal Generator or the receiver from the line by use of a transformer, or place a .2 MFD. condenser in both test leads of the Signal Generator.

Connect the Signal Generator through a .1 MFD. condenser to the variable condenser side of the loop. Connect the ground side of the Signal Generator to the chassis. Adjust the Signal Generator to 455 Kilocycles and set the variable condenser of the receiver to minimum capacity (fully opened). With volume control full on and minimum output from the Signal Generator adjust the two trimmers on top of the 1st and 2nd I.F. transformers (T3-T4) for maximum output. Now connect the Signal Generator through a .00025 condenser to the external antenna connection on the back of the loop. Connect ground side of Signal Generator to terminal marked "G" on back of loop. Adjust frequency to 1630 K. C., set variable condenser at minimum capacity (fully opened) and adjust the oscillator trimmer (C11) for maximum output. Set Signal Generator to 1400 K.C., tune receiver to signal and adjust the Antenna trimmer (C12) on top of the variable condenser for maximum output.

TUBE SOCKETS ARE VIEWED FROM UNDERSIDE OF CHASSIS
VOLTAGE READINGS INDICATED AT SOCKET TERMINAL ARE TO CHASSIS WITH 1000 OHM PER VOLT METER, WITH NO SIGNAL APPLIED TO SET. LINE VOLTAGE 117 V.
WHERE NO VOLTAGE IS SHOWN, (T) INDICATES ZERO VOLTAGE OR A VERY LOW READING
ALIGNMENT IS TO BE MADE AT THE FREQUENCY SHOWN AT EACH TRIMMER CONDENSER
CAPACITY VALUES ARE IN MICROFARADS

* ON AUTOMATIC RECORD CHANGER MODEL, THE MOTOR SWITCH IS PART OF THE RECORD CHANGER

* In later sets, C9A changed to a single 40-µf, 150-v condenser, Part No. A-18-280 and C9B changed to a single 20-µf, 150-v condenser, Part No. A-18-272.

CAUTION: This is an A.C./D. C. receiver and when aligning the set it is necessary to isolate the Signal Generator or the receiver from the line by use of a transformer, or place a .2 MFD. condenser in both test leads of the Signal Generator.

Connect the Signal Generator through a .1 MFD. condenser to the variable condenser side of the loop. Connect the ground side of the Signal Generator to the chassis. Adjust the Signal Generator to 455 Kilocycles and set the variable condenser of the receiver to minimum capacity (fully opened). With volume control full on and minimum output from the Signal Generator adjust the two trimmers on top of the 1st and 2nd I.F. transformers (T3-T4) for maximum output. Now connect the Signal Generator through a .00025 condenser to the external antenna connection on the back of the loop. Connect ground side of Signal Generator to terminal marked "G" on back of loop. Adjust frequency to 1630 K. C., set variable condenser at minimum capacity (fully opened) and adjust the oscillator trimmer (C11) for maximum output. Set Signal Generator to 1400 K.C., tune receiver to signal and adjust the Antenna trimmer (C12) on top of the variable condenser for maximum output.

	A83-279	Retainer, dial scale left
	A83-280	Retainer, dial scale right
	A83-273	Dial diffusing plate

The alignment should be made with volume control fully on, and the output from the signal generator as low as possible, to prevent A.V.C. action from interfering with correct alignment.

With the output meter connected across the voice coil of the speaker, the output meter reading for 50 milliwatts is .4 volts using a signal which is modulated 400 c.p.s.

Adjust all trimmers for maximum output. Repeat alignment procedure given below as a final check.

CAUTION: This is an A.C.-D.C. receiver and when aligning the set it is necessary to isolate the Signal Generator or the Receiver from the line by use of a transformer, or place a .2 MFD. condenser in both test leads of the Signal Generator.

ALIGNMENT PROCEDURE

With an output meter connected across the voice coil of the speaker, the output meter reading for 50 milliwatts is .4 volts using a signal which is modulated 30% at 400 c.p.s. Follow through the procedure as outlined below for proper alignment.

Connect the signal generator to the grid cap of the 1A7 GT Tube through a .1 MFD. Condenser. Connect the ground lead of the generator to the chassis. Adjust the signal generator to 455 K.C. and set the variable condenser of the receiver to minimum capacity (fully opened). With the volume control full on and minimum output from the signal generator adjust the two trimmers on top of the first and second I.F. transformers for maximum output.

Now connect the signal generator to the antenna connection of the receiver through a .00025 condenser. Adjust the signal generator frequency to 1725 K. C. and set the variable condenser to minimum capacity (fully opened), and adjust the oscillator trimmer (C1B) for maximum output. Set signal generator to 1500 K. C. and tune receiver to signal. Adjust the antenna trimmer (C1A) on the variable condenser for maximum output.

Code	Part No.	DESCRIPTION

ALIGNMENT PROCEDURE

I.F. ALIGNMENT – SWING THE VARIABLE CONDENSER TO MINIMUM CAPACITY POSITION. FEED 455 K.C. SIGNAL TO GRID OF 12SA7 TUBE THRU .1 MFD CONDENSER AND ADJUST FOUR I.F. TRIMMERS FOR MAXIMUM RESPONSE.

R.F. ALIGNMENT – SET DIAL POINTER TO 1400 K.C. ON DIAL. SET SIGNAL GENERATOR TO 1400 K.C. FEEDING OUTPUT INTO STANDARD RADIATING LOOP. ADJUST HIGH FREQUENCY TRIMMER FOR MAXIMUM OUTPUT THEN ADJUST ANT. TRIMMER LOCATED ON RECEIVER LOOP FOR MAXIMUM OUTPUT.

SET SIGNAL GENERATOR TO 600 K.C. AND WHILE ROCKING GANG, ADJUST LOW FREQUENCY TRIMMER FOR MAXIMUM OUTPUT, RETURN TO 1400 K.C. AND REPEAT HIGH FREQUENCY ADJUSTMENT.

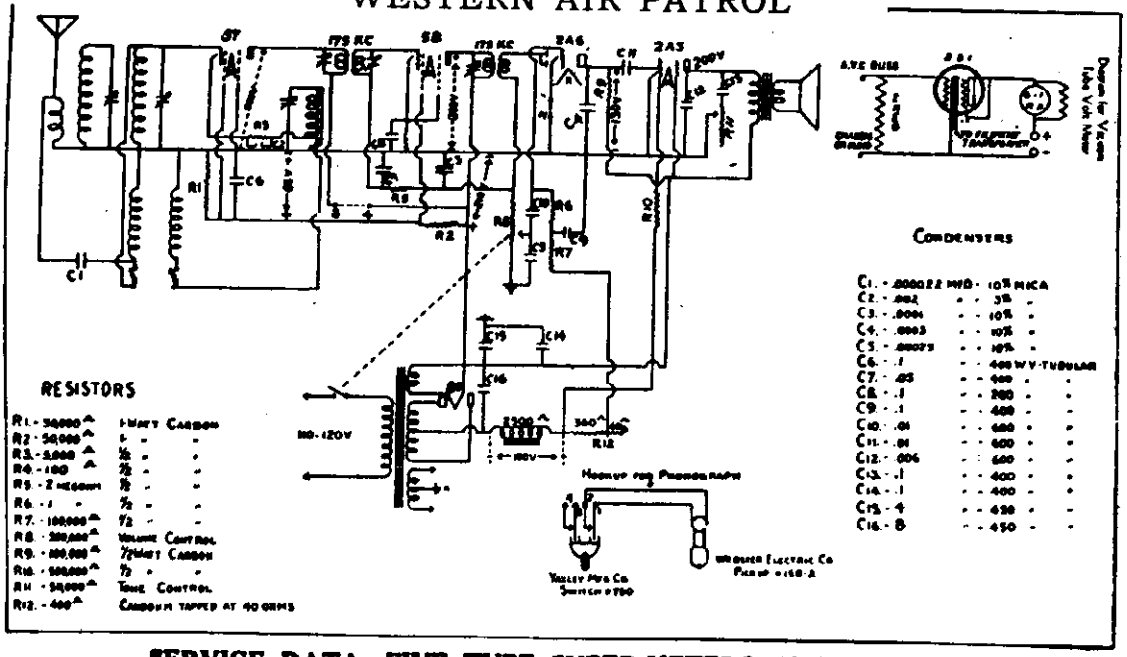
MODEL 5-Tube
Super. '34-'35

WESTERN AIR PATROL



SERVICE DATA, FIVE TUBE SUPER-HETERODYNE, 1934-1935

All models have automatic volume control of the diode type, controlling the first detector as well as the high frequency amplifier tubes. This A.V.C. makes it impossible to service and rebalance without a meter of the type to be described. This meter will work on any make or type of A.V.C., provided care is used. It can not be damaged by improper connection of the leads.

PARTS REQUIRED FOR VACUUM TUBE VOLT METER

1—0 to 1 or 0 to 1.5 milliammeter.
1—Bell ringing transformer with secondary of 6-10 volts.
1—5 prong socket.
1—551 tube.
1—2 megohn grid leak.
1—10 ohm rheostat.
1—45 volt B battery.
Clips, Box, Cord, Hookup Wire.

USING VACUUM TUBE VOLT METER

The cathode clip is connected to the cathodes of the tubes controlled by the A.V.C. The buss clip is connected to the A.V.C. buss in front of the isolating resistor.

Adjust rheostat shunt until meter shows full scale reading.

All balancing is done with maximum peak indicated by the meter swing toward 0. Sensitivity of various receivers can be checked by the swing of meter from a known station. Short Wave fading can be seen by tuning in the station with meter connected to set.

REBALANCING

Do not rebalance a set until you are sure it requires it. 99 per cent of the sets do not need it. We do not find one case in one hundred that really should be rebalanced.

INTERMEDIATES

Connect a 175 K.C. oscillator to the first detector grid (No. 57 tube) leaving grid cap in place. Set dial at 1400 K.C. Hook up vacuum tube volt meter as described and carefully adjust 3 screws on top of Intermediates for maximum gain (minimum reading of meter). Don't flat top any stages. Have all shields in place. Keep volume control at lowest level.

CONDENSER GANG

Set dial at 1400 K.C. when gang is at minimum position and tighten dial set screws. Tune in a station (or use an oscillator) to a known frequency signal around 1400 K.C. Carefully adjust oscillator section of gang until frequency is correct on dial.

If the intermediates are balanced on 175 K.C., the dial will now track within 5 K.C. over the entire dial.

Adjust first detector section for maximum gain and follow by adjusting band pass trimmers.

Don't bend any condenser plates unless absolutely necessary.

OVERLOADING—OR POOR QUALITY AT LOW VOLUME

The chief cause of this trouble is too long an antenna. A powerful local station will cause the R. F. tubes to block. Check this by disconnecting the antenna on the station causing the trouble. If too close to a powerful station, installing a switch in the aerial circuit helps this. In rare cases the set seems to overload and the A.V.C. works too quickly on all stations.

Check the following:

Disconnect 2 meg. resistor from A.V.C. buss at tie point. Have all tubes cold. Use high voltage, high resistance ohmmeter capable of reading 25 megohms and test from ground to A.V.C. buss for leakage. After condensers have charged, no leakage should be shown. This must read around 100 megohms to ground.

If slight leakage is observed, disconnect bypass condensers from buss until defective one is found. Sometimes moisture is found on coil terminals. Scrape this clear.

NOISY OPERATION (Not Static)

A defective tube will cause a sharp 60 cycle R.F. pickup. This is most prominent on low frequency. Replace with a good tube.

In many cases it is found that the noise cannot be eliminated by servicing the receiver. Noise may enter into the light lines or via the antenna. The only way to check the source is to turn off one after another all electrical apparatus in the vicinity of the set.

There is no freak or trick antenna that will eliminate natural static.

GENERAL

All resistors, bypass condensers and filter units are marked.

Voltages are shown at tube socket on diagram.

99 per cent of trouble in a chassis is caused by defective tubes, check them carefully.

WESTERN AUTO SUPPLY CO.

MODEL D1645

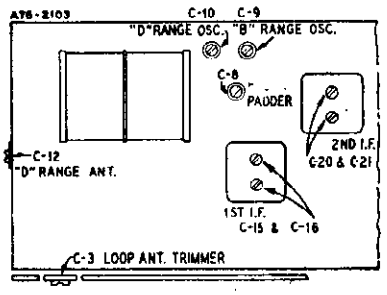
ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.
Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.
Allow Chassis and Signal Generator to "Heat Up" for several minutes.

The following equipment is required for aligning: An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed. Output Indicating Meter—Non-Metallic Screwdriver. Dummy Antennas—.1 mf., 100 mmf., and 400 ohms.

	SIGNAL GENERATOR FREQUENCY SETTING	CONNECTION AT RADIO	DUMMY ANTENNA	BAND SWITCH SETTING	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM
I.F.	455 KC	Grid of 6SA7 Pin 8	.1 mf.	B Range	Turn Rotor to Full Open	1st I.F. (C15) & (C16) 2nd I.F. (C20) & (C21)
RANGE B	1620 KC	Antenna Lead	100 mmf.	B Range	Turn Rotor to Full Open	Oscillator Range B (C9)
	1400 KC	Antenna Lead	100 mmf.	B Range	Tune Rotor to Max. Output	Ant. Range B (C3)
	600 KC	Antenna Lead	100 mmf.	B Range	Tune Rotor to Max. Output	Oscillator (C8) See Note B
	Repeat above steps at 1620 and 600 KC until readjusting the oscillator Range B Trimmer (C8) causes no further improvement of output.					
RANGE D	15,600 KC	Antenna Lead	400 Ohm	D Range	Turn Rotor to Full Open	Oscillator Range D (C10)
	15,600 KC	Antenna Lead	400 Ohm	D Range	Turn Rotor to Full Open	Ant. Range D (C2)
LOOP RANGE B	Reassemble chassis in cabinet. 1400 KC	Antenna Lead	100 mmf.	B Range	Tune Rotor to Max. Output See Note A	Ant. Range B (C3)

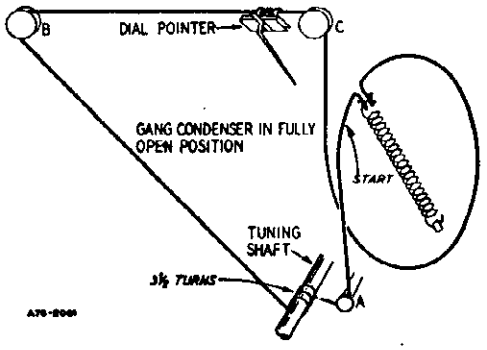


NOTE A—Set pointer at the 1400 KC mark on the dial scale. Attach pointer to drive cord.

NOTE B—Turn rotor back and forth and adjust the trimmer until peak of greatest intensity is obtained.

DRIVE CORD REPLACEMENT

The drive cord should be replaced as shown on the accompanying illustration using a 50" drive cord for the purpose. After the cord has been installed, stretch the tension spring and tie the free end of the cord to it, then cut off any excess string that may remain.



Before removing the chassis from the cabinet it will be necessary to detach the dial pointer from the dial string. To do this, spread the tabs on the pointer and pull the dial string off the pointer.

The dial lamp socket assemblies may be disengaged from the cabinet mounting by squeezing together and pulling away from the cabinet mounting, the spring bracket to which the dial lamp socket is mounted. Take care not to bend or damage the large drive pulley on the gang condenser while doing this.

When replacing the chassis in the cabinet it will be necessary to tune in a station of a known frequency and move the dial pointer until that frequency is indicated on the dial and then attach the pointer to the dial string. Take care not to scuff or cut the dial string or bend the pointer during this operation.

MODELS D2610, D2611

REPLACEMENT PARTS LIST

When ordering parts mention part number, model number, and series

Schematic Diagram Symbol	Part No.	Description
		CONDENSERS
C1		See "Antenna plate" under "Miscellaneous"

*The values of all resistors listed above are based on RMA standards. Due to conditions beyond our control some receivers have been shipped with resistors of pre-standardized values. This receiver will operate equally well with resistors of either group. An illustration of the difference follows:

Pre-standardized value—50,000 ohms, ±10%, 1/3 watt
RMA value—47,000 ohms, ±10%, 1/2 watt

NOTE ON TUBE REPLACEMENT

Replace a defective metal 12SK7 tube with another metal tube. Replace a glass 12SK7 tube with either a metal tube or with an exact duplicate of the tube now in the set.

		DIAL PARTS
	112822	Dial scale
	112824	Crystal for dial scale

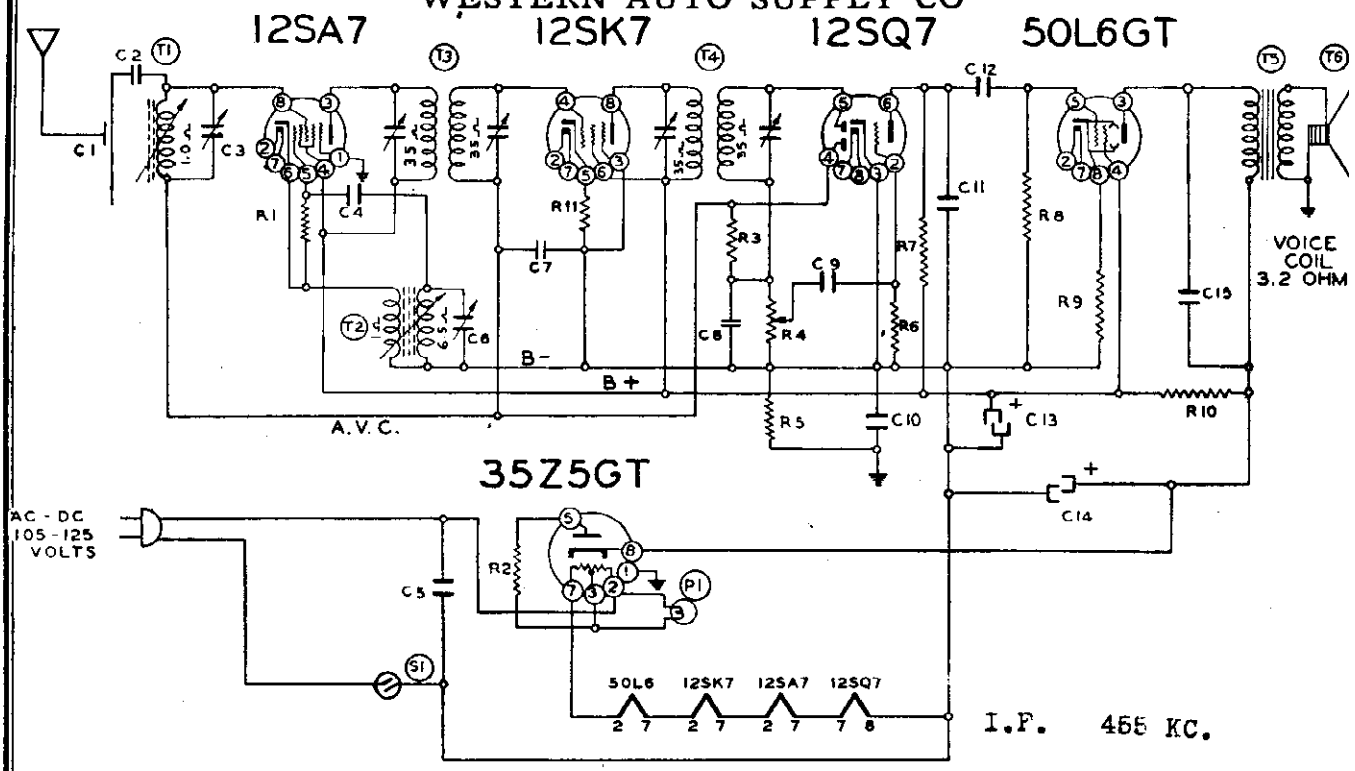
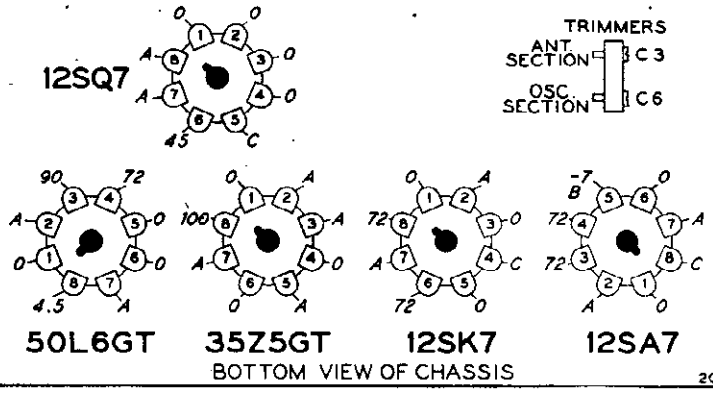
We cannot supply speaker cones or fields separately. We can replace or repair a damaged speaker if it is returned to our factory, transportation charges prepaid.

WESTERN AUTO SUPPLY COMPANY

WESTERN AUTO SUPPLY CO



NOTES - VOLTAGES MEASURED WITH A 1000-OHM-PER-VOLT VOLTMETER BETWEEN SOCKET TERMINALS AND NEGATIVE B SUPPLY.
A - CANNOT BE MEASURED WITH VOLTMETER.
B - OSCILLATOR VOLTAGE MEASURED WITH R.F. CHOKE IN SERIES WITH VOLTMETER LEAD.
C - DIODE VOLTAGE, LESS THAN ONE VOLT NEGATIVE, CANNOT BE MEASURED ACCURATELY.



Voltages at tube sockets

Technical Data

Tuning Range	535 to 1720 kc.
Intermediate Freq.	455 kc.
Power Consumption	35 watts
Sensitivity (for 0.05 watt output	60 microvolts average
Selectivity	80 kc. at 1000 time signal at 1000 k
Power Output(in voice coil)	
Undistorted	0.8 watt
Maximum	1.2 watt

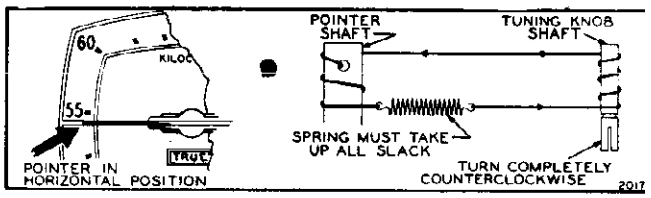
REPLACING DIAL STRING (See Illustration)

1. Rotate the tuning shaft to its extreme counter-clockwise position (rotors completely closed).

2. Tie one end of the string to the tension spring. Wind the string around the pointer shaft, passing it through the hole, and around the tuning knob shaft as shown. The direction of winding and the number of turns must be exactly as illustrated. IMPORTANT: When the installation is complete, and when the condenser rotors are closed, the spring should be close to the pointer shaft.

3. Tie the other end of the string to the spring, first stretching the spring so that it will take up all slack.

4. Remove the crystal covering the face of the dial. Rotate the pointer, against the friction of the shaft, until it is in a horizontal position, as illustrated.



Dial string replacement

For Parts list, see P.15

ALIGNMENT PROCEDURE

- No aligning adjustments should be attempted until all other possible causes of trouble have been checked.
- Turn volume control to maximum for all adjustments.
- Connect ground post of signal generator to B— of radio through a 0.1 mfd. condenser.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.

Band	Signal Generator Frequency Setting	Dummy Antenna	Connection to Radio	Position of Iron Cores (Dial Setting)	Trimmers Adjusted (in order shown)	Adjustment
I.F.	455 Kc.	.1 mfd.	Grid of 12SA7	All the way out	Two trimmers on top of output I.F. can	Adjust for maximum output
	455 Kc.	.1 mfd.	Grid of 12SA7	All the way out	Two trimmers on top of input I.F. can	Adjust for maximum output
BROADCAST	1720 Kc.	.1 mfd.	Grid of 12SA7	All the way out	Oscillator trimmer C6 (see chassis view, page 2)	Adjust for maximum output
	1720 Kc.	200 mmf.	Outside Antenna Clip	All the way out	Antenna trimmer C3 (see chassis view, page 2)	Adjust for maximum output
	1400 Kc.	200 mmf.	Outside Antenna Clip	Turn dial to 1400 Kc.	Adjust position of antenna coil	Adjust for maximum output (see coil view below)
	1720 Kc.	200 mmf.	Outside Antenna Clip	Turn dial to 1720 Kc.	Antenna trimmer C3 (see chassis view, page 2)	Check for tracking (see note below)

NOTE: After the antenna coil has been tracked at 1400 Kc. it is necessary to check the adjustment of antenna trimmer C3 again at 1720 Kc. If no appreciable change in trimmer adjustment is necessary, the coil is in track. If the trimmer requires considerable adjustment, it will be necessary again to adjust the position of the antenna coil at 1400 Kc. These two adjustments should be made several times, until no change of trimmer adjustment is required at 1720 Kc.

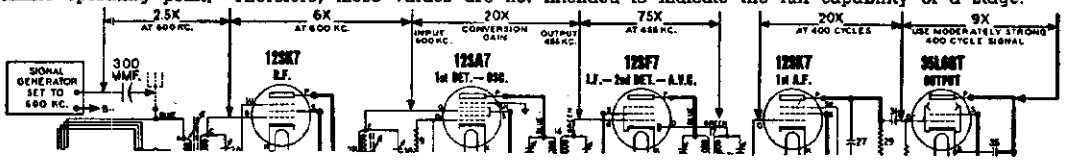
504214

APPROXIMATE STAGE GAIN DATA

Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe following precautions:

1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes.)
2. For R.F. and I.F. measurements connect negative terminal of a 3 volt battery (two 1½ volt cells in series) to A.V.C. lead and positive terminal to B—. This provides a definite operating point. IMPORTANT: Disconnect battery when measuring audio stage gains.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
4. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 3 volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.

Lettered terminals in illustrations correspond to similarly lettered terminals on the circuit diagram.

MODEL D2612

WESTERN AUTO SUPPLY CO.

ALIGNMENT PROCEDURE

1. Remove chassis and loop from cabinet. Solder approximately 8" of insulated wire to any B— connection (see voltage chart on opposite side for convenient B— location). Then reinstall chassis and loop in cabinet. The B— lead should extend from under the chassis at the back.
2. Connect ground lead of signal generator to B— lead.
3. Connect output meter across the speaker voice coil (terminals at back of speaker.)
4. Turn the tuning control knob clockwise as far as it will go (tuner mechanism is now in maximum open position with tuning slugs almost completely withdrawn from coils). Dial pointer should then point to 1600 Kc mark on scale. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.
5. Set volume control at maximum volume position and use a weak signal from the signal generator.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF GENERATOR TO	SIGNAL GENERATOR FREQUENCY	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
Set tuner mechanism to maximum open position by turning the tuning control knob clockwise as far as it will go (Dial pointer at 1600 Kc). Then check whether the positions of the tuning slugs correspond to the positions shown in Fig. 1 below. If settings are incorrect, rotate the individual core and threaded stem until desired position is reached. Note that threaded stem is prevented from moving by a dab of speaker cement at top.						
.1 MFD. Condenser	Ungrounded terminal of trimmer No. 6 (see Fig. 2 below for location of trimmer.)	455 KC	Any point where it does not affect the signal.	1-2	2nd I.F.	Adjust for maximum output. Then repeat adjustment.
				3-4	1st I.F.

300 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1600 KC	Tune to 1600 KC generator signal	6	Broadcast R.F.	Adjust for maximum output.
				7	Broadcast Antenna	Adjust for maximum output.
300 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1400 KC	Tune to 1400 KC generator signal	Ant. coil tuning slug		Adjust position of slug for maximum output.
				R.F. coil tuning slug		Adjust position of slug for maximum output.
300 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1600 KC	Tune to 1600 KC generator signal	6	Broadcast R.F.	Recheck adjustment for maximum output.
				7	Broadcast Antenna	Recheck adjustment for maximum output.
Apply a coating of speaker cement at top of each tuning core stem to prevent movement.						

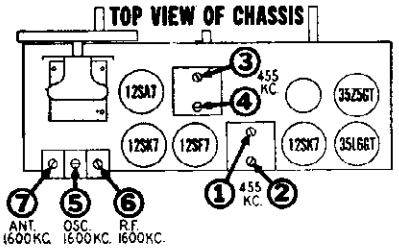

FIG. 2

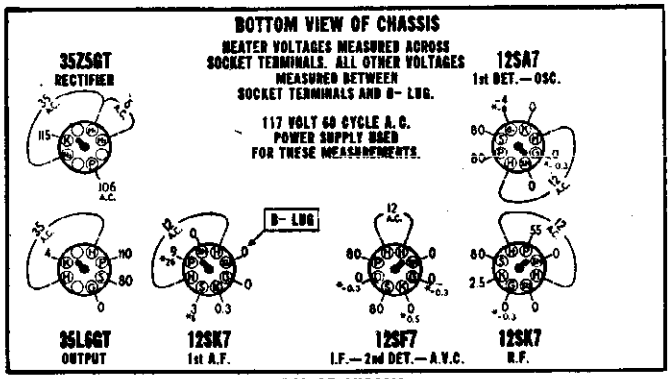
AUDIO OSCILLATION

The audio system of this receiver utilizes a two stage type of inverse feed-back arrangement and, should it ever be necessary to replace the speaker or output transformer, it is important to maintain a definite phase relationship in the feed-back circuit. If the connections to the output transformer are reversed or if the feed-back connection is made to the wrong side of the output transformer secondary, the system will become regenerative instead of degenerative. Under those conditions audio oscillation may result. If that occurs, oscillation may be prevented by reversing the connections to the secondary of the output transformer.

SOCKET VOLTAGES

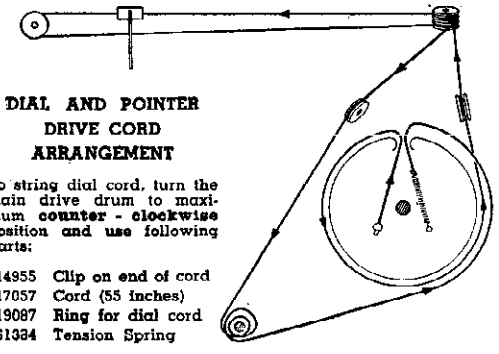
Measured with voltmeter having sensitivity of 1000 ohms per volt except where indicated by (*).

VOLUME ON FULL WITH NO SIGNAL — DIAL TUNED TO 540 KC.



REAR OF CHASSIS

*—Measured with vacuum tube voltmeter



DIAL AND POINTER DRIVE CORD ARRANGEMENT

To string dial cord, turn the main drive drum to maximum **counter - clockwise** position and use following parts:

114955	Clip on end of cord
117057	Cord (55 inches)
119087	Ring for dial cord
161384	Tension Spring

WESTERN AUTO SUPPLY CO.
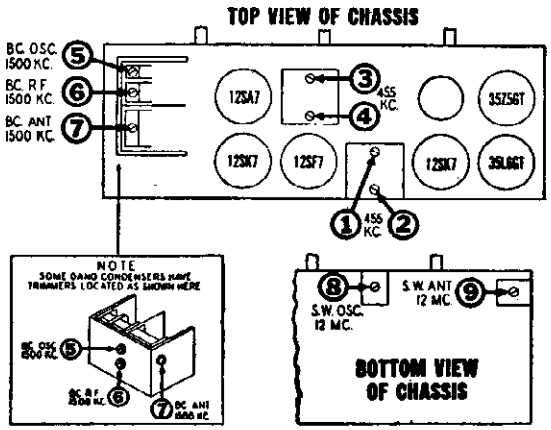
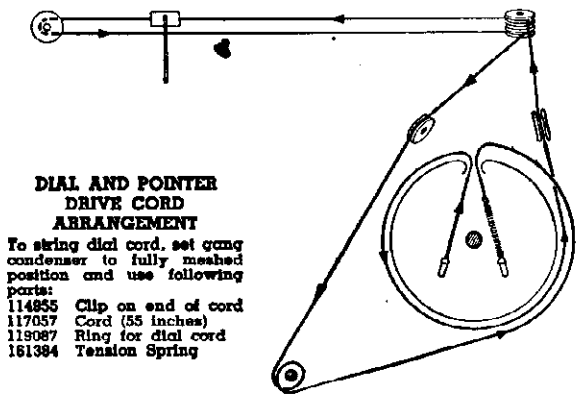
ALIGNMENT PROCEDURE

1. Remove chassis and loop antenna from cabinet. Reconnect loop to chassis and space it approximately same distance from chassis as when installed in cabinet.
2. Note that there are four calibrating lines stamped into the metal dial frame. When gang condenser is fully meshed, dial pointer should be in the position indicated by first line at the left. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.
3. Connect an output meter across the speaker voice coil or from plate of 35L6GT tube to B— through a .1 Mfd. condenser (see voltage chart for convenient B— connection).
4. Connect ground lead from signal generator to B— through a .25 Mfd. condenser.
5. Set volume control at maximum volume position and use a weak signal from the signal generator.

IMPORTANT:—Align this receiver in exactly the order shown below. Broadcast band must be aligned before short wave band.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF GENERATOR TO	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
200 MMFD. Mica Condenser	Control Grid of 12SA7	455 KC	Broadcast	Any point where it does not affect the signal	1-2 3-4	2nd I.F. 1st I.F.	Adjust for maximum output. Then repeat adjustment.
200 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1500 KC	Broadcast	Set pointer to 1500 KC reference line stamped into metal dial plate (first line at the right)	5	Broadcast Oscillator (Shunt)	Adjust for maximum output.
200 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1500 KC	Broadcast	Tune to 1500 KC generator signal	6	Broadcast R.F.	Adjust for maximum output.
200 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1500 KC	Broadcast	Tune to 1500 KC generator signal	7	Broadcast Antenna	Adjust for maximum output.
400 OHM Resistor	External Antenna Clip on Loop Frame	12 MC	Short Wave	Set pointer to 12 MC. Reference line stamped into metal dial plate (second line from the right)	8	Short Wave Oscillator	Adjust to bring in signal. Check to see if proper peak was obtained by tuning in image at approx. 11.1 MC. If image does not appear, realign at 12 MC. with trimmer screw farther out. Recheck image.
400 OHM Resistor	External Antenna Clip on Loop Frame	12 MC	Short Wave	Tune to 12 MC generator signal	9	Short Wave Antenna	Adjust for maximum output. Try to increase output by detuning trimmer and retuning receiver dial until maximum output is obtained.





DIAL AND POINTER DRIVE CORD ARRANGEMENT

To string dial cord, set gang condenser to fully meshed position and use following parts:

114855 Clip on end of cord
117057 Cord (55 inches)
119087 Ring for dial cord
161384 Tension Spring

SOCKET VOLTAGES

Measured with voltmeter having sensitivity of 1000 ohms per volt except where indicated by (*).

2013

Voltages at tube socket terminals

IMPORTANT!

This receiver, unless otherwise marked, must be operated on an AC voltage of 105 to 125 volts, 50 to 60 cycles, or on a DC voltage of 105 to 125 volts. If you are in doubt as to the voltage of your power supply, consult your local power company. DO NOT INSERT THE PLUG IN THE POWER RECEPTACLE UNLESS YOU ARE SURE THAT THE CORRECT VOLTAGE IS AVAILABLE. Receivers of this same model which are for use on voltages other than those specified above are so marked.

SETTING THE PUSHBUTTONS

The pushbuttons may be used, after proper adjustment, for the automatic tuning of any six stations which you select. They can be set up in any order.

1. Turn on the radio. Allow it to warm up for at least one minute.
2. Push out the call letters of the six stations from the call-letter sheets supplied with this manual.
3. Insert one call-letter tab in the rectangular opening in each of the pushbuttons, in any sequence. Press an acetate tab (supplied in small envelope) into each of the pushbuttons.
4. Check to see that the locking screw in the center of the tuning knob (see illustration) is loose. If it is not, turn it several turns to the left (counterclockwise). A coin may be used for this purpose.
5. Press the first pushbutton down all the way. With one hand hold the button down firmly and with the other carefully tune in the desired station. Release the pushbutton.
6. Follow this procedure for each of the five other buttons adjusting each one for a different station.
7. Rotate the tuning knob on the side of the cabinet as far to the right as it will go. Tighten the locking screw in the center of the knob. IT IS IMPORTANT THAT THIS SCREW BE TIGHTENED VERY FIRMLY.
8. The pushbuttons are now properly set for automatic tuning. Any of the six stations may now be tuned in simply by pressing the proper button down as far as it will go. If it is desired to reset any of the buttons for a new station loosen the locking screw in the center of the tuning knob, set the pushbutton as described above, and re-tighten the locking screw.

Power consumption .....35 watts
Selectivity.....55 Kc. broad at 1000 times signal at 1000 Kc

MODEL D2615

WESTERN AUTO SUPPLY CO.
LIST OF REPLACEMENT PARTS

When ordering parts specify part number, model number, and series
Use Only Genuine Factory Replacement Parts

NOTE ON TUBE REPLACEMENT

Replace a defective metal 12SK7 tube with another metal tube. Replace a glass 12SK7 tube with either a metal tube or with an exact duplicate of the tube now in the set.

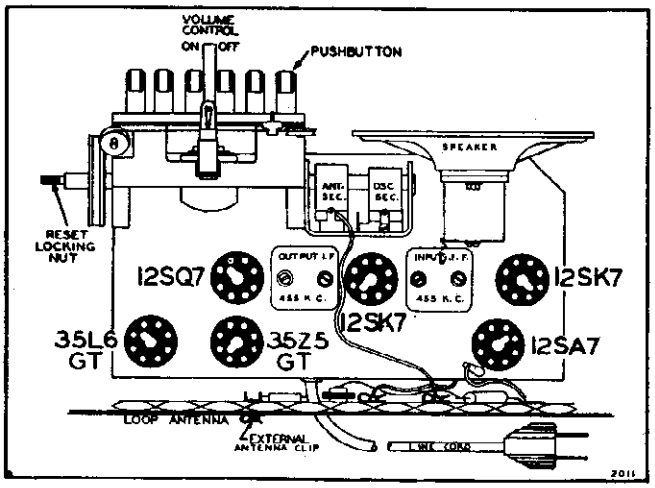
R2	A-9B1-50	100 ohms, ±10%, ½ watt
R4	A-9B1-70	4700 ohms, ±10%, ½ watt
R5	A-9B1-25	100,000 ohms, ±20%, ½ watt
R6	A-9B1-82	47,000 ohms, ±10%, ½ watt
R7	A-9B1-42	22 ohms, ±10%, ½ watt
R8	A-9B2-54	220 ohms, ±10%, 1 watt
R9	A-9B2-63	1200 ohms, ±10%, 1 watt
R10, R12	A-9B1-52	150 ohms, ±10%, ½ watt
R11	A-9B1-34	3.3 megohms, ±20%, ½ watt
R13	A-9B1-29	470,000 ohms, ±20%, ½ watt
R14	A-9B1-27	220,000 ohms, ±20%, ½ watt
R16	A-9B1-23	47,000 ohms, ±20%, ½ watt
R17	A-9B1-35	4.7 megohms, ±20%, ½ watt
		COILS
T1, T2	B-13E-10213	Loop antenna, complete with back and loading coil.
T3	A-13D-10215	Oscillator coil assembly, complete
T4	108140G	Input I.F. coil assembly, complete in can
T5	108145C	Output I.F. coil assembly, complete in can
		SPEAKER
T7	114191	5-inch P.M. speaker, with bracket
T6	10595B	Output transformer for speaker

*The values of all resistors listed above are based on RMA standards. Due to conditions beyond our control some receivers have been shipped with resistors of pre-standardized values. This receiver will operate equally well with resistors of either group. An illustration of the difference follows:
Pre-standardized value—50,000 ohms, ±10%, 1/3 watt
RMA value—47,000 ohms, ±10%, 1/2 watt

Sensitivity (0.05 watt output) ..... 10 microvolts ave.
Power output (in voice coil)
Undistorted ..... 1 watt
Maximum ..... 1.7 watts
Voice coil impedance ..... 3.2 ohms

Schematic Diagram Symbol	Part No.	Description
		DIAL AND TUNING PARTS
P1	107249	Pilot light bulb, 6-8 volts, type T-47
	107311	Socket assembly for pilot light
	112784	Station call letters, set of two sheets
	115448B	End plate for tuner assembly (end of chassis)
	115448D	End plate for tuner assembly (next to gang)
	115146	Cams (6 used on cam shaft)
	115143	Key washers (13 used on cam shaft)
	117528	Brass spacer (1 used on cam shaft)
	117602	Brass spacer (4 used on cam shaft)
	131181	Compression spring for locking collar
	117604	Locking collar
	117470	Brass spacer
	112746	Drive pulley
	117600	Lever shaft
	115361	Lever, assembled with cam roller
	120283	Return spring for lever
	117612	Stop rod for lever
	115543	Dial bracket with three pulleys
	112745	Pointer
	B-6D-10214	Dial scale, calibrated
	112744	Crystal, clear, to cover dial scale
	120285	Coil tension spring (inside of cam shaft string drum)
	117424	Locking screw, in center of tuning knob.
		MISCELLANEOUS
	121171	Tube sockets, 8-prong octal
R15, S1	101211	Volume control and on-off switch
C, C4, C7	B-8A-10212	Variable condenser, 2-gang
	10798D	Line cord and plug

We cannot supply speaker cones or fields separately. We can replace or repair a damaged speaker if it is returned to our factory, transportation charges prepaid.



Top view of chassis

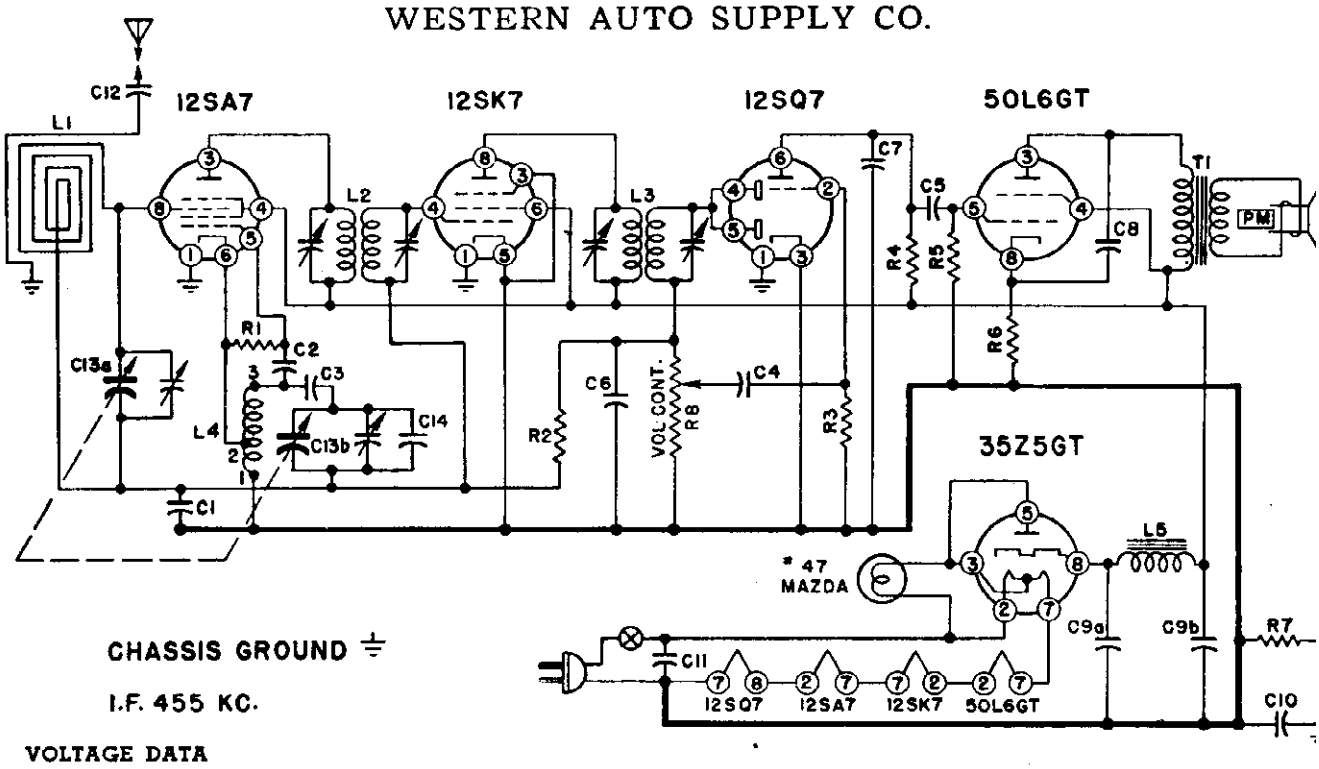
ALIGNMENT PROCEDURE

- No aligning adjustments should be attempted until all other possible causes of trouble have been checked.
- Chassis must be removed from cabinet for proper alignment. Slight adjustments of the oscillator and antenna circuits can be made, without removing the chassis, through two holes provided on the bottom of the cabinet. The two adjustment screws can be reached with a long insulated screwdriver.
- It is important that during alignment the loop antenna be maintained at the same distance from the chassis as when the chassis is installed in the cabinet.
- Turn volume control to maximum for all adjustments.
- Connect ground post of signal generator to B— of radio through a 0.1 mfd. condenser.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.

Band	Signal Generator Frequency Setting	Dummy Antenna	Connection to Radio	Tuning Condenser Setting	Adjust for maximum output (see chassis view)
I.F.	455 Kc.	.1 mfd.	Grid of 12SA7	Rotor full open (plates out of mesh)	4 trimmers on input and output I.F. transformers
Broadcast	1650 Kc.	.1 mfd.	Grid of 12SA7	Rotor full open (plates out of mesh)	Oscillator trimmer C7 on bottom of radio
	1400 Kc.	None	See note below	Set dial at 1400 Kc.	Antenna trimmer C2 on bottom of radio

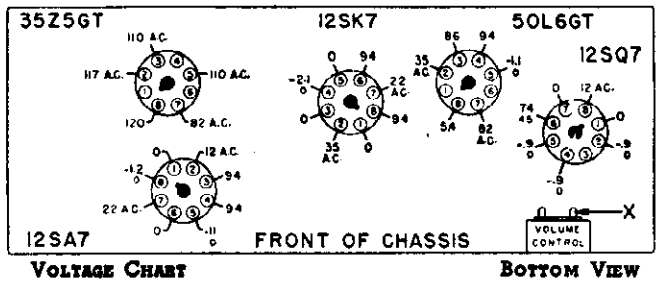
Note: Lay output lead of generator in back of loop antenna. Turn up generator output. Loop antenna will pick up energy.

WESTERN AUTO SUPPLY CO.



VOLTAGE DATA

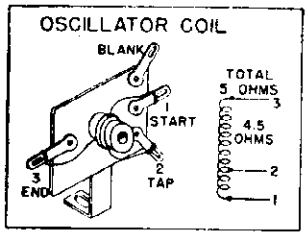
Voltages are measured from the socket terminals and the point marked "X" on the voltage chart. With the dial tuned to the low frequency end, no signal and the volume control set at maximum, a vacuum tube voltmeter was used for all readings. The A.C. line input was 117 volts A.C. for all measurements shown. Where use of a 1000 ohm per voltmeter would result in noticeably lower readings due to the increased drain of this type of instrument, a second reading is shown directly below the initial reading.

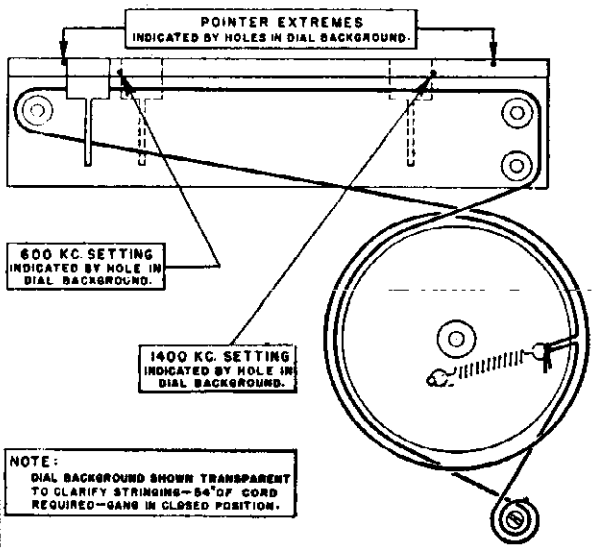


VOLTAGE CHART — BOTTOM VIEW

TRUETONE TUBES USED

12SA7—1st Det. Osc.
12SK7—I. F. Amplifier
12SQ7—2nd Det. — A. V. C. — 1st Audio
50L6 GT—Beam Power Output
35Z5 GT—Rectifier





POWER SUPPLY

This receiver is designed to operate from any AC (Alternating Current) power supply line of 110-120 volts, 50-60 cycles or DC (Direct Current) power supply line of 110-120 volts. If the receiver fails to operate after several minutes on DC, reverse the power line plug.

On AC only the line plug should be tried both ways and left in a position that gives minimum hum.

ALIGNING INSTRUCTIONS

All of the adjustments have been very carefully set with signal generators at the factory and require no further adjustment, unless it becomes necessary to replace a coil or transformer, or if the adjustments have been tampered with in the field. Under no circumstances attempt any adjustments without first making certain that adjustment is necessary and only after voltages, tubes and condensers have been checked and found to be normal. To properly re-align this receiver, a signal generator as well as an output meter, must be used. (See next page for full instructions.)

MODEL D2620

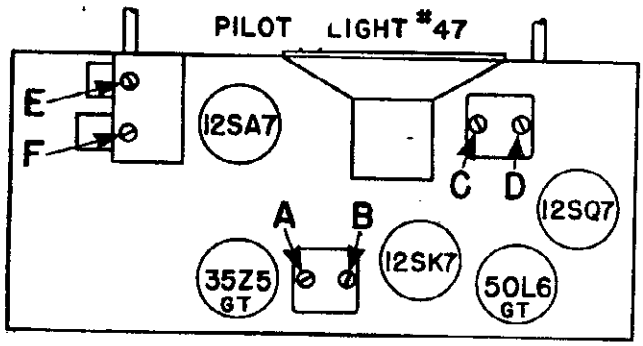
WESTERN AUTO SUPPLY CO.
ALIGNMENT PROCEDURE

- Volume control—Maximum all adjustments.
- Connect radio chassis to ground post of signal generator with a short heavy lead.
- Connect dummy antenna value in series with generator output lead, when needed (see below).
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

The following equipment is required for aligning:

- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
- Output indicating meter.
- Non-metallic screwdriver.

Dummy antenna—.1 mf.



BACK OF CHASSIS

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Variable Condenser Setting	Trimmers Adjusted (In Order Shown)	Trimmer Function	Adjustment
I. F.	455 KC.	.1 MFD.	Gang Condenser Ant. Stator	Rotor full open (Plates out of mesh)	C, D	Output I.F.	Adjust to maximum output
	455 KC.	.1 MFD.	Gang Condenser Ant. Stator	Rotor full open (Plates out of mesh)	A, B	Input I.F.	Adjust to maximum output
BROAD-CAST	1630 KC.	.1 MFD.	Gang Condenser Ant. Stator	Rotor full open (Plates out of mesh)	E gang-front	Oscillator	Adjust to maximum output
	1400 KC.	Inductive Coupling—Use a loop or place Gen. lead close to Rec. loop. No connection bet. Receiver and Generator		Set dial to tune in Generator Signal	F gang-rear	Antenna	Adjust to maximum output

This is all that is necessary for the alignment unless the plates of the gang have been bent out of shape. In case of bent plates, set the signal generator and receiver to 600 KC and bend the plates into the position for maximum output.

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC. After each band is completed, repeat the procedure as a final check.

Frequency Range—540 to 1630 K.C.

Intermediate Frequency 455 K.C. Power consumption 30 watts.

REPLACEMENT PARTS

PAPER CONDENSERS

Part No.	Symbol No.	Description
64B1-12	C-12	Condenser, Tubular .005 mfd. 600 V.
64B1-22	C-11	Condenser, Tubular .05 mfd. 400 V.
64B1-24	C-3, C-8	Condenser, Tubular .02 mfd. 400 V.
64B1-25	C-4, C-5	Condenser, Tubular .01 mfd. 400 V.
64B1-30	C-1	Condenser, Tubular .01 mfd. 200 V.
64A2-1	C-10	Condenser, Tubular .2 mfd. 900 V.

65B7-27	C-7	Condenser, Mica 500 mmf. ±20%

ELECTROLYTIC CONDENSERS

67A3	C-9a	30 mfd. 150 V.
	C-9b	50 mfd. 150 V.

RESISTORS

60B8-151	R-6	150 ohm ½ W. ±10%
60B8-223	R-1	22,000 ohm ½ W. ±10%
60B8-154	R-7	150,000 ohm ½ W. ±10%
60B8-224	R-4	220,000 ohm ½ W. ±10%
60B8-474	R-5	470,000 ohm ½ W. ±10%
60B8-105	R-2	1 meg ½ W. ±10%
60B8-106	R-3	10 meg ½ W. ±10%
75B1-6	R-8	1 meg Volume Control & Switch

TRANSFORMERS and COILS

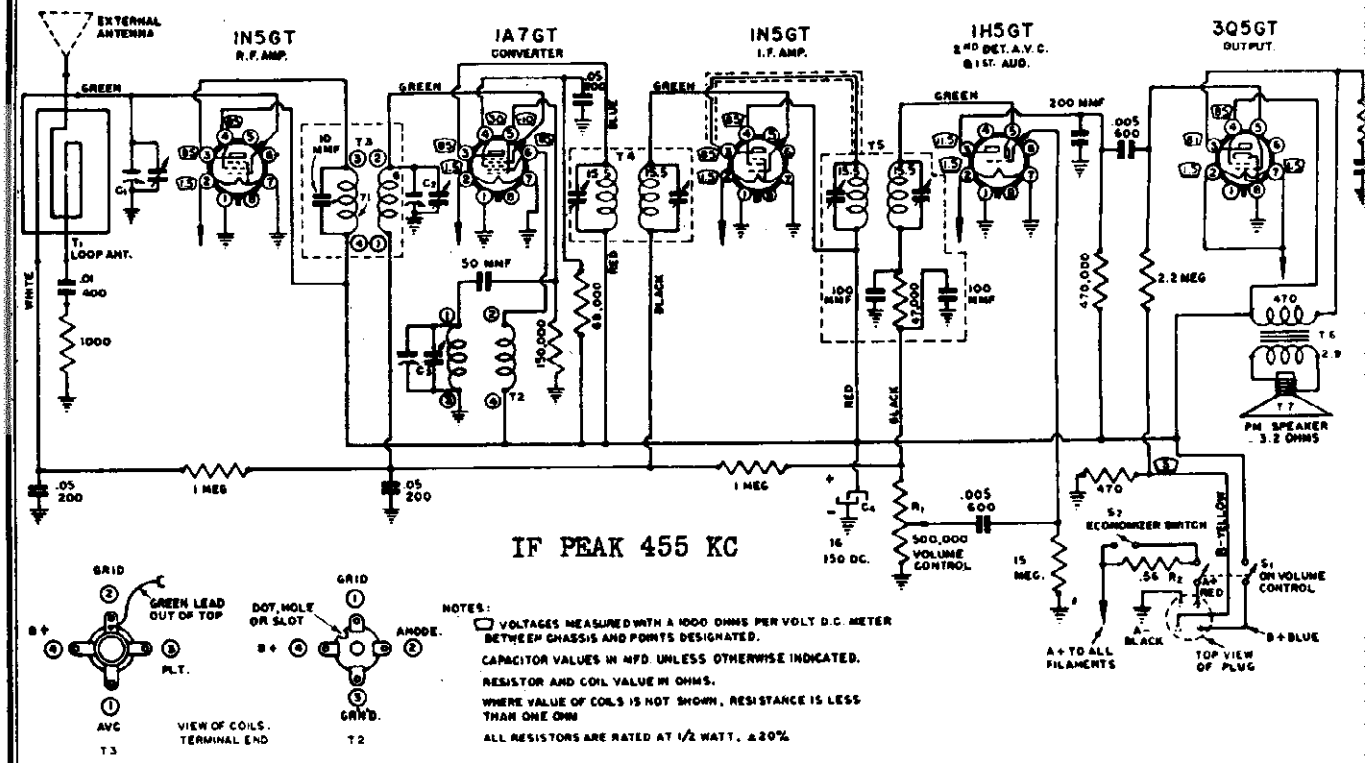
69B4	L-1	Antenna, Loop
72B3	L-2	Transformer, 1st I. F.
72B4	L-3	Transformer, 2nd I. F.
69A5	L-4	Oscillator, Coil
74A1	L-5	Choke Coil (Filter)
		Transformer, Output (Specify full part number of Speaker, including Mfg. Code when ordering)

MISCELLANEOUS (Alphabetical)

Part No.	Description
X22C3-1	Background, Dial
35C29	Cabinet (Wood) (D-2620)
43B17	Cover, Back
89A1	Cord, Line
50A1-1	Cord, Dial (54")
A10I2	Drum and Hub Assy., Dial
23A7-1	Escutcheon
12A1-2	Grommets, Rubber
33A10-2	Knob, Walnut
1A67-29-2	Mounting Bolts, 8-32x¾" lg.
81A1-8	Pilot Light #47
82A2-3	Pilot Light Socket & Leads
25A10-3	Pointer Slide
25A11-3	Pointer Clip
25A12-1	Pointer
17A1-3	Pulley, Fibre Dial
21B16	Scale, Glass Dial
28A1-1	Shaft, Tuning
13A1-4-47	Snap Buttons, (Cabinet Back)
87A10-2	Socket, Laminated Octal Tube
78B4-1	Speaker, 5" PM and Output Trans.
19A1-3	Spring, Dial Cord Tension

WESTERN AUTO SUPPLY CO. OF CAL.

MODEL 43-6451



NOTES:

- VOLTAGES MEASURED WITH A 1000 OHMS PER VOLT D.C. METER BETWEEN CHASSIS AND POINTS DESIGNATED.
- CAPACITOR VALUES IN MFD. UNLESS OTHERWISE INDICATED.
- RESISTOR AND COIL VALUE IN OHMS.
- WHERE VALUE OF COILS IS NOT SHOWN, RESISTANCE IS LESS THAN ONE OHM
- ALL RESISTORS ARE RATED AT 1/2 WATT, ±20%

SERVICE PARTS LIST MODEL 43-6451

Order Parts by Model No. and Part No.

Part No.	Name
25296	Adaptor, for use with 2 volt storage battery.
25566	Bearing (for wood pulleys)
25561	Cabinet
25597	Coil, R. F. (T3)
25598	Coil, Oscillator (T2)
25600	Condenser, Electrolytic 16 Mfd, 150 V. (C4)
25592	Condenser—Tuning, 3 Gang, less Tuning Shaft (C1, C2, C3)
25367	Control, Volume, with On-Off Switch (R1)
25811	Cord, Dial, complete with Spring and Pointer Coupling
25696	Knob, Tuning or Volume
25609	Loop (T1)
25612	Plug, Battery Cable 4 Prong
	Pointer, Dial — See, "Track-Pointer"
25336	Pulley—Wood
25616	Scale, Dial
25766	Shaft—Tuning with "spool" pulley
25620	Socket—Tube
25593	Speaker 5" P. M. Dynamic (T7) (less Transformer)
25319	Switch, Economizer (S2)
25808	Track, Pointer, complete with Brackets and Pointer
25621	Transformer I. F. Input (T4)
25622	Transformer I. F. Output (T5)
25594	Transformer—Speaker Output (T6)

Reference Numbers such as (C4) are shown on circuit diagram.

Parts not listed above, may be ordered by part number as shown in the picture and by complete description, send a sketch if possible.

We cannot supply speaker cones. We can replace or repair a damaged speaker for a nominal price if it is returned to our factory, transportation charges prepaid.

MODEL 43-6451

WESTERN AUTO SUPPLY CO. OF CAL.

Model 43-6451

Five Tube Battery Radio

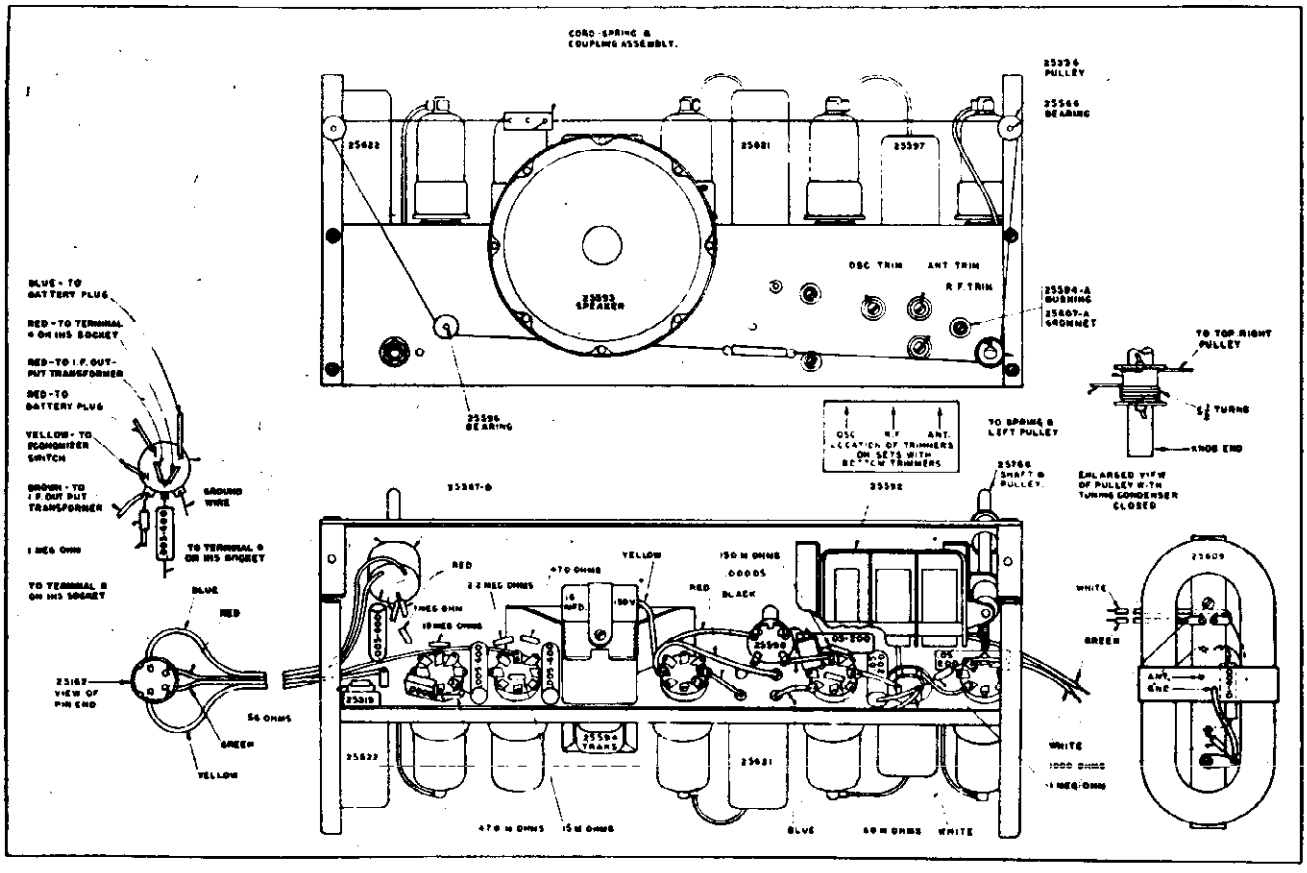
Service Notes

How To Remove Chassis From Cabinet—Remove knobs by pulling straight off, disconnect battery by removing plug, and remove two screws inserted through bottom of cabinet. Chassis can be removed now. To REMOVE GLASS DIAL—remove the four wood screws which are inserted from the interior of cabinet. (Note—After installing chassis in cabinet see that the bakelite strip attached to dial cord is engaged with the pin on the dial pointer.)

To Properly Align—Remove chassis from cabinet, and align I. F. Transformers in the conventional manner with a test oscillator adjusted to 455 KC, connected to the grid of the 1A7GT through a .1 Mfd condenser, with the tuning condenser set at minimum capacity. To align tuning condenser, connect test oscillator to antenna wire (green) through a .0001 Mfd. condenser. Adjust oscillator trimmer condenser (located on left top) to 1620 KC with tuning condenser at minimum capacity (completely out of mesh). The antenna and R. F. sections are trimmed at 1400 KC. Antenna trimmer is top right; R. F. trimmer is below at right. Dial pointer may be adjusted to scale by slipping bakelite pointer coupling on dial cord.

Battery Unit Voltages—Should be checked with receiver turned on—if B voltage is below 60 Volts, battery unit should be replaced.

Dial Cord Replacement—Is best accomplished by replacing complete cord assembly #25811, which is made up to correct length. In an emergency 30 lb. fish line may be used. See picture of chassis for correct installation.



WESTERN AUTO SUPPLY CO. OF CAL.

MODEL 43-868

Model 43-8685

Six Tube AC Operated Radio Including Rectifier

Service Notes

The circuit diagram below is complete and will enable the serviceman to check all component parts in the event service is required. Voltages at various important points are indicated, as well as values of condensers and resistors.

REMOVAL OF CHASSIS—Disconnect set from wall plug. Remove knobs by pulling straight out. Remove loop plug on back of chassis. Remove two screws under cabinet, chassis may be withdrawn from rear.

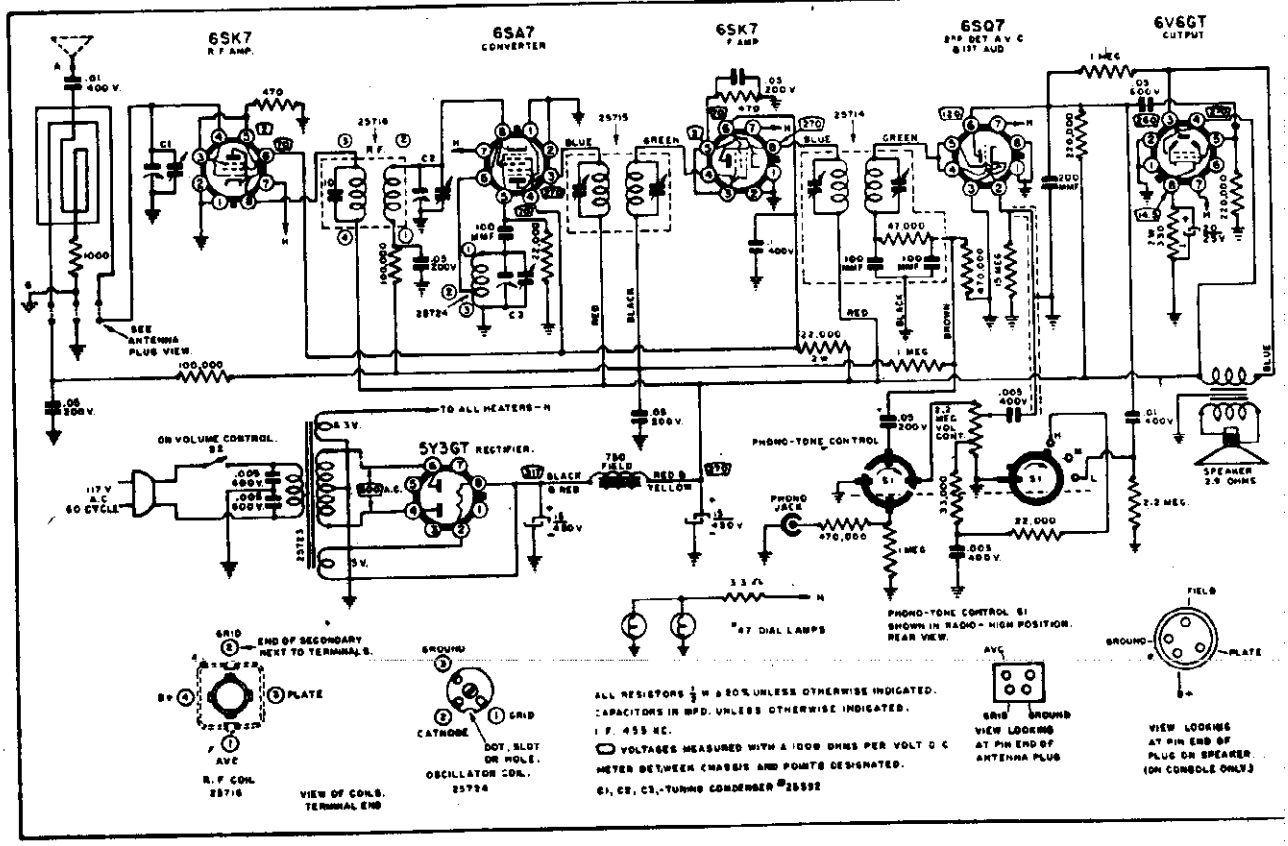
ALIGNMENT—Sets are properly aligned at the factory with precision equipment and the adjustments should not be disturbed unless a coil, tuning condenser or IF transformer has to be replaced or the set has been subject to damage or tampering. Alignment should only be done with the aid of an accurate signal generator and output indicating instrument.

TO PROPERLY ALIGN—Remove chassis from cabinet, and align I. F. Transformers in the conventional manner with a Signal Generator adjusted to 455 KC, connected to the grid of the 6SA7 through a .1 Mfd. condenser, with the tuning condenser set at minimum capacity. To align tuning condenser, carefully place loop in normal relation to chassis, connect Signal Generator to antenna clip through a .0001 Mfd. condenser. Adjust oscillator trimmer condenser (located on left top) to 1620 KC with tuning condenser at minimum capacity (complete out of mesh). The antenna and R. F. sections are trimmed at 1400 KC. Antenna trimmer is top right; R. F. trimmer is below at right. Dial pointer may be adjusted to scale by slipping pointer coupling on dial cord.

DIAL CORD REPLACEMENT—Is best accomplished by replacing complete cord assembly No. 25834 which is made up to correct length. In an emergency 30 lb. fish line may be used. See picture of chassis for correct installation.

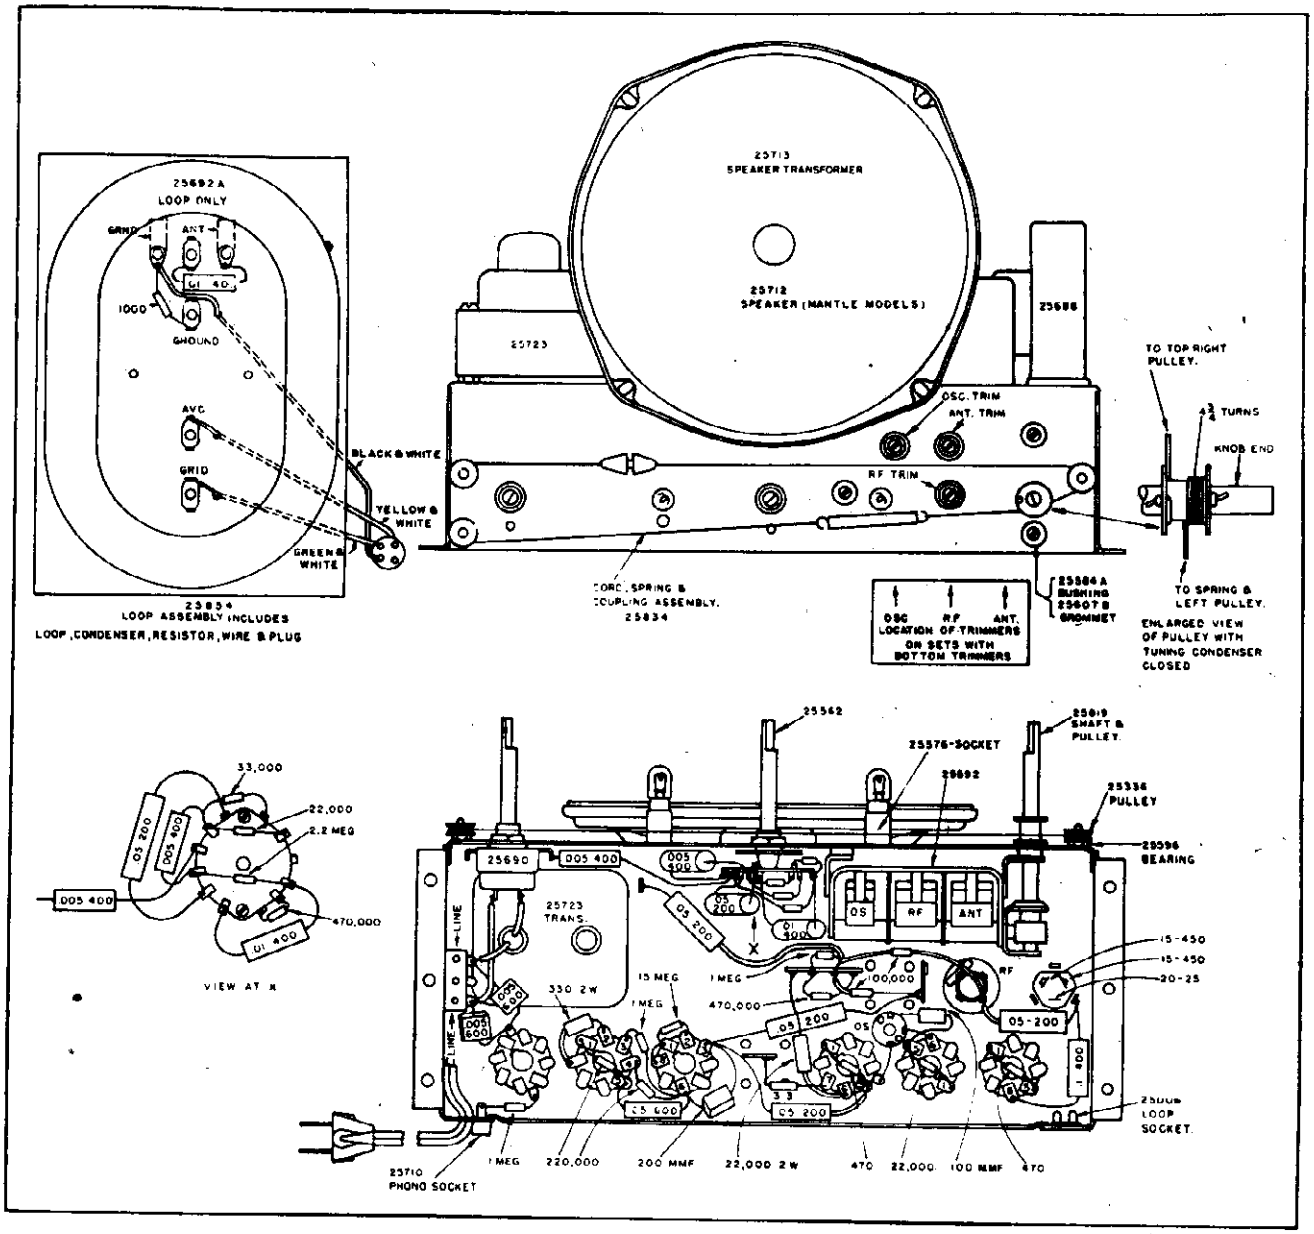
DIAL SCALE REPLACEMENT—Remove chassis. Remove pointer track by removing the two wood screws holding it to the cabinet. Dial scale may now be lifted out from front of cabinet. When installing new scale —see that long screws in track bracket engage the notches in the ends of the scale.

INSTALLING CHASSIS—Replace chassis in cabinet—noting that shafts are approximately centered in holes. Replace screws under base of cabinet, replace loop plug, push knobs on shafts. Hold the pointer, back of dial, near center of scale, with your finger or any small instrument, turn the tuning knob to the right or left until the pointer drive coupling connects itself with the pointer.



MODEL 43-8685

WESTERN AUTO SUPPLY CO. OF CAL.



SERVICE PARTS LIST

MODEL 43-8685

When ordering parts always mention complete factory model number, series and issue.

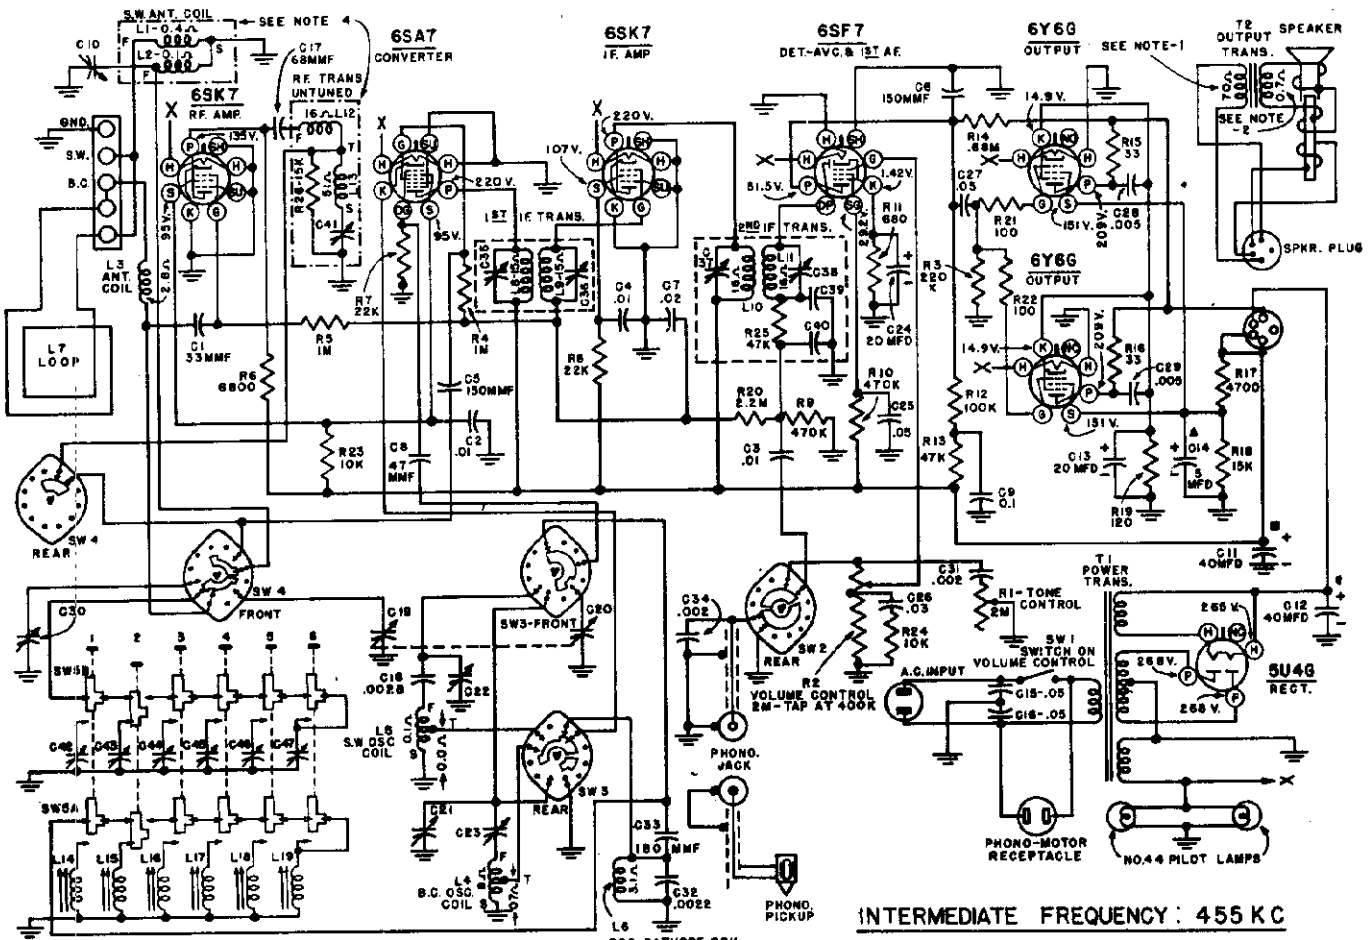
Part No.	Description
25692	Antenna—Loop
25596	Bearings—For Wood Pulleys
25572	Bracket—Tuning Condenser—Front
25573	Bracket—Tuning Condenser—Rear
25574	Bracket—Speaker
25765	Bracket—Pointer Track
25660	Cabinet
25597	Coil—R. F.
25724	Coil—Oscillator
25688	Condenser—Filter 15-450, 15-450, 20-25
25592	Condenser—Tuning C-1, C-2, C-3
25690	Control—Volume (with AC Switch S-2)
25068	Cord—AC and Plug
25834	Cord—Dial (includes Spring and Pointer Coupling)
25751	Dial Scale Glass
25578	Dial Pointer
25829	Knob—Tone
25696	Knob—Volume and Tuning
25710	Phono Pick-Up Socket
25693	Plug—For Loop
25336	Pulley—Wood—Small
25819	Pulley—Manual Drive With Shaft
25607	Rubber—Grommets
25774	Screw—Set For Worm Gear (Tuning Condenser)
25576	Socket—Dial Lamp
25620	Socket—Octal
25006	Socket—For Loop
25712	Speaker—With Transformer
25562	Switch—Tone S-1,
25711	Track—Pointer
25715	Transformer—I. F. Input
25714	Transformer—I. F. Output
25713	Transformer—Output—Speaker
25723	Transformer Power 60 Cycles

Note: Resistors and condensers not listed will be supplied on order—specify value.

We cannot supply speaker cones. We can replace or repair a damaged speaker for a nominal price if it is returned to our factory, transportation charges prepaid.

In ordering any part not listed give complete description and a sketch, if possible.

Record Changer: For H107, H108, General Instrument Model



NOTES—
1. SPEAKER PLUG REMOVED.
2. VOICE COIL DISCONNECTED.
3. SWITCH SW2-3 & 4 SHOWN AS VIEWED FROM FRONT OF SET IN P.B-B.C. POSITION. EXTREME COUNTER CLOCKWISE POSITION IS PHONO. SECOND POSITION CLOCKWISE IS P.B.-B.C. BAND. THIRD POSITION CLOCKWISE IS MANUAL B.C. BAND. FOURTH POSITION CLOCKWISE IS S.W. BAND.
4. DOT-DASH LINE DENOTES ASSEMBLY OF COMPONENT PARTS UNSHIELDED
5. ALL VOLTAGES MEASURED FROM CHASSIS (GND.) USING 20,000 OHMS/VOLT METER. LINE VOLTAGE 117 V.A.C. MAX. VOLUME CONTROL SETTING AT NO SIGNAL CONDITIONS FOR THE BROADCAST BAND. READINGS SHOULD APPROXIMATE THE VALUES SHOWN WITHIN 20 PERCENT.

PUSH BUTTONS

Push buttons 1 to 3 are designed to receive stations from 900 to 1600 kc; push buttons 4 to 6 are designed to receive stations from 540 to 900 kc.

1. Turn on radio and allow it to warm up for five minutes.
2. Set the phono-band switch on "BROADCAST." Tune in the desired station in the frequency range 900 to 1600 kc.
3. Reset the phono-band switch on "PUSH BUTTON" and depress the first push button (right button, viewed from the front). Adjust L14, using a small long-handled screwdriver, to receive the station. Adjust C42 for maximum volume on the station.
4. Return the band switch to "BROADCAST" to make sure that the push button has been set to the desired station.
5. Adjust remaining push buttons in the same manner.

Tuning Drive Ratio ..... 30 to 1

MODELS H104,H105,H107, H108,H110,H111,H137, WESTINGHOUSE ELECTRIC CORP. H138

PARTS LIST FOR MODELS H-110, H-111, H-137 AND H-138

The parts listed below for the MODELS H-104, H-105, H-107and H-108 apply to MODELS H-110, H-111, H-137 and H-138 with the following exceptions:

V-3390	Decal, band (H-110 and H-111 only)
V-3792	Decal, band (H-137 and H-138 only)
V-3197	Decal, tone (H-110 and H-111 only)
V-3791	Decal, tone (H-137 and H-138 only)
V-3282-1	Knob, tone (H-110 and H-137 only)
V-3282-2	Knob, tone (H-111 and H-138 only)
V-3282-3	Knob, band (H-110 and H-137 only)
V-3282-4	Knob, band (H-111 and H-138 only)
V-3284-1	Knob, tuning and volume (H-110 and H-137 only)
V-3284-2	Knob, tuning and volume (H-111 and H-138 only)
V-3832-1	Cardboard and grille cloth assy., speaker section (H-110 only)
V-3832-2	Cardboard and grille cloth assy., speaker section (H-111 only)
V-3833-1	Cardboard and grille cloth assy., record storage section (H-110 only)
V-3833-2	Cardboard and grille cloth assy., record storage section (H 111 only)
V-3686-1	Grille cloth, speaker (H-137 only)
V-3686-2	Grille cloth, speaker (H-138 only)
V-3283-1	Loop assembly (L7)

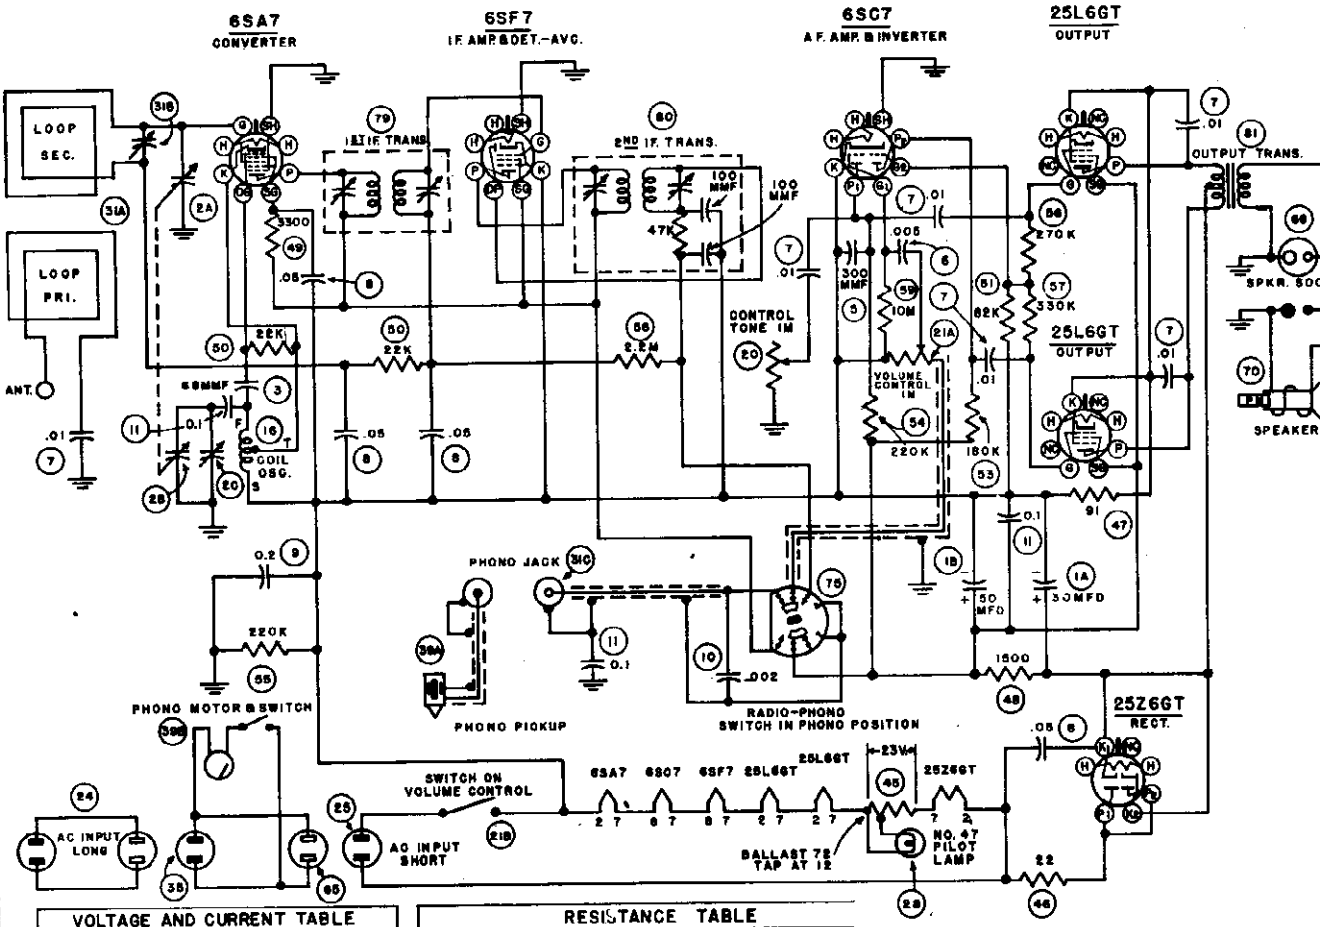
PARTS LIST FOR MODELS H-104, H-105, H-107 AND H-108

When ordering parts specify model number of set in addition to part number and description of part.

Part No.	Description
V-3615	Asbestos sheet (H-104 and H-105 only)
V-3186	Background, felt
V-3532S	Bar, flat, for phono mtg. (H-107 and H 108 only).
V-3338	Bracket assembly, dial background
V-3185	Bracket, dial light
V-1102-1	Cabinet (H-104 only)
V-1102-2	Cabinet (H-105 only)
RCM20A330M	Capacitor, 33 mmf mica (C1)
RCP10W4103A	Capacitor, 0.01 mfd 400 v. (C2, C3, C4)
RCM20A151M	Capacitor, 150 mmf mica (C5, C6)
RCP10W4203A	Capacitor, 0.02 mfd 400 v. (C7)
RCM20B470M	Capacitor, 47 mmf mica (C8)
RCP10W4104A	Capacitor, 0.1 mfd 400 v. (C9)
V-3170	Capacitor, S.W. ant. trimmer (C10)
V-3216	Capacitor, electrolytic, 40 mfd 350 v. (C11), 40 mfd 350 v. (C12), 20 mfd 25 v. (C13), ½ mfd 250 v. (C-14)
V-3241	Capacitor, dual line filter (C15, C16)
RCM20A680M	Capacitor, 68 mmf mica (C17)
RCM30C002H	Capacitor, 0.0028 mfd S.W. padder (C18)
V-3233	Capacitor, variable, 2-gang (C19, C20)
V-3217	Capacitor, 3-gang trimmer (C21, C22, C23)
V-3236	Capacitor, electrolytic, 20 mfd 25 v. (C24)
RCP10W4503A	Capacitor, 0.05 mfd 400 v. (C25)
RCP10W4303A	Capacitor, 0.03 mfd 400 v. (C26)
RCP10M4503A	Capacitor, 0.05 mfd 400 v. (C27)
RCP10M6502A	Capacitor, 0.005 mfd 600 v. (C28, C29)
V-3191	Capacitor, B.C. ant. trimmer (C30)
RCP10W6202A	Capacitor, 0.002 mfd 600 v. (C31)
RCM30B222M	Capacitor, 0.0022 mfd mica (C32)
RCM20C181J	Capacitor, 180 mmf mica (C33)
RCP10W6202M	Capacitor, 0.002 mfd 600 v. (C34)
V-3183	Clip, speed
V-3224	Coil, S.W. ant. (L1, L2)
V-3238	Coil, ant. loading (L3)
V-3243	Coil, B.C. and S.W. osc. (L4, L5)
V-3213	Coil, osc. cathode (L6)
V-3254	Connector, phone
V-3222	Control, tone, 2 megohms (R1)
V-3221	Control, volume and power, 2 megohms tapped at 400,000 ohms (R2) and switch (SW1)
V-3219S-1	Cord, dial drive
V-3239	Cord, power A-C
V-3421	Cover, back (H-107 and H-108 only)
V-3390	Decal, band
V-3197	Decal, tone
V-3263	Dial
V-3364	Escutcheon, push button
V-3348-1	Grille cloth, speaker (H-107 only)
V-3348-2	Grille cloth, speaker (H-108 only)
V-3924-1	Panel and grille cloth assy., cabinet door (H-107 only)
V-3924-2	Panel and grille cloth assy., cabinet door (H-108 only)
V-3268	Grommet, var. cond. mounting
V-3274S	Holder, tube
V-3262-3	Knob, band (H-104 and H-107 only)
V-3262-4	Knob, band (H-105 and H-108 only)
V-3262-1	Knob, tone (H-104 and H-107 only)
V-3262-2	Knob, tone (H-105 and H-108 only)
V-3264-1	Knob, tuning and volume (H-104 and H-107 only)
V-3264-2	Knob, tuning and volume (H-105 and H-108 only)
(W) No. 44	Lamp, pilot light 6.3 v.
V-3394	Loop assembly (L7) (H-104 and H-105 only)
V-3283-1	Loop assembly (L7) (H-107 and H-108 only)
V-3229-1	Moulding, dial (H-104 and H-105 only)
V-3229-2	Moulding, dial (H-107 and H-108 only)
V-3414	Plate, glass front (H-104 only)
V-3817	Plate, glass front (H-105 only)
V-3194	Plate, glass front (H-107 only)
V-3818	Plate, glass front (H-108 only)
V-3178	Pointer assembly
V-3166S	Pulley, 7/16 dia.
V-3398-1	Push button with spring (H-104 and H-107 only)
V-3398-2	Push button with spring (H-105 and H-108 only)
V-3181	Rail, pointer
RC10AE224M	Resistor, 220K ¼ w. (R3)
RC10AE105M	Resistor, 1M ¼ w. (R4, R5)
RC41AE682K	Resistor, 6800 ohms 2 w. (R6)
RC10AE223M	Resistor, 22K ¼ w. (R7, R8)
RC10AE474M	Resistor, 470K ¼ w. (R9, R10)
RC10AE681M	Resistor, 680 ohms, ¼ w. (R11)
RC10AE104M	Resistor, 100K ¼ w. (R12)
RC10AE473M	Resistor, 47K ¼ w. (R13)
RC10AE684M	Resistor, 0.68M ¼ w. (R14)
RC10AE330K	Resistor, 33 ohms ¼ w. (R15, R16)
RC41AE472M	Resistor, 4700 ohms 2 w. (R17)
RC41AE153M	Resistor, 15K 2 w. (R18)
V-3282	Resistor, 120 ohms 3 w. (R19)
RC10AE225M	Resistor, 2.2M ¼ w. (R20)
RC10AE101M	Resistor, 100 ohms ¼ w. (R21, R22)
RC41AE103M	Resistor, 10K 2 w. (R23)
RC10AE103M	Resistor, 10K ¼ w. (R24)
V-3164	Shaft, tuning
V-3353-1	Slide mechanism, left hand unit (H-107 and H-108 only)
V-3353-2	Slide mechanism, right hand unit (H-107 and H-108 only)
V-3220	Socket, A-C power
V-3275S	Socket, moulded octal
V-3246S	Socket, octal
V-3252-2	Socket, pilot light
V-3162S	Socket, speaker input
V-3294	Speaker (incl. output trans. T2) 6" electro-dynamic (H-104 and H-105 only)
V-3244	Speaker (incl. output trans. T2) 8" electro-dynamic (H-107 and H-108 only)
V-3248S	Spring, dial drive
V-3167S-1	Stud, pulley—threaded (short)
V-3167S-2	Stud, pulley—threaded (long)
V-3261-1	Switch, push button (SW5A, SW5B)
V-3289	Switch, selector (SW2, SW3, SW4)
V-3365	Tube, station
V-3431	Window, station tab
V-3255	Terminal board, ant. gnd.
V-3228S-2	Terminal board, 2 lugs
V-3231	Terminal board, 3 lugs
V-3232	Terminal board, 5 lugs
V-3218	Transformer, 1st I-F (L8, L9, C35, C36)
V-3248	Transformer, 2nd I-F (L10, L11, C37, C38, C39, C40, R25)
V-3250	Transformer, power (T1)
V-3245	Transformer, untuned R-F (L12, L13, C41, R26)
V-3317	Tuner, push button (L14 to L19, and C42 to C47 incl.)
V-3237	Washer, cup
V-3184S	"C" washer
V-3215S	Washer, spring

WESTINGHOUSE ELECTRIC CORP.



VOLTAGE AND CURRENT TABLE

ALL VOLTAGES ARE MEASURED FROM THE NEGATIVE SIDE OF THE DUAL FILTER CAPACITOR USING A 20,000 OHMS PER VOLT METER. ALL CURRENTS ARE MEASURED FROM TOP OF TUBE SOCKETS USING A BREAK-IN ADAPTER. LINE VOLTAGE 117 V.A.C. SIGNAL VOLTAGE ZERO.

TUBE	SOCKET TERMINAL K		SG	P	I_K ma.

Pilot Lamp: (1).....Westinghouse No. 47, 6.3 volts, .15 ampere

Frequency Range:

Standard Broadcast .....550 to 1600 kc
Intermediate Frequency .....455 kc

Phonograph Specifications:

1. Automatic record changer, single button control.
2. Plays either 12 ten-inch or 10 twelve-inch records automatically.
3. Balanced tone arm.
4. Voltage and frequency of motor - 105 - 120 volts, 50 - 60 cycles, single phase a.c.
5. Type of cartridge - high impedance crystal.
6. Type of needle - straight shank steel or semi-permanent sapphire.

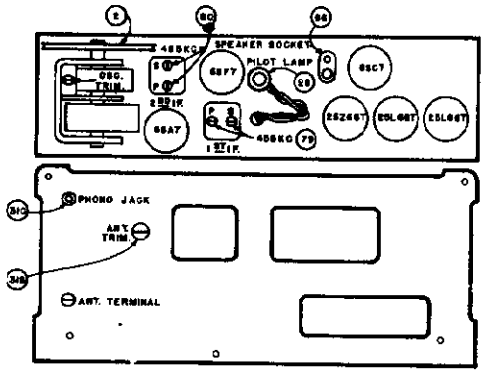
Record Changer: General Instrument Model

Alignment Procedure

The overall sensitivity and selectivity of these models is affected to a great extent by the alignment of the i-f and r-f circuits. In general, a complete realignment of both circuits is unnecessary. If realignment is required, however, the following procedure must be used:

1. Disconnect the receiver from the 105-120 volt power source.
2. Remove the rear cover - loop assembly as outlined above.
3. Pull off the four knobs at the front of the cabinet.
4. Remove the pilot lamp socket from the speaker bracket. Remove the speaker plug from its socket. This socket is located at the front of the chassis near the 6SC7 tube.
5. To release the chassis, remove the two screws from the bottom of the cabinet.
6. Reconnect the speaker. Place the power plug in the 105-120 volt a-c or d-c convenience outlet and set the controls on the front as follows:
   a. Volume control and a-c switch - full on.
   b. Radio-phonograph switch - in RADIO position (extreme counter clockwise).
   c. Tone control - HIGH position (extreme clockwise).
   d. Tuning dial - 1600 kc position.
7. Connect the signal generator to the control grid of the 6SF7 i-f amplifier tube through a series capacitor of 0.1 mfd. Adjust the signal generator for an output frequency of 455 kc; keep the signal reduced to avoid a.v.c. action.
8. Connect an a-c output meter across the speaker voice coil; place the meter range switch on the highest output scale position for the preliminary adjustments.
9. Using an alignment tool, adjust the secondary trimmer of the second i-f transformer for the maximum output indication on the meter. As the circuits come into alignment, it will be necessary to further reduce the test signal amplitude in order to prevent a.v.c. action. Always use the lowest range on the meter which will give at least one-half scale deflection. Adjust the primary trimmer of the second i-f transformer for maximum output indication.
10. Connect the signal generator output to the control grid of the 6SA7 mixer tube, and adjust in turn, the secondary and primary trimmers of the first i-f transformer for maximum output indication.
11. Leave the signal generator connected to the control grid of the 6SA7 mixer tube. Reduce the test signal to the lowest perceptible value and carefully "peak" each adjustment in Steps 9 and 10 for maximum output indication.
12. Connect the signal generator to the antenna terminal on the back cover - loop assembly through a capacitor of approximately 200 mmfd.; adjust the signal generator to an output frequency of 1615 kc. Rotate the tuning condenser until the minimum capacity stop is reached, and adjust the oscillator trimmer for the maximum response on the output meter.
13. Disconnect the signal generator test lead from the antenna terminal. Turn attenuator on the signal generator for full output. Adjust the signal generator for 1400 kc. Bring the output lead near, but do not connect to, the loop antenna. Tune in the test signal as accurately as possible on the radio. If the test signal is too strong, move the lead farther away. Adjust the antenna trimmer for maximum output on the meter.

    Note: The antenna trimmer must be readjusted after the chassis is replaced in the cabinet as the metal chassis and speaker affect the inductance of the loop.
14. Check on radio stations at selected points for calibration and sensitivity.



The foregoing alignment procedure is condensed in the following table as a convenience for the service technician.

Steps	Connect Signal Generator to—	Adjust Signal Generator to—	Tune Radio Dial to—	Adjust
1	6SF7 control grid through 0.1 mfd. capacitor	455 kc	1600 kc	secondary trimmer of 2nd i-f transformer for maximum output
2	6SF7 control grid through 0.1 mfd. capacitor	455 kc	1600 kc	primary trimmer of 2nd i-f transformer for maximum output
3	6SA7 control grid through 0.1 mfd. capacitor	455 kc	1600 kc	secondary trimmer of 1st i-f transformer for maximum output
4	6SA7 control grid through 0.1 mfd. capacitor	455 kc	1600 kc	primary trimmer of 1st i-f transformer for maximum output
5	antenna terminal through 200 mmfd. capacitor	1615 kc	gang at minimum	trimmer of oscillator section, tuning capacitor for maximum output
6	radiated signal (no actual connection)	1400 kc	1400 kc	antenna trimmer for maximum output

Power Supply Polarity:

When the receiver is operated on 105-120 volts 60 cycles a.c., a slight hum may be heard if the power plug is inserted in such a manner that the "hot" side of the supply line is connected nearest to the chassis. To eliminate this trouble, reverse the plug in the convenience outlet.

When operated on direct current, the set will not function at all if the power plug polarity is reversed with respect to the line voltage. If it does not function within one minute after it is turned on, reverse the plug.

Ground Connections:

The use of an external ground is not recommended for two reasons: First, the r-f circuits are returned to ground through the a-c or d-c supply line; second, the radio chassis is connected to one side of the supply line through a 220,000 ohm resistor and a capacitor of 0.2 mfd. If the power plug is inserted in such a manner that the "hot" side of the supply line is connected nearest to the chassis, the use of an external ground would place the 105-120 volt supply voltage directly across the resistor-capacitor combination. This might cause a loud hum or, under certain conditions, actual damage to the receiver.

PARTS LIST FOR H-122 AND H-130

When ordering parts specify model number of set in addition to part number and description of part.

Item No.	Part No.	Description of Part
1	V-3304	Capacitor, electrolytic
1A	Part of Item 1	Capacitor, 30 mfd.
1B	Part of Item 1	Capacitor, 50 mfd.
2	V-3535	Capacitor, variable two-gang
2A	Part of Item 2	Capacitor, loop tuning
2B	Part of Item 2	Capacitor, oscillator tuning
2C	Part of Item 2	Capacitor, oscillator trimmer
3	RCM20A680M	Capacitor, 68 mmfd.
5	RCM20A301M	Capacitor, 300 mmfd.
6	RCP10W6502A	Capacitor, .005 mfd.
7	RCP10W4103A	Capacitor, .01 mfd.
8	RCP10W4503A	Capacitor, .05 mfd.
9	RCP10W4204K	Capacitor, 0.2 mfd.
10	RCP10W6202A	Capacitor .002 mfd.
11	RCP10W4104A	Capacitor, 0.1 mfd.
16	V-3382	Coil, oscillator
20	V-3303	Control, tone
21	V-3298	Control, volume and switch
21A	Part of Item 21	Control, variable resistor
21B	Part of Item 21	Control, switch
24	V-3392	Cord, power a.c. long (H-122 only)
25	V-3372-122	Cord, power short (H-122 only)
25	V-3372-130	Cord, power (H-130 only)
28	Westinghouse No. 47	Light, pilot
31	V-3660	Loop, antenna (H-122 only)
31	V-3656	Loop, antenna (H-130 only)
31A	Part of Item 31	Loop, winding
31B	Part of Item 31	Loop, trimmer
31C	Part of Item 31	Phono socket
35	V-3379	Receptacle

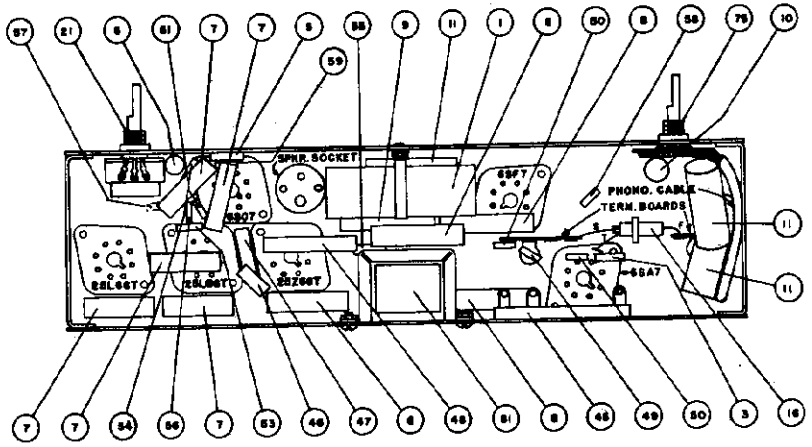
39B		Phonograph motor and switch (See Service Notes, V-3269-2 Record Changer)
45	V-3311	Resistor, ballast
46	RC20AE220M	Resistor, 22 ohms ½ watt
47	RC30AE910J	Resistor, 91 ohms 1 watt
48	RC40AE152M	Resistor, 1,500 ohms 2 watts
49	RC10AE332M	Resistor, 3,300 ohms ¼ watt
50	RC10AE223M	Resistor, 22,000 ohms ¼ watt
51	RC10AE823K	Resistor, 82,000 ohms ¼ watt
53	RC20AE184K	Resistor, 180,000 ohms ½ watt
54	RC20AE224K	Resistor, 220,000 ohms ½ watt
55	RC10AE224M	Resistor, 220,000 ohms ¼ watt
56	RC10AE274K	Resistor, 270,000 ohms ¼ watt
57	RC10AE334K	Resistor, 330,000 ohms ¼ watt
58	RC10AE225M	Resistor, 2.2 megohms ¼ watt
59	RC10AE105M	Resistor, 10 megohms ¼ watt
65	V-3398-1	Socket, regular a.c. power
66	V-3299	Socket, speaker
70	V-3291	Speaker, 6" PM
75	V-3301	Switch, radio phono
79	V-3323	Transformer, 1st i-f
80	V-3329	Transformer, 2nd i-f



81	V-3297	Transformer, output
	V-3219S-1	Cord, dial drive
	V-3343	Pointer assembly
	V-3321	Rail, pointer
	V-3335	Socket, pilot light
	V-3246S	Socket
	V-3248S	Spring, dial drive
	V-1109-1	Cabinet (radio section H-122 only)
	V-1110-1	Cabinet (less radio section H-122 only)
	V-1111-2	Cabinet (H-130 only)
	V-3425	Dial (H-122 only)
	V-3647-2	Dial (H-130 only)
	V-3413	Knob, tone (H-122 only)
	V-3262-2	Knob, tone (H-130 only)
	V-3413	Knob, tuning (H-122 only)
	V-3262-2	Knob, tuning (H-130 only)
	V-3331-1	Knob assembly, volume (H-122 only)
	V-3667-2	Knob assembly, volume (H-130 only)
	V-3331-2	Knob assembly, radio-phono (H-122 only)
	V-3667-4	Knob assembly, radio-phono (H-130 only)
	V-3333S-1	Medallion

Power Output:

Undistorted (radio) ..... 3 watts
Undistorted (phonograph) ..... 3.5 watts
Maximum ..... 5 watts

Loudspeaker:

Type ..... 6½" dia. P.M. dynamic
Voice Coil Impedance ..... 3.2 ohms

Power Supply Rating:

H-122 combination ..... 105 - 120 volts, 50 - 60 cycles a.c.
H-130 or radio section of H-122 only ..... 105 - 120 volts d.c. or 105 - 120 volts, 50 - 60 cycles a.c.

Power Consumption:

H-122 combination ..... 150 watts
H-130 or radio section of H-122 ..... 60 watts

Special Provisions:

H-130: Phonograph, FM, and television sound input connection at rear of cabinet
H-122: FM and television sound input connection at rear of cabinet

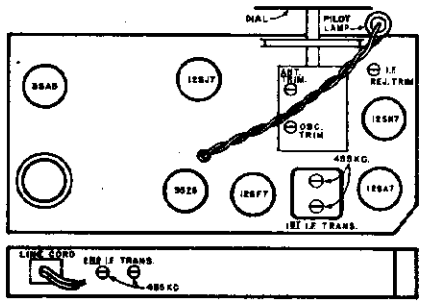

Fig. 1

Alignment Procedure (Refer to Fig. 1):

The overall sensitivity and selectivity of the Little Jewel are affected to a great extent by the alignment of the i-f and r-f circuits. In general, a complete realignment of both circuits is unnecessary. If realignment is required, however, the following procedure is recommended:

1. Remove the knobs, the plastic cover, and the loop as outlined above.
2. Remove the Allen head screw from the left-hand plastic cover and carefully lift off the cover.
3. Turn on the receiver and tune to a quiet spot near 1600 kc.
4. Connect an a-c output meter across the speaker voice coil. Turn the meter range switch to a high-voltage position.
5. Connect the outer conductor of the signal generator test lead to the common negative (this is the metal can enclosing the filter capacitors). Reduce the output of the signal generator to prevent a.v.c. action during the alignment procedure.
6. Connect the inner conductor of the signal generator test lead to the 12SF7 i-f amplifier control grid through a capacitance of 0.01-mfd. Adjust the signal generator frequency to 455 kc.
7. With an insulated screwdriver or neutralizing tool, adjust the second i-f transformer **secondary** trimmer for maximum reading on the output meter. Use the lowest practicable scale on the meter and, as the circuits come into alignment, reduce the signal generator output to prevent a.v.c. action.
8. Repeat operation 7, this time adjusting the second i-f transformer **primary** trimmer.
9. Connect the signal generator output, through the 0.01 mfd. capacitor, to the control grid of the 12SA7 converter tube. Repeat operations 7 and 8, this time adjusting the secondary and primary trimmers of the **first** i-f transformer.
10. Connect the signal generator output, adjusted to 455 kc, to the antenna terminal at the bottom of the cabinet. Tune the radio dial to 600 kc. Adjust the i-f rejection trimmer for **minimum** reading on the output meter.
11. Connect the test oscillator output through a capacitance of 50 mmfd. to the antenna terminal at the bottom of the cabinet. Adjust the signal generator frequency to 1615 kc. Tune the receiver tuning condenser to minimum. Adjust the trimmer on the oscillator section of the main tuning condenser for **maximum** reading on the output meter.
12. Adjust the signal generator to 1400 kc. Bring the output lead near the receiver input but do not make an actual connection. Tune in the test signal on the receiver dial and adjust the antenna trimmer for maximum output as read on the output meter.

The foregoing alignment procedure is condensed in the following table as a convenience for the service technician:

Steps	Connect Signal Generator to—	Adjust Signal Generator to—	Tune Radio Dial to—	Adjust for Maximum Output
1	12SF7 grid in series with a .01 mfd. capacitor	455 kc	quiet point near 1600 kc.	primary and secondary 2nd i-f transformer
2	12SA7 grid in series with a .01 mfd. capacitor	455 kc	quiet point near 1600 kc.	primary and secondary 1st i-f transformer
3	12SA7 grid in series with a .01 mfd. capacitor	455 kc	quiet point near 1600 kc.	repeat 1 and 2
4	antenna terminal	455 kc	600 kc	adjust i-f rejection trimmer for minimum output
5	antenna terminal in series with a 50 mmfd. capacitor	1615 kc	gang at minimum	oscillator trimmer
6	radiated signal from signal generator	1400 kc	1400 kc	adjust antenna trimmer

Power Supply Polarity:

When the receiver is operated on 110 volts 60 cycles a.c., a slight hum may be heard if the power plug is inserted in such a manner that the "hot" side of the supply line is connected nearest to the chassis. To eliminate this trouble, reverse the supply plug in the convenience outlet.

When operated on direct current, the set will not function at all if the power plug polarity is reversed with respect to the line voltage. If it does not operate within one minute after it is turned on, reverse the plug in the convenience outlet.

Tube Replacement:

When replacing tubes this procedure must be followed to prevent damage to the loop and other delicate parts:

1. Disconnect the power plug from the 110-volt service outlet.
2. Pull the knobs and remove the Phillips head screw from the right-hand plastic cover.
3. Carefully remove the plastic cover and handle.
4. Lift the loop assembly and tilt it forward until the tubes are accessible.
5. Turn the tuning dial to 550 kc to avoid damage to the rotor plates of the tuning condenser.

PARTS LIST FOR H-125 AND H-126

When ordering parts specify model number of set in addition to part number and description of part.

Item No.	Part No.	Description of Part
1	V-3466	Loop antenna
3	V-3474	Capacitor, variable
3A	Part of Item 3	Capacitor, antenna tuner
3B	Part of Item 3	Capacitor, antenna trimmer
3C	Part of Item 3	Capacitor, oscillator tuner
3D	Part of Item 3	Capacitor, oscillator trimmer
5	RCM20A470K	Capacitor, 47 mmfd.
6	RCM20A470M	Capacitor, 47 mmfd.
7	RCM20A101M	Capacitor, 100 mmfd.

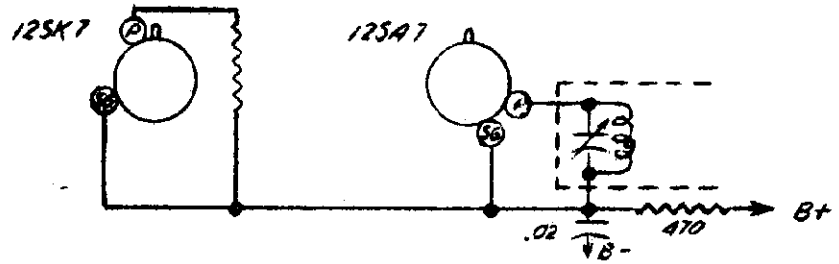
46	RC20AE474K	Resistor, 470,000 ohms 0.5 watt
47	V-3475	Speaker, 5 inch permanent magnet
48	V-3496	Transformer, output
50	V-3471	Transformer, 1st i-f
51	V-3472	Transformer, 2nd i-f
	V-3219S-1	Cord, dial drive
	V-3455-1	Dial (for Model H-125 only)
	V-3455-2	Dial (for Model H-126 only)
	V-3449	Drive shaft bearing
	V-3480	Shaft, drive
	V-3468	Socket, molded octal tube
	V-3469	Socket, molded octal tube (shielded)
	V-3499	Socket, pilot light
	V-3448	Spring, dial drive
	V-3435	Bumper, felt (screw type)
	V-3501-1	Case assembly, center
	V-3461-1	Cover, left-hand (H-125 only)
	V-3459-1	Cover, right-hand (H-125 only)
	V-3498-1	Handle assembly (H-125 only)
	V-3481-1	Knob (H-125 only)
	V-3491	Terminal strip assembly
	V-3461-2	Cover, left-hand (H-126 only)
	V-3459-2	Cover, right-hand (H-126 only)
	V-3498-2	Handle assembly (H-126 only)
	V-3481-2	Knob (H-126 only)
	V-3711-1	Baffle and Grille Cloth Assembly (H-125)
	V-3711-2	Baffle and Grille Cloth Assembly (H-126)
	V-3333S-1	Medallion (H-125 only)
	V-3333S-2	Medallion (H-126 only)
	V-3745	Socket, lock-in

SUBJECT: CIRCUIT CHANGE, H-125 and H-126 Radios

Effective July 11, 1946, all Model H-125 and H-126 radios which have the letter "C" stamped on the end of the chassis directly below the output tube, have been changed as follows:

A 470 ohm 1/4 watt isolating resistor has been inserted in the plate and screen supply line for the R.F. and converter stages, and a .02 mfd, 200 volt paper by-pass capacitor has been connected from the tube side of this resistor to the common negative line. These connections are shown below.



Where this change has been incorporated in the radio, voltages at the R.F. and converter tube sockets will differ slightly from the values given in the original Service Notes. Approximate voltages when the change is incorporated are as follows: 12SK7 screen grid 66 V., plate 30 V.; 12SA7 screen grid 66 V., plate 65 V.

Procurement difficulties with respect to certain components make the change advisable at this time.

ALIGNMENT PROCEDURE

IF USING A CATHODE RAY OSCILLOGRAPH, THE VERTICAL "HIGH" TERMINAL IS TO BE CONNECTED TO THE 1N5GT GRID CAP WITH A 2.0 MEG. RESISTOR IN SERIES AT THE GRID END.

FOR THE I.F. ALIGNMENT USE A DUMMY ANTENNA CAPACITOR OF .01 MFD. AND COUPLE TEST SIGNAL TO GRID CAP OF THE 1A7GT.

FOR PRELIMINARY ADJUSTMENT OF THE OSCILLATOR CIRCUIT USE THE SAME DUMMY ANTENNA AND CONNECTION POINT. FEED THE TEST GENERATOR TO THE ANTENNA LEAD USING A 200 MMFD. CAPACITOR AS A DUMMY ANTENNA, ADJUST THE ANTENNA TRIMMER C-4 FOR MAXIMUM AT 1500 KC/S. THEN READJUST THE OSCILLATOR SHORTED LOOP FOR MAXIMUM AT 600 KC/S WHILE ROCKING THE GANG CAPACITOR. RECHECK AT 1500 KC/S.

TO THE SERVICE MAN:

The alignment of this chassis is conventional.

A 4700 ohm resistor R5 between the low end of the volume control and ground allows some audio output with normal signal input when the volume control is in counter clockwise positions. This is the Guardian Reminder circuit.

If the audio output is objectionably high (with the volume control in counter clockwise position) resistor R5 may be reduced in value to 2500 ohms or removed from the circuit and the low end of the control grounded.

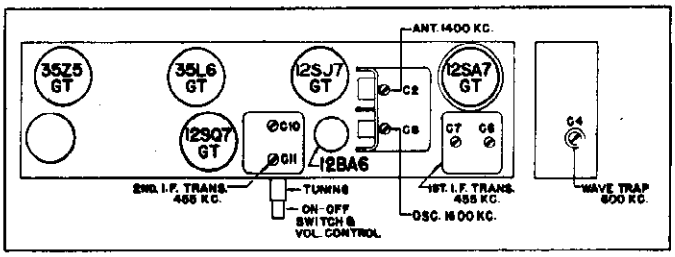
MODELS 6D015—6D030
CHASSIS No. 6C05

TO THE SERVICE MAN:

The filter circuits of chassis 6C05 incorporate new features that should be well understood by the service man. An examination of the schematic drawing will show the output transformer tapped slightly off center. This tap is the B + connection from filter resistor R11 and capacitor C19 off the cathode of the rectifier 35Z5 to the 35L6 plate. The lower connection of the output transformer feeds B + to the rest of the tubes in the receiver. Current flowing through the upper windings of the output transformer to the 35L6 produces a magnetic field which is 180° out of phase with the magnetic field produced by current flowing in the opposite direction through the output transformer to the rest of the receiver, therefore, most of the AC hum is cancelled. Further reduction of hum is accomplished by filtering through resistor R10 and 12 and capacitors C17 and 18.



TUBE AND TRIMMER LOCATION

This development in filtering systems allows a higher effective plate voltage on the 35L6 for increased power output.

NOTE: The output transformer must be replaced with an exact duplicate, Part No. 206-547. Be sure to add the speaker code letter to the transformer part number.

This receiver is equipped with a Phono Jack and Plug located on the rear of the chassis. To use the receiver with a record player, set the Band Switch to one of the short-wave bands and control the volume of the record reproduction with the receiver Volume Control.

PHONO

Este receptor está provisto de una conexión para el fonógrafo, y una clavija o toma, situadas en la parte posterior del chàsis. Para usar el receptor con un "Tocadiscos," ajuste el cambio de banda a una de las bandas de onda corte y cambie el volumen del sonido por medio del control de volumen del receptor.

PHONO

Ce récepteur est pourvu d'une "Cheville de Phonographe" et une prise, qui se trouvent au dos du châssis. Pour employer le poste avec un appareil phonographique externe ("record player"), tournez le commutateur sélectionneur de bandes à une des bandes d'ondes courtes, et réglez le volume du son au moyen du contrôle du volume du poste.

INSTRUCCIONES PARA LA INSTALACION Y FUNCIONAMIENTO

INFORMACION GENERAL

Después de desembalar el receptor, el papel engomado usado en embalaje y embarque, tiene que quitarse del chasis.

Este receptor es un moderno aparato superheterodino, de cinco tubos, que sintoniza las bandas de onda larga y corta, como sigue: 540 a 1660 Kc. (555 a 180 metros), 2100 a 7300 Kc. (143 a 41 metros), 6800 a 22,500 Kc. (44 a 13.3 metros) y una gama de ondas especial desde 9400 a 12,200 Kc. (31.9 a 24.6 metros) con ensanchamiento de banda en 25 y 31 metros.

El receptor está provisto de altoparlante de imán permanente del tipo electro-dinámico, y un regulador de tono de dos posiciones.

SUMINISTRO DE ENERGIA

Este receptor funciona con un acumulador de 6 voltios solamente.

Consumo de energía del chasis con altoparlante de imán permanente es de 2.2 amperios. El máximum de salida de fuerza es de 2.2 vatios.

INSTALLATION, OPERATING AND SERVICE INSTRUCTIONS

GENERAL

After the receiver has been unpacked from the carton, the paper tape used for packing and shipping must be removed from the chassis.

This receiver is a modern five tube superheterodyne, tuning over the following standard broadcast and short-wave bands: 540 to 1660 Kc (555 to 180 meters), 2100 to 7300 Kc (143 to 41 meters), 6800 to 22,500 Kc (44 to 13.3 meters), and a special range covering 9400 to 12,200 Kc (31.9 to 24.6 meters) with spread bands at 25 and 31 meters.

It is equipped with a permanent magnet dynamic type speaker and a two position tone control.

POWER SUPPLY

This receiver operates from a 6 volt storage battery only.

Power consumption of the receiver is 2.2 amperes. The maximum power output is 2.2 watts.

LES INSTRUCTIONS POUR L'INSTALLATION ET LE FONCTIONNEMENT

GENERAL

Après déballage du récepteur de la boite en carton, la bande de papier-cache employée pour l'emballage et l'expédition doit être enlevée du châssis.

Le présent poste est un récepteur superhétérodyne moderne à cinq lampes, dont l'accord englobe les bandes standard suivantes d'ondes moyennes et d'ondes courtes: 540 à 1660 Kc. (555 à 180 mètres), 2100 à 7300 Kc. (143 à 41 mètres), 6800 à 22,500 Kc. (44 à 13.3 mètres), et une échelle spéciale qui couvre de 9400 à 12,200 Kc. (31.9 à 24.6 mètres) avec épanouissement des bandes à 25 et 31 mètres.

Ce poste est équipé avec un haut parleur à aimant permanent du type électro-dynamique, et un contrôle de son à deux positions.

ALIMENTATION DE COURANT

Ce récepteur de TSF ne fonctionne qu'avec accu de six volts.

La consommation de courant du châssis utilisant le haut parleur à aimant permanent est de 2.2 ampères. Le débit maximum de puissance est de 2.2 watts.

¡OJO!
Es indispensable que las terminales del acumulador estén conectadas a la terminal positiva o negativa correspondientes. De lo contrario, no se puede obtener recepción y el vibrador puede dañarse.

CAUTION
Be certain that the battery clips are connected to the proper plus and minus terminals of the battery; otherwise reception cannot be obtained and the vibrator may be damaged.

PRECAUTION
S'assurer que les pattes d'attache sont connectées avec les propres bornes plus ou mois de l'accu, comme autrement on n'aura pas de réception et le vibrateur pourra s'avarier.

ANTENA

Una buena antena es indispensable para la recepción de radio. Una antena exterior de 13 a 20 metros instalada lo más alto posible es la más apropiada para uso general. Si se ha de suar una antena ya instalada, ésta debe examinarse minuciosamente para determinar su estado pues puede haber conexiones oxidadas o rotas, que nulifican la eficacia de la antena. Por otra parte si ha de instalarse una antena nueva hay que tomar las precauciones necesarias para que el alambre de bajada no haga contacto con la pared o con cualquier objeto que resulte en una conexión a tierra. Todas las conexiones deben estar correctamente soldadas para prevenir contra la oxidación y los ruidos que se producen a consecuencia de esto.

ANTENNA

A good antenna is necessary for satisfactory reception. An outside antenna from 40 to 60 feet in length and as high as possible will give good all around results. If your present antenna is to be used, a thorough examination should be made to determine its condition, as the connections may be corroded or broken thus rendering the antenna unfit for service. If a new antenna is to be constructed, care should be taken to prevent the lead-in wire from grounding to trees, walls or gutters and all connections should be properly soldered to prevent corrosion and resulting noise. Connect the antenna lead-in to the post marked "A" at the back of the chassis.

ANTENNE

Une bonne antenne s'impose pour obtenir une réception satisfaisante. Une antenne extérieure de 13 à 20 mètres de long et placé aussi haut que possible donnera d'excellents résultats pour tout service. Si vous vous proposez d'utiliser votre antenne actuelle, il conviendra d'en faire un examen approfondi pour en déterminer l'état car les connexions peuvent en être rouillées ou rompues, ce qui rendrait l'antenne impropre à l'emploi. Si on décide de construire une nouvelle antenne, il convient de veiller à ce que le fil d'entrée ne rejoigne pas la terre par des arbres, des murs ou des gouttières, et toutes les connexions devront être soudées avec soin pour prévenir la corrosion et les parasites qui en résulteraient.

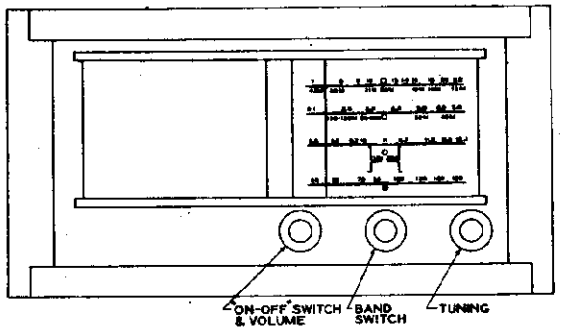

FIG. 1. CONTROLS.

Conéctese el alambre de bajada de la antena a la terminal marcada "A" en la parte trasera del chasis.

TIERRA

Una conexión a tierra bién hecha mejorará considerablemente la recepción aumentando la fuerza de las señales de estaciones lejanas y reduciendo el ruido de fondo. La conexión de tierra más satisfactoria consiste en una sección de tubería de un metro a 1.50 metros de largo, colocada verticalmente y casi cubierta de tierra húmeda; un extremo de la conexión a tierra se conecta a la terminal marcada "G" en el chasis.

FUNCIONAMIENTO

(Véase la fig. 1). El grabado indica la posición y propósito de cada perilla. Haciendo girar la perilla combinada interruptor (ON-OFF) y regulador de volumen hacia la derecha, el receptor empieza a funcionar. Las válvulas requieren un minuto más o menos para calentarse. Para aumentar el volumen es necesario girar la perilla hacia la derecha. El volumen se reduce haciendo girar la perilla hacia la izquierda y el receptor se apaga cuando se oye el ruido del interruptor.

Para sintonizar una estación gírese la perilla selectora hasta que la aguja indique la frecuencia deseada. La sintonización debe hacerse en el centro de la frecuencia de la onda para obtener la mejor calidad de tono posible.

El tono se cambia por medio de un interruptor en la parte atrás del receptor, de "Treble" (alto) a "Bass" (bajo).

El receptor tiene cuatro gamas de onda, y cualquiera de ellas puede seleccionarse por medio del conmutador de bandas. La banda que se está usando estará indicada por medio de un punto rojo en el centro de la escala correspondiente.

GROUND

A good ground will aid reception materially by improving the signal strength of distant stations and reducing background noise. The best ground is a 4 to 6 foot pipe driven down to damp earth; the ground lead-in should be securely soldered to this.

A suitable ground may be obtained by making a good connection to a water pipe or radiator. Connect the ground lead-in to the post marked "G" at the rear of the chassis.

PLACING THE RECEIVER IN OPERATION

Note figure 1. This shows the position and purpose of each control. Turning the combination "ON-OFF" switch and volume control to the right will turn the receiver ON. Approximately one minute will be required for the tubes to heat to operating temperature. Continued rotation of this knob to the right increases the volume. Turning this control to the left decreases the volume and, when a click is heard, turns the receiver OFF.

When tuning in a station turn the tuning knob slowly to the desired station. Care should be taken to tune the receiver to the middle of the signal, otherwise the tone will be impaired.

The tone may be changed by means of the switch at the back of the radio from "Treble" to "Bass."

The receiver has four tuning ranges, any one of which may be selected by means of the band switch. The band in use will be indicated by a red dot in the center of the corresponding scale.

Daylight has a decided effect on the reception of short wave stations and different wave lengths are most effective at different times of the day. The following table may be used as a guide.

PRISE DE TERRE

Une bonne prise de terre aidera notablement la réception en améliorant la force du signal pour les stations distantes et en réduisant le bruit de fond. La meilleure prise de terre consiste d'un tuyau de 4 à 6 pieds qu'on enfonce dans le sol humide; la prise de terre devra y être solidement soudée.

On peut réaliser une prise de terre convenable en établissant une bonne connexion au tuyau d'eau ou à un radiateur. Reliez la prise de terre au montant marqué "G" à l'arrière du châssis.

MISE DU RECEPTEUR EN SERVICE

Notez la fig. 1. Elle montre la position et l'objet de chaque contrôle. En tournant le commutateur combinaison interrupteur "ON-OFF" et contrôle du volume, vers la droite, le récepteur sera mis en circuit. If faut compter environ 1 minute pour que les lampes se chauffent à la tempèrature de fonctionnement. En continuant de tourner ce bouton vers la droite, le volume augmente en intensité. En tournant ce même contrôle vers la gauche, on diminue le volume de sonorité et: quand on entend un léger clic, c'est qu'on a mis le récepteur hors circuit.

Quand vous accordez une station, tournez le bouton de syntonisation lentement jusqu'à ce que vous ayez obtenu la station désirée. Il convient de veiller à accorder le poste au milieu de la fréquence d'onde correspondante; autrement le ton en sera affecté.

Le ton peut être modifié au moyen du commutateur qui se trouve à l'arrière du poste, et cela de la position "Treble" (haut) à "Bass" (bas).

Le récepteur possède quatre échelles d'accord parmi lesquelles on peut sélectionner l'une quelconque d'entre elles au moyen du commutateur sélectionneur de bandes. La bande en usage sera indiquée par un point rouge au centre de l'échelle correspondante.

La réception radiophonique sur ondes courtes est définitivement affectée par la lumière du jour et la réception sur différentes longueurs d'ondes est plus ou moins efficace à différents moments de la journée. Nous donnons à gauche un barème qui peut être suivi pour l'écoute des différentes stations pendant le jour ou la nuit.

La luz del día tiene una decidida influencia sobre la recepción de la onda corta y diferentes longitudes de onda alcanzan mayor eficacia a diferentes horas del día. El cuadro a la derecha puede ser usado como guía para sintonizar a diferentes horas del día y la noche.

SHORT WAVE BAND	TIME OF BEST RECEPTION
16 meters and below	A.M. (Morning hours)
19 and 25 meters	P.M. (Afternoon)
25 and 31 meters	P.M. (Early evening)
31 and 49 meters	P.M. (Late evening)

VALVULAS

Este receptor usa las válvulas siguientes:

7Q7 – 7B7 – 7C6 – 6L5G y 1J6G.

La fig. 2 muestra la posición de las válvulas.

TUBES

The following tubes are employed in this receiver:

7Q7 – 7B7 – 7C6 – 6L5G and 1J6G.

Figure 2 shows the correct socket for each tube.

LAMPES

Les lampes suivantes sont employées sur ce poste:

7Q7 – 7B7 – 7C6 – 6L5G et 1J6G.

La figure 2 montre la douille correcte pour chaque lampe.

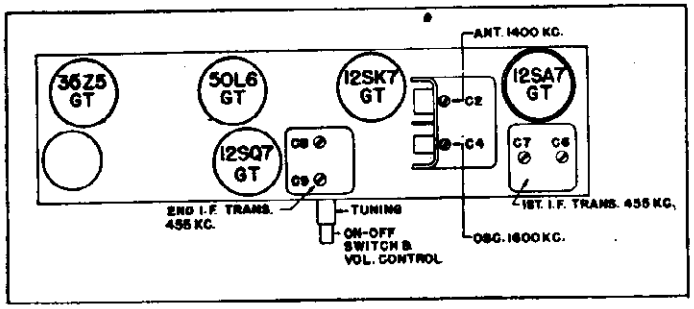
TO THE SERVICE MAN:

The filter circuits of chassis 5C01 incorporate new features that should be well understood by the service man. An examination of the schematic drawing will show the output transformer tapped slightly off center. This tap is the B+ connection from filter resistor R10 and capacitor C18 off the cathode of the rectifier 35Z5 to the 50L6 plate. The lower connection of the output transformer feeds B+ to the rest of the tubes in the receiver. Current flowing through the upper windings of the output transformer to the 50L6 produces a magnetic field which is 180° out of phase with the magnetic field produced by current flowing in the opposite direction through the output transformer to the rest of the receiver, therefore, most of the AC hum is cancelled. Further reduction of hum is accomplished by filtering through resistor R9 and 11 and capacitors C16 and 17. Capacitor C15 across the primary of the output transformer by passes high frequency back to ground.



TUBE AND TRIMMER LOCATION

This development in filtering systems allows a higher effective plate voltage on the 50L6 for increased power output.

NOTE: The output transformer must be replaced with an exact duplicate Part No. 202-549. Be sure to add the speaker code letter to the transformer Part number.

TO THE SERVICE MAN:

The 5C02 and 5C04 chassis are identical electrically. Chassis 5C02 has a Record Reject push button switch on the receiver control panel to reject records.

The socket P1 is used to connect the automatic record changer to the receiver.

The Phono-Radio switch is a two position double acting push-button switch and when in the "in" position connects the changer for playing records.

Chassis 5C04 has the same Phono-Radio switch arrangement. However, the 5C04 does not have socket P1 and the Record Reject switch. The record player is connected to the receiver by a shielded cable and socket arrangement.

INSTRUCCIONES PARA INSTALACION, FUNCIONAMIENTO Y SERVICIO

GENERALIDADES

Después de desembalar el receptor de su caja de cartón, deberá quitarse del chasis las bandas de papel engomado usado para el empaque y embarque.

Este receptor es un superheterodino moderno que sintoniza sobre las siguientes escalas de onda larga y de onda corta: 545 a 1520 Kc. (550 a 197 metros), 2350 a 7100 Kc. (127.7 a 42.3 metros), 6900 a 22,000 Kc. (43.5 a 13.6 metros).

SUMINISTRO DE ENERGIA

El receptor puede ser usado ya sea conectado a corriente alterna (C.A.) de 25 a 60 ciclos, o a corriente continua (C.C.)

> **IMPORTANTE**
>
> **Este receptor es enviado de la fábrica para ser usado sobre una corriente de 210-250 voltios. Para ajustar el receptor para una corriente de 115 voltios retire el tornillo de cierre del tubo de resistencia. Retire el tubo de su portatubo y vuelva a insertarlo en la posición 115 voltios, indicada sobre el chasis.**

Si el receptor no comienza a funcionar dentro de un minuto cuando se le conecta a una corriente continua, la ficha de contacto debe ser invertida en el enchufe de la pared. Debe emplearse también este procedimiento en caso de escucharse un zumbido cuando el receptor funciona con corriente alterna.

El consumo total de energía cuando funciona con 115 voltios, es de 25 watios; y cuando funciona con 230 voltios, es de 58 watios.

La máxima producción de energía funcionando con 115 voltios es de 1.4 watios; y con 230 voltios, es de 3 watios.

> **IMPORTANTE**
>
> **Se dispone de resistencias especiales para funcionar con suministros de energía de los siguientes voltajes:**
> **150 Voltios. Parte No. 100-87**
> **175 Voltios. Parte No. 100-89**
> **200 Voltios. Parte No. 100-91**
> **Estos tubos de resistencia deben ser insertados de tal manera que el alfiler de inserción esté en la posición de 220 voltios, de lo contrario no funcionará el receptor.**

Es indispensable una buena antena para obtener una recepción satisfactoria. Una antena exterior de 13 a 20 metros de longitud y de la mayor altura posible, dará buenos resultados para uso general. Si ha de usar su antena actual, ésta debe ser minuciosamente examinada para determinar su estado, ya que las conexiones pueden estar oxidadas o interrumpidas, haciéndola inapropiada para el uso. Si se ha de instalar una nueva antena hay que tomar las precauciones necesarias para

INSTALLATION, OPERATING AND SERVICE INSTRUCTIONS

GENERAL

After the receiver has been unpacked from the carton, the paper tape used for packing and shipping must be removed from the chassis.

This receiver is a modern superheterodyne, tuning over the following standard broadcast and short-wave bands: 545 to 1520 Kc. (550 to 197 meters), 2350 to 7100 Kc. (127.7 to 42.3 meters), 6900 to 22,000 Kc. (43.5 to 13.6 meters).

POWER SUPPLY

The receiver may be used on either alternating current (A.C.) of 25 to 60 cycles or direct current (D.C.).

> **IMPORTANT**
>
> **This receiver is shipped from the factory for use on 210-250 volt power supply. To adjust the receiver for 115 volt power supply, remove the locking screw on the ballast tube. Remove the tube from its socket and re-insert it in the 115 volt position as indicated on the chassis.**

If the receiver does not operate within one minute when connected to direct current, the power plug should be reversed at the wall socket. This procedure should also be followed if a hum is apparent when the receiver is operated on alternating current.

The total power consumption when operated on 115 volts is 25 watts, and when operated on 230 volts, 58 watts.

The maximum power output on 115 volts is 1.4 watts and on 230 volts is 3 watts.

> **IMPORTANT**
>
> **Special ballasts are available for operation with power supplies of the following voltages:**
> **150 Volt... Part No. 100-87**
> **175 Volt... Part No. 100-89**
> **200 Volt... Part No. 100-91**
> **These ballast tubes must be inserted so the hold down bracket is in 220 volt position or the receiver will not operate.**

ANTENNA

A good antenna is necessary for satisfactory reception. An outside antenna from 40 to 60 feet in length and as high as possible will give good all-around results. If your present antenna is to be used, a thorough examination should be made to determine its condition, as the connections may be corroded or broken, thus rendering the antenna unfit for service. If a new antenna is to be constructed, care should be taken to prevent the lead-in wire from grounding to trees, walls or gutters and all connections should be properly soldered to prevent corrosion and resulting noise. Connect

INSTRUCTIONS POUR INSTALLATION, OPERATION ET SERVICE

GENERALITES

Après avoir déballé le poste-récepteur de son cartonnage, les bandes de papier utilisées pour l'empaquetage et le transport seront enlevées du chassis.

Ce poste est un superhétérodyne moderne dont la syntonisation couvre les échelles de réception des ondes longues et des ondes courtes suivantes: de 545 à 1520 Kc. (de 550 à 197 mètres), de 2350 à 7100 Kc. (de 127,7 à 42,3 mètres), de 6900 à 22,000 Kc. (43,5 à 13,6 mètres).

SOURCE DE PUISSANCE

On peut employer ce récepteur soit avec du courant alternatif (C.A.) de 25 à 60 cycles, soit avec du courant continu (C.C.).

> **AVIS**
>
> **Ce récepteur a été prévu par la fabrique pour usage avec une source de puissance de 210 à 225 volts. Afin d'adapter le récepteur à une source de puissance de 115 volts, enlevez la vis d'attache du tube de résistance. Enlevez le tube de son support et remettez-la à la position de 115 volts indiquée sur le chassis.**

Si le poste ne fonctionne pas dans une minute après avoir été connecté avec le courant continu, tournez la fiche en sens inverse, dans la prise du mur. Ceci sera fait également si un bourdonnement se produit lorsque le poste fonctionne sur courant alternatif.

La consommation totale de puissance lorsque le poste est opéré sur 115 volts, est de 25 watts; et de 58 watts lorsqu'il fonctionne sur 230 volts.

Le débit de puissance maximum sur 115 volts est de 1,4 et sur 230 volts est de 3 watts.

> **AVIS**
>
> **Des résistances spéciales peuvent être obtenues pour usage avec débits de puissance aux voltages suivants:**
> **150 volts... Pièce No. 100-87**
> **175 volts... Pièce No. 100-89**
> **200 volts... Pièce No. 100-91**
> **Ces tubes de résistance doivent être insérés de façon à ce que l'emboîture d'attache soit à la position de 220 volts ou le poste ne pourra pas être mis en jeu.**

ANTENNE

Une bonne antenne est nécessaire pour obtenir une réception satisfaisante.

Une antenne extérieure de 40 à 60 pieds (13 à 20 mètres) de longueur et aussi élevée que possible donnera de bons résultats pour l'usage général. Si vous devez employer votre antenne actuelle, examinez-la soigneusement afin d'en déterminer l'état. Les connections peuvent en être rouillées ou cassées, rendant l'antenne inutilisable. Si une nouvelle antenne doit être construite, soyez sûr

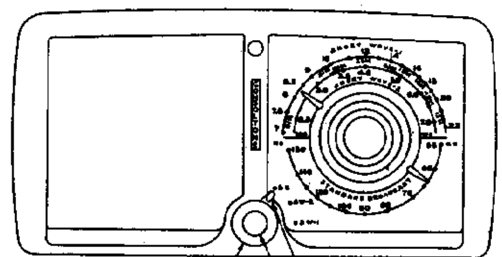

FIG. 1 CONTROLS

que el alambre de bajada no haga contacto con las paredes, árboles o cualquier otre objeto. Todas las conexiones deberán ser correctamente soldadas para evitar la oxidación y la producción de ruido consiguiente. Conéctese el extremo del alambre de bajada de la antena a la terminal azul en la parte posterior del chasis.

TIERRA

Una buena conexión a tierra mejorará efectivamente la recepción, aumentando la fuerza de las señales de las estaciones lejanas y reduciendo el ruido de fondo. La mejor conexión a tierra es un caño de 1.50 mt. introducido en tierra húmeda. El alambre a tierra debe ser soldado al caño o asegurado cuidadosamente con una buena grapa de toma de tierra, limpiando previamente con cuidado el caño en éste punto. Una buena conexión a tierra puede obtenerse haciendo una buena conexión a un caño de agua o a un radiador. Conecte el extremo de la bajada a tierra a la terminal del alambre negro situado en la parte posterior del chasis.

PUESTA DEL RECEPTOR EN FUNCIONAMIENTO

Estudie la Figura 1. Esta indica la posición y finalidad de cada control. Girando hacia la derecha la perilla de la combinación "OFF-ON" y del control de volumen, el receptor se pondrá en funcionamiento (ON), encendiéndose una luz piloto, roja. Se requiere aproximadamente 30 segundos para que los tubos se calienten a la temperatura de funcionamiento. Continuando la rotación de esta perilla a la derecha, aumenta el volumen. Girando esta perilla hacia la izquierda disminuye el volumen, y cuando se oye un ruido "clic" se desconecta el receptor. Cuando se está sintonizando una estación, gire la perilla de sintonización lentamente hacia la estación deseada. Deberá ponerse cuidado para sintonizar el receptor le the antenna lead-in to the blue lead at the back of the chassis.

GROUND

A good ground will aid reception materially by improving the signal strength of distant stations and reducing background noise. The best ground is a 4 to 6 foot pipe driven in moist earth. The ground wire should be soldered to the pipe or fastened securely with a good ground clamp, first thoroughly cleaning the pipe at that point.

A suitable ground may also bo obtained by making a good obtained by making a good connection to a water pipe or radiator. Connect the ground lead-in to the black wire at the rear of the chassis.

PLACING THE RECEIVER IN OPERATION

Study Figure 1. This shows the position and purpose of each control. Turning the combination "OFF-ON" switch and volume control to the right will turn the receiver ON and a red pilot will light up. Approximately 30 seconds will be required for the tubes to heat to operating temperature. Continued rotation of this knob to the right increases the volume. Turning this control to the left decreases the volume and, when a click is heard, turns the receiver OFF.

When tuning in a station turn the tuning knob slowly to the desired station. Care should be taken to tune the receiver properly, otherwise the tone will be impaired.

The receiver has three tuning ranges, any one of which may be selected by means of the band switch. The band in use will be indicated by the band switch lever pointing to one of three white dots marked BC, SW-2 and SW-1 on the dial face.

Daylight has a decided effect on the reception of short wave

que le fil de prise de terre ne fasse pas contact dans un arbre, un mur ou un fossé et que toutes les connections soient soudées convenablement afin d'éviter la rouille et les bruits parasites qui en sont le résultat. Attachez le fil d'entrée de l'antenne au terminal bleu au dos du chassis.

PRISE DE TERRE

Une bonne prise de terre favorisera beaucoup la réception en renforçant la puissance des signaux des stations éloignées et en diminuant les bruits parasites. La meilleure prise de sol se fait au moyen d'un tuyeau de 4 à 6 pieds (1,5 mètres) de longueur, placé dans une terre humide. Le fil de prise de terre devra être soudé au tuyeau ou attaché bien solidement avec un bon crampon de sol, le tuyeau ayant été nettoyé soigneusement à cet endroit au préalable.

Une bonne prise de terre peut aussi être effectué en attachant soigneusement le fil de prise de terre à un tuyeau d'eau ou à un radiateur. Attachez le fil d'entrée au terminal noir au dos du chassis.

MISE EN FONCTION

Etudiez la figure 1. Elle démontre la position et le rôle de chaque bouton de contrôle. Tournez le commutateur combinaison "Off-On" et le bouton de commande de volume vers la droite et le poste sera mis en fonction et allumera la lampe-pilote rouge. Environ 30 secondes seront nécessaires pour chauffer les tubes à la température d'opération. Pour augmenter le volume, continuez de tourner le bouton vers la droite. Si vous le tournez vers la gauche, le volume diminuera et pour cesser la réception, continuez de tourner vers la gauche jusqu'à la production d'un déclic.

Pour syntoniser une station, tournez lentement le bouton d'accord jusqu'à la station désirée. L'accord doit être mis au point soigneusement, autrement la qualité du son s'en ressentira.

Le poste a trois gammes d'accord, dont on peut choisir

bidamente, de lo contrario se desmejorará el tono.

El receptor tiene tres escalas de sintonización, pudiendo seleccionarse cualquiera por medio de una perilla de escalas. La escala en uso estará indicada por el indicador de la perilla de escala señalando a uno de los puntos blancos marcados BC, SW-2 y SW-1 en la superficie del dial.

La luz del día tiene una decidida influencia sobre la recepción de las estaciones de onda corta, teniendo las diferentes longitudes de onda mayor eficacia a distintas horas del día. El cuadro a la derecha puede ser usado como guia.

VALVULAS

En este aparato se emplean las siguientes **válvulas:**

12SA7GT	35L6GT
12SK7GT	35Z5GT
12SQ7GT	100-85

La Figura 2 indica la situación correcta del porta-válvula para cada válvula.

stations and different wave lengths are most effective at different times of the day. The table below may be used as a guide.

SHORT WAVE BAND	TIME OF BEST RECEPTION
16 meters and below	A.M. (Morning hours)
19 and 25 meters	P.M. (Afternoon)
25 and 31 meters	P.M. (Early evening)
31 and 49 meters	P.M. (Late evening)

TUBES

The following tubes are used in this set:

12SA7GT	35L6GT
12SK7GT	35Z5GT
12SQ7GT	100-85

Figure 2 shows the correct socket location for each tube.

n'importe laquelle au moyen du commutateur de bande. La bande en usage sera indiquée par l'aiguille de repère du commutateur de bande, indiquant l'un des trois points blancs marqués BC, SW-2 et SW-1 sur le cadran.

La lumière du jour joue un rôle incontestable quant à la réception des stations à ondes courtes; et les différentes longueurs d'ondes sont mieux reçues à des heures différéntes. La table à la gauche peut être employée comme guide.

TUBES

Les tubes suivants sont employés avec cet appareil:

12SA7GT	35L6GT
12SK7GT	35Z5GT
12SQ7GT	100-85

La figure 2 montre la position correcte du support de chaque tube.

INSTRUCCIONES PARA LA INSTALACION Y FUNCIONAMIENTO

INFORMACION GENERAL

Después de desembalar el receptor, el papel engomado usado en embalaje y embarque, tiene que quitarse del chasis. La tabla de montajé, usada solamente en los receptores con gabinetes de material plástico, puede removerse siguiendo las instrucciones que se encuentran sobre dicha tabla. Radios con gabinetes de madera no requieren una tabla de montaje, y están listos para funcionar después de quitar el papel engomado.

Este receptor es un moderno aparato superheterodino, de seis válvulas, incluyendo una reguladora, que sintoniza las bandas de onda larga y corta, como sigue: 540 a 1660 Kc. (555 a 180 metros), 2100 a 7300 Kc. (143 a 41 metros), 6800 a 22,500 Kc. (44 a 13.3 metros) y una gama de ondas especial desde 9400 a 12.200 Kc. (31.9 a 24.6 metros) con ensanchamiento de banda en 25 y 31 metros.

Está equipado con altoparlante electrodinámico y un regulador de tono de dos posiciones.

SUMINISTRO DE ENERGIA

El receptor puede ser usado con corriente alternada (C.A.) de 50 á 60 períodos o con corriente continua (C.C.). Sale de la fábrica ajustado para uso con 230 voltios y puede ser reajustado para funcionar con corriente de 115 voltios, removiendo el tornillo de cierre en la válvula reguladora ("Ballast"), quitando el tubo de su zócalo y volviendo a insertar este en el zócalo en la posición de 115 voltios tal como está indicado en el mismo.

Si el receptor no funciona después de estar conectado a la corriente continua durante un minuto, el tomacorriente tiene que ponerse en posición opuesta en el enchufe. Este procedimiento tiene que seguirse también, si se siente un zumbido cuando el receptor está funcionando sobre corriente alternada.

El consumo total de energía cuando está operando en 115 voltios, es de 26 vatios, y cuando está operando en 230 de 60 vatios. La potencia de salida máxima en 115 voltios es de 2.1 vatios, y en 230 voltios es de 4.25 vatios.

Cuando se requiera, podemos suministrar tubos de resistencia especiales para funcionamiento con corrientes otras que de 115 ó 230 voltios, como sigue:

150 voltios—No. de ref. 100-87
175 voltios—No. de ref. 100-89
200 voltios—No. de ref. 100-91

Los tubos de resistencia deben colocarse en la posición de 230 voltios. De otra manera, el receptor no funcionará.

ANTENA

Una buena antena es indispensable para la recepción de radio y mientras más cuidadosa sea la instalación mejores serán

INSTALLATION, OPERATING AND SERVICE INSTRUCTIONS

GENERAL

After the receiver has been unpacked from the carton, the paper tape used for packing and shipping must be removed from the chassis. The mounting board, used only on receivers with plastic cabinets, may be removed by following the instructions placed on the board. Radios with wooden cabinets do not require a mounting board; they are ready for operation after removing the paper tape.

This receiver is a modern six tube (including ballast) superheterodyne, tuning over the following standard broadcast and short-wave bands: 540 to 1660 Kc (555 to 180 meters), 2100 to 7300 Kc (143 to 41 meters), 6800 to 22,500 Kc (44 to 13.3 meters), and a special range covering 9400 to 12,200 Kc (31.9 to 24.6 meters) with spread bands at 25 and 31 meter.

It is equipped with an electrodynamic speaker and a two position tone control.

POWER SUPPLY

The receiver may be used on either alternating current (A. C.) or 50 to 60 cycles or direct current D.C.) It leaves the factory adjusted for use on 230 volt power supply and may be readjusted to operate on 115 volt power lines by first removing the locking screw on the ballast tube, removing the tube from its socket, and reinserting in the socket in the 115 volt position as indicated on the socket.

If the receiver does not operate within one minute when connected to direct current, the power plug should be reversed at the wall socket. This procedure should also be followed if a hum is apparent when the receiver is operated on alternating current.

The total power consumption when operated on 115 volts is 26 watts, and when operated on 230 volts, 60 watts.

The maximum power output on 115 volts is 2.1 watts and on 230 volts is 4.25 watts.

Special ballast tubes are available for operation with mains other than 115 or 230 volts. They are as follows:

150 Volt....Part No. 100-87
175 Volt....Part No. 100-89
200 Volt....Part No. 100-91

These ballast tubes must be inserted so the hold-down bracket is in the 230 volt position; otherwise the receiver will not operate.

ANTENNA

A good antenna is necessary for satisfactory reception, and is well worth the effort expended in its construction. An outside antenna from 40 to 60 feet in length and as high as possible will give good all-around results. If your present antenna is to be used, a thorough examination should be made to determine its condi-

LES INSTRUCTIONS POUR L'INSTALLATION ET LE FONCTIONNEMENT

GENERAL

Après déballage du récepteur de la boite en carton, la bande de papier-cache employée pour l'emballage et l'expédition doit être enlevée du châssis. Le panneau de montage, usé seulement avec des récepteurs avec meubles en matière plastique, peut être enlevé en suivant les instructions données sur le panneau. Les récepteurs de TSF avec meubles en bois n'ont pas besoin d'un panneau de montage; ils sont prêts à fonctionner après que la bande de papier-cache a été enlevée.

Le present poste est un récepteur superhétérodyne moderne à six lampes, compris la lampe ballaste, dont l'accord englobe les bandes standard suivantes d'ondes moyennes et d'ondes courtes: 540 à 1660 Kc. (555 à 180 mètres), 2100 à 7300 Kc. (143 à 41 mètres), 6800 à 22,500 Kc. (44 à 13.3 mèters), et une échelle spéciale qui couvre de 9400 à 12,200 Kc. (31.9 à 24.6 mètres) avec épanouissement des bandes à 25 et 31 mètres.

Il est équipé d'un hautparleur électrodynamique et d'une commande de ton a deux positions.

ALIMENTATION DE COURANT

On peut user le poste récepteur dans le courant alternatif (C.A.) 50 à 60 périodes ou le courant continu. (C.C.) Il est sorti de l'usine réglé pour fonctionner sur une provision d'énergie de 230 volts, et on peut rajuster pour l'opération sur courant de 115 volts en enlevant d'abord la vis de blocage dans la lampe ballaste, enlevant la lampe de sa douille, et remplaçant dans la douille dans la position 115 volts comme indiqué dans la douille.

Si le poste récepteur n'opère pas en dedans d'une minute quand il est relié au courant constant, on devrait renverser la prise de courant à la douille dans le mur. On devrait adapter cette procédure aussi si un murmure est apparent quand le poste récepteur est opéré dans le courant alternatif.

La consomption totale d'énergie quand en opération dans 115 volts est 26 watts, et quand en opération dans 230 volts est 60 watts.

Le maximum rendement d'énergie dans 115 volts est 2.1 watts et dans 230 volts est 4.25 watts.

Des valves spéciales (valves de résistance) sont disponibles pour des réseaux autres que de 115 ou 230 volts, comme suit:

150 volts—Pièce No. 100-87
175 volts—Pièce No. 100-89
200 volts—Pièce No. 100-91

Ces valves de résistance doivent être insérées de manière que la barre de serrage se trouve en position de 230 volts, autrement le récepteur ne fonctionnera pas.

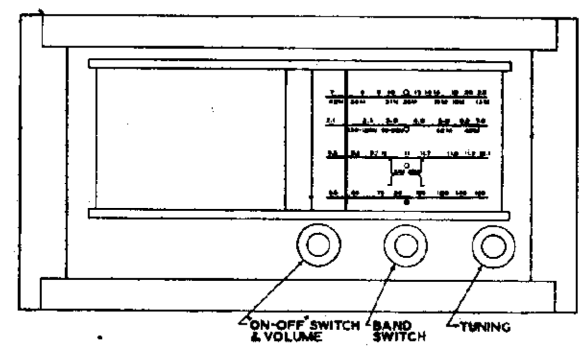

FIG. 1—CONTROLS

los resultados. Una antena exterior de 13 a 20 metros instalado lo más alto posible es la más apropiada para uso general. Si se ha de usar una antena ya instalada, ésta debe examinarse minuciosamente para determinar su estado pues puede haber conexiones óxidadas o rotas, que nulifican la eficacia de la antena. Por otra parte si ha de instalarse una antena nueva hay que tomar las precauciones necesarias para que el alambre de bajada no haga contacto con la pared o con cualquier objeto que resulte en una conexión a tierra. Todas las conexiones deben estar correctamente soldadas para prevenir contra la oxidación y los ruidos que se producen a consecuencia de esto. Conéctese el alambre de bajada de la antena a la terminal marcada "A" en la parte trasera del chasis.

TIERRA

Una conexión a tierra bién hecha mejorará considerablemente la recepción aumentando la fuerza de las señales de estaciones lejanas y reduciendo el ruido de fondo. La conexión tierra más satisfactoria consiste en una sección de tubería de un metro a 1.50 metros de largo, colocada verticalmente y casi cubierta de tierra húmeda; un extremo de la conexión a tierra se conecta a la terminal marcada "G" en el chasis.

FUNCIONAMIENTO

(Véase la fig. 1). El grabado indica la posición y propósito de cada parilla. Haciendo girar la perilla combinada interruptor (OFF-ON) y regulador de volumen hacia la derecha, el receptor empieza a funcionar. Las válvulas requieren un minuto más o menos para calentarse. Para aumentar el volumen es necesario girar la perilla hacia la derecha. El volumen se reduce haciendo girar la perilla hacia la izquierda y el receptor se apaga cuando se oye el ruido del interruptor.

Para sintonizar una estación gírese la perilla selectora hasta que la aguja indique la frecuencia deseada. La sintonización debe hacerse en el centro exacto de la señal para obtener

tion, as the connections may be corroded or broken, thus rendering the antenna unfit for service. If a new antenna is to be constructed, care should be taken to prevent the lead-in wire from grounding to trees, walls, or gutters and all connections should be properly soldered to prevent corrosion and resulting noise. Connect the antenna lead-in to the post marked "A" at the back of the chassis.

GROUND

A good ground will aid reception materially by improving the signal strength of distant stations and reducing background noise. The best ground is a 4 to 6 foot pipe driven down to damp earth; the ground lead-in should be securely soldered to this.

A suitable ground may be obtained by making a good connection to a water pipe or radiator. Connect the ground lead-in to the post marked "G" at the rear of the chassis.

PLACING THE RECEIVER IN OPERATION

Note Fig. 1. This shows the position and purpose of each control. Turning the combination "Off-On" switch and volume control to the right will turn the receiver ON. Approximately one minute will be required for the tubes to heat to operating temperature. Continued rotation of this knob to the right increases the volume. Turning this control to the left decreases the volume and, when a click is heard, turns the receiver OFF.

When tuning in a station turn the tuning knob slowly to the desired station. Care should be taken to tune the receiver to the exact middle of the wave; otherwise the tone will be impaired.

The tone may be changed by means of the switch at the back of the radio from "High" to "Low."

The receiver has four tuning scales, any one of which may be selected by means of the

ANTENNE

Une bonne antenne s'impose pour obtenir une réception satisfaisante, et vaut bien l'effort nécessaire pour sa construction. Une antenne extérieure de 13 à 20 mètres de long et placée aussi haut que possible donnera d'excellents résultats pour tout service. Si vous vous proposez d'utiliser votre antenne actuelle, il conviendra d'en faire un examen approfondi pour en déterminer l'état car les connexions peuvent en être rouillées ou rompues, ce qui rendrait l'antenne impropre à l'emploi. Si on décide de construire une nouvelle antenne, il convient de veiller à ce que le fil d'entrée ne rejoigne pas la terre par des arbres, des murs ou des gouttières, et toutes les connexions devront être soudées avec soin pour prévenir la corrosion et les parasites qui en résulteraient. Reliez le fil d'entrée de l'antenne au montant marqué "A" à l'arrière du châssis.

PRISE DE TERRE

Une bonne prise de terre aidera notablement la réception en améliorant la force du signal pour les stattions distantes et en réduisant le bruit de fond. La meilleure prise de terre consiste d'un tuyau de 1 à 1.50 mètres qu'on enfonce dans le sol humide; la prise de terra devra y être solidement soudé.

On peut réaliser une prise de terre convenable en établissant une bonne connexion au tuyau d'eau ou à un radiateur. Reliez la prise de terre au montant marqué "G" à l'arrière du châssis.

MISE DU RECEPTEUR EN SERVICE

Notez la figure 1. Elle montre la position et l'objet de chaque contrôle. En tournant le commutateur combinaison interrupteur "OFF-ON" et contrôle du volume, vers la droite, le récepteur sera mis en circuit. Il faut compter environ 1 minute pour que les lampes se chauffent à la température de fonctionnement. En continuant de tourner ce bouton vers la droite, le volume augmente en intensité. En tournant ce même contrôle vers la gauche, on diminue le volume de so-

la mejor calidad de tono posible.

El tono se cambia por medio de un interruptor en la parte atrás del receptor, de "High" (alto) a "Low" (bajo).

El receptor tiene cuatro gamas de onda, y cualquiera de ellas puede seleccionarse por medio del conmutador de bandas. La banda que se esté usanda estará indicada por medio de un punto rojo en el centro de la escala correspondiente.

La luz del día tiene una decidida influencia sobre la recepción de la onda corta y diferentes longitudes de onda alcanzan mayor eficacia a diferentes horas del día. El cuadro a la derecha puede ser usado como guía para sintonizar a diferentes horas del día y la noche.

VALVULAS

Este receptor usa las válvulas siguientes:

14Q7 - 7B7 - 7C6 - 50C6G - 35Z5GT - 100-85. 50L6GT

La fig. 2 muestra la posición de las válvulas.

FONOGRAFO

Este receptor está equipado con un "jack" y una ficha de fonógrafo situada en la parte posterior del chasis. Para utilizar el receptor con un tocadiscos, coloque el conmutador de bandas en una de las bandas de onda corta y controle el volumen de la producción del disco con el Control de Volumen del receptor.

band switch. The scale in use will be indicated by a red dot in the center of the corresponding scale.

Daylight has a decided effect on the reception of short wave stations and different wave lengths are most effective at different times of the day. The following table may be used as a guide.

SHORT WAVE BAND	TIME OF BEST RECEPTION
16 meters and below	A.M. (Morning hours)
19 and 25 meters	P.M. (Afternoon)
25 and 31 meters	P.M. (Early evening)
31 and 49 meters	P.M. (Late evening)

TUBES

The following tubes are employed in this receiver.

14Q7 - 7B7 - 7C6 - 50C6G - 35Z5GT - 100-85. 50L6GT

Figure 2 shows the correct socket for each tube.

PHONO

This receiver is equipped with a phono jack and plug located on the rear of the chassis. To use the receiver with a record player, set the Band Switch to one of the short wave bands and control the volume of the record reproduction with the receiver Volume Control.

norité et, quand on entend un léger clic, c'est qu'on a mis le récepteur hors circuit.

Quand vous accordez une station, tournez le bouton de syntonisation lentement jusqu'a ce que vous ayez obtenu la station désirée. Il convient de veiller à accorder le poste exactement au milieu de la longueur d'onde correspondante; autrement le ton en sera affecté.

Le ton peut être modifié au moyen du commutateur qui se trouve à l'arrière du poste, et cela de la position "High" (haut) à "Low" (bas).

Le récepteur possède quatre échelles d'accord parmi lesquelles on peut sélectionner l'une quelconque d'entre elles au moyen du commutateur sélectionneur de bandes. La bande en usage sera indiqueé par un point rouge au centre de l'échelle correspondante.

La réception radiophonique sur ondes courtes est définitivement affectée par la lumière du jour et la réception sur différentes longueurs d'ondes est plus ou moins efficace à différents moments de la journée. Nous donnons à gauche un barème qui peut être suivi pour l'écoute des différentes stations pendant le jour ou la nuit.

LAMPES

Les lampes suivantes sont employées sur ce poste:

14Q7 - 7B7 - 7C6 - 50C6G - 35Z5GT - 100-85.

La figure 2 montre la douille correcte pour chaque lampe.

PHONO

Ce récepteur est muni d'un "Phono Jack" et d'un Fiche placés au dos du Chassis. Pour faire fonctionner l'appareil avec le gramophone placez le Commutateur de Bandes à l'une des bandes d'ondes courtes et contrôlez le volume du son du disque par le bouon de contrôle de volume du récepteur.

PHONO

Este receptor esta provisto de una conexión para el fonógrafo, y una clavija o toma, situadas en la parte posterior del chasis. Para usar el receptor con un "Tocadiscos," ajuste el cambio de banda a una de las bandas de onda corta y controle el volumen del sonido con el control de volumen del receptor.

PHONO

The Phono Jack and Plug is located on the rear of the receiver chassis. When using a record player with this receiver set the band switch to one of the short wave bands. Control the phono volume with the receiver Volume Control.

PHONO

Ce recepteur est pourvu d'une "Cheville de Phonographe" et une prise, qui se trouvent au dos du châssis. Pour employer le poste avec un appareil phonographique externe ("record player"), tournez le commutateur sélectionneur de bandes à une des bandes d'ondes courtes, et réglez le volume du son au moyen du controle du volume du poste.

INSTRUCCIONES PARA LA INSTALACION Y FUNCIONAMIENTO

INFORMACION GENERAL

Despues de desembalar el receptor el papel engomado usado en embalaje y embarque, tiene que quitarse del chasis.

Este receptor es un moderno aparato superheterodino, de cinco tubos, que sintoniza las bandas de onda larga y corta siguientes: 540 a 1660 Kc. (555 a 180 metros), 2100 a 7300 Kc. (143 a 41 metros), 6800 a 22,500 Kc. (44 a 13.3 metros) y una escala especial de ondas desde 9400 a 12,200 Kc. (31.9 a 24.6 metros) con ensanchamiento de banda en 25 y 31 metros.

SUMINISTRO DE ENERGIA

PRECAUCION! ESTE RECEPTOR NO DEBE CONECTARSE A CORRIENTE CONTINUA (C.C.)

El transformador de fuerza fué ajustado en la fábrica a un voltaje máximo, y puede ajustarse al voltaje deseado mediante el conmutador graduado que se encuentra en el transformador.

El chasís 5C63BT ha sido diseñado para funcionar con 115 ó 225 voltios, de 50 ó 60 períodos.

El chasís 5C63AT ha sido diseñado para funcionar con 115 ó 225 voltios, de 25 a 100 períodos.

El chasís 5C63CT ha sido diseñado para funcionar con 95, 115, ó 150 voltios, de 50 a 60 períodos.

Para cerciorarse de las características exactas del servicio eléctrico en su localidad, consulte a la Compañía de Luz Eléctrica o pregunte a su agente Zenith; ajústese el conmutador del transformador de fuerza al voltaje correcto si fuere necesario.

El consumo total de energía es de 40 vatios y la salida máxima es de 3.5 vatios.

INSTALLATION, OPERATING AND SERVICE INSTRUCTIONS

GENERAL

After the receiver has been unpacked from the carton, the paper tape used for packing and shipping must be removed from the chassis.

This receiver is a modern five tube superheterodyne, tuning over the following standard broadcast and short-wave bands: 540 to 1660 Kc. (555 to 180 meters), 2100 to 7300 Kc. (143 to 41 meters), 6800 to 22,500 Kc. (44 to 13.3 meters), and a special range covering 9400 to 12,200 Kc. (31.9 to 24.6 meters) with spread bands at 25 and 31 meters.

POWER SUPPLY

CAUTION: DO NOT CONNECT THIS RECEIVER TO DIRECT CURRENT (D.C.)

This radio was shipped from the factory with the power transformer adjusted for high voltage operation and may be changed for low voltage operation by means of the switch located on the power transformer.

The 5C63BT chassis is designed to operate on 115 or 225 volts, 50 to 60 cycles.

The 5C63AT chassis is designed to operate on 115 or 225 volts, 25 to 100 cycles.

The 5C63CT chassis is designed to operate on 95, 115 or 150 volts, 50 to 60 cycles.

Ascertain your line voltage and frequency, preferably by consulting your dealer or local power company and if necessary reset the power switch to conform to the local power source.

Total power consumption is 40 watts. Maximum power output is 3½ watts.

ANTENNA

A good antenna is necessary for satisfactory reception. An outside antenna from 40 to 60 feet in length and as high as possible will give good all around results. If your present antenna is to be used, a thorough examination should be made to determine its condition, as the connections may be corroded or broken thus rendering the antenna unfit for service. If a new antenna is to be constructed, care should be taken to prevent the lead-in wire from grounding to trees, walls or gutters and all connections should be properly soldered to prevent corrosion and resulting noise. Connect the antenna lead-in to the post marked "A" at the back of the chassis.

LES INSTRUCTIONS POUR LA INSTALLATION ET FONCTIONNEMENT

GENERAL

Après déballage du récepteur de la boîte en carton, la bande de papier-cache employée pour l'emballage et l'expédition doit être enlevée du châssis.

Le présent poste est un récepteur superhétérodyne moderne à cinq lampes, dont l'accord englobe les bandes standard suivantes d'ondes longues et d'ondes courtes: 540 à 1660 Kc. (555 à 180 mètres), 2100 à 7300 Kc. (143 à 41 mètres), 6800 à 22,500 Kc. (44 à 1.3 mètres), et une échelle spéciale qui couvre de 9400 à 12,200 Kc. (31.9 à 24.6 mètres) avec épanouissement des bandes à 25 et 31 mètres.

ALIMENTATION DE COURANT

ATTENTION: NE PAS BRANCHER CE POSTE SUR COURANT CONTINU (C.C.)

Le poste a été expédié de l'usine avec son transformateur de courant réglé pour mise en service sur haut voltage et peut être changé pour emploi sur bas voltage au moyen du commutateur situé sur le transformateur de courant.

Le châssis 5C63BT est prévu pour emploi sur courant de 115 ou 225 volts, 50 à 60 périodes.

Le châssis 5C63AT est prévu pour emploi sur courant de 115 ou 225 volts, 25 à 100 périodes.

Le châssis 5C63CT est prévu pour mise en service sur courant de 95, 115 ou 150 volts, 50 à 60 périodes.

Assurez-vous du voltage et de la fréquence de votre courant, de préférence en consultant votre revendeur ou votre compagnie électrique locale, et, s'il y a lieu, ajustez le commutateur de courant en conformité avec la source électrique locale.

La consommation total de courant est de 40 watts. Le débit maximum de courant est de 3½ watts.

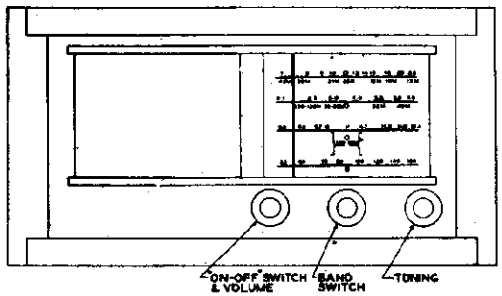

FIG. 1—CONTROLS

ANTENA

Una buena antena es indispensable para la recepción satisfactoria. Una antena exterior de 13 to 20 metros de longitud instalada lo más alto posible es la más apropiada para uso general. Si ha de usar una antena ya instalada, ésta debe examinarse minuciosamente para determinar su estado pues puede haber conexiones oxidadas o rotas, que nulifican la eficacia de la antena. Por otra parte si ha de instalarse una antena nueva hay que tomar las precauciones necesarias para que el alambre de bajada no haga contacto con la pared o con cualquier objeto

ANTENNE

Une bonne antenne s'impose pour obtenir une réception satisfaisante. Une antenne extérieure de 13 à 20 mètres de longueur et placée aussi haut que possible donnera d'excellents résultats pour tout service. Si vous vous proposez d'utiliser votre antenne actuelle il conviendra d'en faire un examen approfondi pour en déterminer l'état car les connexions peuvent en être rouillées ou rompues, ce qui rendrait l'antenne impropre à l'emploi. Si on décide de construire une nouvelle antenne, il convient de veiller à ce que le fil d'entrée ne rejoigne pas la terre par des arbres, des murs ou des gouttières, et toutes les connexions

que resulte en una conexión a tierra. Todas las conexiones deben estar correctamente soldadas para prevenir contra la oxidación y los ruidos que se producen a consecuencia de esto. Conéctese el alambre de bajada de la antena a la terminal marcada "A" en la parte trasera del chasis.

TIERRA

Una conexión a tierra bien hecha mejorará considerablemente la recepción aumentando la fuerza de las señales de estaciones lejanas y reduciendo el ruido de fondo. La conexión a tierra más satisfactoria consiste en una sección de tubería de un metro a 1,50 metros de largo, introducida verticalmente en tierra húmeda; un extremo de la conexión a tierra se conecta a la terminal marcada "G" en el chasis

FUNCIONAMIENTO

(Véase la fig. 1). El grabado indica la posición y propósito de cada perilla. Haciendo girar la perilla combinada del interruptor (ON-OFF) y regulador de volumen hacia la derecha, el receptor empieza a funcionar. Las válvulas requieren 30 segundos más o menos para calentarse. Para aumentar el volumen es necesario girar la perilla hacia la derecha. El volumen se reduce haciendo girar la perilla hacia la izquierda y el receptor se apaga cuando se oye el ruido del interruptor.

Para sintonizar una estación gírese la perilla selectora hasta que la aguja indique la frecuencia deseada. La sintonización debe hacerse en el centro de la frecuencia para obtener la mejor calidad de tono posible.

El tono se cambia por medio de un interruptor en la parte posterior del receptor, de "Alto" a "Bajo."

El receptor tiene cuatro escalas de onda, y cualquiera de ellas puede seleccionarse por medio del conmutador de bandas. La banda que se esté usando estará indicada por medio de un punto rojo en el centro de la escala correspondiente.

GROUND

A good ground will aid reception materially by improving the signal strength of distant stations and reducing background noise. The best ground is a 4 to 6 foot pipe driven down to damp earth; the ground lead-in should be securely soldered to this.

A suitable ground may be obtained by making a good connection to a water pipe or radiator. Connect the ground lead-in to the post marked 'G" at the rear of the chassis.

PLACING THE RECEIVER IN OPERATION

Note figure 1. This shows the position and purpose of each control. Turning the combination "ON-OFF" switch and volume control to the right will turn the receiver ON. Approximately 30 seconds will be required for the tubes to heat to operating temperature. Continued rotation of his knob to the right increases the volume. Turning this control to the left decreases the volume and, when a click is heard, turns the receiver OFF.

When tuning in a station turn the tuning knob slowly to the desired station. Care should be taken to tune the receiver to the middle of the signal; otherwise the tone will be impaired.

The tone may be changed by means of the switch at the back of the radio from "Treble" to "Bass."

If a hum is apparent, reverse the power plug in the wall outlet.

The receiver has four tuning ranges, any one of which may be selected by means of the band switch. The band in use will be indicated by a red dot in the center of the corresponding scale.

Daylight has a decided effect on the reception of short wave stations and different wave lengths are most effective at different times of the day. The following table may be used as a guide.

SHORT WAVE BAND	TIME OF BEST RECEPTION
16 meters and below	A.M. (Morning hours)
19 and 25 meters	P.M. (Afternoon)
25 and 31 meters	P.M. (Early evening)
31 and 49 meters	P.M. (Late evening)

VALVULAS

Este receptor usa las válvulas siguientes:

7Q7 6X5GT
7A7 6K6GT
6SQ7GT

La fig. 2 muestra la posición de las válvulas.

TUBES

The following tubes are employed in this receiver:

7Q7 6X5GT
7A7 6K6GT
6SQ7GT

Figure 2 shows the correct socket location for each tube.

MISE DU RECEPTEUR EN SERVICE

Notez la fig. 1. Elle montre la position et l'objet de chaque contrôle. En tournant le commutateur combinaison interrupteur "ON-OFF" et contrôle du volume, vers la droite, le recepteur sera mis en circuit. Il faut compter environ 30 secondes pour que les lampes se chauffent à la température de fonctionnement. En continuant de tourner ce bouton vers la droite, le volume augmente en intensité. En tournant ce même contrôle vers la gauche, on diminue le volume de sonorité et, quand on entend un léger clic, c'est qu'on a mis le récepteur hors circuit.

Quand vous accordez une station, tournez le bouton de syntonisation lentement jusqu'a ce que vous ayez obtenu la station désirée. Il convient de veiller à accorder le poste au milieu de la fréquence d'onde correspondante; autrement le ton en sera affecté.

Le ton peut être modifié au moyen du commutateur qui se trouve à l'arrière du poste, et cela de la position "Haut" à "Bas."

Le récepteur possède quatre échelles d'accord parmi lesquelles on peut selectionner l'une quelconque d'entre elles au moyen du commutateur sélectionneur de bandes. La bande en usage sera indiquée par un point rouge au centre de l'echelle correspondante.

La réception radiophonique sur ondes courtes est définitivement affectée par la lumière du jour et la réception sur différentes longueurs d'ondes est plus ou moins efficace à différents moments de la journée. Nous donnons à gauche un barème qui peut être suivi pour l'ecoute des différentes stations pendant le jour ou la nuit.

LAMPES

Les lampes suivantes sont employées sur ce poste:

7Q7 6X5GT
7A7 6K6GT
6SQ7GT

La figure 2 montre la douille correcte pour chaque lampe.

DISTORTION AND POOR SENSITIVITY: Distortion and poor sensitivity caused by a short between turns on the wavemagnet. Poor sensitivity and set fails to operate on low frequency end of dial--replace oscillator coil.

UNCONTROLLED OSCILLATION: A 470,000 ohm carbon resistor soldered across the secondary of the first i-f transformer will correct this condition.

MODELS 6D014—6D029
CHASSIS No. 6C01

TO THE SERVICE MAN:

Chassis 6C01 features a high gain tuned R.F. circuit ahead of a conventional superheterodyne circuit, with feedback in the audio circuit, and a new filter circuit to reduce hum to a minimum.

Part of the audio voltage from the voice coil is fed back to the first audio grid(12SQ7) in phase through resistor R10 and R7 to a tap on the volume control R6. Capacitor C15 bypasses highs to ground. One side of the output transformer secondary is grounded. The side grounded determines the phase relationship of the feedback voltage, therefore, when replacing the output transformer be certain the proper end of the secondary is grounded or degeneration will result. The overall result of this arrangement is to boost the bass tones.

The filter circuits of chassis 6C01 incorporate new features that should be well understood by the service man. An examination of the schematic drawing will show the output transformer tapped slightly off center. This tap is the B + connection from filter resistor R11 and capacitor C20 off the cathode of the rectifier 35Z5 to the 35L6 plate. The lower connection of the output transformer feeds B+ to the rest of the tubes in the receiver. Current flowing through the upper windings of the output transformer to the 35L6 produces a magnetic field which is 180° out of phase with the magnetic field produced by current flowing in the opposite direction through the output transformer to the rest of the receiver, therefore, most of the AC hum is cancelled. Further reduction of hum is accomplished by filtering through resistors R12 and R13 and capacitors C18 and C19.

This development in filtering systems allows a higher effective plate voltage on the 35L6 for increased power output.

NOTE: The output transformer must be replaced with an exact duplicate, Part No. 206-549 be sure to add the speaker code letter to the transformer Part Number.

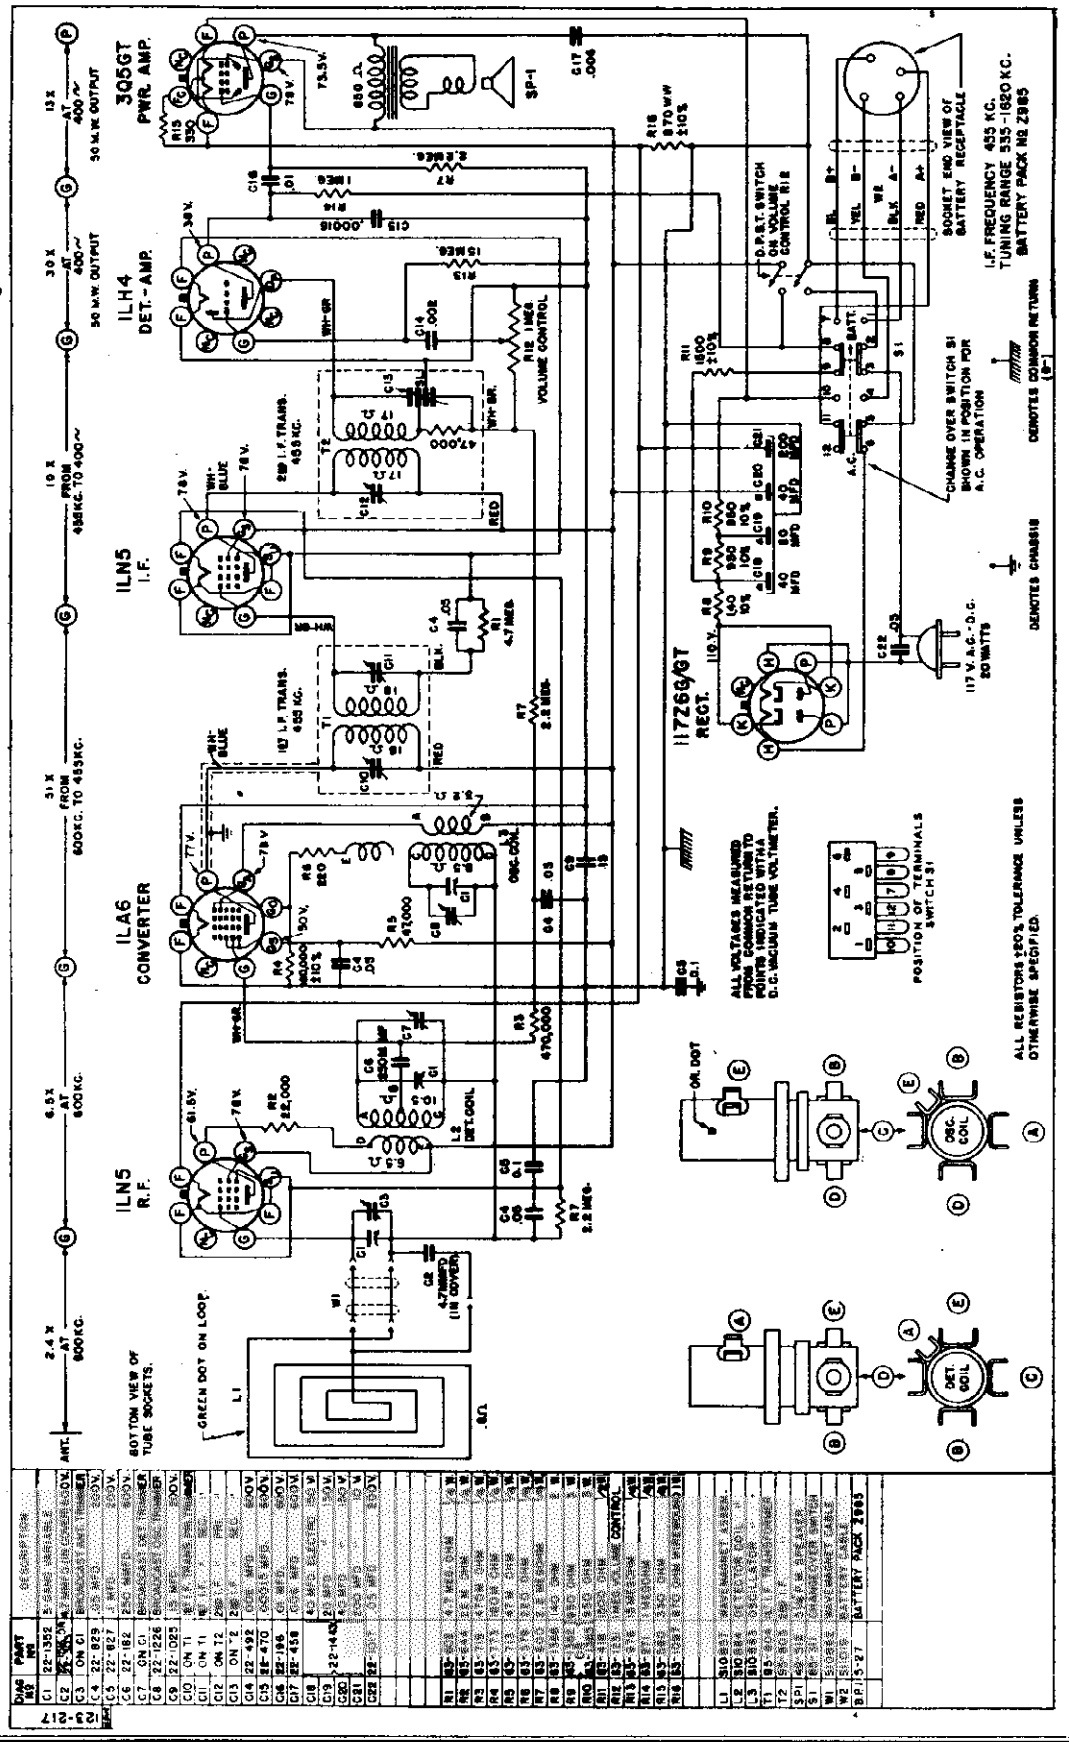
MODEL 6G001
Chassis 6C40

ZENITH RADIO CORP.

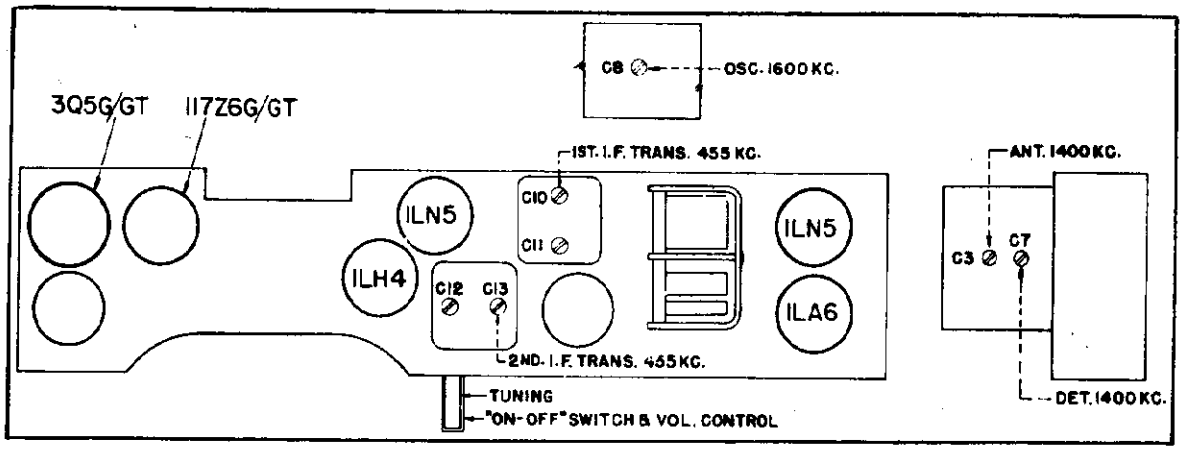
BLOCKING: The a-c plug being inserted in the battery saver switch socket while the on-off switch is on may cause the set to block and become dead. Switching the set off and on will relieve this blocked condition and return the set to normal operation.



TO THE SERVICE MAN:

The 6C40 chassis is an AC, DC or battery operated superheterodyne circuit with a stage of RF amplification. The chassis is isolated from the DC circuit, and all measurements must be made from a common negative point. The most convenient place to reach this negative point is the terminal strip to which C5 is connected. The DC resistance from chassis to any circuit must be almost infinite. If any circuit becomes grounded a hum will appear. Microphonic tubes will cause audio howl. Check 1LA6.

The wavemagnet is connected to the chassis through the hinges in the cabinet, snaps and flexible leads. If the RF becomes weak or dead, check resistance of wavemagnet at condenser gang. The DC resistance across the two leads should be approximately 1 ohm. If the circuit is open, remove the two screws that hold the handle and top panel. When the top is removed, the wavemagnet connecting leads will be visible for inspection. Also loosen the snap-on socket and check for shorted or broken leads.



TUBE AND TRIMMER LOCATION

IF Alignment: Remove the chassis from the cabinet and arrange the units so that the wavemagnet can be plugged in. All the connections and adjustments can be made from the top of the chassis. Connect a signal generator, through a .1 mfd. dummy antenna, to the lug on top of the center section of the gang condenser (converter grid) and condenser gang frame. Connect an output meter across the voice coil of the speaker (two lugs provided). Set the signal generator to 455Kc. and adjust C10, C11, C12 and C13 for maximum indication on the output meter. Always keep the signal output from the generator just high enough to get an indication, otherwise excessive loading may result. Remove the signal generator leads from the gang.

RF Alignment: Connect a two turn loop across the leads of the signal generator, loosely couple this loop to the wavemagnet. Set the signal generator and the dial pointer of the receiver to 1600 Kc. and adjust C8 to resonance. Set the signal generator and dial pointer to 1400 and adjust C7 (detector) and C3 (RF) to resonance. These trimmers are on the side of gang condenser. Check operation and re-install set in cabinet. Tune in a weak station near 1400 Kc. or use background noise and readjust C3 through the hole in the side of the cabinet for maximum sensitivity.

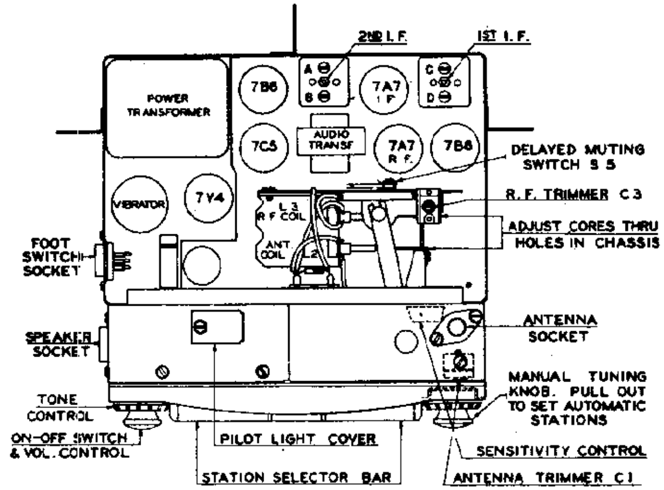

Fig. 7. Top View of Chassis

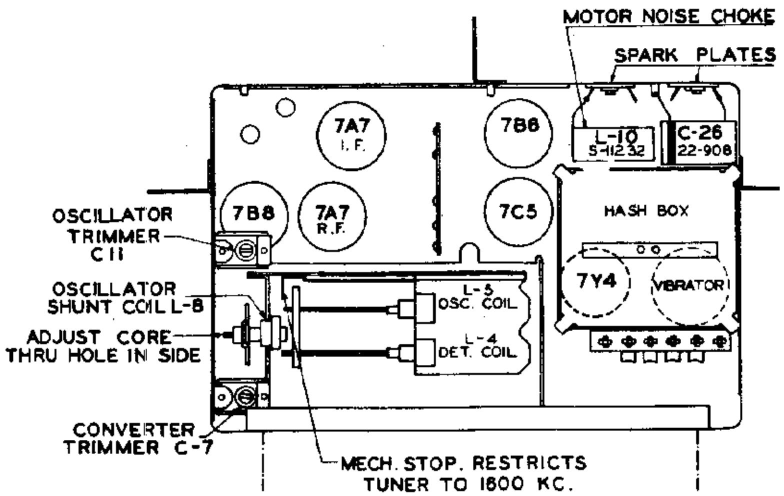

Fig. 8. Bottom View of Chassis

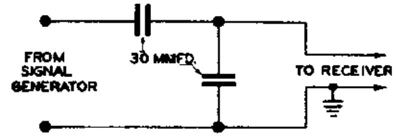

Fig. 9. Dummy Antenna

Fig. 9 shows the schematic of a recommended dummy antenna, closely resembling actual antenna capacity, to be used in series with signal generator leads when aligning the R.F. section of the receiver.

ALIGNMENT

Maximum performance depends on accurate alignment of the receiver; therefore follow these instructions carefully.

CAUTION: Make all alignment adjustments to the receiver with the volume control set at maximum, and the tone control in the treble position. Reduce the signal intensity as much as possible at the signal generator. Connect the output meter across the voice coil.

I.F. ALIGNMENT PROCEDURE

1—Remove top and bottom covers from receiver.

2—Set signal generator to 265 Kc.

3—Apply signal from generator through a .1 Mfd. dummy to 7B8 converter grid. (Pin No. 6 on socket.)

4—Adjust I.F. trimmers A, B, C and D (Fig. 7) in the order named for maximum output. Repeat the operation to assure accurate alignment.

R.F. AND OSCILLATOR ALIGNMENT

1—Connect signal generator leads through dummy, illustrated in Fig. 9, to antenna lead in socket on receiver.

2—Set signal generator to 535 Kc.

3—Place set in manual tuning position and set dial to 535 Kc.

4—Adjust oscillator trimmer C-11 (Fig. 8) for maximum response.

5—Set signal generator to 1200 Kc.

6—Tune set to 1200 Kc.

7—Adjust converter trimmer C-7 (Fig. 8) and R.F. trimmer C-3 (Fig. 7) for maximum response.

8—If dial calibration is off after making above adjustments, a correction can be made by loosening dial scale mounting screws and sliding scale to desired position.

CORE OR COIL REPLACEMENT ONLY

WARNING: The following adjustments are to be made ONLY if a core or coil is replaced.

1—Replace coil or core.

2—Set signal generator to 1700 Kc.

3—Connect signal generator leads through dummy, illustrated in Figure 9, to antenna receptacle on the receiver.

4—Set receiver dial to 1600 Kc. (maximum high frequency end of dial.)

5—Screw the core completely out of the antenna coil, the R.F. coil, the converter coil, and the oscillator coil.

6—Adjust oscillator trimmer C-11 (Fig. 8) at 1700 Kc.

7—Adjust converter trimmer C-7, R.F. trimmer C-3, and antenna trimmer C-1 (Fig. 7 and 8) for maximum output reading.

8—Replace cores to their approximate original position.

9—Set generator dial and receiver dial to 1200 Kc.

10—Adjust oscillator core L-5 (Fig. 8) to scale at 1200 Kc.

11—Adjust the antenna core, R.F. core, and converter core (Fig. 7 and 8) for maximum output reading.

12—Set signal generator to 600 Kc.

3—"Rock in" shunt oscillator coil L-8 (Fig. 8) for maximum output reading. This should be done only as a last resort. This is the same as rocking in the padder condenser on a ganged condenser receiver.

14—Check receiver at 1200 Kc. for calibration and gain. If the receiver is off scale or weak, repeat operations 9, 10 and 11.

15—After alignment is complete, the maximum high frequency tuning range should be checked. If the range is greater or less than 1605 Kc., the mechanical stop for the tuner cross arm should be bent to limit the frequency coverage to 1605 Kc.

After all adjustments have been made, glue core screws with speaker cement.

IMPORTANT: After reinstalling the receiver in the car, allow it to operate for approximately 15 minutes to reach normal operating temperature. Extend antenna to maximum. Check the antenna trimmer alignment on a weak station at approximately 1200 Kc.

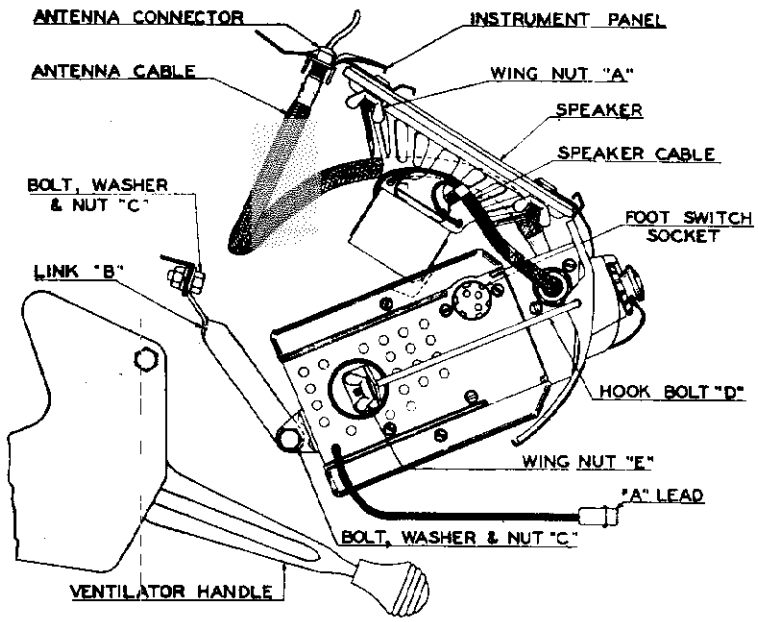

Fig. 1. Set Installed, Cut Away View.

RECEIVER INSTALLATION

Figures 1 and 2, illustrating the installed receiver, the escutcheon plate, and the control knobs, are given here to facilitate removal and reinstallation of this receiver when service or repair is necessary. To take the receiver from the car, remove the link "B" and loosen the hook bolts "D."

MANUAL TUNING

1. Press station selector touch bar (Fig. 2) several times or until the letter "M" appears in indicator window.
2. Pull manual tuning control knob (right hand) outward and turn to tune in desired station. Be sure to tune to exact frequency to assure the best tone quality.

VOLUME—Adjust left hand control knob for desired volume.

TONE CONTROL—The tone control is located behind the volume control knob. Turn in either direction for most pleasing tone.

ADJUST-O-MATIC TUNING

There are five automatic tuning positions which may be adjusted to five desired stations. If these positions have not been previously adjusted proceed as follows:

1. Press station selector touch bar until number 1 appears in station indicator window.

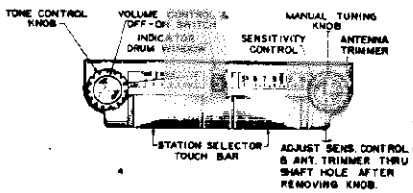

Fig. 2. Front Panel View

2. Pull manual tuning knob outward to engage the adjust-o-matic mechanism.
3. Select the station desired and tune to its frequency by turning the tuning knob. Tune very carefully for clearest reception.
4. Press station selector bar, pull manual tuning knob outward and tune in station desired for No. 2 position. Use same procedure for positions No. 3, 4 and 5.

When the five adjust-o-matic positions have been adjusted to the five desired stations as instructed, it is only necessary to press the station selector bar to return to dial tuning, or to only one of the stations set up on the Adjust-o-Matic.

DELAYED AUTOMATIC MUTING CIRCUIT

Pressing either the touch-bar or the foot control switch automatically mutes the receiver for the duration of the change cycle. This action is accomplished by applying 6 volts negative to the 7B6 first audio grid through the 1 megohm resistor R-21. (See schematic diagram.) This negative voltage blocks the grid of the 7B6 until the voltage bleeds off through the 15 megohm resistor R-14. Then the receiver will again operate normally.

NOTE: If the battery polarity is reversed the receiver will not mute and it may become distorted during the change cycle. Always connect the positive (+) terminal of the storage battery or power supply to the receiver case when checking the receiver.

INTERFERENCE SUPPRESSION

There should be no motor noise or interference from the ignition system if the receiver has been installed in the car according to the instructions furnished with it. The interference suppression equipment may be checked for proper installation by referring to the following illustrations:

The circuit breaker condenser No. 22-1148 should be installed as shown in Figure 3.

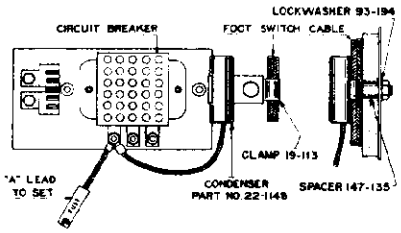

Fig. 3

The voltage regulator condenser No. 22-1148 and the ground strap should be installed as shown in Figure 4 below.

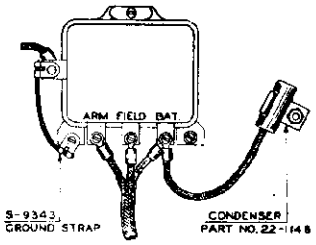

Fig. 4

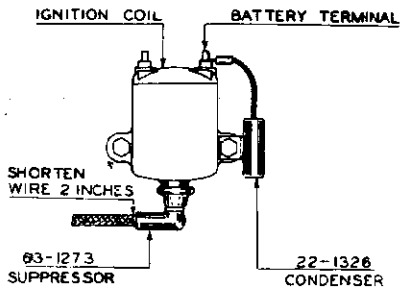

Fig. 5

The ignition coil condenser No. 22-1326 and suppressor with rubber nipple No. S-10408 should be installed as shown above in Figure 5. The oil gauge condenser No. 22-1326 should be installed as shown in Figure 6. Note the different locations for 6 and 8 cylinder cars.

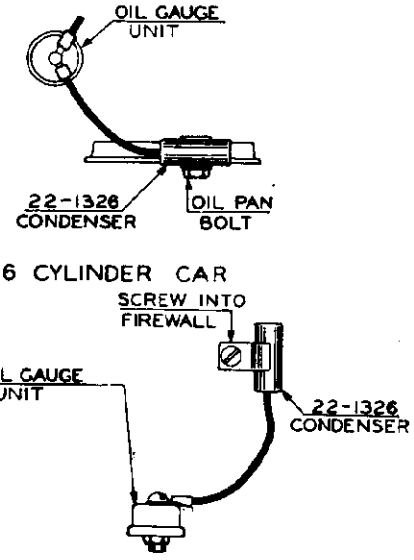

Fig. 6

Be sure the inside windshield divider trim strip, the antenna connector and all the instrument panel bolts are tight in order to make a good ground contact with the car body.

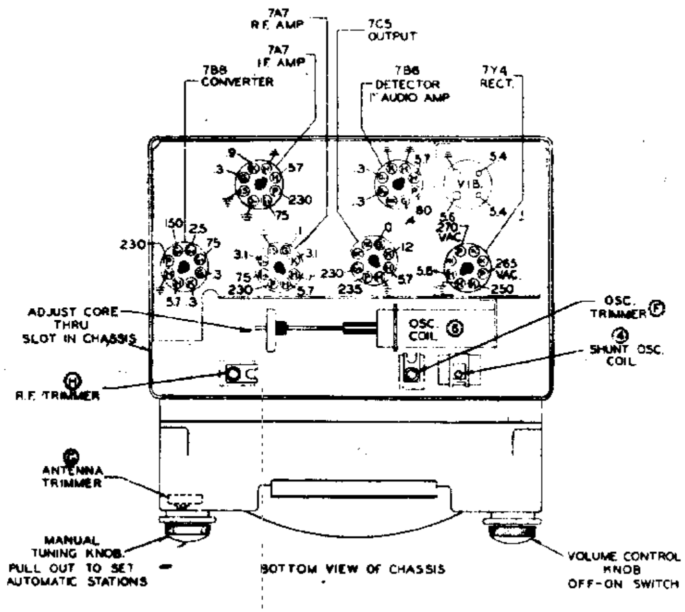

FIG. 8

Figure 8 shows the approximate voltages as measured with a 1000 ohm per volt meter measured between the socket terminals and the chassis. Volume control set at maximum with no signal. Battery Voltage—6.3.

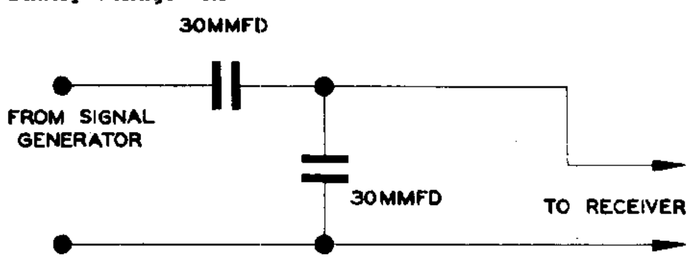

FIG. 9

Schematic of a recommended dummy antenna, closely resembling actual antenna capacity, to be used in series with signal generator leads when aligning the R. F. section of the receiver.

IMPORTANT: When reinstalling the receiver in the car, allow it to operate for approximately 15 minutes to reach normal operating temperature before checking the antenna trimmer alignment on a weak station at approximately 1200 Kc.

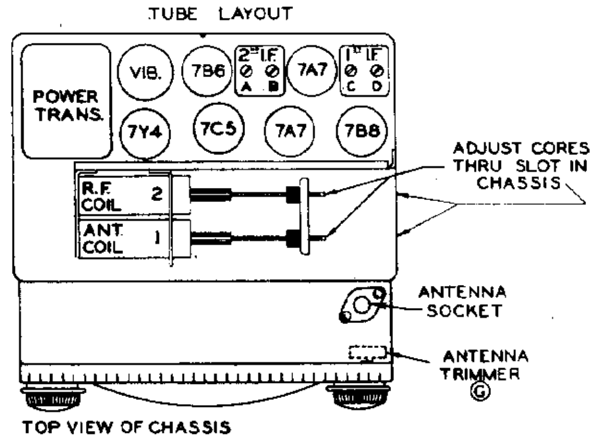

FIG. 7

Maximum performance is dependent upon the accurate alignment of the receiver, so follow the alignment instructions carefully.

CAUTION: Make all alignment adjustments to the receiver with the volume control turned full on. Reduce the signal intensity, if necessary, at the signal generator. Connect the output meter across the voice coil

I.F. ALIGNMENT PROCEDURE

1—Remove the top and bottom covers from the receiver.

2—Place the receiver in the Manual tuning position and set the pointer at the low frequency end of the dial. (540 Kc.)

3—Set the signal generator at 265 Kc.

4—Apply the signal from the generator through a .1 mfd. dummy to the 7B8 converter grid.

5—Adjust trimmers A-B-C and D (Fig. 7) for maximum output. Repeat the operation to assure accurate alignment.

R. F. AND OSCILLATOR ALIGNMENT

1—Set the signal generator at 1640 Kc.

2—Connect the signal generator leads, through the dummy as illustrated in Figure 9, to the antenna receptacle on the receiver.

3—Set the receiver dial at 1640 Kc. (Maximum high frequency end of dial.)

4—Screw the cores completely out of the antenna, R.F. and oscillator coils.

5—Set the oscillator trimmer (F—Fig. 8) at 1640 Kc.

6—Peak the R.F. and antenna trimmers (G and H—Fig. 8) for maximum output reading.

7—Replace the cores to their approximate original positions in the antenna, R.F. and oscillator coils.

8—Set the generator and the receiver dial at 1200 Kc.

9—Adjust the oscillator core (6—Fig. 8) to scale at 1200 Kc.

10—Adjust the antenna and R.F. cores (1 and 2—Fig. 7) for maximum output reading.

11—Set the signal generator at 600 Kc.

12—"Rock in" the Shunt oscillator core (4—Fig. 8) for maximum output reading. (Same as rocking in the padder condenser on a ganged condenser receiver.)

13—Check the receiver at 1200 Kc. for calibration and gain. If the receiver is off scale or weak, repeat operations 9 and 10.

RECEIVER INSTALLATION:

Figures 1 and 2, illustrating the escutcheon plate, control knobs and the installed receiver are given here to facilitate removal and reinstallation of the receiver when service or repairs are necessary.

Remove the Link "B" and loosen the hook bolts "D" to remove the receiver from the car.

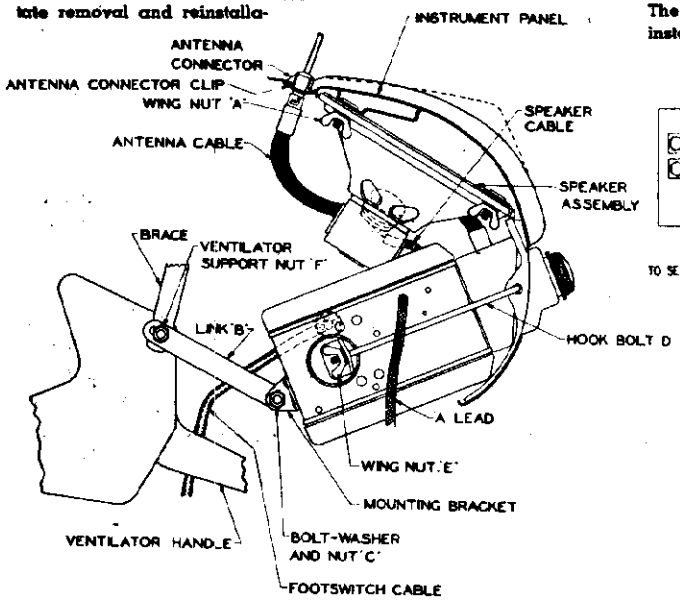

FIG. 1

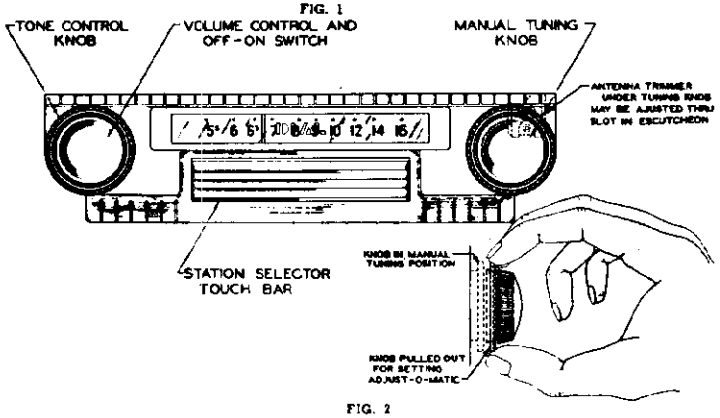

FIG. 2

INTERFERENCE SUPPRESSION

There should be no motornoise or interferences from the ignition circuit, if the receiver has been installed in the car according to the instructions furnished with it. The interference suppression equipment may be checked for proper installation by referring to the following illustrations:

The circuit breaker condenser No. 22-1148 should be installed as shown in Figure 3.

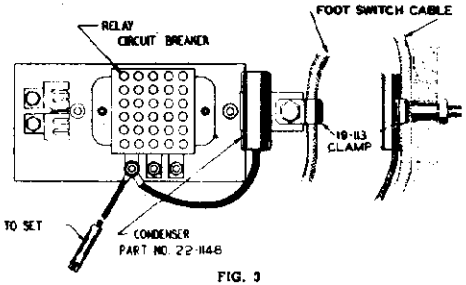

FIG. 3

NOTE: To set up a station on any automatic position, pull the tuning knob out and tune the receiver as in manual tuning. Press the tuning knob in to its original position after the station has been accurately tuned in.

The voltage regulator condenser No. 22-1148 and the ground strap No. S-9343 should be installed as shown in Figure 4 below.

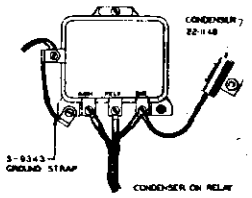

FIG. 4

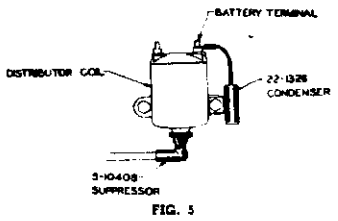

FIG. 5

The distributor primary condenser No. 22-1326 and suppressor with rubber nipple No. S-10408 should be installed as shown above in Figure 5.

The oil gauge condenser No. 22-1326 should be installed as shown in Figure 6.

Note the different locations for 6 and 8 cylinder cars.

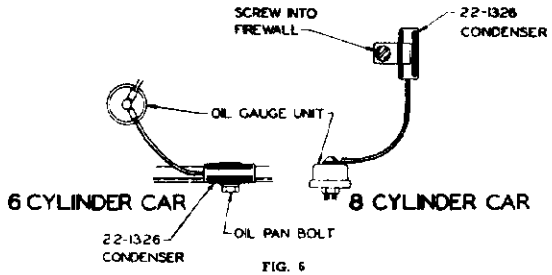

FIG. 6

Check the inside windshield divider trim strip, the antenna connector, and all the instrument panel bolts so they make a good ground contact with the body.

DELAYED AUTOMATIC MUTING CIRCUIT

Pressing either the Touch-bar or the foot control switch automatically mutes the receiver for the duration of the change cycle. This action is accomplished by applying 6 volts negative to the 7B6 first audio grid through the 1 megohm resistor R-14. (See schematic diagram.) This negative voltage blocks the grid of the 7B6 until the voltage bleeds off through the 15 megohm resistor R-13, when the receiver will again operate normally. NOTE: The storage battery in the car must be properly polarized to apply the negative muting voltage to the receiver. If the battery polarity is reversed the receiver will not mute and it may become distorted during the change cycle. Always connect the positive (—) terminal of the storage battery or power supply to the receiver case when checking the receiver.

DIAL AND TUNING MECHANISM

12-894	Rear magnet mounting bracket	$ .15
19-127	Dial scale mounting clip	.01

NASH WIRING DIAGRAM

ZENITH RADIO CORP. 123-241

TUNING RANGE: ..... 540-1600 Kc.

INTERMEDIATE FREQUENCY: ..... 265 Kc.

SENSITIVITY: ..... 4 microvolts at one watt output.

CURRENT CONSUMPTION: ..... 7.5 amperes

INSTANTANEOUS CURRENT CONSUMPTION DURING AUTOMATIC CHANGE CYCLE: ..... 20 amperes

POWER OUTPUT: ..... 5.5 watts measured at the voice coil.

SPEAKER: ..... 8" round, instrument panel mounting.

ZENITH RADIO CORP.

DELAYED AUTOMATIC MUTING CIRCUIT

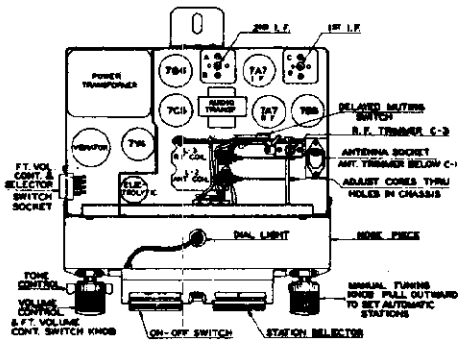

Fig. 10. Top View of Chassis.

Pressing either the Push-bar or the foot control switch automatically mutes the receiver for the duration of the change cycle. This action is accomplished by applying 6 volts negative to the 7B6 first audio grid through the 1 megohm resistor R-22. (See schematic diagram.) This negative voltage blocks off the grid of the 7B6 until the voltage bleeds off through the 15 megohm resistor R-14. Then the receiver will again operate normally. NOTE: If the battery polarity is reversed the receiver will not mute and it may become distorted during the change cycle. Always connect the positive (+) terminal of the storage battery or power supply to the receiver case when checking the receiver.

ALIGNMENT

Maximum performance depends on accurate alignment of the receiver; therefore follow these instructions carefully.

CAUTION: Make all adjustments on the receiver with volume control turned full on and foot volume control cable plugged into its socket. Reduce signal intensity as much as possible at signal generator. Connect output meter across voice coil.

I.F. ALIGNMENT PROCEDURE

1. Remove top and bottom covers from receiver.
2. Set signal generator to 265 Kc.
3. Apply signal from generator through a .1 Mfd. dummy to 7B8 converter grid. (Pin No. 6 on socket.)
4. Adjust I.F. trimmers A, B, C, and D (Fig. 10), in the order named for maximum output. Repeat the operation to assure accurate alignment.

R.F. AND OSCILLATOR ALIGNMENT

1. Connect signal generator leads through dummy illustrated in Fig. 12 to antenna lead in socket on receiver.
2. Set signal generator to 535 Kc.
3. Place set in manual tuning position and set dial to 535 Kc.
4. Adjust oscillator trimmer C-11 (Fig. 11), for maximum response.

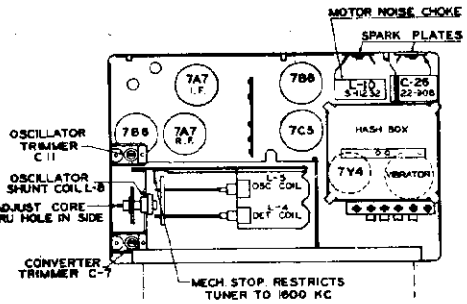

Fig. 11. Bottom View of Chassis.

5. Set signal generator to 1200 Kc.
6. Tune set to 1200 Kc.
7. Adjust converter trimmer C-7 (Fig. 11) and R.F. trimmer C-3 (Fig. 10) for maximum response.
8. If dial calibration is off after making above adjustments, a correction can be made by loosening dial scale mounting screws and sliding scale to desired position.

CORE OR COIL REPLACEMENT ONLY

WARNING: The following adjustments are to be made ONLY if a core or coil is replaced.

1. Replace coil or core.
2. Set signal generator to 1700 Kc.
3. Connect signal generator leads through dummy illustrated in Figure 12 to antenna receptacle on the receiver.
4. Set receiver dial to 1600 Kc. (Maximum high frequency end of dial.)
5. Screw the core completely out of the antenna coil, the R. F. Coil, the converter coil, and the oscillator coil.
6. Adjust oscillator trimmer C-11 (Fig. 11), at 1700 Kc.
7. Adjust converter trimmer C-7, R.F. trimmer C-3, and antenna trimmer C-1 (Fig. 10 and 11) for maximum output reading.
8. Replace cores to their approximate original positions
9. Set generator dial and receiver dial to 1200 Kc.
10. Adjust oscillator core (Figure 10) to scale at 1200 Kc.
11. Adjust the antenna core, R.F. core, and converter core (Fig. 10 and 11), for maximum output reading.
12. Set signal generator to 600 Kc.
13. "Rock in" shunt oscillator coil (Fig. 10) for maximum output reading. (This should only be done as a last resort.) This is the same as rocking in the padder condenser on a ganged condenser receiver.
14. Check receiver at 1200 Kc. for calibration and gain. If the receiver is off scale or weak, repeat operations 9, 10 and 11.
15. After alignment is complete, the maximum high frequency tuning range should be checked. If the range is greater or less than 1605 Kc. the mechanical stop for the tuner cross arm should be bent to limit the frequency coverage to 1605 Kc.

After all adjustments have been made, glue core screws with speaker cement.

IMPORTANT: After reinstalling the receiver in the car, allow it to operate for approximately 15 minutes to reach normal operating temperature. Check the antenna trimmer alignment on a weak station at approximately 1200 Kc. Extend antenna to maximum before adjusting the antenna trimmer.

The approximate voltages are measured with a 1000 ohm per volt meter between the socket terminals and the chassis as shown on the circuit diagram. The Volume Control is set at maximum with no signal. Battery voltage is 6.3

AUTOMATIC TUNING

There are five automatic tuning positions which may be adjusted to five desired stations. If these positions have not been previously adjusted proceed as follows:

1. Press station selector bar until number 1 appears in station indicator window.
2. Pull manual tuning knob outward to engage the automatic mechanism.
3. Select the station desired and tune to its frequency by turning tuning knob. Tune very carefully for clearest reception.
4. Press station selector bar, pull manual tuning knob outward, and tune in station desired for No. 2 position. Use same procedure for positions No. 3, 4 and 5.

When the five automatic positions have been adjusted to the five desired stations as instructed, it is only necessary to press the station selector bar to return to dial tuning, or any one of the stations adjusted on the Automatic.

MANUAL TUNING

1. Press Automatic Tuning Station Selector (Fig. 2) several times or until the letter "M" appears in indicator window.
2. Pull Manual tuning control knob (right hand) outward and turn to tune in desired station. Be sure to tune to exact frequency to assure the best tone quality.

VOLUME—Adjust left hand control knob for desired volume.

TONE CONTROL—The tone control is located behind the volume control knob. Turn in either direction for most pleasing tone.

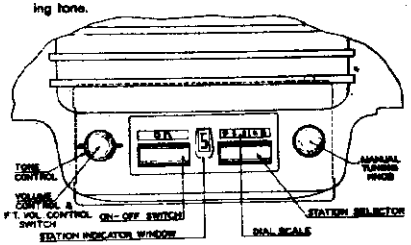

Fig. 2. Front View

ZENITH RADIO CORP.

INTERFERENCE SUPRESSION

There should be no motor noise or interference from the ignition circuit if the receiver has been installed in the car according to the instructions furnished with it. The interference suppression equipment may be checked for proper installation by referring to the following illustrations:

The generator condenser No. 22-920 should be installed as shown below in Figure 3.

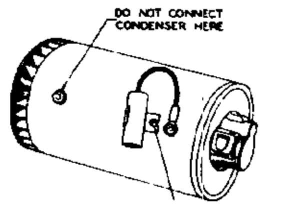

Fig. 3

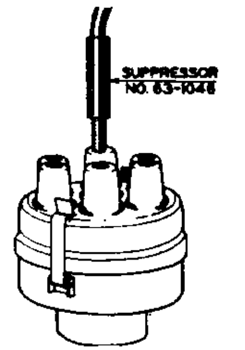

Fig. 4

The distributor supressor No. 63-1046 should be connected as shown above in Figure 4.

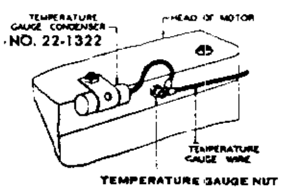

Fig. 5

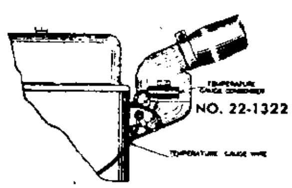

Fig. 6

The No. 22-1322 temperature gauge condenser should be installed as shown in Figure 5 for Nash 600 series cars and Figure 6 for Ambassador cars.

The ammeter and fuel gauge condensers No. 22-919 should be installed as shown in Figure 7.

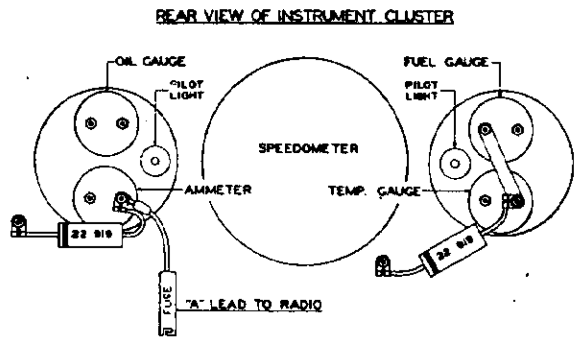

Fig. 7

The motor hood bond spring No. 80-145 should be installed as shown in Figure 8. Note that the sharp extrusions are facing down toward the front of the car before the hood grounding strip is bent back. Make sure the instrument panel bolts and chassis mounting bolts are tight.

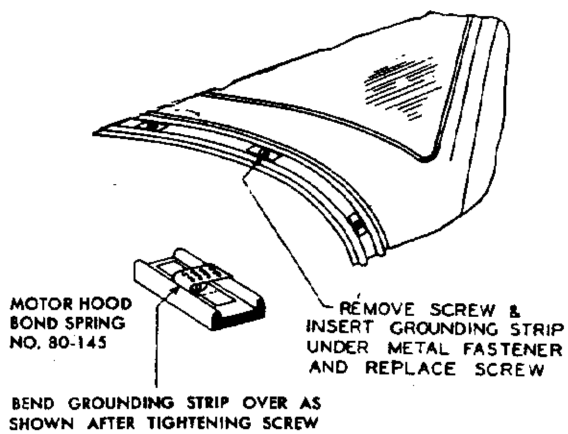

Fig. 8

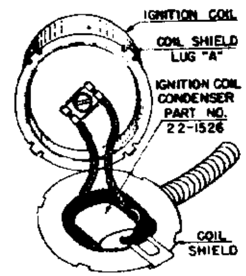

Fig. 9. Ign. Coil Cond.

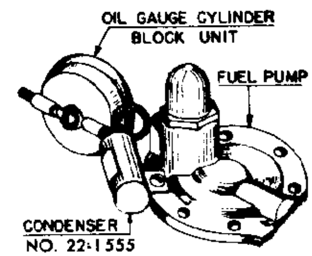

Fig. 9A. Oil Gauge Cond.

Straighten coil shield lugs "A" on back of ignition coil. Remove shield. Condenser should be installed as shown in Fig. 9. When replacing shield be sure to bend lugs down tightly to insure good connection between shield and coil. The oil gauge condenser should be installed as shown in Fig. 9A.

Record Changer: Zenith Model 511

TO THE SERVICE MAN:

A feature of chassis 6C21 is a high gain tuned R.F. stage ahead of the conventional superheterodyne circuit.

When making repairs or adjustments on the chassis be sure to have the Phono-Radio switch in Radio position (button out).

The Tone Control circuit used in chassis 6C21 is unusual. Attenuation or control occurs in both the grid and plate circuit of the triode section of the 6SQ7 tube. To increase the bass response Resistor R10 and Capacitor C9 boost the bass in the grid circuit.

Capacitor C14 and the Variable Tone Control R12 attenuate the highs in the plate circuit.

When the tone control R12 is in the treble position attenuation to highs are greatly reduced in the plate circuit and minimum bass boost takes place in the grid circuit.

When the tone control is in bass position, attenuation to the highs takes place in the plate circuit with maximum bass boost in the grid circuit.

The result of this arrangement allows a smooth tone control over the audio frequency range.

INSTRUCCIONES PARA LA INSTALACION, FUNCIONAMIENTO Y SERVICIO

GENERAL

Después de desembalar la combinación, quítese el papel engomado usado para la protección del chasis durante el embarque.

El receptor emplea un circuito superheterodino de sintonización altamente desarrollada sobre las siguientes bandas de onda larga y corta; 545 a 1520 kilociclos (550 a 197 metros), 2350 a 7100 kilociclos (127.7 a 42.3 metros) y 6900 a 22000 kilociclos (43.5 a 13.6 metros).

SUMINISTRO DE ENERGIA

Esta combinación está diseñada para funcionar ya sea en 50 ó 60 períodos de una corriente alterna (C.A.) de 105 a 120 voltios. El consumo total de corriente de las líneas de suministro es de 46 vatios.

PRECAUCION

No intente usar esta combinación con corriente continua (C.C.) o con ninguna fuente de corriente fuera de la especificada previamente para evitar daño serio. Un transformador especial que puede obtener de su vendedor permitirá usarlo en 200 a 250 voltios de C.A.

INSTALLATION, OPERATING AND SERVICE INSTRUCTIONS

GENERAL

After the combination has been unpacked, remove the paper tape used for protection of the chassis in shipment.

The receiver employs a highly developed superheterodyne circuit tuning over the following standard broadcast and shortwave bands: 545 to 1520 kilocycles (550 to 197 meters) 2350 to 7100 kilocycles (127.7 to 42.3 meters) and 6900 to 22000 kilocycles (43.5 to 13.6 meters).

POWER SUPPLY

This combination is designed for operation on either 50 or 60 cycle 105-120 volt alternating current (A.C.)

Total current consumption from the power lines is 46 watts.

CAUTION:

Do not attempt to use this combination on direct current D.C. or any current source other than that specified above otherwise serious damage will result. A special transformer obtainable from your dealer will permit use on 200 to 250 volt A.C. lines.

METHODE D'INSTALLATION, OPERATION ET SERVICE

GENERALITES

Après avoir déballé le poste-combinaison, les bandes de papier utilisées pour la protection du chassis durant le transport devront être enlevées.

Le poste emploie un circuit hautement dévelopé superhétérodyne dont la bande de sélection couvre les rangées de radiodiffusion normales et les ondes courtes suivantes: de 545 à 1520 kilocycles (de 550 à 197 mètres), de 2350 à 7100 kilocycles (de 127.7 à 42,3 mètres) et 6900 à 22000 kilocycles (de 43,5 à 13,6 mètres).

SOURCE DE PUISSANCE

Cette combinaison fonctionne sur courant alternatif de 50 ou 60 cycles, 105-120 volts.

La consommation totale des lignes de puissance est de 46 watts.

PRECAUTION.

N'essayez pas d'employer cette combinaison sur courant continu ou sur courant autre que celui mentionné plus haut, sinon de sérieux dégâts résulteront. Un transformateur spécial, à obtenir chez votre fournisseur, en permettra l'usage sur les lignes A.C. de 200 à 250 volts.

ANTENA

Es indispensable una buena antena para obtener la recepción satisfactoria. Una antena exterior de 13 a 20 metros de longitud y de la mayor altura posible dará buenos resultados para uso general. Si ha de usar su antena actual, ésta debe ser minuciosamente examinada para determinar su estado pues las conexiones pueden estar oxidadas o rotas haciéndola inapropiada para el uso. Si se ha de instalar una nueva antena hay que tomar las precauciones necesarias para que el alambre de bajada no haga contacto con las paredes, árboles o cualquier otro objeto en la conexión a tierra. Todas las conexiones deberán ser correctamente soldadas para evitar la oxidación y el ruido que se produciría. Conecte el alambre de bajada de la antena al alambre terminal marcado "Ant" en la parte posterior del chasis.

TIERRA

Una buena conexión a tierra mejorará efectivamente la recepción, aumentando la fuerza de las señales de las estaciones lejanas y reduciendo el ruido de fondo. La mejor conexión a tierra es un caño de un metro a 1.50 metros introducido en tierra húmeda.

El alambre a tierra debe ser soldado al caño o asegurado cuidadosamente con una buena grapa de tierra, previa limpieza cuidadosa del caño en ese punto. Una tierra conveniente

ANTENNA

A good antenna is necessary for satisfactory reception. An outside antenna from 40 to 60 feet in length and as high as possible will give good all-around results. If your present antenna is to be used, a thorough examination should be made to determine its condition. The connections may be corroded or broken, thus rendering the antenna unfit for service. If a new antenna is to be constructed, care should be taken to prevent the lead-in wire from grounding to trees, walls or gutters and all connections should be securely soldered to prevent corrosion and resulting noise. Connect the antenna lead-in to the wire marked "Ant" at the back of the chassis.

GROUND

A good ground will aid reception materially by improving the signal strength of distant stations and reducing background noise. The best ground is a 4 to 6 foot pipe driven in moist earth.

The ground wire should be soldered to the pipe or fastened securely with a good ground clamp, first thoroughly clean-

ANTENNE

Une bonne antenne est nécessaire pour obtenir une réception satisfaisante. Une antenne extérieure de 40 à 60 pieds (12-18 m) de long et aussi élevée que possible donne de bons résultats généraux. Si votre antenne actuelle devra être utilisée, elle devra subir un examen minutieux afin d'en déterminer l'état. Les couplages en peuvent être corrodés ou cassés, rendant par là l'antenne inutilisable. Si une nouvelle antenne est construite, prenez soin que la prise de terre n'ait pas lieu dans un arbre, sur un mur ou dans un fossé et tous les couplages devront être soudés avec soin afin d'éviter la corrosion et les bruits parasites. Attachez le fil conducteur de l'antenne au fil marqué "Ant" au dos du chassis.

PRISE DE TERRE

Une bonne prise de terre aide considérablement à augmenter la puissance des stations distantes et diminuera les parasites. La meilleure prise de terre est un tuyeau de 4 à 6 pieds (1.25 à 2 mètres) enfoncé dans un sol humide.

Le fil de prise devra être soudé au tuyeau ou bien attaché fermement avec une bonne attache de prise, le tuyeau étant nettoyé soigneusement à cet endroit. Une prise de terre satisfaisante peut être obtenue en attachant solidement le fil de prise à un tuyeau

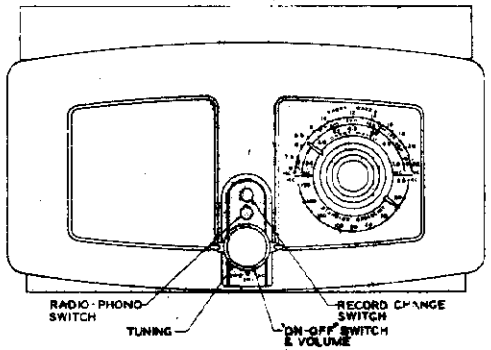

FIG. 1 PANEL CONTROLS

puede ser obtenida haciendo una buena conexión a un caño de agua o radiador. Conecte la bajada a tierra al alambre marcado "Gnd" en la parte posterior del chasis.

INTERRUPTOR FONOGRAFO-RADIO

El interruptor Fono-Radio es del tipo de botón de presión de doble acción.

Para tocar discos el botón debe ser introducido por presión. Presionando el botón una segunda vez lo volverá a la posición de Radio. (Vea la figura 1.)

SINTONIZACION

La figura 1 indica la posición de las perillas del control de sintonización y de volumen. Para poner el instrumento en funcionamiento, gire la perilla del control de volumen hacia la derecha. Esto pondrá en funcionamiento el aparato. Espere unos 30 segundos para que las válvulas alcancen la temperatura de funcionamiento.

Para sintonizar el aparato, gire la perilla de Control de Volumen lentamente a la estación deseada. Reajuste la perilla de Control de Volumen hacia la derecha o hacia la izquierda hasta alcanzar el volumen deseado. Para desconectar el receptor (OFF) gire la perilla de Control de Volumen todo lo que pueda hacia la izquierda, o hasta que oiga un ruído "clic."

El receptor tiene trés escalas de sintonización, cualquiera de los cuales puede ser seleccionada por medio del Interruptor de Banda (Vea la Fig. 1). La banda en uso estará indicada por el indicador del Interruptor de Banda.

Las éstaciones de onda corta deberán ser sintonizadas girando la Perilla de Sintonización muy lentamente. El receptor es muy selectivo a las frecuencias más altas (ondas cortas).

La luz del día tiene una decidida influencia sobre la recepción de las estaciones de onda corta. Las diferentes longitudes de onda tienen mayor eficacia a diferentes horas del día. Usese la tabla siguiente de guia para sintonizar.

ing the pipe at that point. A suitable ground may also be obtained by making a good connection to a water pipe or radiator. Connect the ground lead-in to the wire marked "Gnd" at the rear of chassis.

PHONO-RADIO SWITCH

The Phono-Radio switch is of the double acting push button type.

To play records the button must be pushed in. Pushing the button a second time will return it to the Radio position. (See Figure 1.)

TUNING

Figure 1 shows the position of Tuning and Volume Control knobs. To place the instrument in operation, turn the Volume Control knob to the right. This will turn on the set. Allow about 30 seconds for the tubes to reach operating temperature.

To tune the set, turn the Tuning Control knob slowly to the desired station. Readjust the Volume Control knob to the right or left for the desired volume. To turn the receiver OFF rotate the Volume Control knob as far as it will go to the left, or until a "click" is heard.

The receiver has three tuning ranges, any one of which may be selected by means of the Band Switch (see Fig. 1). The band in use will be indicated by the Band Switch pointer.

Short wave stations must be tuned in by turning the Tuning Knob very slowly. The receiver is very selective at the higher frequencies (short waves).

Daylight has a decided effect on the reception of short wave stations. Different wave lengths are most effective at different times of the day. Use the following table as a guide in tuning.

SHORT WAVE BAND	TIME OF BEST RECEPTION
16 meters and below	A.M. (Morning hours)
19 and 25 meters	P.M. (Afternoon)
25 and 31 meters	P.M. (Early evening)
31 and 49 meters	P.M. (Late evening)

d'eau ou à un radiateur. Branchez le fil de prise au fil marqué "Gnd" au dos du chassis.

COMMUTATEUR PHONO-RADIO.

Le commutateur Phono-Radio est du type bouton-poussoir à action double. Pour faire jouer les disques, appuyez sur le bouton. Appuyez une seconde fois et le poste sera remis à la position Radio. (Voyez la figure 1).

ACCORD

La figure 1 montre la position des boutons d'accord et de régulateur d'amplification. Pour mettre l'appareil en fonction, tournez le bouton du régulateur d'amplification vers la droite. Ceci mettra le poste en opération. Laissez les tubes se chauffer 30 secondes environ afin d'arriver à température de réception.

Pour obtenir la station voulue, tournez le bouton d'accord lentement jusqu'au point désiré. Ajustez à nouveau le bouton du régulateur d'amplification vers la droite ou la gauche jusqu'au volume convenable. Pour en cesser l'usage, tournez le bouton du régulateur d'amplification autant que possible, jusqu'à provoquer un déclic.

Ce poste a trois échelles d'accord; chacune d'entre elles peut être choisie par moyen du commutateur de bande (voir figure 1). La bande en usage est indiquée par l'aiguille du commutateur de bande.

La réception des stations à ondes courtes se fera en tournant le bouton d'accord très lentement. Le récepteur est très sélectif aux plus hautes fréquences (ondes courtes).

La lumière du jour a un effet décidé quant à la réception des stations à ondes courtes. Les longueurs d'ondes diverses auront leur meilleure réception à des heures diverses. Employez la table suivante comme guide pous la syntonisation.

TUBES

Les tubes suivants sont employés pour cette combinaison:

12SA7GT	50L6GT
12SK7GT	35Z5GT
7C6	7F7

VALVULAS

Las siguientes válvulas se emplean en esta combinación

12SA7GT	50L6GT
12SK7GT	35Z5GT
7C6	7F7

La figure 4 indica la posición correcta de cada válvula en su respectivo porta válvulas.

INSTRUCCIONES PARA EL FUNCIONAMIENTO DEL CAMBIA-DISCOS AUTOMATICO ZENITH CON BRAZO DE TONO COBRA

GENERALIDADES

Su Cambia-Discos Automático Zenith es un mecanismo nuevo muy mejorado equipado con el "pickup" revolucionario Cobra, una característica exclusiva de Zenith producida como resultado de muchos años de investigación y de desarrollo. Controles eléctricos ponen en funcionamiento su mecanismo, de Comienzo-Detención con una velocidad relámpago (3½ segundos), por medio de un botón de presión situado en el tablero de control de recepción.

El sensacional Pickup Radiónico Cobra tiene un "Fila-

TUBES

The following tubes are employed in this combination:

12SA7GT	50L6GT
12SK7GT	35Z5GT
7C6	7F7

Figure 4 shows the correct position of each tube in its respective socket.

OPERATING INSTRUCTIONS FOR ZENITH AUTOMATIC RECORD CHANGER WITH COBRA TONE ARM

GENERAL

Your Zenith Automatic Record Changer is a new, highly improved mechanism equipped with the new revolutionary Cobra pickup, an exclusive Zenith feature, produced as the result of many years of research and development. Electric controls trip its Start-Stop mechanism with lightning speed (3½ seconds) by a push button on the receiver control panel.

La figure 4 montre la position propre à chaque tube dans son support respectif.

INSTRUCTIONS POUR L'EMPLOI DU CHANGE-DISQUES AUTOMATIQUE

ZENITH AVEC BRAS-ACOUSTIQUE A SONORITE COBRA

GENERALITES

Votre Change-Disques Automatique Zénith est un nouvel appareil, beaucoup amélioré, muni du nouveau pick-up Cobra, un perfectionnement révolutionnaire produit exclusivement par Zenith après de nombreuses années de recherches et de développement. Des commandes électriques déclanchent son mécanisme d'appel Start-Stop avec la rapidité de l'éclair (3 secondes et demie) au moyen d'un bouton sur le panneau de contrôle du récepteur.

Ce pick-up radionique Cobra a le nouveau "Filament Flottant" qui allonge la durée d'usage d'un disque par mille pour cent et révèle une beauté de ton inconnue jusqu'ici et qui

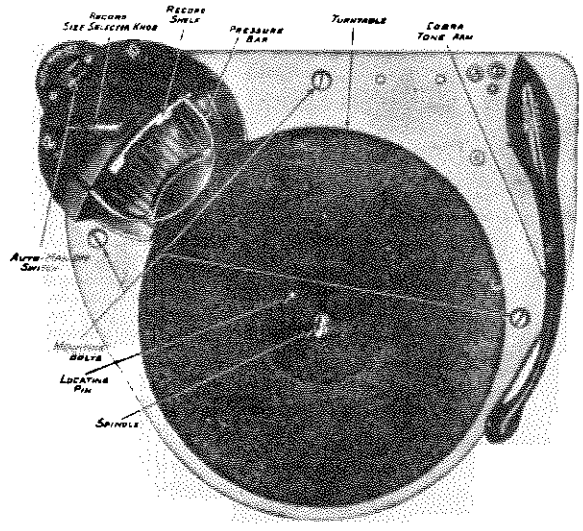

Fig. 2. Record Changer Top View

mento Flotante" nuevo que extiende la duración del disco más del 1000 por ciento, revela bellezas de tono no escuchadas hasta el presente y no es afectado por los cambios de temperatura y de humedad. El cambia-discos tocará automáticamente doce discos de 10 pulgadas ó diez discos de 12 pulgadas. Es posible un programa continuo de su propia selección de 45 minutos de duración con una sola carga del cambia-discos.

El cambia-discos está equipado con un motor sincrónico de comienzo automático que impulsa la placa giratoria porta discos a 78 rpm. El cambia-discos puede hacerse funcionar con una corriente alterna (C.A.) de 50 ó 60 ciclos cambiando el manguito de la impulsión del motor.

PUESTA DEL CAMBIA-DISCOS EN FUNCIONAMIENTO

El Cambia-Discos ha sido embalado cuidadosamente para evitar ser dañado durante el embarque, debiéndose retirar todo el material de embalar antes de intentar ponerlo en funcionamiento. Asegúrese de leer todos los rótulos y remueva todas las cintas de embalar, pernos, etc.

Utilice un destornillador de hoja ancha y rote los pernos de montaje (Fig. 2) en el sentido de las agujas del reloj hasta que las cabezas estén parejas con la plancha de montaje. Esto permite que el cambiador "flote" montado contra sacudidas.

No deje de remover la banda de empaque para permitir que el pre-amplificador fono flote libremente montado sobre caucho; de lo contrario será oído el chillido del audio y microfónico cuando funcione el cambia discos.

PRECAUCION

El Cambia-Discos es expedido con el manguito del motor del fonógrafo instalado para 60 ciclos. El manguito de 50 ciclos está unido al Cambia-Discos debiendo ser instalado antes de intentarse hacerlo funcionar con una corriente de 50 ciclos.

The sensational Radionic Cobra Pickup has the new "Floating Filament" that lengthens record life over 1000 per cent, detects tone beauty unheard of before and is not affected by humidity and temperature changes. The changer will automatically play either twelve 10 inch records or ten 12 inch records. A continuous program of your own selection with a playing time of 45 minutes is possible with one loading of the changer.

The changer is equipped with a synchronous self-starting motor which drives the turntable at 78 RPM. The changer may be operated on 50 or 60 cycle alternating current (A.C.) by changing the motor drive bushing.

PLACING THE RECORD CHANGER IN OPERATION

The Record Changer has been securely packed to avoid damage in shipment and all packing material must be removed before an attempt to operate it is made. Be sure to read all tags and remove packing strips, bolts, etc.

Use a wide blade screwdriver and turn the three mounting bolts (see Fig. 2) clockwise until the heads are flush with the mounting plate. This allows the changer to "float" on its shock mounts.

Do not fail to remove the packing strip to allow the phono preamplifier to float freely on its rubber mounts or audio howl and microphonics will be heard when playing the Record Changer.

CAUTION

The Changer is shipped with the 60 cycle phono motor bushing installed. The 50 cycle bushing is attached to the Changer and must be installed before operation on 50 cycle current is attempted.

n'est affectée ni par l'humidite, ni par les hausses et baisses de température. L Change-Disques jouera automatiquement soit douze disques de 25 cms., soit 10 disques de 30 cms. Un programme continu de votre propre choix d'une durée de jeu de 45 minutes est désormais possible avec une seule mise de disques.

Le Change-Disques est muni d'un moteur synchrone à déclanchement autonome qui donne au plateau tourne-disques une vitesse de 78 RPM. Le change-disques peut être utilisé sur un courant alternatif soit de 50, soit de 60 cycles en changeant la douille du moteur.

FONCTIONNEMENT DU CHANGE-DISQUES

Le Change-Disques a été empaqueté avec soin afin d'éviter d'être endommagé durant le transport et les papiers et autres matériaux d'emballage en seront enlevés avant d'essayer de faire fonctionner l'appareil. Lisez attentivement toutes les étiquettes et enlevez les bandes d'emballage, les boulons, etc.

Servez-vous d'un tournevis à large lame et tournez les trois boulons de montage (voyez figure 2) dans la même direction que les aiguilles d'une montre jusqu'à ce que les têtes des boulons soient à ras de la plaque de montage. Ceci permettra au Change-Disques de "flotter" sur son support anti-choc.

Ne pas omettre d'enlever les bandes d'emballage afin que le pré-amplificateur-phono puisse être balancé sans entraves sur sa monture de caoutchouc; sinon des audio-cris et des parasites microphoniques se feront entendre pendant la mise en jeu du Change-disques.

IMPORTANT

Le Change-Disques est expédié avec la douille phono-moteur de 60 cycles en place. La douille à 50 cycles est attachée au Change-Disques et doit être installée avant d'essayer de faire fonctionner l'appareil sur un courant de 50 cycles.

MANERA DE HACERLO FUNCIONAR

A. Cargamento para Funcionamiento Automatico

1. Colóquese la Perilla Selectora de Tamaño de Discos ya sea en 10 ó en 12, dependiendo del tamaño del disco que desee tocar. NO MEZCLE DISCOS DE 10 PULGADAS CON DISCOS DE 12 PULGADAS.

2. Elévese la Varilla de Presión lo más que sea posible.

3. Presiónese ligeramente y gírese el Vástago en sentido contrario al movimiento de las agujas de reloj hacia la posición de CARGA.

Posicion de Cargo

4. Colóquese la pila de discos (hasta doce de 10 pulgadas ó diez de 12 pulgadas) sobre el vástago.

5. Colóquese la Varilla de Presión sobre la pila de discos.

B. Modo de Poner en Marcha el Cambia-Discos

1. Empújese el botón FONO-RADIO situado en el tablero de recepción.

2. Colóquese el interruptor AUTO-MAN-OFF en el Cambia-Discos en posición AUTO.

3. Empújese el botón del CAMBIA-DISCOS situado en el tablero de recepción. Si quisiera suprimir un disco, sólo es necesario empujar el botón del CAMBIA-DISCOS situado en el tablero de recepción. Esto permitirá que sea tocado el disco siguiente.

C. Detencion del Cambia-Discos

1. Cerciórese que la aguja esté en la posición de tocar (en contacto con el disco).

2. Colóquese el interruptor AUTO-MAN-OFF en posición OFF.

3. Elévese el brazo de tono y muévalo hacia la posición de descanzo (es decir, hacia la derecha de la placa giratoria).

HOW TO OPERATE

A. Loading for Automatic Operation

1. Set RECORD SIZE SELECTOR KNOB to either 10 or 12, depending on the size of record you wish to play. DO NOT INTERMIX 10 INCH AND 12 INCH RECORDS.

2. Raise the PRESSURE BAR up as far as it will go.

3. Press lightly and turn the SPINDLE counterclockwise to the LOAD position.

Load Position

4. Place the stack of records (up to twelve 10 inch or ten 12 inch) over the spindle.

5. Set the PRESSURE BAR down on the record stack.

B. Starting the Changer

1. Push PHONO-RADIO button on the receiver panel.

2. Set the AUTO - MAN - OFF switch on the Record Changer to AUTO.

3. Push the RECORD CHANGE button on the receiver panel. Should you desire to reject a record, it is only necessary to push the RECORD CHANGE button on the radio receiver panel. This will allow the next record to be played.

C. Turning the Changer Off

1. See that the needle cartridge is in the playing position (in contact with the record).

2. Set the AUTO - MAN - OFF switch to OFF.

3. Lift the tone arm and move it to the rest position (that is, to the right of the turntable).

COMMENT FAIRE FONCTIONNER L'APPAREIL

A. Mise de Disques Pour Fonctionnement Automatique

1. Placez le BOUTON SELECTEUR DE GRANDEUR DE DISQUES soit à 10, soit à 12 d'après la taille des disques que vous allez jouer. Ne mêlez pas de disques de grandeurs différentes.

2. Elevez la BARRE D'APPUI aussi haut que possible.

3. Appuyez légèrement et tournez le fuseau dans la direction opposée à celle des aiguilles d'une montre jusqu'à la position "LOAD" (MISE).

Position "Load"

4. Placez la pile de disques (jusqu'à 12 disques de 25 cms —ou 10 disques de 30 cms) sur le fuseau.

5. Remettez la BARRE D'APPUI sur la pile de disques.

B. Mise en Fonction du Change-Disques

1. Appuyez sur le bouton PHONO-RADIO au panneau du récepteur.

2. Placez le commutateur "AUTO - MAN - OFF" du Change-Disques à la position AUTO.

3. Appuyez sur le bouton CHANGE-DISQUES sur le panneau du récepteur. Quand vous voudrez rejeter un disque, vous n'aurez qu'à appuyer sur le bouton CHANGE-DISQUES au panneau du récepteur. Ceci mettra le disque suivant en jeu.

C. Arret du Change-Disques.

1. Il faut que l'aiguille soit en position pour le jeu (en contact avec le disque).

2. Placez le commutateur AUTO-MAN-OFF a la position OFF.

D. Descarga

Para retirar la pila de discos de la placa giratoria después que haya sido tocado el último disco, procédase de la siguiente manera:

1. Deténgase el Cambia-Discos de la manera descrita en el párrafo C.

Posicion de Descarga

2. Elévese la VARILLA DE PRESION lo más alto posible.

3. Presiónese ligeramente y gírese el VASTAGO en el sentido de las agujas de reloj hacia la posición de DESCARGA.

4. Levántese VERTICALMENTE toda la pila de discos o todos los discos que puede manipular convenientemente, hasta retirar los discos del vástago.

E. Funcionamiento Manual

Las grabaciones hechas en la casa no son para uso automático, debiendo ser tocadas manualmente; es decir, por separado, como se hace en un tocadiscos no automático. Para funcionamiento manual coloque el interruptor AUTO-MAN-OFF en posición MAN (véase la Fig. 2). El brazo de tono queda libre, pudiendo ser movido a voluntad. Se suministra una aguja de ubicación sobre la placa giratoria para las grabaciones hechas en la casa.

F. Si se Deja el Cambia-Discos Funcionando

No se producirá daño alguno si olvida de detener el Cambia-Discos después que haya tocado toda la selección de discos. Repetirá el último disco hasta ser detenido o vuelto a cargar.

DISCOS RUIDOSOS

Si bien una tonalidad mala es ocasionada por una aguja gastada, el ruido de rayado y de fondo indica por lo general, un disco gastado. La cantidad de ruido de desgaste y de fondo en los discos nuevos variará de acuerdo con la calidad de fabricación, tipo de música grabada y el cuidado que se le presta a los discos. La colocación de una capa muy ligera de cera sobre el vástago eliminará el chillido causado por la fricción entre el vástago y los discos, toda vez que se presente este inconveniente.

D. Unloading

To remove the record stack from the turntable after the last record has been played, proceed as follows:

1. Turn the Record Changer OFF as described in paragraph C.

Unload Position

2. Raise the PRESSURE BAR as far up as it will go.

3. Press lightly and turn the SPINDLE clockwise to the UNLOAD position.

4. Raise the record stack, or as many records as you can conveniently handle STRAIGHT UP until the records are entirely clear of the spindle.

E. Manual Operation

Home recordings are not intended for automatic use and must be played manually, that is, singly as on a non-automatic record player. For manual operation set the AUTO-MAN-OFF switch to the MAN position (see Fig. 2). The tone arm is now free and may be moved at will. A locating pin is provided on the turntable for home recordings.

F. If the Changer is Left Running

No damage will be done if you forget to turn off the Changer after it has played the entire selection of records. It will repeat the last record until stopped or reloaded.

NOISY RECORDS

Poor tone is usually caused by a worn needle cartridge, however, scratch and background noise usually indicates a worn record. The amount of wear and background noise on new records will vary depending on the quality of manufacture, type of music recorded and care given the records. A very thin coat of wax on the spindle will eliminate squeaking caused by friction between the spindle and records (should this condition exist).

CARE OF RECORDS

Small effort on your part will insure long life for your records. Do not expose them to heat from the sun, radiators or stoves. Store your records in albums in a cool, dry place resting vertically or horizontally. Remove dust and dirt with a soft cloth using a light circular motion. Even a fine film of dust often contains abrasive particles which, when ground against the record surface by the needle can cause very rapid wear.

Important

Never allow records to remain on the spindle when the Record Changer is not in use. To do so may result in warping and failure of the Changer to play such records.

CHANGING THE NEEDLE CARTRIDGE

If it becomes necessary to change the Needle Cartridge due to wear or mishandling, study Fig. 3 and proceed as follows.

D. Pour Enlever

Pour enlever la pile de disques du plateau après avoir joué le dernier disque, faites ce qui suit:

1. Tournez le commutateur à la position OFF, comme on l'a décrit plus haut au paragraphe C.

Position "Unload"

2. Levez la BARRE D'APPUI aussi haut que possible.

3. Appuyez légèrement et tournez le fuseau dans la même direction que les aiguilles d'une montre jusqu'à la position UNLOAD.

4. Levez la pile de disques, ou autant d'entre eux que vous voulez soulever facilement, tout droit jusqu'à ce que les disques soient entièrement dégagés du fuseau.

E. Fonctionnement Manuel.

Les disques faits chez soi ne sont pas prévus pour le jeu automatique et doivent être employés manuellement, c'est-à-dire séparément, comme sur un gramophone ordinaire, non-automatique. Pour ce fonctionnment manuel, tournez le commutateur AUTO-MAN-OFF à la position MAN (voyez la figure 2).

Le bras acoustique est maintenant libre et vous pouvez le mouvoir à votre gré. Une aiguille de repère est placée sur le plateau tourne-disques pour les disques faits chez soi.

F. Cas Dans Lesquels le Change-Disques est Oublie en Action

Aucun dégât ne résultera si vous oubliez d'interrompre le Change-Disques après avoir joué tous vos disques. Il répétera le dernier jusqu'à ce que vous l'arrêtiez ou le remplaciez.

DISQUES BRUYANTS

Une sonorité défectueuse est causée d'habitude par une aiguille usagée. Un bruit de râclage ou des ronflements parasites indiquent d'ordinaire que le disque a été endommagé par l'usage. Une rapide usure de disques neufs et la présence de bruits parasites dépendra de la qualité de la manufacture, du type de musique enregistrée et du soin que l'on aura pris du disque. Une couche de cire très mince sur le fuseau éliminera le grincement causé par le frottement du disque contre le fuseau si cette condition existe.

CUIDADO DE LOS DISCOS

Un pequeño esfuerzo hecho por usted les asegurará una larga duración a sus discos. No los exponga al calor solar, de los radiadores o de las estufas. Guarde sus discos en álbumes en un sitio fresco y seco, en posición vertical u horizontal. Retirese el polvo y la suciedad con un paño suave, empleando un movimiento circular. Mismo una fina película de polvo contiene frecuentemente particulas abrasivas, que cuando se muelen contra la superficie del disco por la aguja pueden ocasionar desgaste muy rápido.

Importante

Nunca deje permanecer a los discos sobre el vástago cuando no está en uso el Cambia-Discos pues podría ocasionar la combadura y la falla del Cambia-Discos para tocar tales discos.

CAMBIO DEL CARTUCHO DE AGUJAS

En caso de que se haga necesario cambiar el Cartucho de Agujas debido a desgaste o cuidado inapropiado, estúdiese la Fig. 3 y procédase de la manera siguiente:

SOIN DE DISQUES

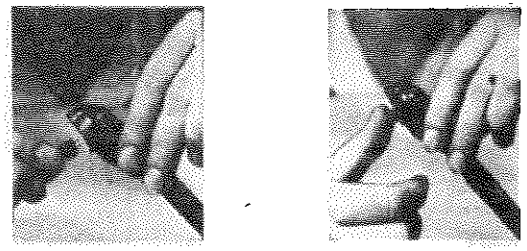
Très peu d'effort de votre part vous assurera d'une longue durée pour vos disques. Ne les exposez pas à la chaleur du soleil, des radiateurs ou des fourneaux. Gardez vos disques dans des albums en un endroit frais et sec et placez-les, soit horizontalement, soit verticalement. Epoussetez-les avec un chiffon fin et un léger mouvement circulaire. Une couche de poussière, quelque légère qu'elle soit, contient souvent des particles abrasives, qui, lorsqu'elles sont écrasées sur la surface du disque par l'action de l'aiguille, l'endommageront rapidement.

Important

Ne laissez jamais les disques sur le fuseau lorsque vous n'employez pas le Change-Disques. Cela pourrait faire gauchir et fausser les disques et démonter le Change-Disques.

CHANGEMENT DE LA CARTOUCHE A AIGUILLE

S'il est nécessaire de changer la cartouche à aiguilles, soit qu'elle soit usée ou qu'elle ait été endommagée, étudiez la figure 3 et faites ce qui suit:



Needle Cartridge Out — Inserting Needle Cartridge

Fig. 3. Replacing the Needle Cartridge

1. Colóquese el interruptor OFF-MAN-AUTO en posición OFF.

2. Elévese el BRAZO DE TONO.

3. Tómese el CARTUCHO DE AGUJAS rojo con la punta de los dedos y retíresela suavemente hacia fuera en línea recta.

4. Insértese un nuevo CARTUCHO DE AGUJAS y empújela hacia adentro suavemente con el pulgar. El Cartucho es graduado, pudiendo sólo ser insertado en un sentido. Póngase cuidado, pues forzando el cartucho en un ángulo inapropiado dañará la ranura.

1. Set the OFF - MAN - AUTO switch to OFF.

2. Raise the TONE ARM.

3. Grasp the red NEEDLE CARTRIDGE with the finger tips and gently pull it straight out.

4. Insert a new Needle Cartridge and push it in gently with the thumb. The Cartridge is indexed and can only be inserted one way. Use care — forcing the cartridge in at the wrong angle will damage the socket.

1. Tournez le commutateur AUTO-MAN-OFF à position OFF.

2. Levez le bras acoustique.

3. Saisissez la cartouche à aiguilles rouge entre le bout des doigts et tirez doucement tout droit.

4. Insérez une nouvelle cartouche et enfoncez-la lentement avec le pouce.

La cartouche est marquée et ne peut être mise en place que d'une seule façon. Faites-le avec soin. Si vous enfoncez la cartouche de biais avec force le porte-aiguille sera endommagé.

INSTRUCCIONES PARA LA INSTALACION Y FUNCIONAMIENTO

INFORMACION GENERAL

Este receptor es un moderno aparato superheterodino de 7 válvulas, con una gama de ondas comprendiendo frecuencias entre 545 y 21,900 Kilociclos. Esta gama de ondas está dividida en tres bandas, marcadas en el cuadrante como sigue: "Broadcast" — "Short Wave 1" — "Short Wave 2." La mayor facilidad de sintonización en la onda corta en las cinco escalas adicionales, incorporando las bandas de 13, 16, 19, 25 y 31 metros, se obtiene por medio de ampliación de banda, la cual permite que las estaciones de onda corta se sintonicen con la misma facilidad que las estaciones locales.

¡OJO! Asegúrese que los pernos que soportan el chasis durante el embarque estén suficientemente flojos para permitir que el chasis flote libremente antes de que el receptor se ponga a funcionar.

SUMINISTRO DE ENERGIA

Este radio receptor puede ajustarse para ser operado con una fuente de energiá de 115 voltios, 40 a 60 períodos, o con 235 voltios, 40 a 60 períodos, así como con un acumulador de 6 voltios, por medio del conmutador que se encuentra en la parte posterior del chasis.

INSTALLATION, OPERATING AND SERVICE INSTRUCTIONS

GENERAL

This receiver is a modern 7-tube superheterodyne with tuning ranges covering frequencies between 545 k.c. and 21,900 k.c. This tuning range is divided into three bands which are labeled on the dial scale "Broadcast" — "Short Wave 1" and "Short Wave 2." Extreme ease of tuning over the short wave band is provided by means of five additional tuning ranges covering the 13, 16, 19, 25 and 31 meter bands with a band spread arrangement which allows short wave stations to be tuned in as easily as stations on the broadcast band.

CAUTION: Make sure that the bolts supporting the chassis during shipment are loosened sufficiently to allow the chassis to float freely before the receiver is placed in operation.

POWER SUPPLY

This receiver may be adjusted for use on either a 115 volt, 40 to 60 cycle power supply, 235 volt 40 to 60 cycle power supply, or a 6-volt storage battery by means of the switch on the rear of the chassis.

When a storage battery is used as the source of power, care should be taken that the RED battery lead of the receiver is connected to the positive (+) terminal of the battery, and the BLACK lead to the negative (—) terminal of the battery.

If the receiver has a constant hum when connected to an alternating current power supply reverse the power plug in the wall socket.

CAUTION: UNDER NO CIRCUMSTANCES SHOULD THE POWER CORD BE CONNECTED TO DIRECT CURRENT AS SEVERE DAMAGE WILL RESULT.

INSTRUCTIONS POUR INSTALLATION ET FONCTIONNEMENT

GENERALITES

Poste de T.S.F. superhétérodyne de 7 lampes avec rangées couvrant les périodes entre 545 et 21,900 k.c. L'échelle de sélection est divisée en trois rangées marquées sur le vernier "Broadcast" — "Ondes courtes 1" et "Ondes courtes 2." La sélection des stations en ondes courtes se fait aussi facilement que celle sur ondes longues, grâce à 5 échelles différentes pourvues d'une extension, couvrant les rangées de 13, 16, 19, 25 et 31 mètres.

PRECAUTION: Assurez-vous que les boulons qui supportent le châssis en route soient suffisamment lâches pour permettre qu'il flotte librement avant que le poste soit mis en fonction.

SOURCE D'ALIMENTATION

Ce poste récepteur peut être ajusté pour être utilisé sur une source d'alimentation de 115 volts, de 40 à 60 périodes, ou sur une de 235 volts de 40 à 60 périodes ou encore sur un accu de 6 volts, au moyen du commutateur qui se trouve au dos du chassis.

Quand on utilise un accumulateur comme source d'alimentation, on doit faire attention que le fil rouge au dos du récepteur soit branché à la borne positive (+) de l'accumulateur, et le fil noir, à la borne négative (—).

Cuando se utiliza un acumulador como fuente de energía conéctese el alambre ROJO del receptor al polo positivo (+) del acumulador, y el alambre NEGRO del receptor al polo negativo (—).

Si el receptor produce un zumbido constante cuando está conectado con corriente alterna, inviértase el tomacorriente en el zócalo de la pared.

¡OJO! BAJO NINGUNA CIRCUNSTANCIA HA DE CONECTARSE ESTE RECEPTOR A CORRIENTE CONTINUA (C.C.) POR CAUSAR ESTO DAÑOS IRREPARABLES.

TUBES

The following tubes are used: (See Fig. 2)

7H7	7C6
6K8GT	6L5G
7B7	1J6G
	6X5G

Si un grondement se produit dans le récepteur après qu'il ait été branché à une source d'alimentation de courant alternatif, changez la position de la fiche dans le réceptacle monté dans la cloison.

PRECAUTION: CE RECEPTEUR DE T.S.F. NE DOIT SOUS AUCUN PRETEXTE ETRE BRANCHE A UNE SOURCE DE COURANT CONTINU (C.C.) POUR EVITER DES DOMMAGES SERIEUX.

LAMPES

Il emploie les lampes suivantes (Voir Fig. 2):

7H7	7C6
6K8GT	6L5G
7B7	1J6G
	6X5G

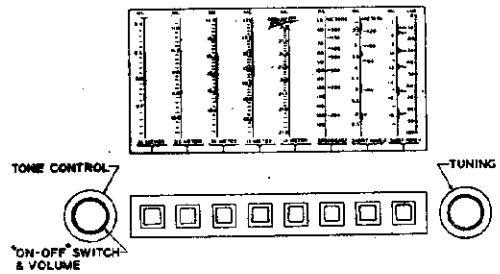

FIG. 1. Controls

VALVULAS

Las siguientes válvulas son usadas (Véase Fig. 2)

7H7	7C6
6K8GT	6L5G
7B7	1J6G
	6X5G

Cuando se usa una antena "doublet," el alambre doble tiene que conectarse a las terminales A y Z en la parte de atrás del chasis, y el anillo que conecta las terminales Z y G tiene que ser removido.

Cuando se usa una antena de un solo alambre, éste se conecta a la terminal A, y el anillo que conecta las terminales Z y G se deja donde está, y una buena conexión tierra tiene que hacerse a la terminal G. La antena tiene que ser de 15 a 30

When using a doublet antenna the twisted pair should be connected to terminals A and Z on the rear of the chassis, and the connecting link between terminals Z and G should be removed.

When using a single wire antenna, the lead-in is connected to terminal A, the connecting link between terminals Z and G is left in place and a good ground connection should be connected to terminal G. The antenna should be from 50 to 100 feet in length, and placed as high as possible. Too long an antenna may cause interference between stations, while too

Quand on emploie une antenne "Doublet" les fils doivent être branchés aux bornes A et Z au dos du châssis, et le contacteur entre les bornes Z et G doit être enlevé.

Quand l'antenne que l'on utilise a un seul fil, il doit être branché à la borne A, le contacteur entre Z et G laissé en place et une bonne prise de terre faite à la borne G. L'antenne doit avoir de 50 à 100 pieds de long et installée aussi haut que possible. Une antenne trop longue peut causer des interférences entre les stations, tandis qu'une trop courte donnera une réception

metros de largo y tiene que colocarse tan alto fuera del edificio como sea posible. Una antena demasiado larga puede causar interferencia entre estaciones, mientras que una antena demasiado pequeña dará como resultado una recepción defectuosa de las estaciones más débiles. Nunca debe conectarse el receptor a una antena vieja sin antes haberla examinado cuidadosamente para determinar su condición, porque las conexiones pueden estar rotas u oxidadas, reduciendo así el rendimiento del receptor.

FUNCIONAMIENTO

La posición y el nombre de cada perilla de control está señalado en la Fig. 1. El uso de estas perillas es como sigue:

Interruptor de Fuerza y Regulador de Volumen — Gírese la perilla a la derecha. Se requieren aproximadamente 30 segundos para que las válvulas se calienten y el receptor esté en condiciones para funcionar. Siguiendo la rotación de esta perilla se aumenta el volumen.

Conmutador de Ondas — Los ocho botones debajo del cuadrante determinan la banda que ha de usarse. Solamente apriete el botón correspondiente a la banda que se desea sintonizar. La escala del cuadrante que se encuentra directamente encima del botón que se usa, automáticamente entra en función.

Sintonización—La perilla situada a la derecha se utiliza para sintonizar las diferentes escalas del cuadrante. La sintonización ha de hacerse lenta y cuidadosamente para evitar que las estaciones más lejanas y débiles pasen desapercibidas; un arreglo de volante interior se usa para pasar fácil y rapidamente de un extremo al otro. Solamente hágase girar la perilla en la dirección deseada, y el volante continuará la rotación hasta el sitio deseado en la escala, donde el indicador se detiene por medio de una ligera presión en la perilla.

small an antenna will result in poor reception from the weaker stations. Never connect an old antenna to your receiver without a thorough examination first being made to determine its condition, as the connecions may be broken or corroded and cause very unsatisfactory reception.

OPERATION

The position and purpose of the control knobs are shown in Fig. 1. The use of each is as follows:

Volume and On-Off Switch — Rotation to the right turns the receiver on. Approximately 30 seconds is required for the tubes to heat before reception will be obtained. Continued rotation of this control regulates the volume.

Band Switches. — The 8 push buttons at the bottom of the escutcheon determine which tuning range is in use. Merely press the button corresponding to the wave band over which tuning is desired. The dial scale immediately above the button which has been pressed will then be in use.

Tuning — The right hand knob is used to tune over the various dial scales. All tuning should be very slowly and carefully done so as not to pass over the weaker more distant stations. The internal fly wheel arrangement is used to provide an easy means of moving rapidly from one portion of the scale to another. Merely spin the knob in the direction required, the fly wheel will keep it in rotation until the desired portion of the scale is reached after which a slight pressure on the knob will stop further rotation.

When tuning for a station move the pointer over the signal in both directions and set it at the point of maximum volume, least noise and clearest tone. Daylight has a decided effect on the reception of short wave stations and different wave lengths are most effective at different times of the day. The following table may be used as a

pièrre dans les stations faibles. Il ne faut jamais brancher le récepteur à une vielle antenne sans en faire l'examen complet de sa condition, car les connections peuvent être cassées ou corrodées et donner par là un mauvais rendement.

FONCTIONNEMENT

La position et le but des boutouns de commande sont montrés sur la Fig. 1. et leur utilisation est comme suit:

Commutateur Marche-Arrêt et de Volume — Le récepteur est branché quand le bouton est tourné vers la droite. Trente secondes suffisent approximativement pour que les lampes puissent être chauffées avant que l'on obtienne une réception. On contrôle le volume en tourhant le bouton davantage vers la droite.

Commutateur d'échelles — Les 8 bouton-poussoirs au bas de l'écusson indiquent l'échelle utilisée. Pressez simplement sur un bouton pour obtenir l'échelle que l'on désire. Immédiatement le vernier qui se trouve au-dessus du bouton sera mis en utilisation.

Sélection — Le bouton à droite sert à faire la sélection des diverses échelles sur le vernier. La sélection doit être faite doucement et soigneusement pour ne pas passer les stations faibles et lointaines. Une combinaison de roues à engrenages procure le moyen de faire le déplacement d'un bout à l'autre du vernier rapidement. Faites simplement tourner le bouton dans la direction voulue et le système de roues à engrenages continuera à tourner jusqu'à ce que l'on atteigne la partie du vernier que l'on désire, après quoi une légère pression sur le bouton arrêtera la rotation de ce dernier.

Quand on fait la sélection d'une station, placez l'aiguille-repère des deux cotés de la démarcation jusqu'à ce que l'on obtienne le volume maximum, le moindre bruit, et la tonalité la plus claire. La réception sur

Cuando se esté sintonizando una estación, muévase la aguja sobre la señal en ambas direcciones hasta encontrar el punto de mayor intensidad, menor ruido y mayor claridad de tono. La luz del dia tiene una decidida influencia sobre la recepción de la onda corta, y diferentes longitudes de onda alcanzan mayor eficacia a diferentes horas del dia. El cuadro a la derecha puede ser usado como guía para sintonizar a diferentes horas del dia y la noche.

REGULADOR DE TONO

El regulador de tono proporciona un medio para variar la proporción de tonos altos y bajos y permite que el tono del receptor se cambie a gusto del radio-escucha.

Rotación a la izquierda aumenta la proporción de notas bajas y rotación a la derecha aumenta las notas altas.

FONOGRAFO

Este receptor puede ser usado como un excelente amplificador de fonógrafo conectando cualquier tocadiscos con un brazo acústico de alta impedancia a las terminales de fonógrafo en la parte posterior de chasis y poniendo el conmutador de fono-radio en la posición "phono." Los reguladores de volumen y tono del receptor se usan para regular la reproducción de discos.

guide for listening at different times during the day or night.

SHORT WAVE BAND	TIME OF BEST RECEPTION
15 meters and below	A.M. (Morning hours)
19 and 25 meters	P.M. (Afternoon)
25 and 31 meters	P.M. (Early evening)
31 and 49 meters	P.M. (Late evening)

TONE CONTROL

The tone control provides a means of varying the proportion of bass and treble notes and allows the tone of the receiver to be changed to suit the user's taste.

Rotation to the left increases the proportion of bass or low notes and rotation to the right increases the treble notes.

PHONO

The receiver may be used as an excellent phono amplifier by connecting any good high impedance type phono pickup to the phono terminals on the rear of the chassis and placing the phono-radio switch on the rear of the chassis in the "phono" position. The volume and tone controls of the receiver will be effective on record reproduction.

ondes courtes est affectée définitivement par le jour, de même que celle sur différentes longueurs d'ondes est plus ou moins efficace à divers moments de la journée. Le graphique à gauche peut être utilisé comme guide d'écoute pour la réception à différents moments pendant le jour ou la nuit.

COMMANDE DE TONALITE

La commande de tonalité procure un moyen de combiner les notes basses avec les aigües et permet aussi de changer la tonalité du récepteur à son goût.

La rotation du bouton vers la gauche augmente les notes basses et vers la droite les notes aigües.

PHONO

Le récepteur peut être utilisé comme un excellent amplificateur de phono en branchant le pickup de bonne impédance aux bornes du phono au dos du châssis et en plaçant le commutateur radio-phono qui se trouve aussi au dos du châssis dans la position "phono." Les commandes de volume et de tonalité sont très efficaces dans la reproduction phonographique.

I. F. 265 KC.
TUNING RANGE 540 KC. TO 1600 KC.

5EH-18805A 7ML080
5EH-18805B 7ML081

SENSITIVITY: ..... 6 microvolts at one watt output.

UNDISTORTED POWER OUTPUT: ..... 7.5 watts measured at the voice coil.

SPEAKER: ..... 6" x 9" oval, instrument

TUNING RANGE: ..... 540-1600 Kc.

INTERMEDIATE FREQUENCY: ..... 265 Kc.

CURRENT CONSUMPTION: ..... 8.5 amperes

INSTANTANEOUS CURRENT CONSUMPTION DURING AUTOMATIC CHANGE CYCLE: ..... 20 amperes

DELAYED AUTOMATIC MUTING CIRCUIT

Pressing the touch-bar or the foot control switch automatically mutes the receiver during the station changing cycle. After the hand or foot pressure is removed, the noise of tuning through stations on the return stroke is eliminated automatically. This special circuit applies a large negative voltage to the 1st audio grid to bias it beyond cut off. When the tuner is operated, the delayed muting switch S3 on the back of the tuner connects the grid side of the condenser C19 to ground and charges it positively. As soon as the tuner starts its return stroke, the switch grounds the positive terminal of the condenser and ungrounds the grid side. The grid side now becomes negative with respect to ground and cuts off the 1st audio tube. The charge rapidly leaks off through R12 and R14, and the receiver operates normally after the change cycle.

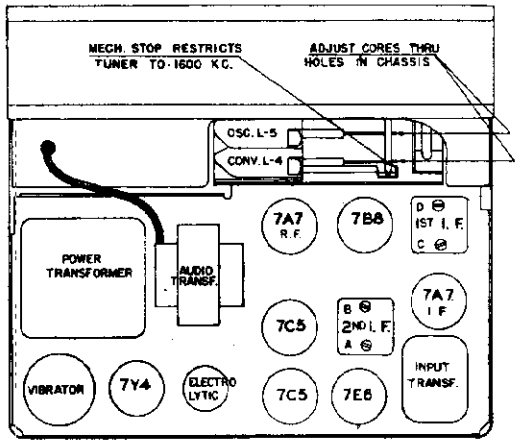

Fig. 9. Top View of Chassis

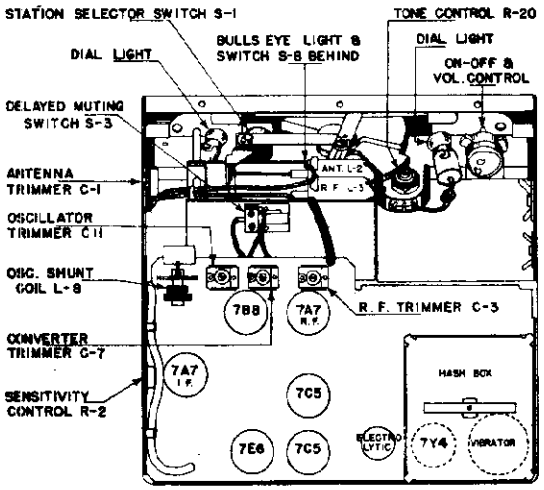

Fig. 10. Bottom View of Chassis

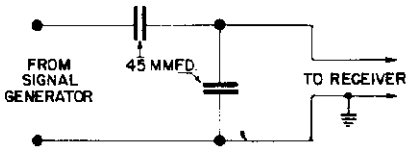

Fig. 11

Figure 11 shows the schematic of a recommended dummy antenna, closely resembling actual antenna capacity, to be used in series with signal generator leads when aligning the R.F. section of the receiver.

ALIGNMENT

Maximum performance depends on accurate alignment of the receiver; therefore follow these instructions carefully.

CAUTION: Make all alignment adjustments to the receiver with the volume control set at maximum and the tone control in the treble position. Reduce the signal intensity as much as possible at the signal generator. Connect the output meter across the voice coil.

I.F. ALIGNMENT PROCEDURE

1. Remove top and bottom covers from receiver.
2. Set signal generator to 265 Kc.
3. Apply signal from generator through a .1 Mfd. dummy to 7B8 converter grid. (Pin No. 6 on socket.)
4. Adjust I.F. trimmers A, B, C and D (Fig. 9) in the order named for maximum output. Repeat the operation to assure accurate alignment.

R.F. AND OSCILLATOR ALIGNMENT

1. Connect signal generator leads through dummy illustrated in Fig. 11 to antenna lead in socket on receiver.
2. Set signal generator to 535 Kc.
3. Place set in manual tuning position and set dial to 535 Kc.
4. Adjust oscillator trimmer C-11 (Fig. 10) for maximum response.
5. Set signal generator to 1200 Kc.
6. Tune set to 1200 Kc.
7. Adjust converter trimmer C-7 (Fig. 10) and R.F. trimmer C-3 (Fig. 10) for maximum response.
8. If dial calibration is off after making above adjustments, a correction can be made by turning eccentric screw at fulcrum of dial pointer.

CORE OR COIL REPLACEMENT ONLY

WARNING: The following adjustments are to be made ONLY if a core or coil is replaced.

1. Replace coil or core.
2. Set signal generator to 1700 Kc.
3. Connect signal generator leads through dummy illustrated in Figure 11 to antenna receptacle on the receiver.
4. Set receiver dial to 1600 Kc. (Maximum high frequency end of dial.)
5. Screw the core complete out of the antenna coil, the R.F. coil, the converter coil, and the oscillator coil.
6. Adjust oscillator trimmer C-11 Fig. 10 at 1700 Kc.
7. Adjust converter trimmer C-7, R.F. trimmer C-3, and antenna trimmer C-1 (Fig. 10) for maximum output reading.
8. Replace cores to their approximate original positions.
9. Set generator dial and receiver dial to at 200 Kc.
10. Adjust oscillator core L5 (Figure 9) to scale at 1200 Kc.
11. Adjust antenna, R.F. and converter cores (Figures 9 and 10) for maximum output reading.
12. Set signal generator to 600 Kc.
13. "Rock in" shunt oscillator coil L8 (Fig. 10) for maximum output reading. This should be done only as a last resort. This is the same as rocking in the padder condenser on a ganged condenser receiver.
14. Check receiver at 1200 Kc. for calibration and gain. If the receiver is off scale or weak, repeat operations 9, 10 and 11.
15. After alignment is complete, the maximum high frequency tuning range should be checked. If the range is greater or less than 1605 Kc., the mechanical stop for the tuner cross arm should be bent to limit the frequency coverage to 1605 Kc.

After all adjustments have been made, glue core screws with speaker cement.

IMPORTANT: After reinstalling the receiver in the car, allow it to operate for approximately 15 minutes to reach normal operating temperature. Extend antenna to maximum. Check the antenna trimmer alignment on a weak station at approximately 1200 Kc.

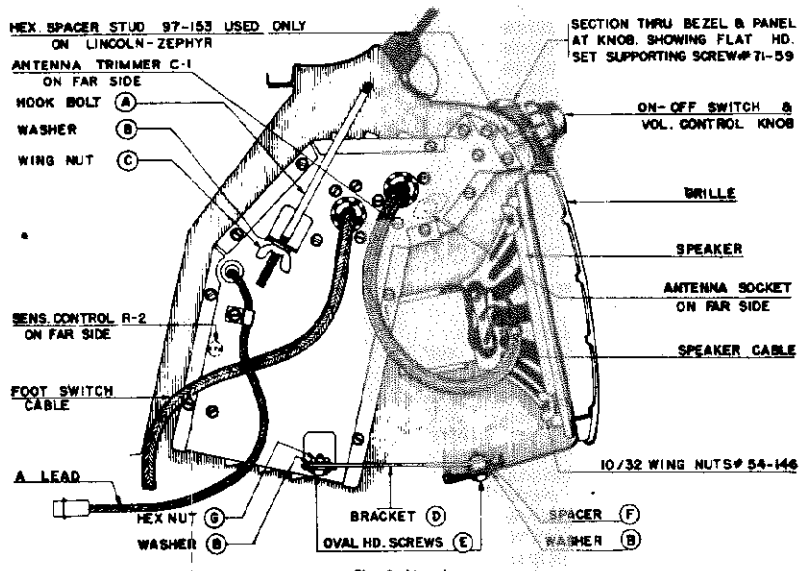

Fig. 2. Lincoln

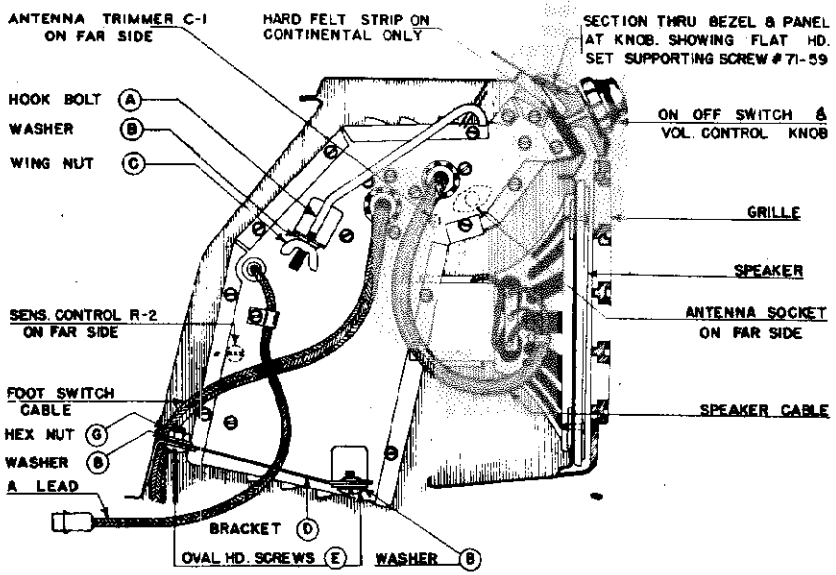

Fig. 2A. Continental

RECEIVER INSTALLATIONS

Figures 1, 1A, 2 and 2A, illustrating the escutcheon plates, control knobs and the installed receivers, are given here to facilitate removal and reinstallation of the receivers when service or repair is necessary.

To take the receiver from the car, remove the tuning and volume control knobs. Remove the 8-32 flathead screws that support the receiver at the top. Remove the lower support brackets "D" and finally loosen the hook bolts "A."

To remove the Continental speaker, remove grille (held in place by four nuts on back side of instrument panel). Then remove four machine screws No. 69-84 holding the speaker to the front of the instrument panel. (Fig. 2A.)

The Lincoln speaker is held to the rear of the panel by four wing nuts No. 54-146. (Fig. 2.)

MANUAL TUNING

1. Press station selector touch-bar (Fig. 1) several times or until the green dot appears in the back ground of the dial.

2. Pull manual tuning (right hand) control knob outward and turn to tune in desired station. Be sure to tune to exact frequency to assure the best tone quality.

VOLUME—Adjust left hand control knob for desired volume.

TONE CONTROL—The tone control is located under dial cale. (Fig. 1.) Turn in either direction for most pleasing one.

ADJUST-O-MATIC TUNING

If not previously set up for Adjust-O-Matic operation, proceed as follows:

1. Press station selector touch bar (Fig. 1) until green dot appears in dial scale background. Press the touch bar once more to advance Adjust-O-Matic mechanism to the No. 1 position.

2. Pull manual tuning knob outward to engage the Adjust-O-Matic mechanism.

3. Select the station desired and tune to its frequency by turning the tuning knob. Tune very carefully for clearest reception.

4. Press station selector bar, pull tuning knob outward and tune in station desired for No. 2 position. Use same procedure for positions No. 3, 4 and 5.

When the five Adjust-O-Matic positions have been adjusted to the five desired stations as instructed, it is only necessary to press the selector bar to return to dial tuning or to any one of the stations selected on the Adjust-O-Matic.

INTERFERENCE SUPPRESSION

There should be no motor noise or interference from the ignition circuit if the receiver has been installed in the car according to the instructions furnished with it. The interference suppression equipment may be checked for proper installation by referring to the following illustrations:

The two ignition coil condensers No. 22-1147 should be installed as shown in Figure 3 below.

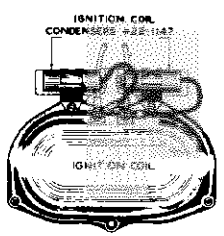

Fig. 3

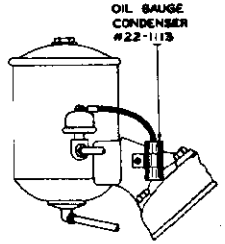

Fig. 4

The oil gauge condenser No. 22-1113 should be installed as shown in Figure 4.

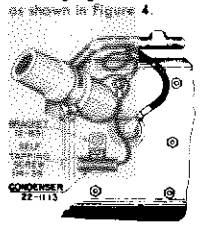

Fig. 5

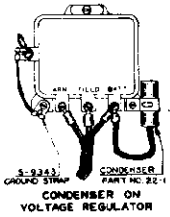

Fig. 6

The temperature gauge condenser No. 22-1113 should be installed with its bracket fastened under one of the cylinder head nuts as shown in Figure 5.

The voltage regulator condenser and ground strap should be installed as shown in Figure 6.

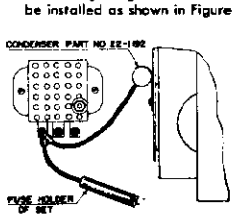

Fig. 7

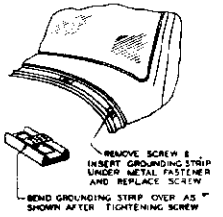

Fig. 8

The No. 22-1192 condenser and the "A" lead should be connected together at the circuit breaker inside the car above the steering column as shown in Figure 7.

The No. 80-145 motor hood bond spring should be installed as illustrated in Figure 8.

	S12195	Dial light socket & wire assem.—L.H.
	S12196	Dial light socket & wire assem.—R.H.
	S12197	Dial light socket & wire assem.—Manual ind.
	S12232	Tone control knob & bushing assem. (46-589)

Note: In ordering Adjusting Spring and Core marked *, be sure to give color code information.

MOTOR NOISE SUPPRESSION KIT

S12125	Motor noise suppression kit complete
S-9343	Ground strap
12-831	Suppressor condenser mtg. bracket
22-1111	Voltage regulator condenser
22-1113	Water gauge & oil gauge condenser
22-1147	Ignition coil condenser
22-1192	"A" lead condenser
80-145	Motor hood band spring
114-39	No. 8 x ¼ hex head S.T. screw

INSTALLATION PARTS

S12126	Set installation kit complete
12-972	Set installation bracket
19-114	Foot switch cable clip
54-99	No. 12-24 x 7/16 hex nut
54-146	No. 10-32 wing nut (4 used)
54-151	No. 12-24 wing nut (2 used)
64-141	Foot switch installation eyelet
68-4	No. 6 Allen head set screw wrench
71-59	No. 8-32 x ½ flat head M.S.
93-340	3/32 x .255 x ½ washer (steel)
93-372	No. 12 int. shakeproof lockwasher
93-524	Foot switch installation washer
112-310	No. 10 x 2 R.H. S.M. screw
112-342	No. 12-24 x 5/8 B.H. M.S.
112-348	Set installation screw

PARTS LIST CONTINENTAL MODEL 7ML081 (CHASSIS 7C80)

1946 ADJUST-O-MATIC RADIO

The parts list for Model 7ML081 is the same as for Model 7ML080 with the following parts omitted and added:

ADD

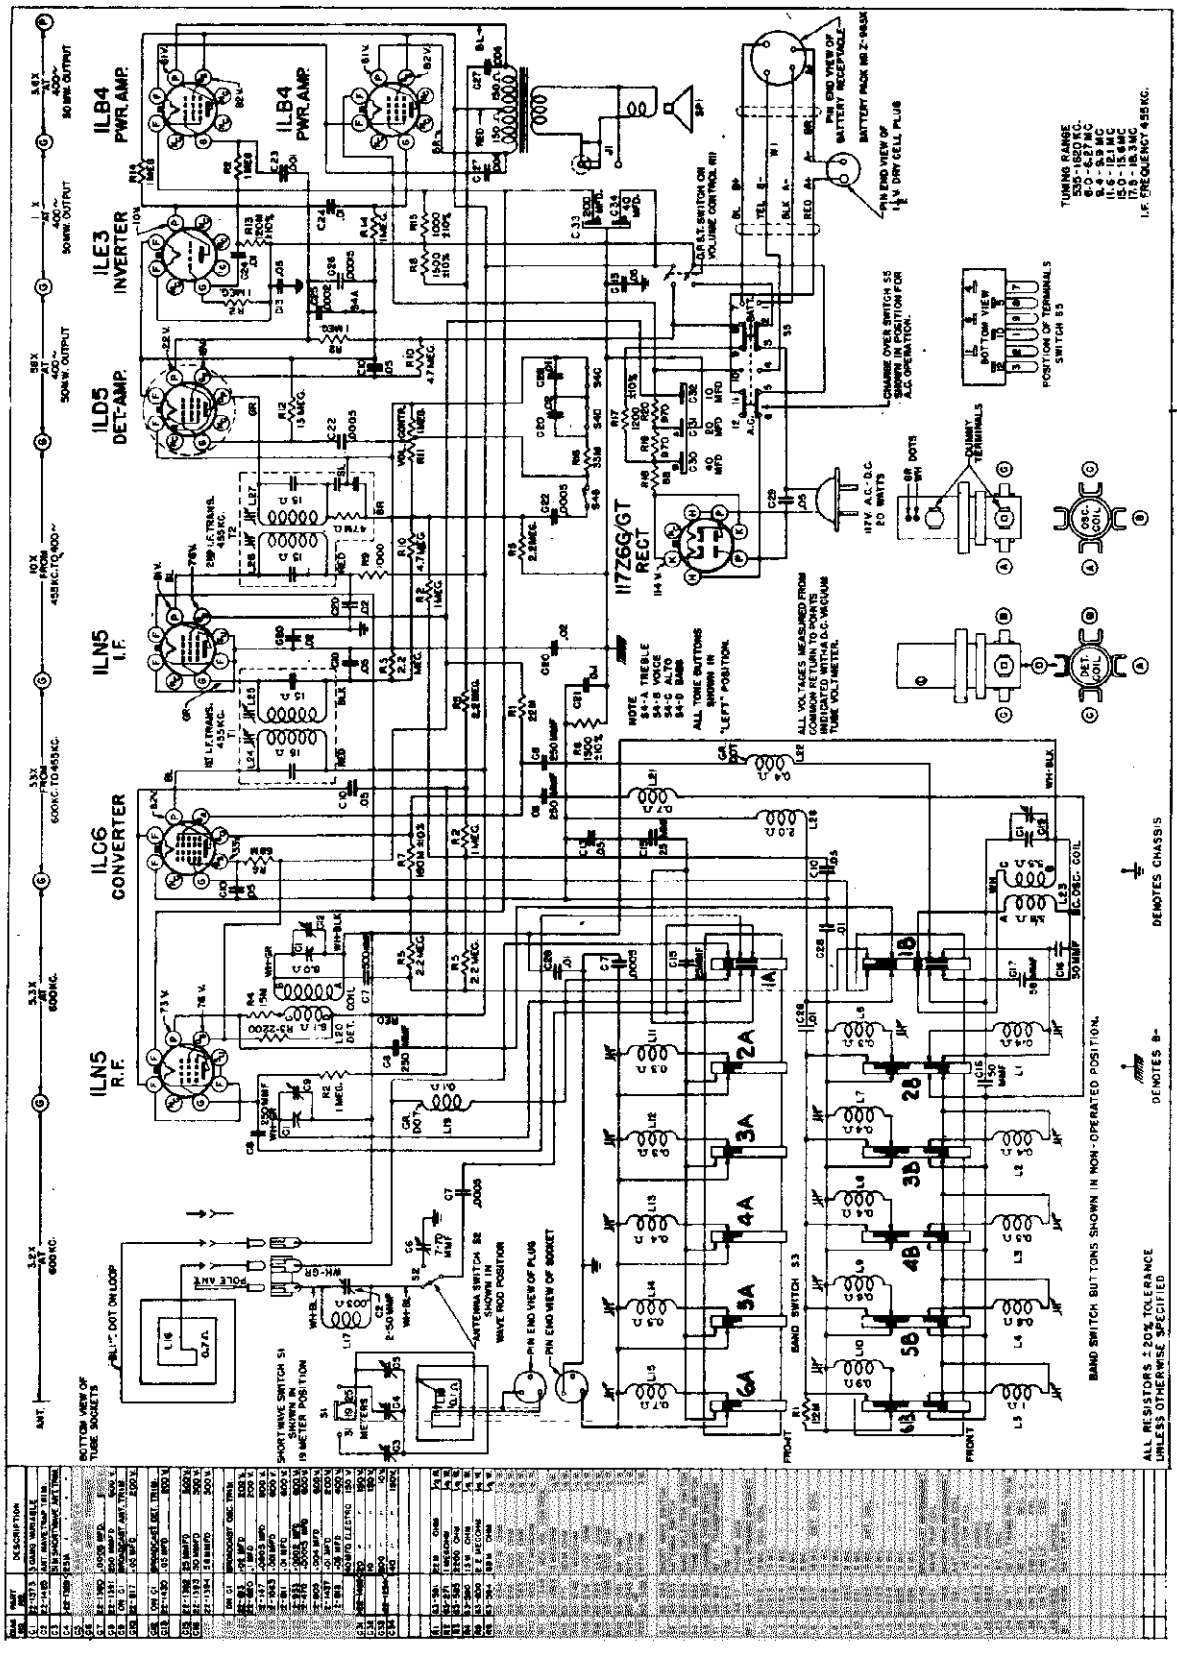
Diagram No.	Part No.	Description
SP2	49-539	6" x 9" dynamic speaker
	112-545	Set installtion screw L.H.
	112-546	Set installation screw R.H.
	69-84	10/32 x ¼ R.H. M.S.
	71-29	8/32 x 7/8 F.H M.S.
	93-369	No. 10 internal shakeproof lockwasher
	93-593	7/16 external shakeproof lockwasher
	208-539*	Cone and voice coil

OMIT

Diagram No.	Part No.	Description
SP1	49-543	6" x 9" dynamic speaker
	97-235	Set installation mounting stud
	54-146	10/32 wing nut (4 used)
	71-59	8/32 x ½ flat head M.S.
	112-348	Set installation screw
	208-543	Cone and voice coil

When ordering cone and voice coil assembly marked*, be sure to give manufacturer's code letter that follows base number.

ZENITH RADIO CORP.



MICROPHONICS: Howl caused by a microphonic 1LD5 tube. These tubes have been improved, and all tubes after F6B (June '46) are non-microphonic and should replace the older type.

For alignment see pp. 15-69 and 15-

MODEL 8G005

CHASSIS 8C40, 8C40BT

TO THE SERVICE MAN:

CAUTION—Before attempting to operate this receiver, make certain that the Line Voltage Switch is properly set.

1. For 110-125 V. AC or DC operation set the Line Voltage Switch to 115 V. AC-DC.

2. For 210-240 V. AC operation, set the switch to the 220 V. AC position.

3. For 210-240 V. DC operation, set the switch to the 220 V. DC position.

The 8C40BT chassis is an AC, DC or battery operated superheterodyne circuit with a stage of tuned radio frequency amplification and band spread tuning over the 49, 31, 25, 19, and 16 meter bands.

The audio amplifier used in chassis 8C40BT features phase inversion and push-pull power output.

If removal of the chassis from the cabinet becomes necessary, great care must be exercised so that the coil assembly is not damaged.

The 8C40BT chassis is isolated from the DC circuits, and all measurements must be from a common negative point. The most convenient place to reach this point is at the junction where C13 is connected to the filter condenser. The DC resistance from the chassis to any circuit must be almost infinite. If any circuit becomes grounded to the chassis, a hum will appear. Microphonic tubes will cause an audio howl. Check the 1LD5 and 1LC6 tubes.

The wavemagnet is connected to the chassis through the hinges in the cabinet, snaps and flexible leads. If the RF becomes weak or dead, check resistance of wavemagnet at the condenser gang. The DC resistance across the two leads should be approximately 1 ohm. If the circuit is open, unscrew the four wood screws and the two screws which hold the handle. The top can now be removed and connecting leads will be visible for inspection. Also loosen the snap-on socket and check for broken or shorted leads.

The alignment of chassis 8C40BT is conventional. However, care must be exercised when making adjustments, and the alignment procedure must be followed exactly. Set the chassis over a metal plate approximately the same distance the battery pack is from the bottom of the chassis when it is in the cabinet. This procedure will introduce the approximate amount of metal in the field of the RF and oscillator coils as when the chassis is in the cabinet. A signal generator of reasonable accuracy and good attenuation must be used. An output meter (AC) of the copper oxide rectified type with a range of 1 to 30 volts in several steps is necessary to get accurate output readings. Alignment wrenches should be of the non-metallic type, especially when making adjustments at the higher frequencies.

When reinstalling the chassis in the cabinet be careful not to disturb the cabling between the short wave coil assembly and chassis. Tune in a weak broadcast signal near 1400 Kc., and touch up trimmer C9. This will insure maximum performance after alignment.

A LOS MECANICOS

PRECAUCION: Antes de empezar el funcionamiento de este receptor, cerciórese de que el interruptor del Voltaje de la Linea esté debidamente ajustado.

1. Para corriente de 110-125 voltios, corriente continua o corriente alterna, adjústese el interruptor del Voltaje de la Linea a 115 voltios C.C. o C.A.

2. Para corriente de 210-240 v. C.A., ajústese el interruptor a 220 v. C.A.

3. Para corriente de 210-240 v. C.C., ajústese el interruptor en la posición de 220 v. C.C.

El bastidor 8C40BT es un circuito superheterodino que funciona por corriente alterna o corriente continua o por batería de acumuladores con una etapa de amplificación de radiofrecuencia sintonizada y un ensanche de banda que sintoniza con las bandas de 49, 31, 25, y 16 metros.

La válvula amplificadora de audofrecuencia que se usa en el bastidor 8C40BT da importancia a la inversión de fases y a la salida simétrica de la energía.

Si se hace necesario quitar el bastidor del armario, deberá ejercerse gran cuidado para evitar que se dañe el embobinado.

El bastidor 8C40BT está aislado de los circuitos de corriente continua, y todas las medidas deben hacerse desde un punto negativo común. El lugar más conveniente para alcanzar este punto está en la unión donde C13 está conectado al condensador del filtro. La resistencia de la corriente continua procedente del bastidor a cualquier circuito deberá ser casi infinita. Si uno de los circuitos está a masa (cortocircuito) con el bastidor, se oirá un zumbido. Las válvulas microfónicas producirán un aullido de audio. Examínense las válvulas 1LD5 y 1LC6.

El imán de ondas está conectado al badtidor por medio de las bisagras en el armario, garras, y conductores (plomos) flexibles. Si la energía radiofrecuente se debilita o no existe. Inspecciónese la resistencia del imán de ondas en el múltiple del condensador. La resistencia de la C.C. a través de los dos conductores (plomos) deberá sera aproximadamente de 1 ohm. Si el circuito está abierto, aflójense los cuatro tornillos de madera y los dos tornillos que sostienen el mango. Ahora, la tapa se puede quitar, quedando visibles para su inspección los conductores conectadores. Aflójese también el casquillo de resorte y exáminese para ver si hay conductores rotos o en cortocircuito.

El alineamiento del armazón 8C40BT es convencional; sinembargo, debe tenerse cuidado al hacerse ajustes o composturas, y es imperativo hacer el alineamiento siguiendo el procedimiento exactamente. Colóquese el armazón sobre una plancha de metal aproximadamente a la misma distancia que el paquete de los acumuladores está del armazón cuando éste está en el armario. Este procedimiento introducirá en el campo de las bobinas de R.F. y del oscilador la cantidad aproximada de metal que hay cuando el armazón está en el armario. Hay que usar un generador de señales que funcione con exactitud y buena atenuación. Se necesita un medidor de rendimiento de C.A. del tipo rectificado de óxido de cobre, con una amplitud de 1 a 30 voltios en varias etapas, para obtener medidas correctas del rendimiento. Hay que usar llaves de alineamiento que no sean de metal, especialmente cuando se hagan ajustes o reparaciones en las frecuencias altas.

Cuando se instale otra vez el armazón en el armario, téngase cuidado de no desarreglar las posicion de los cables que se extienden entre el conjunto de la bobina de onda corta y el armazón. Sintonícese con una señal de radiodifusión débil cerca de 1400 Kc., y tóquese la pieza C9 (trimmer). Así se obtendrá un funcionamiento máximo después del alineamiento.

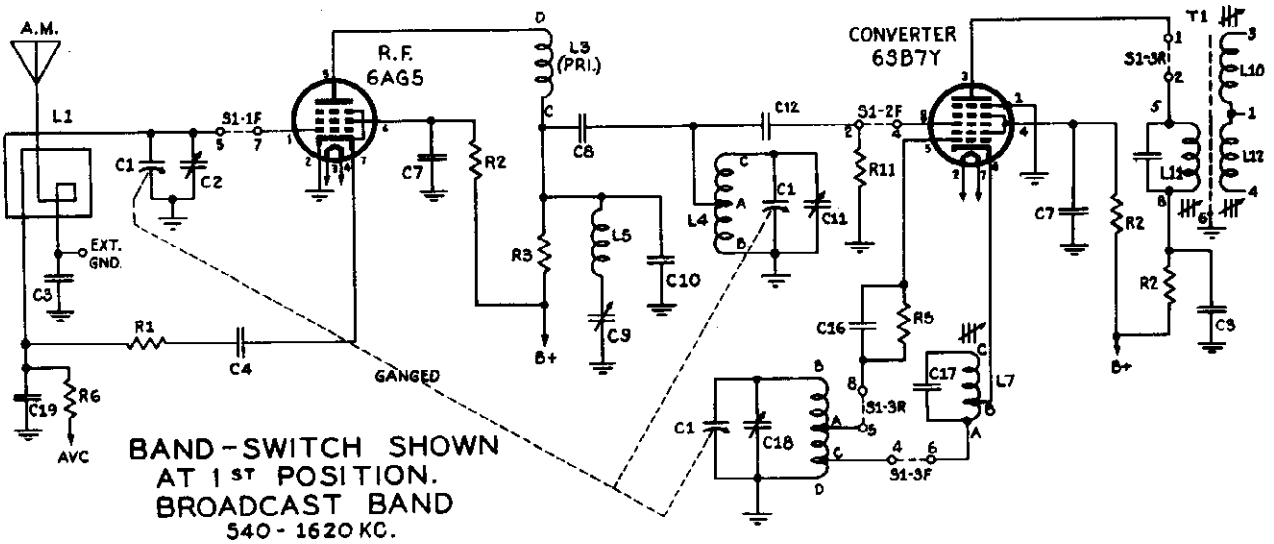
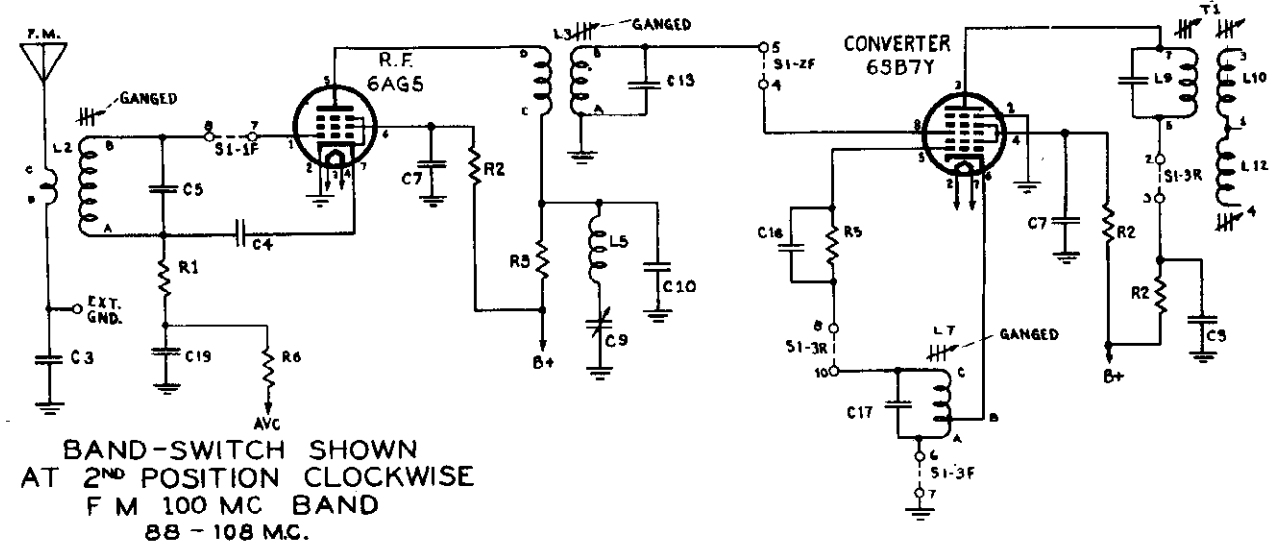
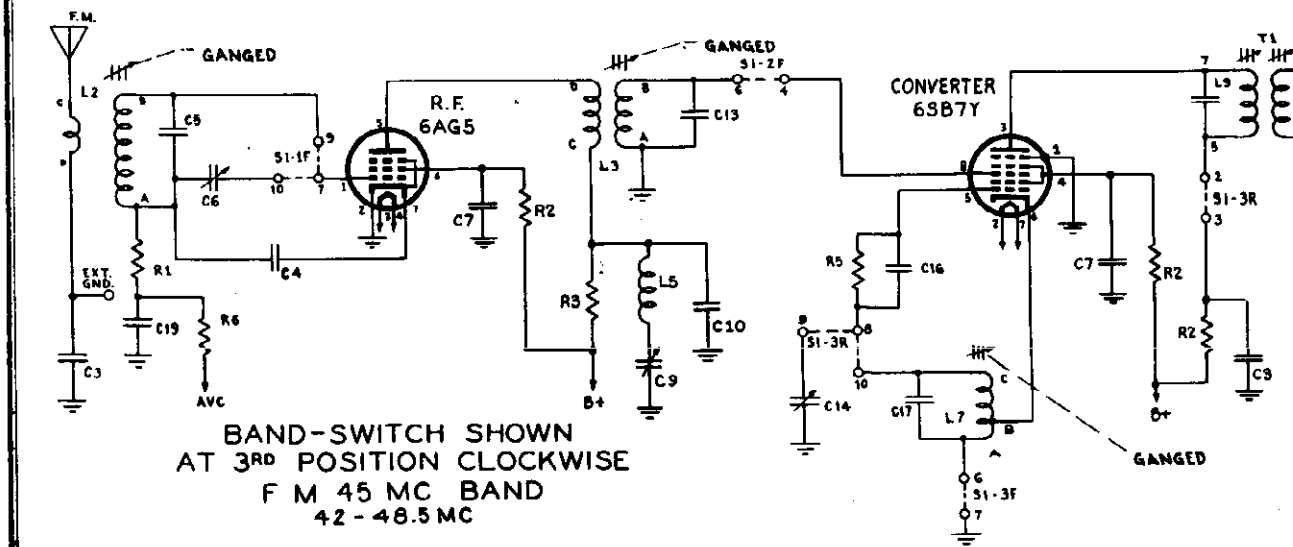
ang and i-f transformer.
screw nearest the dial.

ZENITH RADIO CORP.







MODULATION HUM: Under humid conditions, the insulating material inside the a-c plug, and the back cover would absorb moisture and if the solder lug was in contact with this material, some of the a-c voltage would leak into the back cover. Since this back cover was next to the loop, hum modulation would be evident.
To remedy this condition, remove the back from the receiver, and open the a-c connector, and bend the solder lug away from the insulating wall. A vinylite sleeve over the solder lugs will insure good insulation.

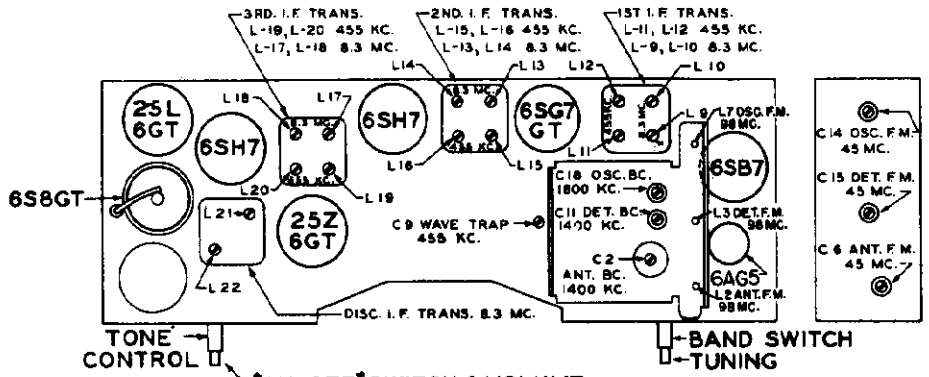
HUM COMES UP AS VOLUME CONTROL IS ADVANCED: Hum in the 8C01 chassis may be caused by an open .05-200v condenser which is connected between the metal shell of the volume control and chassis.

TO THE SERVICE MAN:

The 8C01 chassis incorporates a superheterodyne circuit with two stages of IF, and one stage of RF amplification on all bands.

When adjustments are made on the 8C01 or any AC-DC chassis, a line isolation transformer (110 V input to 110 V output) is recommended in order to avoid a "hot" chassis. If an isolation transformer is not available, check the AC voltage between chassis and bench ground, and if there is any indication of voltage, reverse the plug before handling the set.

AM Alignment: The alignment of this chassis on the standard broadcast band is conventional. The alignment slugs in the IF transformers are threaded and screw into the coil forms. The slugs are slotted for a small size fiber screw driver. Do not press hard on the aligning tool(fiber screw driver) or the threads in the coil forms will strip and adjustment will be impossible.



MODELS 8H023 – 8H034
CHASSIS No. 8C01
TUBE AND TRIMMER LOCATION

FM RF Alignment: The same coil slug arrangement which tunes the 100 MC FM band also tunes the 45 MC band. However, on 45 MC the band switch connects trimmer condensers in parallel and padding wires in series with the 100 MC coils. The tuning slugs are attached to threaded shafts and the slugs are varied in the field of the coils by turning the shafts clockwise or counter-clockwise. After adjustments the shafts must be secured with a drop of speaker cement.

FM IF Alignment: The same type of tuning slugs for aligning the AM IF Amplifier are used for the FM I.F.'s. Observe the same precautions when making adjustments. The second 8.3 Mc If stage is overcoupled. Overcoupling gives a wide band pass with good sensitivity. When an overcoupled stage is aligned with an unmodulated signal, the stage must be loaded. A 300 ohm carbon resistor soldered across the secondary of the second IF transformer provides a satisfactory load for this circuit. The resistor leads must be kept short to reduce the distributed capacity of the circuit.

When aligning a loaded stage, it will be found that considerable signal from the generator will be required, and that it will tune broadly. THE LOAD RESISTOR MUST BE REMOVED AFTER ALIGNMENT.

If the signal generator used does not have sufficient output to overcome the temporary loss caused by the load resistor, the load resistance may be increased or the signal fed into the preceding stage.

FM Discriminator Alignment: When the secondary of the discriminator is aligned (operation 6) use sufficient signal input to get a good positive and negative indication before setting the slug for zero reading. A center zero indicating meter is recommended for this adjustment, but is not absolutely necessary. Reversing the leads of a non-zero center meter, or observing closely when this meter starts to go to the left (negative) of zero will give the same results.

ALIGNMENT PROCEDURE

Operation	Connect Oscillator to	Dummy Antenna	Input Signal Frequency	Band	Set Dial To	Adj. Trimmers	Purpose
1	Pin 8 on Converter Tube 6SB7 Socket	.05 Mfd.	455 Kc. Modulated	BC	600 Kc.	L-11,12,15,16, 19 and 20	Align I.F. channel for maximum output
2	Pin 1 on R.F. tube 6AG5 socket	.05 Mfd.	455 Kc. Modulated	BC	600 Kc.	C9	Adjust wavetrap for minimum output
3	2 turns loosely cpld. to wavemagnet		1600 Kc. Modulated	BC	1600 Kc.	C18	Set oscillator to dial scale
4	2 turns loosely cpld. to wavemagnet	.05 Mfd.	1400 Kc. Modulated	BC	1400 Kc.	C11 & C2	Align det. and ant. stages.
5 (a)	Pin 4(grid)on 6SH7 limiter socket	.05 Mfd.	8.3 Mc. Unmodulated	FM 45		L21 coil slug Primary discr.	Align primary of discrimator for maximum reading
6 (b)	Pin 4(grid)on 6SH7 limiter socket	.05 Mfd.	8.3 Mc. Unmodulated	FM 45		L22 coil slug sec. of disc.	Adjust secondary of discriminator for zero reading
7 (c)	Pin 4 (grid) on 6SH7 2nd IF tube socket	.05 Mfd.	8.3 Mc. Unmodulated	FM 45		L17 & L18 Prim.&Sec.of 3rd IF trans.	Align 3rd IF transformer for maximum reading
8(c)(d	Pin 4 (grid) on 6SG7 1st IF tube socket	.05 Mfd.	8.3 Mc. Unmodulated	FM 45		L13 & L14 primary and sec. of 2nd IF transformer	Align 2nd IF transformer for maximum reading
9(c)(d	Pin 8(grid) on 6SB7 converter tube socket	.05 Mfd.	8.3 Mc. Unmodulated	FM 45		L9 & L10 Primary & Sec. of 1st IF transformer	Align 1st IF transformer for maximum reading
10 (c)	Antenna Post (Remove line ant.)	270 ohms	98 Mc. Unmodulated	FM 100	98 Mc.	L7 Osc. Coil slug	Set oscillator to dial scale
11 (c)	Antenna Post (Remove line ant.)	270 ohms	98 Mc. Unmodulated	FM 100	98 Mc.	L3 & L2 Det. and RF coil slugs	Align det. and ant. stages to maximum reading
12 (c)	Antenna Post (Remove line ant.)	270 ohms	45 Mc. Unmodulated	FM 45	45Mc.	C14	Set oscillator to dial scale
13 (c)	Antenna Post (Remove line ant.)	270 ohms	45 Mc. Unmodulated	FM 45	45 Mc.	C15 & C6	Align detector & ant. stages for maximum reading

IMPORTANT: Alignment of this chassis will in most cases be unnecessary unless an IF or RF transformer is replaced or the adjustments have been tampered with.

Correct alignment can only be made if the following procedure is followed:

A vacuum tube voltmeter with an isolation resistor of 200,000 ohms in series with the hot lead will serve for FM adjustments. This lead should be shielded.

An AC output meter connected across the primary or secondary of the output transformer will be satisfactory for all AM adjustments.

The signal generator output should be kept just high enough to get an indication on the meter.

(a) Vacuum Tube Voltmeter pin 5 on discriminator transformer to chassis (half discriminator load.)

(b) Vacuum Tube Voltmeter pin 7 on discriminator transformer to chassis (full discriminator load.)

(c) Vacuum Tube Voltmeter 6SH7 limiter grid (pin 4) to chassis.

(d) 300 ohm $\frac{1}{2}$ watt carbon resistor soldered across the secondary L14 (pin 2 and 3 of 2nd, IF trans.). The leads to the resistor must be as short as possible and the resistor removed before operation 10 is started.

A 300 ohm carbon resistor soldered across the secondary of the second IF transformer provides a satisfactory load for this circuit. The resistor leads must be kept short to reduce the distributed capacity of the circuit.

When aligning a loaded stage, it will be found that considerable signal from the generator will be required, and that it will tune broadly. THE LOAD RESISTOR MUST BE REMOVED AFTER ALIGNMENT.

If the signal generator used does not have sufficient output to overcome the temporary loss caused by the load resistor, the load resistance may be increased or the signal fed into the preceding stage.

FM Discriminator Alignment: When the secondary of the discriminator is aligned (operation 6) use sufficient signal input to get a good positive and negative indication before setting the slug for zero reading. A center zero indicating meter is recommended for this adjustment, but is not absolutely necessary. Reversing the leads of a non-zero center meter, or observing closely when this meter starts to go to the left (negative) of zero will give the same results.

CHASSIS 8C20-8C21-8HO-9HO-SERIES

HUM COMPLAINT ON 9HO SERIES:

Check audio and a-c leads to the volume control. The leads from the tone control must be dressed away from the a-c leads. The high voltage secondary leads from the power transformer must be dressed away and close to the chassis from the 47,000 resistor on the tap points.

HOWL ON AM 8HO SERIES:

Howl due to vibrations transmitted into the oscillator sections of the gang condenser by the speaker. To remedy this condition, a felt strip can be placed between the rear of the gang, and the first i-f transformer. It may also be necessary to move the oscillator section lead underneath the gang slightly to reduce tension.

STRIPPED IF SLUG INSERTS:

Damaged i-f slug thread inserts may be replaced by unscrewing the slug and pushing out the old insert.
Two types of inserts are used, 83-1063 short and 83-1069 long.

FM SPEAKERS 8HO AND 9HO SERIES:

Some of the earlier 8C20-21 chassis are wired for electro-dynamic speakers only. Later production sets are wired for either electro-dynamic or PM speakers which have the filter unit attached to the speaker frame. These chassis are identified by a dot of black paint on or near the speaker socket. To use the PM speakers on the earlier sets, it will be necessary to run a lead from B-(center tap of high-voltage winding) to a lug on the speaker socket which connects to the negative side of the filter on the speaker.

BUZZ IN DIAL ESCUTHEON 8HO AND 9HO SERIES:

If the dial assembly comes in contact with the power transformer a buzz will result and a 83-1331 felt spacer should be added between the dial and transformer.

INCREASING BASS RESPONSE OF PHONO:

To increase the bass response on records, the value of R5 in the phono preamplifier may be increased. Do not increase the value to over 10,000 ohms or audio howl may be heard.

IMPROVING FM RECEPTION ON 8HO AND 9HO SERIES:

In FM Consoles, a cabinet FM antenna may be added in addition to the line antenna. This antenna is made up of two 28 inch lengths of wire. One wire is connected to the FM antenna post, the other to chassis. The two wires are then tacked in the cabinet in opposite directions, and should not come in contact with ground.

WAVE TRAP TRIMMER SHORTING OUT:

A .002 mfd 600 volt condenser has been added in series with the wave trap. This condenser removes the d-c potential from the trap and eliminates the possibility of breakdown.

AUDIO HOWL AS VOLUME CONTROL IS ADVANCED (FM RECEPTION):
FM howl may be caused by the speaker vibrating the oscillator slug. A fiber spacer between the oscillator, and detector slug shafts in the FM tuner will eliminate vibration. A thin rubber band tied to the center of the oscillator slug shaft and upper frame will also eliminate the howl.

TO THE SERVICE MAN:

The 11C21 chassis incorporates a superheterodyne circuit with two stages of IF, and one stage of RF amplification on all bands.

AM Alignment: The alignment of this chassis on the short wave and standard broadcast band is conventional. The alignment slugs in the IF transformers are threaded and screw into the coil forms. The slugs are slotted for a small size fiber screw driver. Do not press hard on the aligning tool (fiber screw driver) or the threads in the coil forms will strip and adjustment will be impossible.

FM RF Alignment: The same coil slug arrangement which tunes the 100 MC FM band also tunes the 45 MC band. However, on 45 MC the band switch connects trimmer condensers in parallel and padding wires in series with the 100 MC coils. The tuning slugs are attached to threaded shafts and the slugs are varied in the field of the coils by turning the shafts clockwise or counter-clockwise. After adjustments the shafts must be secured with a drop of speaker cement.

FM IF Alignment: The same type of tuning slugs for aligning the AM IF Amplifier are used for the FM I.F.'s. Observe the same precautions when making adjustments. The second 8.3 Mc IF stage is overcoupled. Overcoupling gives a wide band pass with good sensitivity. When an overcoupled stage is aligned with an unmodulated signal, the stage must be loaded. A 300 ohm carbon resistor soldered across the secondary of the second IF transformer provides a satisfactory load for this circuit. The resistor leads must be kept short to reduce the distributed capacity of the circuit.

When aligning a loaded stage, it will be found that considerable signal from the generator will be required, and that it will tune broadly. THE LOAD RESISTOR MUST BE REMOVED AFTER ALIGNMENT.

If the signal generator used does not have sufficient output to overcome the temporary loss caused by the load resistor, the load resistance may be increased or the signal fed into the preceding stage.

FM Discriminator Alignment: When the secondary of the discriminator is aligned (operation 9) use sufficient signal input to get a good positive and negative indication before setting the slug for zero reading. A center zero indicating meter is recommended for this adjustment, but is not absolutely necessary. Reversing the leads of a non-zero center meter, or observing closely when this meter starts to go to the left (negative) of zero will give the same results.

HUM COMPLAINT: Check for excessive length of the a-c line cord inside the main chassis between the point of entrance and the solder lugs. This slack may be in close proximity of the tone control leads.

DIFFERENCES IN 11C21-11C21Z CHASSIS: Sets using chassis 11C21Z are equipped with FM speakers. FM speakers cannot be used on 11C21 chassis. When ordering speaker replacements specify 11C21 or 11C21Z chassis.

IMPROVING FM RECEPTION: In FM Consoles a cabinet FM antenna may be added in addition to the line antenna. This antenna is made up of two 28-inch lengths of wire. One wire is connected to the FM antenna post, the other to chassis. The two wires are then tacked in the cabinet in opposite directions, and should not come in contact with ground.

HOWL ON FM: FM howl may be caused by the speaker vibrating the oscillator slug. A fiber spacer between the oscillator, and detector slug shafts in the FM tuner will eliminate vibration. A thin rubber band tied to the center of the oscillator slug shaft and upper frame will also eliminate the howl.

INCREASING BASS RESPONSE ON PHONO: To increase the bass response on records, the value of R5 in the phono-preamplifier may be increased. Do not increase the value to over 10,000 ohms or audio howl may be heard.

STRIPPED IF THREAD INSERTS: Damaged IF slug thread inserts may be replaced by unscrewing the slug, and pushing out the old insert. Two types of inserts are used, 83-1063 short, and 83-1069 long.

WAVE TRAP TRIMMER SHORTS OUT: A .002 mfd 600 volt condenser has been added in series with the grounded side of the wave trap.

12 (c) (d)	Pin 8(grid)on 6SB7 converter tube socket	.05 Mfd.	8.3 Mc. Unmodulated	FM 45		L13 & L14 prim. & sec. of 1st IF transformer	Align 1st IF transformer for maximum reading
13 (c)	Antenna Post (remove line ant.)	270 ohms	98 Mc. Unmodulated	FM 100	98 Mc.	L10 Osc. coil Slug	Set oscillator to dial scale
14 (c)	Antenna Post (Remove line ant.)	270 ohms	98 Mc. Unmodulated	FM 100	98 Mc.	L5 and L3 Det. and RF coil slugs	Align det. and Ant. stage to maximum reading
15 (c)	Antenna Post (remove line ant.)	270 ohms	45 Mc. Unmodulated	FM 45	45 Mc.	C22	Set oscillator to dial scale
16 (c)	Antenna Post (remove line ant.)	270 ohms	45 Mc. Unmodulated	FM 45	45 Mc.	C14 and C6	Align detector and ant. stages for maximum reading

IMPORTANT: Alignment of this chassis will in most cases be unnecessary unless an IF or RF transformer is replaced or the adjustments have been tampered with.

Correct alignment can only be made if the following procedure is followed:

A vacuum tube voltmeter with an isolation resistor of 200,000 ohms in series with the hot lead will serve for FM adjustments. This lead must be shielded.

An ordinary AC output meter connected across the primary or secondary of the output transformer will be satisfactory for all AM adjustments.

The signal generator output should be kept just high enough to get an indication on the meter.

(a) Vacuum Tube Voltmeter pin 5 on discriminator transformer to chassis (half discriminator load.)
(b) Vacuum Tube Voltmeter pin 7 on discriminator transformer to chassis (full discriminator load).
(c) Vacuum Tube Voltmeter 6SH7 limiter grid (pin 4 to chassis).
(d) 300 ohm ½ watt carbon resistor soldered across the secondary L18 (pin 2 and 3 of 2nd IF trans.). The leads to the resistor must be as short as possible and the resistor removed before operation 13 is started.

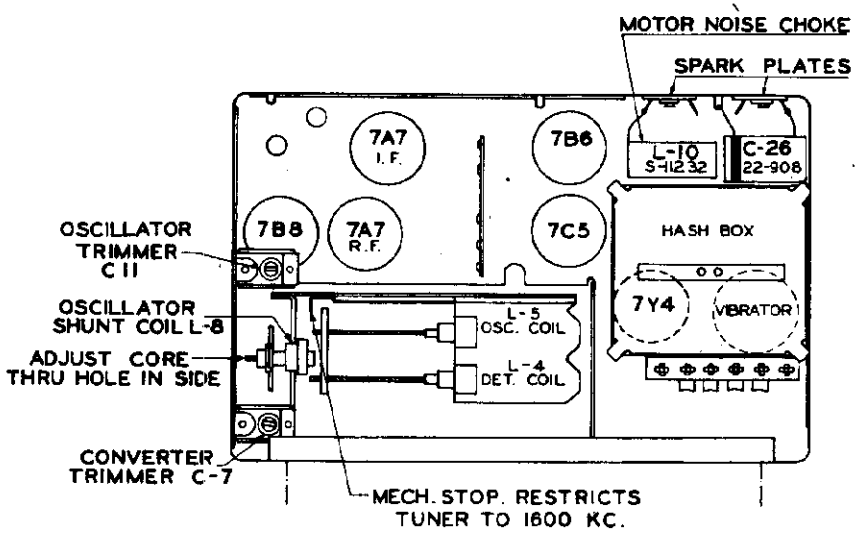

Fig. 11. Bottom View of Chassis

ALIGNMENT

Maximum performance depends on accurate alignment of the receiver; so follow these instructions carefully.

CAUTION: Make all adjustments on the receiver with volume control turned full on and foot volume control cable plugged into its socket. Reduce signal intensity as much as possible at signal generator. Connect output meter across voice coil.

I.F. ALIGNMENT PROCEDURE

1. Remove top and bottom covers from receiver.
2. Set signal generator to 265 Kc.
3. Apply signal from generator through a .1 Mfd. dummy to 7B8 converter grid. (Pin No. 6 on socket.)
4. Adjust I.F. trimmers A, B, C and D (Fig. 10), in the order named for maximum output. Repeat the operation to assure accurate alignment.

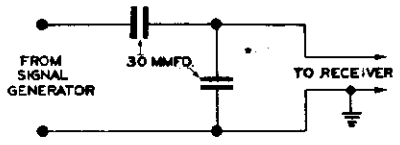

Figure 12. Dummy Antenna

Figure 12 shows the schematic of a recommended dummy antenna closely resembling actual antenna capacity to be used when aligning the R.F. section of the receiver.

R.F. AND OSCILLATOR ALIGNMENT

1. Connect signal generator leads through dummy illustrated in figure 12 to antenna lead in socket on receiver.
2. Set signal generator to 535 Kc.
3. Place set in manual tuning position and set dial to 535 Kc.
4. Adjust oscillator trimmer C-11 (Fig. 11) for maximum response.
5. Set signal generator to 1200 Kc.
6. Tune set to 1200 Kc.
7. Adjust converter trimmer C-7 (Fig. 11) and R.F. trimmer C-3 (Fig. 10) for maximum response.
8. If dial calibration is off after making above adjustments, a correction can be made by loosening dial scale mounting screws and sliding scale to desired position.

CORE OR COIL REPLACEMENT ONLY

WARNING: The following adjustments are to be made ONLY if a core or coil is replaced.

1. Replace coil or core.
2. Set signal generator to 1700 Kc.
3. Connect signal generator leads through dummy illustrated in figure 12 to antenna receptacle on the receiver.
4. Set receiver dial to 1600 KC. (Maximum high frequency end of dial.)
5. Screw the core completely out of the antenna coil, the R.F. Coil, the converter coil, and the oscillator coil.
6. Adjust oscillator trimmer C-11 (Fig. 11) at 1700 Kc.
7. Adjust converter trimmer C-7, R.F. trimmer C-3, and antenna trimmer C-1 (Fig. 10 and 11) for maximum output reading.
8. Replace cores to their approximate original positions.
9. Set generator dial and receiver dial to 1200 Kc.
10. Adjust oscillator core (Fig. 10) to scale at 1200 Kc.
11. Adjust the antenna core, R.F. core, and converter core (Fig. 10 and 11), for maximum output reading.
12. Set signal generator to 600 Kc.
13. "Rock in" Shunt oscillator coil (Fig. 10) for maximum output reading. (This should only be done as a last resort.) This is the same as rocking in the padder condenser on a ganged condenser receiver.
14. Check receiver at 1200 Kc. for calibration and gain. If receiver is off scale or weak, repeat operations 9, 10 and 11.
15. After alignment is complete, the maximum high frequency tuning range should be checked: If the range is greater or less than 1605 Kc. the mechanical stop for the tuner cross arm should be bent to limit the frequency coverage to 1605 Kc.

After all adjustments have been made, glue core screws with speaker cement.

IMPORTANT: After reinstalling the receiver in the car, allow it to operate for approximately 15 minutes to reach normal operating temperature. Check the antenna trimmer alignment on a weak station at approximately 1200 Kc. Extend antenna to maximum before adjusting the antenna trimmer.

MANUAL TUNING

1. Press the automatic tuning push button on the left side beneath automatic indicator window several times or until the letter "M" appears on the automatic indicator.
2. Pull manual tuning (right hand) control knob outward and turn to tune in desired stations. Tune to exact frequency for the best tone quality.

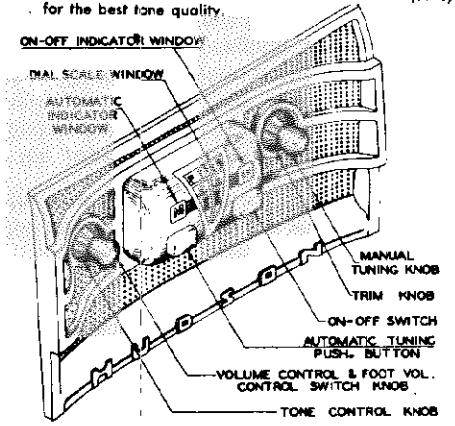

Fig. 1. Operating Controls.

AUTOMATIC TUNING

There are five automatic tuning positions which may be adjusted to five desired stations. If these positions have not been previously adjusted, proceed as follows:

1. Press the automatic tuning push button (on the left side) until Number 1 appears in the automatic indicator window.
2. Pull the manual tuning knob OUTWARD to engage the automatic mechanism.
3. Select the station desired and tune to its frequency by turning the tuning knob. Tune very carefully for clearest reception. CAUTION: DO NOT ATTEMPT TO FORCE TUNING KNOB IN. Knob will return to the "IN" position when the automatic tuning push-button is pressed.
4. Press the automatic station selector push button, pull manual tuning knob outward, and tune in station desired for No. 2 position. Use same procedure for positions No. 3, 4 and 5.

When the five automatic positions have been adjusted to the five desired stations as instructed, it is only necessary to press the AUTOMATIC button to return to MANUAL tuning, or to any one of the stations selected on the automatic.

FOOT CONTROL

The Foot Control provides a convenient means of selecting stations, controlling the volume, and muting the set without taking the hands off the steering wheel or the eyes from the road. Its function is identical to that of the station selector push button and the volume control knob combined. The foot control requires no set up or other adjustment. Press the foot control button all the way down to change stations. Press lightly to silence radio during conversation. Turn the knob with the shoe tip to adjust the volume to any desired point. When using the foot volume control feature turn the panel volume control fully to the left, or until it clicks.

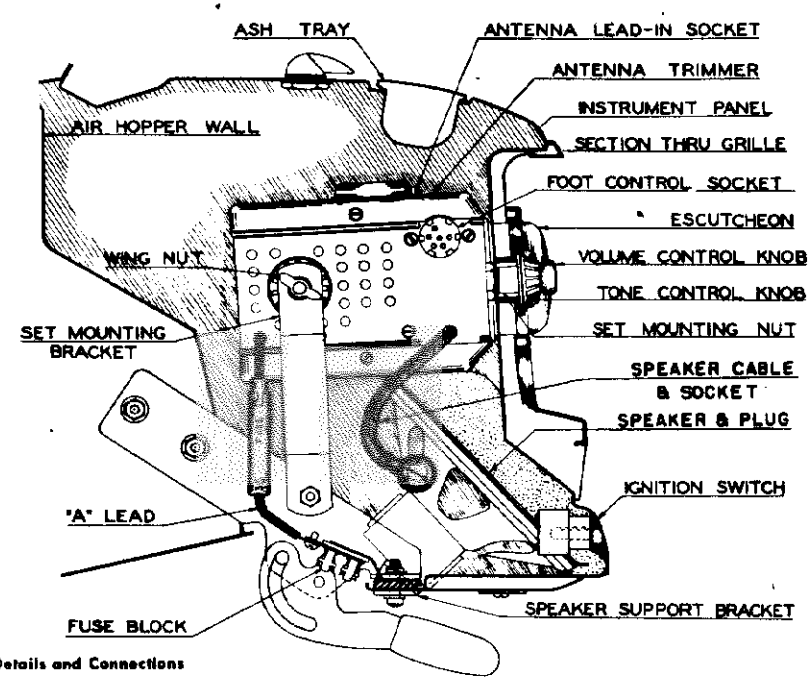

Fig. 2. Mounting Details and Connections

RADIO INSTALLATION INSTRUCTIONS

1. Install the antenna. Complete instructions are packed with each antenna kit.
2. Remove the decorative plate, in the center of the grille, covering the radio opening.
3. Remove the floor mat around the clutch and brake pedals. Place the foot control over the holes provided in the floor board. Fasten it with the three No. 8 R.H. self-tapping screws furnished in the installation kit (Fig. 3).
4. Dress the foot control lead to the left of the clutch pedal and up behind the fire wall pad.
5. Lift the cap from the foot control. Replace the floor mat and cut a hole for the foot control button. To replace the foot control cap, press it firmly and turn until the notches in the cap slip into the flanges on the foot control button.
6. Remove accessory switch bracket.
7. Plug the foot control cable into the socket provided on the left end of the receiver. With this end of the receiver down and the control shafts to the right, push the receiver up between the instrument panel and the air hopper as far as it will go. Turn the radio clockwise until the knob shafts point downward. Lift the front of the receiver up until the shafts slide through the slots provided below the shaft openings in the instrument panel. Bring the receiver forward so that the knob shafts protrude through the shaft openings.
8. Fit the knob shaft bushing nuts on the shafts and tighten as much as possible with the fingers. Place the tips of long nose pliers in the holes in the nuts and tighten securely.
9. Attach set mounting bracket by fastening one end to the side of the receiver case with the wing nut. Fasten the other end of the radio mounting bracket to the cowl ventilator handle bracket with ¼" x ¾" M.S., flat washer, and nut. (Fig. 2.)
10. Remove cardboard protector from speaker unit and fasten speaker and bracket assembly in place with two ¼" x ¾" M.S. flat washers, two lock washers, and two nuts provided. (Fig. 2.) Plug the speaker cable into the socket provided on the speaker frame.
11. Fasten the controls in place as shown in figure 1. NOTE: Tuning knob must be placed 3 16" away from the instrument panel in order to rotate freely in the automatic position.
12. Fasten the accessory switch bracket back in place.
13. Remove the ash tray assembly and plug the antenna lead into the socket provided on the top of the receiver.
14. Fasten the "A" lead to the fuse block as indicated in figure 2.
15. Turn the receiver on and allow it to operate for approximately fifteen minutes in order for it to reach normal operating temperature. Tune in a weak station near 1200 Kc. Reach through the ash tray opening with a small screw driver and adjust the antenna trimmer, located on the top of the receiver, for maximum volume. (Fig. 2.) Replace ash tray.

INTERFERENCE ELIMINATION

IMPORTANT: Use the utmost care in the following operations to insure freedom from motor noise. Be sure that good ground contacts are made between the interference condensers and the car body. If necessary, clean away paint or dirt with emery paper. Tighten all nuts and bolts securely.

1. Remove the top mounting screw of the horn relay near the voltage regulator and under this screw mount the condenser No. 22-1537. Connect the lead to the voltage regulator battery terminal. (Fig. 4.)

2. Install suppressor in center hole of distributor cap. Place high tension lead in the top of suppressor. Be sure the suppressor and the lead are fastened securely. (Fig. 5.)

3. On the six cylinder car, remove the bolt, above the ignition coil, from the firewall. Mount the condenser No. 22-1537 under this bolt. Connect the lead to the coil terminal as shown in figure 6A.

   On the eight cylinder car, remove the bottom screw from the ignition coil mounting bracket. Install the condenser No. 22-1537 under the screw. Connect the lead to the coil terminal as shown in figure 6B.

4. Loosen the upper rear cap screw of the engine water jacket plate. **CAUTION: Do not REMOVE cap screw.** Slide the slotted bracket of the condenser No. 22-1260 under the head of this screw. Tighten the screw.

   Attach the condenser lead to the water temperature element in the head. (Fig. 7A.)

5. Remove the tape from the hole (located near the left rear cylinder head nut) in the dash. Fasten the flat ground strip to this hole with a sheet metal screw and lock washer. On the six cylinder car, place the other end of the strip on top of the regular stud nut, and fasten it in place with the special nut furnished in the installation kit. (Fig. 7A.) On the eight cylinder cars, bolt the other end of the strap under the regular stud nut. (Fig. 7B.)

6. Install the motor hood bond spring No. 80-145 as shown in Figure 8. Fasten with No. 8 sheet metal screw. Part No. 112-365.

PARTS LIST

1946 RADIO RECEIVER KIT *
Model DB 46 (Part Number 208815)

Items included in kit are:

- Radio receiver
- Mounting bracket, screws, lockwashers, knobs
- Speaker and bracket assembly
- Foot volume control and switch assembly
- Distributor suppressor
- Temperature gauge condenser
- Ignition coil and generator condenser
- Motor hood bonding spring
- Motor bond strap
- Sheet metal screw
- Nut for 6 cyl. cars
- Lockwasher

RADIO ANTENNA KITS *

Part No. 209558—66" Telescopic Antenna including all installation parts.

Part No. 209762—92" Telescopic Antenna including all installation parts.

Part No. 205451—Vacuum Operated Antenna including all installation parts.

(See antenna kits for full installation instructions.)

NOTE: Kits marked * are not available from the radio manufacturer. See your Hudson dealer

COILS AND CHOKES

Diag. No.	Zenith Part No.	Hudson Part No.	Description
L9	20-213	204890	Main hash choke

PARTS LIST (Continued)

Diag. No.	Zenith Part No.	Hudson Part No.	Description
	202-420	209749	Installation instruction book
S1	S11269	209566	Hand selector and muting switch assembly
	S11310	209934	Antenna socket, bracket & terminal assembly
FS3	S11758	208812	Foot switch, vol. control & cable assembly

SPEAKER AND MOUNTING COMPONENTS

	12-937	204020	Speaker support bracket
SP1	49-538	208826	6" dynamic speaker
	54-30	170567	No. 8-32 x 5/16 x 7/64 hex nut
	57-945	204022	Speaker cover plate
	114-88	205287	No. 8-32 x 1 2 hex hd. M.S.
	114-167	205288	No. 10-32 x 5/16 hex acorn hd. M.S.
	196-53	204024	Rubber speaker gasket
	208-538*	209751	Cone & voice coil assem.

Note: When ordering cone and voice coil assembly marked *, be sure to give manufacturer's code letter.

INSTALLATION PARTS AND KNOBS

	S11321	209753	Installation kit complete
	12-938	204021	Set mounting bracket
	22-1260	152021	Temperature gauge cond.
	22-1537	208592	Generator and ignition coil condenser
	46-459	205293	Tone control knob
	54-157	70874	1/4-20 x 7/16 x 3/16 hex nut
	54-173	205283	Set mounting nut
	54-174	205289	1/4-20 wing nut
	63-1252	205281	Distributor suppressor
	80-145	205282	Motor hood bond spring
	80-232	209752	Knob retaining spring
	112-310	170687	Foot Sw. mtg. screw
	112-365	170304	No. 8 x 1/2" B.H.S.M. screw
	114-168	70872	1/4-20 x 3/4 hex hd. M.S.
	S12271	209936	Tuning control & trim. knob assem. (46-550 & 584)
	S12272	209937	Volume control knob and spring assem. (46-549)
	93-577	12857	.062 x 17/64 x 3/4 steel washer
	83-986	204481	Motor bond strap
	112-361	71707	No. 8 self tapping screw
	93-575	170395	Lock washer
	54-188	170859	Hex nut (for 6 cyl. cars only)

DIAL AND TUNING MECHANISM ASSEMBLY

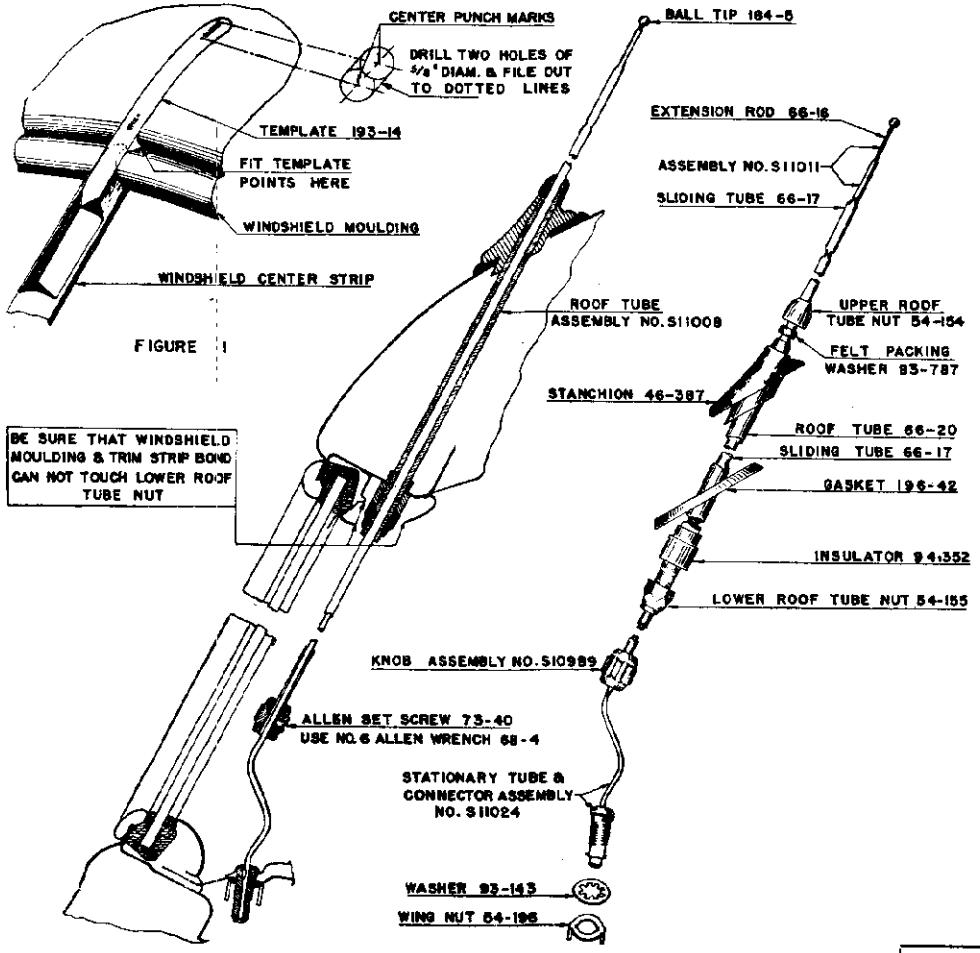
	26-337	209682	Dial scale (manual tuning)
	34-132	209691	Indexing disc
	34-133	209692	Ratchet gear
	34-135	209789	Volume control gear
	46-581	209553	Selector knob (2 used)
	57-1061	209560	Escutcheon
	57-1151	209694	Name plate
	59-158	204040	Dial pointer
	80-329	209695	Gear indexing spring
	80-331	209681	Cross arm return spring
	80-332	209696	Cam lever spring
	80-336	209697	Ratcher gear return spring
	80-340	209698	Lever spring
	80-341	209699	Kick-off spring
	80-342	209700	Tuning shaft spring
	80-343	209701	Solenoid switch spring
	80-344	209702	Solenoid switch contact spring
	80-425	209703	Knob return spring
S3	100-31	71550	Dial light bulb
	149-44*	209799	Adjusting spring & core
	188-45	209705	Turret screw lock ring
	S10826	209706	Solenoid end plug and bracket assembly
L6	S10829	209567	Solenoid and terminal assembly
	S10831	209707	Ratchet and bracket
	S10836	209708	Cross arm assembly
	S11052	204025	Tuning shaft and gear assembly
	S11082	209709	Turret assembly
	S11313	209738	Dial drum and bracket assembly
	S11494	209739	Mounting plate and lever assembly
	S11976	209740	Dial light socket and wire assembly

Note: In ordering Adjusting Spring and Core marked (*), be sure to give color code information.

FORD MERCURY INTEGRAL AERIAL
FOR 1946 CLOSED CARS
INSTALLATION INSTRUCTIONS

CAUTION — AERIAL SHOULD BE INSTALLED BEFORE RADIO IS INSTALLED

FIGURE 1



COMPLETED INSTALLATION
FIGURE 2

EXPLODED VIEW
FIGURE 3

1. Locate the roof hole by laying the metal template (furnished with the antenna kit) along the upper end of the windshield divider strip as shown in Fig. 1. Prick punch two holes at the word marked "Closed" on template as shown. Be careful not to allow the drill or cutter to punch a hole through the headlining. The accurate drilling of the lower edge of the bottom hole is important for the correct fitting of the roof tube and the smooth operation of the aerial. Cut out the metal between the lines as shown in Fig. 2.

2. Remove rear vision mirror bracket.

3. Remove plastic button from top center instrument board.

4. Loosen sliding tube knob and lower roof tube nut. (See Fig. 4.) (Caution: Upper roof tube nut is not to be loosened at any time!) Allow knob, nut and insulator to slip down and ride loosely on stationary tube. Next slip stationary tube out of the sliding tube and push upper end through hole in moulding behind rear vision mirror until the connector at the bottom of the tube can be dropped into hole in top of instrument panel. Assemble washer and wing nut from below panel.

5. From the outside of the car, thread the sliding tube (complete with roof tube, gasket, stanchion and upper roof tube nut) over the stationary tube which now extends through hole in roof, and lower the assembly into car. Rubber gasket and stanchion should be located properly around hole.

6. Working from the inside of the car, slide the insulator over the roof tube so that the shoulder of the insulator seats well into the hole. Make sure the roof tube does not raise out of the hole during this operation. The lower roof tube nut should be tightened only enough to assure a good moisture seal of exterior parts of aerial.

CAUTION: Be sure that neither the center trim strip bond nor the windshield moulding touches the lower roof tube nut (Fig. 2).

7. Align the sliding tube knob with the lower end of the sliding tube. Tighten using Allen Wrench.

IMPORTANT — KEEP THE INSULATORS FREE FROM OIL OR POLISHING WAX
