+ NOTES +

This chassis is shown with glass-counterpart tube.
* Metal, metal-glass or glass-counterpart tubes may be used. For example the Output tube shown is a glass-counterpart tube numbered 6F6-G. A metal-glass tube would be numbered 6F6-MG and a Metal tube would be numbered 6F6.
Wood spacers and metal panel used in cascade models only.

INSTRUCTIONS FOR ALIGNING THE MIDWEST 7-TUBE 1935-36 MODEL RECEIVERS

- (1) Set the signal generator to 456 k.c. and connect it from the mixer grid to ground.
- (2) Remove the oscillator tube from the receiver.
- (3) Connect the output meter from the plate of the output tube to positive B+.
- (4) Using a moderately weak signal approximately 40 microvolts, align the two I.F. transformers to maximum output.
- (5) Keep decreasing the oscillator input and realigning for maximum gain.

This completes the alignment of the I.F. amplifier.

Insert the oscillator tube. Connect the signal generator and mixer grid lead between antenna and ground.

- (1) Set the wave change switch to the "E" Band.
- (2) Set the signal generator to 325 k.c.
- (3) Adjust the "E" oscillator trimmer to maximum gain, then adjust the "E" Band R.F. and the "E" Band mixer trimmers for maximum gain.
- (4) Reset the signal generator to 135 k.c. and rotate the receiver dial to 135 k.c.
- (5) Adjust the "E" Band padder for maximum signal.
- (6) Repeat the adjustment of trimmers and padders until the adjustment of one does not effect the adjustment of the other.

This completes the alignment of the "E" Band.

- (1) Set the wave change switch to the "A" Band.
- (2) Set the signal generator to 1490 k.c.
- (3) Adjust the "A" oscillator trimmer to maximum gain, then adjust the "A" Band R.F. and the "A" Band mixer trimmers for maximum gain.
- (4) Reset the signal generator to 550 k.c. and rotate the receiver dial to 550 k.c.
- (5) Adjust the "A" Band padder for maximum signal.
- (6) Repeat the adjustment of trimmers and padders until the adjustment of one does not effect the adjustment of the other.

This completes the alignment of the "A" Band.

- (1) Set the wave change switch to the "L" Band.
- (2) Set the signal generator to 3.8 megacycles.
- (3) Adjust the "L" oscillator trimmer to maximum gain, then adjust the "L" Band R.F. and the "L" Band mixer trimmers for maximum gain.
- (4) Reset the signal generator to 1.6 megacycles and rotate the receiver dial to 1.6 megacycles.
- (5) Adjust the "L" Band padder for maximum signal.
- (6) Repeat the adjustment of trimmers and padders until the adjustment of one does not effect the adjustment of the other.

This completes the alignment of the "L" Band.

- (1) Set the wave change switch to the "M" Band.
- (2) Set the signal generator to 11.5 megacycles.
- (3) Adjust the "M" oscillator trimmer to maximum gain, then adjust the "M" Band R.F. and the "M" Band mixer trimmers for maximum gain.

This completes the alignment of the "M" Band.

- (1) Set the wave change switch to the "H" Band.
- (2) Set the signal generator to 26 megacycles.
- (3) Adjust the "H" Band oscillator trimmer to maximum gain, then adjust the "H" Band R.F. and the "H" band mixer trimmers for maximum gain.

This completes the alignment of the "H" Band.

INSTRUCTIONS FOR ALIGNING THE MIDWEST 7-37 AC-30 RECEIVER

- (1) Set the signal generator to 456 k.c. and connect it from the mixer grid to ground.
- (2) Be sure that set is not tuned to a station.
- (3) Connect the output meter from the plate of the output tube to positive B.
- (4) Using a moderately weak signal approximately 60 microvolts, align the two I.F. transformers to maximum gain.
- (5) Keep decreasing the oscillator input and realigning for maximum gain.

This completes the alignment of the I.F. amplifier.

Connect the signal generator between antenna and ground. Connect mixer grid lead to grid of mixer tube.

- (1) Set the wave change switch to the "A" band.
- (2) Set the signal generator to 1490 k.c.
- (3) Adjust the "A" oscillator trimmer to maximum gain, then adjust "A" band mixer trimmer for maximum gain.
- (4) Reset the signal generator to 550 k.c. and rotate the receiver dial to 550 k.c.
- (5) Adjust the "A" band padder for maximum signal.
- (6) Repeat the adjustment of trimmers and padders until the adjustment of one does not effect the adjustment of the other.

This completes the alignment of the "A" band.

- (1) Set the wave change switch to the "B" band.
- (2) Set the signal generator to 12 mc.
- (3) Adjust the "B" oscillator trimmer to maximum gain, then adjust the "B" band mixer for maximum gain.

This completes the alignment of the "B" band.

Short Wave Receiver

- (1) Set the wave change switch to the "C" band.
- (2) Set the signal generator to 4 m.c. Set dial at 75.
- (3) Adjust the "C" oscillator trimmer to maximum gain, then adjust the "C" band mixer trimmers for maximum gain.
- (4) Reset the signal generator to 2 m.c. and rotate the receiver dial to 16.
- (5) Adjust the "C" band padder for maximum signal.
- (6) Repeat the adjustment of trimmers and padders until the adjustment of one does not effect the adjustment of the other.

This completes the alignment of the "C" band s.w.

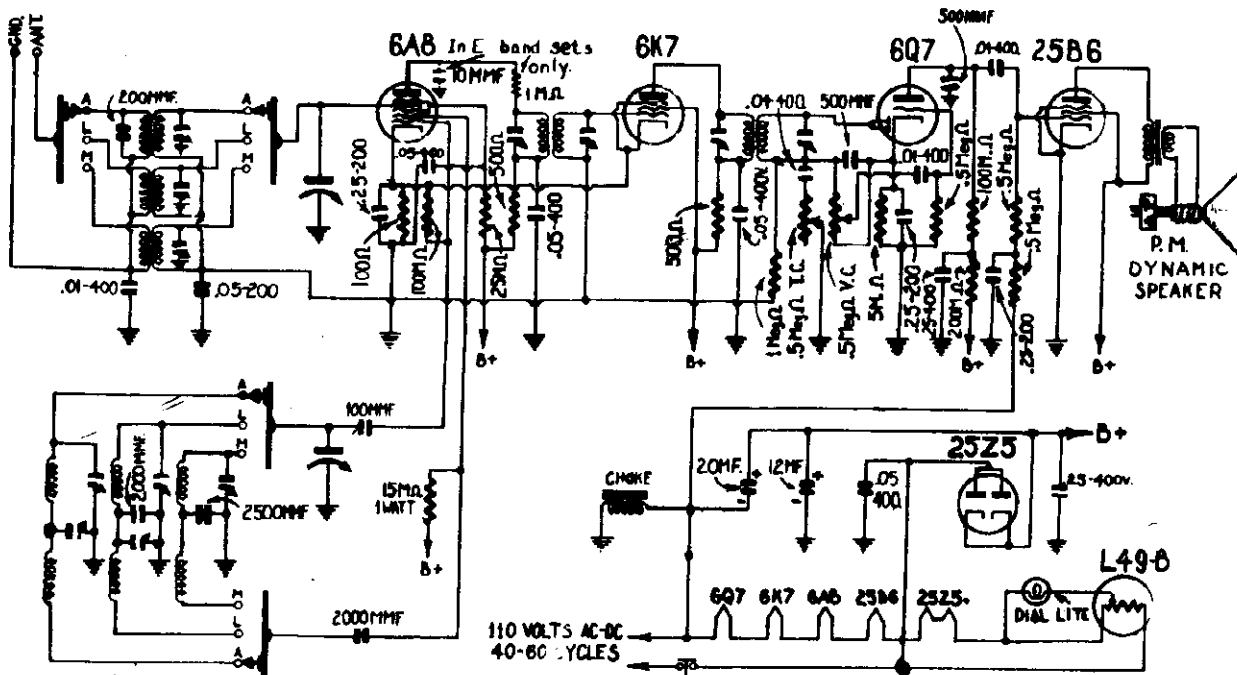

Long Wave Receiver

- (1) Set the wave change switch to the "C" band.
- (2) Set the signal generator to 325 k.c.
- (3) Adjust the "C" oscillator trimmer to maximum gain, then adjust the "C" band mixer trimmers for maximum gain.
- (4) Reset the signal generator to 150 k.c. and rotate the receiver dial to 150 k.c.
- (5) Adjust the "C" band padder for maximum signal.
- (6) Repeat the adjustment of trimmers and padders until the adjustment of one does not effect the adjustment of the other.

This completes the alignment of the "C" band l.w.

7-37 BATT.

Doc NO. 683

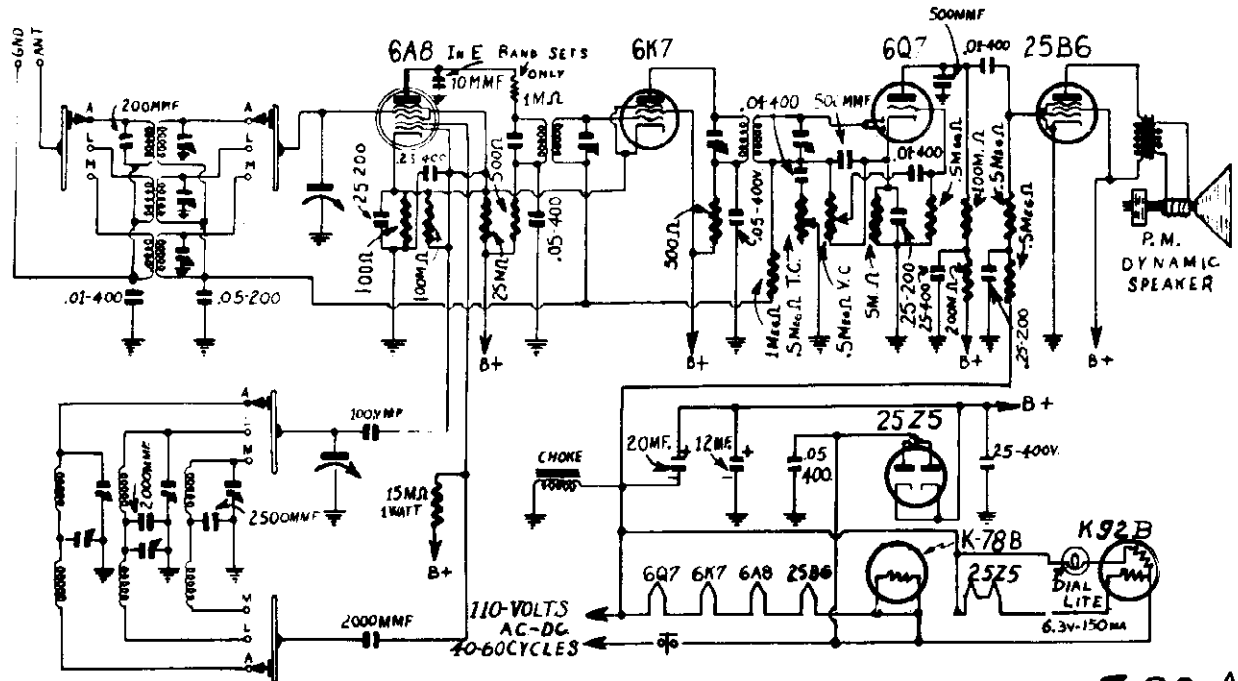

7-37 BATT.

- (3) Aligning 1.8 - 5.8 m.c. Band: - Disconnect dummy antenna from test oscillator and insert a 400 ohm resistor in series with the test oscillator output. Set test oscillator frequency to 5.8 m.c. Bring in 5.8 m.c. signal on dial to maximum output by adjusting 5.6, m.c. oscillator trimmers.
- (4) Aligning 5.8 - 18.3 m.c. Band: - Leaving 400 ohm resistor in series with test oscillator output, set oscillator frequency to 18 m.c., and adjust 18 m.c. oscillator trimmers for maximum output. It is important that the fundamental peak on 18 m.c. be reached.
- Start with trimmers at minimum capacity, the first peak on the trimmers will be the fundamental frequency if trimmer is screwed toward maximum capacity another peak will be observed. This is the image peak and is not used in aligning the receiver.
- Set test oscillator at 15 m.c. and adjust 15 m.c. antenna trimmers for maximum output.

- (1) I.F. Alignment: - Set test oscillator at 465 k.c. and connect output from oscillator to grid of 6A7 tube through an .02 mfd. series condenser. Important: Do not remove grid clip from tube. Peak each of the first and second I.F. transformer trimmer for maximum gain on output meter.
- (2) Aligning 720 - 535 k.c. Band: - Check tuning dial. Adjust by turning gang condenser until plates touch maximum capacity stop, at which point the dial needle must be exactly even with the last line at the low frequency end of the dial calibration. Connect test oscillator to antenna lead through a standard dummy antenna.
- Set test oscillator to 1720 k.c. and, using 1720 k.c. oscillator trimmer, adjust to maximum signal output at 1720 k.c. on the dial.
- Set test oscillator at 1400 k.c. and adjust 1400 k.c. preselector and antenna trimmers for maximum output.
- Set test oscillator at 600 k.c. and adjust 600 k.c. oscillator padder for maximum signal strength at 600 k.c. on the dial.

from ground

MODEL 8-33, Early
Socket, Trimmers
Alignment

MID-WEST RADIO CORP.

Using a standard signal generator and having approximate frequency from 400 k.c. to 20 m.c. and a standard output meter.

I. F. ALIGNMENT

- (1) Connect output of signal generator to control grid of 57 first detector tube. Connect output meter to plate of output tube to ground. Set signal generator to 450 k.c. and adjust the trimmers of the three I.F. transformers for the greatest output. The 1st I. F. transformer will be found to contain two adjustments; the 2nd, one adjustment; and the 3rd, two adjustments.

This completes the I. F. alignment.

Note: To assure more accurate trimmer setting always use lowest possible test oscillator output consistent with readable output meter scale deflection.

R. F. ALIGNMENT

- (2) Connect signal generator to antenna post of the receiver through a standard dummy antenna with the band selector switch in the A position and the variable trimmer at minimum capacity and the dial at 100. Set signal generator at 540 k.c. and adjust the A padder for maximum gain. Set signal generator at 1400 k.c. and adjust R. F. and mixer trimmers for maximum gain. Receiver dial during this operation is set at about 15. Tighten the A trimmer as tight as it will go and turn it back one half turn for proper adjustment.

- (3) Turn band selector switch to L position. Set signal generator to 3800 k.c. and adjust trimmer D to the greatest output. This setting will be at about 15 on the dial.

This completes the R. F. alignment.

Note: We do not advise the customer to attempt adjustment on the M and H bands as this is done at the factory by experts. If set appears to be broad in tuning, we suggest that you inspect the spacing of the I. F. transformers. The correct spacing for I.F. transformers is 5/8".

Note: To assure more accurate trimmer setting always use lowest possible test oscillator output consistent with readable output meter scale deflection.

MODEL 8-33 (2 Gang, 4 Band)

MODEL 8-33 (2 Gang, 5 Band) MIDWEST RADIO CORP.

Alignment

ALIGNMENT PROCEDURE

MODEL 8-33 (2 GANG-4 BAND), 8-33 (2 GANG-5 BAND)

- (1) Set the signal generator to 456 KC and connect it from the mixer grid to ground.
- (2) Remove the oscillator tube from the receiver.
- (3) Using a moderately weak signal approximately 40 micro-volts, align the three IF transformers to maximum output.
- (4) Keep decreasing the oscillator (signal generator) input and repeat the alignment for maximum output and gain.

Insert the oscillator tube into the receiver. Connect the signal generator and mixer grid lead between the antenna and ground.

"E" Band Alignment

- (1) Set the wave band change switch to the "E" band position.
- (2) Set the signal generator to 325 KC.
- (3) Adjust the "E" oscillator trimmer to maximum gain, then adjust the "E" band mixer trimmers for maximum gain.
- (4) Reset the signal generator to 135 KC and rotate the receiver dial to 135 KC setting.
- (5) Adjust the "E" band padder for maximum signal.

"A" Band Alignment

- (1) Set the receiver wave change switch to the "A" band position.
- (2) Set the signal generator to 1490 KC.
- (3) Adjust the "A" oscillator trimmer to maximum gain, then adjust the "A" band RF and the "A" band mixer trimmers for maximum gain.
- (4) Reset the signal generator to 550 KC, and rotate the receiver dial position to 550 KC.
- (5) Adjust the "A" band padder for maximum signal.
- (6) Repeat the adjustment of trimmers and padders until the adjustment of one does not effect the adjustment of the other.

"L" Band Alignment

- (1) Set the wave change switch to the "L" band position.
- (2) Set the signal generator to 3.8 MC.
- (3) Adjust the "L" band oscillator trimmer to maximum gain, then adjust the "L" band RF and Mixer trimmers for maximum gain.
- (4) Reset the signal generator to 1.5 MC, and rotate the receiver dial to the 1.6 MC position.
- (5) Adjust the "L" band padder for maximum signal.
- (6) Repeat the adjustment of trimmers and padders until the adjustment of one does not effect the adjustment of the other.

"M" Band Alignment

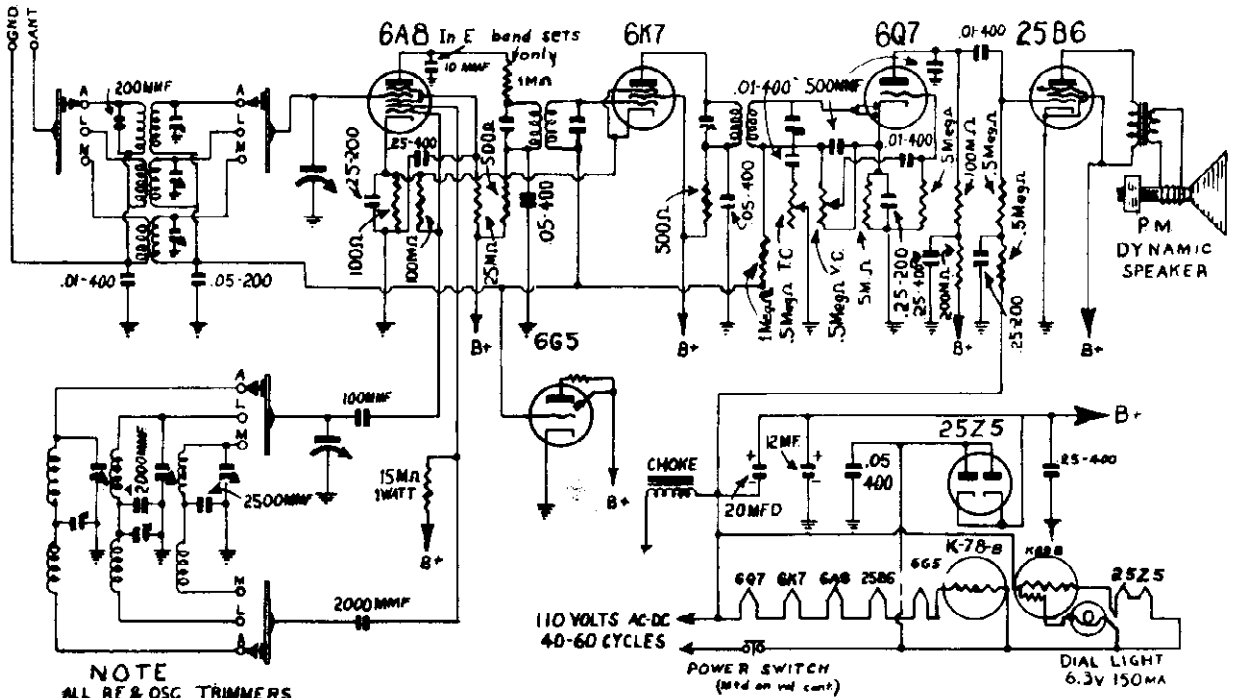

- (1) Set the wave change switch to the "M" band position.
- (2) Set the signal generator to 11.5 MC.
- (3) Adjust the "M" band oscillator trimmer to maximum gain, then adjust the "M" band RF and Mixer trimmers for maximum gain.

"H" Band Alignment

- (1) Set the wave change switch to the "H" band position.
- (2) Set the signal generator to 28 MC.
- (3) Adjust the "H" band oscillator trimmer to maximum gain, then adjust the "H" band RF and Mixer trimmers for maximum gain.

MID-WEST RADIO CORP.

MODEL 8-38 AC-DC
Schematic, Socket

NOTE
ALL RF & OSC TRIMMERS
ARE 45MMFD MAX CAP
OSC PADDERS ARE
500MMFD MAX CAP

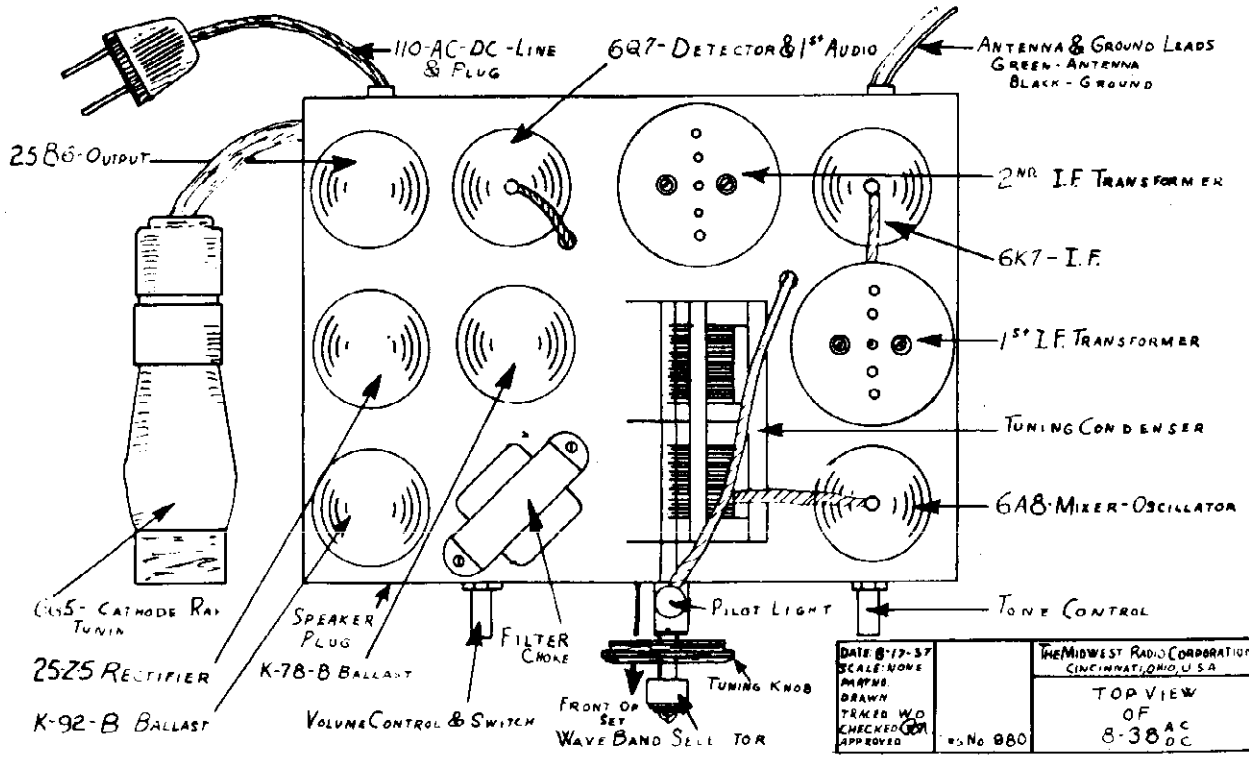

E-BAND NOTE
In sets having long wave band, E (long wave)
band coil replaces L band coil. Colpitts
oscillator is used - no tickler coil. No fixed
padder is used. Variable padder is 140MMFD
Max Cap in place of 500 MMFD. RF filter
is added in plate circuit of 6AB.

I.F. = 456Kc.

MID-WEST RADIO CORP.

MODEL 9-32
Schematic, Voltage
Alignment

ALIGNMENT PROCEDURE

- (1) Set the signal generator to 175 KC and connect it from the mixer grid to ground.
- (2) Remove the oscillator tube from the receiver, using weak signal (approx. 40 microvolts), align the IF transformers to maximum output.

IF transformers to maximum output.

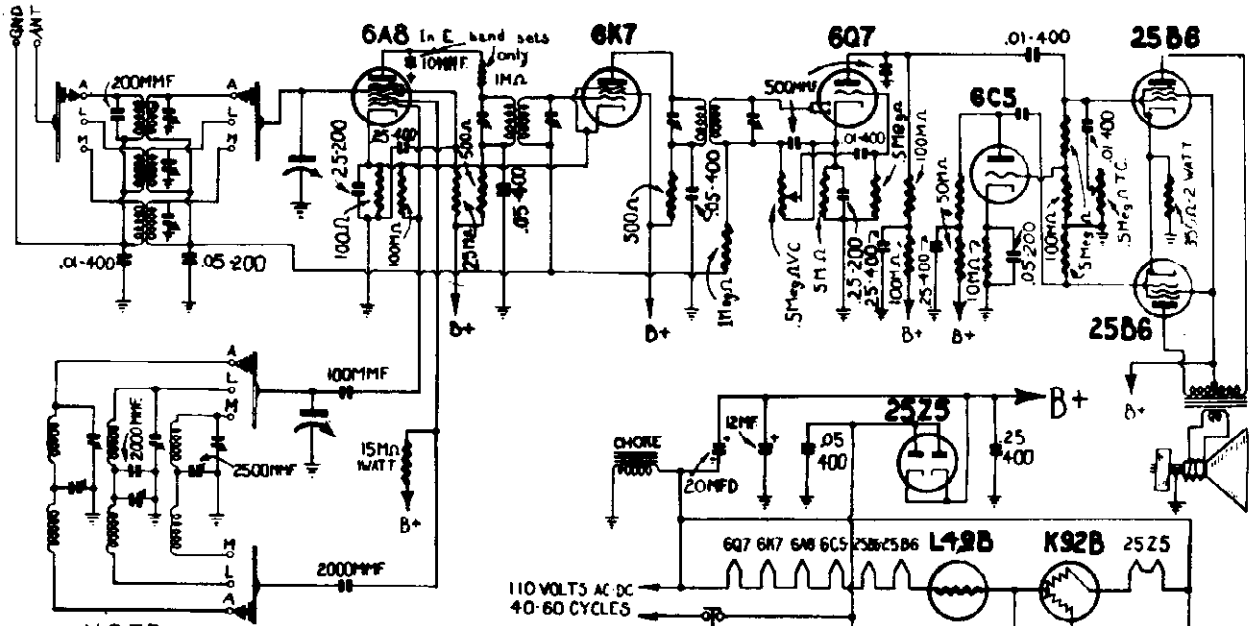

Insert the oscillator tube. Connect the signal generator to 1490 KC, located at between antenna and ground. Connect the mixer lead to the grid of the mixer tube.

- (1) Set signal generator and receiver to 1490 KC, located at 10 on the receiver dial. (variable condenser)
- (2) Oscillator section is adjusted by bending plates of the
- (3) Adjust mixer & RF trimmers for maximum gain.

MODEL 10-37 AC-DC

Socket, Trimmers Alignment

MID-WEST RADIO CORP.

I. F. ADJUSTMENT - The signal generator is set at 456 KC and is connected to the grid of the first detector (6A7). With the oscillator section of the tuning condenser short-circuited, and the receiver volume control at its maximum position, the I. F. trimmers are adjusted for maximum output. These trimmers may be found on the I. F. transformer shield cans to the right and rear of the gang condenser.

18 MEGACYCLE ADJUSTMENT - The high side of the signal generator is connected to the antenna lead of the receiver and the low side of the ground lead. The receiver and the signal are both tuned to a frequency of 18 MC with the selector switch in position for band No. 1. The oscillator trimmer condenser is adjusted so that the 18 MC signal is tuned in exactly at the 18 MC calibration point, with the volume control on full and the signal generator adjusted for minimum input. The antenna preselector and first detector trimmers are then adjusted in the order named for maximum output. These trimmers are located on the tops of the shield cans at the left side of the chassis; reading from front to back, these coils are as follows: 1. antenna preselector; 2. first detector; 3. oscillator. It will be noted that there are four trimmers on each of these coils. The adjustment screw for the trimmer in the front left hand corner of each is painted red. This denotes the trimmer for the No. 1 band.

5 MC ADJUSTMENT - With the band selector switch in position for operation on band No. 2 and the receiver and signal generator both set at 5 MC. The procedure outlined above is repeated. The oscillator trimmer is found on the rear coil can, and is located to the right of the red painted trimmer. The antenna preselector and interstage coil trimmers are located in the same positions on the corresponding shield cans.

The signal generator is set at 1.7 MC and the signal tuned in on the dial. The padcer condenser for this band is adjusted for maximum gain while the gang tuning condenser is rocked slightly to the right and left. The 5 MC adjustment should then be rechecked. The 1.7 MC padcer is located on the subbase on which the gang tuning condenser is mounted and is the left hand one at the group of three found here.

1400 KC ADJUSTMENT - The band selector switch is set in position for operation on the No. 3 band. The receiver and signal generator are both set at 1400 KC and the procedure outlined above is repeated. The oscillator trimmer is found on the rear coil can, and is located diagonally opposite the red painted trimmer. The other trimmers for this band are located in similar positions on the corresponding coil cans.

The signal generator is set at 600 KC and the signal tuned in on the dial. The padcer condenser for this band is adjusted for maximum response while the gang tuning condenser is rocked slightly to the right and left. The 1400 KC adjustment should then be rechecked. The 600 KC padcer is located on the sub-panel on which the gang tuning condenser is mounted and is the center of the three located at this point.

340 KC ADJUSTMENT - The band selector switch is set in position for operation on band No. 4. The receiver and generator are both tuned to 340 KC and the procedure outlined above is repeated. The oscillator trimmer is located on the rear coil can. It is the one directly behind the trimmer marked in red. The other trimmers for this band are located in similar positions on the corresponding shield cans.

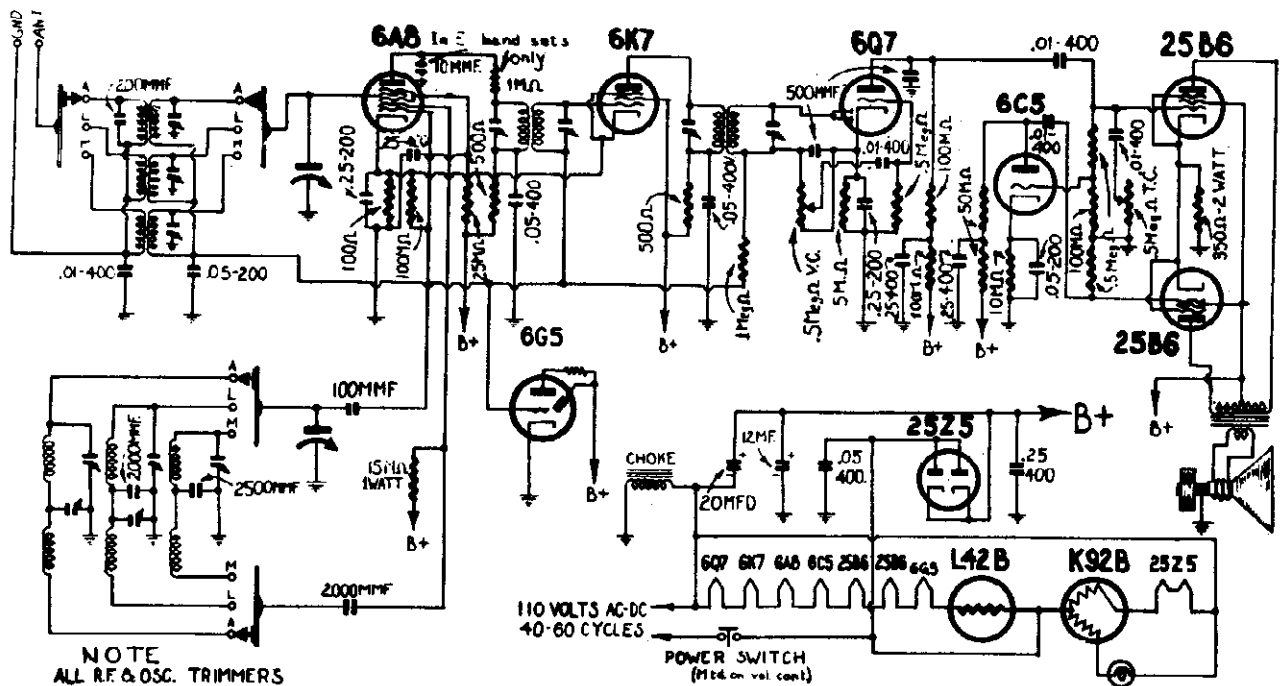

The signal generator is set at 150 KC and the signal is tuned in on the dial. The padcer condenser for this band is adjusted for maximum response while the gang tuning condenser is rocked slightly to the right and left. The 340 KC adjustment should then be rechecked. The 150 KC padcer is located on the sub-panel on which the tuning condenser is mounted and is the right hand one of this group.

MODEL 11-37

MODEL 11-37 AC-DC

Alignment

MID-WEST RADIO CORP.

ALIGNMENT INSTRUCTIONS FOR MODEL 11-37 AC
AND MODEL 11-37 AC-DC

- (1) Set the signal generator to 456 k.c. and connect it from the mixer grid to ground.
- (2) Remove the oscillator tube from the receiver.
- (3) Connect the output meter from the plate of the output tube to positive B.
- (4) Using a moderately weak signal approximately 40 microvolts, align the three I.F. transformers to maximum output.
- (5) Keep decreasing the oscillator input and re-aligning for maximum gain.

This completes the alignment of the I.F. amplifier. Insert the oscillator tube. Connect the signal generator between antenna and ground. Connect mixer lead to grid of mixer tube.

- (1) Set the wave change switch to the "E" band.
- (2) Set the signal generator to 325 k.c., and also the dial.
- (3) Adjust the "E" oscillator trimmer to maximum gain, then adjust the "E" band R. F. and the "E" band mixer trimmers for maximum gain.
- (4) Reset the signal generator to 135 k.c. and rotate the receiver dial to 135 k.c.
- (5) Adjust the "E" band padder for maximum signal.
- (6) Repeat the adjustment of trimmers and paddors until the adjustment of one does not effect the adjustment of the other.

This completes the alignment of the "E" band.

- (1) Set the wave change switch to the "A" band.
- (2) Set the signal generator to 1490 k.c.

- (5) Adjust the "A" oscillator trimmer to maximum gain, then adjust the "A" band R.F. and the "A" band mixer trimmers for maximum gain.
 - (4) Reset the signal generator to 550 k.c. and rotate the receiver dial to 550 k.c.
 - (5) Adjust the "A" band padder for maximum signal.
 - (6) Repeat the adjustment of trimmers and paddors until the adjustment of one does not effect the adjustment of the other.
- This completes the alignment of the "A" band.
- (1) Set the wave change switch to the "L" band.
 - (2) Set the signal generator to 3.8 m.c.
 - (3) Adjust the "L" oscillator trimmer to maximum gain, then adjust the "L" band R.F. and the "L" band mixer trimmers for maximum gain.
 - (4) Reset the signal generator to 1.6 m.c. and rotate the receiver dial to 1.6 m.c.

- (5) Adjust the "L" band padder for maximum signal.
- (6) Repeat the adjustment of trimmers and paddors until the adjustment of one does not effect the adjustment of the other.

This completes the alignment of the "L" band.

- (1) Set the wave change switch to the "M" band.
- (2) Set the signal generator to 11.5 m.c.

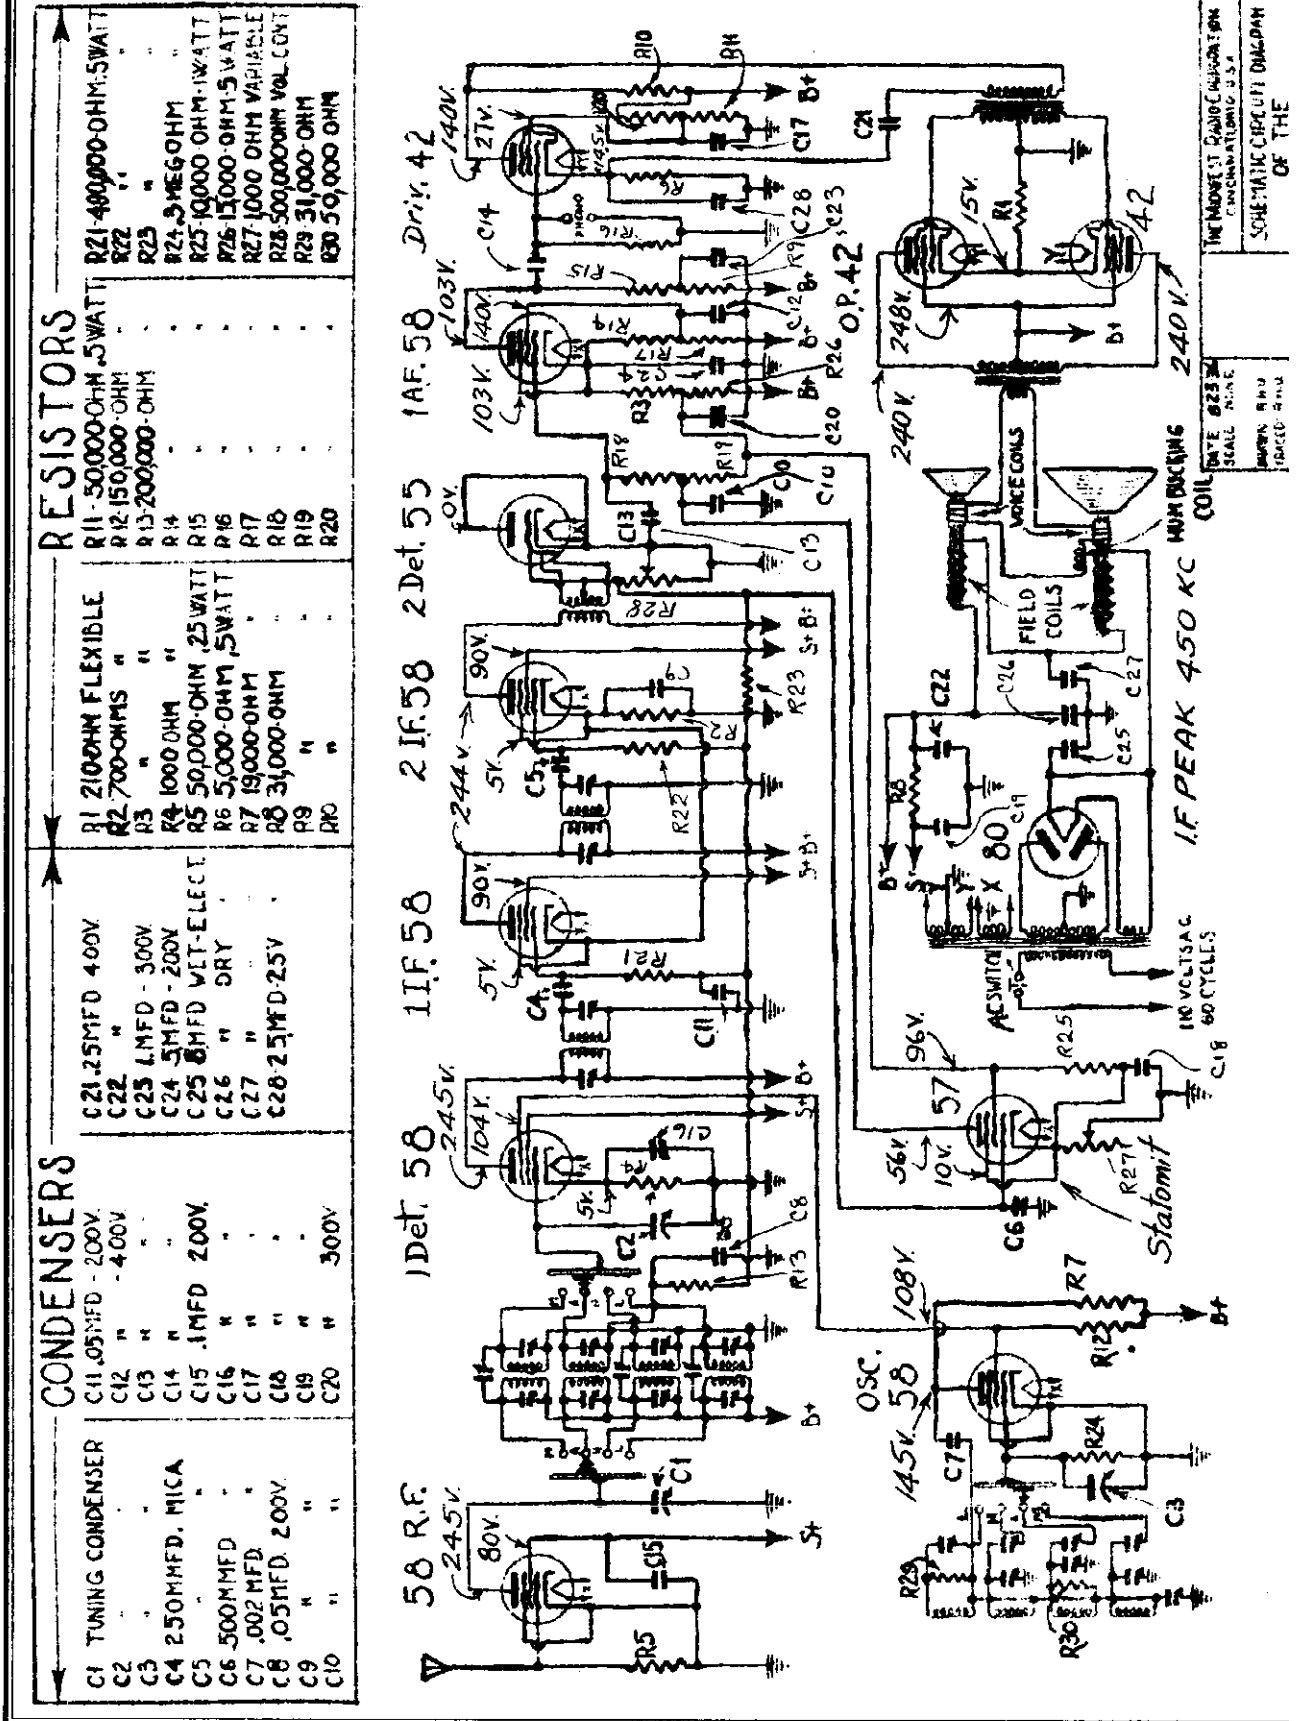

- (3) Adjust the "M" oscillator trimmer to maximum gain, then adjust the "M" band R.F. and the "M" band mixer trimmers for maximum gain.

This completes the alignment of the "M" band.

- (1) Set the wave change switch to the "H" band.
- (2) Set the signal generator to 28 m.c.

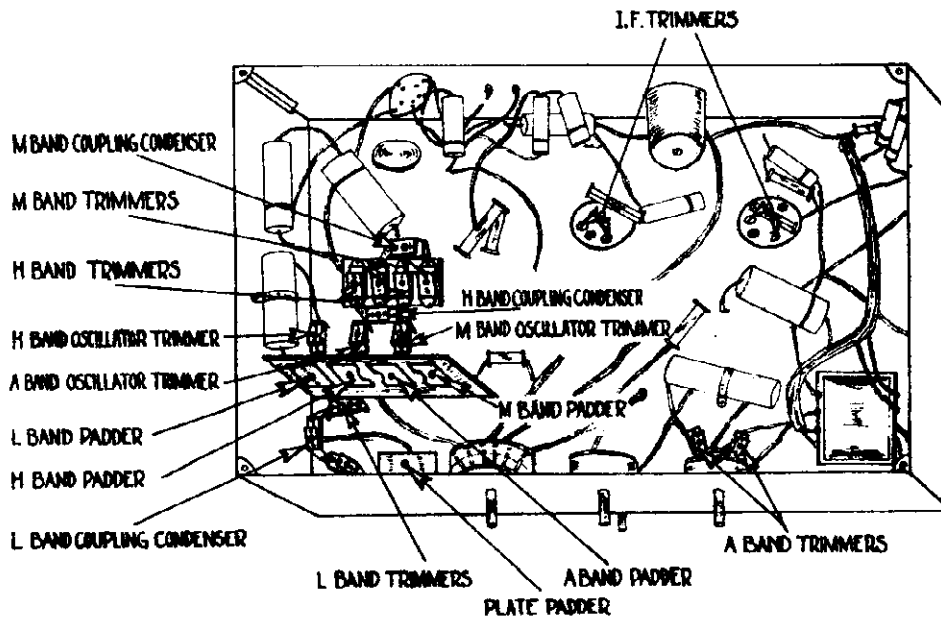

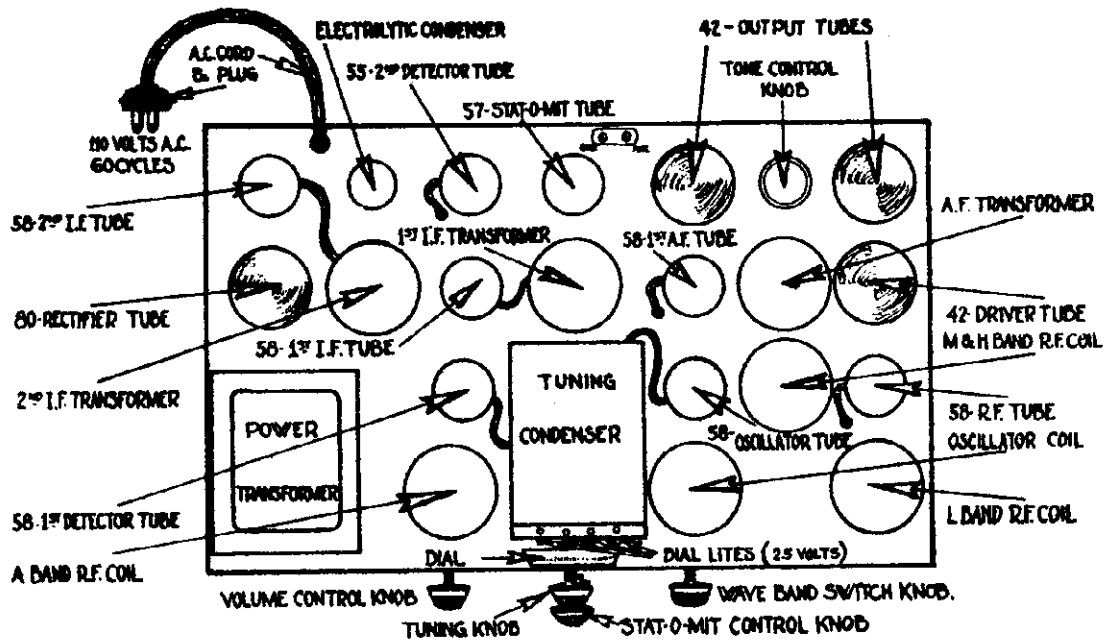

- (3) Adjust the "H" band oscillator trimmer to maximum gain, then adjust the "H" band R.F. and the "H" band mixer trimmers for maximum gain.

This completes the alignment of the "H" band.

MODEL 12-35
 Socket, Trimmers
 Alignment

MID-WEST RADIO CORP.

Before aligning the i-f amplifier, check the spacing of the i-f transformers, as they sometimes collapse resulting in broad tuning. The spacing should be 3/4 inch between faces of the coils. Wax coils in place. Set signal generator at 450 kc and adjust i-f trimmers. Measure the AVC voltage developed for peaking purposes.

A BAND-WHITE. Do not adjust the plate padder. This has been done at the factory and should not be changed. Set dial at 5 and signal generator at 1490 kc. Adjust A-Band r-f trimmers to maximum output and then padder at 560 kc with dial set at 98.

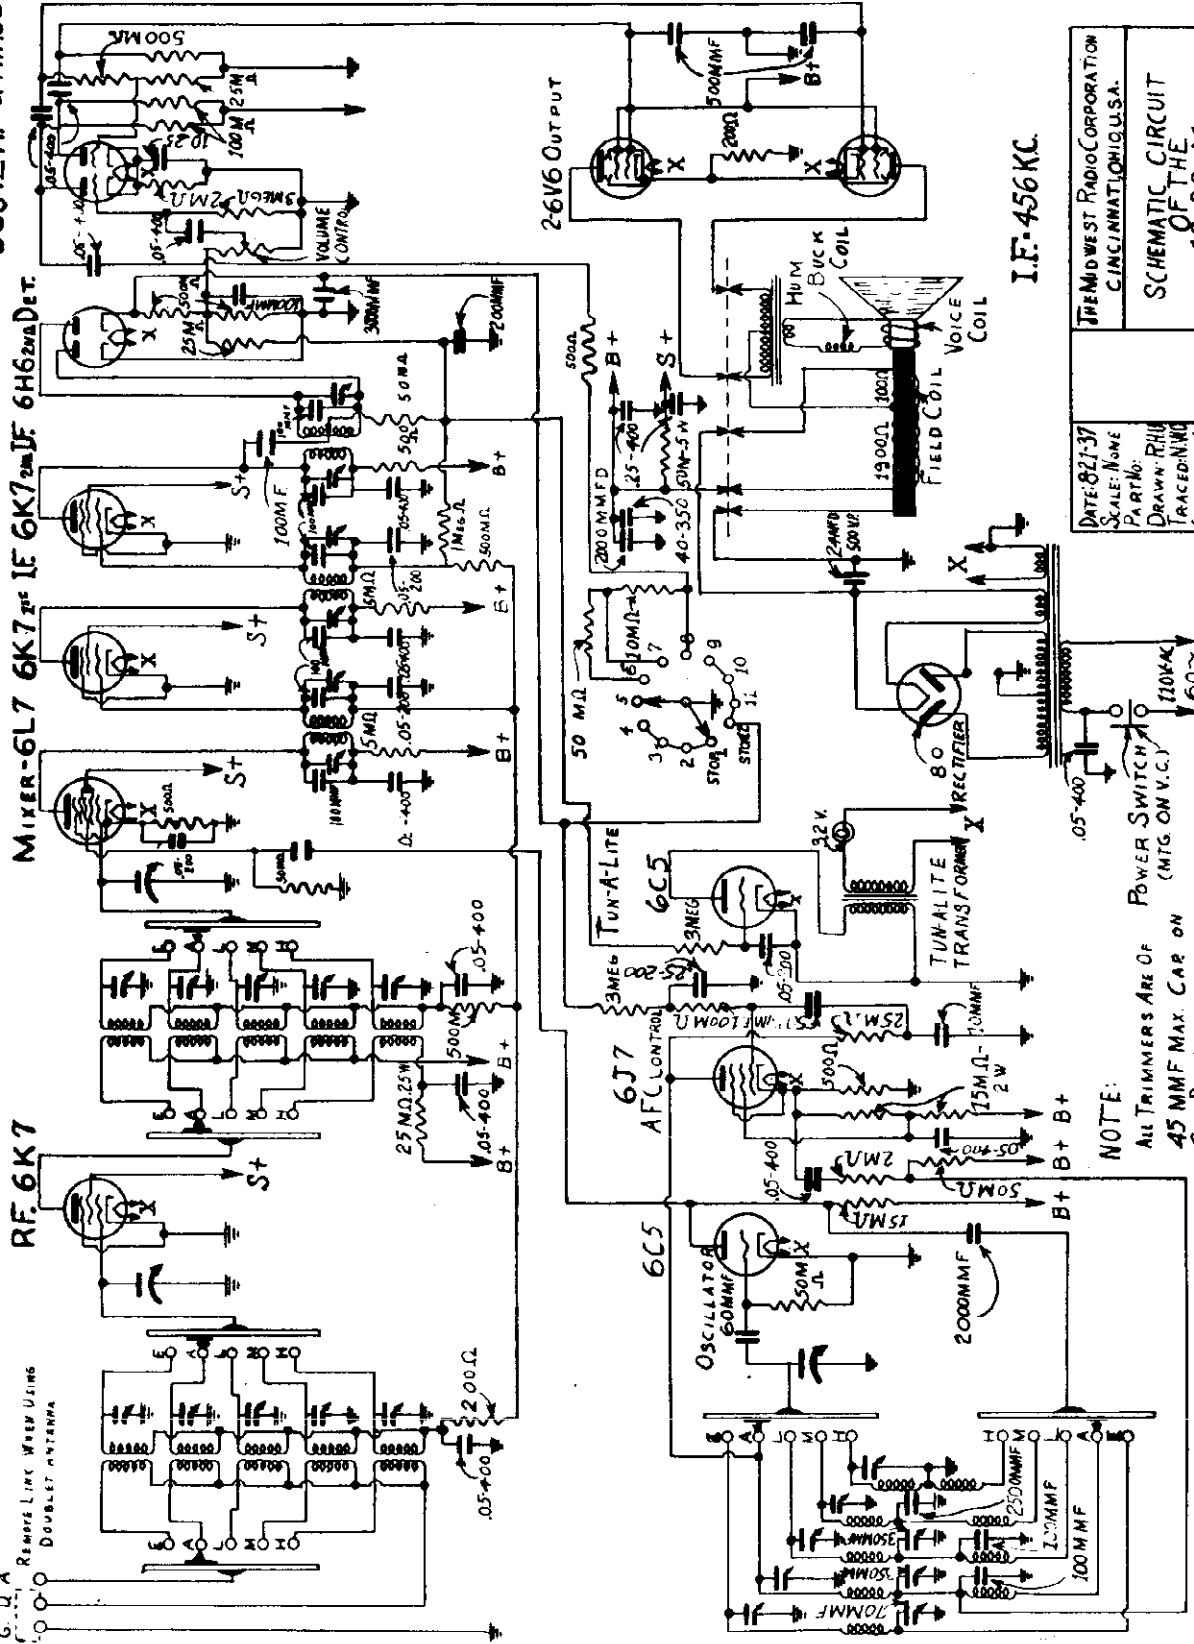

L BAND-RED. Set dial at 2. Adjust r-f trimmers at 4.1 mc. Set dial at 98 and adjust padder at 1712 kc. Adjust feed condenser until maximum sensitivity is reached over the whole band. Generally this condenser will be tight.

M BAND-GREEN. Set dial at 2. Adjust r-f trimmers at 9 mc. Adjust padder at 4.5 mc. Adjust feed condenser as was done in L Band.

H BAND-ALBER or BLUE. Set dial at 5. Adjust r-f trimmers at 20 mc. Adjust padder at 9 mc. with dial at 98. Adjust feed condenser as was done in L Band.

MODEL 14-37
 MODEL 14-37(Int.)
 MODEL 14-37A
 Trimmers, Alignment

ALIGNMENT PROCEDURE
 MODELS 14-37, 14-37A, AND 14-37 INTERMEDIATE

INTERMEDIATE FREQUENCY ALIGNMENT

- (1) Set the signal generator to 456 KC and connect it from the Mixer tube grid to ground.
- (2) Remove the Oscillator tube from the receiver.
- (3) Connect the output meter from the plate of the output tube to the positive "B".
- (4) Using a moderately weak signal of approximately 40 microvolts, align the three IF transformers to maximum output.
- (5) Keep decreasing the signal generator input and re-align for maximum gain.

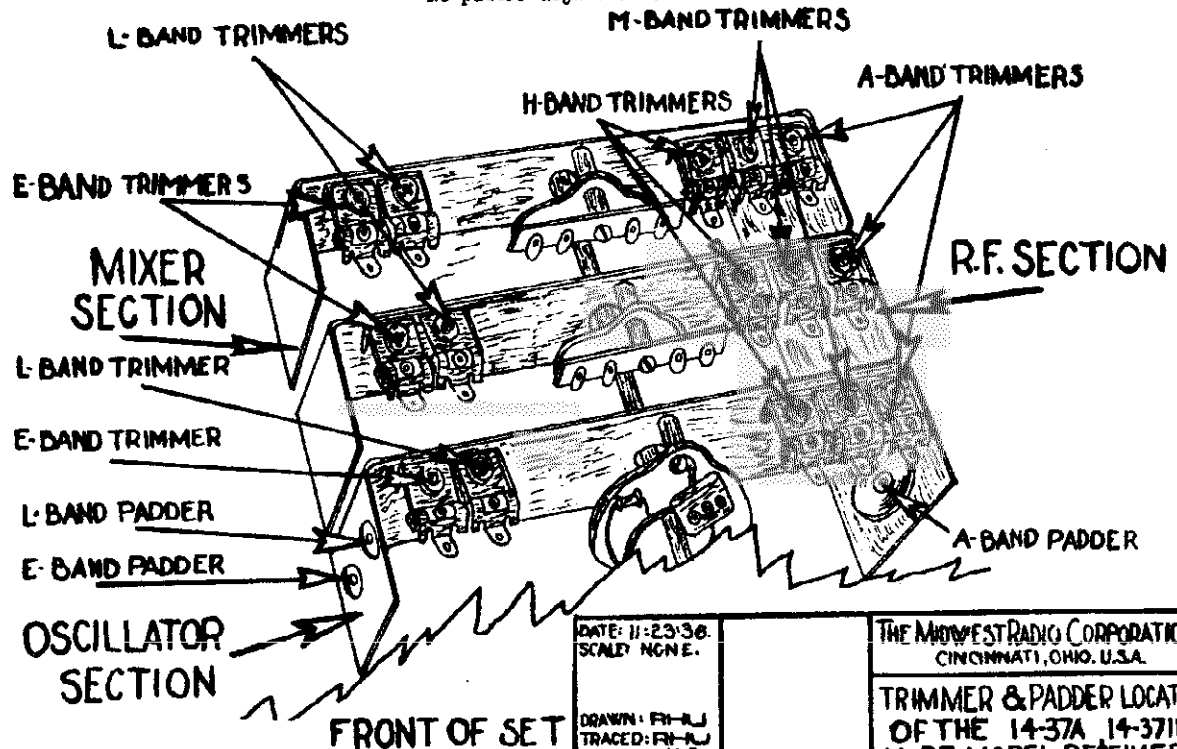

"E" Band ALIGNMENT

- (1) Set the receiver wave change switch to the "E" Band.
- (2) Set the signal generator to 325 KC.
- (3) Adjust the "E" Band Oscillator trimmer to maximum gain, then adjust the RF and Mixer trimmers of the same band to maximum gain.
- (4) Reset the signal generator to 135 KC and set the receiver dial to the same frequency.
- (5) Adjust the "E" band padder for maximum signal.
- (6) Repeat the adjustments of trimmers and padder until the adjustment of one does not affect the adjustment of the other.

"A", "L", "M", AND "H" BAND ALIGNMENT

The procedure of alignment of these bands are the same as given above for the "E" band. The frequencies for their adjustment are as follows :-

- "A" BAND- Adjust Oscillator, RF, and Mixers trimmers to 1490 KC
 Adjust Oscillator padder to 550 KC.
- "L" BAND- Adjust Oscillator, RF, and Mixer trimmers to 3.8 MC
 Adjust Oscillator padder to 1.6 MC.
- "M" BAND- Adjust Oscillator, RF, and Mixer trimmers to 11.5 MC
 No padder adjustment.
- "H" BAND- Adjust Oscillator, RF, and Mixer trimmers to 28 MC
 No padder adjustment.

Socket, Trimmers
Voltage, Alignment
Notes

MID-WEST RADIO CORP.

Using a standard signal generator and having an approximate frequency from 400 k.c. to 14 m.c. and a standard output meter.

I. F. ALIGNMENT

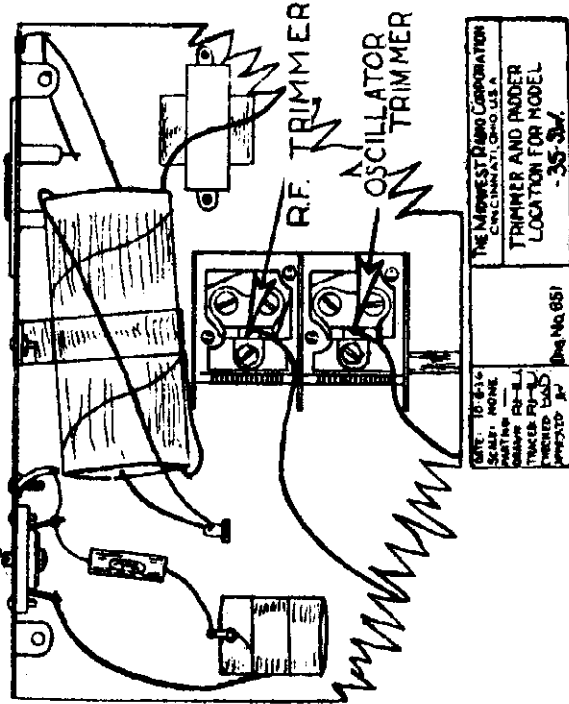

- (1) Set signal generator to 465 k.c. and connect output of signal generator to grid of 6A7 tube, shorting out front section of variable condenser. Connect output meter to plate of 43 tube and ground. Adjust both 1st and 2nd I.F. grid and plate trimmers for maximum output on meter.

NOTE: To assure more accurate trimmer setting always use lowest possible test oscillator output consistent with readable output meter scale deflection.

R. F. ALIGNMENT

- (2) Setting dial and signal generator at 1450 k.c., connect signal generator to antenna post of receiver through a standard dummy antenna. Adjust R. F. trimmers on variable condenser so that maximum output is obtained at this frequency. Set signal generator and dial at 860 k.c. and adjust "A" band paddler in rear of set for maximum output. Short wave adjustments are automatically taken care of by carefully calibrated coils and fixed condensers. No adjustment is needed for the particular band.

EC BAND PADDLER

FRONT OF SET

NOTE: The schematic of the MODEL 35 SW is the same as the MODEL 35-6-SW, with the exception that the 6A7 screen grid by-pass condenser has a value of 0.1 MFD capacity instead of 0.02 MFD. The Model 35-6-SW schematic should show one side of the line grounded to the same point on chassis that the series filaments are grounded.
The Intermediate Frequency for the Short-Wave Model is 465 KC. For the Long-Wave Model the "IF" is peaked at 175 KC. For the latter additional paddlers are shown on the top view.

MODEL 18-36A(Int.)

Socket, Trimmers Alignment

MID-WEST RADIO CORP.

ALIGNMENT PROCEDURE

A good signal generator with accurate frequency calibration and an output meter are required. An INTERMEDIATE FREQUENCY of 456 KC is used.

- (1) Set the signal generator to 456 KC and connect it from the mixer grid to ground.
- (2) Remove the Oscillator tube from the receiver.
- (3) Connect the output meter from the plate of the output tube to positive B₁ and from the plates of one pair of tubes to the plates of the other pair of output tubes.
- (4) Using a weak signal of approximately 40 microvolts, align the I.F. transformer to maximum output.
- (5) Gradually decrease the signal and realign the I.F. amplifier.
- (6) Increase the input from the signal generator to approximately 100 microvolts. Align the A.V.C. transformer for minimum output.
- (7) Repeat using weaker signal strengths for the I.F. and stronger signal strengths for the A.V.C. adjustments until absolute peak is assured.

Insert the oscillator tube. Connect the signal generator between antenna and ground. Connect mixer lead to grid of the mixer tube.

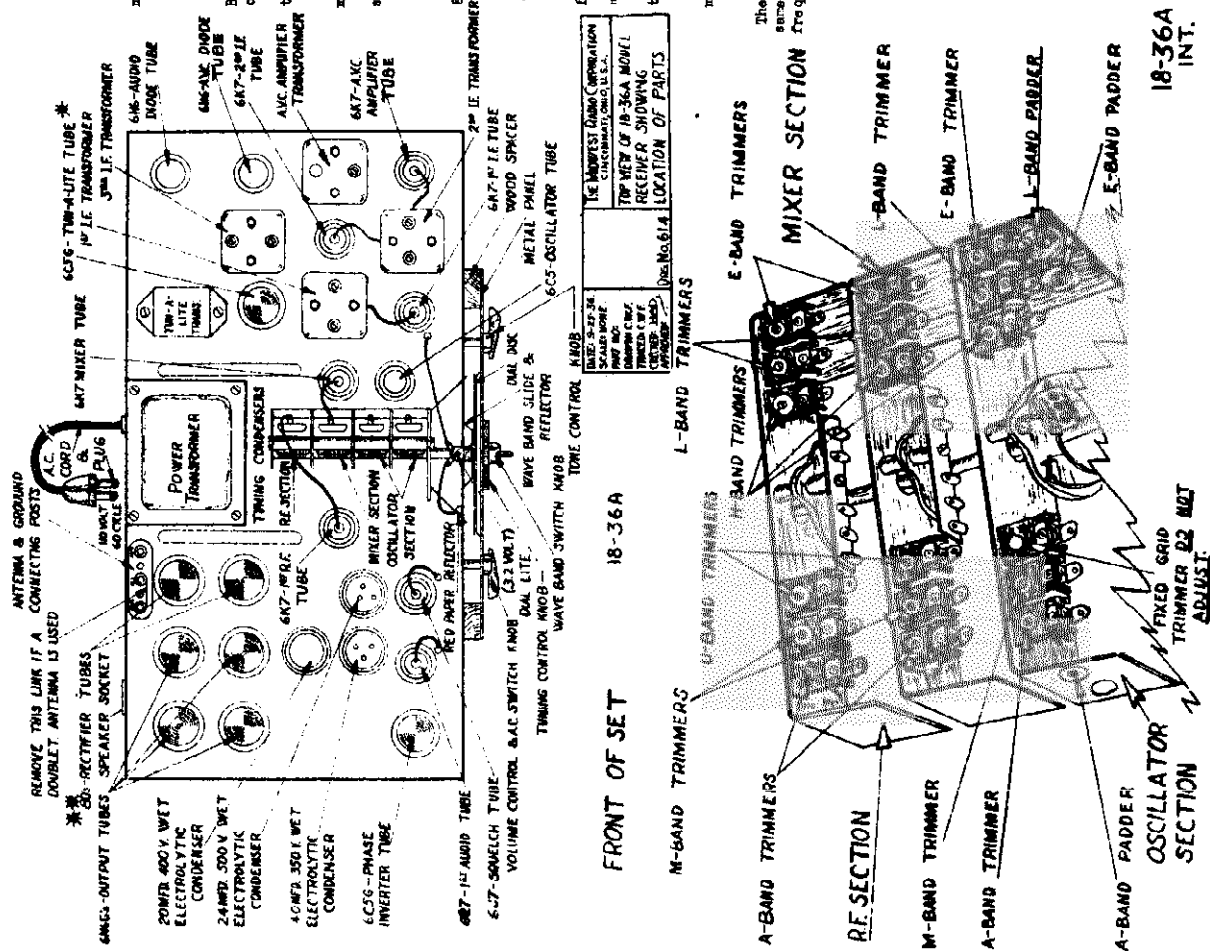

"E" BAND ADJUSTMENT

- (1) Set the receiver wave change switch to the "E" Band.
- (2) Set the generator to 328 KC, and set the receiver dial to same frequency setting.
- (3) Adjust the "E" Oscillator trimmer to maximum gain, then adjust the "E" Band RF and "MIXER" trimmers for maximum gain.
- (4) Reset the signal generator to 165 KC and change the receiver dial to 135 KC frequency setting.
- (5) Adjust the "E" Band padder for maximum signal.
- (6) Repeat the adjustment of the trimmers and padders until the adjustment of one does not affect the adjustment of the other.

The procedure for adjustments of the "A", "L", "M", "H", and "U" Bands are the same as given above for the "E" Band. The bands are adjusted to the following frequencies:

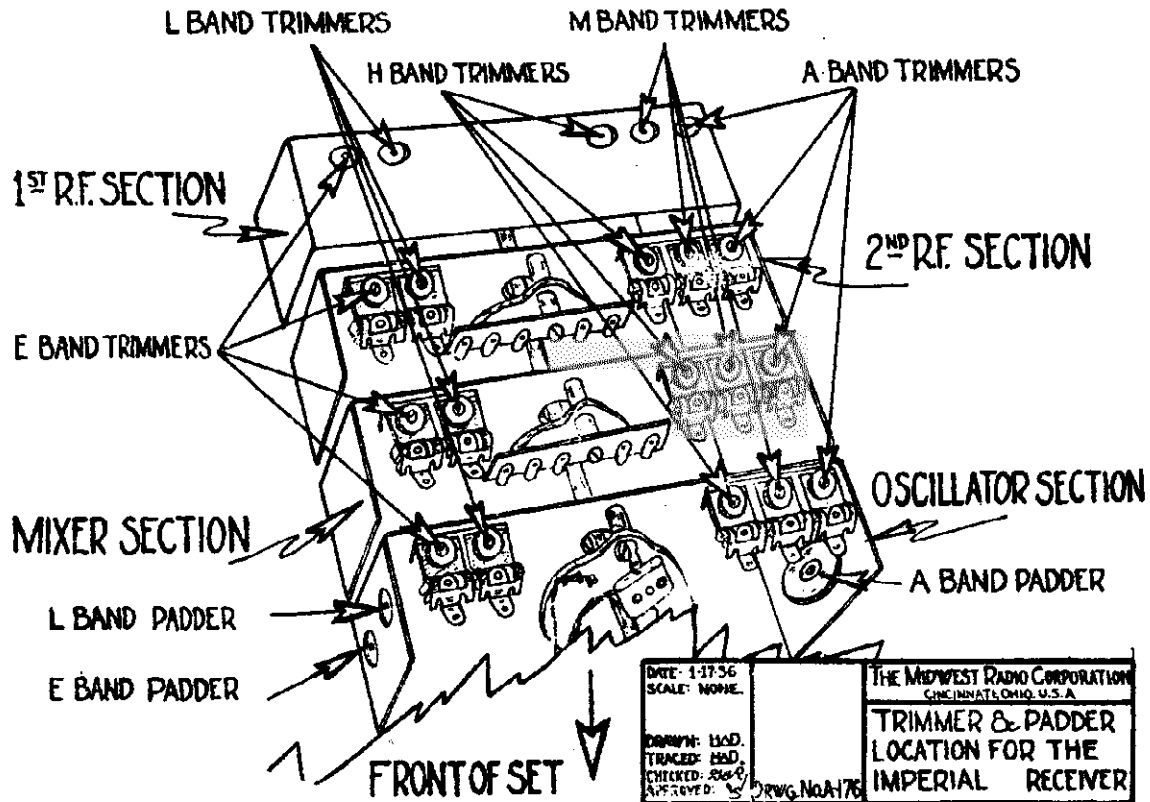

- "A" Band - Adjust Oscillator, then RF and Mixer trimmers to 1490 KC
Adjust Oscillator padder at 550 KC
- "L" Band - Adjust Oscillator, then RF and Mixer trimmers to 3.8 MC
Adjust Oscillator padder at 1.6 MC
- "M" Band - Adjust Oscillator, then RF and Mixer trimmers to 11.5 MC
No padder adjustment.
- "H" Band - Adjust Oscillator, then RF and Mixer trimmers to 28 MC
No padder adjustment.
- "U" Band - Tune receiver until signal is heard, then adjust the Mixer trimmer for maximum gain. No other adjustments are required on this band.

MODEL Imperial 18(1935)
Schematic, Voltage, Alignment

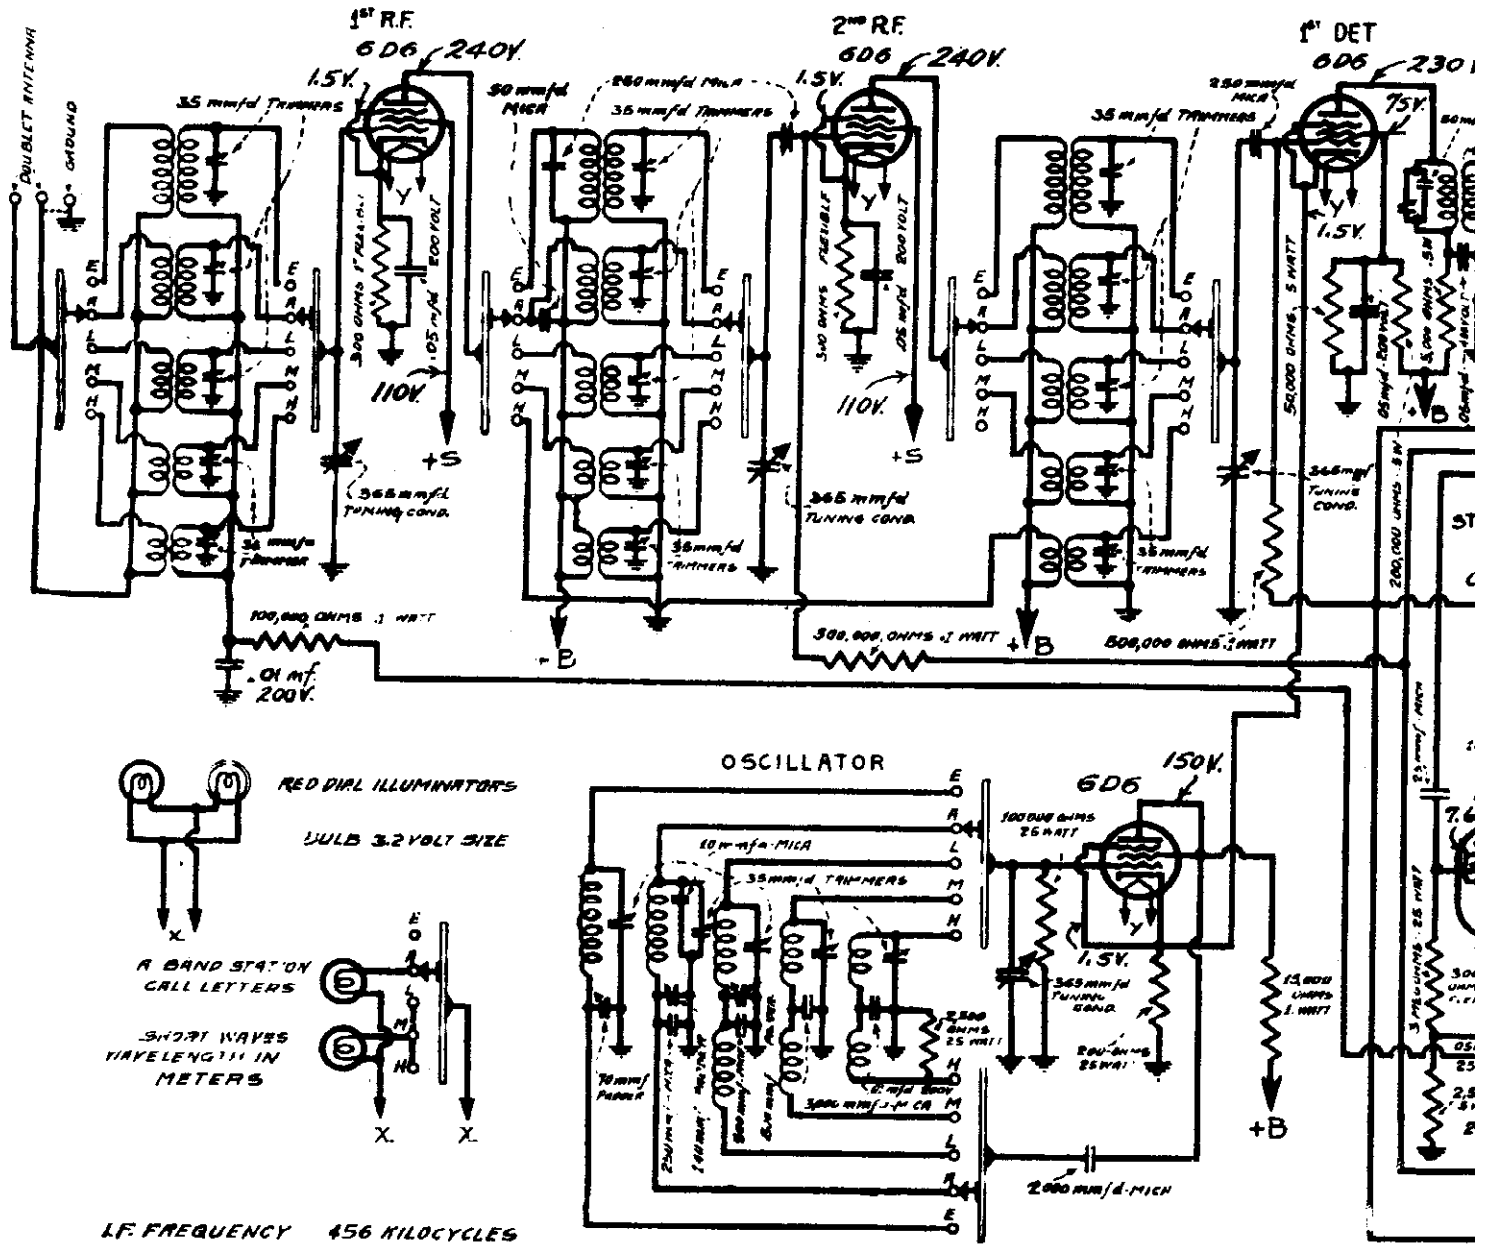

PROCEDURE

Let signal generator and receiver to 550 KC. Adjust "A" Band padder to maximum gain.

BAND ADJUSTMENT - Set switch to "L" Band. Set signal generator and receiver to 1.6 MC. Trim "L" Band Oscillator, RF, and Mixer trimmers to maximum gain. Reset signal generator and receiver to 1.6 MC, and adjust "L" Band padder to maximum signal.

BAND ADJUSTMENT - Set switch to "M" Band. Set signal generator and receiver to 5 MC. Adjust Oscillator, RF, and Mixer trimmers for maximum gain. No padder adjustment is provided for on the "M" Band.

BAND ADJUSTMENT - Set the wave change switch of the receiver to the "H" Band. Set the signal generator and receiver to 28 MC. Adjust the "H" Band trimmers of the Oscillator, RF, and Mixer circuits until a maximum signal is obtained. Padder adjustment is provided for on the "H" Band.

LF. FREQUENCY 456 KILOCYCLES

DRAWN: MARCH 12 1935 BY FRIE SCH. CHECKED BY [Signature] APPROVED BY [Signature]

DRAWING NO 182

ALIGNMENT PROCEDURE

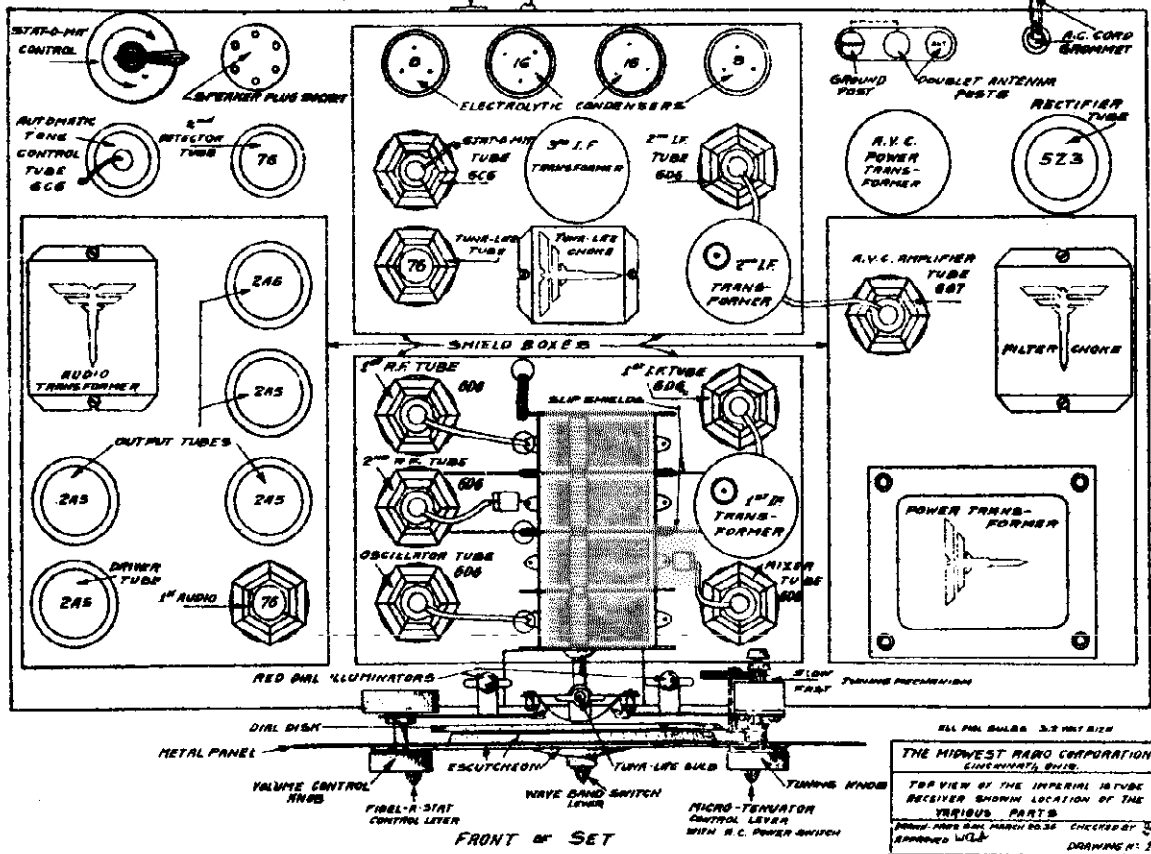

Set the signal generator to 456 KC. Remove oscillator tube from receiver, set the Microtenuator to maximum, with approximately 40 microvolts into the grid of the mixer, peak the 3rd, 2nd, and 1st IF Transformers to maximum audio output. Do not measure AVC as indication of output. Increase input to Mixer grid to 100 microvolts, tune AVC transformer to maximum dip, set microtenuator at minimum setting. Do not shield coils to maximum dip. Recheck adjustments to the above procedure. Replace oscillator tube in receiver.

"E" BAND ADJUSTMENT - Connect signal generator to ANT. and Gnd. posts. Set wave change switch to "E" Band. Set signal generator to 325 KC. Trim "E" Band Osc. trimmers for maximum signal. Trim the "E" Band RF and Mixer trimmers for maximum signal, set signal generator and receiver dial to 135 KC. Trim "E" Band padder for maximum gain.

"A" BAND ADJUSTMENT - Set switch to "A" Band. Set signal generator and dial of receiver to 1490 KC. Trim "A" Band Oscillator, RF, and Mixer trimmers to maximum gain.

Reset signal generator to 3.8 MC. T
 "L" BAND
 3.8 MC. T

Remove oscillator tube from receiver, set the Microtenuator to maximum, with approximately 40 microvolts into the grid of the mixer, peak the 3rd, 2nd, and 1st IF Transformers to maximum audio output. Do not measure AVC as indication of output. Increase input to Mixer grid to 100 microvolts, tune AVC transformer to maximum dip, set microtenuator at minimum setting. Do not shield coils to maximum dip. Recheck adjustments to the above procedure. Replace oscillator tube in receiver.

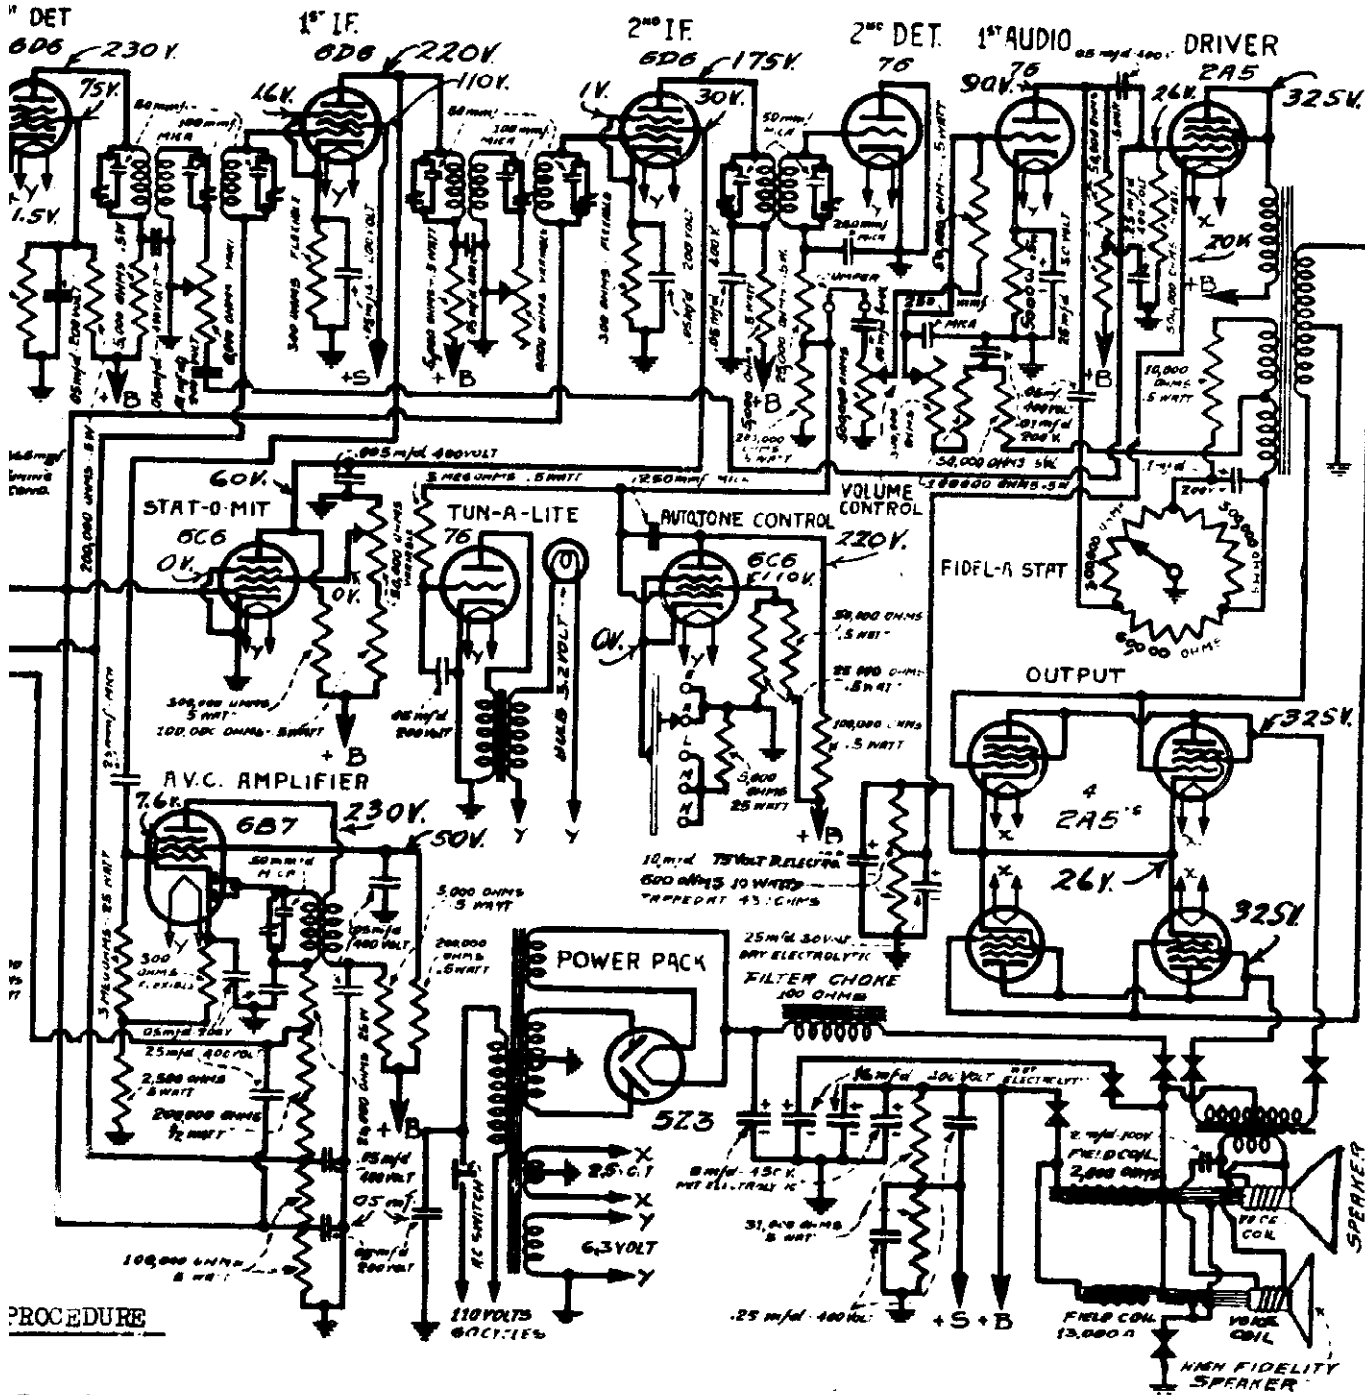

"E" BAND ADJUSTMENT - Connect signal generator to ANT. and Gnd. posts. Set wave change switch to "E" Band. Set signal generator to 325 KC. Trim "E" Band Osc. trimmers for maximum signal. Trim the "E" Band RF and Mixer trimmers for maximum signal, set signal generator and receiver dial to 135 KC. Trim "E" Band padder for maximum gain.

"A" BAND ADJUSTMENT - Set switch to "A" Band. Set signal generator and dial of receiver to 1490 KC. Trim "A" Band Oscillator, RF, and Mixer trimmers to maximum gain.

Reset signal generator to 3.8 MC. Trim "M" Band padder to 11.5 MC. Set the signal generator to "H" BAND. Set the signal generator to "H" BAND. No padder.

RADIO CORP.

MODEL Imperial 18(1935)
Schematic, Voltage, Alignment

PROCEDURE

Reset signal generator and receiver to 550 KC. Adjust "A" Band padder to maximum gain.

"L" BAND ADJUSTMENT - Set switch to "L" Band. Set signal generator and receiver to 3.8 MC. Trim "L" Band Oscillator, RF, and Mixer trimmers to maximum gain. Reset signal generator and receiver to 1.6 MC, and adjust "L" Band padder to maximum signal.

"M" BAND ADJUSTMENT - Set switch to "M" Band. Set signal generator and receiver to 11.5 MC. Adjust Oscillator, RF, and Mixer trimmers for maximum gain. No padder is provided on the "M" Band.

"H" BAND ADJUSTMENT - Set the wave change switch of the receiver to the "H" Band. Set the signal generator and receiver to 28 MC. Adjust the "H" Band trimmers of the Oscillator, RF, and Mixer circuits until a maximum signal is obtained. No padder adjustment is provided for on the "H" Band.

MID-WEST RADIO CORP.

MODEL Regal(1936)
Alignment, Trimmers

I-F ALIGNMENT: Remove oscillator tube from its socket. Set signal generator to 456 kc and connect it from mixer grid to ground. Using a signal of about 40 microvolts, adjust i-f trimmers to maximum. Decrease signal and re-align i-f amplifier. Increase signal to about 100 microvolts and align AVC transformer for minimum output. Repeat using weaker signal for i-f amplifier and stronger signal for AVC adjustments until an absolute peak is assured. Replace oscillator tube.

R-F ALIGNMENT: Signal generator connected to antenna post and ground.

E-Band: Set band switch to E band and signal generator and dial of set to 325 kc. Adjust "E" oscillator trimmer for maximum; then "E" r-f and mixer trimmers for maximum. Set signal generator and dial to 135 kc and adjust "E" padder for maximum. Repeat adjustments until one does not affect the adjustment of the others.

A-Band: Set band switch to A band and signal generator and dial to 1490 kc. Adjust oscillator, r-f, and mixer trimmers of "A" band for maximum. Set signal generator and dial to 550 kc and adjust "A" padder for maximum. Repeat adjustments as before.

L-Band: Set band switch to L band and signal generator and dial to 3.8 mc. Adjust oscillator, r-f, and mixer trimmers of "L" band for maximum. Set signal generator and dial to 1.6 mc and adjust "L" padder for maximum. Repeat adjustments as before.

M-Band: Set band switch to M band, and signal generator and dial to 11.5 mc. Adjust oscillator, r-f, and mixer trimmers for maximum.

H-Band: Set band switch to H band and signal generator and dial to 28 mc. Adjust oscillator, r-f, and mixer trimmers for maximum.

U-Band: Set band switch to U band and signal generator to 60 mc. Tune set until signal is received. Adjust "u" mixer trimmer for maximum.

MODEL Regal(1936)
Socket, Chassis

MID-WEST RADIO CORP.

~NOTE~
This chassis is shown equipped with the best tube combination available.
* Metal, metal-glass, or glass counter part tubes may be used. For example the output tubes shown are glass counter-part tubes numbered -6N6-G; metal glass tubes would be numbered 6N6-MG and metal tubes would be numbered -6N6.
** Use only 80 type Rectifier tubes.

Caution

In all work on the chassis and movie dial, extreme care must be taken not to scratch the film or damage the color filter. The film is easily scratched and should not be touched by the hand or any other object.

Fig. 3—Drive Takeup Assembly

Fig. 7—Replacement of Film Drum Drive Cord

Fig. 5—Effect of Lamp Socket Assembly Height

Fig. 6—Early Dial Lamp Assemblies

Adjustments and Service Data MOVIE DIAL AND DRIVE August, 1936

Bringing Lens Adjustment to a Focus

Important—Turn the band switch to the standard wave position.

Move the focusing lever (see Fig. 2) up or down until the image on the screen is clearest. In Fig. 1 is shown the effect of correct and incorrect focusing. Care should be taken not to touch the color filter.

Adjusting Reflecting Mirror

On the back wall of the projector compartment are two screws as shown in Fig. 2, the purpose of which is to adjust the position of the reflecting mirror vertically and horizontally.

If the raising and lowering adjustment screw (see Fig. 2) is not adjusted properly, the image will be too high or too low on the screen and the kilocycle or megacycle lines will not be horizontal. Also, part of the image may be cut off. If this condition exists loosen the nut which holds this screw in place. Back this nut off about one turn and then carefully turn this screw until the image is centered on the screen and the lines are horizontal. Use a fine blade screwdriver for this adjustment. Retighten the nut.

If the image cannot be centered from top to bottom, it may be necessary to adjust the elevator height in accordance with the article on this subject in this manual.

If the image on the screen is too far to the right, there will be a space at the left of the screen without light. If the image is too far to the left the same condition is true on the right side of the screen. In either case, loosen the nut which holds the left and right adjusting screw in place—see Fig. 2. Back this nut off about one turn and then carefully turn this screw with a fine blade screwdriver until the image is centered. Retighten the nut.

Drive Takeup Assembly

Later models are equipped with a drive takeup assembly illustrated in Fig. 7, by means of which the dial drum can be rotated a slight amount for calibration purposes. The earlier models do not have this adjustment. However, a special unit illustrated in Fig. 3 can be put on.

This unit is assembled to the film drum bracket and drive cord as shown in Fig. 3. Unscrew the two set screws and open the slot to the maximum position by turning the adjusting screw in a counter-clockwise direction. Place the unit in position on the bracket.

Push it as far to the left as possible (from back of chassis) and tighten the two set screws. These will extend beneath the film drum bracket. Then place the drive cord between the two pulleys as shown.

Tighten the calibration screw to secure the required cord tension. When this is done the radio might be out of calibration. If this condition occurs, the film drum may be shifted to the proper position by loosening the two screws inside the drum at the bottom. After these two screws are tightened, a fine calibration adjustment may then be obtained by turning the calibration screw.

Dial Calibration

The radio is properly calibrated if, when a station is correctly tuned in, the vertical red line on the screen crosses the call letters of that station. If the red line is found to be on one side of the call letters of a large number of stations on the standard wave band (the same side in each case), the dial is out of calibration.

To re-calibrate, tune in the signal of one of the larger nearby stations. Choose a station which is near the 1300 KC end of the dial and tune carefully to resonance. Turn the calibration screw (see

Fig. 2, 3 or 7) until the vertical red line on the screen is at the center of the call letters of that station.

If the film drum cannot be turned a sufficient amount by means of the calibration screw, loosen the 2 screws at the bottom of the drum which hold it in place. Adjust the position of the drum and tighten the screws. The early models do not have the cord take-up calibration screw mentioned above.

These models must be calibrated by loosening the drum screws.

The dial will then be properly calibrated and this adjustment should not be changed unless re-calibration again becomes necessary. It should be remembered that after calibration a few of the stations will be tuned in when the vertical red line is near the end of the call letters and city of a station. That is because of slight variations in the film.

Adjusting Elevator to Raise or Lower Image

Adjust the lamp assembly height until the lines on the screen are straight—see article on this adjustment in this manual.

Turn the upper reflecting mirror adjusting screw—see Fig. 2, until the lines on the screen are horizontal.

Turn the band switch to the second short wave position (green).

Loosen the elevator adjusting screw—see Fig. 4.

Raise and lower the elevator until the megacycle line (at bottom) is between the letters "S" and "T" of the word "West" on the glass at either side of the glass screen.

Tighten the elevator adjusting screw.

Removing Play between Band Switch and Elevator

If the elevator arm stops and the band switch stops do not coincide, there will be a certain amount of play between the band switch and the elevator. When this condition occurs, the position of the image on the screen will not be fixed, but can be moved up or down by turning the band switch knob.

To remedy this condition, first turn the band switch to the second short wave position (green).

Loosen the set screw and square head screw on the band switch shaft collar, see Fig. 4. Turn the band switch shaft clockwise as far as it will go. Push the collar arm clockwise as far as it will go without pulling the elevator arm ball bearing out of the bottom slot.

Then tighten the square head screw and set screw in the elevator arm collar.

Planetary Drive Assembly

The planetary assembly is the unit that is integral with the tuning shaft. It is illustrated in Fig. 3.

If the nut of this assembly is too tight, the drive will be jerky and will turn hard in high speed. If this condition exists, back off this nut one or two turns and note the effect.

If this nut is too loose, the drive will slip in low speed. The remedy in this case, of course, is to tighten the nut.

Should the condenser drive cord slip when the planetary pulley is turning, inspect the tuning condenser, drive drum and film drum to see if they are turning properly or if they are being obstructed in some way.

If the drive turns unevenly (rough in spots), this may mean that the planetary assembly is defective or damaged internally and a new unit will be required.

Changes in Early Models

Film Drum Base—In the early models a metal film drum base was used. This was replaced in later models with a molded base. The latter type is used in filling orders and is interchangeable with the early type. A clamping plate is now included with the molded base Film Drum Assembly.

Lamp Socket Assembly—Two changes were made in the lamp socket assemblies in the early models. The type used with each receiver is illustrated in the instruction book packed with that model. For further information regarding this assembly see the article "Replacing and Positioning the Dial Lamp" in this manual.

Cleaning Light Reflecting and Transmitting Parts**Cleaning the Lenses**

It is very seldom necessary to clean the lenses. Occasionally, however, dust or dirt on the lens may cause the image on the screen to be spotted or foggy. If this is the case, the lenses may be removed as explained below and may then be cleaned by wiping carefully with a clean chamois or soft cloth.

Removing Condenser Lens—This lens is inside the film drum as shown in Fig. 2. Turn the band switch to the standard wave position. Take out screw (C) holding the condenser lens bracket in place—see Fig. 4. Turn this bracket in a clockwise direction (from top) and lift it out carefully to avoid scratching the film.

This lens can be cleaned without removal or may be forced out of the tube with a wood block. When the lens is replaced, line up the end of the lens barrel with the edge of the tube.

In replacing the condenser lens bracket, shift this bracket until the end of the condenser lens tube is about 1/8 inch from the dial lamp.

Removing Projector Lens—This lens is inside the projector lens tube as shown in Fig. 2. Turn the band switch to the standard wave position. Take out the three screws which hold the projector compartment shield in place. Then remove the projector compartment shield by tilting the top slightly to the back and toward the right (from back of shield). Move the focusing lever to the highest position. Unscrew and remove this lever.

Push the color filter in a counter-clockwise direction (from front) as far as it will go. Insert a fine blade screwdriver into the projector lens tube (from the front). The blade of the screwdriver should engage the end of the barrel of this lens and push against it until it has been pushed a slight distance

toward the projector compartment. CAUTION—Do not let the screwdriver touch the glass. Then insert the screwdriver through the slot in the side of this tube, again engaging the barrel of the lens. Push against the barrel until the lens can be removed by hand from the projector compartment.

Cleaning the Reflecting Mirror, Film, Color Filter and Glass Screen

As in the case of the lenses, it is very seldom necessary to clean the reflecting mirror, film, color filter or glass screen. If, however, the image on the screen is spotted or foggy, it may be necessary to clean these items as explained below.

Reflecting Mirror—The reflecting mirror is located within the projector compartment. Remove the projector compartment shield as described above under "Removing Projector Lens". The glass may then be cleaned without removal of this assembly. Wipe the glass carefully with a clean chamois or soft cloth.

Film—The film may be dusted with a camel hair brush or fine cloth. CAUTION—Extreme care must be taken not to scratch the film.

Color Filter—To clean the color filter, turn the band switch to the second short wave position (green). Clean the filter using a fine cloth or chamois. CAUTION—Extreme care must be taken not to damage the filter.

Glass Screen—If the screen should become dirty, the front may be cleaned by wiping with a clean, dry cloth. If the back of the screen becomes dirty, it should be cleaned with alcohol. Care should be taken not to get any alcohol on the paint on the letters at the sides of the screen, or on the r, line at the front of the screen.

MODEL Movie Dial Drive Replacing Parts

MONTGOMERY-WARD & CO.

Replacing Parts

Replacing and Positioning the Dial Lamp

Caution—If a new lamp is required, use only the correct lamp, as shown in the parts list and on the label on each radio.

These are special lamps and can be purchased only through Wards stores and mail order houses. The life of the lamp is somewhat less than that of a radio tube.

First, turn the radio off.

Loosen the thumb screw and lift the lamp socket assembly out of the light tube—see Fig. 2. This can be lifted vertically by grasping the insulated top of the assembly through which the wire runs.

Remove the old lamp from the socket and put in the new one.

Replace the lamp socket assembly in the light tube with the light tube embossing in the groove of the lamp socket assembly—see Fig. 2. Do not tighten the thumb screw yet.

Turn the radio on.

Then grasp the top of the lamp socket assembly and move it up or down until the image on the screen is clearest and the lines are horizontal. The effect of having the lamp assembly too high or low is shown in Fig. 5. Tighten the thumb screw.

Early Types—There were two earlier types of lamp socket assemblies.

In the assembly shown in Fig. 6(A) the procedure differs from the above as follows:

To remove the socket assembly from the light tube, grasp the locking ring and turn it in a counter-clockwise direction until the pins are at the vertical portion of the slots. Then lift it out.

When replacing the lamp socket assembly in the light tube, line up the slots in the locking ring over the pins at the top of the light tube. Push the locking ring down and turn it clockwise until the pins move as far as possible into the horizontal portion of the slot—see Fig. 6(A).

To make the image on the screen clear and the lines horizontal, turn the adjusting nut. This moves the lamp assembly up or down depending on the direction of rotation.

In the assembly shown in Fig. 6(B), the procedure differs from that used in the (A) type as follows:

To remove the lamp socket assembly, unscrew the locking ring screw until it is free of the locking ring. Then pry the locking ring upward with a screw driver and lift the assembly out of the light tube.

When replacing the assembly in the light tube, line up one of the holes in the locking ring with the screw in the bracket. Push the locking ring down on the light tube and tighten the locking ring screw until it enters the hole in the locking ring.

Turn the adjusting nut as explained for the type (A) assembly. If the adjusting nut turns hard,

grasp the black insulated top of the assembly and lift upward slightly until the nut turns freely.

Important—Latest type used for parts orders. In filling orders for this assembly the latest type, illus- trated in the parts list, is shipped. This is inter- changeable with all early types.

The early types of lamp socket and light tube did not have the groove and embossing illustrated in Fig. 2. When one of the latest type of socket as- sembly is used in these models, it will be necessary to turn the assembly until the filament is at right angles to the lens.

Replacing the Film Drum Assembly

Remove the lamp socket assembly from the light tube by lifting it out in accordance with instructions in "Replacing and Positioning the Dial Lamp".

Remove the projector compartment shield by tak- ing out the three screws which hold it in place— See Fig. 2.

Take out the two screws (B and D) which hold the lens and light bracket in place—See Fig. 4. Now remove the lens and light bracket taking care not to scratch the inside of the film.

Remove the film drum assembly by unscrewing the two small screws located inside the drum at the bottom.

Mount the new film drum assembly on the film drum supports leaving the paper around the film for protection, and insert the clamping plate within the film drum. The film drum and clamping plate should then be so placed that the small screws are in the center of the two slots.

Replace the lens and light bracket taking care not to scratch the inside of the film.

Replace the projector compartment shield and dial lamp assembly.

Now remove the paper from the film, turn the radio on and calibrate the dial in accordance with the instructions in the article "Dial Calibration".

The film and mounting drum are sold as one as- sembly and cannot be ordered separately.

Replacing the Glass Screen

Loosen the screws holding the glass screen clamps on each side of the screen. Loosen these only enough to enable the glass screen to be removed by lifting it out from the top.

Mount the new screen from the top being very careful not to touch the back of the screen, as touch- ing the screen will leave fingerprints on the rough- ened or ground portion.

Push the glass screen down until it rests on the shelves provided for it.

Tighten the four screws holding the screen clamps just enough so that the glass is held firmly in place.

Replacing Film Drum Drive Cord

Remove the projector compartment and glass screen assembly together. To do this, take out the 2 screws (A) see Fig. 4, at the back of the top of the projector compartment, the 2 screws (E) at the bot- tom of the glass screen bracket, and the 2 brass col- lars from the volume control and tone control shafts.

Disconnect the tension spring from the arm at the right side of drive mechanism—see Fig. 7.

Remove the old cord by unsoldering it from the small lug on the film pulley. Clean the excess solder off of this lug. With a narrow blade screwdriver carefully bend this lug out toward the vertical posi- tion, a slight amount.

Turn the tuning shaft until the condenser plates are completely in mesh.

Turn the film drum so that the lug on the film pulley is in the position shown in Fig. 7. This is important.

Insert the new drive cord in the left slot in the drive drum (from front) and wind the cord in a clockwise direction one half turn around the drive drum.

Continue the cord horizontally to the lug on the film pulley. Loop the cord around this lug in the manner shown in Fig. 7.

Wind the cord on the film pulley one turn counter-clockwise, being sure that the end coming from the pulley passes over the cord from the drive drum.

Bring the cord over the brass tension pulley and back again to the left. Insert the end in the right slot in the drive drum.

Replace tension spring and reassemble projector compartment, glass screen and collars to the chassis.

Set the signal generator to 600 KC and carefully tune in the signal. Adjust the position of the film drum in accordance with the article "Dial Calibra- tion" in this manual until the 600 KC mark on the dial is at the red line on the screen. Do not touch the film with the fingers.

When the above adjustments have been made, carefully bend the lug on the film pulley down over the cord and solder, being sure that the upper cord leaving the pulley receives no solder.

Replacing Condenser Drive Cord

Remove the projector compartment and glass screen assembly together. To do this, take out the 2 screws (A) see Fig. 4, at the back of the top of the projector compartment, the 2 screws (E) at the bottom of the glass screen bracket and the 2 brass collars from the volume control and tone control shafts.

Turn the drive drum until it is in the position shown in Fig. 4.

Place the loop at the end of the drive cord (with- out the spring) over the small hook nearest the cut out part of the drive drum.

Now turn the chassis on its back. Bring the cord down over the right side (from front) of the drive drum and over the planetary drive pulley, keeping the cord in the groove provided for it. Bring the drive cord up over the left side (from front) of the drive drum to the cut out part of the drum. While holding the cord in place, return the chassis to normal position.

Then bring the cord in toward the inside of the drum, attaching the tension spring to the small hook provided for it.

Reassemble the projector compartment, glass screen and collars to the chassis.

Replacing the Color Filter Semaphore

Push the focusing lever up as far as it will go.

Cut a strip of paper the width of the film drum assembly and place this around the film holding it on with a string wound around the drum. This will protect the film from being scratched on the outside.

Remove the projector compartment shield by tak- ing out the three screws which hold it in place—See Fig. 2.

Remove the lens and light bracket by taking out screws (B and D) which hold it in place—See Fig. 4. Care must be taken not to scratch the inside of the film when removing this bracket.

Remove the horseshoe washer from the stud hold- ing the color filter semaphore in place. Then take off the color filter semaphore.

Take the spring off of the old assembly. Put this spring on the new assembly, the straight end of the spring being placed under the small clip provided for it on the color filter semaphore.

Now replace the color filter semaphore on the stud on which it mounts. Put on the horseshoe washer, pinching the open ends together. The free end of the spring should catch the edge of the lens and light bracket.

Next turn the color filter one complete turn in a counter-clockwise direction (from front) to provide tension on the spring.

Holding the semaphore in this position, replace the entire assembly with the semaphore stop placed under the film drum. (drum in second short wave or highest position). Care must be taken not to scratch the inside of the film when replacing the lens and light bracket assembly.

Now replace the projector compartment shield and remove the paper from around the film.

Turn the radio on and bring the letters on the screen into proper focus by means of the focusing lever—See Fig. 2. The effects of incorrect focusing are shown in Fig. 1.

Alignment, Notes

Phonograph Connections

Phonograph connections can be made as shown in Fig. 7. The parts required are shown in the parts list. Knowltons are provided in the back panel of the chassis for mounting the phono jack and phono switch. See Fig. 7.

The phono switch must be mounted with one set of terminals nearest the bottom of the chassis base. The connections are made by opening the diode return circuit at the volume control. Unsolder the .01 mfd. condenser C27 from the volume control.

Strip about 2 3/4 inches of the shielding from each end of the cable furnished with the phono attachment parts. Connect one lead of the cable to the terminal on the volume control from which condenser C27 was removed. The other end of this lead is connected to the phono switch as shown in Fig. 7. The second cable lead is connected to the open end of condenser C27. Then connect the other end of this lead to the phono switch as shown in Fig. 7. Both of the shielded cable leads connected to the phono switch are con-

nected to the switch terminals nearest the chassis base. Before connecting the cable leads to the phono switch, it will be necessary to slip a piece of varnished tubing over the portion of the cable that passes near the 6K7 1st I.F. tube socket.

Now ground the shielding by soldering it to the lugs on the chassis base. One of these lugs is located just below the planetary drive; the other is near the rear mounting foot of the gang condenser.

Complete the other connections as illustrated in Fig. 7. The lead between the tone control and the .05 mfd. tubular condenser C36 mounted on the back of the chassis base, should be covered with a piece of varnished tubing.

The tin plate shield is soldered to the tone control mounting bracket in such a way that when it is bent down toward the bottom and back of the chassis it will shield the lower leads of the phono switch and the lead between the tone control and tubular condenser C36.

After making the phono connections, the I.F. stages should be realigned.

Alignment and Calibration

Adjust the oscillator Range B trimmer (C18) until maximum output is obtained. The location of this trimmer is shown in Fig. 3.

1500 KC Adjustment

Set the signal generator for 1500 KC. Turn the rotor of the tuning condenser carefully until maximum output is obtained. Loosen the pointer set screw and set the large pointer at the 1500 KC mark on the standard wave band scale. Retighten the set screw.

Adjust the interstage Range B trimmer (C4) and antenna Range B trimmer (C1) to maximum. Do not change the setting of the oscillator Range B trimmer.

600 KC Adjustment

Set the signal generator for 600 KC. Turn the tuning condenser rotor until maximum output is obtained. Turn the rotor slowly back and forth, at the same time adjusting the 600 KC trimmer, until the peak of greatest intensity is obtained. See Fig. 3 for location of this trimmer.

Range C Alignment

CAUTION—When aligning the short wave bands be sure NOT to adjust at the image frequency. This can be checked as follows: Let us say the signal generator is set for 5000 KC. The signal will then be heard at 5000 KC on the dial of the radio. The image signal, which is much weaker, will be heard at 5000 less 912 KC, or 4088 KC. It may be necessary to increase the input signal to hear the image.

5800 KC Adjustment

Set the signal generator for 5800 KC. Connect the antenna lead of the receiver through a 400 ohm resistor to the output of the signal generator.

Adjust the oscillator Range B trimmer (C18) until maximum output is obtained. The location of this trimmer is shown in Fig. 3.

1500 KC Adjustment

Set the signal generator for 1500 KC. Turn the rotor of the tuning condenser carefully until maximum output is obtained. Loosen the pointer set screw and set the large pointer at the 1500 KC mark on the standard wave band scale. Retighten the set screw.

Adjust the interstage Range B trimmer (C4) and antenna Range B trimmer (C1) to maximum. Do not change the setting of the oscillator Range B trimmer.

600 KC Adjustment

Set the signal generator for 600 KC. Turn the tuning condenser rotor until maximum output is obtained. Turn the rotor slowly back and forth, at the same time adjusting the 600 KC trimmer, until the peak of greatest intensity is obtained. See Fig. 3 for location of this trimmer.

Range C Alignment

CAUTION—When aligning the short wave bands be sure NOT to adjust at the image frequency. This can be checked as follows: Let us say the signal generator is set for 5000 KC. The signal will then be heard at 5000 KC on the dial of the radio. The image signal, which is much weaker, will be heard at 5000 less 912 KC, or 4088 KC. It may be necessary to increase the input signal to hear the image.

5800 KC Adjustment

Set the signal generator for 5800 KC. Connect the antenna lead of the receiver through a 400 ohm resistor to the output of the signal generator.

The planetary assembly is the unit that is integral with the tuning shaft. It is at the bottom of the belt. If the nut of this assembly is too tight, the drive will be jerky and will turn hard in high speed. If this condition exists, back off this nut one or two turns and note the effect. If the nut is too loose, the drive will slip in slow speed. The remedy in this case is, of course, to tighten up the nut.

Should the drive belt slip when the planetary pulley is turning, first inspect the drive drum assembly. This is the assembly which is mounted on the tuning condenser shaft. If this assembly and the tuning condenser rotor turn satisfactorily, the belt is probably too loose and a new one will be required. In the sets with the flat belt type of drive, there is an idler pulley which can be positioned, and by means of which the belt tension can be increased. In this type, therefore, the belt tension should be increased before attempting to put on a new one.

The replacement parts list shows the parts used in each type of drive and the parts common to both types.

Switch Contact Location Numbering

A standard arrangement for switch contact location numbering has been adopted. This numbering is illustrated in Fig. 2. In contact locations not used, the number applying to that particular location is not employed.

Twenty-five Cycle Receivers

The twenty-five cycle receiver differs from the sixty cycle receiver only in the fact that a different power transformer is used. The correct power transformer is shown in the parts list.

The twenty-five cycle receiver can be operated satisfactorily from a sixty cycle power supply. However, the reverse is not true, the sixty cycle receiver cannot be operated from a twenty-five cycle power supply.

A 115-230 volt, 40 to 60 cycle as well as other power transformers with special power ratings are also available for this model.

Trimmer Replacement

If one trimmer of the gang trimmer strip should become defective, it is not necessary to replace the entire strip. A single trimmer P-17A36, as shown in the replacement parts list, may be used. Disconnect the lead from the coil side (side not grounded) of the defective trimmer in the strip. This connection is then made to the single trimmer. Connect it to the side of the trimmer not in contact with the adjusting screw. The other side of the single trimmer is then connected to a good ground, using a piece of heavy wire in order to support the trimmer adequately. In replacing a trimmer, be sure to keep both leads as short as possible and keep the ungrounded lead as far from ground as possible.

Voltage Chart

The voltage readings are taken with a voltmeter having a resistance of 1,000 ohms per volt. The standard metal tube socket terminal numbering system (bottom of socket) is shown in Fig. 3. On the schematic circuit diagram, Fig. 2 is a list giving the complete names of the tube elements and the corresponding symbols as used on the sockets on the schematic.

Turn the rotor of the tuning condenser to the full open position.

Turn the band selector to the Range C position (1st short wave band).

Adjust the oscillator Range C trimmer (C17) until maximum output is obtained. See Fig. 3 for location of this trimmer.

5000 KC Adjustment

Set the signal generator for 5000 KC. Turn the rotor of the tuning condenser carefully until maximum output is obtained.

Adjust the interstage Range C trimmer (C9) and antenna Range C trimmer (C3) to maximum.

1800 KC Adjustment

Set the signal generator for 1800 KC. Turn the tuning condenser rotor until maximum output is obtained.

Turn the rotor slowly back and forth, at the same time adjusting the 1800 KC trimmer, until the peak of greatest intensity is obtained. See Fig. 3 for location of this trimmer.

Range D Alignment

18,300 KC Adjustment

Set the signal generator for 18,300 KC.

Keep the antenna lead of the receiver connected through the 400 ohm resistor to the output of the signal generator.

Turn the rotor of the tuning condenser to the full open position.

Turn the band selector to the Range D position (2nd short wave band).

Adjust the oscillator Range D trimmer (C12) until maximum output is obtained. See Fig. 3 for location of this trimmer.

15,000 KC Adjustment

Set the signal generator for 15,000 KC.

Turn the rotor of the tuning condenser carefully until maximum output is obtained.

Adjust the interstage Range D trimmer (C8) and antenna Range D trimmer (C2) to maximum.

When adjusting the interstage Range D trimmer, it will be necessary at the same time to turn the tuning condenser rotor slowly back and forth until the peak of greatest intensity is obtained.

Do not change the setting of the oscillator Range D trimmer.

6000 KC Adjustment

Set the signal generator for 6000 KC.

Turn the tuning condenser rotor until maximum output is obtained.

Turn the rotor slowly back and forth at the same time adjusting the 6000 KC trimmer until the peak of greatest intensity is obtained. See Fig. 3 for location of this trimmer.

Drive Assembly

This model uses a two-speed planetary drive.

All of the early sets are equipped with a flat belt and may be identified by the 1/4 inch wide belt. The later sets use the same type of drive, but have a black cord belt. This is a bronze cable with a black fabric covering. It is about 1/8 inch in diameter.

The belt type also has an idler pulley which the cord type does not have.

MODEL 62-236

Alignment, Notes

MONTGOMERY-WARD & CO.

General Service Data

Roof Speaker

The Ford and General Motors 1936 automobiles have provision for mounting a speaker in the car roof (Ford 5 1/4 inch speaker, General Motors 5 1/4 or 8 inch speaker). This model is so designed that roof speaker installations in those cars can readily be made.

There are three general types of speaker installation. In the first type of installation the single 5 1/4 inch speaker attached to the chassis cover is used.

Control Head Mounting

This auto radio is supplied with a new type of control head known as the No. 4 Universal. This head in conjunction with suitable escutcheon plates and mounting brackets can be mounted in the instrument panel of practically all widely sold 1936 automobiles. In the case of 1935 and earlier cars, it can be mounted in the instrument panel, under the panel or on the steering column.

The escutcheon plate, dial crystal, special mounting brackets and knobs for the various cars are put up in kit form.

The control head, volume control fitting, flexible shafts, pilot lamp assembly, dial scale and pointer are packed with each radio.

In Fig. 6 are shown the various locations at which the control head is mounted. The head is intended for installation primarily in the instrument panel of the car. Most 1936 and many 1935 cars have a name plate or ash receiver on the instrument panel, the removal of which permits installation of the radio control head. Complete installation data is contained in the instruction booklet packed with each radio.

Alignment and Calibration

Adjust the R.F. interstage and antenna 1400 KC trimmers for maximum output.

Do not change the setting of the oscillator trimmer.

600 KC Adjustment

Set the signal generator for 600 KC.

Connect the output of the signal generator through a .05 mf. condenser to the control grid of the 6D6 R.F. tube.

Turn the tuning condenser rotor until maximum output is obtained. Then turn the tuning condenser rotor back and forth, at the same time adjusting the 600 KC padder (see Fig. 2) until the peak of greatest intensity is obtained.

Re-connect the output of the signal generator to the shielded antenna lead through a 150 mmf. condenser (1500 mmf. if antenna is high capacity).

Adjust the 600 KC antenna trimmer to maximum. This trimmer is reached from the outside of the case—see Fig. 3.

Adjusting Antenna 600 KC Trimmer

After the receiver is installed and the car antenna is connected, it will be necessary to adjust the antenna trimmer. Tune in a weak signal at approximately 600 KC with the volume control about three-fourths on. Turn the adjusting screw of the antenna 600 KC trimmer up or down until maximum output is obtained. See Fig. 3 for location of this trimmer.

Calibrating the Receiver

To calibrate the receiver, tune in a station of known frequency. At the back of the control head is the calibration screw. Remove the pilot lamp assembly. Insert a fine blade screwdriver and turn this screw until the pointer on the dial scale is at the frequency of the station being received. The knob must be held during this adjustment.

If the control head is inaccessible it may be calibrated by setting the pointer from the front. Remove the rotor by inserting a knife blade under the lower edge. Loosen the pointer screw, set the pointer and retighten.

Misalignment of condensers generally manifests itself as broad tuning and lack of volume at portions or all of the standard wave band. The receivers are all properly aligned at the factory with precision instruments and realignment should not be attempted unless all other possible causes of the faulty operation have first been investigated and unless the service technician has the proper equipment.

A signal generator that will provide accurately calibrated signals over the standard wave band and at the intermediate frequency, and an output meter are required for indicating the effect of adjustments.

Use a non-metallic screwdriver for the adjustments. The complete procedure is as follows:

I. F. Adjustment

Set the signal generator for a signal of 175 KC. Connect the output of the signal generator through a .05 mf. condenser to the rotor of the R. F. interstage section of the tuning condenser. (See Fig. 2 for location of this section.)

Connect the ground lead of the signal generator to the chassis ground.

Set the volume control at the maximum position. Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

Then adjust the three I.F. trimmers until maximum output is obtained. The location of these trimmers is shown in Fig. 2.

1575 KC Adjustment

Set the signal generator for 1575 KC.

Turn the rotor of the tuning condenser to the full open position.

If a low capacity antenna is used, connect the shielded antenna lead from the chassis through a 150 mmf. condenser to the antenna post of the signal generator. (If high capacity, use 1500 mmf.)

For this and all subsequent adjustments keep the volume control at the maximum position and attenuate the signal from the signal generator to prevent AVC action.

Adjust the trimmer of the oscillator section of the three gang condenser until maximum output is obtained—see Fig. 2 for location of this trimmer.

1400 KC Adjustment

Set the signal generator for 1400 KC.

Turn the rotor of the tuning condenser carefully until maximum output is obtained.

In the second type of installation, a single 5 1/4 inch or 8 inch roof speaker is used. The third type of installation is the dual speaker mounting using two 5 1/4 inch speakers, one in the car roof and the other on the chassis cover. (The 8 inch and 5 1/4 inch speakers cannot be used together).

The electrical connections of the different speaker installations are shown in the schematic—Fig. 1. Complete information regarding the method of making the installations and the kits of parts required are in the installation manual packed with each radio.

Installation and Noise Suppression

The necessary information for installing this receiver and for suppression of ignition and generator noise is contained in the Installation Manual which is packed with each receiver.

Be sure that the cover is well grounded to the chassis case—clean off paint or particles of dirt which may prevent a good ground.

Voltagages at Sockets

In the voltage chart are given the voltagages at the sockets with all tubes in and the set in operating condition. The antenna should be disconnected.

The voltagages can be read with the chassis in the case, by means of an analyzer plug.

If the chassis unit is taken out of the case, all of the socket terminals can easily be reached under the circuit

Circuit

fer. AVC voltage is applied to the control grid circuits of the 6D6 R.F. and I.F. tubes. The manual volume control varies the audio voltage applied to the grid of the 75 tube.

In the output stage a 41 tube is employed. A dynamic reproducer is used. Provision is made for a single roof speaker and dual speaker (chassis and roof) connections. The electrical connections for the different speaker installations are shown in the schematic. For the single 8 inch or dual 5 1/4 inch speakers, the tapped connection of the output transformer secondary is used.

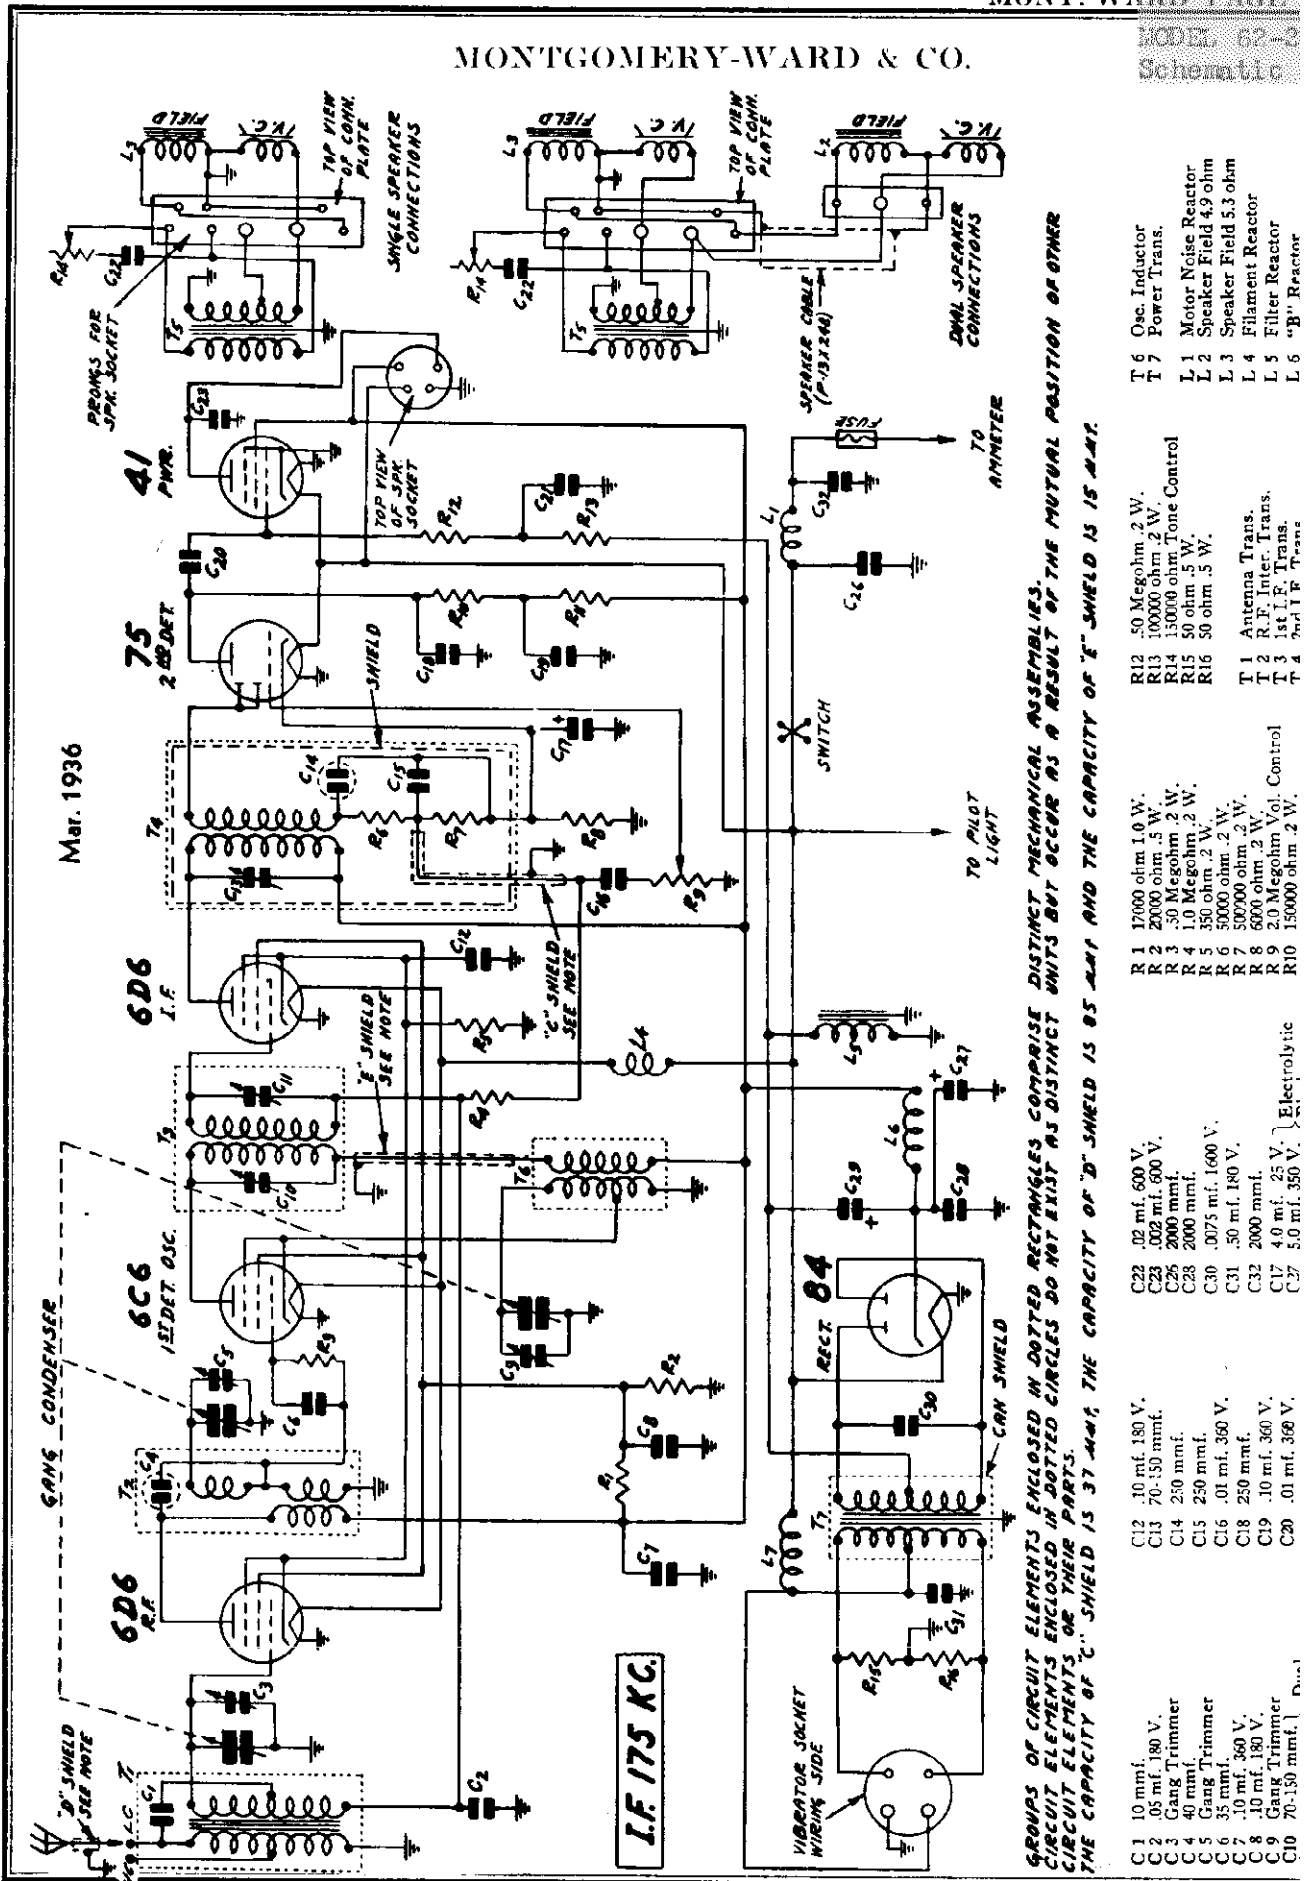

The vibrator in the power unit interrupts the current through the primary of the power transformer. The use of a vibrating interrupter in the primary circuit and a high ratio transformer results in the application of high voltage AC to the rectifier tube plates. The 84 full wave rectifier tube, filter choke and filter condensers convert this high voltage AC into high voltage DC for the plate and screen circuits.

This model is a 6 tube automobile radio covering the standard wave band. It has a tuning range as shown in the specifications above. The signal is fed through an antenna transformer with tuned secondary into a 6D6 tube which functions as an R.F. amplifier. A tapped connection is provided in the primary of the antenna transformer for installations in cars in which a high capacity antenna is used.

The output of the R.F. tube is fed through another R. F. transformer with tuned secondary into a 6C6 tube which functions as the first detector and oscillator. The oscillating circuit is tuned by the oscillator section of the gang condenser and is always resonant at a frequency 175 KC above the frequency to which the R.F. circuits are tuned.

One stage of I.F. amplification is employed using a 6D6 tube. The primary and secondary of the first I.F. transformer and the primary of the second I.F. transformer are tuned by small trimmer condensers. A 75 dual diode-triode tube functions as a diode 2nd detector, AVC tube and a one stage audio amplifier.

General Service Data

Installation and Noise Suppression

The necessary information for installing this receiver and for suppression of ignition and generator noise is contained in the Installation Manual which is packed with each receiver. Two additional items regarding reduction of noise can be mentioned as follows:

Be sure that the cover is well grounded to the chassis case—clean off paint or particles of dirt which may prevent a good ground.

In extreme cases of motor noise it is advisable to open the distributor rotor arm that is, increase the length of the arm by using a small machine's hammer. This will lessen the gap between the rotor arm and the stationary contacts, reducing the spark. Be sure, after peening the arm, that it does not strike the stationary contacts.

Voltagas at Sockets

In the voltage chart are given the voltages at the sockets with all fuses in and the set in operating condition. The antenna should be disconnected.

The voltages can be read with the chassis in the case, by means of an analyzer plug.

If the chassis unit is taken out of the case, all of the socket terminals can easily be reached under the chassis with test probe.

Control Head Mounting

This auto radio is supplied with a new type of control head known as the No. 4 Universal. This head in conjunction with suitable escutcheon plates and mounting brackets can be mounted in the instrument panel of practically all widely sold 1936 automobiles. In the case of 1935 and earlier cars, it can be mounted in the instrument panel under the panel or on the steering column.

The escutcheon plate, dial crystal, special mounting brackets and knobs for the various cars are put up in kit form.

The control head, volume control fitting, flexible shafts, pilot lamp assembly, dial scale and pointer are packed with each radio.

In Fig. 5 are shown the various locations at which the control head is mounted. The head is intended for installation primarily in the instrument panel of the car. Most 1936 and many 1935 cars have a name plate or ash receiver on the instrument panel, the removal of which permits installation of the radio control head. Complete installation data is contained in the instruction booklet packed with each radio.

Circuit

A 75 dual diode-tube functions as a diode 2nd detector, AVC tube and a one stage audio amplifier. AVC voltage is applied to the control grid circuit of the 6D6 R.F. and I.F. tubes. The manual volume control varies the audio voltage applied to the grid of the 75 tube.

In the output stage a 41 tube is employed. A dynamic reproducer is used.

The vibrator in the power unit interrupts the current through the primary of the power transformer. The use of a vibrating interrupter in the primary circuit and a high ratio transformer results in the application of high voltage AC to the rectifier tube plates. The 84 full wave rectifier tube, filter choke and filter condensers convert this high voltage AC into high voltage DC for the plate and screen circuits.

Alignment and Calibration

mmf. condenser to the antenna post of the signal generator. (If high capacity, use 1700 mmf.)

For this and all subsequent adjustments keep the volume control at the maximum position and attenuate the signal from the signal generator to prevent AVC action.

Adjust the trimmer of the oscillator section of the three gang condenser until maximum output is obtained—see Fig. 2 for location of this trimmer.

1400 KC Adjustment

Set the signal generator for 1400 KC. Turn the rotor of the tuning condenser carefully until maximum output is obtained.

Adjust the 1st detector and antenna trimmer for maximum output. Do not change the setting of the oscillator trimmer.

Adjusting Antenna Trimmer

After the receiver is installed and the car antenna is connected it will be necessary to adjust the antenna trimmer. Tune in a weak signal between 1200 and 1400 KC with the volume control about three-fourths on. Remove the cover of the chassis case. The antenna trimmer is on the center tuning condenser section—see Fig. 2. Turn the adjusting screw of this condenser up or down until maximum output is obtained. CAUTION—Do not turn any of the other trimmer adjusting screws for this adjustment.

Calibrating the Receiver

To calibrate the receiver, tune in a station of known frequency. At the back of the control head is the calibration screw. Remove the pilot lamp assembly. Insert a fine blade screwdriver and turn this screw until the pointer on the dial scale is at the frequency of the station being received. The knob must be held during this adjustment.

If the control head is inaccessible it may be calibrated by setting the pointer from the front. Remove the crystal by inserting a knife blade under the lower edge. Loosen the pointer screw, set the pointer and retighten.

This model is a 6 tube automobile receiver covering the standard wave band. It has a tuning range as shown in the specifications above. The signal is fed through an antenna transformer with tuned secondary into a 6D6 tube which functions as an R.F. amplifier. The output of this tube is fed through another R.F. transformer with tuned secondary into a 6C6 tube which functions as the first detector and oscillator. The oscillating circuit is tuned by the oscillator section of the gang condenser and is always resonant at a frequency 175 KC above the frequency to which the R.F. circuits are tuned.

One stage of I.F. amplification is employed using a 6D6 tube. The primary and secondary of the first I.F. transformer and the primary of the second I.F. transformer are tuned by small trimmer condensers.

Misalignment or mistuning of condensers generally manifests itself as broad tuning and lack of volume at portions or all of the standard wave band. The receivers are all properly aligned at the factory with precision instruments and realignment should not be attempted unless all other possible causes of the faulty operation have first been investigated and unless the service technician has the proper equipment.

A signal generator that will provide accurately calibrated signals over the standard wave band and at the intermediate frequency, and an output meter are required for indicating the effect of adjustments.

Use a non-metallic screwdriver for the adjustments. The complete procedure is as follows:

1. F. Adjustment

Set the signal generator for a signal of 175 KC. Connect the antenna lead of the signal generator thru a .05 mf. condenser to the stator of the 1st detector section of the tuning condenser. (See Fig. 2 for location of this section.) This can be done by pushing a wire or conductor between the stator plates or by extending an insulated wire thru the hole in the shield over the stator and pushing the wire thru the hole in the lug which extends up from the insulated stator assembly.

Connect the ground lead of the signal generator to the chassis ground. Short out the oscillator section of the tuning condenser.

Set the volume control at the maximum position. Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

Then adjust the three I.F. trimmers until maximum output is obtained. The location of these trimmers is shown in Fig. 2.

1650 KC Adjustment

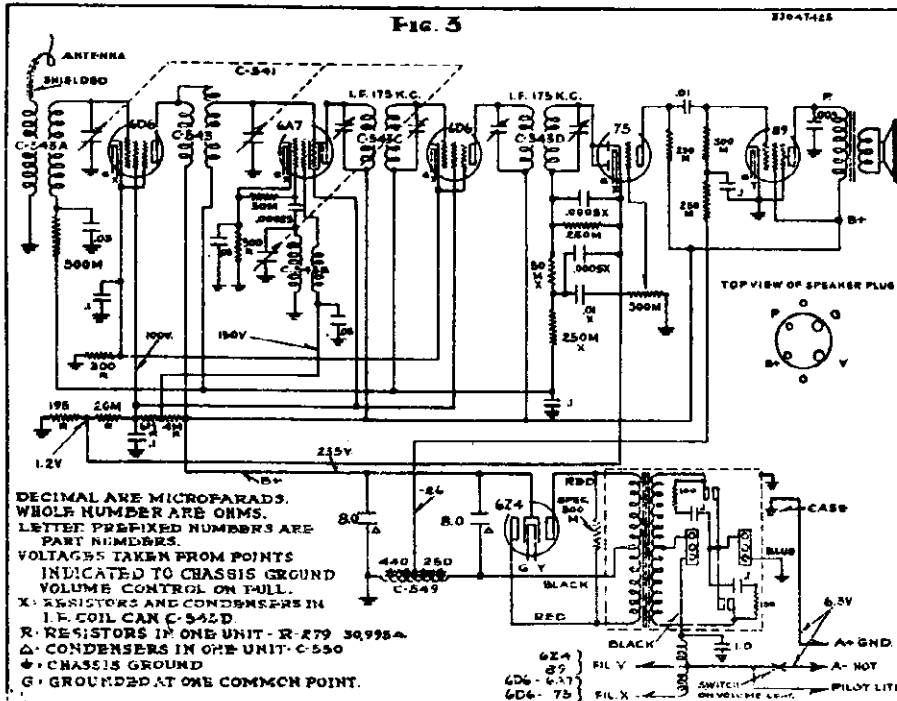

Set the signal generator for 1650 KC.

Turn the rotor of the tuning condenser to the full open position.

If a low capacity antenna is used connect the shielded antenna lead from the chassis through a 150

MONTGOMERY-WARD & CO.

Alignment
Circuit Data

Circuit

This model is a two band radio with a tuning range in each band as shown in the specifications above. Two band coverage is accomplished by means of two sets of R.F. and oscillator coils and a single section double throw switch.

Referring to the schematic circuit diagram, Fig. 2, T1 and T2 are the antenna transformer and oscillator coil assemblies. The standard wave and short wave coils are indicated by the letters B and D respectively.

The band switch completes connections to the coils in use. When it is in the Range B position, a double tuned antenna R.F. stage is used while for the D Range, a single tuned secondary is used. A type 6J7 tube functions as the 1st detector.

A separate type 6C5 tube is employed in the oscillator circuit. The oscillating circuit is always resonant at 456 KC above the frequency to which the R.F. amplifier is tuned.

The oscillator potential is fed into the cathode circuit of the 6J7 1st detector tube. As a result of the heating of the two frequencies, the intermediate or beat frequency of 456 KC is present in the plate circuit of this tube.

One stage of I.F. amplification is employed using a 6K7 tube. The primaries and secondaries of the first and second I.F. transformers are tuned by small trimmer condensers.

Referring to the 1st and 2nd I.F. transformers, T3 and T4, in Fig. 2, it will be noted that there is a coupling winding shown below the primary of T3 and below the secondary of T4.

When the selectivity control is in the sharp position, the coupling windings are open circuited and the loose coupling which exists between the primary and secondary of these transformers results in high selectivity.

When the selectivity control is in the broad position, the coupling winding which is wound under the primary in the case of T3 is connected in series with the secondary. In the case of T4, the coupling winding which is wound under the secondary is in series with the primary. This provides overcoupling which results in a greatly widened resonance curve. Passage of a wide range of audio frequencies is thus obtained.

A type 6Q7 duo-diode triode tube functions as the 2nd detector and a one stage amplifier. AVC voltage is applied through isolating resistors to the control grid circuits of the 1st detector and I.F. tubes. The audio voltage developed across volume control resistor R10 is applied through the movable arm to the control grid of the 6Q7 tube.

Resistance coupling is used between the first audio stage and the output stage which employs a type 6F6 output pentode tube. A type 1W4 full wave rectifier is used in the power unit.

The 6C5 tuning indicator tube is wired as shown in the schematic. The action of this tube is described in other service manuals as well as in current literature and will not be repeated here.

slowly back and forth until the peak of greatest intensity is obtained.

Do not change the setting of the oscillator Range D trimmer.

6000 KC Adjustment

Set the signal generator for 6000 KC.

Turn the tuning condenser rotor until maximum output is obtained.

Turn the rotor slowly back and forth at the same time adjusting the 6000 KC trimmer (C10) until the peak of greatest intensity is obtained. See Fig. 3 for location of this trimmer.

Trimmer Replacement

If one trimmer of the gang trimmer strip should become defective, it is not necessary to replace the entire strip. A single trimmer 17A36, as shown in the replacement parts list, may be used. Disconnect the lead from the coil side (side not grounded) of the defective trimmer in the strip. This connection is then made to the single trimmer. Connect it to the side of the trimmer not in contact with the adjusting screw.

The other side of the single trimmer is then connected to a good ground, using a piece of heavy wire in order to support the trimmer adequately. In replacing a trimmer, be sure to keep both leads as short as possible and keep the ungrounded lead as far from ground as possible.

Twenty-five Cycle Radios

The twenty-five cycle model differs from the sixty cycle model only in the fact that a different power transformer is used. The correct power transformer is shown in the parts list.

The twenty-five cycle receiver can be operated satisfactorily from a sixty cycle power supply. However, the reverse is not true, the sixty cycle receiver cannot be operated from a twenty-five cycle power supply.

A 115-230 volt, 40 to 60 cycle as well as other power transformers with special power ratings are also available for this model.

Fig. 1—Arrangement of Controls

Alignment and Calibration

Correct alignment is extremely important in connection with standard and short wave radios. The receivers are all properly aligned at the factory with precision instruments and re-alignment should not be attempted unless all other possible causes of the faulty operation have first been investigated and unless the service technician has the proper equipment.

A signal generator which will provide an accurately calibrated signal at 456, 1730, 1500, 600, 18,300, 15,000 and 6000 KC and an output indicating meter are required. It will be practically impossible to align the receiver if unsatisfactory apparatus is used.

Use a non-metallic screwdriver for the adjustments. The complete procedure is as follows:

I. F. Adjustment

Set the signal generator for a signal of 456 KC.

Connect the output of the signal generator through a .1 mf. condenser to the grid of the 1st detector.

Connect the ground lead of the radio to the ground post of the signal generator.

Turn the band switch to the Range B position (standard wave band).

Turn the selectivity control to the sharp position and keep it in this position for all adjustments.

Turn the volume control to the maximum position. Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

Then adjust the four I.F. trimmers until maximum output is obtained. The adjusting screws for these condensers are reached from the top of the chassis, and the location is shown in Fig. 3.

Range B Alignment

After the procedure for the alignment of each range, as explained below, is completed, it is advisable to repeat the procedure as a final check.

1730 KC Adjustment

Set the signal generator for 1730 KC.

Turn the rotor of the tuning condenser to the full open position.

Keep the band switch in the standard wave position.

Connect the antenna lead of the radio through a 200 mmf. condenser to the output of the signal generator.

For this and all subsequent adjustments keep the volume control at the maximum position and attenuate the signal from the signal generator to prevent AVC action.

Adjust the oscillator Range B trimmer (C13) until maximum output is obtained. The location of this trimmer is shown in Fig. 3.

1500 KC Adjustment

Set the signal generator for 1500 KC.

Turn the rotor of the tuning condenser carefully until maximum output is obtained.

Loosen the two screws inside of the film drum at the bottom which hold the drum in place. Set the drum at the 1500 KC mark and retighten the screws. Adjust the antenna Range B trimmers (C4) and (C5) to maximum.

Do not change the setting of the oscillator Range B trimmer.

Turn the band switch to the Range D position (short wave band).

Adjust the oscillator Range D trimmer (C9) until maximum output is obtained. See Fig. 3 for location of this trimmer.

15,000 KC Adjustment

Set the signal generator for 15,000 KC.

Turn the rotor of the tuning condenser carefully until maximum output is obtained.

Adjust the antenna Range D trimmer (C3) to maximum.

When adjusting this trimmer, it will be necessary at the same time to turn the tuning condenser rotor.

600 KC Adjustment

Set the signal generator for 600 KC.

Turn the tuning condenser rotor until maximum output is obtained.

Turn the rotor slowly back and forth at the same time adjusting the 600 KC trimmer (C17) until the peak of greatest intensity is obtained. See Fig. 3 for location of this trimmer.

Range D Alignment

CAUTION—When aligning the short wave band can be checked as follows: Let us say the signal generator is set for 15,000 KC. The signal will then be heard at 15,000 on the dial of the radio. The image signal, which is much weaker, will be heard at 15,000 less 912 KC, or 14,088 KC. It may be necessary to increase the input signal to hear the image.

18,300 KC Adjustment

Set the signal generator for 18,300 KC.

Connect the antenna lead of the receiver through a 400 ohm resistor to the output of the signal generator.

Turn the rotor of the tuning condenser to the full open position.

FOR ADDITIONAL DATA ON MOVIE DIAL, SEE INDEX

MONTGOMERY-WARD & CO. Movie Dial Adjustment and Replacement Data

Movie Dial Adjustments and Replacements

Issue Letter of Radio

The issue letter is the large letter appearing on the under side of the chassis which identifies the chassis as to major part changes. There are two distinct types of chassis known as Issue A and Issue B. The adjustments, as described in the following paragraphs, cover both issues unless otherwise specified.

A chassis bearing the issue letter "A" may be further identified by the die stamped Light and Projector Lens Bracket and the separate die stamped Condenser Lens and Aperture Bracket. See Fig. 9.

The chassis bearing the issue letter "B" may be further identified by a die cast combination Lens, Light and Aperture Bracket. See Fig. 10.

Bringing Lens Adjustment to a Focus

Important—Turn the band switch to the standard wave position.

Move the focusing lever (see Fig. 9) up or down until the image on the screen is clearest. In Fig. 7 is shown the effect of correct and incorrect focusing.

Replacing and Positioning the Dial Lamp

Caution—If a new lamp is required, use only a G. E. lamp, Ward's catalogue No. 61P8204. Get this from your nearest Ward store or Ward Mail Order House.

First, turn the radio off.

Loosen the thumb screw and lift the lamp socket assembly out of the light tube—see Fig. 9. This can be lifted vertically by grasping the insulated top of the assembly through which the wire runs.

Remove the old lamp from the socket and put in the new one.

Replace the lamp socket assembly in the light tube with the light tube embossing in the groove of the lamp socket assembly—see Fig. 9. Do not tighten the thumb screw yet.

Turn the radio on.

Then grasp the top of the lamp socket assembly and move it up or down until the image on the screen is clearest and the lines are horizontal. The effect of having the lamp assembly too high or low is shown in Fig. 8. Tighten the thumb screw.

Dial Calibration

The radio is properly calibrated if, when a station is correctly tuned in, the vertical red line on the screen crosses the call letters of that station. If the

compartment up and away from the chassis. Remove the screw from the bottom of the lens and light bracket and take out this bracket, being careful not to scratch the film.

Issue A—Remove the condenser lens bracket from the lens and light bracket—see Fig. 9. The lens can then be cleaned without removal, or it may be forced out of the tube with a wood block. After the lens has been cleaned, reinsert it in the lens tube until the end of the lens barrel is about $\frac{1}{8}$ inch inside the tube.

Issue B—Remove the aperture cap—see Fig. 10. Insert a fine blade screw driver into the slot and then push the condenser lens away from the light tube until it is possible to remove the lens. Clean the lens carefully. Replace the lens so that the lens barrel projects about $\frac{1}{32}$ inch beyond the lens tube. Replace the aperture cap so that the square notch of the aperture cap fits over the square rib as illustrated.

Removing Projector Lens—Remove the projector compartment and lens and light bracket as explained in the first paragraph of the article "Removing Condenser Lens."

The projector lens may then be removed by first unscrewing the focusing lever assembly (Issue A radios have focusing lever only). Then push the lens barrel out of the projector lens tube. Clean the lens carefully. Replace the lens barrel so that the threaded hole will coincide with the slot opening of the bracket. Replace the focusing lever assembly.

Reassembling—Replace the lens and light bracket taking care not to scratch the inside of the film.

Replace the projector compartment, glass screen and dial lamp assembly.

When replacing the glass screen, the glass is put on with the frosted side toward the inside of the assembly.

Refocus the projector lens.

Cleaning the Film and Glass Screen

As in the case of the lenses, it is very seldom necessary to clean the film or glass screen. If, however, the image on the screen is spotted or foggy, it may be necessary to clean these items as explained below.

Film—The film may be dusted with a camel hair brush or fine cloth. **CAUTION**—Extreme care must be taken not to scratch the film.

Glass Screen—If the screen should become dirty, the front may be cleaned by wiping with a clean, dry cloth. If the back of the screen becomes dirty, it should be cleaned with alcohol. Care should be taken not to get any alcohol on the red line at the front of the screen.

Replacing the Film Drum Assembly

Remove the lamp socket assembly from the light tube by lifting it out in accordance with instructions in "Replacing and Positioning the Dial Lamp."

Remove the glass screen, projector compartment and lens and light bracket as described in the article "Removing Condenser Lens."

Remove the film drum assembly by unscrewing the two small screws located inside the drum at the bottom.

Mount the new film drum assembly on the film drum supports leaving the paper around the film for protection, and insert the clamping plate within the film drum. The film drum and clamping plate should then be so placed that the small screws are in the center of the two slots.

Replace the lens and light bracket taking care not to scratch the inside of the film.

Replace the projector compartment, glass screen and dial lamp assembly.

Now remove the paper from the film, turn the radio on and calibrate the dial in accordance with the instructions in the article "Dial Calibration."

The film and mounting drum are sold as one assembly and cannot be ordered separately.

Replacing Rubber Friction Drive Pinion

Loosen the set screw on the brass bushing which holds the rubber pinion—see Fig. 11. Push out the small horseshoe washer on the tuning shaft in back and below the glass screen. Push the tuning shaft from the front until the brass bushing may be removed. Place the new rubber pinion over the brass bushing and replace the bushing on the tuning shaft. Tighten the set screw on the brass bushing after the bushing has been returned to its original position. Replace the horseshoe washer.

Replacing Friction Drive Drum

If it is ever necessary to replace the friction drive drum, be sure that the stop on the drum fits into the stop on the condenser before the gang rotor is either completely meshed or completely open (maximum or minimum position).

MODELS 62-310, 62-410

Battery Data

MONTGOMERY-WARD & CO.

Caution the customers not to turn the pointer up higher than necessary as it will burn out the tubes and run down the battery. Also tell them to turn the pointer back to the starting position when a new 3 volt "A" battery is installed.

2 Volt Storage Battery—When this type of battery is used, turn the voltage regulator pointer to the position on the scale marked "2 Volt storage battery", and leave it there at all times.

"A" Battery (Models without Voltage Regulator)
These models are designed for use with a 2 volt storage battery. Any other battery of higher voltage, if connected directly, will damage the tubes.

Air Cell "A" Battery—If this type of battery is used, a series resistor will be required to reduce the voltage to the proper level of 2 volts for the tube filaments.

Testing Batteries

If the receiver does not operate satisfactorily test the batteries under load. A high resistance meter is required for the "B" and "C" voltages. If any of the batteries are considerably below their rated voltage, new ones should be used. When the "B" batteries are replaced the "C" battery should also be replaced. The reason for this is that the "C" drain is such that the "C" battery is run down in about the same time as the "B" batteries.

Fig. 4—3 V. Dry "A" Battery Connections

Fig. 5—"A" Battery Voltage Regulator

Batteries Required

The batteries and voltages required are shown in Figs. 2 and 3. The "A" drain is .6 amperes at 2 volts while the "B" drain is discussed below.

"B" Battery Life

The majority of potential complaints on short "B" battery life can be prevented if proper instructions are given to the customer at the time the receiver is installed.

Class "B" amplification is used in the output stage and the "B" battery consumption will, therefore, depend upon the output volume. The "B" consumption will also depend, to some extent, upon the strength of the incoming signal as the latter affects the AVC voltage. When no signal is being received the "B" drain is 21 milliamperes. When the volume control is at maximum and with high output volume, the "B" drain can become 47 milliamperes. A milliammeter in the "B" line will quickly determine if the "B" drain is excessive or normal.

As the dial lamp is not turned on except when tuning in a station, it is easy to forget to turn the radio off. When this happens, the radio may be on as long as 24 hours or more. A continuous drain of this kind for a long period will shorten the life of the "B" batteries considerably. **Caution the customer regarding this.**

"C" Battery

Any special "C" battery may be used from which a 10½ volt connection can be obtained. It is connected as shown in Fig. 3.

"A" Battery (Models with Voltage Regulator)

Models equipped with the voltage regulator on the back panel of the chassis may use any type of "A" battery delivering from 2 to 3 volts.

3 Volt Dry "A" Battery—When this type of battery is used, turn the voltage regulator pointer (See Fig. 5) to the left as far as possible. The purpose of this regulator is to reduce the voltage of the 3 volt battery to the 2 volts required by the tubes. Keep this pointer turned to the left as far as possible. Advance it one-half mark when reception gets weak. This should be about once a week if the radio is used from two to three hours per day. If it is used from four to five hours a day, it will generally be necessary to turn the pointer up one mark a week.

Fig. 8—R. F. and Oscillator Coil Base Terminal Arrangement and D. C. Resistance of Windings

Voltagcs

Check the voltages at the sockets to see if correct values are being delivered to the tubes. The antenna and ground leads should be disconnected and the antenna and ground leads from the set connected together. The volume control should be turned to the right or maximum position.

All of the voltage readings as shown in the chart are read with a 1,000 ohm-per-volt meter. As high a range as possible should be used. In general, the higher the resistance of the meter, the more accurate the reading will be.

The voltage chart gives the voltages with all tubes in, the speaker connected and the set in operating condition. These voltages are typical of the sets but will vary slightly with variations in individual receivers, tubes, test equipment used and battery voltages.

Switch Contact Location Numbering

A standard arrangement for switch contact location numbering has been adopted. This numbering is illustrated in Fig. 2. In contact locations not used, the number applying to that particular location is not employed.

Trimmer Replacement

If one trimmer of the gang trimmer strip should become defective, it is not necessary to replace the entire strip. A single trimmer P17A36, as shown in the replacement parts list, may be used. Disconnect the lead from the coil side (side not grounded) of the defective trimmer in the strip. This connection is then made to the single trimmer. Connect it to the side of the trimmer not in contact with the adjusting screw. The other side of the single trimmer is then connected to a good ground, using a piece of heavy wire in order to support the trimmer adequately. In replacing a trimmer, be sure to keep both leads as short as possible and keep the ungrounded lead as far from ground as possible.

Planetary Drive Assembly

The planetary assembly is the unit that is integral with the tuning shaft.

If the nut on the back end of this assembly is too tight, the drive will be jerky and will turn hard in high speed. If this condition exists, back off this nut one or two turns and note the effect.

If this nut is too loose, the drive will slip in slow speed. The remedy in this case, of course, is to tighten the nut.

Should the condenser drive cord slip when the planetary pulley is turning, inspect the tuning condenser, drive drum and film drum to see if they are turning properly or if they are being obstructed in some way.

If the drive turns unevenly (rough, in spots), this may mean that the planetary assembly is defective or damaged internally and a new unit will be required.

Dial and Drive Assembly

Complete information regarding the movie dial and drive assembly will be found in the Movie Dial Manual No. 108.

1800 KC Adjustment

Set the signal generator for 1800 KC. Turn the tuning condenser rotor until maximum output is obtained.

Turn the rotor slowly back and forth, at the same time adjusting the 1800 KC trimmer, until the peak of greatest intensity is obtained. See Fig. 6 for location of this trimmer.

Range D Alignment

18,300 KC Adjustment

Set the signal generator for 18,300 KC.

Keep the antenna lead of the receiver connected through the 400 ohm resistor to the output of the signal generator.

Turn the rotor of the tuning condenser to the full open position.

Turn the band switch to the Range D position (second short wave band).

Adjust the oscillator Range D trimmer (C13) until maximum output is obtained. See Fig. 6 for location of this trimmer.

15,000 KC Adjustment

Set the signal generator for 15,000 KC.

Turn the rotor of the tuning condenser carefully until maximum output is obtained.

Adjust the interstage Range D trimmer (C9) and antenna Range D trimmer (C7) to maximum.

When adjusting the interstage and antenna Range D trimmers, it will be necessary at the same time to turn the tuning condenser rotor slowly back and forth until the peak of greatest intensity is obtained.

Do not change the setting of the oscillator Range D trimmer.

6000 KC Adjustment

Set the signal generator for 6000 KC.

Turn the tuning condenser rotor until maximum output is obtained.

Turn the rotor slowly back and forth, at the same time adjusting the 6000 KC trimmer, until the peak of greatest intensity is obtained. See Fig. 6 for location of this trimmer.

General Service Data

Tubes

The tubes used in this receiver are of the 2 volt series. All of them are of the filament or directly heated types. All of them have a 2 volt filament and should not be connected to a power supply not intended for this type of tube. Maximum filament voltage range is 1.8 to 2.0 volts. Operation of the tubes at under or over this value will be injurious to the tubes and may affect operation of the receiver.

Alignment and Calibration

Alignment Procedure

Correct alignment is extremely important in connection with all wave radios. The receivers are all properly aligned at the factory with precision instruments and realignment should not be attempted unless all other reasonable causes of the faulty operation have first been investigated and unless the service technician has the proper equipment.

A signal generator that will provide an accurately calibrated signal at 475, 1730, 1500, 5800, 5000, 1800, 18,300, 15,000 and 6000 KC and an output indicating meter are required. It will be practically impossible to align the receiver if unsatisfactory apparatus is used.

Use a non-metallic screwdriver for the adjustments. The complete procedure is as follows:

I. F. Adjustment

Set the signal generator for a signal of 456 KC.

Connect the output of the signal generator through a .1 mf. condenser to the grid of the 1st detector.

Connect the ground lead of the receiver to the ground post of the signal generator.

Turn the band switch to the Range B position (standard wave band).

Turn the selectivity control to the sharp position and keep it in this position for all adjustments.

Turn the volume control to the maximum position.

Attenuate the signal from the signal generator to prevent the leveling off action of the AVC.

Then adjust the five I.F. trimmers until maximum output is obtained. The adjusting screws for these condensers are reached from the top of the chassis and the location is shown in Fig. 6.

Range B Adjustment

After the procedure for the alignment of each range, as explained below, is completed, it is advisable to repeat the procedure as a final check.

1730 KC Adjustment

Set the signal generator for 1730 KC.

Turn the rotor of the tuning condenser to the full open position.

Keep the band switch in the standard wave position.

Connect the antenna lead of the receiver through a 200 mf. condenser to the output of the signal generator.

For this and all subsequent adjustments keep the volume control at the maximum position and attenuate the signal from the signal generator to prevent AVC action.

Adjust the oscillator Range B trimmer (C17) until maximum output is obtained. The location of this trimmer is shown in Fig. 6.

1500 KC Adjustment

Set the signal generator for 1500 KC. Turn the rotor of the tuning condenser carefully until maximum output is obtained.

Turn the calibration screw (under color filter) until the 1500 KC mark on the dial scale is at the vertical red line on the screen. If the film drum cannot be turned a sufficient amount by means of the calibration screw, loosen the 2 screws inside the drum which hold it in place. Adjust the position of the drum and tighten the screws. The early models do not have the calibration screw mentioned above. These models must be adjusted by loosening the drum screws.

Adjust the interstage Range B trimmer (C11) and antenna Range B trimmer (C4) to maximum.

Do not change the setting of the oscillator Range B trimmer.

600 KC Adjustment

Set the signal generator for 600 KC.

Turn the tuning condenser rotor until maximum output is obtained.

Turn the rotor slowly back and forth, at the same time adjusting the 600 KC trimmer, until the peak of greatest intensity is obtained. See Fig. 6 for location of this trimmer.

Range C Alignment

CAUTION—When aligning the short wave bands be sure NOT to adjust at the image frequency. This can be checked as follows: Let us say the signal generator is set for 5000 KC. The signal will then be heard at 5000 KC on the dial of the radio. The image signal, which is much weaker, will be heard at 5000 less 912 KC, or 4088 KC. It may be necessary to increase the input signal to hear the image.

5800 KC Adjustment

Set the signal generator for 5800 KC.

Connect the antenna lead of the receiver through a 400 ohm resistor to the output of the signal generator.

Turn the rotor of the tuning condenser to the full open position.

Turn the band switch to the Range C position (first short wave band).

Adjust the oscillator Range C trimmer (C15) until maximum output is obtained. See Fig. 6 for location of this trimmer.

5000 KC Adjustment

Set the signal generator for 5000 KC.

Turn the rotor of the tuning condenser carefully until maximum output is obtained.

Adjust the interstage Range C trimmer (C10) and antenna Range C trimmer (C3) to maximum. Do not change the setting of the oscillator Range C trimmer.

Schematic

Alignment and Calibration

Correct alignment is extremely important in connection with all wave radios. The receivers are all properly aligned at the factory with precision instruments and realignment should not be attempted unless all other possible causes of the faulty operation have first been investigated and unless the service technician has the proper equipment.

A signal generator that will provide an accurately calibrated signal at 416, 1730, 1950, 5000, 5000, 1800, 18,300, 19,000 and 6000 KC and an output indicating meter are required. It will be practically impossible to align the receiver if unsatisfactory apparatus is used.

Use a non-metallic screwdriver for the adjustments. The complete procedure is as follows:

I. F. Adjustment

Set the signal generator for a signal of 416 KC. Connect the output of the signal generator through a .1 mf. condenser to the grid of the 1st detector. Connect the ground lead of the receiver to the ground post of the signal generator.

Turn the band switch to the Range B position (standard wave band).

Turn the selectivity control to the sharp position and keep it in this position for all adjustments.

Turn the volume control to the maximum position. Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

Then adjust the five I.F. trimmers until maximum output is obtained. The adjusting screws for these condensers are reached from the top of the chassis and the location is shown in Fig. 3.

Range B Alignment

After the procedure for the alignment of each range, as explained below, is completed, it is advisable to repeat the procedure as a final check.

1730 KC Adjustment

Set the signal generator for 1730 KC. Turn the rotor of the tuning condenser to the full open position.

Keep the band switch in the standard wave position.

Connect the antenna lead of the receiver through a 200 mf. condenser to the output of the signal generator.

For this and all subsequent adjustments keep the volume control at the maximum position and attenuate the signal from the signal generator to prevent AVC action.

Adjust the oscillator Range B trimmer (C19) until maximum output is obtained. The location of this trimmer is shown in Fig. 3.

1500 KC Adjustment

Set the signal generator for 1500 KC. Turn the rotor of the tuning condenser carefully until maximum output is obtained.

Turn the calibration screw (under color filter) until the 1500 KC mark on the dial scale is at the vertical red line on the screen. If the film drum cannot be turned a sufficient amount by means of the calibration screw, loosen the 2 screws inside the drum which hold it in place. Adjust the position of the drum and tighten the screws. The early models do not have the calibration screw mentioned above. These models must be adjusted by loosening the drum screws.

Adjust the 1st and 2nd interstage Range B trimmer (C8 and C11) and antenna Range B trimmer (C1) to maximum.

Do not change the setting of the oscillator Range B trimmer.

600 KC Adjustment

Set the signal generator for 600 KC.

Turn the tuning condenser rotor until maximum output is obtained.

Turn the rotor slowly back and forth at the same time adjusting the 600 KC trimmer until the peak of greatest intensity is obtained. See Fig. 3 for location of this trimmer.

Range C Alignment

CAUTION—When aligning the short wave bands be sure NOT to adjust at the image frequency. This can be checked as follows: Let us say the signal generator is set for 4000 KC. The signal will then be heard at 5000 KC on the dial of the radio. The image signal, which is much weaker, will be heard at 5000 less 912 KC, or 4088 KC. It may be necessary to increase the input signal to hear the image.

5800 KC Adjustment

Set the signal generator for 5800 KC.

Connect the antenna lead of the receiver through a 400 ohm resistor to the output of the signal generator.

Turn the rotor of the tuning condenser to the full open position.

Turn the band switch to the Range C position (first short wave band).

Adjust the oscillator Range C trimmer (C18) until maximum output is obtained. See Fig. 3 for location of this trimmer.

5000 KC Adjustment

Set the signal generator for 5000 KC.

Turn the rotor of the tuning condenser carefully until maximum output is obtained.

Adjust the 1st and 2nd interstage Range C trimmers (C7 and C10) and antenna Range C trimmer (C2) to maximum.

Do not change the setting of the oscillator Range C trimmer.

1800 KC Adjustment

Set the signal generator for 1800 KC. Turn the tuning condenser rotor until maximum output is obtained.

Turn the rotor slowly back and forth at the same time adjusting the 1800 KC trimmer until the peak of greatest intensity is obtained. See Fig. 3 for location of this trimmer.

Range D Alignment

Set the signal generator for 18,300 KC.

Keep the antenna lead of the receiver connected through the 400 ohm resistor to the output of the signal generator.

Turn the rotor of the tuning condenser to the full open position.

Turn the band switch to the Range D position (second short wave band).

Adjust the oscillator Range D trimmer (C17) until maximum output is obtained. See Fig. 3 for location of this trimmer.

15,000 KC Adjustment

Set the signal generator for 15,000 KC.

Turn the rotor of the tuning condenser carefully until maximum output is obtained.

Adjust the 1st and 2nd interstage Range D trimmers (C6 and C9) and antenna Range D trimmer (C1) to maximum.

When adjusting the 2nd interstage Range D trimmer, it will be necessary at the same time to turn the tuning condenser rotor slowly back and forth until the peak of greatest intensity is obtained.

Do not change the setting of the oscillator Range D trimmer.

6000 KC Adjustment

Set the signal generator for 6000 KC.

Turn the tuning condenser rotor until maximum output is obtained.

Turn the rotor slowly back and forth at the same time adjusting the 6000 KC trimmer until the peak of greatest intensity is obtained. See Fig. 3 for location of this trimmer.

Trimmer Replacement

If one trimmer of the gang trimmer strip should become defective, it is not necessary to replace the entire strip. A single trimmer P-17A36, as shown in the replacement parts list, may be used. Disconnect the lead from the coil side (side not grounded) of the defective trimmer in the strip. This connection is then made to the single trimmer. Connect it to the side of the trimmer not in contact with the adjusting screw. The other side of the single trimmer is then connected to a good ground, using a piece of heavy wire in order to support the trimmer adequately. In replacing a trimmer, be sure to keep both leads as short as possible and keep the ungrounded lead as far from ground as possible.

Planetary Drive Assembly

The planetary assembly is the unit that is integral with the tuning shaft.

If the nut on the back end of this assembly is too tight, the drive will be jerky and will turn hard in high speed. If this condition exists, back off this nut one or two turns and note the effect.

If this nut is too loose, the drive will slip in slow speed. The remedy in this case, of course, is to tighten the nut.

Should the condenser drive cord slip, when the planetary pulley is turning, inspect the tuning condenser, drive drum and film drum to see if they are turning properly or if they are being obstructed in some way.

If the drive turns unevenly (rough, in spots), this may mean that the planetary assembly is defective or damaged internally and a new unit will be required.

Twenty-five Cycle Models

The twenty-five cycle receiver differs from the sixty cycle receiver only in the fact that a different power transformer is used. The correct power transformer is shown in the parts list.

The twenty-five cycle receiver can be operated satisfactorily from a sixty cycle power supply. However, the reverse is not true, the sixty cycle receiver cannot be operated from a twenty-five cycle power supply.

A 115-230 volt, 40 to 60 cycle as well as other power transformers with special power ratings are also available for this model.

Phonograph Connections

Phonograph connections can be made as shown in Fig. 7. The parts required are shown in the parts list.

Knockouts are provided in the back of the chassis for mounting the phono jack and phono switch.—See Fig. 8.

The phono switch should be mounted with one set of terminals nearest the bottom of the chassis base.

The connections are made by opening the diode return circuit at the volume control. This is done by removing the wire connecting condenser C42 to resistor R15, R19 and R22, at the terminal strip located near the back of the planetary drive. Cut this wire to correct length and solder it to the proper terminal on the phono switch.—See Fig. 7, keeping the wire close to the back of the chassis base.

A wire is then connected from the lug on the above mentioned terminal strip to which, C42 was connected, to the correct terminal on the phono switch.—See Fig. 7. This wire should be brought directly to the back of the chassis at a point close to the phono jack pin tip nearest the channel provided for a chassis mounting bolt, and then routed over to the switch. Complete the other connections as illustrated in Fig. 7.

It will be necessary to re-route the AC line cord away from the 6CS 1st audio grid lead by running it between the volume control and the filter choke and then straight back to the hole provided for it in the chassis base.

If a hum is heard when the phono pickup is touched, reverse the two pickup leads.

Adding 6N5 Tuning Eye Tube to 6 Volt "B" Batteryless Movie Dial Radios SERVICE MANUAL SUPPLEMENT

Models 62-273 and 62-283 differ from the earlier models 62-327, etc., only in the inclusion of a 6N5 cathode ray tuning eye tube. This service manual gives the tuning eye circuit and parts list and describes the changes necessary to convert the earlier models to the later by adding the tuning eye.

Installation of Tuning Eye in Early Models

Remove the chassis from the cabinet. Drill the necessary hole in the panel from the front of the cabinet to avoid splitting the veneer—See Fig. 1 for location of the hole. As shown in this illustration, the location of the hole depends upon whether the cabinet is a console or a table model. The location of the tuning eye bracket is shown in dotted lines in Fig. 1. This is attached to the back of the panel by means of two small wood screws.

The circuit connections are made in the following manner: Bring the cable from the 6N5 tube socket through the hole in the chassis base adjacent to the oscillator coil—See Fig. 3 in service manual No. 105 for location of the oscillator coil.

Remove the 3 megohm resistor R14 as shown in

Figs. 2 and 3. Solder the terminal strip to the chassis base at the point shown in Fig. 3. Connect resistors R19, R20 and R21 and the wires of the cable as shown schematically and pictorially in Figs. 2 and 3.

The brown lead of the cable, shown soldered to the chassis base, is the shorter of the two brown leads of the cable.

Do not remove any parts, except resistor R14, or any wires from the circuit. The connections to some terminals in Fig. 3 are not shown in order to simplify the illustration.

Alignment and Calibration

Alignment Procedure

Correct alignment is extremely important in connection with all wave receivers. The receivers are all properly aligned at the factory with precision instruments and re-alignment should not be attempted unless all other possible causes of the faulty operation have first been investigated and unless the service technician has the proper equipment.

A signal generator that will provide an accurately calibrated signal at 456, 1730, 1700, 600, 16,000, 15,000 and 6000 KC and an output indicating meter are required. It will be practically impossible to align the receiver if unsatisfactory apparatus is used.

Use a non-metallic screwdriver for the adjustments. The complete procedure is as follows:

I. F. Adjustment

Set the signal generator for a signal of 456 KC. Connect the output of the signal generator through a .1 mf. condenser to the grid of the 1st detector. Connect the ground lead of the radio to the ground post of the signal generator.

Turn the band switch to the Range B position (standard wave band).

Turn the volume control to the maximum position. Attenuate the signal from the signal generator to prevent the levelling-off action of the AVC.

Then adjust the four I.F. trimmers until maximum output is obtained. The adjusting screws for these condensers are reached from the top of the chassis, and the location is shown in Fig. 7.

Range B Alignment

After the procedure for the alignment of each range, as explained below, is completed, it is advisable to repeat the procedure as a final check.

1730 KC Adjustment

Set the signal generator for 1730 KC. Turn the rotor of the tuning condenser to the full open position.

Keep the band switch in the standard wave position.

Connect the antenna lead of the radio through a 200 mmf. condenser to the output of the signal generator.

For this and all subsequent adjustments keep the volume control at the maximum position and attenuate the signal from the signal generator to prevent AVC action.

Adjust the oscillator Range B trimmer (C8) until

maximum output is obtained. The location of this trimmer is shown in Fig. 7.

1500 KC Adjustment

Set the signal generator for 1500 KC.

Turn the rotor of the tuning condenser carefully until maximum output is obtained.

Loosen the pointer screw and set the pointer at the 1500 KC mark on the standard wave band scale. Retighten the screw.

Adjust the antenna Range B trimmer (C2) to maximum.

Do not change the setting of the oscillator Range B trimmer.

600 KC Adjustment

Set the signal generator for 600 KC.

Turn the tuning condenser rotor until maximum output is obtained.

Turn the rotor slowly back and forth at the same time adjusting the 600 KC trimmer (C9) until the peak of greatest intensity is obtained. See Fig. 7 for location of this trimmer.

Range D Alignment

CAUTION—When aligning the short wave band be sure NOT to adjust at the image frequency. This can be checked as follows: Let us say the signal generator is set for 15,000 KC. The signal will then be heard at 15,000 on the dial of the radio. The image signal, which is much weaker, will be heard at 15,000 less 912 KC, or 14,088 KC. It may be necessary to increase the input signal to hear the image.

Tubes

The tubes used in this receiver are of the 2 volt series. All of them are of the filament or directly heated types. All of them have a 2 volt filament and should not be connected to a power supply not intended for this type of tube. Maximum filament voltage range is 1.8 to 2.0 volts. Operation of the tubes at under or over this value will be injurious to the tubes and may affect operation of the receiver.

Voltages

Check the voltages at the sockets to see if correct values are being delivered to the tubes. The antenna and ground should be disconnected and the antenna

16,000 KC Adjustment

Set the signal generator for 16,000 KC. Connect the antenna lead of the radio through a 400 ohm resistor to the output of the signal generator.

Turn the rotor of the tuning condenser to the full open position.

Turn the band switch to the Range D position (short wave band).

Adjust the oscillator Range D trimmer (C7) until maximum output is obtained. See Fig. 7 for location of this trimmer.

15,000 KC Adjustment

Set the signal generator for 15,000 KC.

Turn the rotor of the tuning condenser carefully until maximum output is obtained.

Adjust the antenna Range D trimmer (C1) to maximum. When adjusting this trimmer, it will be necessary at the same time to turn the tuning condenser rotor slowly back and forth until the peak of greatest intensity is obtained.

Do not change the setting of the oscillator Range D trimmer.

6000 KC Adjustment

Set the signal generator for 6000 KC.

Turn the tuning condenser rotor until maximum output is obtained.

Turn the rotor slowly back and forth at the same time adjusting the 6000 KC (C6) trimmer until the peak of greatest intensity is obtained. See Fig. 7 for location of this trimmer.

General Service Data

and ground leads from the set connected together. The volume control should be turned to the right or maximum position.

All of the voltage readings as shown in the chart are read with a 1,000 ohm-per-volt meter. As high a range as possible should be used. In general, the higher the resistance of the meter, the more accurate the reading will be.

The voltage chart gives the voltages with all tubes in, the speaker connected and the set in operating condition. These voltages are typical of the sets but will vary slightly with variations in individual receivers, tubes, test equipment used and battery voltages.

MONTGOMERY-WARD & CO.

Battery Data
Drive Cord Replacements

BATTERIES REQUIRED

The batteries and voltages required are shown in Figs. 2 and 3. The "A" drain is .42 amperes at 2 volts while the "B" drain is discussed below.

"B" BATTERY LIFE

The majority of potential complaints on short "B" battery life can be prevented if proper instructions are given to the customer at the time the receiver is installed.

Class "B" amplification is used in the output stage and the "B" battery consumption will, therefore, depend upon the output volume. The "B" consumption will also depend, to some extent, upon the strength of the incoming signal as the latter affects the AVC voltage. When no signal is being received the "B" drain is 11.5 milliamperes. When the volume control is at maximum and with high output volume, the "B" drain can become 25.5 milliamperes. A milliammeter in the "B" line will quickly determine if the "B" drain is excessive or normal.

As the pilot lamp is not turned on except when tuning in a station, it is easy to forget to turn the radio off. When this happens, the radio may be on as long as 24 hours or more. A continuous drain of this kind for a long period will shorten the life of the "B" batteries considerably. Caution the customer regarding this.

"C" BATTERY

Any special "C" battery may be used from which a 6 volt connection can be obtained. It is connected as shown in Fig. 3.

If standard 4 1/2 Volt "C" batteries are used, connect them as shown in Fig. 4.

"A" BATTERY (MODELS WITH VOLTAGE REGULATOR)

Models equipped with the voltage regulator on the back panel of the chassis may use any type of "A" battery delivering from 2 to 5 volts.

3 Volt Dry "A" Battery - When this type of battery is used, turn the voltage regulator pointer (See Fig. 6) to the left as far as possible. The purpose of this regulator is to reduce the voltage of the 3 volt battery to the 2 volts required by the tubes. Keep this pointer turned to the left as far as possible.

Advance it one-half mark when reception gets weak. This should be about once a week if the radio is used from two to three hours per day. If it is used from four to five hours a day, it will generally be necessary to turn the pointer up one mark a week.

Caution the customers not to turn the pointer up higher than necessary as it will burn out the tubes and run down the battery. Also tell them to turn the pointer back to the starting position when a new 3 volt "A" battery is installed.

2 Volt Storage Battery - When this type of battery is used, turn the voltage regulator pointer to the position on the scale marked "2 Volt storage battery", and leave it there at all times

"A" BATTERY

(MODELS WITHOUT VOLTAGE REGULATOR)

These models are designed for use with a 2 volt storage battery. Any other battery of higher voltage, if connected directly, will damage the tubes.

Air Cell "A" Battery - If this type of battery is used, a series resistor will be required to reduce the voltage to the proper level of 2 volts for the tube filaments.

TESTING BATTERIES

If the receiver does not operate satisfactorily test the batteries under load. A high resistance meter is required for the "B" and "C" voltages. If any of the batteries are considerably below their rated voltage, new ones should be used. When the "B" batteries are replaced the "C" batteries should also be replaced. The

reason for this is that the "C" drain is such that the "C" batteries are run down in about the same time as the "B" batteries.

REPLACING DRIVE CORD

Take off the station pointer by removing the screw at the center of the dial.

Remove the pilot lamp assembly by pulling the socket clip upward off the dial assembly.

Remove the dial assembly by removing the two screws which secure this assembly to the chassis. One screw is located on the drive assembly bracket; the other is on a bracket attached to the top of the gang condenser. The on-off indicator cord tension spring is removed from the small bracket at the upper left hand corner of the dial (from front).

Then lay the complete dial assembly face down in front of the chassis. Remove the on-off indicator disc from the pointer shaft. It is not necessary to remove the volume control collar which holds the indicator cord of this control in position.

Turn the drive drum until the opening in this drum is approximately vertical and with the hole at the top as shown in Fig. 10.

Remove the tension spring and the old drive cord.

See that the eyelet is in the hole in the drive drum as shown in Fig. 10. Insert one end of the new drive cord from the outside through this eyelet in the drive drum.

Tie the end of the cord which has been inserted through the eyelet to one end of the tension spring.

Wrap the cord in a counter clockwise direction (facing front of chassis) around the drive drum approximately one and one-quarter turns progressing toward the front.

Then tilt the chassis up on its back panel and bring the cord mentioned in the previous paragraph down to the drive shaft. Wrap this cord directly below the drive drum three and one-half turns around the drive shaft, as shown in Fig. 10, progressing toward the back of chassis.

Then bring this cord up to the drive drum and wrap it around the drum in back of cord already on the drum until it is up to the eyelet as shown in Fig. 10.

Now insert the free end of the cord through the hole in the eyelet and tie it to the end of the spring. The end of the spring when hanging free and with all slack removed from the drive cord should be 3/8" or less from the flange of the drum, as shown in Fig. 10. Cut off the surplus length of cord after it is tied to the spring.

Then secure the other end of the tension spring over the spur on the drive drum.

Turn the drive shaft back and forth several times.

Replace the dial assembly, pointer and pilot lamp assembly.

Fig. 1 - Arrangement of Controls

Resistance coupling is used between the 1st audio tube and the 2nd audio stage which employs a 30 stage which uses two type 30 tubes in a stage of class "B" amplification. A magnetic reproducer is used.

"C" voltages are obtained from the 6 volt "C" battery connection and from a potentiometer consisting of resistors R9, R10 and R11 connected between the 6 volt "C" connection and ground.

Models with the filament rheostat are connected as shown in Fig. 2. This rheostat permits the use of a 3 volt "A" battery. As shown in Fig. 2, there are two separate variable resistors one of which controls the filament voltage and the other the pilot lamp rheostat. In models which do not have the filament rheostat the "A" connection is made directly to the "A" line and the pilot lamp.

DIAL AND DRIVE ASSEMBLY

ing out the image frequencies on the standard wave band.

The oscillator potential on the oscillator control grid of this tube modulates the electron stream from the cathode in such a manner as to impress on it the oscillator frequency which is always 456 KC above the frequency to which the R.F. amplifier is tuned. The electron stream is also modulated at the signal frequency by the detector control grid. As a result of the beating of the two frequencies, the intermediate or beat frequency of 456 KC is present in the plate circuit of this tube.

One stage of I.F. amplification is employed using a 34 tube. The primaries and secondaries of the first and second I.F. transformers are tuned by small trimmer condensers.

A type 1B5 duo-diode triode tube functions as the second detector and a one stage audio amplifier. The two diode plates are connected together. AVC voltage is applied through isolating resistors to the control grid circuits of the 1st detector and I.F. tubes. The audio voltage developed across volume control resistor R5 is applied through the movable arm to the control grid of the 1B5 tube.

Circuit

This radio is designed to operate from a battery power supply the values of which are shown in Figs. 2 and 3. The tubes used are of the 2 volt type. The radio is designed to operate at a very low current drain from the batteries.

Two bands are covered with a tuning range in each band as shown in the specifications above. Two band coverage is accomplished by means of two sets of antenna and oscillator coils and a single section double throw switch.

Referring to the schematic circuit diagram, Fig. 2, T1 and T2 are the antenna transformer and oscillator coil assemblies and T3 is the image rejector coil assembly. The standard wave and short wave coils are indicated by the letters B and D respectively.

The band switch completes connections to the antenna transformer secondary and oscillator grid coil in use. It also disconnects the antenna transformer secondary and oscillator grid coil not in use.

The antenna transformer with tuned secondary feeds into a type 1C6 pentagrid converter tube which functions as the oscillator and 1st detector. The image rejector pickup coil which is connected to the antenna "B" range transformer, is effective in buck-

Table with multiple columns: Part No., Description, and Page. Includes sections for MISCELLANEOUS, RESISTORS, WIRE WOUND, VALUABLE, DIAL AND DRIVE ASSEMBLY, and DIAL AND DRIVE ASSEMBLY - Continued.

Servicing Power Unit
The power unit is that portion of the chassis assembly contained within the large rectangular shield and the circuit for which is shown within the shield lines at the lower right side of the schematic diagram, Fig. 2.

Resonance Check
The power transformer, choke coil circuits and condenser shorts may be checked by utilizing the vibrator socket terminals and various points on the "A" or "B" lines, without removal of the shield can. For example, when checking the continuity or resistance of the upper half of the transformer secondary, contact may be made with the test leads at the primary vibrator socket terminals. The positive terminal of the 20 mfd. electrolytic condenser, C24.

Removing Transformer and Vibrator Socket Assembly
Take off the unit shield can by removing the four screws in the right side of the chassis from the bolts at the top of the chassis. Unloosen the ground connections from the two lugs on the inside of the chassis base (right side from front). Uncover the black and white coded wire from the terminal strip by moving the front of the chassis. This terminal strip is mounted on the front of the chassis. Remove the bracket holding the terminal strip in the transformer cover.

Replacement of Buffer Condenser C24
This condenser is located in the top of the transformer and vibrator assembly just underneath the vibrator socket. To replace, remove the assembly as explained in the preceding article. In addition, the two screws holding the vibrator socket to the transformer cover assembly should be taken out. The condenser is then easily replaced with the tuning shaft.

Replacement of Tuning Condenser C25
This condenser is located in the top of the transformer and vibrator assembly just underneath the vibrator socket. To replace, remove the assembly as explained in the preceding article. In addition, the two screws holding the vibrator socket to the transformer cover assembly should be taken out. The condenser is then easily replaced with the tuning shaft.

Replacement of Power Transformer
Proceed with replacement of the power transformer as with any other necessary service or replacement and then reassemble.

Replacement of Tuning Condenser C25
This condenser is located in the top of the transformer and vibrator assembly just underneath the vibrator socket. To replace, remove the assembly as explained in the preceding article. In addition, the two screws holding the vibrator socket to the transformer cover assembly should be taken out. The condenser is then easily replaced with the tuning shaft.

Replacement of Power Transformer
Proceed with replacement of the power transformer as with any other necessary service or replacement and then reassemble.

1730 KC Adjustment
Set the signal generator for 1730 KC. Turn the rotor of the tuning condenser to the full open position. Keep the band switch in the standard wave position. Connect the antenna lead of the receiver through a 200 mfd. condenser to the output of the signal generator. For this and all subsequent adjustments keep the volume control at the maximum position and antenna AVC action.

18,400 KC Adjustment
Set the signal generator for 18,400 KC. Keep the antenna lead of the receiver connected through the 400 ohm resistor to the output of the signal generator. Turn the rotor of the tuning condenser to the full open position. Turn the band switch to the Range D position (400 ohm wave band). Adjust the oscillator Range D trimmer (C11) until maximum output is obtained. The location of this trimmer is shown in Fig. 3.

15,000 KC Adjustment
Set the signal generator for 15,000 KC. Turn the rotor of the tuning condenser carefully until maximum output is obtained. Adjust the oscillator Range D trimmer (C11) and antenna Range D trimmer (C2) to maximum. D trimmers, it will be necessary at the same time to turn the tuning condenser rotor slowly back and forth until the peak of greatest intensity is obtained. Do not change the setting of the oscillator Range D trimmer.

6800 KC Adjustment
Set the signal generator for 6800 KC. Turn the tuning condenser rotor until maximum output is obtained. Turn the oscillator Range D trimmer (C11) until maximum output is obtained. See Fig. 3 for location of this trimmer.

600 KC Adjustment
Set the signal generator for 600 KC. Turn the tuning condenser rotor until maximum output is obtained. Turn the oscillator Range B trimmer (C11) and antenna Range B trimmer (C2) to maximum. Adjust the oscillator Range B trimmer (C11) until maximum output is obtained. The location of this trimmer is shown in Fig. 3.

6000 KC Adjustment
Set the signal generator for 6000 KC. Turn the rotor of the tuning condenser carefully until maximum output is obtained. Adjust the oscillator Range C trimmer (C10) and antenna Range C trimmer (C3) to maximum. Do not change the setting of the oscillator Range C trimmer.

2400 KC Adjustment
Set the signal generator for 2400 KC. Turn the tuning condenser rotor until maximum output is obtained. Turn the oscillator Range C trimmer (C10) and antenna Range C trimmer (C3) to maximum. Do not change the setting of the oscillator Range C trimmer.

Range B Alignment
After the procedure for the alignment of each range, as explained below, is completed, it is advisable to repeat the procedure as a final check.

Range C Alignment
Connect the ground lead of the receiver to the ground post of the signal generator. Turn the band switch to the Range B position (standard wave band). Turn the volume control to the maximum position. Attract the signal from the signal generator to prevent the leveling-off action of the AVC. Then adjust the five I.F. trimmer screws until maximum output is obtained. The adjusting screws for these trimmers are located from the top of the chassis and the location is shown in Fig. 4.

Range D Alignment
Set the signal generator for 18,400 KC. Keep the antenna lead of the receiver connected through the 400 ohm resistor to the output of the signal generator. Turn the rotor of the tuning condenser to the full open position. Turn the band switch to the Range D position (400 ohm wave band). Adjust the oscillator Range D trimmer (C11) until maximum output is obtained. The location of this trimmer is shown in Fig. 3.

15,000 KC Adjustment
Set the signal generator for 15,000 KC. Turn the rotor of the tuning condenser carefully until maximum output is obtained. Adjust the oscillator Range D trimmer (C11) and antenna Range D trimmer (C2) to maximum. D trimmers, it will be necessary at the same time to turn the tuning condenser rotor slowly back and forth until the peak of greatest intensity is obtained. Do not change the setting of the oscillator Range D trimmer.

6800 KC Adjustment
Set the signal generator for 6800 KC. Turn the tuning condenser rotor until maximum output is obtained. Turn the oscillator Range D trimmer (C11) until maximum output is obtained. See Fig. 3 for location of this trimmer.

600 KC Adjustment
Set the signal generator for 600 KC. Turn the tuning condenser rotor until maximum output is obtained. Turn the oscillator Range B trimmer (C11) and antenna Range B trimmer (C2) to maximum. Adjust the oscillator Range B trimmer (C11) until maximum output is obtained. The location of this trimmer is shown in Fig. 3.

6000 KC Adjustment
Set the signal generator for 6000 KC. Turn the rotor of the tuning condenser carefully until maximum output is obtained. Adjust the oscillator Range C trimmer (C10) and antenna Range C trimmer (C3) to maximum. Do not change the setting of the oscillator Range C trimmer.

2400 KC Adjustment
Set the signal generator for 2400 KC. Turn the tuning condenser rotor until maximum output is obtained. Turn the oscillator Range C trimmer (C10) and antenna Range C trimmer (C3) to maximum. Do not change the setting of the oscillator Range C trimmer.

Range B Alignment
After the procedure for the alignment of each range, as explained below, is completed, it is advisable to repeat the procedure as a final check.

Trimmer Replacement
If one trimmer of the given trimmer set should become defective, it is possible to replace the trimmer with a new one. A single trimmer P17A26, as shown in the replacement parts list, may be used. Disconnect the lead from the coil side (do not ground) of the defective trimmer in the strip. This connection is then made to the single trimmer. Connect it to the side of the power transformer.

Condenser Replacement
If one condenser of the given condenser set should become defective, it is possible to replace the condenser with a new one. A single condenser P17A26, as shown in the replacement parts list, may be used. Disconnect the lead from the coil side (do not ground) of the defective condenser in the strip. This connection is then made to the single condenser. Connect it to the side of the power transformer.

Transformer and Coils
If one transformer or coil of the given transformer and coil set should become defective, it is possible to replace the transformer or coil with a new one. A single transformer and coil P17A26, as shown in the replacement parts list, may be used. Disconnect the lead from the coil side (do not ground) of the defective transformer or coil in the strip. This connection is then made to the single transformer or coil. Connect it to the side of the power transformer.

Power Transformer
If one power transformer of the given power transformer set should become defective, it is possible to replace the power transformer with a new one. A single power transformer P17A26, as shown in the replacement parts list, may be used. Disconnect the lead from the coil side (do not ground) of the defective power transformer in the strip. This connection is then made to the single power transformer. Connect it to the side of the power transformer.

Vibrator
If one vibrator of the given vibrator set should become defective, it is possible to replace the vibrator with a new one. A single vibrator P17A26, as shown in the replacement parts list, may be used. Disconnect the lead from the coil side (do not ground) of the defective vibrator in the strip. This connection is then made to the single vibrator. Connect it to the side of the power transformer.

Power Transformer
If one power transformer of the given power transformer set should become defective, it is possible to replace the power transformer with a new one. A single power transformer P17A26, as shown in the replacement parts list, may be used. Disconnect the lead from the coil side (do not ground) of the defective power transformer in the strip. This connection is then made to the single power transformer. Connect it to the side of the power transformer.

Vibrator
If one vibrator of the given vibrator set should become defective, it is possible to replace the vibrator with a new one. A single vibrator P17A26, as shown in the replacement parts list, may be used. Disconnect the lead from the coil side (do not ground) of the defective vibrator in the strip. This connection is then made to the single vibrator. Connect it to the side of the power transformer.

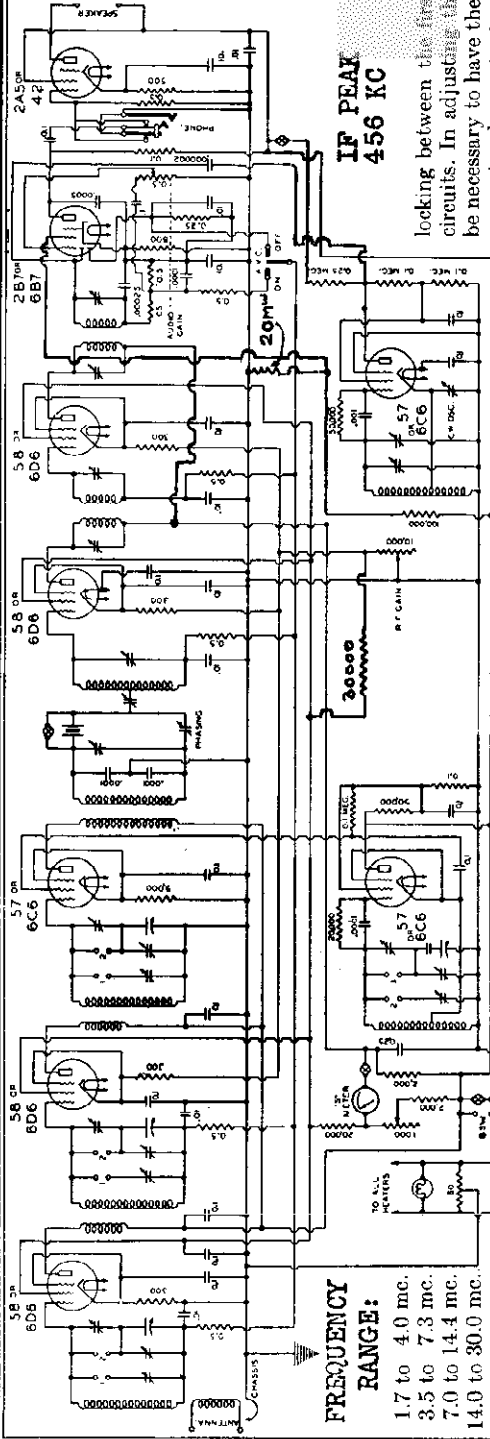

Power Transformer
If one power transformer of the given power transformer set should become defective, it is possible to replace the power transformer with a new one. A single power transformer P17A26, as shown in the replacement parts list, may be used. Disconnect the lead from the coil side (do not ground) of the defective power transformer in the strip. This connection is then made to the single power transformer. Connect it to the side of the power transformer.

locking between the first detector and oscillator circuits. In adjusting the No. 2 trimmer, it will be necessary to have the antenna connected with some signal or noise input.

Band-Spread Adjustment

The four screws must be shifted to the right-hand terminal blocks, as outlined under "Coil Ranges" in the preceding section. The tuning dial is set at 450 and a test oscillator adjusted to the exact high-frequency edge of the proper amateur band. Trimmer No. 7 (of the layout diagram) is adjusted until the signal is picked up. Trimmers Nos. 1, 3 and 5 are then adjusted for maximum sensitivity. The dial is then rotated to the low-frequency end of the band; that is, to 50, and the left-hand calibration curve should be checked. If found incorrect, it will be necessary to adjust the band-spread series padding condenser, mounted inside the oscillator coil and adjustable from the rear by means of a socket wrench. If the low-frequency end of the band is tuned in at any dial reading above 50, the capacity of this series padding condenser must be decreased.

Tracking of the two R. F. and first detector circuits may then be checked by tuning to the low-frequency end of the band and checking the adjustment of the Nos. 1, 8 and 5 trimmers. If more capacity is needed for best sensitivity (as indicated by improved signal strength when the trimmer is rotated clockwise), the series padding condenser of the coil being adjusted must have more capacity. If any of the Nos. 1, 3 or 5 trimmers require less capacity, a corresponding decrease must be made in the capacity of the series padding condenser. After the series padding condenser has been adjusted for trial, the dial is returned to 450 and the procedure repeated.

The coil panel screws must be in the left-hand terminal blocks to give the full coverage range.

The tuning dial is turned to approximately 490 and a frequency meter, or accurate test oscillator, is set to the frequency indicated by the general coverage calibration chart.

The oscillator coil trimmer, shown on the layout diagram of the receiver as No. 8, is then adjusted so that the dial reading checks the calibration curve. Trimmers Nos. 2, 4 and 6 are then adjusted for maximum sensitivity.

The ganging is checked by pressing the outside rotor plate of the oscillator condenser sideways toward the stator.

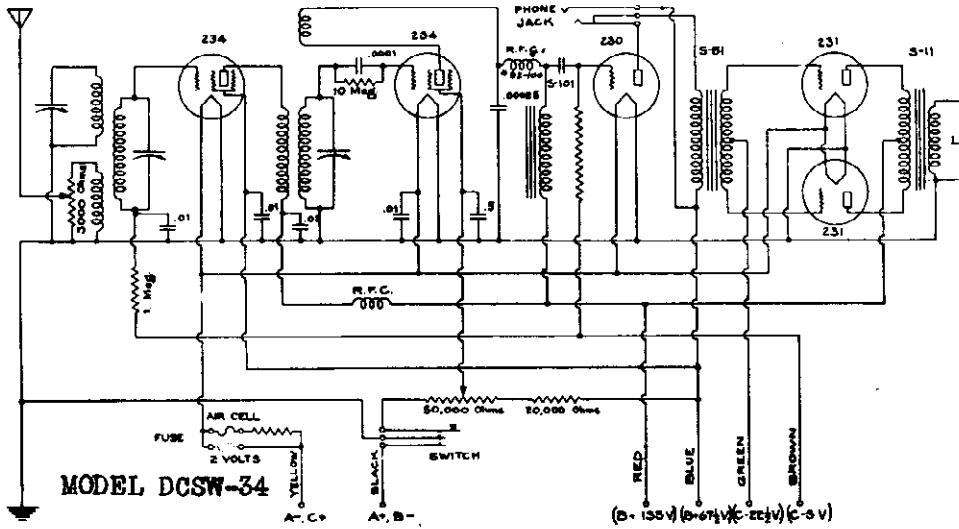

If sensitivity increases, the oscillator coil inductive trimmer must be adjusted to decrease inductance. In the case of the 14 to 30 megacycle coils, inductive trimming is accomplished by moving a loop of wire around the end of the oscillator coil. Bending this loop from right to left across the end of the coil form will increase inductance. After any change in the oscillator coil inductance has been made, it will be necessary to tune back to the high-frequency end of the range in order to readjust the No. 8 trimmer condenser.

In the case of the 14 to 30 megacycle coils, special care must be exercised to see that the oscillator is operating on the high-frequency side of the signal. Two points will be found when adjusting the No. 8 trimmer and of these, the correct one is on the counter-clockwise side. Furthermore, in adjusting the No. 6 trimmer of this coil assembly, there will be some interaction or inter-

bers only, beginning with the number 60 and increasing with wavelength. The d-c coils may be identified by number — from 10 to 21 increasing with wavelength — and by the color strip molded into the top ring. The wavelength of the coils increases with the number of turns of wire.
 Coils can be had extending the wavelengths of the receivers as high as 2000 meters (see catalog page 19), and the coils forms are available for the home winding of special inductors.

Five sets of coils are furnished with each SW-58 and SW-34, two coils to a set, and covering wavelengths from 13.5 to 200 meters. One coil of each set is plugged into the r-f circuit (left hand coil socket) and one coil into the detector coil socket. The two coils of each set are identical, and the wave bands they cover are indicated on the chart on the cover of the receiver and in the catalog coil list.
 The coils for the a-c receiver are designated by num-

NATIONAL COMPANY, INC.

Preliminary Adjustments — The I.F.

All the I.F. transformers are now adjusted for maximum signal. This adjustment need not be made with any great degree of precision, since the crystal will not oscillate at exactly the same frequency to which it will be resonant in the receiver. The Phasing control should be set at "0".

The I.F. adjustments are indicated on the layout diagram, page 4, Nos. 4 to 8 (inclusive).

The crystal filter output coupling condenser, adjustment No. 3, serves as a fixed I.F. gain

control and, in general, should not be touched.

The crystal may now be removed from the oscillator and installed in the receiver. Throw the switch to connect the crystal for single signal reception. Set the selectivity control for maximum selectivity; that is, with the pointer rotated all the way to the right. Now, tune in a steady signal from a local oscillator or monitor. Tuning very slowly across the carrier, there should be one point at which the signal will peak very sharply. The audio pitch of this peak will be nearly the same as the pitch of the beat used when the crystal oscillator was being picked up.

The final adjustment of the I.F. transformers may now be made. Set the control for maximum

selectivity, carefully tune in a steady signal until it is exactly on the crystal peak, and adjust each of the I.F. transformer tuning condensers for maximum signal strength. (In almost all cases where the I.F. amplifier has once been aligned to the crystal, this check is all that would be required, and it is not necessary to put the crystal in an external oscillator.) Even if the I.F. amplifier is considerably out of alignment, the crystal frequency may be found by employing a strong local signal from a monitor or frequency meter, slowly tuning across it while listening for a peak in the audio beat note. If the peak is found at a very high audio pitch it will be necessary to change the tuning of the beat oscillator so that the audio peak will be well inside the limits of audibility. It is probable that if the peak signal is found at all, the I.F. amplifier will not be far out of tune and the readjustments required will be small.

R.F. and H.F. Oscillator Alignment

Complete alignment of any one coil range is made as follows: Set the tuning dial near the high frequency end of the range between 470 and 490, check the dial reading against the calibration curve by means of an accurate test oscillator or a signal of known frequency; readjustment should be made if the dial reading is in error by more than five or six divisions. In checking the error, disregard the numbers between 495 and 500.

Correction for calibration is made by adjustment of the high frequency oscillator trimmer (nearest the front of the receiver).

With calibration correct at the high frequency end of the range, the dial should be rotated toward the lower numbers. The background noise may vary slightly over the range but should not get appreciably weaker except in the case of the .54 to 1.3 mc. coils. Ganging is checked by pressing one of the outside rotor plates of the oscillator condenser sideways toward the stator, but not enough to make the plates touch. The same check may be applied to the first detector and R.F. tuning condensers. Any bending of the rotor plates should make the background noise definitely weaker. A similar check can, of course, be made by bending the rotor plates out, away from the stator, care being taken not to bend the plates so far that they will not return to their original position.

On the two highest frequency ranges, it may be possible to make the initial oscillator adjustment incorrectly. There are two settings of the oscillator trimmer condenser which will tune in the desired signal at the proper point on the dial; of these, the higher frequency setting (least trimmer capacity) is correct. In checking the ganging of the 13.5 to 30. mc. range, the R.F. condenser has little effect upon the background noise at the low frequency end of the scale and at this one point it is better to use a test signal. Should any error in tracking be found on one range, it is probable that the same error will be present on all ranges and correction may be made by permanently bending the rotor plates of the tuning condenser section in question.

NOBLITT SPARKS INDUSTRIES

MODEL 19 Auto Schematic, Voltage Resistance, Parts

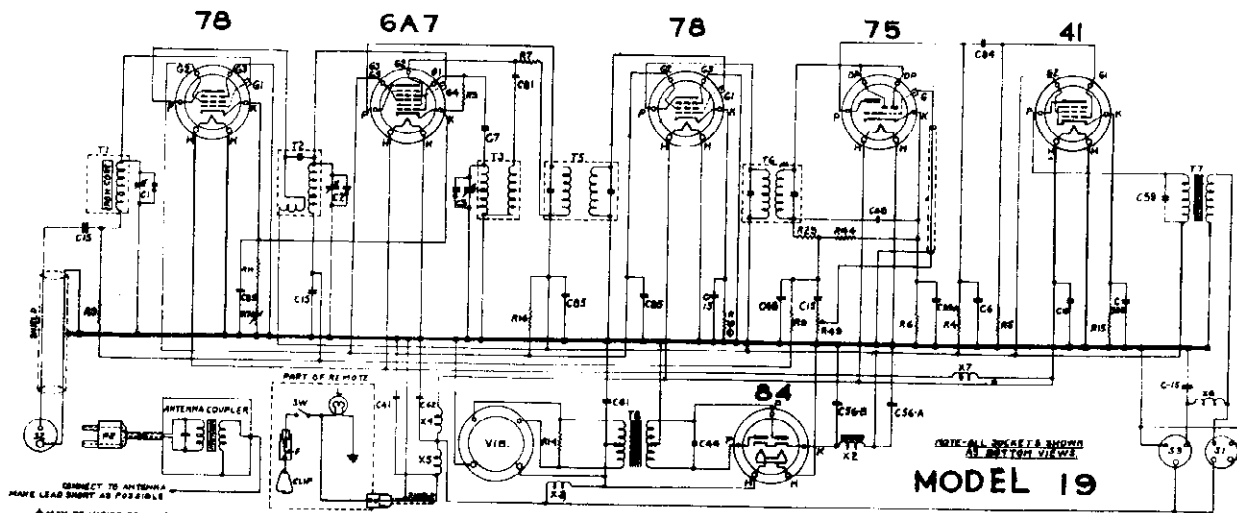

Table listing parts for the Model 19, categorized into Resistors, Capacitors, Coils & Transformers, and Miscellaneous Units. It includes columns for quantity, description, and part number.

MODEL 19 SOCKET VOLTAGES

Volts given here are actually for an input battery voltage of 5.8 amp., even though the normal heater voltage is shown as 6.3 amp.

Table of socket voltages for various tubes (78, 6A7, 75, 41, 84) across different electrodes: Heater, Cathode, Suppressor Grid, Screen Grid, Plate, Oscillator Grid, Anode Grid, and Diode Plates.

* Measured at 1500 K. C.
† Measured with Vacuum Tube Voltmeter.

POINT TO POINT RESISTANCES—MODEL 19

78—R. F. Amplifier

Resistance values for the 78 R.F. Amplifier: Heater (0), Cathode adj. max (1,000 Ω), Suppressor (0), Screen to +B (50,000 Ω), Plate to +B (100 Ω), Control Grid (1,255,000 Ω).

78—I. F. Amplifier

Resistance values for the 78 I.F. Amplifier: Heater (0), Cathode (See Diag.) (1,000 Ω), Suppressor (0), Screen to +B (50,000 Ω), Plate to +B (74 Ω), Control Grid (74 Ω).

41—Power Output

Resistance values for the 41 Power Output stage: Heater (0), Cathode (500 Ω), Control Grid (500,000 Ω), Screen to +B (0), Plate to +B (625 Ω).

6A7—1st Det. Oscillator

Resistance values for the 6A7 1st Det. Oscillator: Heater (0), Cathode adj. max (1,000 Ω), Osc. Grid (100,600 Ω), Anode Grid to +B (20,000 Ω), Screen Grid to +B (50,000 Ω), Plate to +B (74 Ω), Control Grid (1,155,000 Ω).

75—AVC Det; 1st Audio

Resistance values for the 75 AVC Det; 1st Audio stage: Heater (0), Cathode (5,000 Ω), Diode (205,000 Ω), Plate to +B (200,000 Ω), Control Grid, V. C. on (500,000 Ω), Control Grid, V. C. off (Max. 25 Ω).

84—Rectifier

Resistance values for the 84 Rectifier: Heater (0), Cathode to +B (140 Ω), Plate (250 Ω), Plate to Plate (520 Ω).

COIL AND TRANSFORMER RESISTANCES

Table of coil and transformer resistances: Phant. Filter Pri. (8.5 Ω), R. F. Coil Pri. (100.0 Ω), Osc. Coil Pri. (3.0 Ω), Osc. Coil Sec. (1.0 Ω), 1st I. F. Trans. Pri. (75.0 Ω), 2nd I. F. Trans. Pri. (75.0 Ω), Output Trans. Pri. (625.0 Ω), Output Trans. Sec. (.40 Ω), "B" Filter Choke (140.0 Ω), Power Trans. Pri. (.075-.075 Ω), Power Trans. Sec. (175.0-200.0 Ω).

BALANCING INSTRUCTIONS

1. Rotate tuning condenser to extreme left and check to see that pointer lines up with horizontal lines across dial face.
2. Connect Generator to antenna terminal thru 200 MMF condenser. Set dial and signal generator to 1400 KC. Set wave band switch to Broadcast position. Adjust padders 1 and 2 for maximum output.
3. Set dial and Generator to approximately 2400 KC. Set wave band switch to short wave position. Adjust padder No. 3 for maximum output.

BALANCING INSTRUCTIONS

Models 518, 518A, 568, and 568A uses the Permatune Intermediate frequency transformers. All intermediate frequency adjustments are therefore eliminated.

If a check of sensitivity of the I.F. circuits is desired simply connect the output of a signal generator through 200 MMF dummy antenna to the grid cap of the 6A7 tube. Rotate the volume control to full position. The sensitivity at 455 KC should be 200 microvolts minimum for 50 milliwatts at three ohms load across the output of the voice coil winding of the speaker transformer.

1. Connect the Generator to the red antenna wire on the rear of radio chassis Ground the outside shield of the generator output cable to the radio chassis.

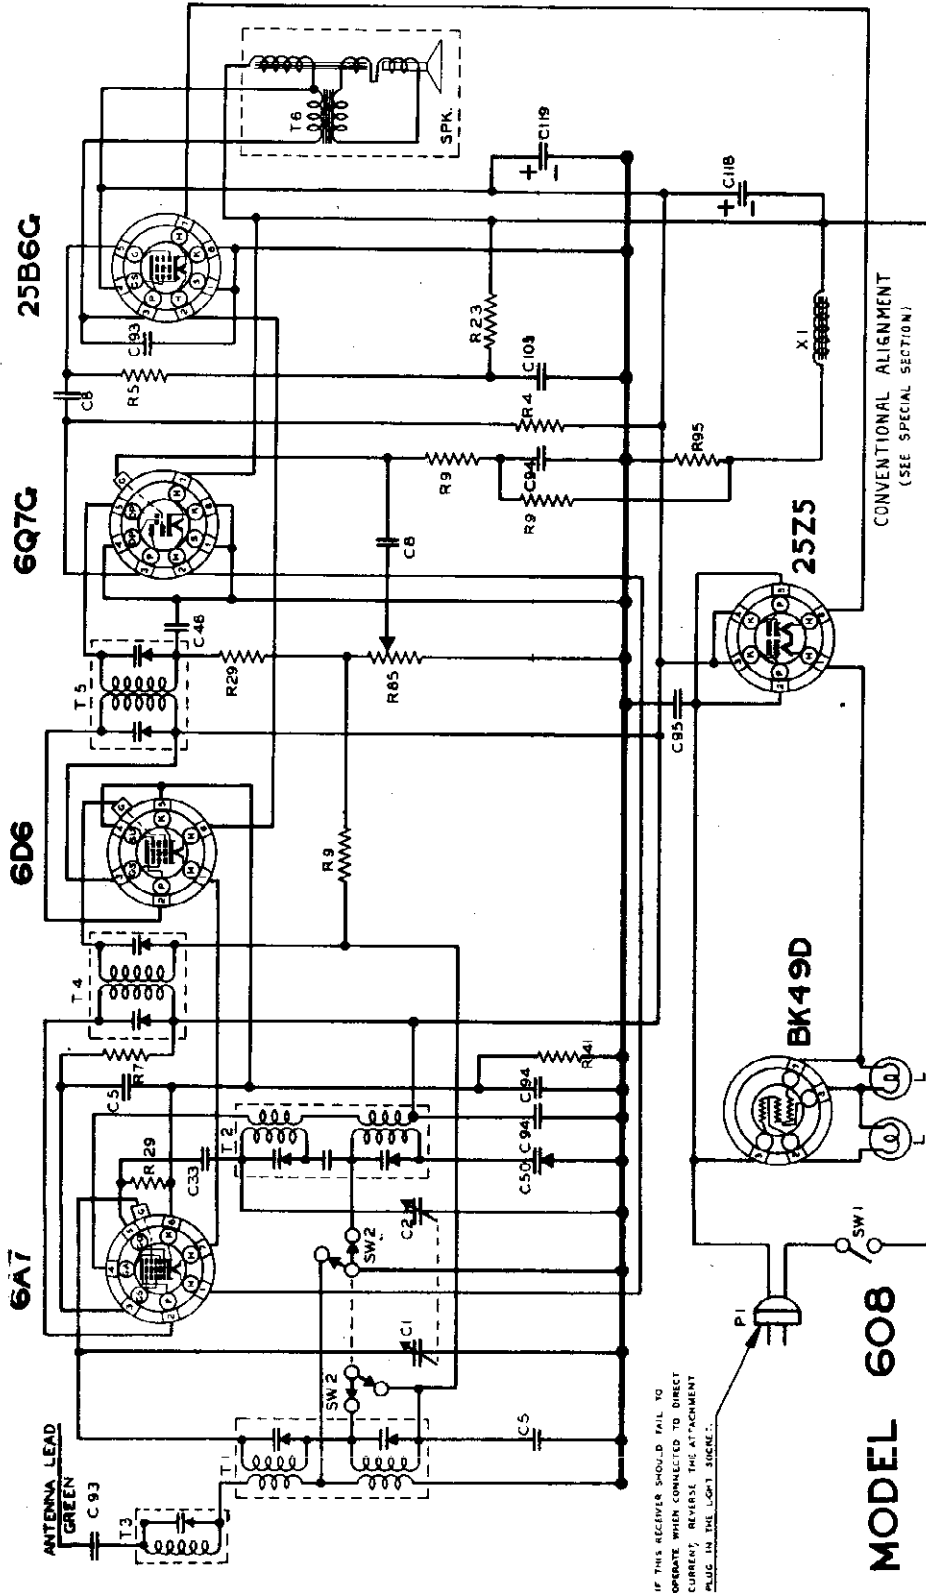

2. Rotate the tuning condenser entirely out of mesh and set dial pointer to 1650 KC. Adjust padder No.1 for maximum output with 1650 KC input from the signal generator.

3. Reset the balancing or signal generator to 1400 KC and retune the radio until the signal is received.

4. Adjust the padder No.2 for maximum output.

ALIGNMENT

Models 618, 618A, 628, 628CS, 638, and 638CS are designed to utilize the full efficiency of the Permatune Intermediate Frequency transformers. Therefore all IF adjustments are eliminated. If a check of sensitivity is desired, connect the output of a standard signal generator thru a 200 MUF antenna dummy to grid cap of the 6A8G tube. Rotate the volume control to maximum position. The sensitivity at 455 KC should be 100 Microvolts for 50 Milliwatts at 3 ohms load across the output of the voice coil winding of speaker transformer.

1.- Rotate tuning condenser completely out of mesh and check to see that dial pointer is parallel to horizontal dial stripes.

2.- Connect Generator to receiver with a standard 200 MUF dummy antenna and after setting the wave band switch to the Short wave position, tune dial to 15 MC, and Generator to same frequency.

3.- Adjust padder No.1 and then padder No.2 for maximum output.

4.- Reset band switch to broadcast band. Set dial to 1500 KC and Generator to same frequency. Adjust padders No.3 and 4 for maximum output.

5.- Retune radio set to 600 KC, reset generator to same frequency, adjust padder No.5 for maximum output. Leave radio tuned to 600 KC, change Generator to 455 KC and increase the output of Generator until signal is heard thru the speaker. Adjust padder No.6 for minimum output. Repeat adjustments.

Alignment, Trimmers Notes

PHILCO RADIO & TELEV. CORP.

socket provided in the dry "A" battery. This lamp acts as a voltage regulator and maintains a constant potential of two volts on the filament of the receiver tubes.

"BC" battery—Philco Part No. 41-8007 is used to supply B and C batteries. This battery contains a socket into which the receiver battery cable plug is inserted.

TYPE CIRCUIT: Superheterodyne; battery operated; with Class "B" output circuit; the Philco Automatic Aerial Tuning System, and built-in connection for the Philco High-Efficiency Aerial.

BATTERY REQUIRED: "A" Philco 172-R, storage battery or a dry "A" battery Philco Part No. 41-8011. If a dry "A" battery is used, a ballast lamp Philco type 1Z1 must be inserted in the

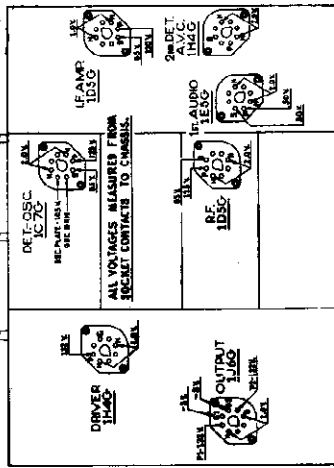

Fig. 1. Socket Voltages and R. F. Compensators

The voltages indicated by arrows were measured with a Philco 625 Circuit Tester which contains a voltmeter having a resistance of 1000 ohms per volt. Volume control is minimum; Range Switch in broadcast position; Storage Battery fully charged.

Aerial Connections

The red and black leads of the High Efficiency Aerial "transmission line" are connected to terminals 1 and 2 respectively, of the terminal panel provided on the rear of the chassis. Connect the jumper on the terminal panel across terminals 3 and 4.

If a temporary aerial is used, the jumper should be across terminals 2 and 3. The aerial connects to terminal 1 and the ground lead to terminal 3. A good ground connection is desirable in all installations.

Dial Calibration

In order to adjust this receiver correctly, the dial must be aligned to track properly with the tuning condenser. To do this rotate the tuning control to the extreme counter-clockwise position (maximum capacity). Loosen the set screw of the dial hub, then turn dial until the glowing indicator is centered on second index line of dial scale (see Fig. 2). Now tighten the dial hub set screw in this position.

Shadow Meter Adjustment

With receiver turned ON, remove aerial lead and adjust the shadow meter as follows:

1. Move the shadow meter coil backwards and forwards, until the opposite edges of the shadow are 1/4 of an inch from each end of the shadow screen, measuring along the bottom edge of the screen. Adjustment of the shadow meter light bracket may be necessary for perfect centering.
2. Remove the "B" Battery plug from its socket and rotate coil until shadow reaches minimum width. This width must not exceed 3/8 of an inch.
3. Replace the "B" Battery plug in its socket. The shadow should then widen until it is not more than 1/4 inch or less than 1/4 inch from each side of the screen, measuring along the bottom edge. If these limits are not obtained readjust the shadow meter as given in paragraphs 1 and 2 until they are obtained.

Alignment of Compensators

Tuning Range 7.5 to 11.6 M. C.

Range Switch	Receiver Dial	Compensators In Order
3	11.0 M. C.	(25) check image 10.06 M. C. on receiver
3	11.0 M. C.	(16), (6) use adjust on (25). Third lug from left side of R. F. Unit 6g.
		6. (See Note A)
		(31)

Tuning Range 6.7 to 7.4 M. C.

Range Switch	Receiver Dial	Compensators In Order
2	4.5 M. C.	(21B), (15A), (5A)
2	1.7 M. C.	(22C)
2	4.5 M. C.	(22B), (15A), (5A)

Tuning Range 800 to 1600 K. C.

Range Switch	Receiver Dial	Compensators In Order
1	1500 K. C.	(22), (15), (5)
1	500 K. C.	(22A) roll tuning condenser
1	1500 K. C.	(22)
1	1400 K. C.	(15), (5)

EQUIPMENT REQUIRED: (1) Signal Generator; Philco Model 086 (tuning range 110 to 11.6 M. C.). In correct instrument for this purpose; (2) output meter Philco Model 025, C. S. C. type, with 1000 ohm per volt meter and is recommended; (3) Fiberoptic screw driver (Philco Part No. 27-7009); (4) Special variable condenser (Philco Part No. 45-2433).

OUTPUT METER: The 025 Output Meter is connected between the plate and the 100 K. C. Driver tube and the chassis. Then adjust the meter to use the 40-80 volt scale.

INTERMEDIATE FREQUENCY CIRCUIT

- Set controls as follows:
- a. Range switch position one (broadcast)
 - b. Volume control maximum
 - c. Connect the 086 Signal Generator output lead through a .1 mfd. condenser to the control grid of the 1C7G tube, and the ground connection of the output lead to the chassis.
 - d. Receiver dial at 890 K. C.
 - e. Signal Generator 470 K. C.
 - f. Adjust compensators (24B), (34P), (33B), and (33P) for maximum output.

RADIO FREQUENCY CIRCUIT

- Tuning Range 11.5 to 16.2 M. C.**
1. Connect signal generator output lead with the .1 mfd. series condenser to terminal No. 1 and the ground lead to terminal No. 3. Terminals 2 and 3 must be connected with the shorting link provided on the aerial panel.
2. Adjust compensators as follows:

Range Switch	Receiver Dial	Compensators In Order
4	16.0 M. C.	(25A) check image at 17.06 M. C. on receiver dial (See Note B)
4	16.0 M. C.	(6A), (16A) use adjust condenser on 25A. First lug from left side of R. F. Unit 6g. (See Note A)
4	11.0 M. C.	(21B), (15A), (5A)
4	16.0 M. C.	(6A), (16A) use adjust condenser on 25A. First lug from left side of R. F. Unit 6g. 6. (See Note A)

NOTE "A":—To eliminate the effect of the Ant. and R. F. compensators decoupling the Osc. circuit, a variable tuning condenser, Philco Part No. 45-2333 is connected from the oscillator compensators to ground when designated in the padding instructions above. Turn the added condenser from the minimum capacity position to the maximum capacity position. The maximum capacity of the added condenser is indicated by the signal from the generator, resulting in a maximum indication on the output meter. Then adjust compensators as noted for maximum output.

NOTE "B":—To accurately adjust the compensator to the fundamental and not the image signal, turn the oscillator compensator to the maximum capacity position clockwise. Then slowly turn the compensator counter-clockwise until a second maximum peak is obtained on the output meter. The first peak in the image band is the maximum peak. The second peak is the fundamental. The procedure is correctly performed, the image signal will be found 940 K. C. below the frequency being used on any high frequency band.

MODEL 37-665

Voltage, Notes

Spkr. Wiring

PHILCO RADIO & TELEV. CORP.

Electrical Specifications

TYPE CIRCUIT:

Superheterodyne, with a High-Frequency tuning range; covering from 25 to 42 megacycles and a Push-Pull pentode audio output circuit.

POWER SUPPLY:

Voltage	Frequency	Power Consumption
115	50 to 60	130 watts
115	25 to 40	130 watts

Power transformers for the different voltage and frequency ratings are listed in the parts list.

Dial Calibration

In order to adjust this receiver correctly, the dial must be aligned to track properly with the tuning condenser. To do this rotate the tuning control to the extreme counter-clockwise position (maximum capacity). Loosen the set screw of the dial hub, then turn dial until the glowing indicator is centered on the middle index line of dial scale (see Fig. 5). Now tighten the dial hub set screw in this position.

Aerial Connections

To obtain the full advantage of the sensitivity of this receiver the Philco High Efficiency Aerial supplied with the receiver must be used. The connections for the aerial are as follows:

The red and black leads of the High-Efficiency Aerial "transmission line" are connected to terminals 1 and 2 respectively, of the terminal panel on the rear of the chassis. Connect the jumper on the terminal panel across terminals 3 and 4.

If a temporary aerial is used, the jumper should be across terminals 2 and 3. The aerial connects to terminal 1 and the ground lead to terminal 3. A good ground connection is desirable in all installations.

Shadow Meter Adjustment

Remove aerial and allow tubes to warm up. Then adjust shadow meter as follows:

1. Move the shadow meter coil backwards and forwards, until the opposite edges of the shadow are $\frac{1}{8}$ of an inch from end of the shadow screen, measuring along the bottom edge of the screen. Adjustment of the shadow meter light bracket may be necessary for perfect centering.

2. Remove the rectifier tube from its socket, and rotate coil until shadow reaches minimum width. This width must not exceed $\frac{1}{8}$ of an inch.

3. Replace the 5Y4G rectifier tube in its socket. The shadow should then widen to not more than $\frac{1}{4}$ of an inch or less than $\frac{1}{4}$ inch from each side of the screen measuring along the bottom edge. If these limits are not obtained readjust the shadow meter as given in paragraphs 1 and 2 until they are reached.

PHILCO TUBES USED: Nine.

Two 6K7G; two 6F6G; two 6J5G; one 6A8G; one 6K5G and one 5Y4G.

SPEAKERS: B Cabinet, K35. Part No. 36-1231.
X Cabinet, H26. Part No. 36-1238.

INTERMEDIATE FREQUENCY:

470 K. C.

TUNING RANGES: Four.

- Range 1—530 to 1720 K. C.
- Range 2—2.3 to 7.4 M. C.
- Range 3—7.35 to 22 M. C.
- Range 4—25 to 42 M. C.

UNDISTORTED OUTPUT: 7 watts.

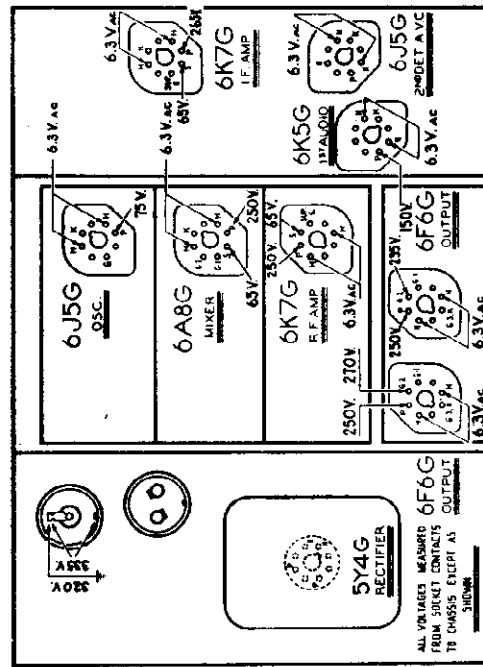

Fig. 1—Socket Voltages—Underside of Chassis View

The voltages indicated by arrows were measured with a Philco #25 Circuit Tester which contains a voltmeter having a resistance of 1000 ohms per volt. Volume Control at minimum, range switch in broadcast position, line voltage 115 A. C.

MODEL 37-665

Alignment
Trimmers

PHILCO RADIO & TELEV. CORP.

Fig. 5—Dial Calibration

Alignment of Compensators

- Equipment Required:** (1) Signal Generator; Philco Model 088 (fundamental frequency 110 to 20000 K. C.) is the correct instrument for this purpose; (2) output meter. Philco Model 025 Circuit Tester incorporates an accurate, sensitive output meter and is recommended; (3) Fibre handle screw-driver (Philco Part No. 27-7059); (4) Special variable condenser (Philco Part No. 45-2325).
- OUTPUT METER:** The 025 Output Meter is connected between the plate and cathode prongs of one of the 6F6G tubes. The meter is adjusted to use the (0-30) volt scale.
- Compensators in Order**
- (29B), (18), (4)
 - (29C) Roll gang
 - (29B)
 - (18), (4)

NOTE "A"—To accurately adjust the compensator to the fundamental and not the image signal, turn the oscillator compensator to the maximum capacity position clockwise. Then slowly turn the compensators counter-clockwise until a second maximum peak is obtained on the output meter. The first peak is the image signal and the receiver must not be adjusted to it. If the above procedure is correctly performed, the image signal will be found 940 K. C. below the frequency being used on any high frequency band.

NOTE "B"—To eliminate the effect of the Ant. and R. F. compensators detuning the Osc. circuit, a variable tuning condenser, Philco Part No. 43-2325 is connected from the oscillator compensators to ground when designated in the padding instruction above. Tune the added condenser from the minimum capacity position until the second harmonic of the receiver oscillator beats against the signal from the generator, resulting in a maximum indication on the output meter. Then adjust compensators as noted for maximum output.

Fig. 6—I. F. Compensators

EQUIPMENT REQUIRED: (1) Signal Generator; Philco Model 088 (fundamental frequency 110 to 20000 K. C.) is the correct instrument for this purpose; (2) output meter. Philco Model 025 Circuit Tester incorporates an accurate, sensitive output meter and is recommended; (3) Fibre handle screw-driver (Philco Part No. 27-7059); (4) Special variable condenser (Philco Part No. 45-2325).

OUTPUT METER: The 025 Output Meter is connected between the plate and cathode prongs of one of the 6F6G tubes. The meter is adjusted to use the (0-30) volt scale.

INTERMEDIATE FREQUENCY CIRCUIT

1. Set controls as follows:
 - a. Range switch position one (broadcast)
 - b. Receiver dial 580 K. C.
 - c. Volume control maximum
 - d. Signal generator 470 K. C.
 - e. Connect the 068 signal generator output lead through a .1 mfd. condenser to the control grid of the 6A8G tube and the generator ground connection to the chassis.
2. Adjust the following I. F. compensators for maximum output: (39P), (39S), (40P) and (40S).

RADIO FREQUENCY CIRCUIT

- Tuning Range (26 to 42 M. C.)**
1. Set controls as follows:
 - a. Range switch position 4
 - b. Connect the signal generator output lead and ground to terminals 1 and 3 respectively on the aerial input panel. Terminals 2 and 3 must be connected with the shorting link provided on the aerial panel.
 2. Adjust compensators as follows for maximum output:

Signal Generator	Receiver Dial	Compensators in Order
13 M. C.	39 M. C.	(23) Check image signal at 38.06 on the Receiver Dial. (See Note A)
13 M. C.	39 M. C.	(9) Roll gang (23A)
13 M. C.	26 M. C.	(9A)
13 M. C.	26 M. C.	(23) check image (Note A)
13 M. C.	39 M. C.	(9) Roll gang

- Tuning Range 7.35 to 22 M. C.**
1. Set controls and adjust compensators for maximum output as follows:

Signal Generator & Receiver Dials	Compensators in Order
18 M. C.	(23B) check image 17.06 M. C.
18 M. C.	(9B), (4B) use shunt condenser on (23B). See Note B
7.0 M. C.	(29), (18A), (4A)
2.35 M. C.	(29A)
7.0 M. C.	(29)
6.0 M. C.	(18A), (4A)
- Tuning Range 2.3 to 7.4 M. C.**
1. Range Switch Position 2
 2. Signal Generator & Receiver Dials

Signal Generator & Receiver Dials	Compensators in Order

Chassis Views

PHILCO RADIO & TELEV. CORP.

PHILCO RADIO & TELEV. CORP.

Electrical Specifications

TYPE CIRCUIT: Superheterodyne, with Magnetic Tuning; Fidelity-selectivity control in the intermediate frequency unit; 10 K. C. audio filter circuit; individual A.V.C. circuits for the R.F. and I.F. amplifiers; Automatic Bass Compensation circuit and Class "A" audio output circuit.

TUNING DIAL: Philco Automatic Dial Tuning Mechanism.

POWER SUPPLY:

Voltage	Frequency	Consumption
115	50 to 60 cycles	275 watts
115	25 to 40 cycles	285 watts

PHILCO TUBES USED: Twenty.

Five 6K7G; two 6B4G; four 6J5G; two 5X4G; one 6N7G; one 6B8G; one 6L7G; one 6H6G; one 6A8G; one 6R7G; one 6F6G.

TONE CONTROLS:

- A. Treble response adjustable by the Fidelity-selectivity control.
- B. Continuously variable Bass Response.

SPEAKERS: One W2 Cathedral High-fidelity Speaker.
Two—CB2 High Frequency Speakers.

Aerial Connections

To obtain the full advantage of the sensitivity of this receiver the Philco High Efficiency Aerial supplied with the receiver must be used. The connections for the aerial are as follows:

The red and black leads of the High-Efficiency Aerial "transmission line" are connected to terminals 1 and 2 respectively, of the terminal panel provided on the rear of the chassis. Connect the jumper on the terminal panel across terminals 3 and 4.

If a temporary aerial is used, the jumper should be across terminals 2 and 3. The aerial connects to terminal 1 and the ground lead to terminal 3. A good ground connection is desirable in all installations.

Removing Cabinet Top and Adjusting Door Hardware

Remove screws from under side of top frame (on some cabinets it will be necessary to loosen the high frequency speaker baffle to reach screws above them). The top is located by two dowels and will lift off after screws are removed.

To adjust doors after removing top, pull nails from washers, loosen nuts, move hardware in direction to align doors. Tighten nuts and drive nails through holes in washers after turning washers to provide new nail hole locations.

If doors are to be removed, lift loose pin out of hardware in top frame; tip door forward slightly and lift off of pin in bottom frame. For this operation it is also necessary to first remove the top.

CAUTION: The top frame (that section which bears the Philco trademark) should never be removed from the cabinet.

Do not glue top when replacing it on cabinet.

Dial Calibration

In order to adjust this receiver correctly the dial must be aligned to track properly with the tuning condenser. To do this proceed as follows:

1. Loosen the set screws on the shaft coupling of the tuning condenser. Then turn the tuning condenser until the plates are in the maximum capacity position. Now set the glowing beam indicator on the index line at the low frequency end of the broadcast band. With dial and tuning condenser in this position tighten set screws.
2. Turn the tuning condenser control until the indicator is on the first division from the index line.
3. With the dial in this position, loosen the shaft coupling set screws. Then turn the dial until the indicator is again on the index line. Tighten the set screws in this position.

NOTE: Be careful when turning the dial that the position of the tuning condenser is not disturbed.

INTERMEDIATE FREQUENCY: 470 K. C.
UNDISTORTED OUTPUT: 15 watts.

TUNING RANGES: Five.

- Range 1—530 to 1600 K. C.
- Range 2—1.58 to 4.75 M. C.
- Range 3—4.7 to 7.4 M. C.
- Range 4—7.35 to 11.6 M. C.
- Range 5—11.5 to 18.2 M. C.

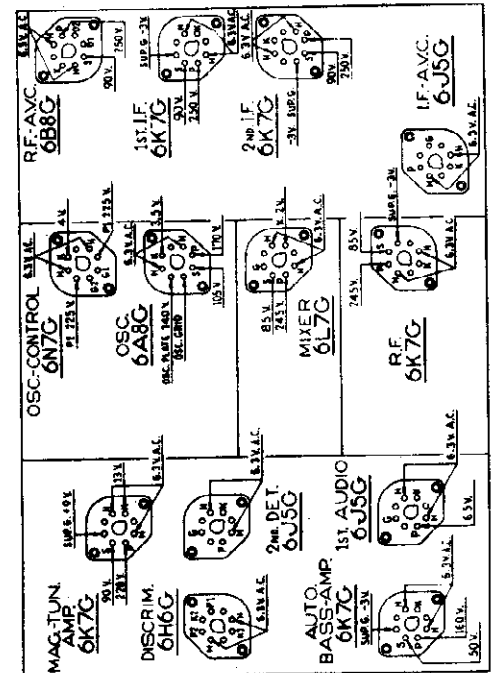

Fig. 1. Receiver Socket Voltage

Fig. 2. Power Amplifier Socket Voltage
The voltages indicated by arrows were measured with a Philco 828 Circuit Tester which contains a voltmeter having a resistance of 1000 ohms per volt. Volume Control at minimum, range switch in broadcast position, line voltage 115 A. C.

PHILCO RADIO & TELEV. CORP.

Coil and Range Switch Connections

Hum Adjustment and Elimination

Adjust compensator (185) for minimum hum with volume control retarded.

If abnormal hum develops with bass compensation control at maximum, change the 6K7G bass amplifier tube. It also may be necessary to interchange the 6B4G output tubes for perfect balance.

MODEL 37-2620
Alignment, Trimmers
Voltage, Chassis

PHILCO RADIO & TELEV. CORP.

Electrical Specifications

Type of Circuit: Superheterodyne with Pentode Output.

Power Supply:	Voltage	Frequency	Power Consumption
	115	50 to 60	65 Watts
	115	25 to 40	65 Watts
	220	50 to 60	65 Watts

Power transformers for the different voltages and frequencies are listed on the Parts List.
Intermediate Frequency: 470 K. C.
Tuning Ranges: Three. Range 1—150 to 350 K. C.; Range 2—530 to 1720 K. C.; Range 3—5.7 to 18 M. C.

Philco Tubes Used: *Six. Two 6K7EG; one 6A8EG; one 6Q7EG; one 6F6EG; one 5Y4G.
Speakers: "B" Cabinet—S7; "J" Cabinet—HS; "CS" Cabinet—K38.

*NOTE—Receivers in the United States use tubes without the "E" designation.

1	Condenser .004 mfd. tubular	30-4185	\$0.25	48	Resistor (330,000 ohms, 1/2 watt)	33-433339	\$0.20		Mask	27-5273	\$0.20
2	Ant. Trans. (Range 1)	32-2218	.50	49	Resistor (490,000 ohms, 1/2 watt)	33-449339	.20		Mask Arm & Link Assembly	31-1940	.15
3	Condenser (.01 mfd. tubular)	30-4169	.20	50	Condenser (.1 mfd. Bakelite)	4998-87	.35		Mask Washer	27-5318	.15
4	Ant. Transformer (Range 2)	32-2108	1.00	51	Resistor (1 megohm, 1/2 watt)	33-510339	.20		Mask Guide & Lamp Support Assy.	38-7844	.04
5	Compensator, Long Wave	31-6126	.40	52	Resistor (.015 mfd. tubular)	30-4358	.20		Mtg. Grommet (R. F. unit)	27-4317	.01
6	Compensator (Five sections)	31-6153	1.50	53	Condenser (.75 mmfd. mica)	30-1063	.20		Mtg. Sleeve (R. F. unit)	28-2257	.01
7	Resistor (10,000 ohms, 1/2 watt)	33-310339	.20	54	Volume Control	33-5158	1.00		Mtg. Screw (R. F. unit)	W-729	.45 C
8	Ant. Trans. (Range 3)	32-2150	1.20	55	Resistor (51,000 ohms, 1/2 watt)	33-351339	.20		Mtg. Washer (R. F. unit)	27-3927	.20
9	Ant. Trans. (Range 4)	32-2175	1.20	56	Condenser (.006 mfd. tubular)	30-4024	.25		Mtg. Washer (R. F. unit)	27-7907	.50 C
10	Condenser (.05 mfd. tubular)	30-4444	.20	57	Condenser (.03, .05 mfd. dual bakelite)	2616-YU	.40		Mtg. Bushing, Rubber (Chassis)	27-4360	.04
11	Resistor (51,000 ohms, 1/2 watt)	33-351339	.20	58	Resistor (1 megohm, 1/2 watt)	33-510339	.20		Mtg. Washer, Rubber (Chassis)	3556	.05
12	Condenser (.05 mfd. tubular)	30-4123	.20	59	Resistor (490,000 ohms, 1/2 watt)	33-449339	.20		Mtg. Washer, Rubber (Chassis)	28-2099	.50 C
13	Condenser (.05 mfd. tubular)	30-4444	.20	60	Condenser (.01 mfd. tubular)	30-4169	.20		Mtg. Bolt	W-783	2.20 C
14	Compensator, R. F. (Four sections)	31-6125	1.00	61	Resistor (3500 ohm, 1/2 watt)	33-255339	.20		Pilot Lamp Assembly	38-7706E	.35
15	R. F. Trans. (Range 4)	32-2176	1.20	62	Resistor (330,000 ohms, 1/2 watt)	33-433339	.20		Panel (Ant. & Ground)	38-7714	.15
16	R. F. Trans. (Range 3)	32-2151	.70	63	Condenser (.003 mfd. tubular)	30-4469	.20		Set Screw (Dial Drive)	W-1641	.02
17	R. F. Trans. (Range 2)	32-2165	1.00	64	Condenser (.003 mfd. tubular)	30-4469	.20		Sleeve Paper (Vol. Draft)	27-9897	
18	R. F. Trans. (Range 1)	32-2219	1.00	65	Output Trans.	32-7634	1.50		Socket (rectifier)	27-6052	.11
19	Compensator R. F. (Two sections)	31-6115	.50	66	Cone & Voice Coil, K 35	35-3174	1.00		Socket (7 prong)	27-6057	.11
20	Condenser (40 mmfd. mica)	30-1076	.20	67	Resistor (25,000 ohms, 1 watt)	33-325439	.20		Socket (8 prong)	27-6058	.11
21	Condenser (250 mmfd. mica)	30-1032	.25	68	Resistor (9000 ohms, 2 watts)	33-290639	.20		Shield (Shadowmeter Light)	28-2917	.02
22	Condenser (.1 mfd. tubular)	30-4455	.25	69	Resistor (10,000 ohms, 3 watts)	33-310639	.20		Shaft & Plate (range switch)	42-1237	.70
23	Condenser (.05 mfd. tubular)	30-4020	.20	70	Field Coil, K 35, H 26 Speakers	26-3887	4.00		Shaft (Volume control)	38-8060	.12
24	Osc. Trans. (Range 1)	32-2221	.50	71	Elect. Cond. (8 mfd.)	30-2024	1.10		Spring (Shadowmeter)	28-8623	.70 C
25	Compensator (Osc. two sections)	31-6074	.40	72	Elect. Cond. (20, 10 mfd.)	30-2163	2.40		Spring (Volume Shaft)	28-4117	.40 C
26	Condenser (35 mmfd. mica)	30-1044	.20	73	Bias Resistor (128 ohms, 1 tap)	33-3280	.30		Spring Thrust (Dial Drive)	28-8611	.01
27	Compensator (Osc. 6 sections)	31-6111	1.50	74	Pilot & Shadowmeter Lamps	34-2059	.15		Washer		
28	Osc. Trans. (Range 2)	32-2130	1.00	75	Power Trans. 115 volt (50 to 60 cycle)	32-7606	6.25		Washer "C" (Dial Drive)	28-3904	.01
29	Osc. Trans. (Range 3)	32-2152	.70	76	Power Trans. 115 volt (25 to 40 cycle)	32-7607	9.00		Washer, Thrust (Dial Drive)	28-3916	.30 C
30	Condenser (3000 mmfd. mica)	30-1028	.45	77	Power Trans. 110/220 volt (50 to 60 cycle)	32-7608	8.00		Washer, Felt (Range switch coupling)	27-8399	1.25
31	Resistor (32,000 ohm, 1/2 watt)	33-323339	.20								
32	Osc. Trans. (Range 4)	32-2182	.70								
33	Condenser (250 mmfd. mica)	30-1032	.25	78	Socket (line voltage socket)						
34	Resistor (10,000 ohms, 1/2 watt)	33-310339	.20	79	Power Switch & Tone Control	42-1184	.75				
35	Tuning Condenser	31-1957	5.00	80	Condenser (.015 mfd. Dual Bakelite)	3793-DG	.40		X CABINET		
36	Elect. Cond. (16 mfd.)	30-2119	1.65	81	Range Switch Ant.	42-1202	1.50		Baffle & Silk	40-5976	.60
37	First I. F. Trans.	32-2170	2.20	82	Range Switch R. F.	42-1254	1.50		Baffle (wood)	16271	
38	Condenser (.1 mfd. tubular)	30-4170	.25						Bezel & Frame Assembly	40-5947	.80
39	2nd I. F. Trans.	32-2172	2.20						Bolt (Speaker)	W-1495	1.60 C
40	Condenser (110 mmfd. mica)	30-1031	.20						Bracket (Bezel)	27-5313	.01
41	Condenser (110 mmfd. dual bakelite)	8093-DG	.25						Class (Bezel)	27-5300	.06
42	Resistor (240,000 ohms, 1/2 watt)	33-424339	.20						Ring (Bezel)	28-3988	.45
43	Resistor (240,000 ohms, 1/2 watt)	33-424339	.20						Speaker H 26	38-1238	8.25
44	Condenser (.01 mfd. tubular)	30-4479	.20						Shield (Chassis)	38-8276	.45
45	Phono Jack	42-1107	.60								
46	Resistor (1 megohm, 1/2 watt)	33-510339	.20						B CABINET		
47	Resistor (1 megohm, 1/2 watt)	33-510339	.20						Baffle & Silk	40-5975	.40
48	Condenser (.03 mfd. Bakelite)	8218-SU	.35						Bezel Assembly	40-5945	.70
49	Resistor (99,000 ohms, 1/2 watt)	33-399339	.20						Gasket (Bezel)	27-8312	.01
									Class (Bezel)	27-8299	.06
									Ring (Bezel)	28-3987	.40
									Speaker (K 35)	35-1231	7.25

Prices Subject to Change Without Notice

EQUIPMENT REQUIRED: (1) Signal Generator; Philco Model 088 (fundamental frequency 110 to 20,000 K. C.) is the correct instrument for this purpose; (2) Output Meter; Philco Model 025 Circuit Tester incorporates an accurate, sensitive output meter and is recommended; (3) Fibre handle screw-driver (Philco Part No. 27-7059); (4) Philco fibre wrench part No. 3164.

MODEL 37-2650

Alignment, Trimmers

PHILCO RADIO & TELEV. CORP.

DIAL CALIBRATION: In order to adjust the receiver correctly, the dial must be aligned to track properly with the tuning condenser. To do this, rotate the tuning condenser control to the extreme counter-clockwise position (maximum capacity). Set range switch in the long wave position. Loosen the screw of dial hub, then turn dial until the glowing indicator is centered on the middle index line of dial scale (See Fig. 7.) Now tighten the dial hub set screw in this position.

INTERMEDIATE FREQUENCY CIRCUIT

1. Set controls as follows:
 - a. Range switch position 2 (Broadcast).
 - b. Receiver Dial at 580 K.C.
 - c. Adjust signal generator for 470 K. C.
 - d. Connect the 088 signal generator output lead through a .1 mfd. condenser to the control grid of the 6A8EG tube and the ground connection to the chassis.
2. Adjust the following I. F. compensators for maximum output: (36P), (36S), (38P), and (38S).

RADIO FREQUENCY CIRCUIT

Tuning Range 11.5 to 18.2 M. C.

1. Connect the signal generator output lead through .1 mfd. condenser to terminal No. 1 and the generator ground lead to terminal No. 3 on aerial input panel. Terminals 2 and 3 must be connected with the shorting link provided on the panel.
2. Set controls and adjust compensators for maximum output as follows:

Range Switch	Signal Generator and Receiver Dial	Compensators in Order
Position 4	18 M. C.	(26D) Check image at 17.060. See note A.
Position 4	18 M. C.	(14B) Use shunt condenser on (26D) (First contact from left side of chassis facing rear underside view.) when adjusting this compensator. See note C. then adjust (6C).
Position 4	18 M. C.	(26E), (14C), (16D)
Position 4	18 M. C.	(26D) Check image at 17.060 M. C. See note A.
Position 4	18 M. C.	(14B) Use shunt condenser on (26D) when adjusting this compensator. See note C. Then adjust (6C).
Position 4	18 M. C.	(26D) Check image at 17.060 M. C.

Tuning Range 5.7 to 11.6 M. C.

Range Switch	Signal Generator and Receiver Dial	Compensators in Order
Position 3	11 M. C.	(26B)
Position 3	11 M. C.	(14) Use shunt condenser on (26B) (Third contact from left side of chassis facing rear underside view.) when adjusting this compensator (See note C). Then adjust (6A).
Position 3	11 M. C.	(26B)
Position 3	6 M. C.	(26C), (14A), (6B)
Position 3	11 M. C.	(26B)
Position 3	11 M. C.	(14) Use shunt condenser on (26B) when adjusting this compensator. See Note C. Then adjust (6A).

Tuning Range 530 to 1720 K. C.

1. Set controls and adjust compensator for maximum output as follows:

Range Switch	Signal Generator and Receiver Dial	Compensators in Order
Position 2	1600 K. C.	(26), (6), and (19A)
Position 2	580 K. C.	(26A) Roll gang through signal for maximum output. See note B.
Position 2	1600 K. C.	(26)
Position 2	1500 K. C.	(6), (19A)

Tuning Range 150 to 350 K. C.

1. Connect the 088 signal generator lead through a 200 mmfd. condenser to terminal No. 1 of the aerial input panel. Set controls and adjust compensators for maximum output as follows:

Range Switch	Signal Generator and Receiver Dial	Compensators in Order
Position 1	300 K. C.	(24), (5), (19)
Position 1	160 K. C.	(24A) Roll gang for maximum output through signal. See note B.
Position 1	300 K. C.	(24), (5), (19)
Position 1	160 K. C.	(24A) Roll gang for maximum output through signal. See note B.

Fig. 7—Dial Scale

Fig. 5—R. F. Compensators Underside of Chassis

OUTPUT METER: The 025 Output Meter is connected to the plate and cathode terminals of one of the (6F6EG) tubes. Adjust the meter to use the (0-30) Volt Scale.

Fig. 6—I. F. Compensators Top of Chassis

NOTE A—To accurately adjust the compensator to the fundamental and not the image signal, turn the oscillator compensator to the maximum capacity position clockwise. Then slowly turn the compensators counter-clockwise until a second maximum peak is obtained on the output meter. The first peak is the image signal and the receiver must not be adjusted to it. If the above procedure is correctly performed, the image signal will be found 940 K. C. below the frequency being used on any high frequency band.

NOTE B—First tune the compensator for maximum output then vary the tuning condenser of the receiver for maximum output about the frequency mark on the dial. Now turn the compensator slightly to the right or left and again vary the receiver turning condenser for maximum output. If the output decreases, set the compensator in the opposite direction. This procedure of first setting the compensator and then varying the tuning condenser is continued until there is no further gain in output reading.

NOTE C—To eliminate the effect of the R. F. Compensator detuning the oscillator circuit, a variable condenser of approximately 350 mmfd. is connected to the oscillator compensator to ground where designated in the instructions above. Tune the added condenser from the minimum capacity position until the second harmonic of the receiver oscillator beats with the signal from the generator, resulting in a maximum reading on the output meter. Then adjust compensators as noted for maximum output.

PHILCO RADIO & TELEV. CORP.

Voltage, Notes
Spkr. Wiring

AERIAL CONNECTIONS

The red and black leads of the High-Efficiency Aerial "transmission line" are connected to terminals 1 and 2 respectively, of the terminal panel provided on the rear of the chassis. Connect the jumper on the terminal panel across terminals 3 and 4.

If a temporary aerial is used, the jumper should be across terminals 2 and 3. The aerial connects to terminal 1 and the ground lead to terminal 3. A good ground connection is desirable in all installations.

SHADOWMETER ADJUSTMENT

Apply power to the receiver and allow tubes to warm up. Then adjust shadowmeter as follows:

1. Move the shadow meter coil backwards and forwards, until the opposite edges of the shadow are $\frac{1}{8}$ of an inch from each end of the shadow screen, measuring along the bottom edge of the screen. Adjustment of the shadow meter light bracket may be necessary for perfect centering.
2. Remove the rectifier tube from its socket, and rotate coil until shadow reaches minimum width. This width must not exceed $\frac{1}{8}$ of an inch.
3. Replace the 5Y4G rectifier tube in its socket. The shadow should then widen to not more than $\frac{1}{8}$ inch or less than $\frac{1}{16}$ inch from each side of the screen measuring along the bottom edge. If these limits are not obtained readjust the shadow meter as given in paragraphs 1 and 2 again.

Fig. 2—Speaker Wiring, Type K35, H26

Tone Control:

Four positions, brilliant, bright, mellow, and deep.

Philco Tubes Used: Eight—Two 6K7EG; Two 6F6EG; one 6A8EG; one 6K5G; one 6J5G and one 5Y4G.

Note: Receivers in the United States use tubes without the "E" designation.

Speaker: K35, B cabinet.
H26, X cabinet.

Type of Circuit:

Superheterodyne, with four tuning ranges; Delayed A. V. C.; Connections for a phonograph; Shadowmeter tuning; Connections for the Philco High Efficiency Aerial, and a push-pull pentode audio output circuit.

Power Supply:

Voltage	Frequency	Consumption
115	50 to 60 cycle	110 watts
115	25 to 40 cycle	110 watts
110/220	50 to 60 cycle	110 watts

The 110/220 volt power transformer Part No. 32-7608 has a voltage selection plug and socket, mounted on top of the power transformer. Place the plug with arrow pointing towards voltage being used.

Tuning Ranges: Four

- Range 1—150 to 350 K. C.
- Range 2—530 to 1720 K. C.
- Range 3—5.7 to 11.6 M. C.
- Range 4—11.5 to 18.2 M. C.

Copyright 1937 Philco Radio & Television Corporation

Intermediate Frequency: 470 K. C.

Undistorted Output: 7 watts.

Fig. 1—Socket Voltages—Underside of Chassis View

The voltages indicated by arrows were measured with a Philco 925 Circuit Tester which contains a voltmeter having a resistance of 1000 ohms per volt. Volume Control at minimum, range switch in broadcast position, line voltage 115 A. C.

Electrical Specifications

TYPE OF CIRCUIT: Superheterodyne, with five tuning ranges; push pull class A output; automatic volume control; bass compensation in the volume control circuit; tone control and connections for a phonograph.

POWER SUPPLY:

Voltage	Frequency	Consumption
115	50 to 60 cycle	130 watts
115	25 to 40 cycle	130 watts
110/220	50 to 60 cycle	130 watts

For 110/220 volt operation a transformer part no. 32-7642 is required. These transformers are built into export receivers only. The transformer has a plug and socket, mounted on top of the power transformer, adjacent to the rectifier tube. Place the plug with arrow pointing towards voltage being used.

INTERMEDIATE FREQUENCY: 470 K. C.

TUNING RANGES: Five.

- Range 1—150 to 350 K. C.
- Range 2—530 to 1600 K. C.
- Range 3—1.6 to 4.8 M. C.
- Range 4—4.6 to 11.5 M. C.
- Range 5—11.5 to 22 M. C.

UNDISTORTED OUTPUT: 10 watts

PHILCO TUBES USED: Two 6K7EG; one 6A8EG; Five 6J5G; Two 6F6EG; and one 5X4G.

NOTE: Receivers in the United States use tubes without the "E" designation.

TONE CONTROL: Four positions.

SPEAKER: "X" cabinet 11 28
"B" cabinet K 37

AERIAL CONNECTIONS

The red and black leads of the High-Efficiency Aerial "transmission line" are connected to terminals 1 and 2 respectively, of the terminal panel provided on the rear of the chassis. Connect the jumper on the terminal panel across terminals 3 and 4.

If a temporary aerial is used, the jumper should be across terminals 2 and 3. The aerial connects to terminal 1 and the ground lead to terminal 3. A good ground connection is desirable in all installations.

SHADOW METER ADJUSTMENT

Apply power to the receiver and allow tubes to warm up. Then adjust shadow meter as follows:

1. Move the shadow meter coil backwards and forwards, until the opposite edges of the shadow are $\frac{1}{8}$ of an inch from each end of the shadow screen, measuring along the bottom edge of the screen. Adjustment of the shadow meter light bracket may be necessary for perfect centering.
2. Remove the rectifier tube from its socket, and rotate coil until shadow reaches minimum width. This width must not exceed $\frac{1}{4}$ of an inch.
3. Replace the 5X4G rectifier tube in its socket. The shadow should then widen to not more than $\frac{1}{4}$ inch or less than $\frac{1}{8}$ inch from each side of the screen measuring along the bottom edge. If these limits are not obtained readjust the shadow meter as given in paragraphs 1 and 2 again.

Model 37-2670

FIG. 2—Speaker Wiring K37, H28

The voltages indicated by arrows were measured with a Philco 025 Circuit Tester which contains a voltmeter having a resistance of 1000 ohms per volt. Volume Control at minimum, range switch in broadcast position, line voltage 115 A. C.

Alignment Trimmers

PHILCO RADIO & TELEV. CORP.

DIAL CALIBRATION: In order to adjust the receiver correctly, the dial must be aligned to track properly with the tuning condenser. To do this, rotate the tuning condenser control to the extreme counter-clockwise position (maximum capacity). Set range switch in the long wave position. Loosen the screw of dial hub, then turn dial until the glowing indicator is centered on the middle index line of dial scale (See Fig. 5.) Now tighten the dial hub set screw in this position.

OUTPUT METER: The Output Meter is connected to the plate and cathode terminals of one of the (6F6EG) tubes. Adjust the meter to use the (0-30) Volt Scale.

INTERMEDIATE FREQUENCY CIRCUIT

Frequency 470 K. C.

1. Set controls as follows:
 - a. Range switch position 2 (Broadcast).
 - b. Receiver dial at 580 K. C.
 - c. Adjust signal generator for 470 K. C.
 - d. Connect the 088 Signal generator output lead through a .1 mfd. condenser to the control grid of the 6A8EG tube and the ground connection to the chassis.
2. Adjust the following I. F. compensators for maximum output- (42S) (42P) (41S) (41P)

RADIO FREQUENCY CIRCUITS

Tuning Range 11.5-22 M. C.

1. Connect the signal generator output lead through a .1 mfd. condenser to terminal No. 1 and the generator ground lead to terminal no. 3 on aerial input panel. Terminals 2 and 3 must be connected with shorting link provided on the panel.
2. Set controls and adjust compensators for maximum output as follows:

Range Switch Position	Signal Generator and Receiver Dial	Compensators
5	20 M. C.	(29C) check image at 19.06 M. C. See Note A
5	20 M. C.	(19 A) Use shunt condenser on 29C (first contact from left underside view of chassis) when adjusting this compensator. Then adjust 7A. (See note C)
5	20 M. C.	(29C)
5	12 M. C.	(29D), (19B), (7B)
5	12 M. C.	(29D)
Range Switch Position	Signal Generator and Receiver Dial	Compensator
5	20 M. C.	(29C) check image
5	20 M. C.	(19A) use shunt, then adjust 7A
5	20 M. C.	(29C)

Tuning Range 4.6 to 11.5 M. C.

Range Switch Position	Signal Generator and Receiver Dial	Compensator
4	11 M. C.	(29B)
4	11 M. C.	(19) use shunt condenser on 29B (third contact from left underside view of R. F. unit) when adjusting this compensator. Then adjust 7.

Tuning Range 1.6 to 4.8 M. C.

Range Switch Position	Signal Generator and Receiver Dial	Compensator
3	4.5 M. C.	(29), (18B), (6B)
3	1.7 M. C.	(29A) (Note B).
3	4.5 M. C.	(29), (18B), (6B)

Tuning Range 530 to 1600 K. C.

Range Switch Position	Signal Generator and Receiver Dial	Compensator
2	1500 K. C.	(27B), (18A), (6A)
2	580 K. C.	(27C) See Note B
2	1500 K. C.	(27B)
2	1400 K. C.	(18A), (6A)

Tuning Range 150 to 350 K. C.

1. Connect the 088 signal generator lead through a 200 mmfd. condenser to terminal No. 1 of the aerial input panel. Set controls and adjust compensators for maximum output as follows:

Fig. 5
Dial Calibration

Fig. 7. R. F. Compensators

Fig. 6. I. F. Compensators

2. Range Switch Signal Generator and Receiver Dial Position

1	300 K. C.	Compensator (27), (18), (6)
1	175 K. C.	(27A) (See Note B)
1	300 K. C.	(27), (18), (6)
1	175 K. C.	(27A) Note B
1	300 K. C.	(27), (18), (6)

NOTE A—To accurately adjust the compensator to the fundamental and not the image signal, turn the oscillator compensator to the maximum capacity position clockwise. Then slowly turn the compensators counter-clockwise until a second maximum peak is obtained on the output meter. The first peak is the image signal and the receiver must not be adjusted to it. If the above procedure is correctly performed, the image signal will be found 940 K. C. below the frequency being used on any high frequency band.

NOTE B—First tune the compensator for maximum output then vary the tuning condenser of the receiver for maximum output about the frequency mark on the dial. Now turn the compensator slightly to the right or left and again vary the receiver tuning condenser for maximum output. If the output decreases, set the compensator in the opposite direction. This procedure of first setting the compensator and then varying the tuning condenser is continued until there is no further gain in output reading.

NOTE C—To eliminate the effect of R. F. compensator detuning the oscillator circuit, a variable condenser of approximately 350 mmfd. is connected from the oscillator compensator to ground where designated in the instructions above. Tune the added condenser from the minimum capacity position until the second harmonic of the receiver oscillator beats with the signal from the generator, resulting in a maximum reading on the output meter. Then adjust compensators as noted for maximum output.

PHILCO RADIO & TELEV. CORP. MODEL 38-1, Code 121
Schematic

AUDIO OUTPUT: 10 watts.

I.F. = 470 K.C.

FREQUENCY RANGES: Three.
 Range one—530 to 1720 K. C.
 Range two—2.3 to 7.4 M. C.
 Range three—7.35 to 22.0 M. C.

Model 38-1, Code 121

August 1937

MODEL 38-1, Code 121
Alignment, Trimmers
Voltage

PHILCO RADIO & TELEV. CORP.

Alignment of Compensators

EQUIPMENT REQUIRED: (1) Signal Generator, having a fundamental frequency range covering the intermediate and tuning frequencies of the receiver. Philco Model 077 Signal Generator which has a fundamental frequency range from 115 to 36000 K. C. is the correct instrument for this purpose; (2) Output Meter, Philco Model 026 Circuit Tester incorporates a sensitive output meter and is recommended; (3) Philco Fiber Handle-Screw Driver, part number 27-7059 and Fibre Wrench, part number 3104.

OUTPUT METER: The 026 Output Meter is connected to the plate and cathode terminals of one of the 6F6G tubes. Adjust the meter to use the (0-30) volt scale and advance the attenuator control of the generator until a readable indication is noted on the output meter after signal is applied to stage being adjusted.

DIAL CALIBRATION: In order to adjust the compensators of this receiver correctly, the dial must be aligned to track properly with the tuning condenser. To do this proceed as follows:

1. Loosen the set screws on the shaft coupling of the tuning condenser. Then turn the tuning condenser until the plates are in the maximum capacity position. Now turn the dial until the glowing beam indicator is on the INDEX LINE at the low frequency end of Range 2. See Fig. 4. With dial and tuning condenser in this position tighten set screws.

2. Turn the tuning condenser control until the indicator is on the 2.2 M. C. mark.

3. With the dial in this position, loosen the shaft coupling set screws. Then turn the dial until the indicator is again on the INDEX LINE. Tighten the set screws in this position.

NOTE: Be careful when turning the dial that the position of the tuning condenser is not disturbed.

INTERMEDIATE FREQUENCY CIRCUIT

A. Set the receiver and signal generator controls as follows:

1. Range Switch (Broadcast Position)
2. Volume Control (Maximum)
3. Magnetic Tuning Switch "Off"
4. Tone Control First Position
5. Signal Generator Dial 470 K. C.

B. Connect the signal generator output cable through a .1 mfd. condenser to the grid of the 6A8G Det. Osc. tube and connect the cableground to the receiver chassis. Set the generator "attenuator" for maximum output. Adjust the I. F. Compensators as follows:

1. Turn compensator (37C) in until the output meter reading decreases almost to zero.
2. Now adjust the compensators, (37B) and (37A), for maximum output; then readjust (37C) for maximum output.
3. Turn compensator (38C) in about three turns, then adjust compensators (38B) and (38A) for maximum output. The adjustment of compensator 38C is given in the "Magnetic Tuning Circuit Adjustments" below.

RADIO FREQUENCY CIRCUIT

1. Set the controls as given under "Intermediate Frequency Circuit" 1 to 4 and set the range switch, signal generator and receiver dials as given under the adjustments of each tuning range in the following procedure.

Connect the Signal Generator output cable into the "Med" jack of the generator panel and connect the other end through a .1 mfd. condenser to the "Red" terminal of the receiver serial panel (rear of chassis). The ground connection of the cable should be connected to the "Blk" terminal.

2. Adjust the "R. F." compensators for maximum output as follows:

Tuning Range:	Signal Generator and Receiver Dial	Compensators in Order
530 to 1720 K. C.		(18), (8B), and (8A)
Range Switch Position	1550 K. C.	(22), Roll Tuning Condenser. See Note B.
1	580 K. C.	(18), (8B), (8A)
1	1550 K. C.	
Tuning Range 2.3 to 7.4 M. C.		Compensators in Order
Range Switch Position	6.0 M. C.	(32)
2	7.35 to 22.0 M. C.	
Tuning Range:	18.0 M. C.	Compensators in Order
Range Switch Position	310V-300V.	(32A), (15), (4)
3	18.0 M. C.	Roll tuning condensers when adjusting (15) and (4). See Note B, check image at 17.000. See Note A.
3	18.0 M. C.	(32A)

MAGNETIC TUNING CIRCUIT ADJUSTMENTS

1. Set the Magnetic Tuning switch in the "out" position.
2. Turn the signal generator indicator to 1000 K. C. and adjust the "Attenuator" control for a weak signal.
3. Adjust volume control for a readable indication on the output meter.
4. Now tune the receiver dial for maximum output at 1000 K. C. The dial must be tuned very accurately to the 1000 K. C. signal in order to make the following adjustment correctly.

5. Turn the Magnetic Tuning Switch "In" and adjust compensator (38C) for maximum output.

The above adjustments are now checked for accuracy as follows:

FREQUENCY TEST:

With the 1000 K. C. signal tuned for maximum output turn the Magnetic Tuning control back and forth; that is, from the "out" to "in" position. The reading of the output meter should not change in either position. If the output meter reading changes, the above magnetic tuning circuit adjustments should be repeated.

A further check on the magnetic tuning adjustment is to very carefully tune in a broadcasting station and turn the switch from the "out" to the "in" position. With the switch in either position, the tone of the station being received should not change. If a change of tone or hiss develops repeat the above Magnetic Tuning Adjustments.

SENSITIVITY TEST:

1. To check the magnetic tuning circuit for sensitivity, turn the magnetic tuning switch to the "off" position, and tune in the 1000 K. C. signal. Then adjust the "attenuator" control of the signal generator for a good audible signal. Approximately 20 volts on the output meter.

2. Now detune the signal (first above and then below the 1000 K. C. mark) to a point at which the signal is weakly heard. At each point turn the magnetic tuning control "on". When the control is turned on the signal should return to normal output strength. If the magnetic tuning circuit does not pull the signal into resonance, the compensator (38C) should be carefully readjusted.

NOTE "A": To accurately adjust the high frequency oscillator compensator to the fundamental instead of the image signal, turn the oscillator compensator to the maximum capacity position (clockwise). From this position slowly turn the compensator counter-clockwise until a second maximum peak is obtained on the output meter. Adjust the compensator for maximum output using this second peak. The first peak from maximum capacity position of the compensator is the image signal and must not be used in adjusting the compensator.

If the above procedure is correctly performed, the image signal will be found (much weaker) by turning the receiver dial 940 K. C. below the frequency being used on any high frequency range.

NOTE "B": When adjusting the low frequency compensator of Range One (Broadcast) or the antenna and R. F. compensators of the high frequency tuning range; the receiver Tuning Condenser must be adjusted (rolled) as follows: First tune the compensator for maximum output, then vary the tuning condenser of the receiver for maximum output about the frequency dial mark. Now turn the compensator slightly to the right or left and vary the receiver tuning condenser for maximum output. If the out reading increases, turn the compensator in the same direction a trifle more, and again vary the tuning condenser for maximum output. If the output decreases, set the compensator in the opposite direction. This procedure of first setting the compensator and then varying the tuning condenser is continued until there is no further gain in output reading.

Fig. 4. Dial Calibration

Fig. 5. Compensator Locations

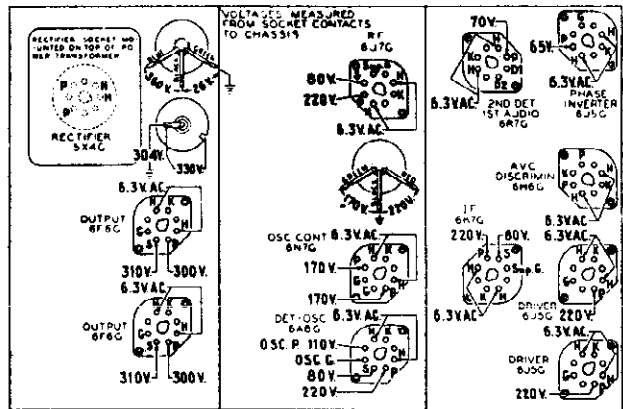

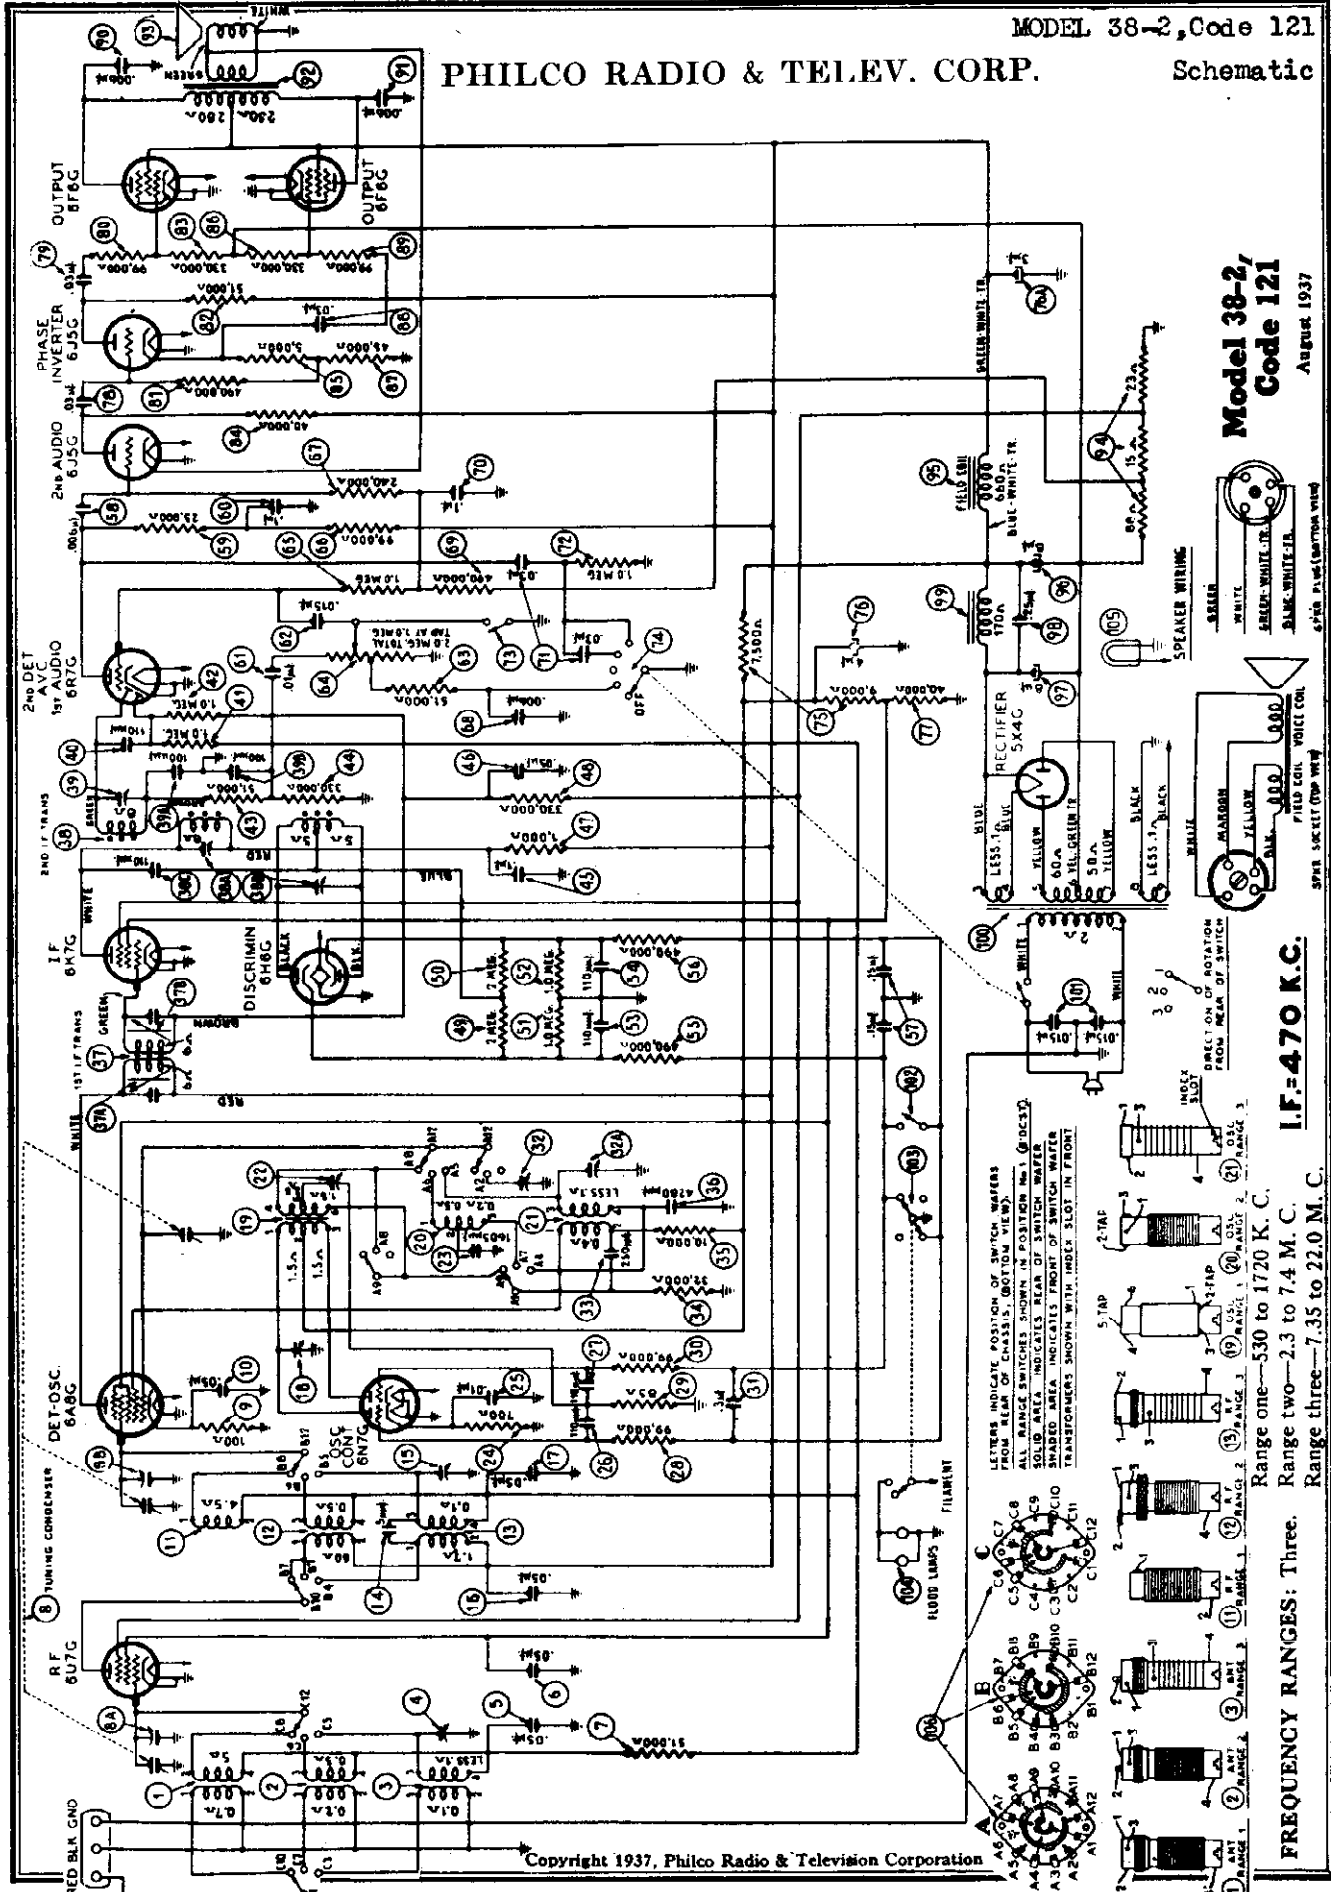

Fig. 1. Underside View of Chassis showing Socket Voltages

The voltages indicated by the arrows were measured with a Philco 026 Circ. It Tester, which contains a sensitive voltmeter. Line voltage 115 A. C.—Volume control minimum—Dial set at point where no signal is present—Range Switch in broadcast position.

I.F.=470 K.C.

Range one—530 to 1720 K. C.
Range two—2.3 to 7.4 M. C.
Range three—7.35 to 22.0 M. C.

FREQUENCY RANGES: Three.

MODEL 38-2, Code 121
Alignment, Trimmers
Voltage

PHILCO RADIO & TELEV. CORP.

Alignment of Compensators

EQUIPMENT REQUIRED: (1) Signal Generator, having a fundamental frequency range covering the intermediate and tuning frequencies of the receiver. Philco Model 077 Signal Generator which has a fundamental frequency range from 115 to 36000 K. C. is the correct instrument for this purpose; (2) Output Meter, Philco Model 026 Circuit Tester incorporates a sensitive output meter and is recommended; (3) Philco Fibre Handle Screw Driver, Part No. 27-7059 and Fibre Wrench, Part No. 3164.

OUTPUT METER: The 026 Output Meter is connected to the plate and cathode terminals of one of the 6F6G tubes. Adjust the meter to use the (0-30) volt scale and advance the attenuator control of the generator until a readable indication is noted on the output meter after signal is applied to stage being adjusted.

DIAL CALIBRATION: In order to adjust the compensators of this receiver correctly, the dial must be aligned to track properly with the tuning condenser. To do this proceed as follows:

- Loosen the set screws on the shaft coupling of the tuning condenser. Then turn the tuning condenser until the plates are in the maximum capacity position. Now turn the dial until the glowing beam indicator is on the INDEX LINE at the low frequency end of Range 2. See Fig. 4. With dial and tuning condenser in this position, tighten set screws.
- Turn the tuning condenser control until the indicator is on the 2.2 M. C. Mark.
- With the dial in this position, loosen the shaft coupling set screws. Then turn the dial until the indicator is again on the INDEX LINE. Tighten the set screws in this position. Be careful when turning the dial that the position of the tuning condenser is not disturbed.

INTERMEDIATE FREQUENCY CIRCUIT

- A. Set the receiver and signal generator controls as follows:
- Range Switch (Broadcast)
 - Volume Control (Maximum)
 - Magnetic Tuning Switch "out"
 - Tone control & A. C. switch first position.
 - Signal generator dial 470 K. C.

B. Connect the signal generator output cable through a .1 mfd. condenser to the grid of the 6A8C Det. Osc. tube and connect the cable ground to the receiver chassis. Now adjust the following compensators for maximum output (38A), (39), (37B), and (37A).

RADIO FREQUENCY CIRCUIT

1. Set the controls as given under "Intermediate Frequency Circuit" 1 to 4 and set the range switch, signal generator and receiver dials as given under the adjustments of each tuning range in the following procedure.

Connect the Signal Generator output cable into the "Med" jack of the generator panel and connect the other end through a .1 mfd. condenser to the "Red" terminal of the receiver aerial panel (rear of chassis). The ground connection of the cable should be connected to the "Blk" terminal.

2. Adjust the "R. F." compensators for maximum output as follows:

Tuning Range: 530 to 1720 K. C.

Range Switch Position	Signal Generator and Receiver Dials	Compensators in Order
1	1550 K. C.	(18), (8B) and (8A)
1	580 K. C.	(22) Roll gang. Note B
1	1550 K. C.	(18), (8B), (8A)

Tuning Range 2.3 to 7.4 M. C.

Range Switch Position	Signal Generator and Receiver Dial	Compensators in Order
2	6.0 M. C.	(32)

Tuning Range 7.35 to 22.0 M. C.

Range Switch Position	Signal Generator and Receiver Dial	Compensators in Order
3	20.0 M. C.	(32A), (15), (4)

Roll tuning condensers when adjusting (15) and (4). See Note B. Check image at 17.060. See Note A. (32A)

MAGNETIC TUNING CIRCUIT ADJUSTMENTS

- Set the Magnetic Tuning switch in the "out" position.
- Turn the signal generator indicator to 1000 K. C. and adjust the "Attenuator" control for a weak signal.
- Adjust volume control for a readable indication on the output meter.
- Now tune the receiver dial for maximum output at 1000 K. C. The dial must be tuned very accurately to the 1000 K. C. signal in order to make the following adjustment correctly.
- Turn the Magnetic Tuning switch "in" and adjust compensator (38B) for maximum output.

The above adjustments are now checked for accuracy as follows:

Fig. 4. Dial Calibration

FREQUENCY TEST

With the 1000 K. C. signal tuned for maximum output turn the Magnetic Tuning control back and forth; that is, from the "out" to "in" position. The reading of the output meter should not change in either position. If the output meter reading changes, the above magnetic tuning circuit adjustments should be repeated.

A further check on the Magnetic Tuning adjustment is to very carefully tune in a broadcasting station and turn the switch from the "out" to the "in" position. With the switch in either position, the tone of the station being received should not change. If a change of tone or hiss develops repeat the above Magnetic Tuning Adjustments.

SENSITIVITY TEST

1. To check the magnetic tuning circuit for sensitivity, turn the magnetic tuning switch to the "out" position, and tune in the 1000 K. C. signal. Then adjust the "attenuator" control of the signal generator for a good audible signal. Approximately 20 volts on the output meter.

2. Now detune the signal (first above and then below) the 1000 K. C. mark to a point at which the signal is weakly heard. At each point turn the magnetic tuning control "on". When the control is turned on the signal should return to normal output strength. If the magnetic tuning circuit does not pull the signal into resonance, the compensator should be carefully readjusted.

NOTE "A"—To accurately adjust the high frequency oscillator compensator to the fundamental instead of the image signal, turn the oscillator compensator to the maximum capacity position (clockwise). From this position slowly turn the compensator counter-clockwise until a second maximum peak is obtained on the output meter. Adjust the compensator for maximum output using this second peak. The first peak from maximum capacity position of the compensator is the image signal and must not be used in adjusting the compensator.

If the above procedure is correctly performed, the image signal will be found (much weaker) by turning the receiver dial 940 K. C. below the frequency being used on any high frequency range.

NOTE "B"—When adjusting the low frequency compensator of Range One (Broadcast) or the antenna and R. F. compensators of the high frequency tuning ranges; the receiver Tuning Condenser must be adjusted (rolled) as follows: First tune the compensator for maximum output, then vary the tuning condenser of the receiver for maximum output about the frequency dial mark. Now turn the compensator slightly to the right or left and vary the receiver tuning condenser for maximum output. If the out reading increases, turn the compensator in the same direction a trifle more, and again vary the tuning condenser for maximum output. If the output decreases, set the compensator in the opposite direction. This procedure of first setting the compensator and then varying the tuning condenser is continued until there is no further gain in output reading.

*A complete list of the automatic tuning mechanism parts is given in Bulletin 273. Those parts shown above marked with an asterisk differ from those shown on Bulletin 273.

PHILCO RADIO & TELEV. CORP.

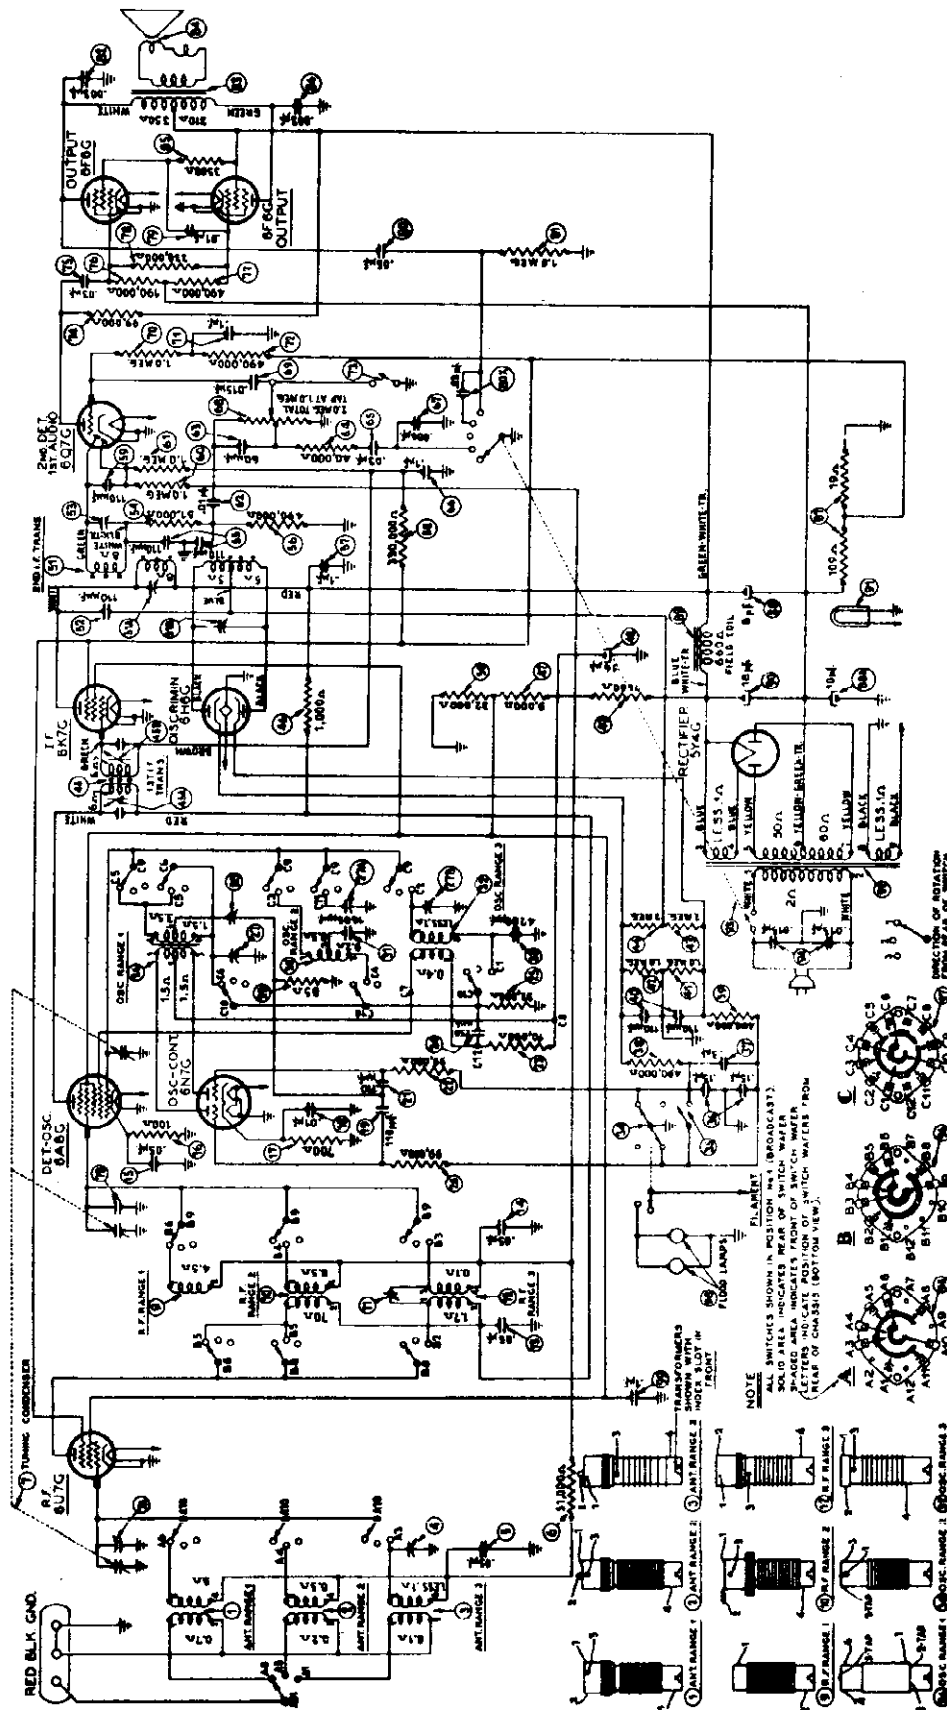

Fig. 4. Schematic Diagram Model 38-3

Electrical Specifications

INTERMEDIATE FREQUENCY: 470 K. C.

UNDISTORTED OUTPUT: 5 watts.

PHILCO TUBES USED: Nine. One 6U7GR, one 6K7G I. F. amplifier, one 6A8C, Det. Osc., one 6N7G, osc. control; one 6H6C, discriminator; one 6Q7G, 2nd det. 1st audio; two 6F6G output, and one 5Y4G rectifier.

TUNING RANGE: Three. Range one—830 to 1720 K. C. Range two—2.3 to 7.4 M. C. Range three—7.35 to 22 M. C.

TOPE CONTROL: Four positions.

SPEAKER: 1100

TYPE CIRCUIT: Superheterodynes, with such features as: magnetic tuning control on the broadcast range; automatic volume control; iron core adjusted first I. F. transformer; push-pull Pentode audio output, using screen phase inversion; Base compensation in the Volume Control circuit, and the Philco Automatic Tuning Mechanism.

Consumption

Frequency 50 to 60 cycles

25 to 40 cycles

116

115

Different Transformers are required for operation on the frequencies list above. These are shown on the parts list.

April, 1937

MODEL 38-3

Alignment, Voltage
Trimmers

PHILCO RADIO & TELEV. CORP.

Alignment of Compensators

EQUIPMENT REQUIRED: (1) Signal Generator; Philco Model 077 signal generator, using fundamental frequency from 115 to 36000 K. C. is the correct instrument for the purpose; (2) Output meter; Philco model 026 circuit tester incorporates a sensitive output meter and is recommended; (3) Philco fibre handle screw-driver, part No. 27-7059 and fibre wrench part No. 3164.

OUTPUT METER: The 026 output meter is connected to the plate and cathode terminals of one of the 6F6G tubes. Adjust the meter to use the (0-30) volt scale and advance volume control of receiver until a readable indication is noted after signal generator is connected in the following adjustments.

DIAL CALIBRATION: In order to adjust this receiver correctly the dial must be aligned to track properly with the tuning condenser. To do this proceed as follows:

1. Loosen the shaft coupling set screws. Then turn the tuning condenser fully closed and the dial to the first index line. Now tighten the shaft coupling set screws, and rotate the dial until the 520 K. C. mark is midway between the index line and the glowing beam indicator.
2. With condenser in this position loosen the set screws of the shaft coupling on the tuning condenser.
3. Then turn the tuning dial until the glowing beam indicator is entered on the index line.

NOTE: Be careful when turning the dial that the position of the tuning condenser is not disturbed.

4. Now tighten the shaft coupling set screws.

INTERMEDIATE FREQUENCY CIRCUIT

With signal generator output lead connected through a .1 mfd. condenser to the grid of the 6AB8 det-osc.tube; and controls set as follows, adjust I. F. compensators for maximum output.

- a. Magnetic Tuning Knob (34) off
- b. Tone Control (98) normal
- c. Volume Control (98) maximum
- d. Receiver dial 580 K. C.
- e. Signal generator 470 K. C.
- f. Range Switch position (Broadcast)
- g. Compensators in order (53), (51A), (45A), (45B).

RADIO FREQUENCY CIRCUIT

Tuning Range 530 to 1720 K. C.

1. Connect the signal generator output lead through a .1 mfd. condenser to "RED" terminal of the aerial panel and the generator ground to the chassis of the receiver.
2. Other controls set as given under intermediate frequency circuit, with the exception of those as follows: Adjust compensators for maximum output as follows:

Range Switch	Signal Generator	Receiver Dial	Compensators in Order
1	1500 K. C.	1600 K. C.	(27) (7B) (7A)
1	580 K. C.	580 K. C.	(28) Roll gang through signal when padding this compensator. (See Note B)
1	1600 K. C.	1600 K. C.	(27)
1	1500 K. C.	1600 K. C.	(7B) (7A)

Tuning Range 2.3 to 7.4 M. C. Adjust compensators for maximum output as follows:

Range Switch	Signal Generator	Receiver Dial	Compensators in Order
2	6 M. C.	6 M. C.	(27A)

Tuning Range 7.35 to 22 M. C. Adjust compensators for maximum output as follows:

Range Switch	Signal Generator	Receiver Dial	Compensators in Order
3	18 M. C.	18 M. C.	(27B) check image at 17.96 M. C. (See Note A)
			(11) (4) Use shunt condenser on (27B) or roll gang through signal when padding compensator No. 11 (See Note C)
3	18 M. C.	18 M. C.	(27B)

MAGNETIC TUNING ADJUSTMENT: Set the range switch in position one (530 to 1720 K. C.) and the magnetic tuning switch in the "out" position. Now turn the signal generator and receiver dial to any frequency in the Broadcast band. The receiver dial must be adjusted very accurately for maximum output.

Set the magnetic tuning control in the "on" position (clockwise). Compensator (51B) of the magnetic tuning transformer is now adjusted for maximum output.

The above adjustment is now checked for accuracy, by turning the magnetic tuning control "off" and "on." In either position, there should be no change in the tone of the signal. If a change of tone or hiss develops, it indicates a shift in frequency and the adjustment must be repeated.

NOTE A—To accurately adjust the high frequency oscillator compensator to the fundamental instead of the image signal, turn the oscillator compensator to the maximum capacity position (clockwise). Then slowly turn compensator counter-clockwise until a second maximum peak is obtained on the output meter. This second peak is the fundamental signal, and the compensator must be adjusted for maximum output with it. The first peak from maximum capacity position of the compensator is the image signal and must not be used in adjusting this compensator.

If the above procedure is correctly performed, the image signal will be found (much weaker) 940 K. C. below the frequency being used on any high frequency range.

NOTE B—First tune compensator (28) for maximum output, then vary the tuning condenser of the receiver for maximum output about the 580 K. C. dial mark. Now turn compensator (28) slightly to the right or left and vary the receiver tuning condenser for maximum output. If the output reading increases, turn compensator (28) in the same direction a trifle more, and again vary the tuning condenser for maximum output. If the output decreases, set the compensator in the opposite direction. This procedure of first setting the compensator and then varying the tuning condenser is continued until there is no further gain in output reading.

NOTE C—To eliminate the effect of the R. F. compensator detuning the Osc. circuit, a variable tuning condenser of approximately 350 mmfd. is connected from the oscillator compensator to ground when designated in the padding instruction above. Tune the added condenser until the second harmonic of the receiver oscillator beats against the signal from the generator, resulting in a maximum indication on the output meter. Then adjust compensators as noted for maximum output.

Fig. 2. I. F. Compensators Top of Chassis

Fig. 3. R. F. Compensators Underside of Chassis

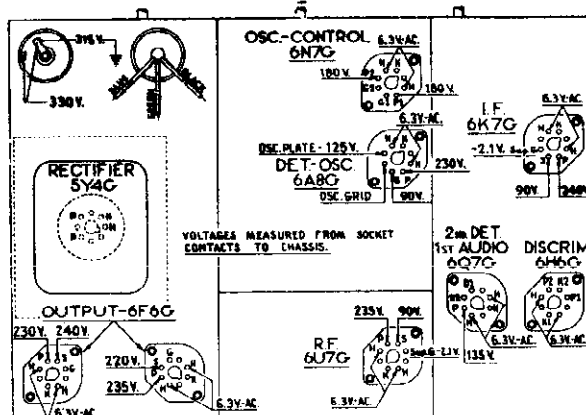

Fig. 1. Socket Voltages, Underside of Chassis—The voltages indicated by arrows were measured with a Philco 026 Circuit Tester which contains an accurate voltmeter. Volume Control at minimum, range switch in broadcast position, line voltage 115 A. C.

Prices subject to change without notice.

to 1000 and the "Attenuator" for maximum output.

- Turn the receiver dial to 580 K. C.
- Receive Volume Control maximum.
- Range Switch Broadcast Position.
- Adjust compensators (28B), (28A), (23B), and (23A) for maximum output. If the output meter goes off scale when adjusting the compensators retard signal generator attenuator.

RADIO FREQUENCY CIRCUIT

- Tuning Range: 5.7 to 16.2 M. C.
- With one end of the shielded lead of the signal generator output lead in the "Med" jack, connect the other end through the .1 mfd. condenser to the "Red" terminal of the aerial panel of the receiver. The output lead ground must be connected to the black terminal or to the chassis.

- Set the controls and adjust the R. F. compensators as follows:

Volume Control	Max.
Range Switch	2
Signal Generator	18 M. C.
Compensator Control	2
Compensator Dial	(5C) See Note A

Tuning Range: 530 to 1720 K. C.

- | | | |
|------------------|---|------------|
| Range Switch | 1 | 1500 K. C. |
| Signal Generator | 1 | 580 K. C. |
| Compensator Dial | 1 | 1500 K. C. |

NOTE A—To accurately adjust the high frequency oscillator compensator to the fundamental instead of the image signal, turn the oscillator compensator to the maximum capacity position (clockwise). From this position slowly turn the compensator counter-clockwise until a second maximum peak is obtained on the output meter. Adjust the compensator for maximum output using this second peak. The first peak from maximum capacity position of the compensator is the image signal and must not be used in adjusting the compensator.

If the above procedure is correctly performed, the image signal will be found (much weaker) by turning the receiver dial 940 K. C. below the frequency being used on the high frequency range.

Service Data

FOR CONE-CENTRIC TUNING MECHANISM—MODEL 4

Complete information for setting the stations on the Cone-Centric Tuning mechanism of Model 38-4 will be found in the instruction sheet (Form No. 39-5533) which is supplied with each set.

The locations of a few assemblies of the Cone-Centric Automatic Tuning mechanism is illustrated in Fig. 2. The part numbers and prices of these assemblies are listed on page 3. A complete list of replacement parts and detailed service data for the mechanism will be found in bulletin 282.

Aerial Connections

To obtain the full advantage of the sensitivity of these receivers, the Philco High Efficiency Aerial Part No. 40-6112 must be used. For attaching the aerial to the receiver a terminal panel is provided at the rear of the chassis. This panel contains three screw terminals marked "Red", "Blk" and "Gnd". Connect the red and black wires of the Philco High Efficiency Aerial transmission line to the "Red" and "Blk" terminals respectively.

If you use a temporary aerial, connect it to the "Red" terminal. A good ground connection is necessary for best reception. The terminal mark "Gnd" should be connected to a water pipe or any other good ground source.

Electrical Specifications

TYPE CIRCUIT: An eight tube A.C. operated super-heterodyne circuit is incorporated in these receivers with features, such as Philco foreign tuning systems; a high gain R.F. amplifier; two tuning ranges; iron core adjusted I.F. transformers; automatic volume control; bias compensation; and a pentode push-pull audio output circuit. The same circuit is used in both models. The features, however, such as tuning mechanism; speaker, and cabinets differ in each model.

PHILCO TUBES USED: Eight—6U7G, R. F. amp.; 6A8G, Det. Osc.; 6K7G, I. F. amp.; 613C, 2nd Det., A.V.C.; 6K5G, 1st audio; two 6F6G, audio output; and one 5Y4G rectifier.

Alignment of Compensators

EQUIPMENT REQUIRED: (1) Signal Generator, having a fundamental frequency range covering the tuning and intermediate frequencies of the receiver. Philco Model 077 Signal Generator which has a fundamental frequency range from 115 to 36000 K. C. is the correct instrument for this purpose; (2) Output meter, Philco Model 026 circuit tester incorporates a sensitive output meter and is recommended; (3) Philco Fibre Handle Screw Driver, part No. 27-7059 and Fibre Wrench, part No. 3164.

OUTPUT METER: The 026 output meter is connected to the plate and cathode terminals of one of the 6F6G tubes. Adjust the meter to use the (0-30) volt scale and advance the attenuator control of the generator until a readable indication is noted on the output meter after signal is applied.

DIAL CALIBRATION: In order to adjust the receiver correctly the dial must be aligned to track properly with the tuning condenser. To adjust the dial of each model proceed as follows:

Model 38-4

- Loosen the tuning condenser shaft coupling set screws (use wrench Part No. 45-248D), and turn the tuning condenser to the maximum capacity position (Plates fully meshed). Turn the selector knob until the dial pointer is on the small black dot at the low frequency end of the Range One scale. With condenser and pointer set in this position tighten set screws.
- Now turn the selector knob clockwise until the dial pointer moves 1/16 of an inch to the left of the small dot and the first straight line on the scale (See Fig. 6). Hold pointer and condenser in this position, and carefully loosen shaft coupling set screws.
- After set screws are loose, turn the selector knob until dial pointer is again on the small black dot at the low frequency end of Range One scale.

Be careful when turning the selector knob that the position of the tuning condenser is not disturbed. Tighten shaft coupling set screws with condenser and dial pointer in this position.

Model 38-5

- Turn the tuning condenser to maximum capacity position (plate fully meshed).
- Holding the tuning condenser in this position, loosen the dial clamp by turning the dial until the indicator is centered on the middle index line (See Fig. 7). Tighten clamp in this position. Before any of the following adjustments are made, the receiver should be turned "on" for at least 5 minutes.

INTERMEDIATE FREQUENCY CIRCUIT

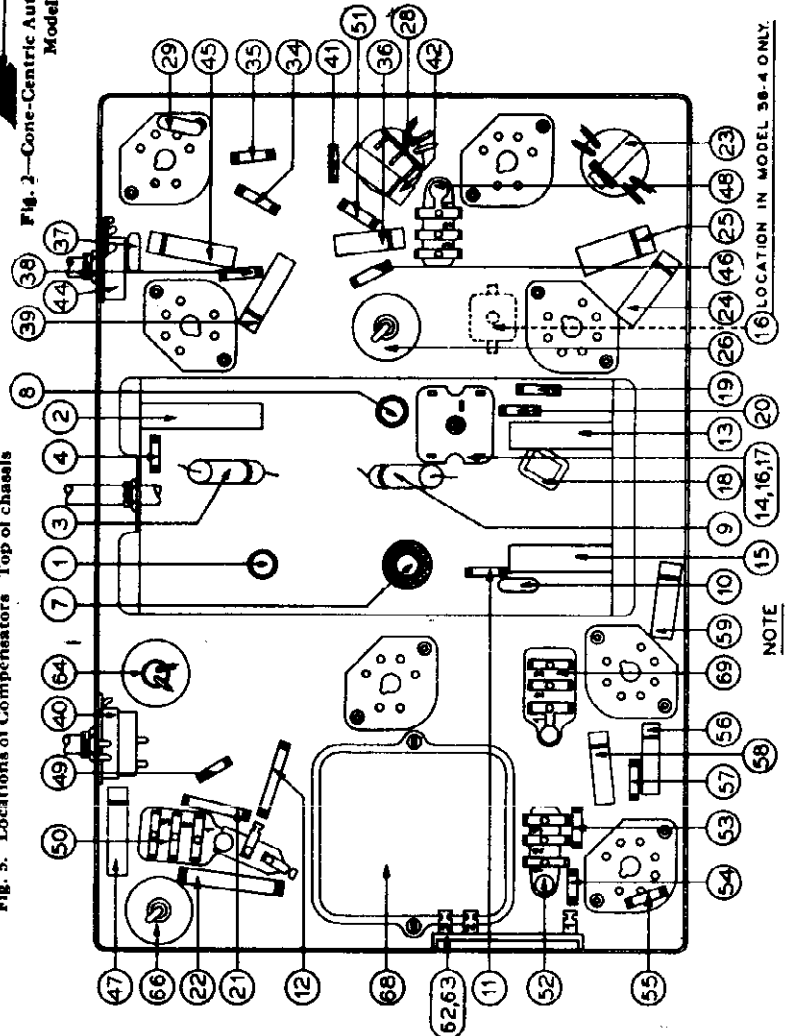

Insert the signal generator shielded output lead into the "Med" jack on the panel of the generator. Connect the other end of the output lead through a .1 mfd. condenser to the grid of the 6A8G, det. osc. tube and the ground connection of the signal generator to the chassis. Set the signal generator and receiver control, and adjust the I. F. compensators as follows:

- Set Signal Generator at 470 K. C. Turn "Multiplier" Control

needed: (3) Philco Fibre Handle Screw Driver, part No. 27-7059 and Fibre Wrench No. 3164.

OUTPUT METER: The 025 output meter is connected to the plates and cathode terminals of the 6F6G tube. Adjust the meter to use the (0-30) volt scale and advance the attenuator control of the generator until a readable indication is noted on the output meter.

DIAL CALIBRATION: In order to adjust the receiver correctly the dial must be aligned to track properly with the tuning condenser. To adjust the dial of each model proceed as follows:

Model 38-7: 1. Loosen the shaft coupling set screws, using wrench Part No. 45-2481; then turn the tuning condenser to the maximum capacity position (plate fully meshed). Now turn the selector knob until the dial pointer is on the small black circle at the low frequency end of the Range One scale. With condenser and pointer set in this position tighten set screws. 2. Now turn the selector knob (clockwise) until the dial pointer moves 1/16 of an inch from the small circle (clockwise), see Fig. 3. Leave pointer in this position and loosen coupling set screws. 3. After loosening set screws, turn the selector knob until pointer is again on the small black dot at low frequency end of Range One scale. Be careful when turning the selector knob that the position of tuning condenser is not disturbed. Tighten coupling set screws with condenser and dial pointer in this position.

Models 8 and 9: 1. Turn the tuning condenser to maximum capacity position (plates fully meshed). 2. Loosen the clamp of dial, then turn the dial—being careful that position of tuning condenser is not disturbed—until the glowing indicator is centered on the middle index line at the low frequency end of Range One scale. Tighten the dial clamp in this position.

Note—Before the following adjustments are performed, the receiver must be tuned on and allowed to heat for 15 minutes.

INTERMEDIATE FREQUENCY CIRCUIT

Insert the signal generator output lead into the "Med." jack on the panel of the generator. Connect the other end of the output lead through a .1 mf. condenser to the grid of the 6AG5, det. osc. tube and the ground connection of the signal generator to the chassis. Set the signal generator and receiver controls, and adjust the I. F. compensator as follows:

1. Set Signal Generator at 470 K. C. Turn "Multiplier" Control to 1000 and the "Attenuator" for maximum output.
2. Turn the receiver dial to 580 K. C.
3. Receiver Volume Control maximum.
4. Range Switch Broadcast Position.
5. Adjust compensators (19B), (19A), (13B), and (13A) for maximum output. If the output meter goes off scale when adjusting the compensators retard signal generator attenuator.

RADIO FREQUENCY CIRCUIT

Tuning Range: 5.7 to 18 M. C.

1. Insert the Signal Generator output lead in the "Med." jack on the panel, and connect the other end through the .1 mf. condenser to the "Red" terminal of the aerial panel of the receiver. The output lead ground must be connected to the "Blk." terminal or to the chassis.
2. Leave the receiver volume control at maximum. Then set the controls and adjust the R. F. compensators as follows:

Range Switch	2	Signal Generator	Compensators
and Receiver Dial	18 M. C.	In Order	In Order
		4B See Note A	
Tuning Range: 5.7 to 17.9 K. C.		Signal Generator	Compensators
		and Receiver Dial	In Order
		1500 KC.	(7A), (4A)
		580 KC.	7
		1500 KC.	7A

Electrical Specifications

Models 38-7, 38-8 and 38-9 receivers employ a six tube A. C. operated superheterodyne circuit with such features as: Two tuning ranges covering standard and short wave broadcasts; Philco foreign tuning system; automatic volume control; bass compensation; tone control, and pentode audio output circuit.

The same circuit is used for each receiver. The features, however, such as, tuning mechanism, speakers and cabinets differ in each model.

Model 38-7 in addition to the features given above employs the Philco automatic tuning mechanism with cone-centric tuning. The chassis of this model is built into a console cabinet type XX, Table Cabinet Type "T", and is designated code 121. The same chassis built into a type "CS" cabinet is identified as code 124.

Model 38-8 differs from the 38-7 in that a manually operated tuning mechanism with shadowmeter tuning is used. This receiver is built into a type "X" cabinet with a type "HS" dynamic speaker.

Model 38-9 is identical to the same as model 38-8 with the exception that the shadowmeter is not used, and that the speaker and cabinet types differ. This model is assembled in a type "T" cabinet with dynamic speaker type "S" and a "K" type cabinet using a dynamic speaker type "HS".

POWER SUPPLY:

Voltage	Frequency	Consumption
115	50 to 60 cycles	70 Watts
115	25 to 40 cycles	70 Watts
115/220V	50 to 60 cycles	70 Watts

Different transformers are required for operation on the frequencies listed above. These are shown on the Parts List.

SERVICE DATA FOR AUTOMATIC TUNING MECHANISM—MODEL 7

Complete information for setting the stations on the cone-centric tuning mechanism of Model 38-7 is covered in the instruction form no. (30-5533) which is supplied with each set.

A few major assemblies of the automatic cone-centric tuning mechanism are listed on page 3 of this bulletin. A complete list of replacement parts, however, and detailed service data for the automatic mechanism, will be found in bulletin 282.

SHADOW METER ADJUSTMENT Model 38-8

Apply power to the receiver and allow tubes to warm up. Then adjust shadow meter as follows:

1. Move the shadow meter coil backwards and forwards, until the opposite edges of the shadow are 1/4 of an inch from each end of the shadow screen, measuring along the bottom edge of the screen. Adjustment of the shadow meter light bracket may be necessary for perfect centering.
2. Remove the rectifier tube from its socket, and rotate the shadowmeter coil until shadow reaches minimum width. This width should not exceed 3/32 of an inch.
3. Replace the 5V4G rectifier tube in its socket. The shadow should then widen to not more than 3/16 inch or less than 1/16 inch from each side of the screen measuring along the bottom edge. If these limits are not obtained readjust the shadow meter as given in paragraphs 1 and 2 again.

Alignment of Compensator

EQUIPMENT REQUIRED: (1) Signal Generator, using fundamental frequency covering the intermediate and tuning ranges of the receivers. Philco Model 077 Signal Generator which has a fundamental frequency range from 115 to 36000 K. C. is the correct instrument for this purpose; (2) Output meter, Philco Model 026 circuit tester incorporates a sensitive output meter and is recom-

Alignment, Parts

PHILCO RADIO & TELEV. CORP.

Alignment of Compensators

EQUIPMENT REQUIRED: (1) Signal Generator, using a fundamental frequency range covering the tuning and intermediate frequencies of the receiver. Philco Model 077 Signal Generator which has a fundamental frequency range from 115 to 36,000 K. C. is the correct instrument for this purpose; (2) Output Meter, Philco Model 026 Circuit Tester incorporates a sensitive output meter and is recommended; (3) Philco Fibre Handle Screw Driver, part No. 27-7059 and Fibre Wrench, part No. 3164.

OUTPUT METER: The 026 Output Meter is connected to the plate and cathode terminals of the 6F6C tubes. Adjust the meter to use the (0-30) volt scale and advance the attenuator control of the generator until a readable indication is noted on the output meter after signal is applied.

DIAL CALIBRATION: In order to adjust the receiver correctly the dial must be aligned to track properly with the tuning condenser. To adjust the dial proceed as follows:

1. Turn the tuning condenser to maximum capacity position (plate fully meshed).
2. Holding the tuning condenser in this position, loosen the clamp and turn the dial until the indicator is centered on the middle index line (See Fig. 3). Tighten clamp with dial in this position.

INTERMEDIATE FREQUENCY CIRCUIT

Insert the signal generator shielded output lead into the "Med" jack on the panel of the generator. Connect the other end of the output lead through a .1 mfd. condenser to the grid of the 6AR5, det. osc. tube and the ground connection of the signal generator to the chassis. Set the Signal Generator and receiver controls, and adjust the I. F. compensators as follows:

1. Set Signal Generator at 470 K. C. Turn "Multiplier" Control to 1000 and the "Attenuator" for maximum output.
 2. Turn the receiver dial to 580 K. C.
 3. Receiver volume control maximum.
 4. Range Switch Broadcast Position.
 5. Adjust compensators (20B), (20A), (13B), (13A) for maximum output.
- If the output meter goes off scale when adjusting the compensators retard signal generator attenuator.

RADIO FREQUENCY CIRCUIT

Tuning Range: 5.7 to 18 M. C.

1. With one end of the shielded lead of the signal generator output lead in the "Med" jack, connect the other end through the .1 mfd. condenser to the "Red" terminal of the aerial panel of the receiver. The output lead ground must be connected to the black terminal or to the chassis.

2. Set the controls and adjust the R. F. compensators as follows:

Volume Control	Range Switch	Signal Generator and Receiver Dial	Compensators in Order
Max.	2	18 M. C.	4B
Tuning Range: 530 to 1770 K. C.			
Range Switch	Signal Generator and Receiver Dial	Compensators in Order	
1	1500 K. C.	7, 4A	
1	580 K. C.	(9)	
1	1500 K. C.	7, 4A	

NOTE A—To accurately adjust the high frequency oscillator compensator to the fundamental instead of the image signal, turn the oscillator compensator to the maximum capacity position (clockwise). From this position slowly turn the compensator counterclockwise until a second maximum peak is obtained on the output meter. Adjust the compensator for maximum output using this second peak. The first peak from maximum capacity position of the compensator is the image signal, and must not be used in adjusting this compensator.

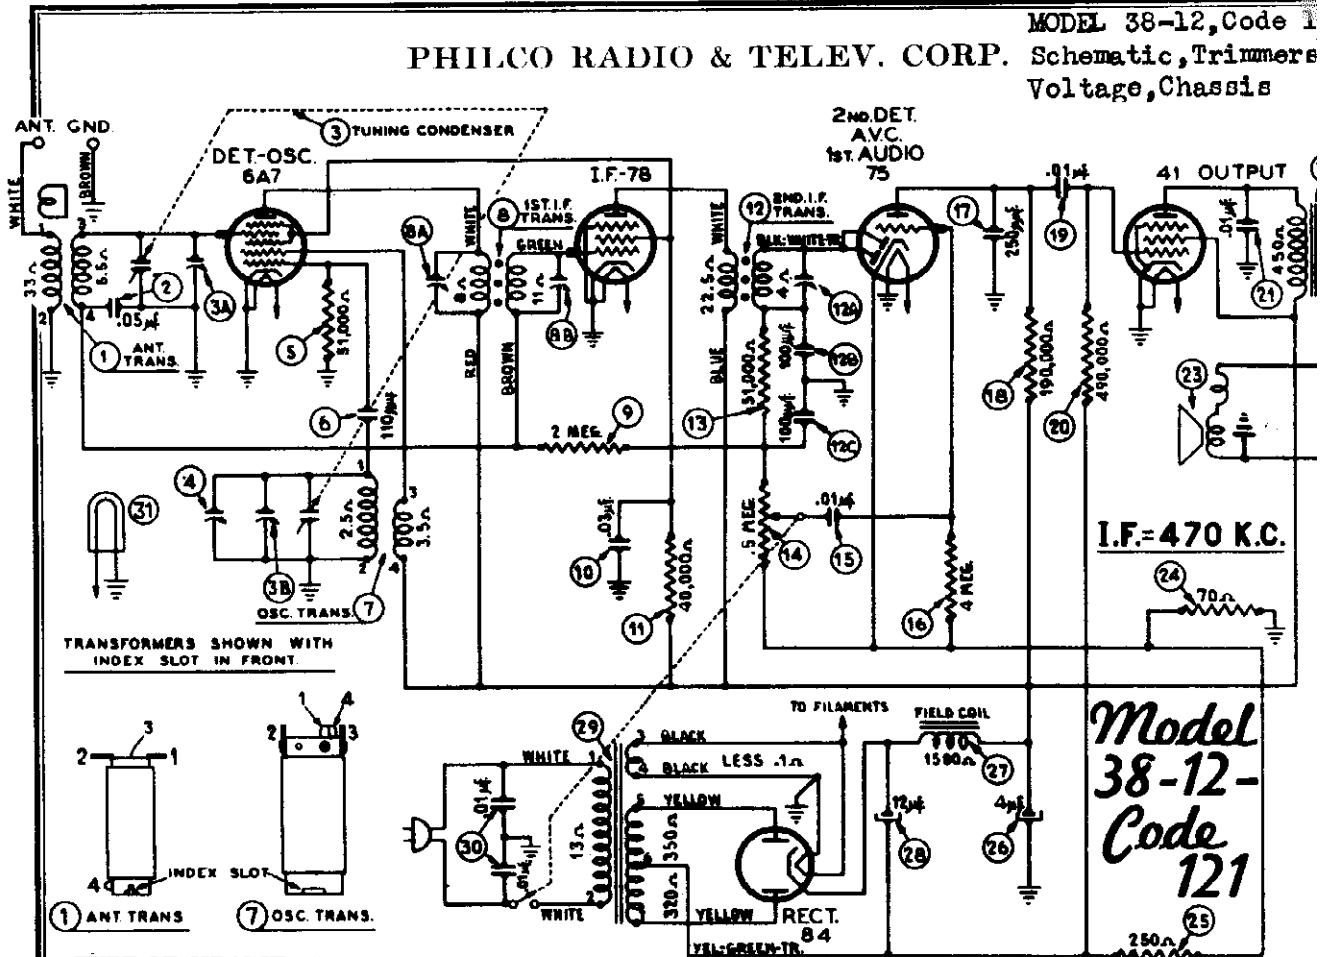

If the above procedure is correctly performed, the image signal will be found (much weaker) by turning the receiver dial 940 K. C. below the frequency being used on the high frequency range.

MODEL 38-12, Code 1
 PHILCO RADIO & TELEV. CORP. Schematic, Trimmers
 Voltage, Chassis

TYPE OF CIRCUIT: A.C. operated, superheterodyne with automatic volume control, Pentode audio output, and covers the standard broadcast and state police frequencies.

INTERMEDIATE FREQUENCY: 470 K.C.

R.F. TUNING RANGE: 540 to 1720 K.C.

June, 15

POWER SUPPLY:

Voltage	Frequency Cycles	Power Consumption
115	50 to 60	40 watts

AUDIO OUTPUT: 2 watts.

TUNING MECHANISM: 8 to 1 Ratio using Pulley

CABINET: Type "T" and "C." and Cord.

PHILCO TUBES USED: Five: One 6A7, Det. Osc.; One 78, I.F.; One 75, 2nd Det., 1st Audio; One 41, Output, and One 84, Rectifier.

FIG. 2.—Locations of Components.

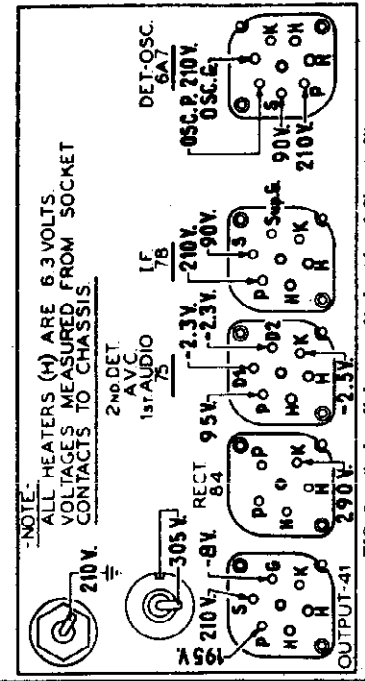

FIG. 3.—Part Locations Underside of Chassis.

NOTE:
 ALL HEATERS (H) ARE 6.3 VOLTS.
 VOLTAGES MEASURED FROM SOCKET CONTACTS TO CHASSIS

FIG. 4.—Socket Voltages—Underside of Chassis View.
 The Voltages indicated by arrows were measured with a Philco 026 Circuit

MODEL 38-12, Code 121

Alignment, Parts

PHILCO RADIO & TELEV. CORP.

Alignment of Compensators

EQUIPMENT REQUIRED: (1) Signal Generator, using a fundamental frequency range covering the tuning and intermediate frequencies of the receiver. Philco Model 077 Signal Generator which has a fundamental frequency range from 115 to 36,000 K.C. is the correct instrument for this purpose; (2) Output Meter, Philco Model 026 Circuit Tester incorporates a sensitive output meter and is recommended; (3) Philco Fibre Handle Screw Driver, Part No. 27-7059 and Fibre Wrench, Part No. 3164.

OUTPUT METER: The 026 Output Meter is connected to the plate and cathode terminals of the 41 tube. Adjust the meter to use the (0-30) volt scale and advance the attenuator control of the generator until a readable indication is noted on the output meter after signal is applied.

DIAL CALIBRATION: In order to adjust the receiver correctly the dial must be aligned to track properly with the tuning condenser. To adjust the dial, proceed as follows:

- 1 Turn the tuning condenser to maximum capacity position (plates fully meshed).
- 2 Holding the tuning condenser in this position, turn the pointer until it is $\frac{1}{16}$ of an inch below the three lines of the scale at the 550 K.C. end. (See Fig. 3.) This is the correct position of pointer at maximum capacity of tuning condenser.

FIG. 3.—Dial Pointer Calibration.

Intermediate Frequency Circuit

Insert the signal generator shielded output lead into the "Med." jack on the panel of the generator. Connect the other end of the output lead through a .1 mfd. condenser to the grid of the 6A7 Det. Osc. tube, and the ground connection of the signal generator to the chassis. Set the Signal Generator and receiver controls, and adjust the I.F. compensators as follows:

- 1 Set Signal Generator at 470 K.C. Turn "Multiplier" Control to 1000 and the "Attenuator" for maximum output.
- 2 Turn the receiver dial to 580 K.C.
- 3 Receiver volume control maximum.
- 4 Adjust compensators, (12A), (8B), (8A), for maximum output. If the output meter goes off scale when adjusting the compensators, retard the signal generator attenuator.

Radio Frequency Circuit

TUNING RANGE: 540 to 1720 K.C.

- 1 With one end of the shielded lead of the signal generator output lead in the "Med." jack, connect the other end through a 100 mmfd. condenser to the white aerial wire (rear of chassis). Connect the signal generator ground to the brown lead or to the chassis of the receiver.
- 2 Set the controls and adjust the R.F. compensators as follows:

Volume Control Max.	Signal Generator and Receiver Dial 1500 K.C.	R.F. Compensators in Order (3B) (3A)
------------------------	--	--

Alignment of Compensators

EQUIPMENT REQUIRED: (1) Signal Generator, using a fundamental frequency range covering the tuning and intermediate frequencies of the receiver. Philco Model 077 Signal Generator which has a fundamental frequency range from 115 to 36,000 K. C. is the correct instrument for this purpose; (2) Output meter, Philco Model 026 circuit tester incorporates a sensitive output meter and is recommended; (3) Philco Fibre Handle Screw Driver, Part No. 27-7059 and Fibre Wrench, Part No. 3164.

OUTPUT METER: The 026 Output Meter is connected to the plate and cathode terminals of the 43 tube. Adjust the meter to use the (0-30) volt scale and advance the attenuator control of the generator until a readable indication is noted on the output meter after signal is applied.

DIAL CALIBRATION: In order to adjust the receiver correctly the dial must be aligned to track properly with the tuning condenser. To adjust the dial, proceed as follows:

1. Turn the tuning condenser to maximum capacity position (plates fully meshed).
2. Holding the tuning condenser in this position, turn the pointer until it is parallel with the index lines (see Fig. 3). This is the correct position of pointer at maximum capacity of tuning condenser.

INTERMEDIATE FREQUENCY CIRCUIT

When adjusting the following compensators, a Philco Set Transformer Part No. 32-2763 must be connected in the signal generator output circuit as follows: Insert the signal generator output lead into the "Med" jack and the ground lead into the "Gnd" jack of the signal generator.

Connect the other end of the output lead to terminal No. 1 on the Set Transformer and the cable ground to Terminal No. 2. No. 3 and 4 terminals of Set Transformer are then connected to the chassis and 6A7 grid respectively of the receiver with short pieces of wire. Insert a 0.1 mfd. in series with the No. 4 lead which connects to the grid.

Set the signal generator and receiver controls and adjust the I. F. compensators as follows:

1. Set Signal Generator at 470 K. C. Turn "Multiplier" Control to 1000 and the "Attenuator" for maximum output.
2. Turn the receiver dial to 580 K. C.
3. Range Switch Broadcast position.
4. Receiver volume control maximum.
5. Adjust compensators, (17A), (14B), (14A), for maximum output. If the output meter goes off scale when adjusting the compensators, retard the signal generator attenuator.

RADIO FREQUENCY CIRCUIT

Tuning Range: 2.3 to 7.4 M. C.

1. Remove terminal No. 4 lead of set transformer from the 6A7 grid and connect to the aerial wire of the receiver through a 400 ohm resistor. Remove the .1 mfd. condenser when using the 400 ohm resistor.

2. Set the controls and adjust the R. F. compensators as follows:

Range	Signal Generator
Switch	and Receiver Dial
Control	R. F. Compensators
Shortwave	6 M. C.
Max.	(4B)

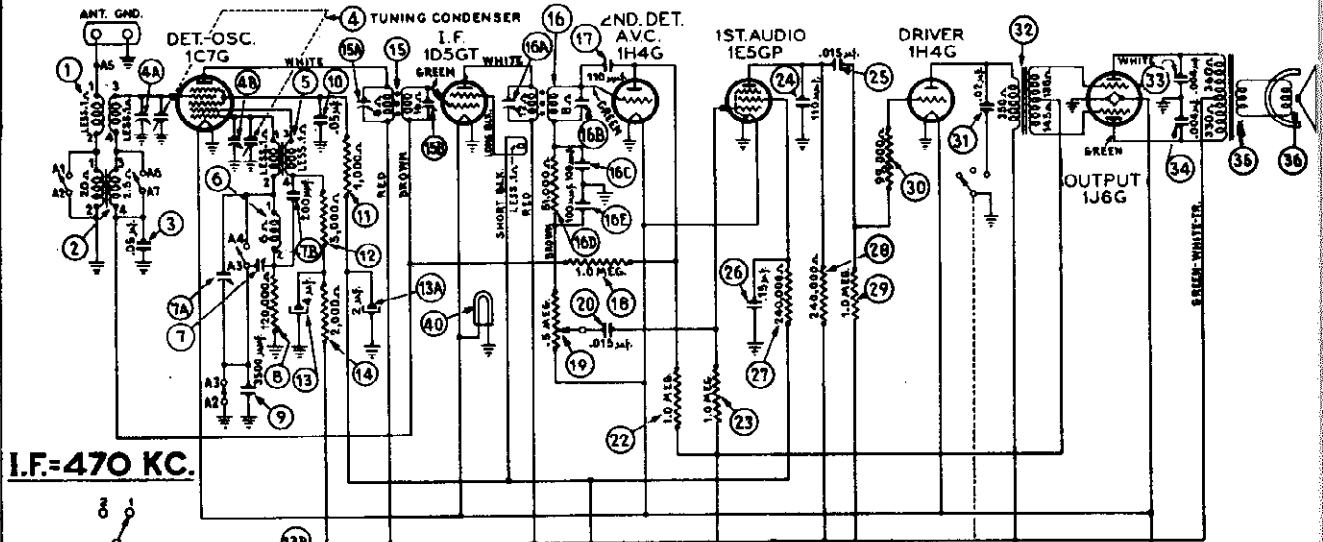

Tuning Range: 530 to 1730 K. C.

1. Remove the 400 ohm resistor from the No. 4 lead and replace with a 100 mmfd. condenser and reconnect to the aerial wire.

Set the controls and adjust the R. F. compensators as follows:

Range	Signal Generator	R. F. Compensators
Switch	and Receiver Dial	In Order
Broadcast	Control	
Max.	1550 K. C.	(12A), (4A)
Max.	580 K. C.	(17) Roll Tuning Condenser
Max.	1550 K. C.	(12A), (4A)

TRANSFORMERS SHOWN WITH INTERMEDIATE FREQUENCY: 470 K. C.
 TUNING RANGES: Two—Range 1, 5.30 to 1720 K. C.
 Range 2, 5.7 to 18.0 M. C.
 POWER OUTPUT: 1 watt.
 TYPE AERIAL: "L" type, Philco Part No. 45-2428.

CABINETS AND SPEAKERS USED:
 July, 1937
Model 38-38, Code 121

Cabinet Type	Speaker Used
T	KR26
K	HR20
X	HR20

TYPE OF CIRCUIT: Six tube, battery operated superheterodyne circuit, having two tuning ranges covering broadcast and short-wave frequencies; Automatic Volume Control; Tone Control, and a class "B" output stage.
 BATTERIES REQUIRED:
 "A" Battery: Two volt storage battery Philco type 172R or Dry "A" battery Philco Part No. 41-8011.
 If a dry A Battery is used, a ballast lamp "type 1F1" MUST be inserted in the socket provided in the (41-8011) battery. This lamp acts as a voltage regulator and maintains a constant potential of two volts on the filament of the tubes.
 "BC" Battery: Philco battery Part No. 41-8007 is used to supply "B" and "C" voltages. This battery contains a socket into which the receiver battery cable plug is inserted.

PHILCO TUBES USED: One 1C7G, 1st Det. & Osc.; one 1D5GT, I. F. amplifier; One 1H4G, 2nd Det. (A.V.C.), one 1E5GP, 1st Audio; one 1H4G, Audio Driver, and one 1J6G, output.

Alignment of Compensators

EQUIPMENT REQUIRED: (1) Signal Generator, having a fundamental frequency range covering the tuning and intermediate frequencies of the receiver. Philco Model 077 A. C. operated Signal Generator or Model 088, battery operated Signal Generator which have the required frequency range are the correct instruments for this purpose; (2) Output meter, Philco Model 026 circuit tester incorporates a sensitive output meter and is recommended; (3) Philco Fibre Handle Screw Driver, Part No. 27-7059 and Fibre Wrench, Part No. 3164.

OUTPUT METER: The 026 Output Meter is connected to the plate terminals of the 1J6G tube. Adjust the meter to use the (0-30) volt scale and advance the attenuator control of the generator until a readable indication is noted on the output meter after signal is applied.

DIAL CALIBRATION: In order to adjust the receiver correctly the dial must be aligned to track properly with the tuning condenser. To adjust the dial proceed as follows:

1. Turn the tuning condenser to maximum capacity position (plates fully meshed).
2. Holding the tuning condenser in this position, loosen the dial clamp; then turn the dial until the indicator is centered on the middle index line. Tighten clamp in this position. See Fig. 3

INTERMEDIATE FREQUENCY CIRCUIT

Insert the signal generator shielded output lead into the "Med" jack on the panel of the generator. Connect the other end of the output lead through a .1 mfd. condenser to the grid of the 1C7G Det. Osc. tube and the ground connection of the signal generator to the chassis. Set the signal generator and receiver controls and adjust the I. F. compensators as follows:

1. Set Signal Generator at 470 K. C. Turn "Multiplier" Control to 1000 and adjust the attenuator for a readable indication on the output meter.
2. Turn the receiver dial to 580 K. C.
3. Receiver Volume Control maximum.
4. Range Switch Broadcast Position.
5. Adjust compensators (16B), (16A), (15B) and (15A) for maximum output. If the output meter goes off scale when adjusting the compensators retard signal generator "attenuator."

RADIO FREQUENCY CIRCUIT

Tuning Range: 5.7 to 18 M. C.

1. With one end of the shielded lead of the signal generator output cable in the "Med" jack, connect the other end through a 400 ohm carbon resistor to the "Ant." terminal of the aerial panel of the receiver. The output lead ground must be connected to the "Gnd" terminal or to the chassis.

2. Set the controls and adjust the R. F. compensators as follows:

Volume Control	Range Switch	Signal Generator and Receiver Dial	Compensators in Order
Max.	2	18 M. C.	(4B) See Note A

Tuning Range: 530 to 1720 K. C.

Remove the 400 ohm resistor from the generator output cable and replace with a 200 mfd. condenser. Then set the controls and adjust the compensators as follows:

Volume Control	Range Switch	Signal Generator and Receiver Dial	Compensators in Order
Max.	1	1500 K. C.	(7A), (4A)
Max.	1	580 K. C.	(7)
Max.	1	1500 K. C.	(7A), (4A)

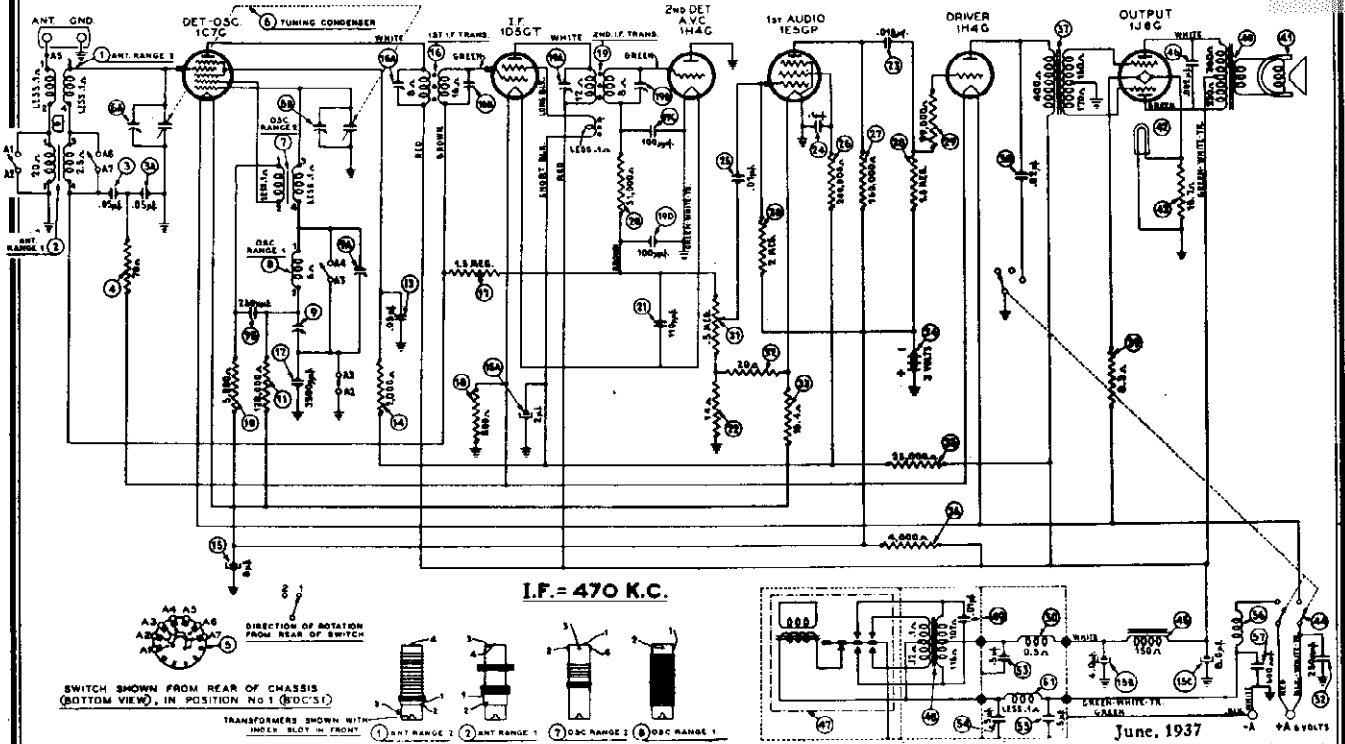

NOTE A—To accurately adjust the high frequency oscillator compensator to the fundamental instead of the image signal, turn the oscillator compensator to the maximum capacity position (clockwise). From this position slowly turn the compensator counter-clockwise until a second maximum peak is obtained on the output meter. Adjust the compensator for maximum output using this second peak. The first peak from maximum capacity position of the compensator is the image signal and must not be used in adjusting the compensator.

If the above procedure is correctly performed, the image signal will be found (much weaker) by turning the receiver dial 940 K. C. below the frequency being used on the high frequency range.

GLOWING BEAM INDICATOR
Dial Calibration

MODEL 38-39, Code 121
 PHILCO RADIO & TELEV. CORP. Schematic, Voltage
 Trimmers, Chassis

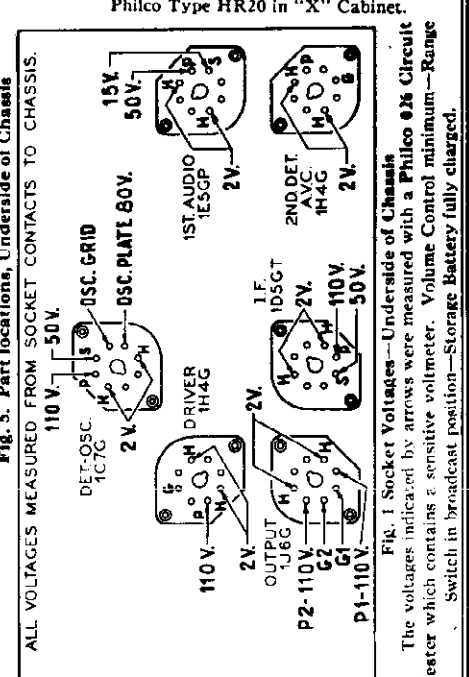

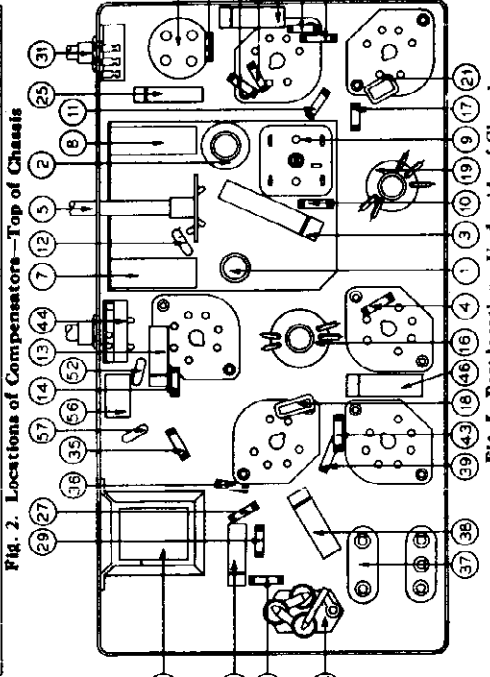

IF = 470 K.C.

TYPE OF CIRCUIT: A six tube superheterodyne circuit is used in this model having two tuning ranges covering standard and short wave broadcasts. The receiver is operated by a 6 volt storage battery and uses a synchronous vibrator for supplying "B" voltage. The vibrator unit is mounted in the cabinet and connected to the receiver chassis through a cable and plug. Additional design features included in this model are: Automatic Volume Control: two point tone control: Class "B" audio output circuit. The receiver is designed to operate from a standard "I" type aerial, Philco Part No. 45-242R. This aerial system should be used to obtain the maximum performance from the receiver. Instructions for installing the aerial are provided in each kit.

Model 38-39, Code 121

- POWER SUPPLY:** 6 volt storage battery Philco Type 116K
Current Drain 1.4 Amps.
- INTERMEDIATE FREQUENCY:** 470 K. C.
- FREQUENCY RANGES:** Range one 530 to 1720 K. C.
Range two 5.7 to 18.0 M. C.
- OUTPUT:** 1.5 watts.
- SPEAKERS USED:** Philco Type KR26 in "T" Cabinet.
Philco Type HR20 in "K" Cabinet.
Philco Type HR20 in "X" Cabinet.

 TUNING RANGE: Two—Range one 530 to 1720 K. C.
 Range two 2.3 to 7.4 M. C.
 UNDISTORTED OUTPUT: 3 watts.
 TONE CONTROL: Two position.

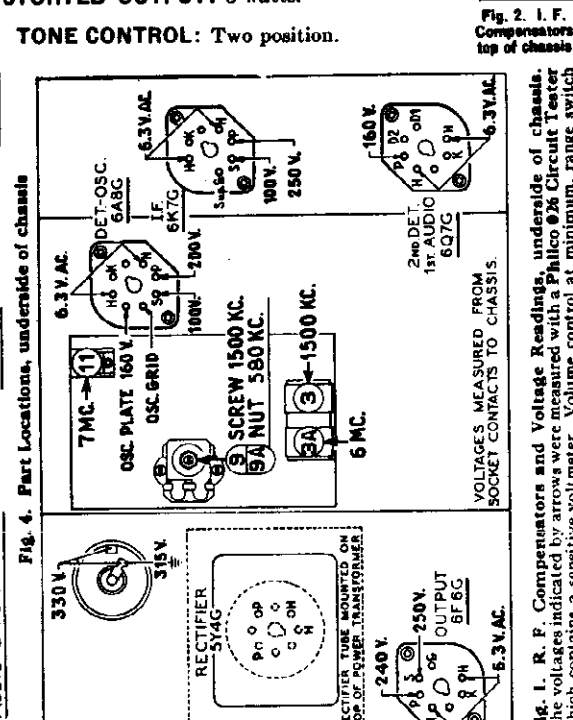

Electrical Specifications

TYPE CIRCUIT: Superheterodyne, with Automatic Volume Control and a pentode audio output circuit.

POWER SUPPLY: Voltage
 115
 115
 115/220

Consumption
 60 watts
 60 watts
 60 watts

PHILCO TUBES USED: One 6A8G, Det. Osc.; one 6K7G, I. F.; one 6Q7G, 2nd Det. audio; one 6F6G, audio output; and one 5Y4G, Rectifier.

MODEL 38-60, Code 125
Alignment, Parts

PHILCO RADIO & TELEV. CORP.

Alignment of Compensators

EQUIPMENT REQUIRED: (1) Signal Generator using a fundamental frequency range covering the intermediate and tuning ranges of the receiver. Philco Model 077 Signal Generator which has a fundamental frequency range from 115 to 36,000 K. C., is the correct instrument for this purpose; (2) output meter, Philco Model 026 circuit tester incorporates a sensitive output meter, and is recommended; (3) Philco Fibre Handle Screw Driver, part No. 27-7059 and Fibre Wrench part No. 3164.

OUTPUT METER: The 026 output meter is connected to the plate and cathode terminals of the 6F6G tube. Adjust the meter to use the (0-30) volt scale and advance attenuator control of the generator until a readable indication is noted on the output meter after a signal is applied to the receiver in the following adjustments.

DIAL CALIBRATION: In order to adjust this receiver correctly the dial must be aligned to track properly with the tuning condenser. To do this proceed as follows:

1. Turn the tuning condenser to the maximum capacity position, then loosen dial hub, set screws and rotate the dial (condenser at maximum capacity) until the glowing beam indicator is centered between the first and second index lines at the low frequency end of the broadcast scale.

2. With dial in this position, tighten dial hub set screws.

INTERMEDIATE FREQUENCY CIRCUIT

Connect the 077 signal generator output lead through a .1 mfd. condenser to the control grid of the 6A8G tube and the ground connection of the output lead to the chassis. Then set the controls of the signal generator and receiver as follows:

- a. Signal Generator 470 K. C.
- b. Receiver dial at 580 K. C.
- c. Range switch of receiver at Range One.
- d. Volume Control maximum.
- e. Adjust I. F. Compensator (18B), (18A), (14B), (14A) for maximum output.

RADIO FREQUENCY CIRCUIT

Tuning Range 530 to 1720 K. C.

1. Connect the signal generator output lead through a 200 mmfd. condenser from the "med" post of the generator to the aerial terminal; and the output lead ground connection to the chassis.

2. The R. F. Compensators are adjusted as follows for maximum output:

Range Switch Position	Signal Generator and Receiver Dial	Compensators in Order
1	1500 K. C.	(9) (3)
1	580 K. C.	(9A) Note A
1	1500 K. C.	(9) (3)

Tuning Range 2.3 to 7.4 M. C.

Remove the 200 mmfd. from the output lead and replace with a 400 ohm carbon resistor and reconnect to the antenna terminal.

Range Switch Position	Signal Generator and Receiver Dial	Compensators in Order
2	7.0 M. C.	(11)
2	6.0 M. C.	(3A)

NOTE A—First tune compensator (9A) for maximum output, then vary the tuning condenser of the receiver for maximum output about the 580 K. C. dial mark. Now turn compensator (9A) slightly to the right or left and vary the receiver tuning condenser for maximum out-

If the output reading increases, turn compensator (9A) in the same direction a trifle more, and again vary the tuning condenser for maximum output. If the output decreases, set the compensator in the opposite direction. This procedure of first setting the compensator and then varying the tuning condenser is continued until there is no further gain in output reading.

Alignment of Compensators

EQUIPMENT REQUIRED: (1) Signal Generator—Philco Model 077 Signal Generator—using fundamental frequency from 115 to 36000 K. C. is the correct instrument for the purpose; (2) Output Meter, Philco Model 026 circuit tester incorporates a sensitive output meter and is recommended; (3) Philco Fibre Handle Screw Driver, part No. 27-7059 and Fibre Wrench part No. 3164.

OUTPUT METER: The 026 output meter is connected to the plate and cathode terminals of the 6F6G tube. Adjust the meter to use the (0-30) volt scale and advance attenuator control of the generator until a readable indication is noted.

DIAL CALIBRATION: In order to adjust this receiver correctly the dial must be aligned to track properly with the tuning condenser. To do this proceed as follows:

1. Turn the tuning condenser to the maximum capacity position. Then loosen dial hub, set screws and rotate the dial (condenser at maximum capacity) until the glowing beam indicator is center on second index line at the low frequency end of the broadcast scale.

2. With dial in this position, tighten dial hub set screws.

INTERMEDIATE FREQUENCY CIRCUIT

Insert the signal generator output lead in the med. jack, and connect the other end through a .1 mfd. condenser to the grid of the 6A8G det. osc. tube. The ground connection of the signal generator is connected to the chassis. Set the signal generator controls and adjust the I. F. compensators as follows:

- a. Set 077 Signal Generator indicator at 470 K. C. Turn the multiplier control to 1000, and set the gain control for maximum output.
- b. Receiver Dial 580 K. C.
- c. Receiver volume control full "on".
- d. Adjust compensator (24B), (24A), (16B) and (16A) for maximum output.

If the output meter goes off scale when adjusting the compensators retard signal generator attenuator.

RADIO FREQUENCY CIRCUIT

Tuning Range 530 to 1650 K. C.

1. Insert the signal generator output lead in the "medium jack" on the panel, and connect the other end through the .1 mfd. condenser to the antenna terminal of the receiver. The output lead ground must be connected to the chassis.

2. Leave the receiver volume control full on. Then set the controls and adjust the R. F. compensators as follows:

Range Switch Position	Signal Generator and Receiver Dial	Compensators In Order
1	1500 K. C.	(5C), (5B), (5A)
1	580 K. C.	(10) (See Note A)
1	1500 K. C.	(5C), (5B), (5A)

Tuning Range 1500 to 3700 K. C.

The alignment of this tuning range is taken care of by the Range 1 adjustments.

NOTE A—First tune compensator (10) for maximum output, then vary the tuning condenser of the receiver for maximum output about the 580 K. C. dial mark. Now turn compensator (10) slightly to the right or left and vary the receiver tuning condenser for maximum output. If the out reading increases, turn compensator (10) in the same direction a trifle more, and again vary the tuning condenser for maximum output. If the output decreases, set the compensator in the opposite direction. This procedure of first setting the compensator and then varying the tuning condenser is continued until there is no further gain in output reading.

PHILCO RADIO & TELEV. CORP.

Alignment of Compensators

EQUIPMENT REQUIRED: (1) Signal Generator, having a fundamental frequency range covering the tuning and intermediate frequencies of the receiver. Philco Model 077 Signal Generator which has a fundamental frequency range from 11.5 to 36000 K. C. is the correct instrument for this purpose; (2) Output Meter, Philco Model 926 Circuit Tester incorporates a sensitive output meter and is recommended; (3) Philco Fibre Handle Screw Driver, Part No. 27-7059 and Fibre Wrench, Part No. 3164.

OUTPUT METER: The 026 Output Meter is connected to the plate and cathode terminals of one of the 6L6G tubes. Adjust the meter to use the (0-30) volt scale and advance the attenuator control of the generator until a readable indication is noted on the output meter after signal is applied to stage being adjusted.

DIAL CALIBRATION: In order to adjust the compensators of this receiver correctly the dial must be aligned to track properly with the tuning condenser. To do this proceed as follows:

1. Loosen the set screws on the shaft coupling of the tuning condenser. Then turn the tuning condenser until the plates are in the maximum capacity position. Now turn the dial until the glowing beam indicator is on the Index Line at the low frequency end of the broadcast band. See Fig. 6. With dial and tuning condenser in this position tighten set screws.
2. Turn the tuning condenser control until the indicator is on the 520 K.C. mark. See Fig. 6.
3. With the dial in this position, loosen the shaft coupling set screws. Then turn the dial until the indicator is again on the Index Line. Tighten the set screws in this position.

NOTE: Be careful when turning the dial that the position of the tuning condenser is not disturbed.

INTERMEDIATE FREQUENCY CIRCUIT

1. Viewing each instrument from the front, set the receiver and Signal Generator controls as follows:

- a. Selectivity-fidelity control (clockwise)
- b. Volume Control at maximum (clockwise)
- c. Magnetic Tuning switch (off)
- d. Bass Compensator switch first position from "off"
- e. Range Switch position one (broadcast)
- f. Receiver dial 580 K. C.
- g. Signal Generator indicator set at 470 K.C. and the "Attenuator" control for maximum output.

GLOWING BEAM INDICATOR

Fig. 6. Dial Calibration

2. Connect the Signal Generator output cable through a .1 mfd. condenser to the grid of the second 6K7G I. F. tube. Then adjust the I. F. compensators as follows:

- a. Close compensator (82B) by turning to the extreme clockwise position, then pad compensator (82A) for maximum output. Now readjust compensator (82B) for maximum output.
- b. Connect the Signal Generator output lead through the .1 mfd. condenser to the grid of the 6L7G tube, and adjust the following compensators for maximum output: (81D), (81C), (81A), (81B).
- c. Repeat (82A)—See Note A. Check for two equal peaks. Fidelity control in expanded position (counter-clockwise).

RADIO FREQUENCY CIRCUIT

1. Set the controls as given under "Intermediate Frequency Circuit" (a-b-c-d) and set the Range Switch, Signal Generator and Receiver Dials as given under the adjustments of each tuning range in the following procedure. Connect the Signal Generator output cable to the "Red" and "Blk" terminals on the aerial panel (rear of chassis). The ground connection of the cable should be connected to the "Blk" terminal.
2. Set the controls and adjust the compensators for maximum output as follows:

Alignment, Part 2
Voltage

PHILCO RADIO & TELEV. CORP.

Aerial Connections

To obtain the full advantage of the sensitivity of this receiver the Philco High Efficiency Aerial supplied with the instrument must be used. Connect the aerial as follows: the "Red" and "Blk" terminals respectively. Connect the "Gnd" terminal to a good ground source. If a temporary aerial is used, connect it to the "Red" terminal.

The aerial terminal panel located on the rear of the chassis, contains three terminals marked "Red," "Blk" and "Gnd". Connect the red and black wires of the aerial lead in (Transmission Line) to

NOTE: The receiver dial **MUST** be tuned very accurately to the 1000 K. C. signal in order to make the following adjustments correctly.

e. After adjusting the receiver dial, turn the Magnetic Tuning switch "on."

f. Now, turn compensator (83B) slightly to the right or left (about 1/4 turn) and proceed with adjustment "g."

g. Adjust compensator (83A) primary of the discriminator transformer for **minimum** output; then readjust compensator (83B) secondary of discriminator transformer for **maximum** output.

The above adjustments are now checked for accuracy as follows:

- Frequency Test:**
With the 1000 K. C. signal tuned for maximum output turn the Magnetic Tuning control back and forth; that is, from the "out" to "in" position. The reading of the output meter should not change in either position. If the output meter reading changes, the above magnetic tuning circuit adjustments should be repeated.
- Sensitivity Test:**
1. To check the magnetic tuning circuit for sensitivity, turn the magnetic tuning switch to the "off" position, and tune in the 1000 K. C. signal. Then adjust the "attenuator" control of the signal generator for a good audible signal. Approximately 20 volts on the output meter.
2. Now detune the signal (first above and then below the 1500 K. C. mark) to a point at which the signal is weakly heard. At each point turn the magnetic tuning control "on." When the control is turned on the signal should return to normal output strength. If the magnetic tuning circuit does not pull the signal into resonance, the primary compensator (83A) should be carefully readjusted.

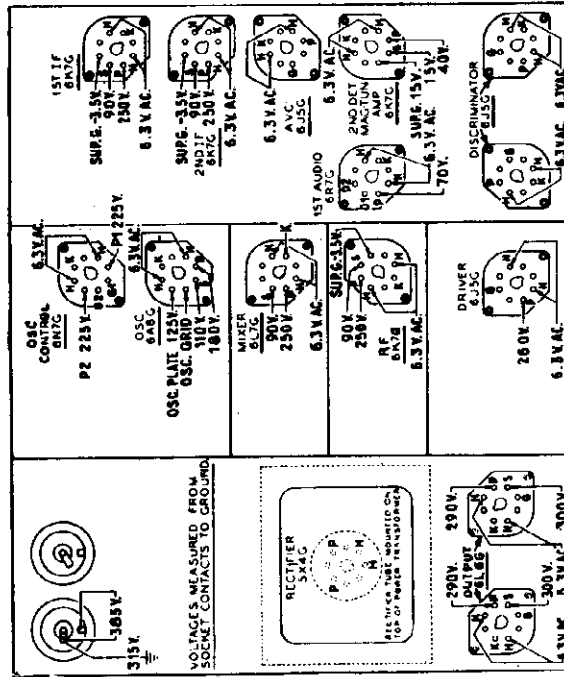

Fig. 1. Underside View of Chassis showing Socket Voltages
The voltages indicated by the arrows were measured with a Philco 926 Circuit Tester, which contains a sensitive voltmeter. Line voltage 115 A. C.—Volume control minimum—Dial set at point where no signal is present.—Range Switch in broadcast position.

- Tuning Range 1.58 to 4.75 M. C.**
- Range Switch and Receiver Dial
 - Position 2 4.5 M. C.
 - Position 2 1.7 M. C.
 - Position 2 4.5 M. C.
- Tuning Range 11.5 to 18.2 M. C.**
- Range Switch and Receiver Dial
 - Position 5 18.0 M. C.
 - Position 5 12.0 M. C.
 - Position 5 18.0 M. C.
- Position 5 12.0 M. C.
 - Position 5 18.0 M. C.

NOTE "A":—Slowly shift signal generator indicator between 460 and 480 K. C. As the indicator is turned, two peaks will be noted on the Output Meter; one about 465 K. C. and the other about 475 K. C. These peaks should give the same deflection or resting on the output meter. If the peaks are unequal Compensator (82A) must be slightly readjusted to the right or left (not more than 1/4 of a turn) until the peaks are equalized. This adjustment is used to compensate for slight differences between peaks. If the compensator must be turned more than 1/4 of a turn in either direction to equalize the peaks, all "B" and "C" adjustments should be carefully readjusted as given under "Intermediate Frequency Circuit" adjustment procedure. Each time the compensator is set in another position, rotate the signal generator through the 400 or 480 K. C. range and note the reading of each peak.

NOTE "B":—When adjusting the low frequency compensator of Range One (Broadcast) or the antenna and R. F. compensator of the high frequency tuning ranges; the receiver Tuning Condenser must be adjusted (rolled) as follows: First tune the compensator for maximum output, then vary the tuning condenser of the receiver for maximum output about the frequency dial mark. Now turn the compensator slightly to the right or left and vary the receiver tuning condenser for maximum output. If the output reading increases, turn the compensator in the same direction a trifle more, and again vary the tuning condenser for maximum output. If the output decreases set the compensator in the opposite direction. This procedure of first setting the compensator and then varying the tuning condenser is continued until there is no further gain in output reading.

NOTE "C":—To accurately adjust the high frequency oscillator compensator to the fundamental instead of the image signal, turn the oscillator compensator to the maximum capacity position (clockwise). From this position slowly turn the compensator counter-clockwise until a second maximum peak is obtained on the output meter. Adjust the compensator for maximum output using this second peak. The first peak from maximum capacity position of the compensator is the image signal and must not be used in adjusting the compensator.

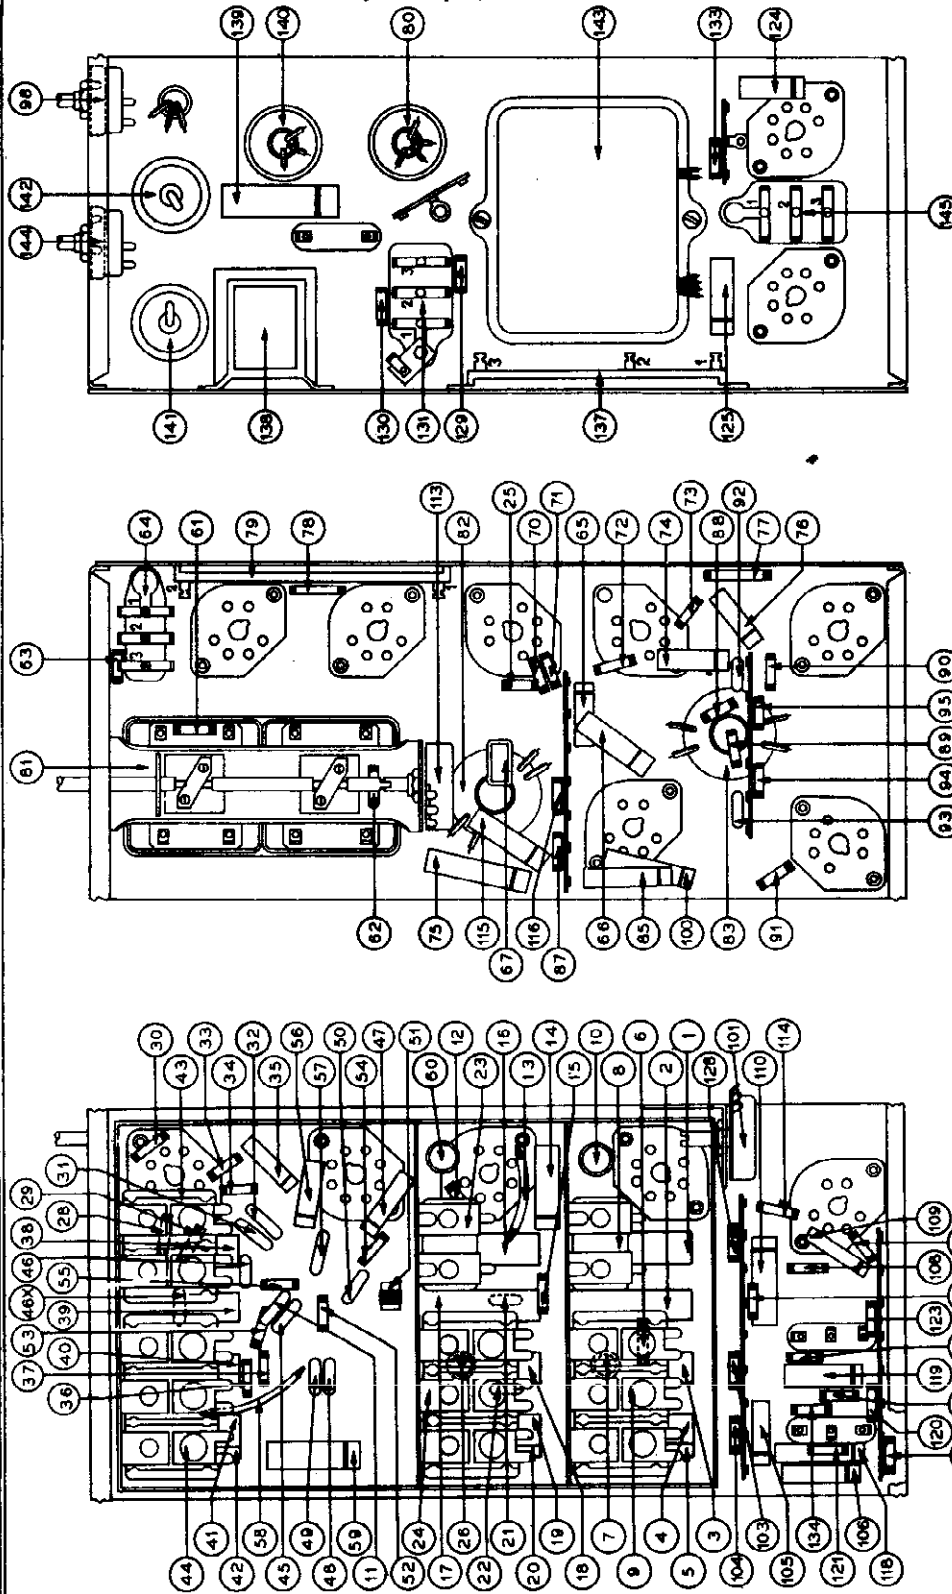

If the above procedure is correctly performed, the image signal will be found (much weaker) by turning the receiver dial 940 K. C. below the frequency being used on any high frequency range.

MAGNETIC TUNING CIRCUIT ADJUSTMENT

- a. Set the Magnetic Tuning switch in the "out" position (counter-clockwise).
- b. Volume control maximum (extreme clockwise).
- c. Turn Treble-Selectivity control to the expanded position (extreme clockwise).
- d. Now, adjust the "Attenuator" control of the signal generator for a weak signal, and turn the indicator to 1000 K. C. Then adjust the receiver dial for maximum output at this frequency.

PHILCO RADIO & TELEV. CORP. Chassis, Notes

PHILCO TUBES USED: 6K7G R.F.; 6L7G Mixer; 6A8G Oscillator; 6N7G Oscillator control; two 6K7G I. F.; 6K7G 2nd Detector Magnetic tuning amplifier; two 6J5G discriminator; 6J5G A. V. C.; 6R7G 1st audio; 6J5G audio driver; two 6L6G audio output, and one 5X4G rectifier.

FREQUENCY RANGES:

- Range One 530 to 1600 K.C.
- Two 1.58 to 4.75 M.C.
- Three 4.7 to 7.4 M.C.
- Four 7.35 to 11.6 M.C.
- Five 11.5 to 18.2 M.C.

UNDISTORTED OUTPUT:
15 watts.

CABINET: Type XX.

Fig. 2. Underside View of Chassis
Different transformers are required for operation on the voltages and frequencies listed above. The part numbers for these transformers are listed on page 5. A special transformer for operation on either 115 or 230 volt—50 to 60 cycle A.C. power circuit can be obtained. This transformer is provided with a plug and socket for selection of either voltage rating. Place the plug with arrow pointing toward voltage being used.

PLCO SPEAKERS USED: One type "W4" with three acoustic clarifiers.

TONE CONTROLS: Two—1. High audio-frequency tone varied by Treble-Selectivity control.
2. Low audio-frequency tone varied by "Bass Tone Control," in the volume control circuit.

TYPE OF CIRCUIT: Model 38-116, code 121 employs a fifteen tube A.C. operated superheterodyne circuit with a spread-band dial having five tuning ranges covering a frequency range from 530 K.C. to 18.2 M.C.

Incorporated in this model are design features such as: magnetic tuning control on each tuning range; automatic volume control; treble-selectivity expander unit in the intermediate frequency circuit; audio bass compensation; acoustic clarifiers to eliminate cabinet resonance; special push-pull audio output circuit using 6L6G beam tubes; and the Philco automatic tuning mechanism.

POWER SUPPLY:	Voltage	Frequency Cycles	Power Consumption
	115	50 to 60	165 watts
	115	25 to 40	165 watts

"	"	"	...	6	Max.
"	600 k.c.	60	...	7	Max.**
"	1400 k.c.	140	...	4	Max.

* Connect a 200-mmf. condenser between signal generator and antenna post of set, at the antenna post.
 ** While rocking.

MODEL NO. 80

Signal Generator Connection	Signal Generator Frequency	Dial Position	Wave Band Switch Position	Trimmer Number	Output Signal
Remove grid clip from det.-osc.					
Control grid of det.-osc.	460 k.c.	55	...	1	Max.
"	"	"	...	2	Max.
Connect grid clip to det.-osc.					
Ant.*	1400 k.c.	140	...	3	Max.
"	"	"	...	4	Max.
"	600 k.c.	60	...	5	Max.**
"	1400 k.c.	140	...	3	Max.**
Note 1	Note 1	Note 1	...	6	Note 1

* Use a 100-mmf. condenser as dummy antenna.
 ** While rocking.

Note 1.—Connect antenna to receiver. Tune in station, first at about 130 and adjust (6) to a point just before squealing starts. Tune in stations along other points on dial. If squealing is present at any point readjust (6) slightly until there is none at any point along dial. This adjustment may have to be changed if set is moved to different location or if antenna length or 2nd det. tube is changed.

MODEL NO. 81

Signal Generator Connection	Signal Generator Frequency	Dial Position	Wave Band Switch Position	Trimmer Number	Output Signal
Remove grid clip from det.-osc.					
Control grid of det.-osc.	460 k.c.	55	Broadcast	1	Max.
"	"	"	"	2	Max.
Connect grid clip to det.-osc.					
Ant.*	1400 k.c.	140	"	3	Max.
"	"	"	"	4	Max.
"	600 k.c.	60	"	5	Max.**
"	1400 k.c.	140	"	3	Max.
"	2400 k.c.	2400 k.c.	Police	6	Max.
"	1700 k.c.	1700 k.c.	"	7	Max.
Note 1	Note 1	Note 1	Broadcast	8	Note 1

* Use a 100-mmf. condenser as dummy antenna.
 ** While rocking.
 Note 1.—Connect antenna to receiver. Tune in station, first at about 130 and adjust (6) to a point just before squealing starts. Tune in stations along other points on dial. If squealing is still present, back off (8) slightly until there is none at any point along dial. This adjustment may have to be changed if antenna length or 2nd det. tube are changed.

Alignment, Trimmers

PHILCO RADIO & TELEV. CORP.

MODELS 95, 96, 296
 MODEL 503
 MODEL 504
 MODEL 505

MODEL NOS. 95, 96, 296

MODEL NO. 505					
Signal Generator Connection	Signal Generator Frequency	Dial Position	Wave Band Switch Position	Trimmer Number	Output Signal
Remove grid clip from 6A7					
Control grid of 6A7	460 k.c.	55	Broadcast	1	Max.
"	"	"	"	2	Max.
"	"	"	"	3	Max.
Connect grid clip to 6A7

"	"	"	3rd ¹	Max.
"	"	"	R.F.	Max.
"	"	"	2nd ¹	Max.
"	"	"	R.F.	Max.
"	"	"	Ant. ¹	Max.

Note 1.—Located on top of chassis, behind gang condenser and between r.f. coil shields.

* Connect a 200-mmf. condenser between the signal generator and the antenna post of the set, at the antenna post.

Note 1.—Wave trap in series with antenna was not used on early production.
 Note 2.—H.F. osc. and ant. trimmers are located on tuning-condenser frame—the ant. trimmer is nearest front of chassis.
 Note 3.—Set signal generator frequency to same as point on dial chosen near low frequency end. Adjustment of (5) will correct the dial calibration.
 * Connect a 200-mmf. condenser between signal generator and antenna post of set, at the antenna post.
 ** While rocking.

MODEL NO. 503

Signal Generator Connection	Signal Generator Frequency	Dial Position	Wave Band Switch Position	Trimmer Number	Output Signal

"	1400 k.c.	1400 k.c.	Range 1	5	Max.
"	520 k.c.	520 k.c.	"	6	Max.

* Use a 200-mmf. condenser as dummy antenna on broadcast band and a 400-ohm carbon resistor on shortwave band.
 Note 1.—Nut adjustment.
 Note 2.—Screw adjustment.
 Caution: The two trimmers on the rear sections of the tuning condenser gang are correctly adjusted and sealed at the factory. Do not change this adjustment.

MODEL 98

Chassis, Parts

PHILCO RADIO & TELEV. CORP.

Fig. 3. Bottom View of Chassis

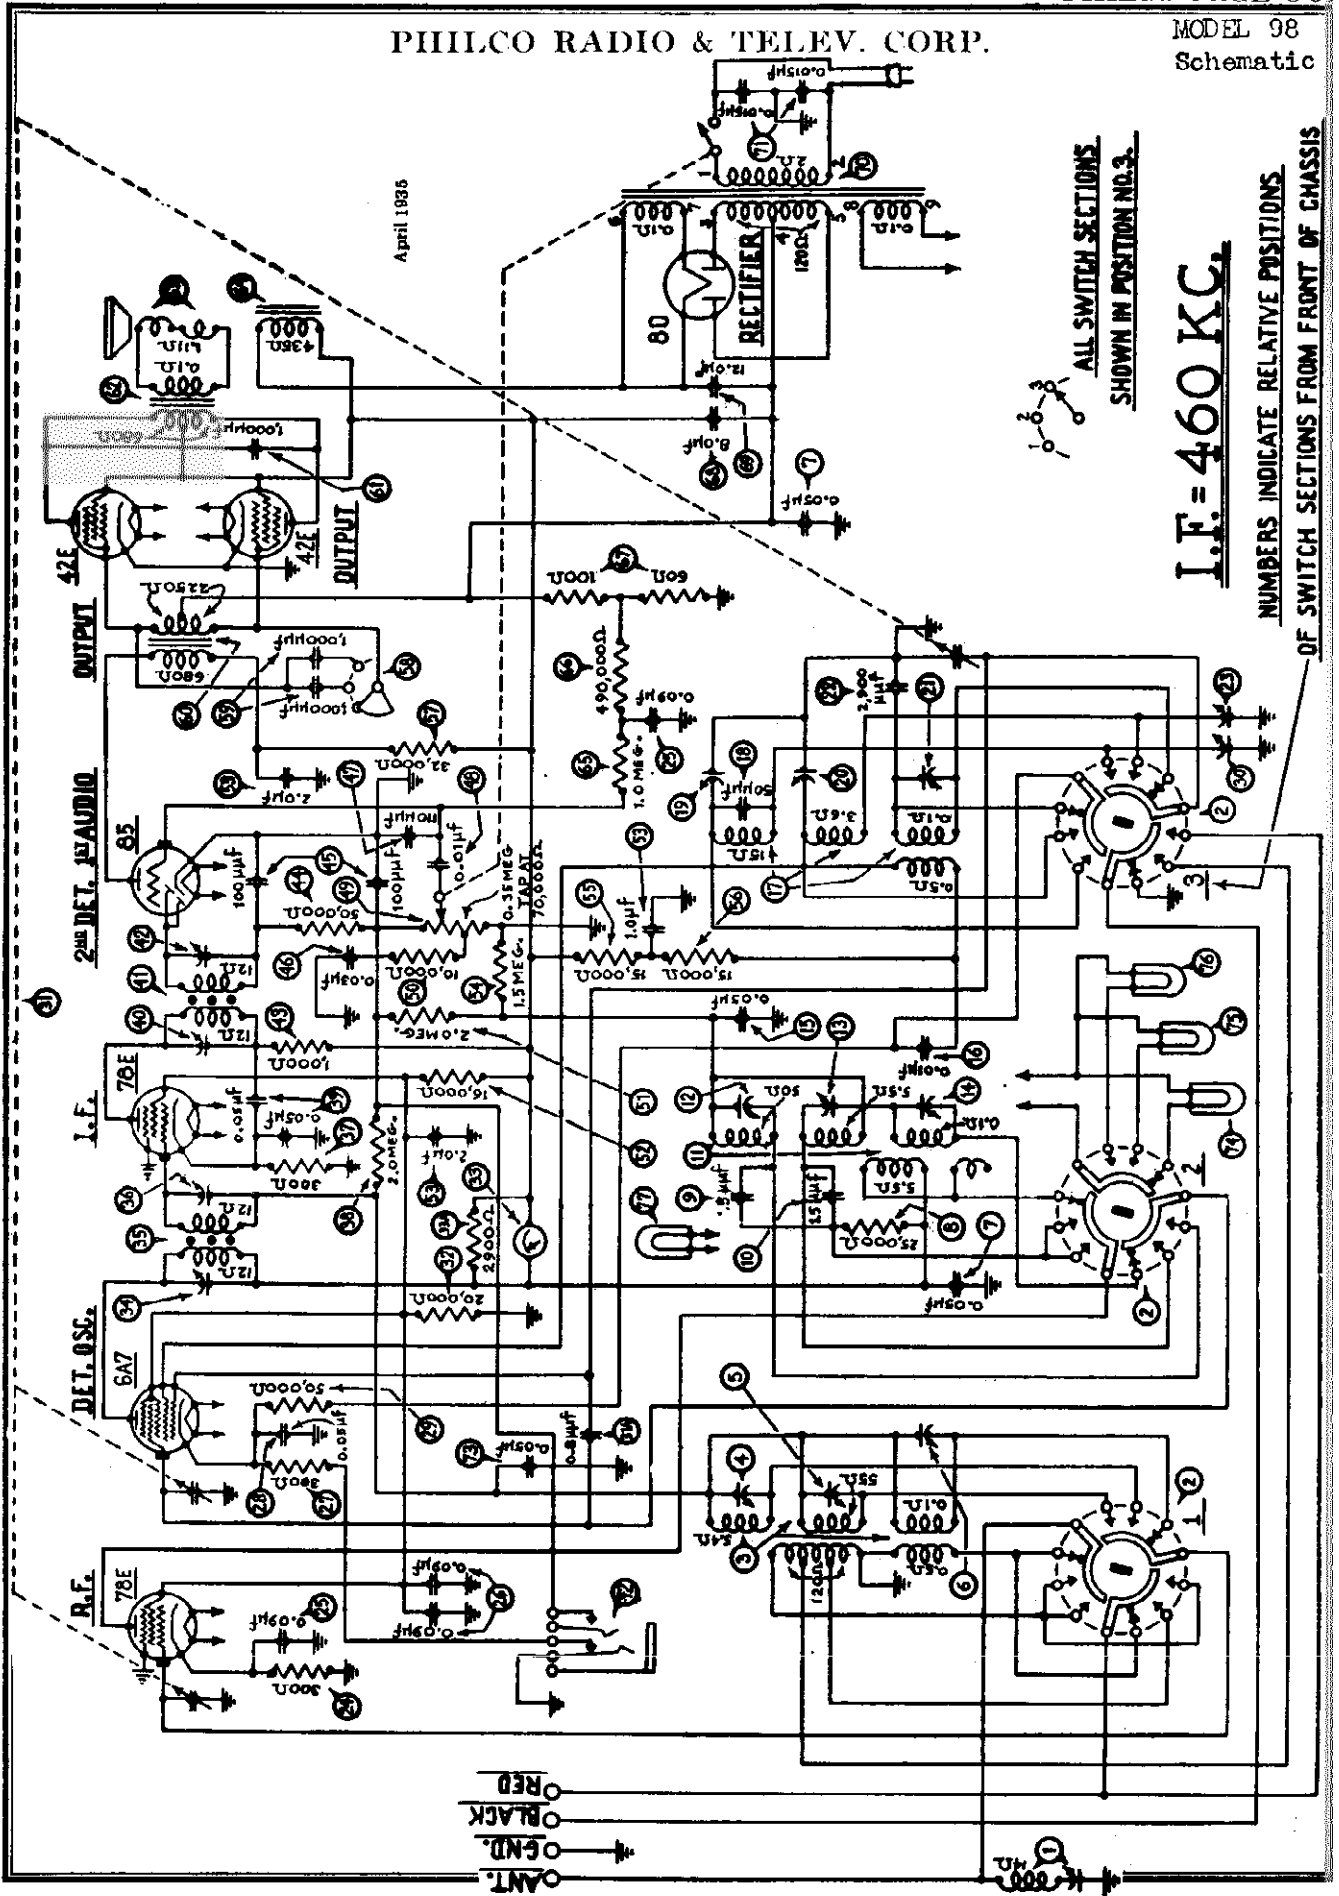

Description	Part No.
1 Wavetrap	38-6718
2 Waveband Switch	42-1106
3 Ant. Transformer	32-1664
4 Compensating Condenser (Ant., Medium Wave)	Part of 3
5 Compensating Condenser (Ant., Long Wave)	Part of 3
6 Compensating Condenser (Ant., Short Wave)	Part of 3
7 Condenser (.05 Mfd. Twin Bakelite Block)	3615-DG
8 Resistor (25000 ohms) (Red, Green, Orange)	3656
9 Condenser (.0000015 Mfd.)	Part of 11
10 Condenser (.0000015 Mfd.)	Part of 11
11 R.F. Transformer	32-1666
12 Compensating Condenser (R.F. Long Wave)	Part of 11
13 Compensating Condenser (R.F. Medium Wave)	Part of 11
14 Compensating Condenser (R.F. Short Wave)	Part of 11
15 Condenser (.05 Mfd. Tubular)	30-4020
16 Condenser (.01 Mfd. Tubular)	30-4169
17 Oscillator Transformer	32-1665
18 Condenser (.00005 Mfd. Mica)	30-1029
19 Compensating Condenser (Osc., Long Wave Series)	31-6044
20 Compensating Condenser (Osc., Medium Series)	31-6044
21 Compensating Condenser (Osc., Short Wave)	Part of 17
22 Condenser (.0029 Mfd. Mica)	30-1054

Adjusting Compensating Condensers

The adjustment of the compensating condensers in Model 98 requires a signal generator covering the broadcast and police band, and also one capable of producing a signal on several frequencies in the short wave band. We recommend the Philco model 024 or 048A instrument for the broadcast frequencies, and the Model 091 crystal controlled short wave signal generator for the "short wave" frequencies. The location of all compensating condensers is shown in Fig. 4.

Adjustment of I. F.

1. Remove the antenna connection from the receiver, disconnect the grid clip from the first detector (type 6A7 tube), and connect the "ANT" output terminal of the Model 048A or 024 signal generator to the grid cap of this tube; connect the "GND" terminal of the signal generator to the "GND" terminal of the receiver.
2. Connect the 0 to 20 volt range of the output meter in the Model 048A or 025 tester to the plate prongs of the two output (42E) tubes or to the two bottom prongs of the speaker plug.
3. Adjust the signal generator to a frequency of 460 K.C. Place the receiver in operation with the dial turned to the low frequency end of the scale, wave band switch to center position, and with the volume control adjusted near its maximum setting. Adjust the signal generator attenuator for approximately half-scale reading of the output meter.
4. The I.F. compensating condensers are located at the tops of the I.F. coil shields (smaller square top cans) and adjusted thru hole in top. The primary is adjusted by the screw, and the secondary by the nut. Adjust condensers ④ and ⑤ (2d I.F.) for maximum reading in the output meter, and then condensers ③ and ⑥ (1st I.F.).

Adjustment of Wave-Trap

Connect the signal generator leads to the antenna and ground terminals of the receiver. Replace the grid clip on the 6A7 grid cap.

With the signal generator still in operation at 460 K.C., adjust the wave-trap ① condenser until a MINIMUM reading is obtained on the output meter. The Philco fibre wrench, part No. 3164, is used for this adjustment.

Adjustment of High and Low Frequency Compensators

1. Leaving the output meter connected to the receiver connect the Philco Model 091 signal generator to the antenna and ground terminals of the chassis and place the signal generator in operation
2. Turn the wave-band switch to the extreme right (short-wave) and adjust the station selector to 18.0 megacycles, at which point the fifth harmonic of the 3600 K.C. signal will be heard. By means of the Philco wrench, part No. 3164, adjust the oscillator S.W., R.F.S.W. and antenna S.W. compensators for maximum reading in the output meter. These are numbered ⑩, ⑪ and ⑫, respectively in figure No. 2.
3. It will now be necessary to again use the broadcast type signal generator Models 024, 048 or equivalent. Connect the output of this signal generator to the antenna and ground terminals of the chassis. Turn the waveband switch to center position and set the station selector dial at 1700 K.C. Adjust the signal generator to the same frequency. Adjust the three compensators for the H.F. end of the broadcast (medium) scale. These are ⑬, ⑭ and ⑮.
4. Turn the dial to 60 and set the signal generator at 600 K.C. Adjust compensator ⑯ (nut) for maximum output.
5. Turn the waveband switch to the extreme left (long-wave) and set the dial at 30 and the signal generator at 300. Adjust condensers ⑰, ⑱ and ⑲ (oscillator, R.F. and antenna) for maximum output.
6. Turn the dial to 17 and set signal generator at 170. Adjust condenser ⑲ (screw) (long-wave series) for maximum output.

Voltage, Alignment
Trimmers
Transformer Data

PHILCO RADIO & TELEV. CORP.

MODELS 233G, 233AG
Alignment, Trimmers

Models 264 and 265

Philco Models 264 and 265 are five-tube superheterodyne radio receivers designed for operation on alternating current. The voltage and frequency for which each type of these models is intended is indicated on the chassis nameplate.

These receivers cover two bands or ranges of receivable frequencies: (1) Long waves or low frequency from 140 to 320 kilocycles (2140 to 935 meters), and (2) medium wave or standard (American) frequencies, from 540 to 1600 kilocycles (555 to 200 meters). A switch on the panel permits quick change from one to the other range.

The tubes used are: 1 type 6A7 detector-oscillator; 1 type 78-E intermediate frequency; 1 type 75 2d detector-1st A. F.; 1 type 42-E output, and 1 type 80 rectifier. The intermediate frequency is 125 kilocycles (K. C.) and the power consumption is 65 watts. The chief difference between Models 264 and 265 is that the latter is equipped with a shadow tuning meter and a phonograph jack.

*Values made with high resistance voltmeter. Refer to Fig. 1.

Models 233G and 233AG

Models 233G and 233AG are battery operated radio receivers covering a frequency range of 535 to 1510 kilocycles (standard wave) and 145 to 310 kilocycles (long wave). A two-position switch changes from one range to the other. The upper scale on the dial covers standard frequencies; the lower scale, low frequencies or long waves.

Model 233G is to be operated from a 2-volt storage (wet) cell for the filament voltage; model 233AG uses a dry battery for the filament supply. The 233AG requires the use of a ballast tube (in the socket provided on the chassis); in model 233G the ballast tube is not needed, and the jumper clip should be left across the two contacts of the ballast tube socket.

These sets use two type 32-E tubes,—one as radio frequency amplifier and one as detector—and one pentode output tube, type 210L.

Models 233G and 233AG utilize the regeneration or "reaction" circuit. This feature is controlled by the reaction control knob (see Fig. 1).

The filament current drain is 0.42 Ampere and the "B" or plate battery drain varies from 12 M. A. to 14 M. A.

Adjusting Compensating Condensers

There are three compensating condensers in these sets. Two are located on the top of the sections of the tuning condenser gang; and one underneath chassis and reached from the rear (thru hole in sub-base).

Connect the set up to the batteries and the antenna lead from signal generator to antenna post of set. Set signal generator at 1500 K.C. Turn wave-band switch to right and set dial at 150. (If set is removed from cabinet, obtain a piece of flat steel, .006" thick, about 1/2" wide and four or five inches long; open condenser gang and bring heel of detector section down on this steel strip; then remove the strip without disturbing setting of condenser gang).

Turn volume control full on and reaction control about 3/4 of the way to full on; then with a suitable hex wrench (such as Philco No. 3164) adjust condensers (A) and (B) (located on tuning condenser gang) to obtain maximum reading in the output meter, which should be connected to primary terminals of the output transformer.

While making the adjustment, advance the reaction control as far as possible without causing oscillation, working for maximum output on both condensers.

Now throw wave-band switch to left and turn dial to 300 K. C. (30 on lower scale of dial). In this position the condenser gang is approximately open. Now adjust condenser (C) (reached from rear) for maximum output, keeping the reaction control advanced as explained above, to just below point of oscillation.

Fig. 1 - Tube Locations

Adjusting Compensating Condensers

H. F. and L. F. (long-wave band)—Turn wave-band switch to the left. Set signal generator at 300 and dial at 30 (lower scale). Adjust condenser (A) to give maximum response in output meter. This condenser is reached from underneath chassis.

Now turn dial to 15 and set signal generator at 150. Adjust condenser (B) for maximum response. Condenser (C) is reached from the rear of the chassis.

NOTE: If reading on output meter is too great during adjustments, turn down "attenuator" on signal generator.

Fig. 2 - Tube Substituents on Rear From Bottom of Chassis

Adjustment of compensating condensers in Models 264 and 265 requires the use of an accurate signal generator (such as the Philco Model 024), an output meter (Philco Model 012 or 025 is recommended), and a special adjusting wrench (Philco No. 3164). The L. F. or intermediate frequency of the set is 125 K. C. Adjustments are made in the following order:

L. F.—Set signal generator at 125 K. C. Remove grid clip from cap of 6A7 tube and connect antenna lead from signal generator to cap of tube, contact ground lead to ground post of set. Set dial of receiver at 55 (upper scale) and wave-band switch at right. See that the antenna is connected to proper current and voltage terminals. Connect the antenna lead to the three L. F. compensating condensers (A), (B), and (C) to give maximum response in the output meter. These adjustments are all made from the rear of the chassis (see Fig. 3), through holes in sub-base.

ANT., DET. and OSC.-H. F. (standard wave)—These are condenser assembly and adjusted from above. (A) is the one nearest the front of chassis.

Set signal generator at 1500. Remove grid clip on cap of 6A7 tube and connect antenna and ground leads from signal generator direct to antenna and ground posts of set. Turn dial of set to 150 and adjust condensers (A), (B) and (C) for maximum reading in output meter.

OSC.-L. F. (standard wave)—Set signal generator at 300 and turn dial of set to 30. Adjust condenser (B), reached from rear of chassis, to give maximum reading in output meter.

MODEL 245
Trimmers, Socket

PHILCO RADIO & TELEV. CORP.

Voltage, Alignment
Transformer Data

PHILCO Model 245 is a six-tube superheterodyne receiver designed to receive three different ranges or bands of radio frequencies, viz: (1) Low frequency, 125 to 340 kilocycles (K. C.); (2) Medium or standard American broadcast frequencies, 540 to 1500 kilocycles; and (3) Short-wave, or high frequencies, from 5.5 to 16.0 megacycles (5500 to 16000 K. C.). A three-position waveband switch changes the reception from one band to the next, starting with low frequency, at the left-hand or counter-clockwise position.

This model has three-point tone control with fixed bass compensation, automatic volume control and pentode output. The tubes used are: Type 6A7 detector oscillator, two type 78-E intermediate frequency, type 75 second detector—1st audio frequency, and type 42-E pentode output tube. A type 80 is used as rectifier. The intermediate frequency of the set is 460 K. C. and the power consumption is 65 watts. This receiver is designed for alternating current (AC) only, of the voltage and cycles indicated on the chassis nameplate.

Adjusting Compensating Condensers
(Intermediate Frequency 460 K. C.)

The adjustment of compensating condensers in Model 245 requires the use of signal generators capable of producing a signal on both standard and long-wave broadcast frequencies, as well as short-waves or high frequencies. For the former two we suggest Philco Model 024 Signal Generator, and for the Short-Wave, Model 091 Crystal Controlled Oscillator. The Model 024 covers frequencies from 105 to 2000 K. C. and the other has a fundamental frequency of 3600 K. C. (3.6 M. C.) any harmonic of which may be used.

Other equipment needed includes some form of output meter, and a suitable insulated-handle wrench and screwdriver for adjusting the condensers. Philco equipment available includes Model 025 or 012 output meter and Part 3164 wrench and 27-7059 screwdriver.

First connect the output meter to the plate and cathode prongs of the 42-E output tube.

Adjustments are then made in the following order; positions of all compensators are shown in Fig. 1.

ADJUSTMENT OF THE INTERMEDIATE FREQUENCY

Remove the grid clip from the type 6A7 tube and connect the "ANT" output terminal of the signal generator to the grid cap of the tube. Connect the "GND" terminal of the signal generator to the "GND" terminal of the receiver chassis.

Set the signal generator at 460 K. C. (the intermediate frequency of Model 245) and with the receiver and signal generator turned on, the wave band switch at center and dial at 600 K. C., adjust each of the I. F. compensating condensers in turn, to give maximum response in the output of the receiver. The three pairs of I. F. compensating condensers are located one pair at the top of each of the three I. F. transformer shields. These are the three metal "cans" near the rear of the chassis. Each of the transformers has a dual compensating condenser mounted at its top, and accessible through a hole in the top of the coil shield. In the dual compensators the Primary circuit is adjusted by turning the screw; the Secondary circuit is adjusted by turning the hex-head nut. The condenser numbers, referring to Fig. 2, are ①, ②, ③, ④, ⑤ and ⑥.

ADJUSTMENT OF THE WAVE TRAP

Replace the grid clip upon the Detector-Oscillator tube (Type 6A7). Connect the output leads from the signal generator directly to the antenna and ground terminals of the receiver. Set the Wave-Band Switch of the receiver to the standard broadcast band (center position) and the Station Selector at the low frequency (340 K. C.) end. Adjust the Wave Trap condenser to give a MINIMUM response to a 460 K. C. signal from the

signal generator. The Wave Trap ① is located at rear and underneath the chassis, and is shown in Fig. 1. It is reached from the rear of the chassis, by inserting the fibre wrench through the hole near rear corner of chassis.

ADJUSTMENT OF SHORT-WAVE COMPENSATORS

H. F. end: The crystal controlled signal generator is used for these adjustments. Turn the wave band switch to the right and the signal generator "on." Turn the dial of the set to about half way between 14 and 15 megacycles (right hand scale) and you should there pick up the 4th harmonic of the 3.6 M. C. signal. Adjust the ant. S. W. compensator ② and the oscillator S. W. compensator ③ (see Fig. 1) to give maximum response in the output meter.

L. F. end: Turn dial of set to a little more than 7 megacycles at which point the second harmonic of the signal generator (7.2 M. C.) should be heard. Adjust condenser ④ (S. W. series) for maximum response. This condenser is also reached from underneath the chassis.

ADJUSTMENT OF MEDIUM OR STANDARD WAVES

The standard broadcast signal generator is now used again. H. F. end: Turn waveband switch to center position. Set signal generator at 1500 K. C. and dial at 150 (center scale). Now adjust condensers ⑤ (Antenna Medium) and ⑥ (oscillator medium) to get maximum response. L. F. end: Turn dial to 60 and set signal generator at 600. Adjust condenser ⑦ (nut) (Series Medium) for maximum output.

ADJUSTMENT OF LONG-WAVE COMPENSATORS

Turn wave-band switch to left-hand position (long wave). Set signal generator at 300 K. C. and dial at 300 (left-hand scale). Connect antenna lead from signal generator to grid cap of 6A7 tube instead of to antenna post of set. Adjust condenser ⑧ (oscillator, long-wave) to get maximum response.

Transfer antenna lead of signal generator to antenna post, and adjust condenser ⑨ (long-wave, maximum) to get maximum response.

Turn dial so that condenser gang is open (dial just beyond end of scale) and adjust condenser ⑩ (antenna long wave minimum) so that there is no oscillation, and noise is reduced to a minimum. This adjustment is located on top of one section of the tuning condenser and is reached from above. Turn the dial to the other end of scale and be sure no oscillation occurs. Finally set signal generator at 175 and dial of set at approximately 175. Adjust condenser ⑪ (screw) (long-wave series) to get maximum reading.

MODEL 261

Voltage, Socket

PHILCO RADIO & TELEV. CORP.

Trimmers, Chassis Alignment

THE MODEL 261 is a five-valve superheterodyne receiver, designed for dual wave reception, of 525-1510 kilocycles (570-200 meters), and 140-320 kilocycles which completely covers the 1000-2000 meter band. This Model contains a Type 6A7E valve as combination first detector and oscillator, a Type 78E valve for the intermediate frequency, a Type 75 valve as second detector and first low frequency stage, a Type 42E as low frequency power output, and a Type 80 rectifier valve. The intermediate frequency is 125 K. C. The power consumption is 63 watts.

Table 1—Valve Holder Data—A. C. Mains Voltage, 240 Volts*

Circuit	Det. Osc.	I. F.	2nd Det. and L. F.	L. F. Power Output	Rectifier
Valve Type	6A7E	78E	75	42E	80
Low Tension—F to F (Volts)	6.3	6.3	6.3	6.3	5.0
High Tension—P to K (Volts)	250	250	190	240	360
Screen Grid Volts—SG to K (6A7E; G3/5 to K)	50	100	25	260	
Control Grid Volts—CG to K (6A7E; G4 to K)	0	4	25	5	
Cathode Volts—K to F	2.2	2.7	0	0	

Table 2—Mains Transformer Data

Terminal	A. C. Volts	Circuit	Color
1	230-260	Primary (Full Primary Winding)	White—20% Black Tr.
1A	200-230	Primary (Tapped Primary Winding)	Green
2	200-260 with ① or ①A	Primary (Common)	White
3-5	6.3	Low Tension	Black
6-7	5.0	L. T. of "80" Valve	Blue
8-10	660	H. T. (Anodes of "80")	Yellow
4		Center Tap of 3-5	Black-Yellow Tracer
9		Center Tap of 8-10	Yellow-Green Tracer

Additional Type 6A7E Values: G1 to K = .4 volt; G2 to K = 260 volts.
 * All of the above values were obtained from the under side of chassis, using test prods and leads with a suitable A. C. voltmeter for L. T. voltages, and a high-resistance, multi-range D. C. voltmeter for all other values. Volume control at maximum and station selector at 525 K. C. Mains Transformer Primary tap on 230-260. Readings taken with a plug-in adaptor will NOT be satisfactory.

Fig. 1—Top View of Chassis

Fig. 2 Bottom View of Chassis, Showing Parts

ADJUSTMENT OF MODEL 261

The receivers are accurately adjusted prior to shipment from the factory. Adjustments of the compensating condensers should only be undertaken with proper instructions and equipment available. An accurately calibrated signal generator is necessary. One will be found in the Philco 048 All-Purpose Set Tester.

The adjustment of the compensating condensers is similar to the procedure outlined in Service Bulletin No. 120-C.

Location of the several compensating condensers can be ascertained by reference to Fig. 3 for their electrical location in the receiver, and to Fig. 2 for the physical location of the compensating condensers at the rear and upon the underside of the receiver chassis.

The intermediate frequency compensating condensers first

should be adjusted. The intermediate frequency is 125 kilocycles. These condensers are ⑳, ㉑, and ㉒, accessible from the rear of the chassis.

The Antenna ⑤, Detector ⑥, and High Frequency (1400 K. C.) Oscillator ⑫ compensating condensers next should be adjusted. These are mounted upon the tuning condenser ③. ④ is nearest the front of chassis. The low frequency compensating condensers are adjusted last. These are ⑬, ⑭, and ⑮. ⑬ is the 600 K. C. compensating condenser; ⑭ the 300 K. C. compensating condenser; and ⑮ the 150 K. C. compensating condenser. The sequence of adjustment should be: ⑬, ⑭, ⑮. ⑬ and ⑮ are accessible from rear of chassis; ⑭ is mounted upon the underside of the chassis.

The I. F. compensating condensers should be given a final retrimming after these adjustments are completed

MODEL 263-E
 Socket, Voltage
 Alignment

PHILCO RADIO & TELEV. CORP.

Model 263-E

Philco model 263-E is a five-valve superheterodyne receiver designed for reception of two bands of frequencies; either 530 to 1500 kilocycles (K.C.) or 140 to 320 kilocycles. It may be operated on either 230 volts (50-60 cycles) alternating current (A.C.), or 230 volts direct current (D.C.) It employs the following valves: One type 6A7 detector oscillator; one type 78-E intermediate frequency; one type 75, second detector and first low frequency; one type 18-E low frequency power output; and one type 25RE as rectifier.

The intermediate frequency of the set is 125 kilocycles and the power consumption is 90 watts.

Valve-holder Voltages (Mains Voltage 230 A.C.)

Valve	6A7	78-E	75	18-E	25RE
Circuit P to K	190	190	100	185	235
Sg to K	70	70	220

6A7: G₁ to K = .2 volt
 6A7: G₂ to K = 200 volts

Above readings made with high resistance D.C. voltmeter using test prods on valve-holders under chassis (see Fig. 1).

ADJUSTING COMPENSATING CONDENSERS

The Intermediate Frequency of Model 263-E is 125 kilocycles.

With the exception of the three compensating condensers located on the three sections of the tuning condenser, all are located underneath chassis, and are reached either through the rear holes in sub-base, or from underneath. Fig. 3 shows all condensers which are located under the chassis.

For proper adjustment, an accurate signal generator having a range from 100 to at least 1600 K.C. is required; also an output meter and a suitable adjusting wrench. Philco Model 024 signal generator, model 012 output meter and No. 3164 fibre hex wrench, are recommended.

Connect the output meter to the plate and cathode prongs of the output valve (type 18E). Turn on the set and signal generator. Turn wave band switch of set to right.

I. F. Compensating Condensers

Remove grid clip from cap of 6A7 valve and connect shielded antenna lead from signal generator to cap of valve. Connect ground terminal of signal generator to ground post of set. Set signal generator at 125 K.C., dial of set at 55 (wave band switch to right). Adjust each of the I. F. condensers (⑨, ⑩ and ⑪ in Figs. 3 and 4) in turn, to give maximum reading in the output meter. These condensers are all reached from the rear of the chassis.

Fig. 1—Top View of Chassis

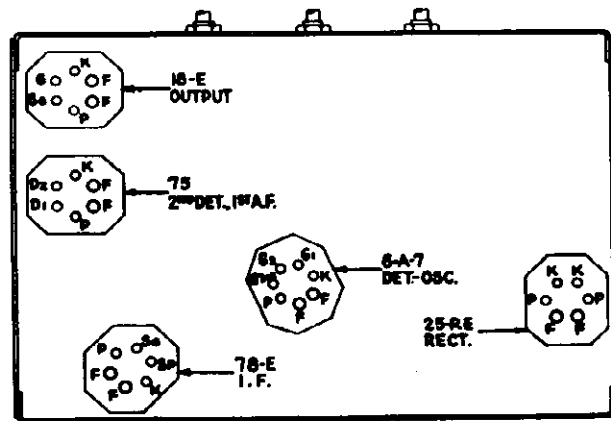

Fig. 2—Valve-holder Terminals
 (Viewed from underneath—for tests)

Antenna, Detector and Osc. HF. (Standard Wave)

Remove antenna lead of signal generator from grid cap of 6A7 valve and replace grid clip. Connect signal generator antenna lead to antenna post on set. Set signal generator at 1500 and turn dial of set to 150. Adjust condensers ①, ② and ③ (located on sections of tuning condenser assembly), so as to get maximum reading in output meter. ① is located nearest front of chassis and ③ nearest rear.

Osc. Long Wave and Long Wave Series; Standard Wave Series

These are condensers ④, ⑤ and ⑥ in the order named. ④ is reached from underneath the chassis; ⑤ and ⑥ from the rear.

First adjust ⑥ (series or L. F. standard wave) with signal generator set at 600 and dial at 60, for maximum output.

Then turn waveband switch to left. Set signal generator at 300 and dial at 30 (lower scale) and adjust ④ for maximum signal; then turn dial to 15 and set signal generator at 150 and adjust ⑤ for maximum signal.

Note 16	10 k.c.	17	Min.

- Note 1.—Adjust signal generator to give an unmodulated output, which should be regulated to give a reading of about two volts on the voltmeter scale (see note 8) during the first i-f. adjustment.
- Note 2.—Turn fidelity-selectivity control all the way to the left.
- Note 3.—The usual output meter cannot be used with an unmodulated signal. Use indirect indication through a v.c. system (for all adjustments unless otherwise noted) by connecting a high-resistance d.c. voltmeter (ohms 0-5 or 0-10 volts) across the i-f. cathode resistor. This method will give minimum scale reading for maximum receiver output, and vice-versa. The voltmeter will indicate about 3.3 volts bias when no signal is applied to the antenna and will decrease upon application of signal.
- Note 4.—Connect 500 mmfd. condenser from plate of second i-f. tube to ground.
- Note 5.—Remove 500 mmfd. condenser (note 4) from plate of second i-f. tube and connect across the third i-f. secondary. Remove this condenser after adjustment is completed.
- Note 6.—Set signal-generator for maximum output.
- Note 7.—Adjust (7) to give minimum width on shadow-tuning meter of receiver.
- Note 8.—Set signal-generator output to give reading of 2 volts on voltmeter.
- Note 9.—Turn fidelity-selectivity control all the way to the right.
- Note 10.—When varying signal-generator frequency through 260 k.c. and 267 k.c., a definite peak on the voltmeter should be noted for each. If these two readings are not the same, they can be equalized by slight readjustment of (8).
- Note 11.—Turn fidelity-selectivity control all the way to the left.
- Note 12.—Through 200 mmfd. condenser.
- Note 13.—Remove voltmeter from cathode resistor and connect regular output meter to plates of output tubes in the usual manner for adjustment of (15), (16) and (17).
- Note 14.—Use "lower capacity peak" for adjustment of (18) to maximum indication on output meter. Neglect "higher capacity peak".
- Note 15.—The accurate adjustment of the 10 k.c. audio filter (17) requires a calibrated audio oscillator. Connect the low side of the audio oscillator to ground and the high side to the variable tap on the receiver volume control.

* While rocking.

PHILCO RADIO & TELEV. CORP.

MODEL 267-E

Philco Model 267-E is a four tube receiver designed for operation on 230 volts 50-60 cycles alternating current (A. C.). It receives over two frequency ranges, viz: 535 to 1510 kilocycles (standard wave) and 145 to 310 K.C. (long wave). The circuit used is the regenerative or "reaction" circuit. Model 267-E employs the following tubes: Type 77-E R. F., type 77-E detector, type 42-E pentode output and type 80 as rectifier. The power consumption is 46 watts.

Fig. 1—Top View

Power Transformer Data (Line Voltage 240)

Terminals (See Fig. 2)	A. C. Voltage	Current	Circuit	Color
1-2	240	Primary	White
3-4	6.3	1.5 A	Filaments	Black
6-7	5.0	2.0 A	Filaments of 80	Blue
9-10	6.30	55 MA	Plates of 80	Yellow
5	Center tap of 3-4	Black-Yellow tracer
8	Center tap of 9-10	Yellow-Green tracer

Tube Socket Voltage (Line Voltage 230)

	R. F. 77-E	Det 77-E	Output 42-E
P-K.....	42	137	245
SG-K.....	35	87	255
K to Gnd.....	0	3.8	0

Above values were obtained by a high resistance D.C. voltmeter and test prods applied to underside of chassis. See Fig. 3.

ADJUSTING COMPENSATING CONDENSERS

There are three compensating condensers in these sets. Two are located on the top of the sections of the tuning condenser gang; and one underneath chassis and reached from the rear (thru hole in sub-base).

Connect the set up to the A. C. line and the antenna lead from signal generator to antenna post of set. Set signal generator at 1500 K.C. Turn wave-band switch to right and set dial at 150. (If set is removed from cabinet, obtain a piece of flat steel, .006" thick, about 1/2" wide and four or five inches long; open condenser gang and bring heel of detector section down on this steel strip; then remove the strip without disturbing setting of condenser gang).

Turn volume control full on and reaction control about 3/4 of the way to full on; then with a suitable hex wrench (such as Philco No. 3164) adjust condensers ④ and ⑦ (located on tuning condenser gang) to obtain maximum reading in the output meter, which should be connected to primary terminals of the output transformer.

While making the adjustment, advance the reaction control as far as possible without causing oscillation, working for maximum output on both condensers.

Now throw wave-band switch to left and turn dial to 300 K.C. (30 on lower scale of dial). In this position the condenser gang is approximately open. Now adjust condenser ⑩ (reached from rear) for maximum output, keeping the reaction control advanced as explained above, to just below point of oscillation.

MODEL 506
Notes, Parts

PHILCO RADIO & TELEV. CORP.

Radio-Phonograph Model 506

PHILCO MODEL 506 has the same superheterodyne broadcast and short-wave receiver chassis as Model 144, and must be operated upon the exact frequency (cycles) of alternating current given upon the name-label of the radio receiver chassis,—for correct speed of the phonograph motor.

Service Bulletin No. 193 on Model 144 gives the data necessary to test and adjust the radio receiver of Model 506, and includes a full description of the adjustment of its compensating condensers.

The radio circuits are the same as those of Model 144,—with the additional phonograph reproducing circuits. Complete schematic wiring diagram of Model 506 is given in Figure 1 of this Bulletin. The audio frequency system of the radio chassis amplifies the impulses generated in the pick-up.

Replacement Parts for the radio chassis and speaker are given in Service Bulletin No. 193 (Model 144); the additional *phonograph* parts are:

	Speed-Change Lever Spring	28-1649	.05		Needle Cup Cover	28-2223	.05

NOTE: Part ⑦ electrolytic condenser is 30-2014 in Model 506 instead of a 30-2020 as used in early Model 144 (30-2026 in current 144).

The electric pick-up is of the high-impedance type. Its impedance, at 1000 cycles, is 10,000 ohms. Its D. C. resistance is 700 ohms. A description of the adjustment of the pick-up is given in Service Bulletin No. 89, "Adjusting the Electric Pick-up".

The electric motor depends upon the frequency (cycles) of the power supply for its correct speed. The power line frequency must be the same as that given in the name-label upon the radio chassis and upon the motor frame. Only a motor of the correct frequency will give the proper turntable speed.

The motor is of the self-starting, synchronous type. The motor should be lubricated at least once every six months. To do this, lift off the turntable and place a few drops of a good grade of light machine oil in the oil-hole in the top-plate of the motor.

If the electric motor should develop a fault, it should be replaced. Do not attempt to repair it; get in touch with your Distributor regarding the faulty motor.

The tone arm must be free to rotate upon its axis at all times. Damage to records will result if it is not.

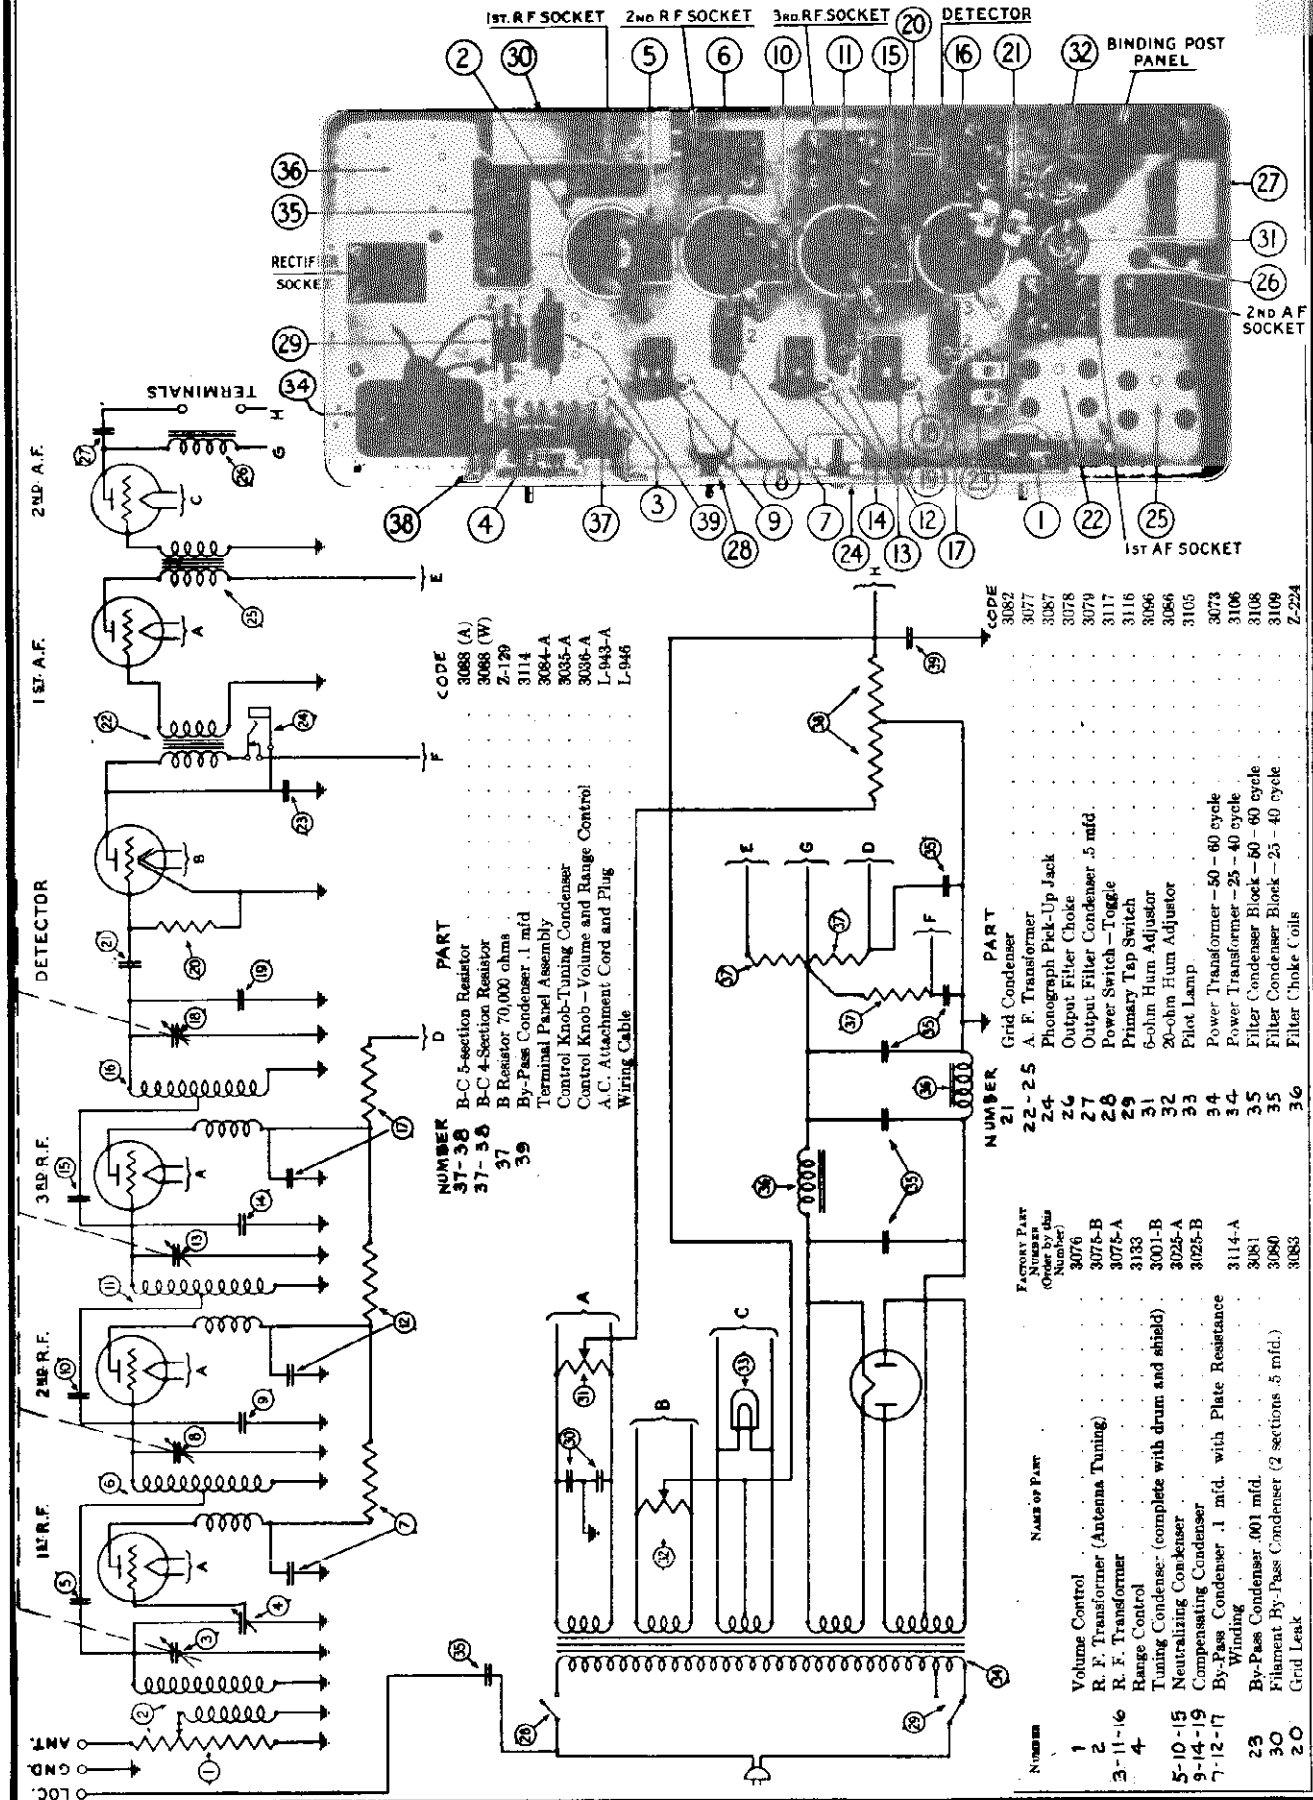

The speaker unit of Model 506 is Type H-16.

The power consumption of Model 506,—with motor running,— is 100 watts.

PHILCO RADIO & TELEV. CORP.

MODEL 642
Schematic

COVERAGE OF EACH BAND: Band 1, 540-1750 K.C.;
Band 2, 1750 to 5800 K.C. (1.75-5.8 megacycles); Band 3,
5700-18000 K.C. (5.7 to 18.0 megacycles).
TUNING DRIVE: Two-speed gear drive, ball bearing.
50 to 1 ratio for slow-speed tuning.
STONE CONTROL: 3-position, with bass compensation
effective in first position.

POWER SUPPLY: Direct Current, 32 volt.

WAVE BANDS: Three—(1) standard (with some Police);
(2) Police, Aircraft and Amateur; (3) Short-wave.

INTERMEDIATE FREQUENCY: 460 K.C.

POWER CONSUMPTION: 43 watts.

TYPE CIRCUIT: Superheterodyne, with preselector R.F. amplifier, and push pull pentode output; built in connections for Philco All-wave aerial; aerial selector built into and operated by wave-band switch.

ALL SWITCH-SECTIONS SHOWN IN POSITION NO. 3

NUMBERS INDICATE RELATIVE POSITIONS OF SWITCH-SECTIONS FROM FRONT OF CHASSIS.

PHILCO RADIO & TELEV. CORP.

MODEL 642
Voltage, Socket
Trimmers, Alignment

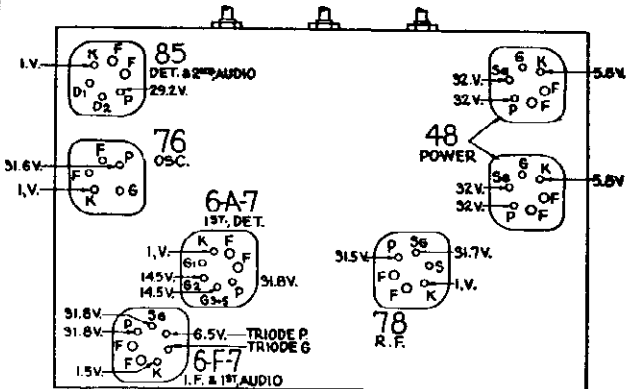

Fig. 1. Tube Sockets as viewed from bottom and Voltage Measurements

Above voltages were obtained by using a PHILCO type 025 Circuit Tester (or 048A All purpose Tester), using test prods applied to underside of chassis. Volume control at minimum; dial at 55; waveband switch counter-clockwise (band 1). Use Fig. 1 for test points. Line voltage 32 volts.

Adjusting Compensating Condensers

The adjustment of the compensating condensers in Model 642 requires a signal generator covering the broadcast and police band, and also one capable of producing a signal at certain frequencies in the short wave band. Philco Model 088 All-wave signal generator is ideal for these requirements. The location of all compensating condensers is shown in Fig. 5. An output meter is also needed, such as the Philco Model 025.

Adjustment of I. F.

I. F. ADJUSTMENTS: Set the signal generator at 460 K.C. with attenuator set at minimum, and attach its antenna lead to the grid of the 6F7 I. F. amplifier tube (removing grid cap). Connect ground lead to ground terminal on set. Set the dial at 55 and turn the waveband switch to position 1 (standard). Adjust the volume control of set to almost maximum (just before oscillator hiss becomes noticeable), and the signal generator attenuator so that about one-fourth ($\frac{1}{4}$) scale reading is had on the output meter. With a fibre screw driver adjust condensers (14) and (15) (2nd I. F.) for maximum reading on output meter. Turn attenuator of signal generator to minimum and remove its antenna lead from the grid of the 6F7 I. F. tube, replacing grid cap. Then place the antenna lead on the grid of the 6A7. Adjust attenuator as before, then proceed to adjust condensers (16) and (17) (1st I. F.) for maximum reading. Care should be taken to keep the output meter reading during adjustments at about one-fourth scale reading. This should be done by using the signal generator attenuator control.

Adjustment of Wave-Trap

1. Connect the signal generator leads to the antenna and ground terminals of the receiver.
2. With the wave-band switch of the receiver still in the extreme left (standard band), (540-1750 K.C.), turn the station selector to 55.
3. With the signal generator in operation at 460 K.C., adjust the wave-trap (1) condenser until a MINIMUM reading is obtained on the output meter. The Philco fibre wrench, part No. 3164, is used for this adjustment. The wave-trap compensator is reached from rear of chassis.

Fig. 2. Location of Tubes (Top View)

Fig. 5. Location of Compensating Condensers

Adjustment of R. F., Oscillator and Detector Stages

1. **SHORT WAVE:** Connect the antenna lead of the signal generator to the grid of the 78 R.F. tube (removing grid clip), and the ground lead to the ground terminal of the set. Set the signal generator dial at 18.0 MC. Turn waveband switch to position 3. Turn the set dial to 18.0 MC. Turn condenser (10) one-half turn from tight. Adjust condenser (14) for maximum output. Turn the set dial and signal generator dial to 6.0 MC and adjust condenser (16) for maximum reading. Remove the signal generator antenna lead from the 78 grid (replacing grid clip) and connect to the antenna post of the set. Tune the set and signal generator back to 18.0 MC and adjust condenser (8) for maximum output. Check image frequency at approximately 17.1 MC.
2. **POLICE:** Turn the waveband switch to position 2 and tune the set and signal generator to 5.5 MC. Adjust condensers (5), (9) and (13) for maximum output. Next tune the set and signal generator to 1800 K.C. and adjust condenser (19) (Nut) for maximum output. Tune the set and signal generator again to 5.5 MC and re-adjust condenser (13) for maximum output.
3. **STANDARD:** Throw waveband switch to position 1. Tune the set and signal generator to 1500 K.C. Adjust condensers (1), (11) and (12) for maximum output. Next tune the set and signal generator to 580 K.C. and adjust condenser (17) (Screw) for maximum output. Readjust the set at 1500 K.C. by tuning condenser (12) for maximum output.

PHILCO RADIO & TELEV. CORP.

The Model 821P, in addition to utilizing all the precautions requisite for circuit stability, uses a sealed, precision QUARTZ CRYSTAL to control the oscillator circuit and hold it on the required frequency. This feature is indispensable in any fixed frequency Receiver used for emergency service

The Receivers, when used with the proper crystals, can be adjusted for any specified frequency between 1550 K.C. and 3600 K.C. Different crystals are used to obtain these frequencies. The crystal frequency, however, is no indication of the Receiver frequency adjustment.

FREQ. OF CRYSTAL	RECEIVER FREQ.	PART No. CRYSTAL
1875 K. C.	1596-1610-1626 K. C.	45-2101
1908 K. C.	1630-1634-1642	
	1650-1658-1666 K. C.	45-2194
1953 K. C.	1674-1683-1690	
	1698-1706-1712 K. C.	45-2195

	2482-2490 K. C.	45-2198
3000 K. C.	2726 K. C.	45-2230
3360 K. C.	3105 K. C.	45-2496

I. F. STAGES — The signal generator must be set exactly to the predetermined frequency and the generator lead connected to the grid cap of the 6A7 detector oscillator tube in series with a .1 mfd. condenser. Adjust padders ⑪, ⑫, ⑬ and ⑭ on the first and second I. F. transformers for maximum reading on the output meter.

R. F. STAGE — Tune the signal generator to the frequency of the transmitter and connect the output of the signal generator to the grid cap of the R. F. tube in series with a .1 mfd. condenser. Turn the tuning condenser to the input frequency and adjust padders ⑮ and ⑯ for maximum reading on the output meter. Notice the position of the padders. They should be out as far as possible, yet with sufficient tension to keep them firmly in place. If the padders are too tight, turn the tuning condenser plates in mesh slightly and repad ⑮ and ⑯. If the padders are too loose, turn the tuning condenser plates out of mesh slightly and repad ⑮ and ⑯. Repeat these adjustments until the correct padding settings are obtained.

The low frequency padder ⑰ must be adjusted to a position where padders ⑮ and ⑯ are not too tight or too loose, i.e., if padder ⑮ is too tight and padder ⑰ too loose, turn the tuning condenser plates out of mesh slightly and screw in a little on padder ⑰. If padder ⑮ is too loose and padder ⑰ too tight, turn the tuning condenser plates in mesh slightly and loosen the padder ⑰ somewhat.

For any given frequency padder ⑰ should be screwed in almost tight (approximately a 1/2 to 3/4 of a turn from tight) for best results and at the same time obtain the correct tuning condenser setting and adjustments of padders ⑮ and ⑯.

The I. F. stages can be tuned to any frequency between 242 K. C. and 278 K. C.

Special attention must be given to the adjustment of the oscillator padder ⑱, which should be backed off the peak slightly to obtain stable crystal operation.

The I. F. frequency used in each Receiver is the difference between the frequency of the crystal in the Receiver and the frequency of the transmitter, i.e., the transmitter frequency is 2422 K. C., the crystal used is 2696 K. C., the difference is 274 K. C., which is the frequency to which the I. F. amplifier must be tuned.

ANTENNA STAGE — Connect the antenna lead, Part No. 41-3191, to the antenna receptacle on the Receiver in series with a 55 mmfd. condenser and set the signal generator to the frequency of the transmitter. Adjust padders ①, ②, ③, ④ and ⑤ for maximum reading on the output meter.

The Receiver must be padded while warm and repadded after it has been operated for several hours.

DO NOT OPEN THE CRYSTAL HOLDER. If for any reason whatever it has been opened, the crystal plates should be very carefully cleaned with carbon tetrachloride. After cleaning, the crystal must not be touched by the fingers. Use a clean cloth for handling.

The Receiver "Q" switch must be in the off position, cutting out the carrier relay circuit.

10	*3400 K. C.	Note 2	55 Mmfd. Condenser Note 2	Set Tuning Condenser at 3400 K. C.	7 - 11

Adjust for maximum reading on the output meter.

NOTE 1—Rock the tuning condenser while adjusting the low frequency padder. Tune the condenser to the signal and adjust the padder for maximum output. Rotate the tuning condenser back and forth slightly for maximum output. Then re-adjust the padder for maximum output. Repeat this procedure until no further improvement is noticed.

NOTE 2—Connect the antenna lead, Part No. 41-3191, to the antenna receptacle on the Receiver in series with a 55 mmfd. condenser.

* The Receiver "Q" switch must be in the off position, cutting out the carrier relay circuit.

JULY 1937

Figure 8 — Model 821PV Top View

RECEIVER
FREQUENCY
RANGE

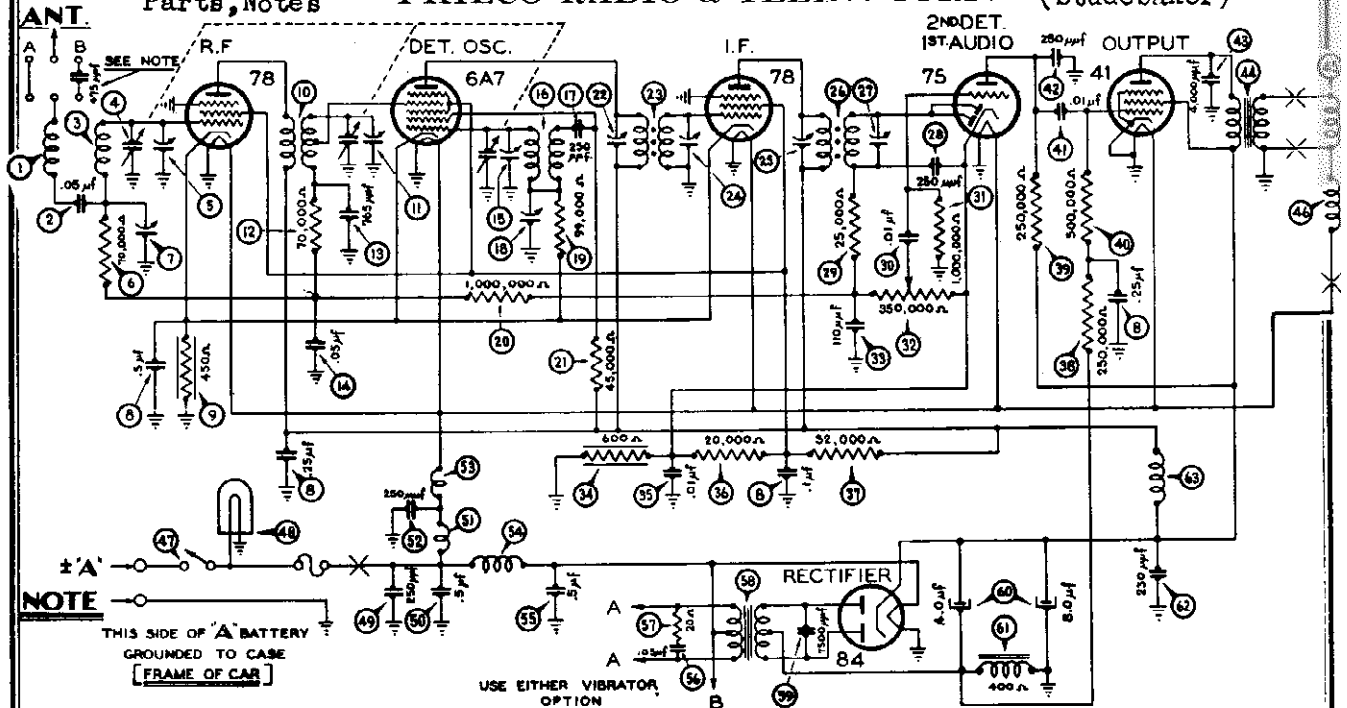

The Model 821P is a fixed frequency, crystal controlled Receiver designed for the medium high frequencies. These are the frequencies used by the Municipal Police, State Police, Marine Fire, Geophysical and Temporary Service and the Forestry, Forest Fire Control, Flood Control, National Park Service, Coast Guard Service, etc. (1550 K. C. to 3600 K. C.).

The Model 821PV is a variable frequency Receiver, designed for use in these same services when it is necessary to receive signals from transmitters operating on different frequencies within these bands. The Model 821PV normally covers the frequency band of 1550 K. C. to 2550 K. C. It can be obtained for use on the higher frequencies, 2300 K. C. to 3600 K. C., on special order at a slight increase in cost.

FIGURE 2

The circuit of the Model S-1416 is similar to the Model 826 with the following exception: The Model S-1416 does not use a condenser plug or connector plug in the Antenna connector on the Receiver. The Antenna connector is changed so that this is not necessary.

MODELS 826, 827, S1416

Socket, Trimmers

Alignment

PHILCO RADIO & TELEVISION CORP.

I. F. TRANSFORMERS AND PADDERS

The I. F. Transformers are assembled complete with padding condensers.

Both the primary and the secondary padders are placed side by side in the top of the transformer shield can. The adjusting screws are accessible thru the holes in the top of the shield. (See Figure 4).

The coil windings terminate in leads instead of terminals or lugs. The color scheme of the leads is given in Figure 3.

FIGURE 3

If replacements are ever necessary, replace the entire coil assembly, 32-2026 for the first I. F. stage and 32-2027 for the second I. F. stage. Neither the coil nor the padders will be furnished separately. Order only by the above numbers.

ADJUSTMENTS

All padding adjustments are carefully made at the factory and ordinarily no readjustments are necessary. However, when readjustments are required, the procedure given below must be followed in detail.

Equipment

Fully charged heavy duty storage battery or 6-volt power pack, 048A or 099 Philco Set Tester, 3164 Padding wrench, 27-7159 Padding screw driver.

General

OUTPUT METER — The output meter must be connected by means of an adapter to the plate of the type 41 output tube and to the Receiver chassis.

SIGNAL GENERATOR — With the Receiver and signal generator set up for operation at the prescribed frequency, turn the Receiver volume control on full and set the signal generator attenuator so that a half scale reading is obtained on the output meter. The signal in the speaker should be audible but not loud.

The shielding on the signal generator output lead must be connected to the Receiver housing.

Procedure

I. F. — Set the signal generator at exactly 260 K. C. Connect the generator lead to the grid cap of the 78 I. F. tube in series with a .1 mfd. condenser (without removing the grid cap).

Adjust the secondary screw padder (7) on the second I. F. transformer for maximum reading on the output meter. Then adjust the primary screw padder (8) for maximum reading. (See Figure 4 for location of padders).

Remove the generator lead from the 78 tube.

Connect the generator lead to the grid cap of the 6A7 tube in series with a .1 mfd. condenser (without removing the grid cap). Adjust the secondary screw padder (24) on the first I. F. transformer for maximum reading on the output meter. Then adjust the primary screw padder (25) for maximum reading. Readjust padders (8) and (7) with the generator lead connected to the type 6A7 tube. (See Figure 4 for location of padders).

HIGH FREQUENCY AND R. F. After padding the first I. F. stage remove the generator lead from the 6A7 tube.

Set the signal generator at 1550 K. C. and then connect the generator lead to the grid cap of the 78 R. F. tube in series with a .1 mfd. condenser (without removing the grid cap).

Turn the tuning condenser plates out of mesh as far as they will go.

With the tuning condenser in this position, adjust the high frequency padder (15) and the R. F. padder (11) until the maximum reading is obtained on the output meter. This is the true setting for 1550 K. C., 155 on the dial scale.

LOW FREQUENCY—Turn the tuning condenser plates in mesh to approximately 580 K. C., 58 on the dial scale and set the signal generator at 580 K. C. Roll the tuning condenser and adjust the low frequency padder screw (18) for maximum reading on the output meter.

HIGH FREQUENCY READJUSTMENT Turn the tuning condenser plates out of mesh to 1550 K. C. and set the signal generator at 1550 K. C. Then adjust the high frequency padder (15) again for maximum reading on the output meter.

MODEL 826 — S-1416 FIGURE 4

MODEL 827 FIGURE 4

Remove the generator lead from the 78 R. F. tube. **ANTENNA—WHEN PADDING THE ANTENNA STAGE IT IS EXTREMELY IMPORTANT THAT THE PROPER DUMMY ANTENNA BE CONSTRUCTED AND USED.**

Connect the signal generator lead to the antenna cable assembly (made up of Part No. 41-3191 cable and a 200 mmfd. condenser Part No. 30-1013) in series between the Receiver antenna receptacle and the signal generator. Plug the cable into the antenna receptacle on the end of the Receiver.

Turn the tuning condenser to 1400 K. C. and set the generator at 1400 K. C. Adjust the padders (11) and (15) for the maximum reading on the output meter.

When the antenna stage adjustment is made with the Receiver installed in the car, the Receiver antenna lead must be connected to the car antenna in the usual manner. Connect the signal generator output lead to a wire placed near the car antenna but not connected to it.

MODEL 827K

Socket, Trimmers
Alignment

PHILCO RADIO & TELEV. CORP.

I. F. TRANSFORMERS AND PADDERS

The I. F. Transformers are assembled complete with padding condensers.

Both the primary and the secondary padders are placed side by side in the top of the transformer shield can. The adjusting screws are accessible thru the holes in the top of the shield. (See Figure 4).

The coil windings terminate in leads instead of terminals or lugs. The color scheme of the leads is given in Figure 3.

FIGURE 3

If replacements are ever necessary, replace the entire coil assembly, 82-2026 for the first I. F. stage and 32-2027 for the second I. F. stage. Neither the coil nor the padders will be furnished separately. Order only by the above numbers.

MODEL 827-K ADJUSTMENTS

All padding adjustments are carefully made at the factory and ordinarily no readjustments are necessary. However, when readjustments are required, the procedure given below must be followed in detail.

Equipment

Fully charged heavy duty storage battery or 6-volt power pack, 048A or 099 Philco Set Tester, 3164 Padding wrench, 27-7159 Padding screw driver.

General

OUTPUT METER — The output meter must be connected by means of an adapter to the plate of the type 41 output tube and to the Receiver chassis.

SIGNAL GENERATOR — With the Receiver and signal generator set up for operation at the prescribed frequency, turn the Receiver volume control on full and set the signal generator attenuator so that a half scale reading is obtained on the output meter. The signal in the speaker should be audible but not loud.

The shielding on the signal generator output lead must be connected to the Receiver housing.

Procedure

I. F. — Set the signal generator at exactly 260 K. C. Connect the generator lead to the grid cap of the 78 I. F. tube in series with a .1 mfd. condenser (without removing the grid cap).

Adjust the secondary screw padder (27) on the second I. F. transformer for maximum reading on the output meter. Then adjust the primary screw padder (25) for maximum reading. (See Figure 4 for location of padders).

Remove the generator lead from the 78 tube.

Connect the generator lead to the grid cap of the 6A7 tube in series with a .1 mfd. condenser (without removing the grid cap). Adjust the secondary screw padder (24) on the first I. F. transformer for maximum reading on the output meter. Then adjust the primary screw padder (22) for maximum reading. Readjust padders (25) and (27) with the generator lead connected to the type 6A7 tube. (See Figure 4 for location of padders).

HIGH FREQUENCY AND R. F. — After padding the first I. F. stage remove the generator lead from the 6A7 tube.

Set the signal generator at 1550 K. C. and then connect the generator lead to the grid cap of the 78 R. F. tube in series with a .1 mfd. condenser (without removing the grid cap).

Turn the tuning condenser plates out of mesh as far as they will go.

With the tuning condenser in this position, adjust the high frequency padder (15) and the R. F. padder (11) until the maximum reading is obtained on the output meter. This is the true setting for 1550 K. C., 155 on the dial scale.

FIGURE 4

LOW FREQUENCY — Turn the tuning condenser plates in mesh to approximately 580 K. C., 58 on the dial scale and set the signal generator at 580 K. C. Roll the tuning condenser and adjust the low frequency padder screw (18) for maximum reading on the output meter.

HIGH FREQUENCY READJUSTMENT — Turn the tuning condenser plates out of mesh to 1550 K. C. and set the signal generator at 1550 K. C. Then adjust the high frequency padder (15) again for maximum reading on the output meter.

Remove the generator lead from the 78 R. F. tube.

ANTENNA — WHEN PADDING THE ANTENNA STAGE IT IS EXTREMELY IMPORTANT THAT THE PROPER DUMMY ANTENNA BE CONSTRUCTED AND USED.

Connect the signal generator lead to the antenna lead assembly (made up of Part No. 41-3191 lead and a 200 mmfd condenser, Part No. 30-1013), in series between the lead and the signal generator. Plug the lead into the antenna lead connector on the end of the Receiver.

Turn the tuning condenser to 1400 K. C. and set the generator at 1400 K. C. Adjust the padders (4) and (5) for the maximum reading on the output meter.

When the antenna stage adjustment is made with the Receiver installed in the car, the Receiver antenna lead must be connected to the car antenna in the usual manner. Connect the signal generator output lead to a wire placed near the car antenna but not connected to it.

FIGURE 3

IF=260KC

NOTE: When the Receiver is installed in a car having a top antenna, under-car antenna, spare wheel antenna or antenna having a similar low relative capacitance (50 mmf. to 450 mmf.) use connector plug in "A".
 When the Receiver is installed in a car having a metal insert top antenna, insulated door antenna, insulated trunk cover antenna or antenna having similarly high relative capacitance (450 mmf. to 2500 mmf.) use condenser plug in "B".

I. F. TRANSFORMERS AND PADDERS

The I. F. Transformers are assembled complete with padding condensers.

Both the primary and the secondary padders are placed side by side in the top of the transformer shield can. The adjusting screws are accessible thru the holes in the top of the shield. (See Figure).

The coil windings terminate in the leads instead of terminals or lugs. The color scheme of the leads is given in Figure 5

FIGURE 5

If replacements are ever necessary, replace the entire coil assembly, 32-2026 for the first I. F. stage and 32-2084 for the second I. F. stage. Neither the coil nor the padders will be furnished separately. Order only by the above numbers.

ADJUSTMENTS

OUTPUT METER — The output meter must be connected by means of an adapter to the plate of the type 41 output tube and to the Receiver chassis.

SIGNAL GENERATOR — With the Receiver and signal generator set up for operation at the prescribed frequency, turn the Receiver volume control on full and set the signal generator attenuator so that a half scale reading is obtained on the output meter. The signal in the speaker should be audible but not loud.

The shielding on the signal generator output lead must be connected to the Receiver housing.

Procedure

I. F. — Set the signal generator at exactly 260 K. C. Connect the generator lead to the grid cap of the 78 I. F. tube in series with a .1 mfd. condenser (without removing the grid cap).

Adjust the secondary screw padder (2) on the second I. F. transformer for maximum reading on the output meter. Then adjust the primary screw padder (1) for maximum reading. (See Figure 6 for location of padders).

Remove the generator lead from the 78 tube.

Connect the generator lead to the grid cap of the 6A7 tube in series with a .1 mfd. condenser (without removing the grid cap). Adjust the secondary screw padder (2) on the first I. F. transformer for maximum reading on the output meter. Then adjust the primary screw padder (1) for maximum reading. Readjust padders (2) and (1) with the generator lead connected to the type 6A7 tube. (See Figure for location of padders).

HIGH FREQUENCY AND R. F. — After padding the first I. F. stage remove the generator lead from the 6A7 tube.

Set the signal generator at 1550 K. C. and then connect the generator lead to the grid cap of the 78 R. F. tube in series with a .1 mfd. condenser (without removing the grid cap).

Turn the tuning condenser plates out of mesh as far as they will go.

With the tuning condenser in this position, adjust the high frequency padder (4) and the R. F. padder (5) until the maximum reading is obtained on the output meter. This is the true setting for 1550 K. C., 155 on the dial scale.

LOW FREQUENCY — Turn the tuning condenser plates in mesh to approximately 580 K. C., 58 on the dial scale and set the signal generator at 580 K. C. Roll the tuning condenser and adjust the low frequency padder screw (3) for maximum reading on the output meter.

HIGH FREQUENCY READJUSTMENT — Turn the tuning condenser plates out of mesh to 1550 K. C. and set the signal generator at 1550 K. C. Then adjust the high frequency padder (4) again for maximum reading on the output meter.

Remove the generator lead from the 78 R. F. tube.

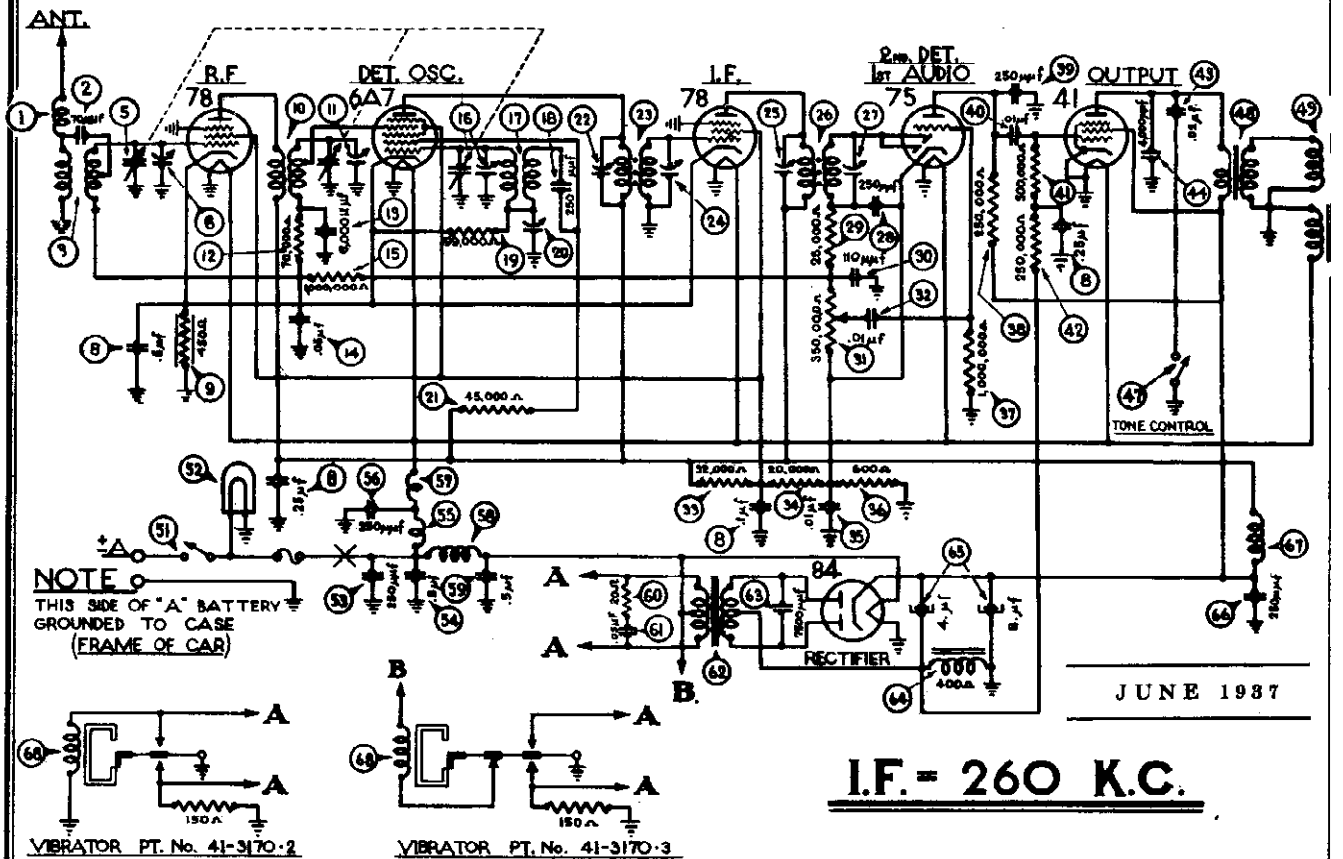

ANTENNA — WHEN PADDING THE ANTENNA STAGE IT IS EXTREMELY IMPORTANT THAT THE PROPER DUMMY ANTENNA BE CONSTRUCTED AND USED.

Connect the signal generator lead to the antenna lead assembly (made up of Part No. 41-3191 lead and a 200 mmfd. condenser, Part No. 30-1013), in series between the lead and the signal generator. Plug the lead into the antenna lead connector on the end of the Receiver.

Turn the tuning condenser to 1400 K. C. and set the generator at 1400 K. C. Adjust the padders (4) and (5) for the maximum reading on the output meter.

When the antenna stage adjustment is made with the Receiver installed in the car, the Receiver antenna lead must be connected to the car antenna in the usual manner. Connect the signal generator output lead to a wire placed near the car antenna but not connected to it.

I. F. TRANSFORMERS AND PADDERS

The I. F. transformers are assembled complete with padding condensers.

Both the primary and the secondary padders are placed side by side in the top of the transformer shield can. The adjusting screws are accessible thru the holes in the top of the shield. (See Figure 4).

The coil windings terminate in leads instead of terminals or lugs. The color scheme of the leads is given in Figure 3.

FIGURE 3

If replacements are ever necessary, replace the entire coil assembly, 32-2026 for the first I. F. stage and 32-2027 for the second I. F. stage. Neither the coil nor the padders will be furnished separately. Order only by the above numbers.

ADJUSTMENTS

All padding adjustments are carefully made at the factory and ordinarily no readjustments are necessary. However, when readjustments are required the procedure given below must be followed in detail.

Equipment

Fully charged heavy duty storage battery or 6-volt power pack, 048A or 099A Philco Set Tester, 3164 Padding wrench, 27-7159 Padding screw driver.

General

OUTPUT METER — The output meter must be connected by means of an adapter to the plate of the type 41 output tube and to the Receiver chassis.

SIGNAL GENERATOR — With the Receiver and signal generator set up for operation at the prescribed frequency, turn the Receiver volume control on full and set the signal generator attenuator so that a half scale reading is obtained on the output meter. The signal in the speaker should be audible but not loud.

The shielding on the signal generator output lead must be connected to the Receiver housing.

Procedure

I. F. — Set the signal generator at exactly 260 K. C. Connect the generator lead to the grid cap of the 78 I. F. tube in series with a .1 mfd. condenser (without removing the grid cap).

Adjust the secondary screw padder ② on the second I. F. transformer for maximum reading on the output meter. Then adjust the primary screw padder ③ for maximum reading. (See Figure 4 for location of padders).

Remove the generator lead from the 78 tube.

Connect the generator lead to the grid cap of the 6A7 tube in series with a .1 mfd. condenser (without removing the grid cap). Adjust the secondary screw padder ④ on the first I. F. transformer for maximum reading on the output meter. Then adjust the primary screw padder ⑤ for maximum reading. Readjust padders ② and ③ with the generator lead connected to the type 6A7 tube. (See Figure 4 for location of padders).

HIGH FREQUENCY AND R. F. — After padding the first I. F. stage remove the generator lead from the 6A7 tube.

Set the signal generator at 1550 K. C. and then connect the generator lead to the grid cap of the 78 R. F. tube in series with a .1 mfd. condenser (without removing the grid cap).

Turn the tuning condenser plates out of mesh as far as they will go. With the tuning condenser in this position, adjust the high frequency padder ⑥ and the R. F. padder ⑪ until the maximum reading is obtained on the output meter. This is the true setting for 1550 K. C., 155 on the dial scale.

FIGURE 4

LOW FREQUENCY — Turn the tuning condenser plates in mesh to approximately 600 K. C., 60 on the dial scale and set the signal generator at 600 K. C. Rock the tuning condenser and adjust the low frequency padder screw ⑩ for maximum reading on the output meter.

HIGH FREQUENCY READJUSTMENT — Turn the tuning condenser plates out of mesh as far as they will go and set the signal generator at 1550 K. C. Then adjust the high frequency padder ⑥ again for maximum reading on the output meter.

Remove the generator lead from the 78 R. F. tube.

Connect the signal generator lead to the antenna lead, Part No. 41-3191.

Turn the tuning condenser to 1400 K. C. and set the generator at 1400 K. C. Adjust the padders ⑩ and ⑥ for the maximum reading on the output meter.

When the antenna stage adjustment is made with the Receiver installed in the car, the Receiver antenna lead must be connected to the car antenna in the usual manner. Connect the signal generator output lead to a wire placed near the car antenna but not connected to it.

I. F. TRANSFORMERS AND PADDERS

The I. F. transformers are assembled complete with padding condensers.

Both the primary and the secondary padders are placed side by side in the top of the transformer shield can. The adjusting screws are accessible thru the holes in the top of the shield.

The coil windings terminate in leads instead of terminals or lugs. The color scheme of the leads is given in Figure 7.

FIGURE 7

If replacements are ever necessary, replace the entire coil assembly, 32-2026 for the first I. F. stage and 32-2027 for the second I. F. stage. Neither the coil nor the padders will be furnished separately. Order only by the above numbers.

General

OUTPUT METER—The output meter must be connected by means of an adapter to the plate of the type 41 output tube and to the Receiver chassis.

SIGNAL GENERATOR—With the Receiver and signal generator set up for operation at the prescribed frequency, turn the Receiver volume control on full and set the signal generator attenuator so that a half scale reading is obtained on the output meter. The signal in the speaker should be audible but not loud.

The shielding on the signal generator output lead must be connected to the Receiver housing.

Procedure

I. F.—Set the signal generator at exactly 260 K. C. Connect the generator lead to the grid cap of the 78 I. F. tube in series with a .1 mfd. condenser (without removing the grid cap).

Adjust the secondary screw padder (20) on the second I. F. transformer for maximum reading on the output meter. Then adjust the primary screw padder (25) for maximum reading. (See Figure 8 for location of padders).

Remove the generator lead from the 78 tube.

Connect the generator lead to the grid cap of the 6A7 tube in series with a .1 mfd. condenser (without removing the grid cap). Adjust the secondary screw padder (25) on the first I. F. transformer for maximum reading on the output meter. Then adjust the primary screw padder (20) for maximum reading. Readjust padders (25) and (20) with the generator lead connected to the type 6A7 tube. (See Figure 8 for location of padders).

HIGH FREQUENCY AND R. F.—After padding the first I. F. stage remove the generator lead from the 6A7 tube.

Set the signal generator at 1550 K. C. and then connect the generator lead to the grid cap of the 78 R. F. tube in series with a .1 mfd. condenser (without removing the grid cap).

Turn the tuning condenser plates out of mesh as far as they will go.

With the tuning condenser in this position, adjust the high frequency padder (16) and the R. F. padder (11) until the maximum reading is obtained on the output meter. This is the true setting for 1550 K. C., 155 on the dial scale.

LOW FREQUENCY—Turn the tuning condenser plates in mesh to approximately 600 K. C., 60 on the dial scale and set the signal generator at 600 K. C. Roll the tuning condenser and adjust the low frequency padder screw (8) for maximum reading on the output meter.

HIGH FREQUENCY READJUSTMENT—Turn the tuning condenser plates out of mesh to 1550 K. C. and set the signal generator at 1550 K. C. Then adjust the high frequency padder (16) again for maximum reading on the output meter.

Remove the generator lead from the 78 R. F. tube.

MODEL P-1417

MODEL G-1418 MODEL N-1418

ANTENNA—WHEN PADDING THE ANTENNA STAGE IT IS EXTREMELY IMPORTANT THAT THE PROPER DUMMY ANTENNA BE CONSTRUCTED AND USED.

Connect the signal generator lead to the antenna cable assembly (made up of Part No. 38-7295 cable and a 155 mmfd condenser in series between the lead and the signal generator. Plug the cable into the antenna receptacle on the top of the Receiver.

Turn the tuning condenser to 1400 K. C. and set the generator at 1400 K. C. Adjust the padders (16) and (11) for the maximum reading on the output meter.

When the antenna stage adjustment is made with the Receiver installed in the car, the Receiver antenna lead must be connected to the car antenna in the usual manner. Connect the signal generator output lead to a wire placed near the car antenna but not connected to it.

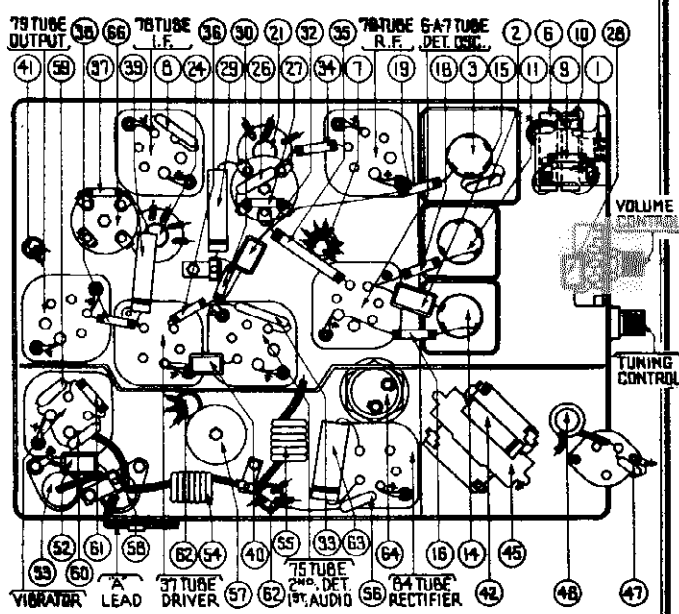

FIGURE 136

CHANGES — "Run Numbers" are stamped on the chassis sub-base for identification. These "Run Numbers" are changed consecutively as major changes are made in the Receiver wiring and parts.

RUN No. 2 — Volume Control removed — Part No. 33-5202 added.

SEE INDEX FOR ALIGNMENT

The Circuit of the Model L-1420 and L-1425 is identical to the Model L-1424 with the following exception:—
The Field for the L-1425 is supplied from the center tap of chokes 64 and 65.

The Models L-1420, L-1424 and L-1425 are Special Custom-Built Receivers used exclusively by the Lincoln Motor Company in their 1937 cars.

MODELS L1420, P1421, P1422, L1424, L1425, P1426 AND P1439, L-1460

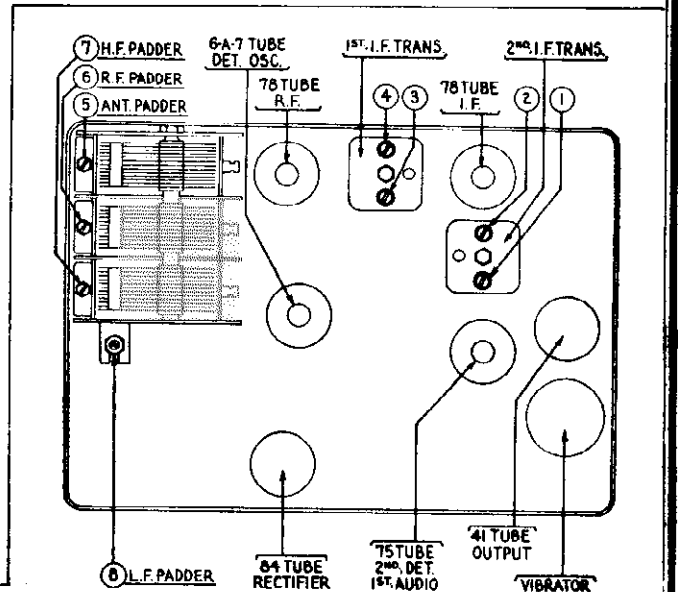

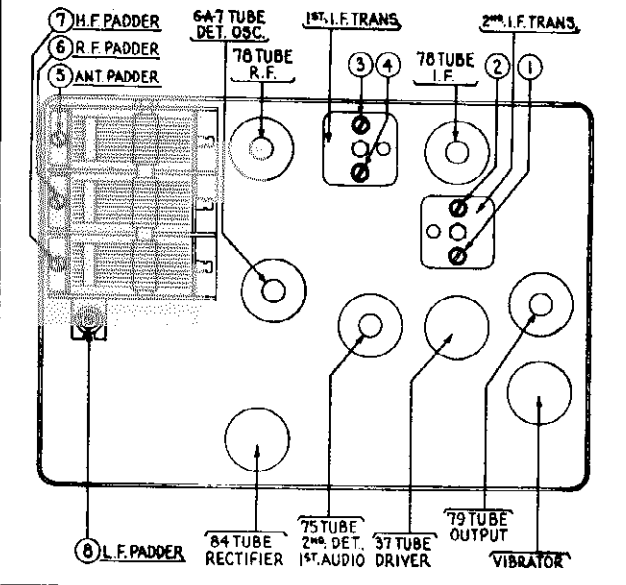

OPERATION	SIGNAL GENERATOR		DUMMY CAPACITY	SPECIAL INSTRUCTIONS	ADJUST PADDER
	FREQUENCY	CONNECTION			
1	260 K. C.	To Grid of 78 Tube—I.F. Stage	.1 Mfd. Condenser in Series with Generator Lead	No Antenna Connection	1-2
2	260 K. C.	To Grid of 6A7 Tube	.1 Mfd. Condenser in Series with Generator Lead	No Antenna Connection	3-4 1-2
3	1500 K. C.	To Grid of 78 Tube—R.F. Stage	.1 Mfd. Condenser in Series with Generator Lead	No Antenna Connection Note 1	7-6
4	580 K. C.	To Grid of 78 Tube—R.F. Stage	.1 Mfd. Condenser in Series with Generator Lead	No Antenna Connection Set Tuning Condensers at 580 K. C.	8 Note 2
5	1550 K. C.	To Grid of 78 Tube—R.F. Stage	.1 Mfd. Condenser in Series with Generator Lead	No Antenna Connection Set Tuning Condensers at 1550 K. C.	7
6	1400 K. C.	Note 4	Note 4	Set Tuning Condensers at 1400 K. C.	6-5

Adjust for maximum reading on the output meter.

NOTE 1—Turn the condenser rotor plates completely out of mesh. Use a piece of bond letterhead paper as a gauge between the heel of the rotor plates and the stator plates and turn the condenser plates in mesh until they strike against the paper.

NOTE 2—Rock the tuning condenser while adjusting the low frequency padder. Tune the condenser to the signal and adjust the padder for maximum output. Rotate the tuning condenser back and forth slightly for maximum output. Then re-adjust the padder for maximum output. Repeat this procedure until no further improvement is noticed.

NOTE 4—Connect the Antenna lead Part No. 41-3191 to the Antenna receptacle on the Receiver in series with the correct dummy capacity. For the L1420, L1424 and L1425 use a 866 mmfd. condenser, for the P1421, P1426 and P1439 use a 230 mmfd. condenser.

MODELS F1440 AND F1442

Socket, Trimmers, Alignment

MODELS DP and DPV POLICE RADIO

OPERATION	SIGNAL GENERATOR		DUMMY CAPACITY	SPECIAL INSTRUCTIONS	ADJUST PADDER
	FREQUENCY	CONNECTION			
1	260 K. C.	To Grid of Detector Oscillator Tube	.1 Mfd. Condenser in Series with Generator Lead	Note 3	1-2 3-4
2	3500 K. C.	Note 4	150 Mmfd. Condenser Note 4	Note 1	7-6-5 8
3	1600 K. C.	Note 4	150 Mmfd. Condenser Note 4	Set Tuning Condenser at 1.6 K. C.	Note 2

Adjust for maximum reading on the output meter.

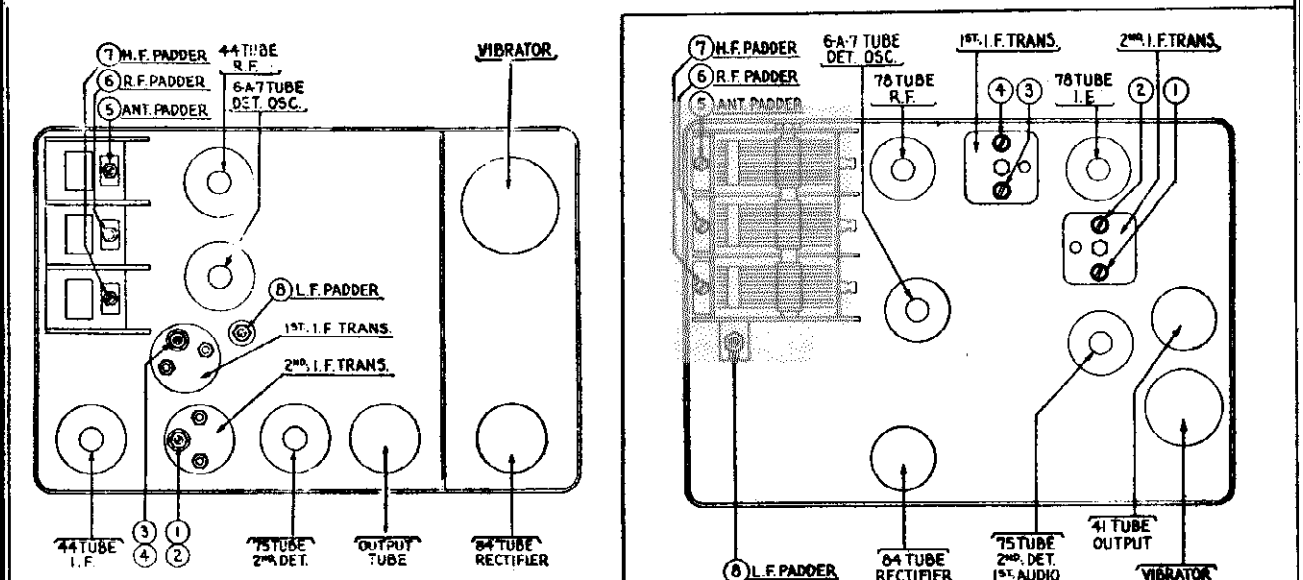

NOTE—When using the Model DPV as a fixed frequency Receiver, use the procedure given above first and then lock the tuning condenser at the desired frequency. If possible, the R.F. and Antenna padders should be adjusted while using the signal from the police transmitter.

NOTE 1—Turn the condenser rotor plates completely out of mesh. Use a piece of bond letterhead paper as a gauge between the heel of the rotor plates and the stator plates and turn the condenser plates in mesh until they strike against the paper.

NOTE 2—Rock the tuning condenser while adjusting the low frequency padder. Tune the condenser to the signal and adjust the padder for maximum output. Rotate the tuning condenser back and forth slightly for maximum output. Then re-adjust the padder for maximum output. Repeat this procedure until no further improvement is noticed.

NOTE 3—Turn the adjusting screw all the way in, then adjust the nut for maximum reading on the output meter. Next adjust the screw for maximum reading on the output meter. This adjustment is critical. Note the maximum reading obtained, turn the screw in again, and readjust, bringing the adjustment up to the maximum reading. Do not pass it and back off.

NOTE 4—Connect the antenna lead, Part No. 41-3191, to the antenna receptacle on the Receiver in series with a 150 mmfd. condenser

MODELS P1430, S1431, P1432, N1433, N1434, G1436, AND S1437

OPERATION	SIGNAL GENERATOR		DUMMY CAPACITY	SPECIAL INSTRUCTIONS	ADJUST PADDER
	FREQUENCY	CONNECTION			
1	260 K. C.	To Grid of 78 Tube—I.F. Stage	.1 Mfd. Condenser in Series with Generator Lead	No Antenna Connection	1-2
2	260 K. C.	To Grid of 6A7 Tube	.1 Mfd. Condenser in Series with Generator Lead	No Antenna Connection	3-4 1-2
3	1500 K. C.	To Grid of 78 Tube—R.F. Stage	.1 Mfd. Condenser in Series with Generator Lead	No Antenna Connection Note 1	7-6 8
4	580 K. C.	To Grid of 78 Tube—R.F. Stage	.1 Mfd. Condenser in Series with Generator Lead	No Antenna Connection Set Tuning Condensers at 580 K. C.	Note 2
5	1550 K. C.	To Grid of 78 Tube—R.F. Stage	.1 Mfd. Condenser in Series with Generator Lead	No Antenna Connection Set Tuning Condensers at 1550 K. C.	7
6	1400 K. C.	Note 4	Note 4	Set Tuning Condensers at 1400 K. C.	8-5

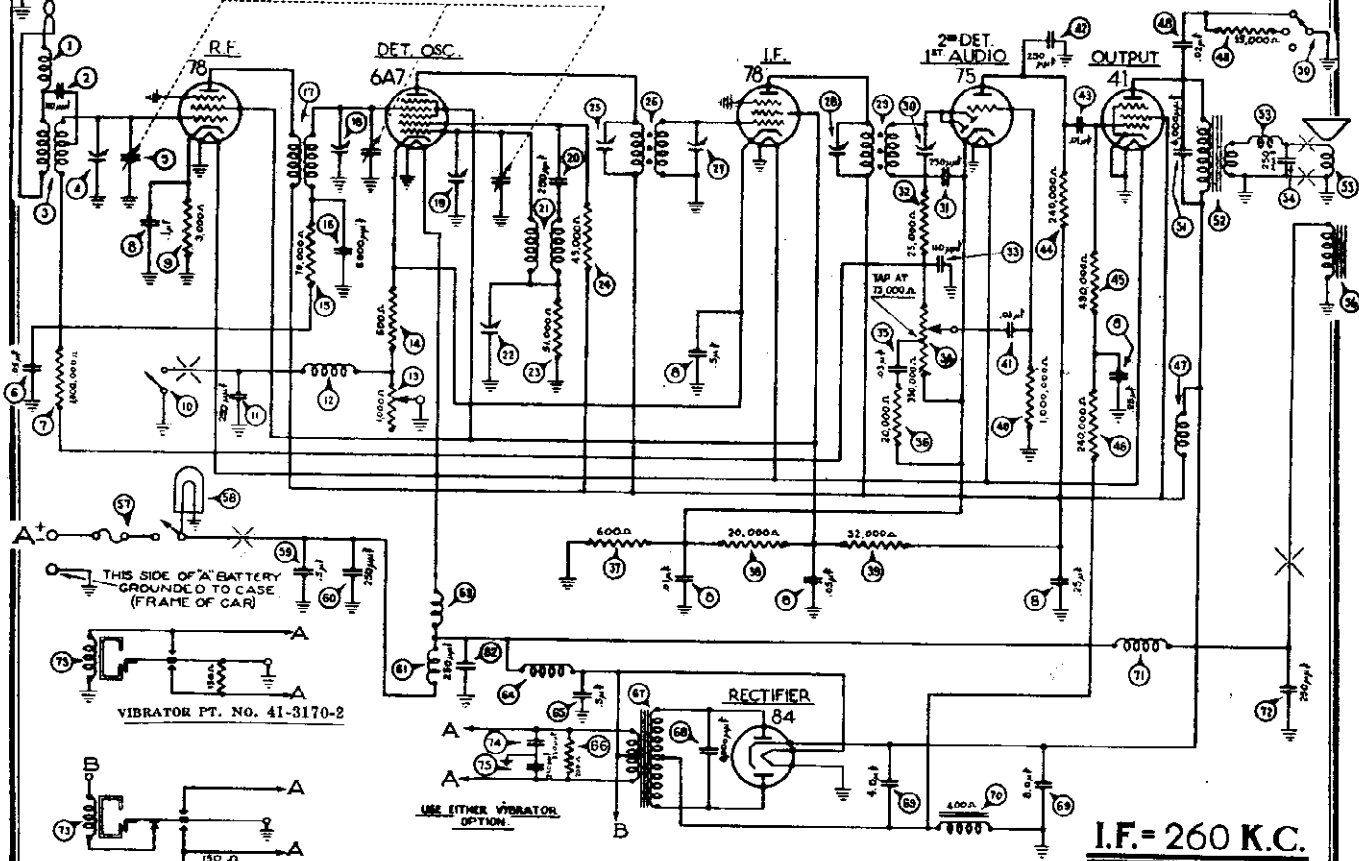

Adjust for maximum reading on the output meter.

NOTE 1—Turn the condenser rotor plates completely out of mesh. Use a piece of bond letterhead paper as a gauge between the heel of the rotor plates and the stator plates and turn the condenser plates in mesh until they strike against the paper.

NOTE 2—Rock the tuning condenser while adjusting the low frequency padder. Tune the condenser to the signal and adjust the padder for maximum output. Rotate the tuning condenser back and forth slightly for maximum output. Then re-adjust the padder for maximum output. Repeat this procedure until no further improvement is noticed.

NOTE 4—Connect the Antenna lead Part No. 41-3191 to the Antenna receptacle on the Receiver in series with the correct dummy capacity. For the P1430 and P1432 use a 230 mmfd. condenser, for the S1431 use a 25 mmfd. condenser (connect lead to the Roof Antenna connector), for the N1433 use a 50 mmfd. condenser (connect lead to the Roof Antenna connector), for the N1434 and S1437 use the standard antenna lead connected directly to the output terminal on the signal generator, for the G1436 use a 1690 mmfd. condenser.

35	Resistor (20,000 ohms)	33-320344	Sensitivity Switch Knob	28-7203
36	Resistor (600 ohms)	33-1212	Tuning & Volume Knob	27-4313
37	Resistor (20,000 ohms)	33-220344	Knob Base	28-4184
38	Resistor (32,000 ohms)	33-332444	Antenna Loom Assembly	38-8030
39	Resistor (1,000,000 ohms)	33-510344	Tee Bolt (Rec. mtg.)	28-6268
40	Condenser (.01 mfd.)	30-4470	Switch and Lead Assembly	41-8217
41	Condenser (250 mmfd.)	30-1032	Speaker Cable	41-3235

CHANGES — "Run Numbers" are stamped on the chassis sub-base for identification. These "Run Numbers" are changed consecutively as major changes are made in the Receiver wiring and parts.

RUN No. 2 — Condenser ⑩ removed (.01 mfd.) — Part No. 30-4479 added (.01 mfd.).

RUN No. 3 — Remove Choke ⑨. Add Choke 32-1438. One side is connected to the filament of the type 41 Tube Socket. The other side connected to Choke ⑨.

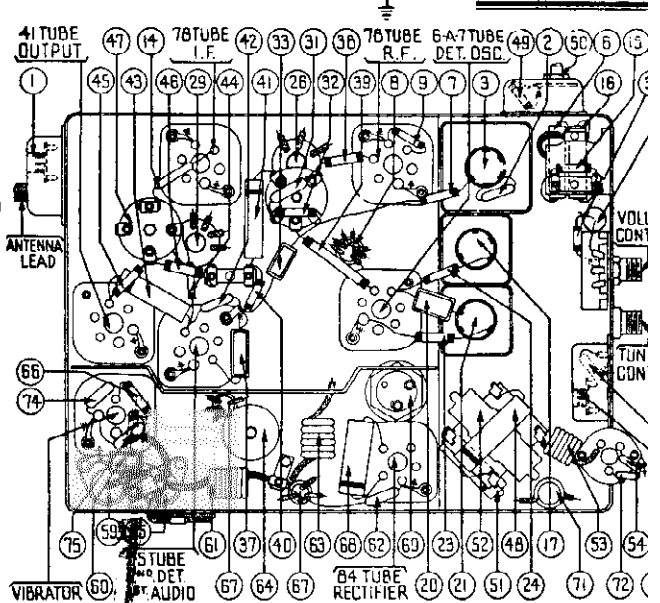

FIGURE 146

Connect a 250 mmfd. condenser Part No. 30-1032 across the filament of type 6A7 Tube Socket.

Connect one side of a 250 mmfd. condenser Part No. 30-1032 between 8 mfd. section of Condenser ⑩ and the "B" Choke ⑨ and the other to ground.

RUN No. 5 — Resistor ⑧ removed (51,000 ohms) Part No. 33-399344 a (99,000 ohms).

RUN No. 6 — A 10,000 ohms resistor Part No. 33-310344 has been added to the Receiver. This is connected in series between the B+ side Choke ⑦ and the 8 mfd. section of Condenser ⑩.

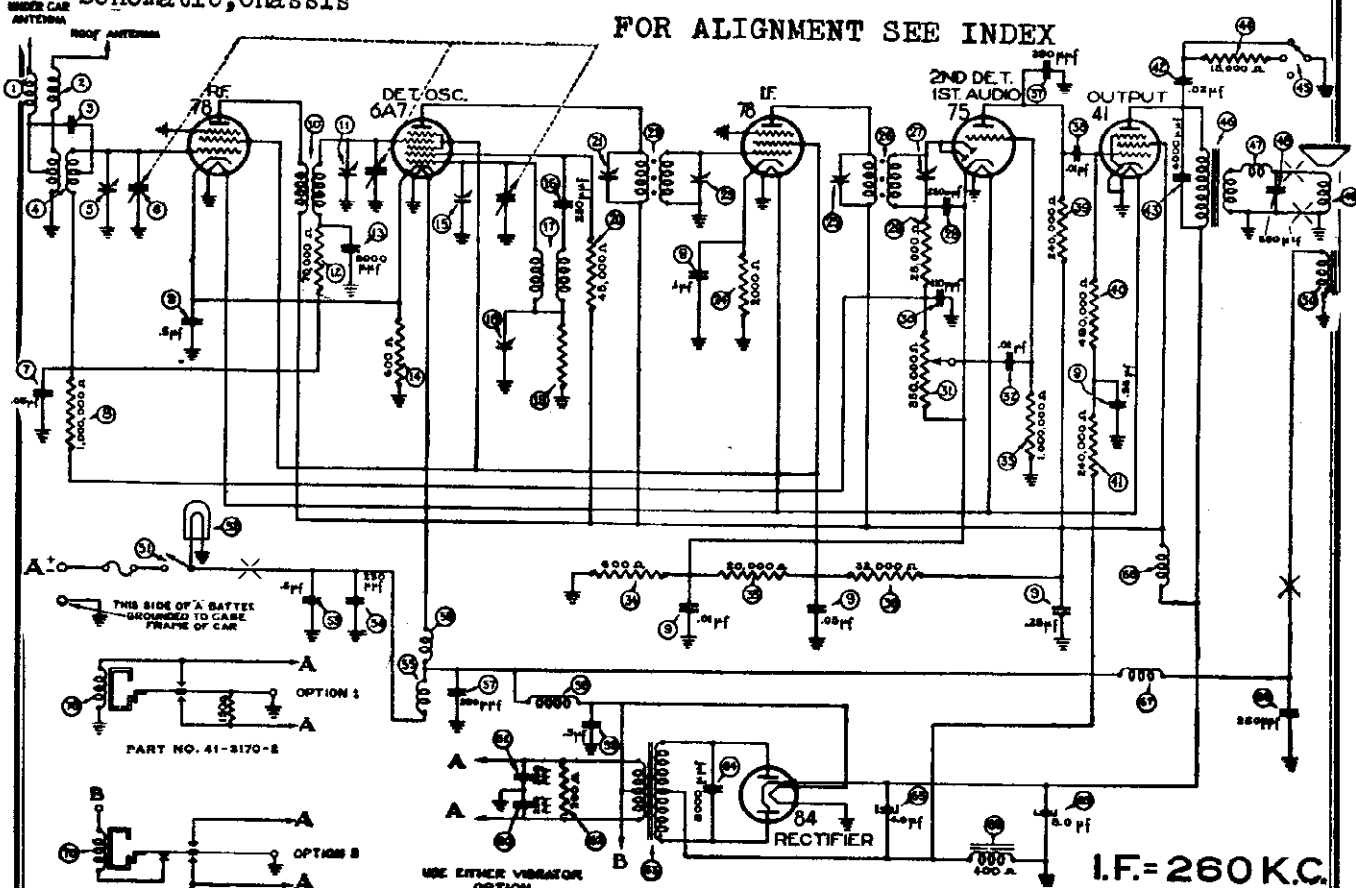

RUN No. 7 — Condenser ② removed (110 mmfd.) Part No. 30-1066 a (80 mmfd.).

3	Condenser (70 mmfd.)	30-1068	Condenser (4,000 mmfd.)	30-4185
4	Antenna Transformer	32-2281	Resistor (15,000 ohms)	33-315344
5	First Padder (on tun. cond.)		Tone Control Switch	42-1273
6	Tuning Condenser	31-1912	Output Transformer	32-7495
7	Condenser (.05 mfd.)	30-4444	Choke	32-1374
8	Resistor (1,000,000 ohms)	33-510344	Condenser (250 mmfd.)	30-1032
9	Condenser (.01-.05-.1-.25-.25-.5 mfd.)	30-4478	Cone and Voice Coil	38-3526
10	R. F. Transformer	32-2231	Field Coil Assembly	32-9236
11	Second padder (on tun. cond.)		On and Off Switch Assembly	42-5617
12	Resistor (70,000 ohms)	33-370344	Pilot Lamp	34-2039
13	Condenser (6,000 mmfd.)	30-4445	Condenser (.5 mfd.)	30-4474
14	Resistor (800 ohms)	33-1212	Coarse Resistor (250 mmfd.)	30-1052
15	Third Padder (on tun. cond.)		"A" Choke	32-1374
16	Condenser (250 mmfd.)	30-1032	Filament Choke	32-1561
17	Oscillator Transformer	32-2232	Condenser (250 mmfd.)	30-1032
18	Low Frequency Padder	31-6056	Vibrator Choke	32-2249
19	Resistor (51,000 ohms)	33-351344	Condenser (.5 mfd.)	30-4474
20	Resistor (45,000 ohms)	33-345344	Coarse Resistor (250 mmfd.)	30-1032
21	Padder (Pri. 1st I. F. Trans.)		Condenser (250 mmfd.)	30-1032
22	First I. F. Transformer	32-2286	Resistor (200 ohms)	33-120344
23	Padder (Sec. 1st I. F. Trans.)		Power Transformer	32-7720
24	Resistor (2,000 ohms)	32-220334	Condenser (8,000 mmfd.)	30-4420
25	Padder (Pri. 2nd I. F. Trans.)		Filter Condenser (4-8 mfd.)	30-2188
26	Second I. F. Transformer	32-2187	Filter Choke	32-7722
27	Padder (Sec. 2nd I. F. Trans.)		Choke	32-2369
28	Condenser (250 mmfd.)	30-1032	"B" Choke	32-1281
29	Resistor (25,000 ohms)	33-325344	Condenser (250 mmfd.)	30-1032
30	Condenser (110 mmfd.)	30-1031	Vibrator (Optional)	41-3170-2
31	Volume Control (350,000 ohms)	33-5139	Inductive Suppressor	32-2250
32	Condenser (.01 mfd.)	30-4124	Tee Bolt (Rec. mtg.)	28-6161
33	Resistor (1,000,000 ohms)	33-510344	Nut (Rec. mtg.)	W518A
34	Resistor (800 ohms)	33-1212	Speaker Cable	41-3247
35	Resistor (30,000 ohms)	33-320334	Tuning and Volume Knob	28-7214
36	Resistor (32,000 ohms)	33-332444	Tone Control Knob	28-7215
37	Condenser (250 mmfd.)	30-1032	Knob Base	28-4184
38	Condenser (.01 mfd.)	30-4145	Tuning & Volume Shaft	28-8895
39	Resistor (240,000 ohms)	33-424344	Tone Control Shaft	28-8896
40	Resistor (490,000 ohms)	33-448344	Scale Assembly	42-5644
41	Resistor (240,000 ohms)	33-424344	Receiver Housing	38-1727
42	Resistor (99,000 ohms)			

CHANGES — "Run Numbers" are stamped on the chassis sub-base for identification. These "Run Numbers" are changed consecutively as major changes are made in the Receiver wiring and parts.

RUN No. 2 — Remove Tone Control Switch ⑩. Add Part No. 42-1273.

RUN No. 3 — Remove Tone Control Switch ⑩. Add Part No. 42-1273.

RUN No. 4 — Choke ⑩ removed, Part No. 32-1438 added. One side is connected to the filament of the type 41 Tube, and the other side is connected to Choke ⑩.

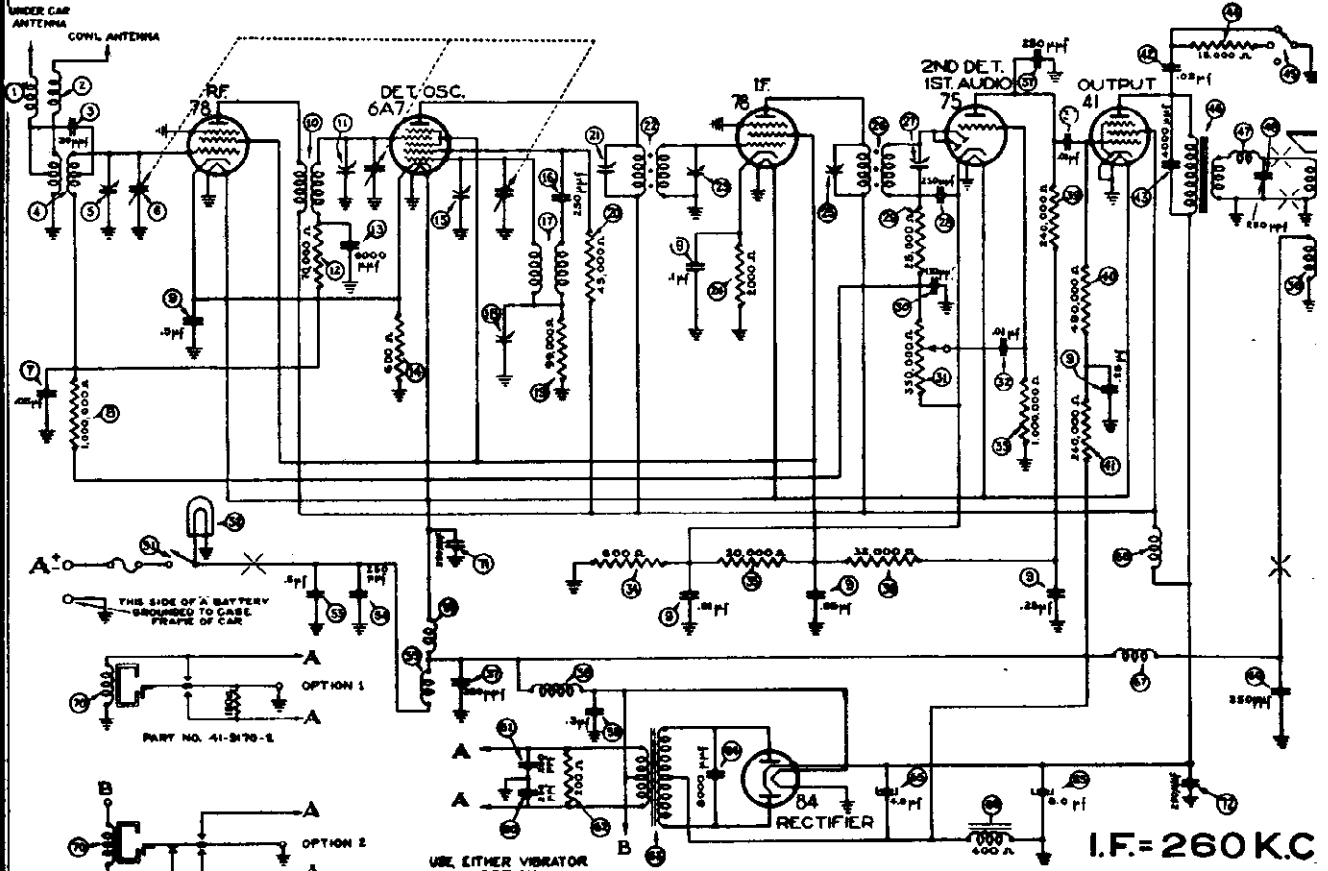

RUN No. 5 — The Antenna Transformer ④ is replaced with a new type having the same part number. It can be identified by the orange paint mark on the fibre.

RUN No. 6 — Resistor ⑩ removed (51,000 ohms) Part No. 33-399344 added (99,000 ohms).

Model N-1433H is a Special Custom-Built Receiver used exclusively by Nash Motor Company in 1937 Nash cars.

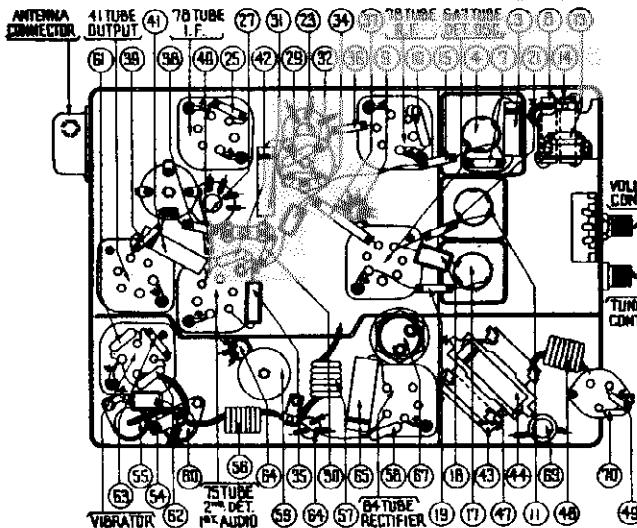

FIGURE 156

CHANGES — "Run Numbers" are stamped on the chassis sub-base for identification. These "Run Numbers" are changed consecutively as major changes are made in the Receiver wiring and parts.

RUN No. 2 — Tuning Condenser (C) removed Part No. 31-1985 added.

RUN No. 4 — Choke (B) removed Part No. 32-1436 added. One side is connected to the filament of the type 41 Tube and the other side is connected to Choke (C).

A 250 mmfd. Condenser Part No. 30-1032 has been added across the filament of the type 6A7 Tube Socket.

A 250 mmfd. Condenser Part No. 30-1032 has been added to the Receiver. One side is connected between the 8 mfd. section of Condenser (C) and the "B" Choke (B) and the other side grounded.

RUN No. 5 — Resistor (R) removed (51,000 ohms) Part No. 33-399344 added (99,000 ohms).

RUN No. 6 — Antenna Choke Part No. 32-2063 added to the Receiver. One side is connected to Condenser (C) and the other side connected to the Antenna Connector on the Receiver.

RUN No. 7 — The grid wire from the type 41 Tube was removed from its original location on the "B" Choke (B) and wired to the other side of "B" Choke (B).

No major change was involved in Run No. 3.

PARTS LIST

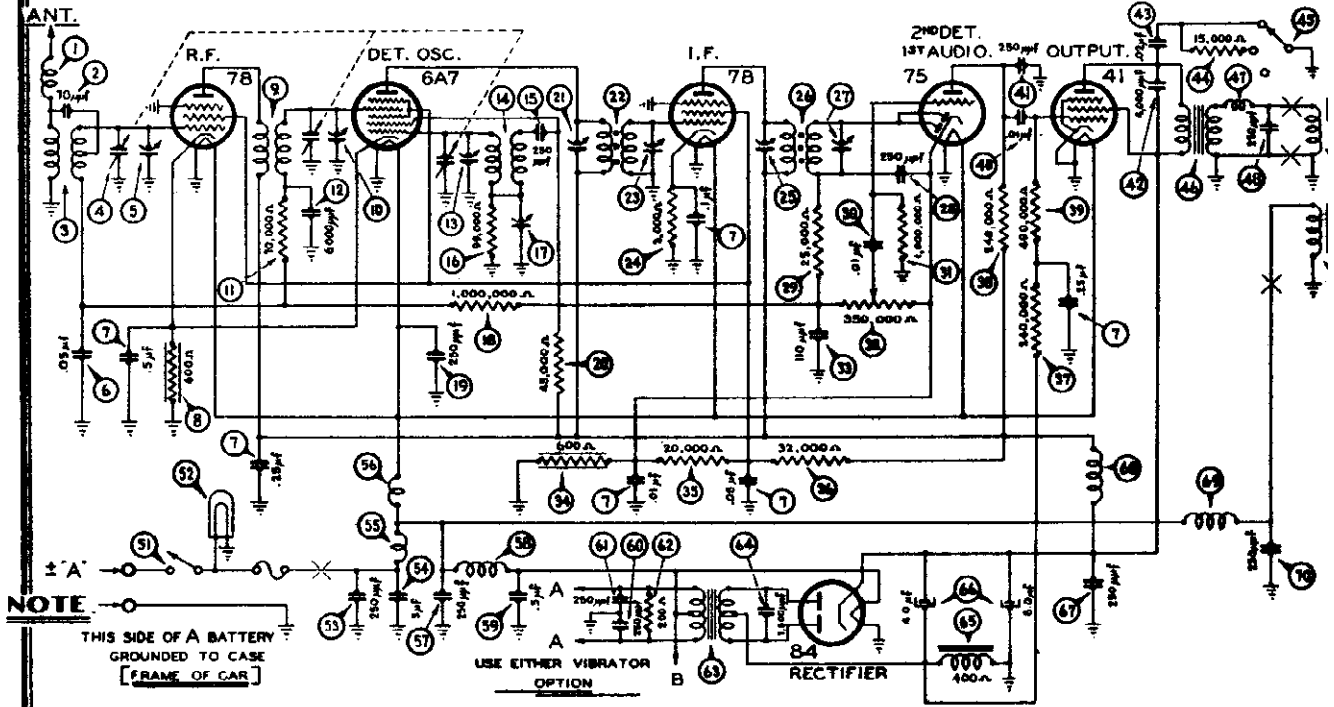

No.	Description	Part No.	Description	Part No.
1	Roof Antenna Transformer	32-2418	Resistor (15,000 ohms)	33-315344
2	Padder	31-8185	Tone Control Switch	42-1139
3	Condenser (.05 mfd.)	30-4444	Output Transformer	32-7495
4	Receiver Antenna Transformer	32-2422	Choke	32-1374
5	Tuning Condenser	31-1954	Condenser (250 mmfd.)	30-1032
6	First Padder (on Tun. Cond.)		Cone & Voice Coil	36-3588
7	Resistor (490,000 ohms)	33-449344	Field Coil Assembly	32-9236
8	Condenser (.05 mfd.)	30-4444	On & Off Switch	42-1277
9	Condenser (.01-.05-1 25-25-.5 mfd.)	30-4478	Pilot Lamp	34-2040
10	Resistor (600 ohms)	33-1212	Condenser (250 mmfd.)	30-1032
11	E. F. Transformer	32-2231	Condenser (.5 mfd.)	30-4474
12	Second Padder (on Tun. Cond.)		"A" Choke	32-1374
13	Resistor (70,000 ohms)	33-370344	Pilot Lamp	32-1561
14	Condenser (6,000 mmfd.)	30-4445	Condenser (250 mmfd.)	30-1032
15	Resistor (1,000,000 ohms)	33-510344	Vibrator Choke	32-2249
16	Third Padder (on Tun. Cond.)		Condenser (.5 mfd.)	30-4474
17	Oscillator Transformer	32-2232	Condenser (250 mmfd.)	30-1032
18	Condenser (250 mmfd.)	30-1032	Condenser (250 mmfd.)	30-1032
19	Resistor (89,000 ohms)	33-389344	Power Transformer	33-120344
20	Low Frequency Padder	31-6056	Condenser (8,000 mmfd.)	30-4420
21	Resistor (45,000 ohms)	33-345344	Filter Choke	32-7722
22	Padder (Pri. 1st I. F. Trans.)		Filter Condenser	30-2168
23	First I. F. Transformer	32-2286	"B" Choke	32-1281
24	Padder (Sec. 1st I. F. Trans.)		Choke	32-2269
25	Resistor (3,000 ohms)	33-230344	Condenser (250 mmfd.)	30-1032
26	Prvler (Pri. 2nd I. F. Trans.)		Vibrator (OPTIONAL)	41-3170-2
27	Second I. F. Transformer	32-2167	Four-prong Socket	27-6044
28	Padder (Sec. 2nd I. F. Trans.)		Pilot Lamp Socket	27-6035
29	Condenser (250 mmfd.)	30-1032	Six-prong Socket	27-6036
30	Resistor (1,000,000 ohms)	33-510344	Seven-prong Socket	27-6037
31	Condenser (.01 mfd.)	30-4124	Tuning Shaft	28-8699
32	Resistor (25,000 ohms)	33-325344	Volume Shaft	28-8714
33	Volume Control (350,000 ohms)	33-5139	Knob	27-4437
34	Condenser (110 mmfd.)	30-1031	Pilot Lamp Assembly	38-8285
35	Resistor (600 ohms)	33-1212	Dial	27-4456
36	Resistor (20,000 ohms)	33-320344	Glass	27-8656
37	Resistor (32,000 ohms)	33-332444	Pointer	27-4457
38	Resistor (240,000 ohms)	33-424344	Fuse	7927
39	Resistor (490,000 ohms)	33-449344	Fuse Insulator	27-7729
40	Resistor (240,000 ohms)	33-424344	Speaker Cable	41-3250
41	Condenser (.01 mfd.)	30-4145	"U" Clamp (Cont. Mfg.)	28-4680

CHANGES — "Run Numbers" are stamped on the chassis sub-base for identification. These "Run Numbers" are changed consecutively as major changes are made in the Receiver wiring and parts.

RUN No. 2 — Resistor ② removed (300 ohms) Part No. 33-220344 a (2000 ohms).

RUN No. 3 — Resistor ③ removed (2000 ohms) Part No. 33-225344 a (2500 ohms).

RUN No. 4 — Reverse all lug connections on "B" Choke ④.

ADJUSTMENTS — The correct padding procedure for the Model F-144 given on Page 107.

The Model F-1442 Concealed Header Bar Speaker with Ear Level Reception is a Special Custom-Built Receiver used exclusively by the Ford Motor Company for the 1937 Ford V-8 cars.

FIGURE 4

A Condenser 73 has been added to the Receiver. One side is connected to the filament of the type 6A7 tube and the side to the ground.
NOTE: The items marked with an asterisk are rarely required for service and in many cases will not be carried in stock local service station. In such cases it will be necessary to order these parts from Philco Transitone, Philadelphia or C

I. F. TRANSFORMERS AND PADDERS

The I. F. transformers are assembled complete with padding condensers.

Both the primary and secondary padders are placed side by side in the top of the transformer shield can. The adjusting screws are accessible thru the holes in the top of the shield. (See Figure 6).

The coil windings terminate in leads instead of terminals or lugs. The color scheme of the leads is given in Figure 5.

FIGURE 5

If replacements are ever necessary, replace the entire coil assembly, 82-2286 for the first I. F. stage and 82-2107 for the second I. F. stage. Neither the coil nor the padders will be furnished separately. Order only by the above numbers.

ADJUSTMENTS

All padding adjustments are carefully made at the factory and ordinarily no readjustments are necessary. However, when readjustments are required, the procedure given below must be followed in detail.

Equipment

Fully charged heavy duty storage battery or 6-volt power pack, 046 Philco Set Tester, 3164 Padding wrench, 27-7159 Padding screw driver.

General

OUTPUT METER — The output meter must be connected by means of an adapter to the plate of the type 41 output tube and to the Receiver chassis.

SIGNAL GENERATOR — With the Receiver and signal generator set up for operation at the prescribed frequency, turn the Receiver volume control on full and set the signal generator attenuator so that a half scale reading is obtained on the output meter. The signal in the speaker should be audible but not loud.

The shielding on the signal generator output lead must be connected to the Receiver housing.

Procedure

I. F. — Set the signal generator at exactly 200 K. C. Connect the generator lead to the grid cap of the 78 I. F. tube in series with a .1 mfd. condenser (without removing the grid cap).

Adjust the secondary screw padder (Ⓢ) on the second I. F. transformer for maximum reading on the output meter. Then adjust the primary screw padder (Ⓣ) for maximum reading. (See Figure 6 for location of padders).

Remove the generator lead from the 78 tube.

Connect the generator lead to the grid cap of the 6A7 tube in series with a .1 mfd. condenser (without removing the grid cap). Adjust the secondary screw padder (Ⓢ) on the first I. F. transformer for maximum reading on the output meter. Then adjust the primary screw padder (Ⓣ) for maximum reading. Readjust padders (Ⓢ) and (Ⓣ) with the generator lead connected to the type 6A7 tube. (See Figure 6 for location of padders).

HIGH FREQUENCY AND R. F. — After padding the first I. F. stage remove the generator lead from the 6A7 tube.

Set the signal generator at 1550 K. C. and then connect the generator lead to the grid cap of the 78 R. F. tube in series with a .1 mfd. condenser (without removing the grid cap).

Using a piece of paper approximately .006" thick as a gauge between the heel of the rotor plates and the stator plates, turn the rotor plates in mesh until they strike against the paper.

With the tuning condenser in this position, adjust the high frequency padder (Ⓢ) and the R. F. padder (Ⓣ) until the maximum reading is obtained on the output meter. This is the true setting for 1550 K. C., 155 on the dial scale.

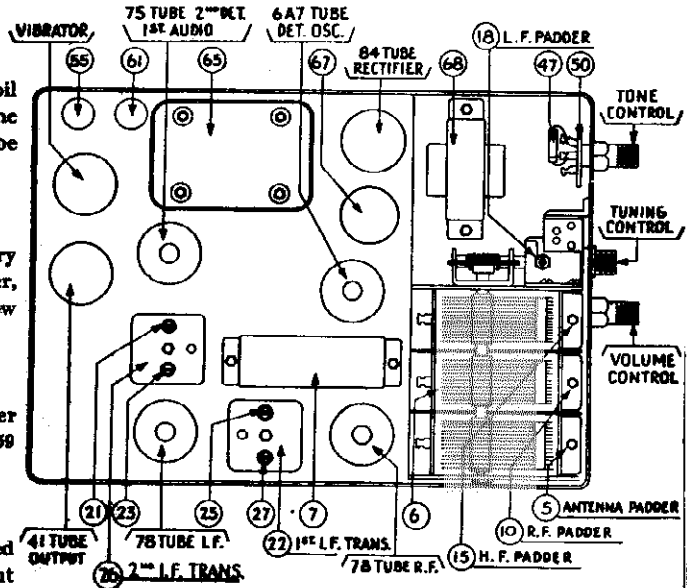

FIGURE 6

LOW FREQUENCY — Turn the tuning condenser plates in mesh to approximately 600 K. C., 60 on the dial scale and set the signal generator at 600 K. C. Roll the tuning condenser and adjust the low frequency padder screw (Ⓢ) for maximum reading on the output meter.

HIGH FREQUENCY READJUSTMENT — Turn the tuning condenser plates out of mesh to 1550 K. C. and set the signal generator at 1550 K. C. Then adjust the high frequency padder (Ⓢ) again for maximum reading on the output meter.

Remove the generator lead from the 78 R. F. tube.

ANTENNA — WHEN PADDING THE ANTENNA STAGE, IT IS EXTREMELY IMPORTANT THAT THE PROPER DUMMY ANTENNA BE CONSTRUCTED AND USED.

Connect the signal generator to the Antenna Cable Assembly (made up of the "Skyway Antenna" lead, Part No. L-2665 lead and a 22 mufd. condenser in series between the lead and the signal generator). Plug the cable into the antenna connector on the end of the Receiver.

Remove the snap button cover over the antenna selector and advance the selector switch to the Skyway antenna position.

Follow this padding procedure regardless of whether the Receiver is used with the Roadway or with the Skyway antenna.

Turn the tuning condenser to 1400 K. C. and set the generator at 1400 K. C. Adjust the padders (Ⓢ) and (Ⓣ) for the maximum reading on the output meter.

When the antenna stage adjustment is made with the Receiver installed in the car, the antenna lead must be connected to the Receiver in the usual manner. Connect the signal generator output lead to a wire placed near the car antenna but not connected to it.

PHILCO RADIO & TELEV. CORP.

MODEL 2620
 Socket, Trimmers
 Chassis, Alignment

PHILCO RADIO & TELEV. CORP.

TYPE CIRCUIT: Superheterodyne, with preselector R.F. amplifier and pentode output (3 watts); built in connections for *Philco All-Wave Aerial*, aerial selector built into and operated by waveband switch.

POWER SUPPLY: Alternating current, voltage and frequency as specified on nameplate of chassis.

TUBES USED: 1 type 78E, R. F.; 1 type 6A7, 1st detector and oscillator; 1 type 78E, I. F.; 1 type 75, detector, AVC, and 1st audio; 1 type 42E, output; 1 type 80, rectifier.

WAVE BANDS: Three (1) long wave (weather); (2) standard, (with some police); (3) short wave.

COVERAGE OF EACH BAND: Band 1, 115 to 350 K.C. Band 2, 540 to 1720 K.C.; Band 3, 5.7 to 18.0 MC.

TUNING DRIVE: Two-speed gear drive, ball bearing, 50 to 1 ratio for slow tuning.

STONE CONTROLS: 3 position, with bass compensation effective in first position.

INTERMEDIATE FREQUENCY: 460 K.C.

POWER CONSUMPTION: 60 watts.

FIGURE 2

generator low at all times to insure proper peaking of the transformers.

WAVE TRAP—Connect the Signal Generator antenna and ground leads to the antenna and ground posts of the set. Replace the grid clip on the 6A7 tube cap. With the signal generator operating at 460 K.C. and the set controls adjusted as for I. F., adjust wavetrap (1) until a minimum reading is obtained in the output meter.

SHORT-WAVE: Turn wave band switch to extreme right (position 3) and set dial at 18.0 meg. Set Signal Generator at 18.0 meg. Connect a shunt condenser across the oscillator section of the gang and tune the shunt for maximum output. Adjust condensers (2) and (3) for maximum output. Remove shunt condenser and adjust condenser (4) for correct calibration. Check the alignment by tuning the set dial at approximately (1.5) meg. for the image frequency.

STANDARD: Turn wave switch to Standard (position 2) and set dial at 1500 K. C. Set Signal Generator at 1500 K. C., adjust condensers (5), (6) and (7) for maximum. Turn dial of set and signal generator to 660 K. C. and adjust condenser (8) for maximum output, retune (9) at 1500 K. C.

LONG WAVE: (Weather) — Turn waveband switch to position 1 (left) (longwave). Set dial at (85) and signal generator at 350 K. C. Adjust condensers (10), (11) and (12) (oscillator, R. F., and Antenna Longwave) for maximum reading.

Turn dial to 17, signal generator to 170 and adjust condenser (13) (longwave series) for maximum reading.

FIGURE 1

ADJUSTING COMPENSATING CONDENSERS

Adjustment of compensating condensers in Model 2620 requires an accurate signal generator covering long-wave, standard wave, police, and short-wave frequencies. The PHILCO Model 088 All-Wave Signal Generator, having a continuous range of from 100 to 20,000 K.C., is ideal for this purpose.

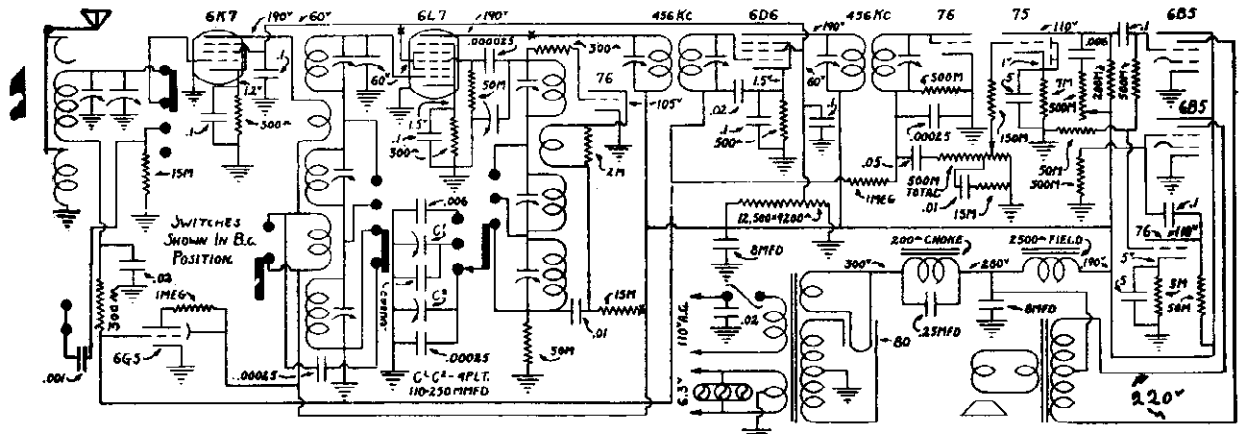

An output meter is also needed. PHILCO Model 025 Circuit Tester includes a high grade output meter.

Philco No. 3161 fibre wrench and No. 27-7069 fibre-handled screwdriver complete the equipment needed for making these adjustments. The location of the various compensating condensers is shown in Fig. 1. Connect the output meter to the plate and cathode contacts of the 42E output tube (using the adapters provided with the "025") and set it at the 6-30 volt range.

I. F. — Connect the antenna lead from the 088 Signal Generator to the grid cap of the 78E, I. F. amplifier (having removed the grid clip from the tube), and the ground lead to the ground post on the chassis. Set the Signal Generator (088) at 460 K.C., volume control of set full on, tone control counter-clockwise, wave band switch in No. 2 position, and condenser gang all the way in. Adjust the signal generator attenuator for approximately 1/4 scale reading on the output meter, now adjust condensers (2) and (3) for maximum reading of the output meter. Remove the signal generator antenna lead from the grid cap (replacing grid clip) and connect to the 6A7 grid cap. Repeat procedure, this time tuning condensers No. (5) and (6) for maximum output reading. Care should be taken to keep the signal input from the signal

16 - 555 m. (18,800 - 5,400 kc.)

SERVICE INFORMATION FOR PILOT MODELS 23, 25, P-23, and P-25

REMOVAL OF CHASSIS FROM CABINET:
To remove the chassis from the cabinet proceed as follows:

Be certain that the line cord is removed from the power outlet socket.
Remove the "dip-on" knobs and felt washers from the controls and loosen the set screw on the tuning knob.
Remove the speaker plug from the socket at the rear of the chassis. Models P-23 and 25 have the socket mounted on the speaker.
Remove the four mounting screws, located underneath the chassis.

Remove the tuning beam plug from the socket at the front of the chassis.
When removing Models P-23 and P-25 from the cabinet remove the photo-radio switch from the motor board, and disconnect wires going to matching transformer. Also disconnect line and ground leads to phono motor.

REALIGNMENT: Should the receiver require re-alignment, the procedure outlined below should be followed. For best results an external modulated oscillator with adequate frequency range, and a visual output meter, should be used.
Before connecting the chassis to the power line, reconnect the speaker cable in its socket at the rear of the chassis.

The R. F. alignment trimmer condensers are mounted on the side of the coil shield.
I. F. ALIGNMENT: When aligning the Intermediate Frequency Amplifier, the external trimmer must be set at 476 kc. The Band Selector Switch should be in the "Broadcast" position, and the tuning condenser should be set at maximum capacity. Connect the "antenna" lead of the external oscillator to the control grid of the type 6K7 tube in the I. F. Amplifier stage through a 1 mfd. fixed condenser. Connect the "ground" lead of the external oscillator to the receiver ground lead. The I. F. alignment capacitors are located at the side of the shielded I. F. Transformers. Rotate the adjusting screw of each capacitor on I. F. Unit No. 2 slowly until maximum output is noted. On completion of this operation, remove the external oscillator lead from the type 6K7 I. F. amplifier tube and connect it in the same manner to the control grid at the top of the type 6A8 tube.

Now rotate each adjustment screw on I. F. Unit No. 1 for maximum output. During these operations use the least possible input to prevent broadening of the resonance peak.
In order to obtain the most accurate realignment of the I. F. amplifier, it is essential to repeat the alignment process in both I. F. Units.
BROADCAST ALIGNMENT: After the I. F. amplifier is completely realigned, connect the external oscillator leads to the receiver antenna and ground leads. Insert a 200 mfd. condenser in series with the antenna lead. Set the Band Selector Switch in the "Broadcast" position and place the tuning control pointer at the 1500 kc. mark. Adjust the broadcast band oscillator trimmer.

BROADCAST ALIGNMENT: After the I. F. amplifier is completely realigned, connect the external oscillator leads to the receiver antenna and ground leads. Insert a 200 mfd. condenser in series with the antenna lead. Set the Band Selector Switch in the "Broadcast" position and place the tuning control pointer at the 1500 kc. mark. Adjust the broadcast band oscillator trimmer.

Range, Model 25 and P-25
16 - 51 m. (18,800 - 5,880 kc.)
181 - 555 m. (1,650 - 540 kc.)
731 - 2140 m. (410 - 140 kc.)

Next adjust the interstage alignment trimmer for maximum response. Finally adjust the antenna section trimmer in the same manner.

Next adjust the 600 kc. padder condenser, located on the top of the oscillator coil. Set the external oscillator at 600 kc. Rotate the receiver tuning control until resonance is indicated. Then rock the tuning control back and forth about this resonance position, and at the same time adjust the padder condenser for the highest resonance peak.

Now repeat the 1500 kc. trimmer adjustment, following in every detail the procedure previously described.

ALIGNMENT OF THE SHORT WAVE BANDS:
The procedure in aligning the short wave bands is identical with that for the broadcast band, with the exception of the adjustment of the padder condenser. Insert a 400 ohm non-inductive resistor in series with the antenna lead. The alignment frequencies are as follows:
Band 2: 90 Meters—(6,000 kc.)
Band 1: 16.6 Meters—(18,000 kc.)

When aligning Band 2, set the Band Selector Switch in the position marked "Band 2". Set the tuning control pointer at 90 meters. Adjust the oscillator alignment capacitor on Band 2 for maximum output. Next adjust the interstage and antenna section alignment capacitors for maximum output.

To align Band 1, set the Band Selector Switch in the position marked "Band 1". Set the tuning control pointer at the 16.6 meter mark. Set the external oscillator at 18.6 meters. Adjust the oscillator section alignment capacitor on Band 1 for maximum output.

Proceed next to align the interstage section of Band 1. In doing this, it is essential to rock the tuning control back and forth about the resonance position and at the same time to adjust the trimmer for the highest resonance peak. Next align the antenna section for maximum sensitivity.

LONG WAVE MODEL 25

The above alignment positions refer to the Model 23 only, which is calibrated in frequency. The alignment points for the Model 25, which is calibrated in meters only, is as follows:

Long Wave Align at 750 meters
Pad at 2,000 meters.
Broadcast Pad at 200 meters.
Band 1 Align at 17 meters.

The Long Wave alignment procedure is similar to that for the Broadcast. A 200 mfd. condenser should be used in series with the antenna lead in aligning this band.

CAUTION: When making repairs on the receiver, use only ROSIN CORE SOLDER. NEVER USE SOLDERING PASTE OR ACID FLUXES OF ANY TYPE.

Model G-44

16.4 - 51 m. (18,300 - 5,900 kc.)
48 - 146 m. (6,250 - 2,050 kc.)
187 - 555 m. (1,600 - 540 kc.)

REMOVAL OF CHASSIS FROM CABINET:

To remove the chassis from the cabinet proceed as follows:
Be certain that the battery cable is removed from the battery compartment.
Remove the "dip-on" knobs and felt washers from the controls and loosen the set screw on the tuning knob.
Remove the speaker plug from the socket at the rear of the speaker.
Remove the four mounting screws, located underneath the chassis.

REALIGNMENT: Should the receiver require re-alignment, the procedure outlined below should be followed. In the absence of an external oscillator, use the tuning control of the receiver. For best results an external modulated oscillator with adequate frequency range, and a visual output meter, should be used.
Before connecting the chassis to the battery, reconnect the speaker cable in its socket at the rear of the chassis.

I. F. ALIGNMENT: When aligning the Intermediate Frequency Amplifier, the external trimmer must be set at 476 kc. The Band Selector Switch should be in the "Broadcast" position, and the tuning condenser should be set at maximum capacity. Connect the "antenna" lead of the external oscillator to the control grid of the type 1D7G tube in the I. F. Amplifier stage through a 1 mfd. fixed condenser. Connect the "ground" lead of the external oscillator to the receiver ground lead. The I. F. alignment capacitors are located at the top of the shielded I. F. Transformers. Rotate the adjusting screw of each capacitor on I. F. Unit No. 2 slowly until maximum output is noted. On completion of this operation, remove the external oscillator leads from the type 1D7G I. F. Amplifier tube and connect it in the same manner to the control grid at the top of the type 1C7G tube.

Now rotate each adjustment screw on I. F. Unit No. 1 for maximum output. During these operations use the least possible input to prevent broadening of the resonance peak.
In order to obtain the most accurate realignment of the I. F. Amplifier, it is essential to repeat the alignment process in both I. F. Units with the external oscillator leads connected across the control grid of the 1C7G tube.

WAVE TRAP ADJUSTMENT: With the oscillator still set at 16 kc., connect the oscillator to the antenna through a 200 mfd. condenser. Then adjust the wave trap condenser for maximum output on the output meter. The trimmer for the wave trap condenser is located underneath the gang condenser.

LOCATION OF TRIMMERS: The trimmers are mounted on the rear of the antenna and oscillator coil shield.
The antenna coil and trimmer assembly is mounted on the rear right corner of the chassis. The oscillator assembly is to the left of the antenna assembly.

In Model G-44 the Broadcast trimmers (oscillator and antenna) are the top trimmers.
The middle trimmer are for B1 and the bottom trimmers for B2.

The top trimmers in Model G-44 are for the long wave band. The middle trimmers are for the medium wave band and the bottom trimmers for the short wave band. The padding condenser adjusting screw for 600 kc. is accessible through the hole at the rear of the chassis of the G-44 Model. On the G-45 Model this screw is the padding adjustment for the long wave band and the hexagon adjusting through which this screw passes is the padding adjustment for medium wave band.

Model G-45

16.4 - 51 m. (18,900 - 5,900 kc.)
187 - 555 m. (1,600 - 540 kc.)
740 - 2,220 m. (405 - 135 kc.)

(MODEL G-45 IS SOLD OUTSIDE THE U. S. A. ONLY)

BROADCAST ALIGNMENT: After the I. F. Amplifier is completely realigned, connect the external oscillator leads to the receiver antenna and ground leads, through a 200 mfd. condenser. Set the Band Switch in the "Broadcast" position and place the tuning control pointer at the 1500 kc. mark. Adjust the broadcast band oscillator trimmer in the same manner.

Next adjust the 600 kc. padder condenser. Set the external oscillator at 600 kc. Rotate the receiver tuning control until resonance is indicated. Then rock the tuning control back and forth about this resonance position, and at the same time adjust the padder condenser for the highest resonance peak.

Now repeat the 1500 kc. trimmer adjustment, following in every detail the procedure previously described.

ALIGNMENT OF THE SHORT-WAVE BANDS:
The procedure in aligning the short-wave bands is identical with that for the broadcast band with the exception of the adjustment of the padder condenser which is of fixed value and requires no adjustment. The alignment frequency is 16.6 Meters—(18,000 kc.)

Turn the Band Switch to the right. Tune the external oscillator to 16.6 meters. Tune the receiver so that the dial pointer is in a position coincidental with the 16.6 meter indication on the dial scale. Adjust the short wave oscillator trimmer for maximum response. Next adjust the signal circuit trimmer for maximum resonance. Repeat the adjustments to assure correct alignment, rocking the gang condenser to right or left for maximum gain.
Model G-44 is aligned in the same manner at 6,000 kc. with the switch in Band 2 position.

LONG WAVE ALIGNMENT: Procedure in the Model G-45 is similar to the Broadcast alignment of that receiver. Align at 375 kc. Adjust the ladder at 150 kc. Should it be necessary to remove the band switch assembly, it is advisable to realign the receiver after re-assembly.

LONG-WAVE BAND: Model G-45 (sold only outside the U. S. A.) has a third band covering 740 to 2,220 meters. Broadcast stations operating on long waves have a limited range, and are located chiefly in Europe. Hence, Model G-45 is not sold in the U. S. A. To tune the long wave stations, simply turn the Band Switch to the third position.

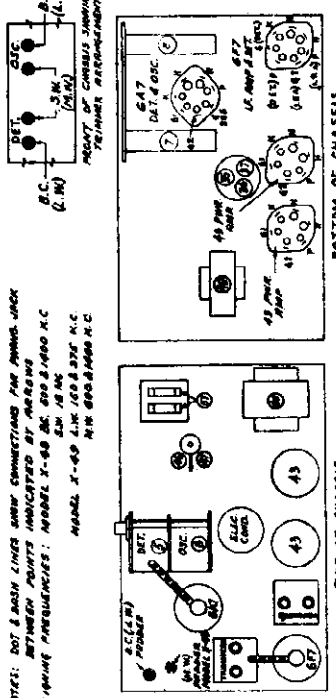

CAUTION: When making repairs on the receiver, use only ROSIN CORE SOLDER. NEVER USE SOLDERING PASTE OR ACID FLUXES OF ANY TYPE.

ANTENNA: While this set will give you amazing results with a few feet of wire for an antenna, you will be well repaid for the slight expense of a good antenna by the improvement in broadcast quality, the increase of distance on foreign short waves, and the reduction of interference.

Pilot engineers recommend the doublet antenna. When using a doublet, connect one lead-in wire to terminal "A" at the rear of the set, and the other one to terminal "D". If you use an ordinary single-wire antenna, connect the antenna to the "A" terminal on the set. Then short the "D" and "G" terminals and connect to a good ground. If you are in doubt about the best antenna for your location, consult your Pilot dealer. He is best able to assist you. Do not depend upon self-applied "experts".

MODEL X49 SUPERHETERODYNE
Range: 178-550 Meters (1,680-545 kc.)
789-2,142 Meters (380-140 kc.)

(Sold in the European area only)

IF PEAK 456 KC

A good antenna is most essential for the reception of signals from stations located thousands of miles from the receiver. The flat top portion of the antenna should be placed as high above the ground and grounded objects as possible. Both lead-in wire and antenna should be located as far from sources of man-made static as possible. Automobile ignition systems, telephone communication lines, electric oil burner installations, motor and trolley power lines are some of the more common offenders of this nature. The installation of a good antenna requires a small amount of additional labor, but the extra effort is always rewarded with improved reception with a minimum of static interference. A properly installed antenna is almost as good as an extra stage of tuned radio frequency amplification.

It is advisable to place the radio receiver close to the incoming lead-in, as frequently an extension about the interior of the house picks up a considerable amount of static along with the desired signal. The illustration shows how to install a lightning arrester if one is desired.

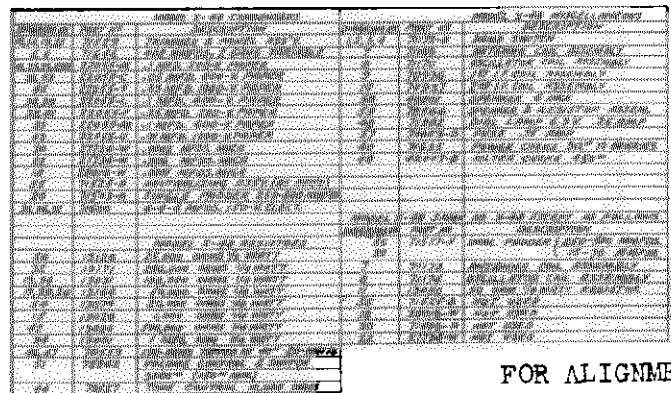

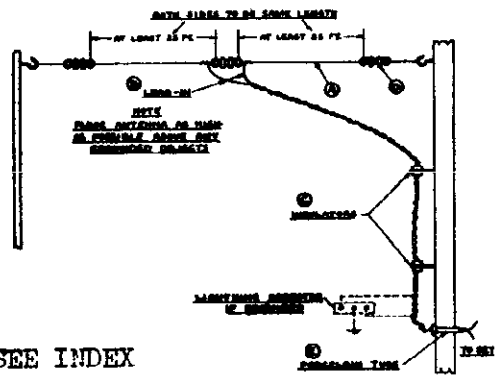

The kit contains two 75 ft. lengths of No. 14 wire. The illustration suggests the use of at least 25 ft. per section. Use as much of the wire up to 75 ft. per section as your location will permit. The letters at the right form a reference to the parts as arranged in the illustration.

Method No. 1: Join the ends of both leads together and connect to antenna terminal of set.
Method No. 2: Connect one wire to antenna lead of set; connect the other wire to the ground lead. Use the method on your set which gives the best performance.

CONTENTS OF PILOT KIT

- 2—75 ft. lengths of No. 14 enameled, copper wire.....A
- 100 ft. twisted pair lead-in wireB

Model G-56
Four Tuning Bands Cover 12.4-566 m. (24,200-530 kc.)
Model G-57

Four Tuning Bands: 12.4-32.5 meters (24,200-9,200 kc.)—20.5-61 meters (14,600-4,900 kc.)
182-566 meters (1,650-530 kc.)—755-2,300 meters (397-130 kc.)
REMOVAL OF CHASSIS FROM CABINET:

To remove the chassis from the cabinet proceed as follows:

Disconnect the battery from the receiver.
 Remove the "aligner" knobs and felt washers from the controls on the chassis.
 Remove the speaker plug from the socket at the rear of the chassis.

Remove the four mounting screws, located underneath the cabinet.

REALIGNMENT: Should the receiver require realignment, the procedure outlined below should be followed. For best results an external modulated oscillator with adequate frequency range, and a visual output meter, should be used.

Before connecting the chassis to the battery, reconnect the speaker cable in its socket at the rear of the chassis.

The location of the R. F. alignment trimmer controls is on the side of the band switch. The trimmers in the lowest row are those for aligning Band 1. Those in the second row from bottom are for Band 2. The trimmer in the third row from bottom is for Band 3. The trimmer in the fourth row from bottom is for Band 4. The Broadcast and Long Wave trimmers for Model G-57, are located in the third and fourth rows respectively from the bottom.

The padding condenser is located under the rear section of the band switch. Access to the padding condenser is made through a hole provided in the rear of the chassis panel. Model G-57 has a Long Wave and a Broadcast padding condenser.

I. F. ALIGNMENT: When aligning the Intermediate Frequency Amplifier, the external oscillator must be set at 455 kc. The Band Selector Switch should be in the position marked "Broadcast", and the tuning condenser should be set at maximum capacity. Connect the antenna lead of the external oscillator to the control grid of the type 6X7 tube in the I. F. Amplifier. Connect the "ground" lead of the external oscillator to the receiver ground lead. The I. F. alignment capacitors are located at the side of the shielded I. F. Transformer. Rotate the adjusting screw of each capacitor on I. F. Unit No. 2 slowly until maximum output is noted. On completion of this operation, remove the external oscillator lead from the type 6X7 I. F. amplifier tube and connect it in the same manner to the control grid at the top of the type 6A8 tube.

Now rotate each adjustment screw on I. F. Unit No. 1 for maximum output. During these operations, use the least possible input to prevent broadening of the resonance peaks.
 In order to obtain the most accurate realignment of the I. F. amplifier, it is essential to repeat the alignment process in both I. F. Units.

BROADCAST ALIGNMENT: After the I. F. amplifier is completely realigned, connect the external oscillator leads to the receiver antenna and ground leads. Insert a 200 mmf. condenser in series with the antenna lead. Set the Band Selector Switch in the "Broadcast" position and place the tuning control pointer at the 1500 kc. mark. Adjust the broadcast band oscillator trimmer.

Next adjust the 600 kc. padding condenser, located in the lower rear portion of the band switch, under the chassis. Set the external oscillator at 600 kc. Rotate

MODELS X-48 & X-49

I. F. ALIGNMENT: When aligning the intermediate Frequency Amplifier, the external oscillator must be set at 455 kc. The tuning condenser should be set at maximum capacity. Connect the antenna lead of the external oscillator to the control grid of the type 6X7 tube in the I. F. Amplifier stage through a 0.1 mfd. fixed condenser. Connect the ground lead of the external oscillator to the receiver ground dip. The I. F. alignment capacitors are located at the top of the shielded I. F. Transformer. Rotate the adjusting screw of each capacitor on I. F. Unit No. 2 slowly until maximum output is noted. On completion of this operation, remove the external oscillator leads from the type 6X7 I. F. Amplifier tube and connect it in the same manner to the control grid at the top of the type 6A7 tube.

Now rotate each adjustment screw on I. F. Unit No. 1 for maximum output. During these operations, use the least possible input to prevent broadening of the resonance peaks.

In order to obtain the most accurate realignment of the I. F. Amplifier, it is essential to repeat the alignment process in both I. F. units with the external oscillator leads connected across the control grid of the 6A7 tube.

BROADCAST ALIGNMENT: After the I. F. Amplifier is completely realigned, connect the external oscillator leads to the receiver antenna and ground leads, this time with a .002 mfd. condenser in the antenna lead. Adjust the tuning control pointer at the 1400 kc. mark. Rotate the broadcast band oscillator trimmer to maximum response. Adjust the signal section trimmer in the same manner.

Next adjust the 600 kc. padding condenser. Set the external oscillator at 600 kc. Rotate the receiver tuning control until resonance is indicated. Then rock the tuning control back and forth about this resonance position, and at the same time adjust the padding condenser for the highest resonance peak.

Now repeat the 1400 kc. trimmer adjustment, following in every detail the procedure previously described.

SHORT-WAVE ALIGNMENT: The procedure in aligning the shortwave bands is identical with that for the broadcast with the exception of the adjustment of the padding condenser. A 400 ohm resistor should be inserted in the antenna lead. The alignment frequency is 16.8 Mcz.—(17,800 kc.).

Turn the Band Switch to the right. Tune the external oscillator to 15.8 meters. Tune the receiver tuning dial pointer in a position corresponding to the 16.8 meter indication on the external oscillator. Next adjust the signal circuit trimmer for maximum response. Repeat all adjustments to assure correct alignment, rocking the gang condenser to right or left for maximum gain.

HIGH BAND ALIGNMENT: Procedure in the Model 49 is similar to that for the Broadcast section of this receiver. Align at 375 kc. Adjust the padding at 180 kc.

CAUTION: When making repairs on the receiver, use only ROSIN CORE SOLDER. NEVER USE SOLD-ERING PASTE OR ACID FLUXES OF ANY TYPE.

1. Examine the label on the rear of the chassis to make sure that the voltage is correct for the power supply you are using.
2. Connect the tube wire at the rear of the chassis to your antenna. For best results use an antenna of the type described in the PILOT antenna instruction sheet. If you are not experienced in erecting antennas, we strongly advise having this done by your radio service man. Good results can be obtained from a single wire about fifty feet long, and as high above surrounding objects as possible.
3. Connect the "back" lead at the rear of the chassis to the ground. This lead should be as short as possible. Wire the connection to the ground.
4. When the connections have been made, switch on the set, by turning the upper left-hand knob clockwise. This is the volume control knob as well as the compass dial, and at the lower right, the Band Switch.
5. When tuning in a station, be very careful to adjust the control set at the center of the response with the volume control volume. Unless that is done, the tone will be distorted.
6. If the tone from local stations is loud enough, to overcome the speaker, reducing the volume slightly will clear up the tone.
7. The tone control is at the lower left. Turning the knob to the left emphasizes the bass. Full musical response is obtained when this knob is turned all the way to the right.
8. If there is no sound in the speaker after the set has been turned on and the tubes have had time to become warm, reverse the position of the plug in the line socket.

NOTE: This PILOT set, in design, the quality of the materials, and the workmanship, is a fine musical instrument. It deserves careful and dry handling. We would like to have the tubes checked twice a year by your radio dealer, to assure the maintenance of its fine musical quality.

SERVICE INFORMATION

REMOVAL OF CHASSIS FROM CABINET:
 To remove the chassis from the cabinet proceed as follows:
 Be certain that the line cord is removed from the power outlet socket.
 Remove the aligner knobs and felt washers from the controls on the front panel.
 Remove the speaker plug from the socket at the rear of the chassis.
 Remove the four mounting screws, located underneath the chassis.
REALIGNMENT: Should the receiver require realignment, the procedure outlined below should be followed. For best results an external modulated oscillator with adequate frequency range, and a visual output meter, should be used.
 Before connecting the chassis to the power line, reconnect the speaker cable in its socket at the rear of the chassis.

VOLTAGES MEASURED AT TUBE SOCKETS

6A7 Det., Osc.	6X7 Amp., Det.
Plate 125 (110)	125 (110)
Screen 45 (45)	45 (45)
Cathode 10 (8)	10 (8)
Filament 6.3 (6.3)	6.3 (6.3)
Speaker field volts—105 (105) volts.	
Anode grid of 6A7—110 (80) volts.	
Trode plate of 6X7—99 (70) volts.	

Notes: Values are given for 220-volt line. For 110-volt line use values in parentheses.

Alignment

PILOT RADIO CORP.

MODEL 223

ALL-WAVE ANTENNA SYSTEM

In order to obtain the most accurate realignment of the I. F. Amplifier, it is essential to repeat the alignment process in both I. F. Units, with the external oscillator connected to the 6A7 tube.

BROADCAST ALIGNMENT: After the I. F. Amplifier is completely realigned, connect the external oscillator leads to the receiver antenna and chassis, this time with a 200 mfd. condenser in the antenna lead. Set the Band Selector Switch in the "Broadcast" position and place the tuning control pointer at the 1500 kc. mark. Adjust the broadcast band oscillator trimmer to maximum response. Next adjust the interstage alignment trimmer for maximum response. Finally adjust the antenna section trimmer in the same manner.

Next adjust the 600 kc. padder condenser, located on the top of the oscillator coil. Set the external oscillator at 600 kc. Rotate the receiver tuning control back and forth about the resonance position, and at the same time adjust the padder condenser for the highest response. Now repeat the 1500 kc. trimmer adjustment, following in every detail the procedure previously described.

ALIGNMENT OF THE SHORT WAVE BANDS: The procedure in aligning the short wave bands is identical with that for the broadcast with the exception of the adjustment of the padder condenser. A 400 ohm resistor should be connected in the antenna lead. The tuning frequency of band 1 is 16.8 Meters—(17,800 kc.) and of Band 2, 9000 kc.

Turn the Band Switch to Band 1. Tune the external oscillator to 16.8 meters. Tune the receiver so that the dial pointer is in a position coincidental with the 16.8 meter indication on the dial scale. Adjust the short wave oscillator trimmer for maximum response. Next adjust the signal circuit trimmer for maximum resonance. Repeat all adjustments to assure correct alignment, rocking the gang condenser to right or left for maximum gain. Then align Band 2 in the same manner at 9000 kc.

NOTE: Should it be necessary to remove any part of the band switch assembly, it is advisable to realign the receiver after reassembly.

CAUTION: When making repairs on the receiver, use only ROSIN CORE SOLDER. NEVER USE SOLDERING PASTE OR ACID FLUXES OF ANY TYPE.

A good antenna is most essential for the reception of signals from stations located thousands of miles from the receiver. The flat top portion of the antenna should be placed as high above the ground as possible. The antenna should be made of non-ferrous metal. As possible. Automobile ignition systems, telephone communication lines, and other electric lines are some of the more common offenders of this nature. The installation of a good antenna requires a small amount of skill and a few tools. The antenna should be installed in a position where it will receive the maximum amount of signal. A properly installed antenna is almost as good as an extra stage of tuned radio frequency amplification. To the incoming signal is frequently an extension about the latitude of the house pick up a considerable amount of static above with the desired signal. It is suggested that you install a lightning arrester in the antenna lead. The kit contains two 75 ft. lengths of No. 14 wire. The illustration suggests the use of at least 25 ft. per section. Use an amount of wire equal to the distance between the antenna and the ground. The battery at the right form a reference to the parts as arranged in the illustration.

Method No. 1: Join the ends of both leads together and connect to the antenna terminal of the lead to antenna of set; connect the other lead to the ground. Use the method on your set which gives the best performance.

CONTENTS OF PILOT KIT

- 2—75 ft. lengths of No. 14 enamel, copper wire.....A
- 100 ft. twisted pair lead-in wire.....B
- 2—Insulated stand-off insulators.....C
- 2—Porcelain insulators.....D
- 2—Porcelain tubes.....E
- 2—Insulated straps.....F

SERVICE INFORMATION
REMOVAL OF CHASSIS FROM CABINET:

To remove the chassis from the cabinet proceed as follows:
Be certain that the line cord is removed from the power outlet socket.
Remove the "dip-on" knobs and felt washers from the controls on the front panel.
Remove the speaker plug from the socket at the top of the chassis.
Remove the four mounting screws located underneath the cabinet.

REALIGNMENT: Should the receiver require realignment, the outlined procedure below should be followed. In the schematic wiring diagram the location and function of the various alignment capacitors are clearly illustrated. For best results an external modulated oscillator with adequate frequency range, and a visual output meter should be used.

Before connecting the chassis to the power line, reconnect the speaker cable in its socket at the top of the chassis.

I. F. ALIGNMENT: When aligning the Intermediate Frequency Amplifier, the external oscillator must be set at 456 kc. The Band Selector Switch should be in the position marked "Broadcast", and the tuning condenser should be set at maximum capacity. Connect the "antenna" lead of the external oscillator to the control grid of the type 6D6 tube in the I. F. Amplifier stage through a .1 mfd. fixed condenser. Connect the "ground" lead of the external oscillator to the receiver chassis. The I. F. alignment capacitors are located at the side of the shielded I. F. Transformer. Using No. 2 slowly until maximum output is noted. On completion of this operation, remove the external oscillator lead from the type 6D6 I. F. Amplifier tube and connect it in the same manner to the control grid at the top of the type 6A7 tube.

Now rotate each adjustment screw on I. F. Unit No. 1 for maximum output. During these operations, use the least possible input to prevent broadening of the resonance peak.

MODEL X105 SUPERHETERODYNE SERVICE INFORMATION

Range: 16-52 Meters (16,800-5,700 kc.)

REMOVAL OF CHASSIS FROM CABINET:

To remove the chassis from the cabinet proceed as follows:
Be certain that the line cord is removed from the power outlet socket.
Use a small screw driver to loosen the set screw on the tuning knob.
Remove the "dip-on" knobs and felt washers from the controls on the front panel.
Remove the speaker plug from the socket at the rear of the chassis.
Remove the four mounting screws, located underneath the cabinet.

REALIGNMENT: Should the receiver require realignment, the outlined procedure below should be followed. In the schematic wiring diagram, the location and function of the various alignment capacitors are clearly illustrated. For best results an external modulated oscillator with adequate frequency range, and a visual output meter, should be used.

Before connecting the chassis to the power line, reconnect the speaker cable in its socket at the rear of the chassis.

I. F. ALIGNMENT: When aligning the Intermediate Frequency Amplifier, the external oscillator must be set

at 456 kc. The Band Switch should be in the position marked "Broadcast", and the tuning condenser should be set at maximum capacity. Connect the "antenna" lead of the external oscillator to the control grid of the type 6D6 tube in the I. F. Amplifier stage through a .1 mfd. fixed condenser. Connect the "ground" lead of the external oscillator to the receiver ground lead. The I. F. alignment capacitors are located at the top of the shielded I. F. Transformer. Rotate the adjusting screw of each capacitor on I. F. Unit No. 2 slowly until maximum output is noted. On completion of this operation, remove the external oscillator leads from the type 6D6 I. F. Amplifier tube and connect it in the same manner to the control grid at the top of the type 6A7 tube.

Now rotate each adjustment screw on I. F. Unit No. 1 for maximum output. During these operations, use the least possible input to prevent broadening of the resonance peak.

In order to obtain the most accurate realignment of the I. F. Amplifier, it is essential to repeat the alignment process in both I. F. Units with the external oscillator leads connected across the control grid of the 6A7 tube.

BROADCAST ALIGNMENT: After the I. F. amplifier is completely realigned, connect the external oscillator leads to the receiver antenna and ground leads, through a .0002 mfd. condenser. Set the Band Switch in the "Broadcast" position and place the tuning control pointer at the 1500 kc. mark. Adjust the broadcast band oscillator trimmer to maximum response. Adjust the signal section trimmer in the same manner.

Next adjust the 600 kc. padder condenser. Set the external oscillator at 600 kc. Rotate the receiver tuning

control until resonance is indicated. Then rock the tuning control back and forth about this resonance position, and at the same time adjust the padder condenser for the highest resonance peak.

Now repeat the 1500 kc. trimmer adjustment, following in every detail the procedure previously described.

ALIGNMENT OF THE SHORT-WAVE BANDS: The procedure in aligning the short wave bands is identical with that for the broadcast with the exception of the adjustment of the padder condenser which is of fixed value and requires no adjustment. The alignment frequency is 16.6 Meters—(18,000 kc.)

Turn the Band Switch to the right. Tune the external oscillator to 16.6 meters. Tune the receiver so that the dial pointer is in a position coincidental with the 16.6 meter indication on the dial scale. Adjust the short wave oscillator trimmer for maximum response. Next adjust the signal circuit trimmer for maximum resonance. Repeat all adjustments to assure correct alignment, rocking the gang condenser to right or left for maximum gain.

LONG WAVE ALIGNMENT: Procedure in the Model X105 is similar to the Broadcast section of that receiver. Align at 375 k.c. Adjust the padder at 160 k.c.

Should it be necessary to remove the band switch assembly, it is advisable to realign the receiver after reassembly.

CAUTION: When making repairs on the receiver, use only ROSIN CORE SOLDER. NEVER USE SOLDERING PASTE OR ACID FLUXES OF ANY TYPE.

RECEIVER DESCRIPTION

- Operating Voltages—115, 125, 150, 220, 240 volts, Alternating Current.
- Frequency Rating—50 to 60 cycles.
- Power Consumption—50 Watts.
- Tubes—1 type 6A7, 1 type 6D6, 1 type 75, 1 type 42, 1 type 80.
- Wavelength Range—16 meters to 52.6 meters—178.5 meters to 350 meters—789 to 2142 meters.
- Undistorted power output—3 watts.
- Intermediate Frequency—456 kc.
- Tube Functions—Type 6A7: Electron emission control oscillator-detector.
Type 6D6: I. F. Amplifier.
Type 75: Duo-diode detector amplifier.
Type 42: Class "A" power pentode.
Type 80: Full-wave rectifier for power supply.

VOLTAGES

The D. C. Voltages measured at the tube sockets of the set should be read with a high resistance voltmeter of at least 1000 ohms per volt.

	OSC. DET. Type 6A7	I. F. Type 6D6	DIODE DET. Type 75	POWER PENTODE Type 42	RECTIFIER Type 80
Plate	230	230	105*	205	***
Cathode	4.	3.8	1.4	**	
Screen	85	85		230	
Filament	6.3	6.3	6.3	6.3	

*Voltages measured through 250,000 ohm plate resistor.

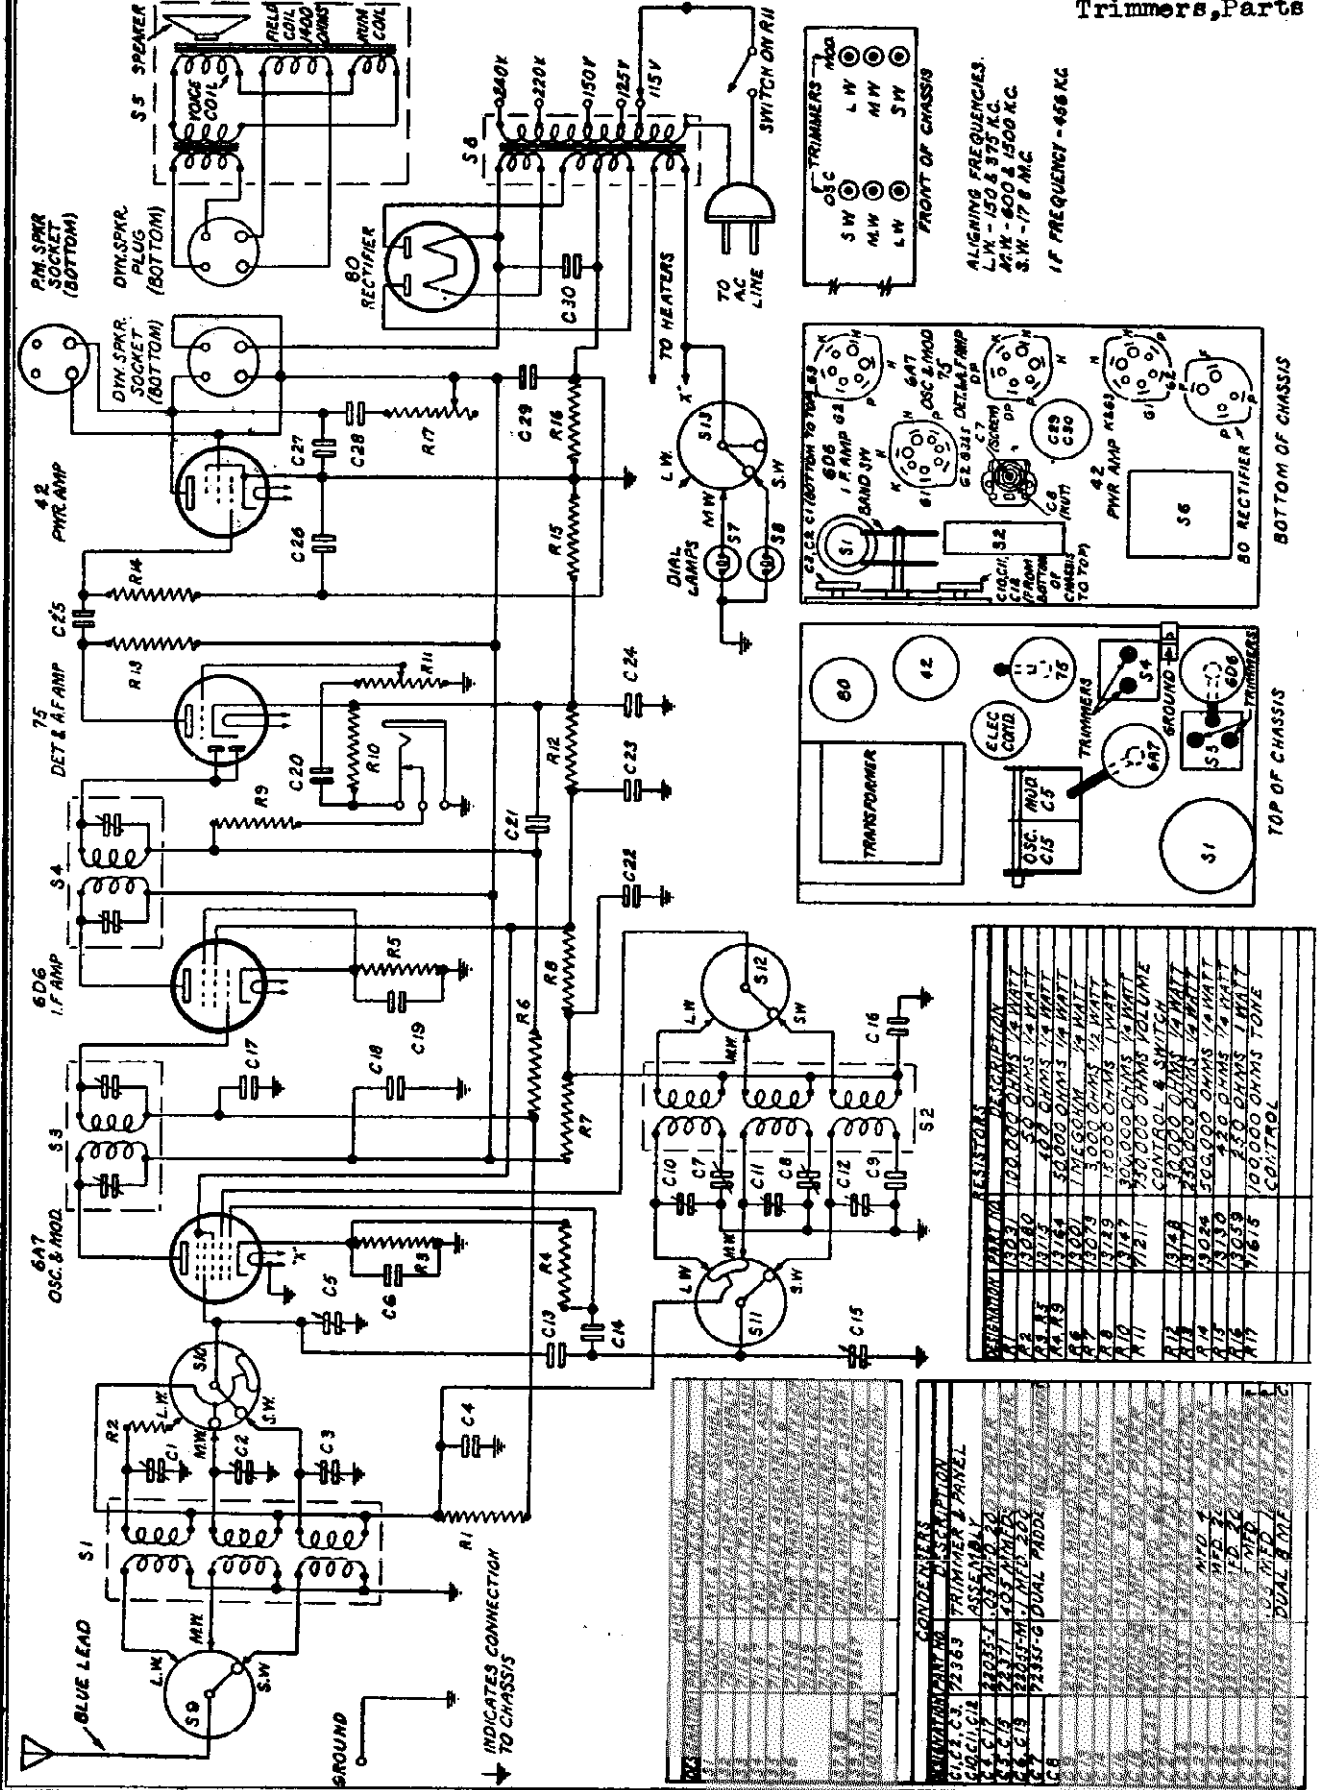

Speaker field voltage 90 volts. All plate voltages measured to cathode. All screen voltages measured to cathode. All cathode voltages measured to chassis frame.

**Grid bias voltage for No. 42 tube obtained across R-16 (250 ohms resistor).

***Filament to chassis ground 315 volts D. C.

Anode grid of 6A7 to cathode—175 volts.

ALL-WAVE ANTENNA SYSTEM

A good antenna is most essential for the reception of signals from stations located thousands of miles from the receiver. The antenna should be located as far from sources of man-made static and grounded objects as possible. Both lead-in wire and antenna wire should be spaced in 6-foot intervals. The antenna system consists of a horizontal wire supported by a central post and two side posts. The wire is connected to a transformer through a coil and a capacitor. The antenna system is designed to receive signals from stations located in any direction.

CONTENTS OF PILOT KIT

- 2-75 ft. lengths of No. 14 enamel-coated copper wire.....A
- 100 ft. twisted pair lead-in wire.....B
- 2-Insulated standard transformers.....C
- 2-Insulated capacitors.....D
- 2-Insulated tubes.....E
- 6-Insulated sockets.....F

SERVICE INFORMATION

REMOVAL OF CHASSIS FROM CABINET:

To remove the chassis from the cabinet proceed as follows:
Be certain that the line cord is removed from the power outlet socket.
Remove the "slip-on" knobs and felt washers from the controls on the front panel.
Remove the speaker plug from the socket at the top of the chassis.
Remove the four mounting screws located underneath the cabinet.

REALIGNMENT: Should the receiver require realignment, the outlined procedure below should be followed. In the schematic wiring diagram the location and function of the various alignment capacitors are clearly illustrated. For best results an external modulated oscillator with adequate frequency range, and a visual output meter should be used.
Before connecting the chassis to the power line, reconnect the speaker cable in its socket at the top of the chassis.

I. F. ALIGNMENT: When aligning the Intermediate Frequency Amplifier, the external oscillator must be set at 456 kc. The Band Selector Switch should be in the position marked "Broadcast," and the tuning condenser should be set at maximum capacity. Connect the antenna lead of the 6D6 tube in the I. F. Amplifier stage through a 1 mfd. fixed condenser. Connect the "ground" lead of the external oscillator to the receiver chassis. The I. F. alignment capacitors are located at the side of the shielded I. F. Transformer. Rotate the adjusting screw of each capacitor on I. F. Unit No. 2 slowly until maximum output is noted. On completion of this operation, remove the external oscillator lead from the type 6D6 I. F. Amplifier tube and connect it in the same manner to the control grid at the top of the type 6A7 tube.

Now rotate each adjustment screw on I. F. Unit No. 1 for maximum output. During these operations, use the least possible input to prevent broadening of the resonance peaks.

MODEL X105 SUPERHETERODYNE SERVICE INFORMATION **Range: 16-52 Meters (16,800-5,700 kc.)**

REMOVAL OF CHASSIS FROM CABINET:

- To remove the chassis from the cabinet proceed as follows:
Be certain that the line cord is removed from the power outlet socket.
Use a small screw driver to loosen the set screw on the tuning knob.
Remove the "slip-on" knobs and felt washers from the controls on the front panel.
Remove the speaker plug from the socket at the rear of the chassis.
Remove the four mounting screws, located underneath the cabinet.

at 456 kc. The Band Switch should be in the position marked "Broadcast," and the tuning condenser should be set at maximum capacity. Connect the "antenna" lead of the external oscillator to the control grid of the type 6D6 tube in the I. F. Amplifier stage through a .1 mfd. fixed condenser. Connect the "ground" lead of the external oscillator to the receiver ground lead. The I. F. alignment capacitors are located at the top of the shielded I. F. Transformer. Rotate the adjusting screw of each capacitor on I. F. Unit No. 2 slowly until maximum output is noted. On completion of this operation, remove the external oscillator leads from the type 6D6 I. F. Amplifier tube and connect it in the same manner to the control grid at the top of the type 6A7 tube.
Now rotate each adjustment screw on I. F. Unit No. 1 for maximum output. During these operations, use the least possible input to prevent broadening of the resonance peaks.
In order to obtain the most accurate realignment of the I. F. Amplifier, it is essential to repeat the alignment process in both I. F. units with the external oscillator leads connected across the control grid of the 6A7 tube.
BROADCAST ALIGNMENT: After the I. F. amplifier is completely realigned, connect the external oscillator leads to the receiver antenna and ground leads, through a .0002 mfd. condenser. Set the Band Switch in the "Broadcast" position and place the tuning control pointer at the 1500 kc. mark. Adjust the broadcast band oscillator trimmer to maximum response. Adjust the signal section trimmer in the same manner.
Next adjust the 600 kc. padder condenser. Set the external oscillator at 600 kc. Rotate the receiver tuning control until resonance is indicated. Then rock the tuning control back and forth about this resonance position, and at the same time adjust the padder condenser for the highest response.
Now repeat the 1500 kc. trimmer adjustment, following in every detail the procedure previously described.
ALIGNMENT OF THE SHORT-WAVE BANDS:
The procedure in aligning the short wave-bands is identical with that for the broadcast with the exception of the adjustment of the padder condenser which is of fixed value and requires no adjustment. The alignment frequency is 16.6 Meters—(18,000 kc.)
Turn the Band Switch to the right. Tune the external oscillator to 16.6 meters. Tune the receiver so that the dial pointer is in a position coincidental with the 16.6 meter indication on the dial scale. Adjust the short wave oscillator trimmer for maximum response. Next adjust the signal circuit trimmer for maximum resonance. Repeat all adjustments to assure correct alignment, rocking the gang condenser to right or left for maximum gain.

LONG WAVE ALIGNMENT: Procedure in the Model X105 is similar to the Broadcast section of that receiver. Align at 375 kc. Adjust the padder at 160 kc.
Should it be necessary to remove the band switch assembly, it is advisable to realign the receiver after re-installing.
CAUTION: When making repairs on the receiver, use only ROSIN CORE SOLDER. NEVER USE SOLDERING PASTE OR ACID FLUXES OF ANY TYPE.

REALIGNMENT: Should the receiver require realignment, the outlined procedure below should be followed. In the schematic wiring diagram, the location and function of the various alignment capacitors are clearly illustrated. For best results an external modulated oscillator with adequate frequency range, and a visual output meter, should be used.
Before connecting the chassis to the power line, reconnect the speaker cable in its socket at the rear of the chassis.
I. F. ALIGNMENT: When aligning the Intermediate Frequency Amplifier, the external oscillator must be set

RECEIVER DESCRIPTION

- Operating Voltages—115, 125, 150, 220, 240 volts, Alternating Current.
- Frequency Rating—50 to 60 cycles.
- Power Consumption—50 Watts.
- Tubes—1 type 6A7, 1 type 6D6, 1 type 75, 1 type 42, 1 type 80.
- Wavelength Range—16 meters to 32.6 meters—178.5 meters to 550 meters—789 to 2142 meters.
- Undistorted power output—3 watts.
- Intermediate Frequency—456 kc.
- Tube Functions—Type 6A7: Electron emission control oscillator-detector.
Type 6D6: I. F. Amplifier.
Type 75: Duo-diode detector amplifier.
Type 42: Class "A" power pentode.
Type 80: Full-wave rectifier for power supply.

VOLTAGES

The D. C. Voltages measured at the tube sockets of the set should be read with a high resistance voltmeter of at least 1000 ohms per volt.

	OSC. DET. Type 6A7	I. F. Type 6D6	DIODE DET. Type 75	POWER PENTODE Type 42	RECTIFIER Type 80
Plate	230	230	105*	205	***
Cathode	4.	3.8	1.4	8*	***
Screen	85	85		230	
Filament	6.3	6.3	6.3	6.3	

*Voltages measured through 250,000 ohm plate resistor.

Speaker field voltage 90 volts. All plate voltages measured to cathode. All screen voltages measured to cathode. All cathode voltages measured to chassis frame.

**Grid bias voltage for No. 42 tube obtained across R-16 (250 ohms resistor).
***Filament to chassis ground 315 volts D. C.
Anode grid of 6A7 to cathode—175 volts.

 731 - 2140 m. (410 - 140 kc.)
MODEL G-174 (MODELS G-175 and G-185 ARE SOLD OUTSIDE THE U. S. A. ONLY)
 187-566 m. (1,600-530 kc.)
 800-2170 m. (375-138 kc.)

REMOVAL OF CHASSIS FROM CABINET:
 To remove the chassis from the cabinet proceed as follows:

Be certain that the line cord is removed from the power outlet socket.

Remove the "alignon" knobs and felt washers from the controls and loosen the set screw on the tuning knob.

Remove the speaker plug from the socket at the rear of the chassis.

Remove the four mounting screws, located underneath the cabinet.

Remove the tuning beam plug from the socket at the front of the chassis.

REALIGNMENT: Should the receiver require realignment, the procedure outlined below should be followed. For best results an external modulated oscillator with adequate frequency range, and a visual output meter, should be used.

Before connecting the chassis to the power lines, reconnect the speaker cable in its socket at the rear of the chassis.

The R. F. alignment trimmer condensers are mounted on the side of the coil shields.

I. F. ALIGNMENT: When aligning the Intermediate-Frequency Amplifier, the external oscillator must be set at 416 kc. The Band Selector Switch should be in the position marked "Broadcast", and the tuning condenser should be set at maximum capacity. Connect the "antenna" lead of the external oscillator to the control grid of the type 6X7 tube in the I. F. Amplifier stage through a .1 mfd. fixed condenser. Connect the "ground" lead of the external oscillator to the receiver ground lead.

I. F. alignment capacitors are located at the side of the shielded I. F. Transformers. Rotate the adjusting screw of each capacitor on I. F. Unit No. 2 slowly until maximum output is noted. On completion of this operation, remove the external oscillator lead from the type 6X7 tube. Amplify the external oscillator lead from the type 6A7 tube. Connect the external oscillator lead to the control grid at the top of the type 6A8 tube.

Now rotate each adjustment screw on I. F. Unit No. 1 for maximum output. During these operations, use the least possible input to prevent broadening of the resonance peaks.

In order to obtain the most accurate realignment of the I. F. amplifier, it is essential to repeat the alignment process in both I. F. Units.

BROADCAST ALIGNMENT: After the I. F. amplifier is completely realigned, connect the external oscillator lead to the receiver antenna and ground through a .0002 mfd. condenser. Leave the Band Switch in the "Broadcast" position and place the tuning control pointer at the 1500 kc. mark. Adjust the broadcast band oscillator trimmer to maximum output.

WAVE TRAP ADJUSTMENT: With the oscillator still set at 416 kc., connect the oscillator to the antenna through a 200 mfd. condenser. Then adjust the wave trap condenser for minimum deflection on the output meter.

BROADCAST ALIGNMENT: After the I. F. amplifier is completely realigned, connect the external oscillator lead to the receiver antenna and ground through a .0002 mfd. condenser. Leave the Band Switch in the "Broadcast" position and place the tuning control pointer at the 1400 kc. mark. Tune the external oscillator to 1400 kc. Adjust the broadcast band oscillator trimmer to maximum output.

CAUTION: When making repairs on the receiver, use only ROSIN CORE SOLDER. NEVER USE SOLDERING PASTE OR ACID FLUXES OF ANY TYPE.

CAUTION: When making repairs on the receiver, use only ROSIN CORE SOLDER. NEVER USE SOLDERING PASTE OR ACID FLUXES OF ANY TYPE.

CAUTION: When making repairs on the receiver, use only ROSIN CORE SOLDER. NEVER USE SOLDERING PASTE OR ACID FLUXES OF ANY TYPE.

CAUTION: When making repairs on the receiver, use only ROSIN CORE SOLDER. NEVER USE SOLDERING PASTE OR ACID FLUXES OF ANY TYPE.

CAUTION: When making repairs on the receiver, use only ROSIN CORE SOLDER. NEVER USE SOLDERING PASTE OR ACID FLUXES OF ANY TYPE.

CAUTION: When making repairs on the receiver, use only ROSIN CORE SOLDER. NEVER USE SOLDERING PASTE OR ACID FLUXES OF ANY TYPE.

CAUTION: When making repairs on the receiver, use only ROSIN CORE SOLDER. NEVER USE SOLDERING PASTE OR ACID FLUXES OF ANY TYPE.

 Model G-162B 240 Volt - AC DC 50-60 cycles Model G-163B

44.5-126 m. (6,750-2380 kc.)
 187-566 m. (1,600-530 kc.)

REMOVAL OF CHASSIS FROM CABINET:

To remove the chassis from the cabinet proceed as follows:

Be certain that the line cord is removed from the power outlet socket.

Remove the knobs and felt washers from the controls on the front panel.

Remove the four mounting screws, located underneath the cabinet and pull chassis out.

REALIGNMENT: If the receiver requires alignment, the procedure outlined below should be followed. In the schematic diagram sheet, the location and function of the various alignment capacitors are clearly illustrated. For best results, an external modulated oscillator with adequate frequency range and a visual output meter, should be used.

I. F. ALIGNMENT: When aligning the Intermediate-Frequency Amplifier, the external oscillator must be set at 416 kc. The Band Switch should be in the position marked "Broadcast", and the tuning condenser should be set at maximum capacity. When aligning the receiver on all positions, the volume control should be turned to the maximum clockwise position. Connect the antenna lead of the external oscillator to the control grid of the 6D6 tube in the I. F. Amplifier through a .1 mfd. fixed condenser. Connect the ground lead of the external oscillator to the chassis. The I. F. alignment trimmers are located at the top of the shielded I. F. Transformers. Rotate the adjusting screw of each capacitor on I. F. Unit No. 2 slowly until maximum output is noted. Following this, connect the external oscillator leads to the control grid of the 6A7 tube. Adjust each trimmer on I. F. Unit No. 1 for maximum gain.

During these operations, use the least possible input to prevent broadening of the resonance peaks.

In order to obtain the most accurate realignment of the I. F. amplifier, it is essential to repeat the alignment process in all I. F. Units, with the external oscillator leads connected to the control grid of the 6A7 tube.

WAVE TRAP ADJUSTMENT: With the oscillator still set at 416 kc., connect the oscillator to the antenna through a 200 mfd. condenser. Then adjust the wave trap condenser for minimum deflection on the output meter.

BROADCAST ALIGNMENT: After the I. F. amplifier is completely realigned, connect the external oscillator lead to the receiver antenna and ground through a .0002 mfd. condenser. Leave the Band Switch in the "Broadcast" position and place the tuning control pointer at the 1400 kc. mark. Tune the external oscillator to 1400 kc. Adjust the broadcast band oscillator trimmer to maximum output.

CAUTION: When making repairs on the receiver, use only ROSIN CORE SOLDER. NEVER USE SOLDERING PASTE OR ACID FLUXES OF ANY TYPE.

CAUTION: When making repairs on the receiver, use only ROSIN CORE SOLDER. NEVER USE SOLDERING PASTE OR ACID FLUXES OF ANY TYPE.

CAUTION: When making repairs on the receiver, use only ROSIN CORE SOLDER. NEVER USE SOLDERING PASTE OR ACID FLUXES OF ANY TYPE.

CAUTION: When making repairs on the receiver, use only ROSIN CORE SOLDER. NEVER USE SOLDERING PASTE OR ACID FLUXES OF ANY TYPE.

CAUTION: When making repairs on the receiver, use only ROSIN CORE SOLDER. NEVER USE SOLDERING PASTE OR ACID FLUXES OF ANY TYPE.

CAUTION: When making repairs on the receiver, use only ROSIN CORE SOLDER. NEVER USE SOLDERING PASTE OR ACID FLUXES OF ANY TYPE.

CAUTION: When making repairs on the receiver, use only ROSIN CORE SOLDER. NEVER USE SOLDERING PASTE OR ACID FLUXES OF ANY TYPE.

CAUTION: When making repairs on the receiver, use only ROSIN CORE SOLDER. NEVER USE SOLDERING PASTE OR ACID FLUXES OF ANY TYPE.

CAUTION: When making repairs on the receiver, use only ROSIN CORE SOLDER. NEVER USE SOLDERING PASTE OR ACID FLUXES OF ANY TYPE.

CAUTION: When making repairs on the receiver, use only ROSIN CORE SOLDER. NEVER USE SOLDERING PASTE OR ACID FLUXES OF ANY TYPE.

CAUTION: When making repairs on the receiver, use only ROSIN CORE SOLDER. NEVER USE SOLDERING PASTE OR ACID FLUXES OF ANY TYPE.

CAUTION: When making repairs on the receiver, use only ROSIN CORE SOLDER. NEVER USE SOLDERING PASTE OR ACID FLUXES OF ANY TYPE.

CAUTION: When making repairs on the receiver, use only ROSIN CORE SOLDER. NEVER USE SOLDERING PASTE OR ACID FLUXES OF ANY TYPE.

To remove the chassis from the cabinet proceed as follows:

Be certain that the line cord is removed from the power outlet socket.

Remove the "alignon" knobs and felt washers from the controls and loosen the set screw on the tuning knob.

Remove the speaker plug from the socket at the rear of the chassis.

Remove the four mounting screws, located underneath the cabinet.

Remove the tuning beam plug from the socket at the front of the chassis.

REALIGNMENT: Should the receiver require realignment, the procedure outlined below should be followed. For best results an external modulated oscillator with adequate frequency range, and a visual output meter, should be used.

Before connecting the chassis to the power lines, reconnect the speaker cable in its socket at the rear of the chassis.

The R. F. alignment trimmer condensers are mounted on the side of the coil shields.

I. F. ALIGNMENT: When aligning the Intermediate-Frequency Amplifier, the external oscillator must be set at 416 kc. The Band Selector Switch should be in the position marked "Broadcast", and the tuning condenser should be set at maximum capacity. Connect the "antenna" lead of the external oscillator to the control grid of the type 6X7 tube in the I. F. Amplifier stage through a .1 mfd. fixed condenser. Connect the "ground" lead of the external oscillator to the receiver ground lead.

I. F. alignment capacitors are located at the side of the shielded I. F. Transformers. Rotate the adjusting screw of each capacitor on I. F. Unit No. 2 slowly until maximum output is noted. On completion of this operation, remove the external oscillator lead from the type 6X7 tube. Amplify the external oscillator lead from the type 6A7 tube. Connect the external oscillator lead to the control grid at the top of the type 6A8 tube.

Now rotate each adjustment screw on I. F. Unit No. 1 for maximum output. During these operations, use the least possible input to prevent broadening of the resonance peaks.

In order to obtain the most accurate realignment of the I. F. amplifier, it is essential to repeat the alignment process in all I. F. Units, with the external oscillator leads connected to the control grid of the 6A7 tube.

WAVE TRAP ADJUSTMENT: With the oscillator still set at 416 kc., connect the oscillator to the antenna through a 200 mfd. condenser. Then adjust the wave trap condenser for minimum deflection on the output meter.

BROADCAST ALIGNMENT: After the I. F. amplifier is completely realigned, connect the external oscillator lead to the receiver antenna and ground through a .0002 mfd. condenser. Leave the Band Switch in the "Broadcast" position and place the tuning control pointer at the 1400 kc. mark. Tune the external oscillator to 1400 kc. Adjust the broadcast band oscillator trimmer to maximum output.

CAUTION: When making repairs on the receiver, use only ROSIN CORE SOLDER. NEVER USE SOLDERING PASTE OR ACID FLUXES OF ANY TYPE.

CAUTION: When making repairs on the receiver, use only ROSIN CORE SOLDER. NEVER USE SOLDERING PASTE OR ACID FLUXES OF ANY TYPE.

CAUTION: When making repairs on the receiver, use only ROSIN CORE SOLDER. NEVER USE SOLDERING PASTE OR ACID FLUXES OF ANY TYPE.

CAUTION: When making repairs on the receiver, use only ROSIN CORE SOLDER. NEVER USE SOLDERING PASTE OR ACID FLUXES OF ANY TYPE.

FILAMENT	2.6	2.25	2.6	.5	15	215**	
	6.3	6.3	6.3	6.3	25	25	

NOTE: The D.C. voltages measured at the tube sockets of the set should be read with a high resistance voltmeter of at least 1,000 ohms per volt.

All voltages measured to chassis.

Speaker field voltage 215 volts.

Anode Grid of 6A7 100 volts.

* Measured through Plate Resistor.

** Cathode to chassis.

NOTE: These measurements should be made with the volume control turned to the right, and with the tuning adjusted at "No signal" position on dial.

REVERSING D.C. PLUG: When the Model 223 is operated on D.C., if the set seems dead, reverse the line plug in the socket. The set will work with the plug in one position, but not in the other.

Range: 16-555 Meters (18,800-545 kc.)
For Operation on 220 Volts—AC-DC

Power Consumption 100 Watts

Line Volts 220 volts A.C.-D.C.

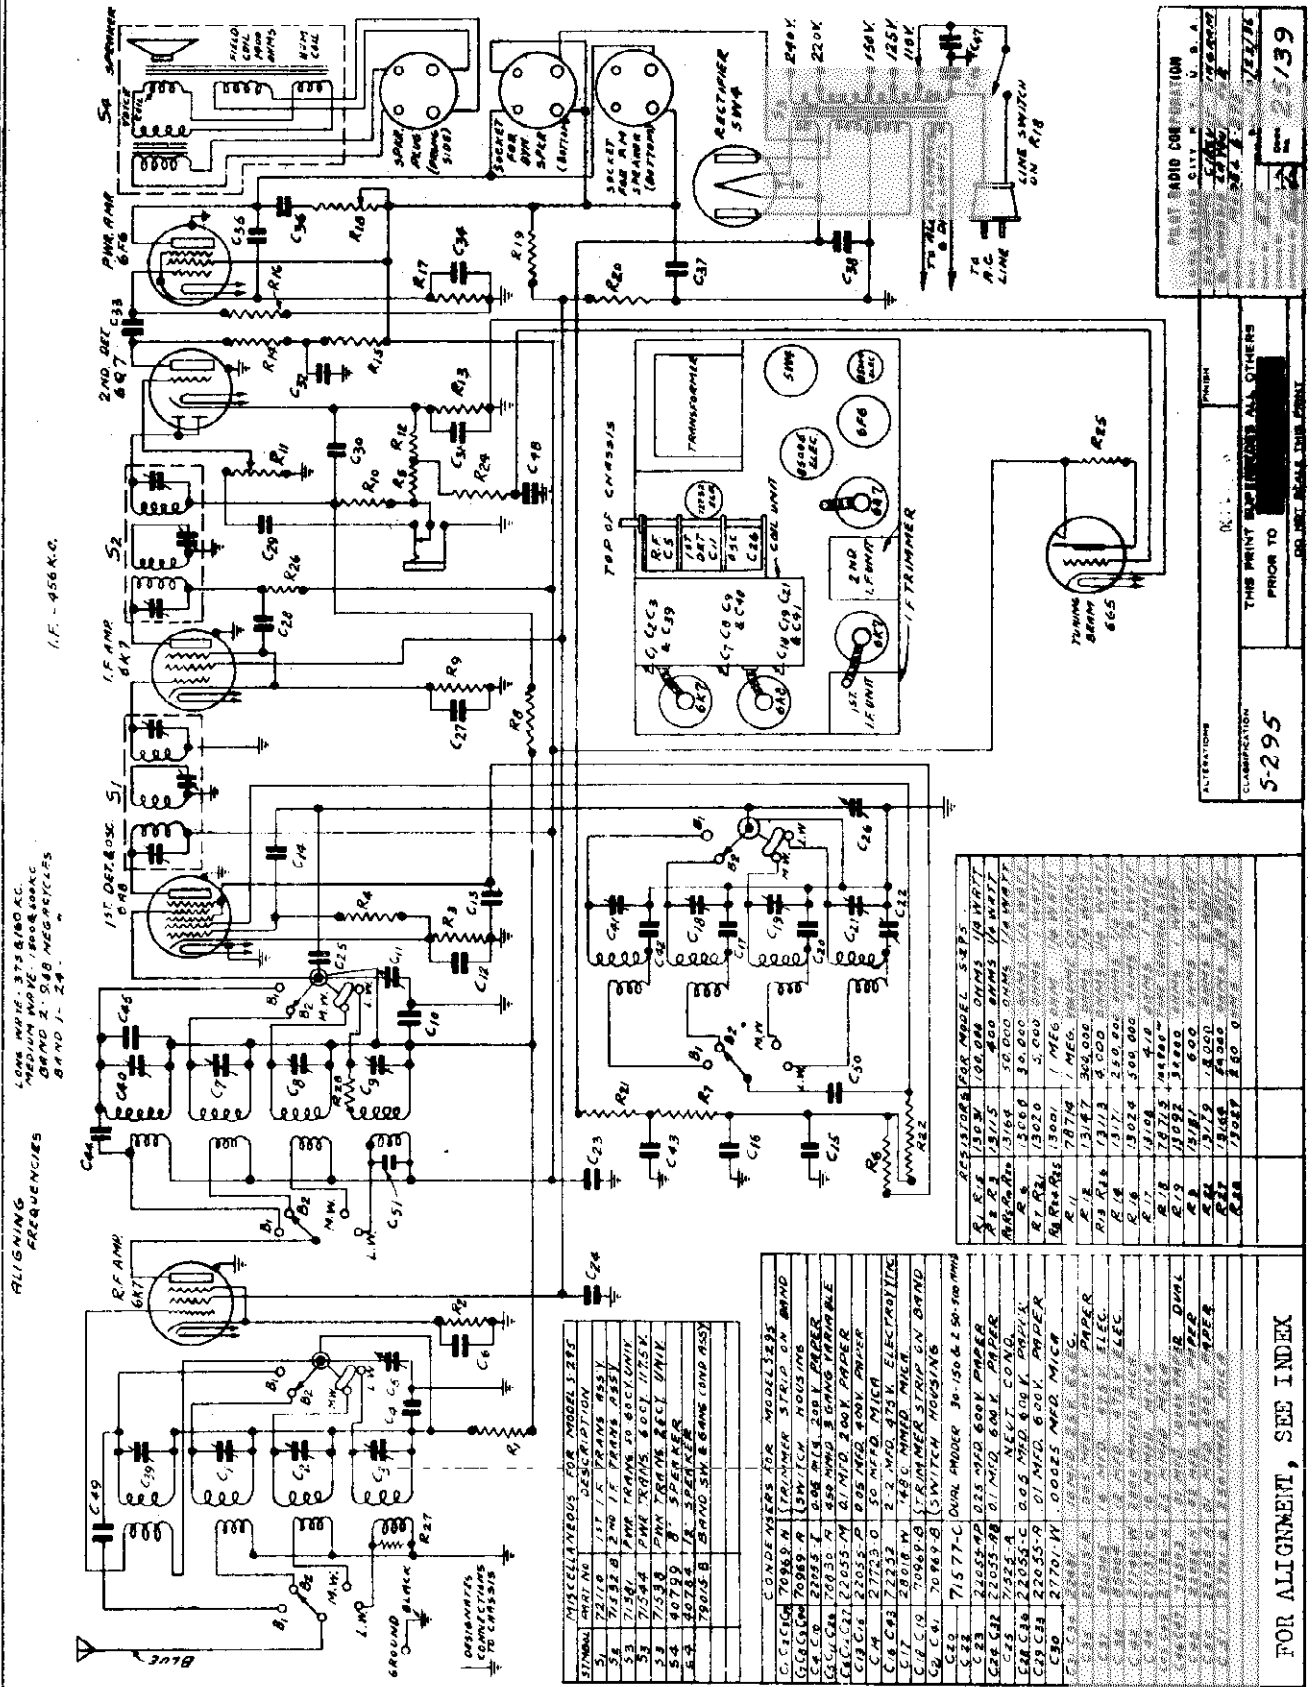

I. F. Frequency 456 Kc.

Power Output 2.3 Watts

Four Tuning Bands: 12.4-32.8 meters (24,100-9,150 kc.) — 29.7-7.9 meters (10,100-3,800 kc.)
182-560 meters (1,650-537 kc.) — 755-2,300 meters (397-130 kc.)

Model X-304
12.7 - 570 m. (23,600 - 525 kc.)

Model X-305
12.7 - 570 m. (23,600 - 525 kc.)
740 - 2150 m. (405 - 136 kc.)

REMOVAL OF CHASSIS FROM CABINET

To remove the chassis from the cabinet proceed as follows:

- Be certain that the line cord is removed from the power outlet socket.
- Remove the knobs and felt washers from the controls and loosen the set screw on the tuning knob.
- Remove the speaker plug from the socket at the rear of the chassis.
- Remove the four mounting screws, located underneath the cabinet, from the socket at the rear of the chassis.

REALIGNMENT

Should the receiver require realignment, the procedure outlined below should be followed. In the alignment procedure, capacitors are clearly illustrated. For best results an external modulated oscillator with adequate frequency range, and a visual output meter, should be used.

I. F. ALIGNMENT

When aligning Band 2, set the Band Switch in the position marked Band 2. Replace the 0.002 mfd. condenser with a 400 ohm non-inductive resistor. Rotate the tuning condenser on the dial scale. Adjust the Band 2 oscillator for maximum sensitivity. Next adjust the trimmer for maximum sensitivity. Check the overall sensitivity of the band at several points along the dial scale.

BROADCAST ALIGNMENT

When aligning Band 2, set the Band Switch in the position marked Band 2. Replace the 0.002 mfd. condenser with a 400 ohm non-inductive resistor. Rotate the tuning condenser on the dial scale. Adjust the Band 2 oscillator for maximum sensitivity. Next adjust the trimmer for maximum sensitivity. Check the overall sensitivity of the band at several points along the dial scale.

REMOVAL OF BAND SELECTOR SWITCH ASSEMBLY

Should it be necessary to remove the receiver after removal of the band selector switch assembly, it is advisable to realign the receiver after reassembly.

CAUTION

When making repairs on the receiver, use only ROSIN CORE SOLDER. NEVER USE SOLDERING PASTE OR ACID FLUXES OF ANY TYPE.

PHONOGRAPH PICKUP

A back is provided at the rear of the chassis for plugging in an extra speaker, which can be used in the living room, in one of your up-stairs rooms, or in the garage.

RECEIVER ALIGNMENT

EQUIPMENT REQUIRED:

- Signal Generator, having accurate frequency calibration.
- Output Meter
- Dummy Antenna; 900 ohm non-inductive resistor in mid. condenser
- .0002 mfd. condenser

CONNECTIONS: The posts marked D and G on the rear of the chassis should be connected to ground. The antenna lead from the signal generator is connected to the grid of the 6L7 intermediate frequency amplifier. The hot lead is transferred to the post marked A in series with a .0002 mfd. condenser when aligning Bands 4, 5, and 6. The .0002 mfd. condenser is connected to ground through a 400-ohm resistor when aligning Bands 1, 2, and 3 with a 400-ohm resistor when aligning Band 1, speaker terminals.

The output meter may be connected to the extra signal generator output. The signal generator should be set to 1500 kc. If this is not possible, the frequency a harmonic of a lower frequency may be used if the aligning signal is too strong.

The broadcast is due to the automatic volume control action. It is for this reason that the signal generator output must be kept low for accurate alignment.

ALIGNMENT PROCEDURE: All the control knobs should be turned to the extreme clockwise positions. The positions of the various trimmers are clearly shown in Figure 1. Connect the signal generator to the speaker for aligning the intermediate-frequency amplifier as described under "connections". Turn the loud speaker switch to the external receiver position. Set the signal generator at 456 kc. and increase its output until a reading is obtained on the output meter. Adjust the frequency trimmer in the order listed below under "I".

Next connect the signal generator for aligning Band 5. Set the signal generator and receiver dial at 1500 kc. Adjust the BY oscillator trimmer for maximum output. The detector and R.F. trimmers should next be adjusted for maximum output.

Band 5 should now be adjusted at the low frequency end of the dial. For this adjustment set the signal generator to 600 kc. and follow instructions under "rocking detector" at 600 kc. Repeat the 1500 kc. adjustment after aligning at 600 kc.

Model 529 has a long wave band (Band 6) which is adjusted in a manner similar to that for Band 5.

Bands 1, 2, 3 and 4 have no adjustment at the low frequency end of the band.

Grid bias voltage applied to L.F. and R.F. tubes—2.5 volts (Measure across R16)
 The above voltages were measured to chassis with a 1000 ohm per volt voltmeter and a 115 volt AC line.
 *Sensitivity control in maximum position. Cathode voltage measured with sensitivity control in maximum position, 9 volts.
 †Measured through high resistance.
 ‡Operating voltage through high resistance.
 ††† Frequency 50-60 cycles

IMAGE FREQUENCY: All bands except Band 1 are aligned with the oscillator slightly higher than the signal frequency. Band 1 has the oscillator adjusted to a frequency below the signal frequency. The possibility of aligning the receiver to the image frequency on Bands 2, 3 and 4 can be eliminated by adjusting the output of the oscillator to a level which will cause the receiver to receive two signals separated by twice the intermediate frequency. The signal which is received at a higher frequency on the receiver dial is the correct signal for alignment. The reverse is true on Band 1.

INTERMEDIATE FREQUENCY ALIGNMENT
 Set Signal Generator at 1500 kc.
 Adjust in Order Listed Below
 LEF-1
 LEF-2
 LEF-3

RADIO FREQUENCY ALIGNMENT

- Set Signal Generator and Receiver Dial at 375 kc.
- Band 6 150 kc.
- Band 5 1500 kc.
- Band 3 600 kc.
- Band 4 4300 kc.
- Band 2 11,000 kc.
- Band 1 60,000 kc.

*Rocking the gang is necessary to obtain correct alignment of the RF circuit. The signal generator should be set to the padding frequency and the gang rotated until the output meter reads maximum output.

The padding condenser for the band to be adjusted is turned a slight amount and the gang condenser turned to the next position. The padding condenser is then set to the padding frequency and the gang rotated until the output meter reads maximum output. The gang condenser in the same direction until a point is reached where the output decreases when the padding and gang are rotated further in the opposite direction. The padding condenser is then turned in the opposite direction where decreased output follows an adjustment of the padding.

ALIGNMENT OF BANDS 2 and 3: Center the indicator when aligning Bands 2 and 3. Center the frequencies covered. The signal generator and receiver indicator are set at the alignment frequency and the oscillator trimmer is adjusted for maximum output, care being taken to avoid adjustment to the image frequency. The intermediate frequency trimmer is now adjusted and the gang condenser is rotated until the output meter reads maximum output, until at some position of both trimmer and gang condenser, maximum output is obtained. The R.F. trimmer is adjusted in the same manner.

BAND 1 ALIGNMENT: The 60,000 kc. signal necessary for alignment may not be obtainable with most signal generators. The third harmonic of 20,000 kc. can be used for alignment. The signal generator should be adjusted to 60,000 kc. on the dial. The lower frequency trimmer should be adjusted to bring the lower frequency signal to the 60,000 kc. calibration on the dial.

Power consumption 200 watts
 Undesired power output—30 watts

REMOVAL OF CHASSIS FROM CABINET:
 To remove the chassis from the cabinet proceed as follows:
 Be certain that the line cord is removed from the power outlet socket.
 Remove the "Upson" knobs and felt washers from the controls and loosen the set screw on the tuning knob.
 Remove the speaker plug from the socket at the rear of the speaker.
 Remove the four mounting screws, located underneath the cabinet.

REALIGNMENT: Should the receiver require realignment, the procedure outlined below should be followed. Refer to the schematic wiring diagram, the tension and function of the various trimmers and the procedure illustrated. For best results an external modulated oscillator with adequate frequency range, and a signal output meter, should be used.

Before connecting the chassis to the power line, reconnect the speaker cable.

I. F. ALIGNMENT: When aligning the Intermediate Frequency Amplifier, the external oscillator must be set at 456 kc. The Band Switch should be in the position marked "Broadcast," and the tuning condenser should be set at maximum capacity. Connect the "antenna" lead of the external oscillator to the control grid of the 6E7-G tube. Connect the "ground" lead of the external oscillator to the receiver ground lead. The I. F. alignment capacitors are located at the top of the shielded I. F. Transformers. Rotate the adjusting screw of each capacitor on I. F. Unit No. 2 slowly until maximum output is obtained. On this step, the speaker terminals of the external oscillator leads from the type 6E7-G I. F. Amplifier tube and connect it in the same manner to the control grid at the top of the type 6A8-G tube.

Now rotate each adjustment screw on I. F. Unit No. 1 for maximum output. During this process, the speaker terminals of the external oscillator should be connected to the control grid of the type 6A8-G tube. At least possible input to prevent broadening of the resonance peaks.

In order to obtain the most accurate realignment of the I. F. Amplifier, it is essential to check the alignment process in both I. F. units with the external oscillator leads connected across the control grid of the 6A8-G tube.

RECEIVER DESCRIPTION

Tube Functions	Type
6A8-G	Electron emission control oscillator-detector
6E7-G	I. F. amplifier
6D7-G	Detector, discriminator, amplifier
6V6-G (2)	Class "A" power amplifier
6Y2-G	Full-wave rectifier for power supply
6B5	Tuning beacon
6H6-G	AVC diode

Frequency Rating —50 to 60 cycles.
 Power Consumption—90 watts.
 Tubes —1 type 6A8-G, 1 type 6E7-G, 1 type 6D7-G, 2 type 6V6-G, 1 type 6Y2-G, 1 type 6B5, type 6H6-G
 Undesired power output—6 watts.
 Intermediate Frequency—456 kc.

Model G-585
 16 - 51 m. (18,800 - 5,860 kc.)
 190 - 571 m. (1,580 - 525 kc.)
 780 - 2,190 m. (385 - 140 kc.)
(MODEL G-585 IS SOLD OUTSIDE THE U.S.A. ONLY)

WAVE TRAP ADJUSTMENT: With the oscillator set at 456 kc., connect the oscillator to the antenna through a .0002 mfd. condenser. Then adjust the wave trap condenser for minimum deflection on the output meter.

BROADCAST ALIGNMENT: After the I. F. Amplifier is completely realigned, connect the external oscillator to the receiver antenna and ground leads, through a .0002 mfd. condenser. The oscillator should be in the "case" position and place the tuning control pointer at the 1500 kc. mark. Adjust the broadcast band oscillator trimmer to maximum response. Adjust the signal section trimmer in the same manner.

Next adjust the 600 kc. padding condenser. Set the external oscillator at 600 kc. Rotate the receiver tuning control until resonance is indicated. Then rock the tuning condenser until the output meter reads maximum response at the same time adjust the padding condenser for the highest resonance peak.

Now repeat the 1500 kc. trimmer adjustment, following in every detail the procedure previously described.

ALIGNMENT OF THE SHORT-WAVE BANDS: The procedure in aligning the short-wave bands is identical with that for the broadcast band with the exception of the adjustment of the padding condenser which is of fixed value and requires no adjustment. The alignment frequency is 17,480 kc.

Turn the Band Switch to the right. Tune the external oscillator to 17 megacycles. Tune the receiver so that the dial pointer is in a position coincidental with the 17 meter indication on the dial scale. Adjust the short wave oscillator trimmer for maximum response. Next adjust the signal circuit trimmer for maximum resonance. Repeat all adjustments to assure correct alignment, reading the frequency meter on the minimum gain.

Model G-584 is aligned in the same manner as 6,000 kc. with the switch in Band 2 position.

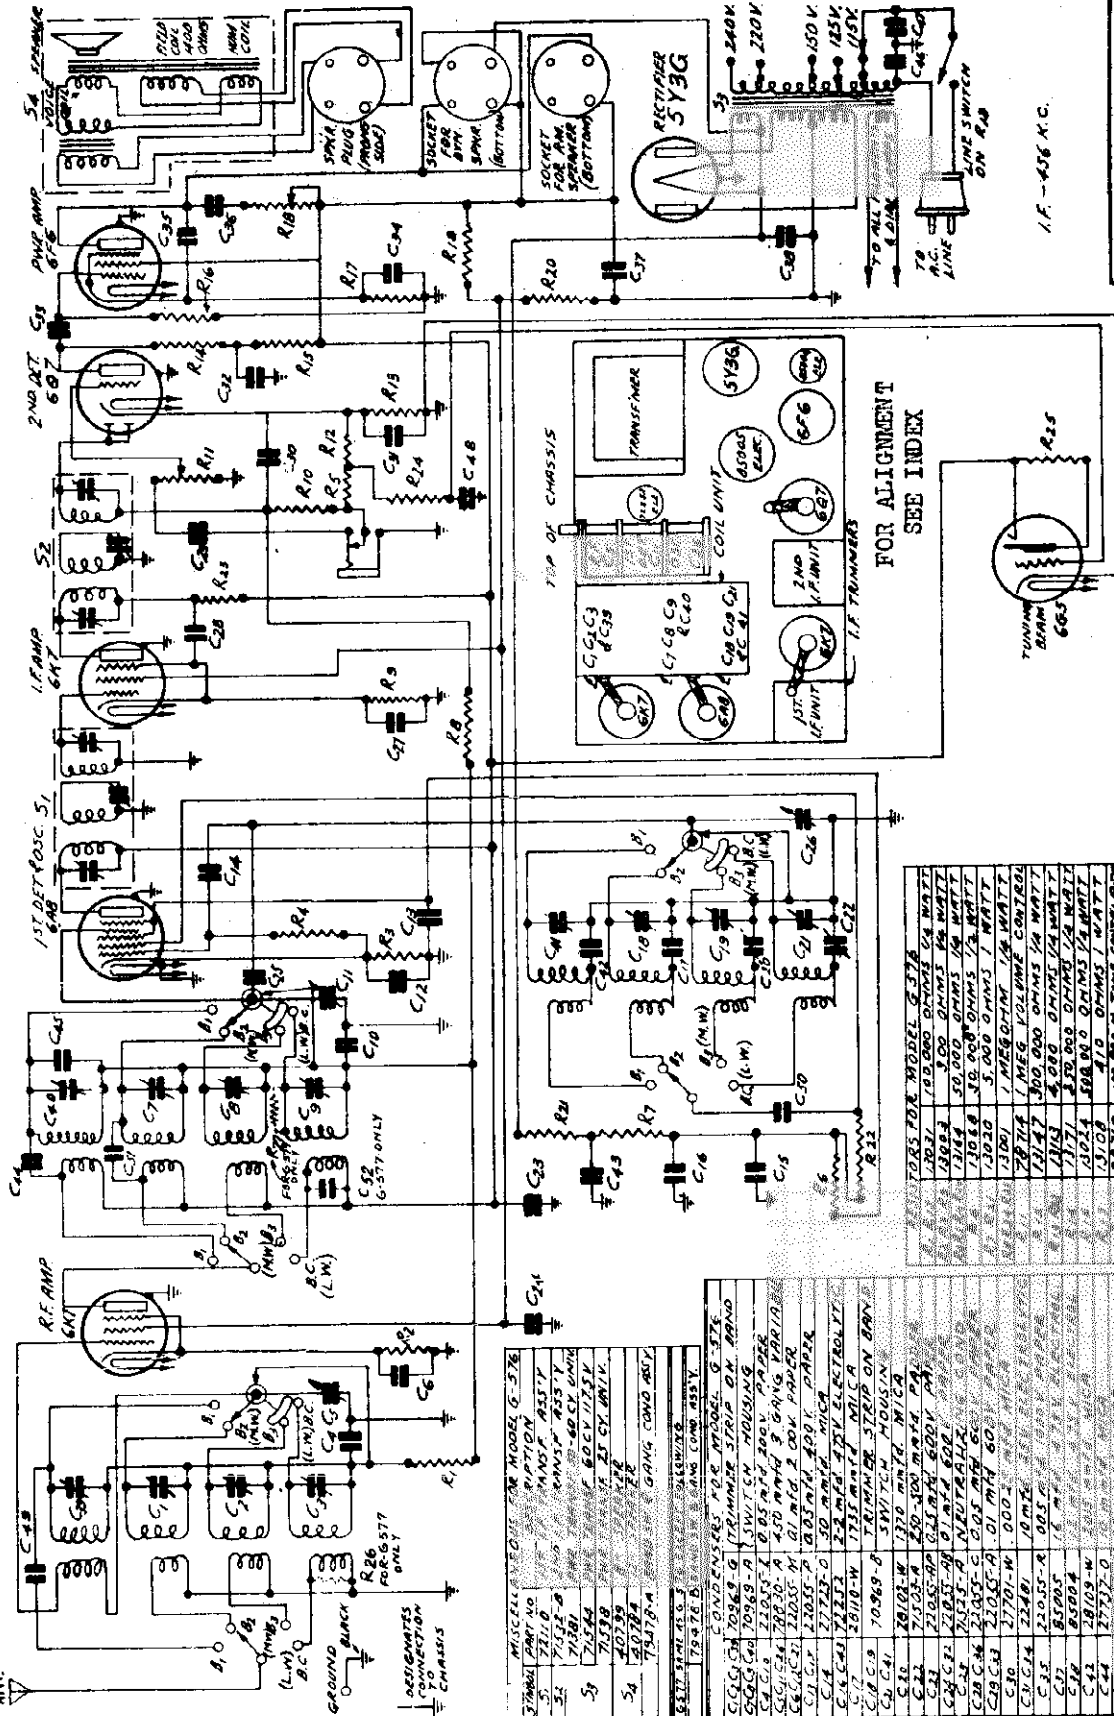

LONG WAVE ALIGNMENT: Proceedure in the Model G-585 is similar to the Broadcast section of 150 kc. Should it be necessary to remove the band switch assembly, it is advisable to realign the receiver after reassembly.

CAUTION: When making repairs on the receiver, use only ROSIN CORE SOLDER. NEVER USE SOLDERING PASTE OR ACID FLUXES OF ANY TYPE.

 MODEL S-623, S-62
 MODELS G-752, G-75
 Alignment

Range, Model 623
 16 - 555 m. (18,800 - 540 kc.)

Range, Model 625
 16 - 555 m. (18,800 - 540 kc.)
 731 - 2140 m. (410 - 140 kc.)

Model G-753
 187-566 m. (1,600-530 kc.)
 800-2170 m. (375-138 kc.)

220:240 V. AC-DC

(MODEL 623 IS SOLD OUTSIDE THE U. S. A. ONLY)

AC-DC Model S-623, for 220-240 V. (50-60 Cycles)
 AC-DC Model S-623-J, for 220-240 V. (25-60 Cycles)

(MODEL G-753 IS SOLD OUTSIDE THE U. S. A. ONLY)

Three tuning bands covering 12.94 m. (25,000-3,200 kc.) and 187-565 m. (1,600-535 kc.)

I. F. ALIGNMENT: When aligning the Intermediate Frequency Amplifier, the external oscillator must be set at 456 kc. The Band Selector Switch should be in the position marked "Broadcast", and the tuning condenser should be set at maximum capacity. Connect the I. F. tube lead to the I. F. Amplifier through a 1 meg. fixed condenser. Connect the "ground" lead of the external oscillator to the receiver ground lead. The I. F. alignment capacitors are located at the side of the shielded I. F. Transformers. Rotate the adjusting screw of each capacitor on I. F. Unit No. 2 slowly until maximum output is noted. On completion of this operation, remove the external oscillator lead from the type 6K7 I. F. amplifier tube and connect it in the same manner to the control grid at the top of the type 6A9 tube.

Now rotate each adjustment screw on I. F. Unit No. 1 for maximum output. During these operations, use the least possible input to prevent broadening of the resonance peaks.

In order to obtain the most accurate realignment of the I. F. amplifier, it is essential to repeat the alignment process in both I. F. Units.

BROADCAST ALIGNMENT: After the I. F. amplifier is completely realigned, connect the external oscillator leads to the receiver antenna and ground leads. Insert a 200 mf. condenser in series with the antenna lead. Set the Band Selector Switch in the "Broadcast" position and place the tuning control pointer at the 1500 kc. mark. Adjust the broadcast band oscillator trimmer.

Next adjust the interstage alignment trimmer for maximum response. Finally adjust the antenna section trimmer in the same manner.

Next adjust the 600 kc. padder condenser, located on the top of the oscillator coil. Set the external oscillator at 600 kc. Rotate the receiver tuning control until resonance is indicated. Then rock the tuning control back and forth about the resonance position, and at the same time adjust the padder condenser for the highest resonance peak.

Now repeat the 1500 kc. trimmer adjustment, following the procedure previously described.

ALIGNMENT FOR SHORT WAVE BANDS (ALL EXCEPT S-623 & S-623J)

The procedure in aligning the short wave bands is identical with that for the broadcast with the exception of the adjustment of the padder condenser. Insert a 400 ohm non-inductive resistor in series with the antenna lead. The alignment frequencies are as follows:

Band 2: 50 Meters—(6,000 kc.)
 Band 1: 16.6 Meters—(18,000 kc.)

When aligning Band 2, set the Band Selector Switch in the position marked "Band 2". Set the tuning control pointer at 50 meters. Adjust the oscillator alignment capacitor on Band 2 for maximum output. Next adjust the interstage and antenna section alignment capacitors for maximum output.

Model G-752
 44.5-126 m. (6,750-2380 kc.)
 187-566 m. (1,600-530 kc.)

(MODEL G-753 IS SOLD OUTSIDE THE U. S. A. ONLY)

REMOVAL OF CHASSIS FROM CABINET:

To remove the chassis from the cabinet proceed as follows:

Be certain that the line cord is removed from the power outlet socket.

Remove the knobs and felt washers from the controls on the front panel.

Remove the four mounting screws, located underneath the cabinet and pull chassis out.

REALIGNMENT: If the receiver requires alignment, the procedure outlined below should be followed: In the schematic diagram sheet, the location and function of the various alignment capacitors are clearly illustrated. For best results, an external modulated oscillator with adequate frequency range and a visual output meter, should be used.

I. F. ALIGNMENT: When aligning the Intermediate Frequency Amplifier, the external oscillator must be set at 456 kc. The Band Switch should be in the position marked "Broadcast", and the tuning condenser should be set at maximum capacity. When aligning the receiver on all positions, the volume control should be turned to the maximum clockwise position. Connect the antenna lead of the external oscillator to the control grid of the 6D6 tube in the I. F. Amplifier through a .1 mf. fixed condenser. Connect the ground lead of the external oscillator to the chassis. The I. F. alignment trimmers are located at the top of the shielded I. F. Transformers. Rotate the adjusting screw of each capacitor on I. F. Unit No. 2 slowly until maximum output is noted. Following this, connect the external oscillator leads to the control grid of the 6A7 tube. Adjust each trimmer on I. F. Unit No. 1 for maximum gain.

During these operations, use the least possible input to prevent broadening of the resonance peak.

In order to obtain the most accurate realignment of the I. F. amplifier, it is essential to repeat the alignment process in all I. F. Units, with the external oscillator leads connected to the control grid of the 6A7 tube.

WAVE TRAP ADJUSTMENT: With the oscillator still set at 456 kc., connect the oscillator to the antenna through a 200 mf. condenser. Then adjust the wave trap condenser to minimum deflection on the output meter.

BROADCAST ALIGNMENT: After the I. F. amplifier is completely realigned, connect the external oscillator leads to the receiver antenna and ground through a .0002 mf. condenser. Leave the Band Switch in the "Broadcast" position and place the tuning control pointer at the 1400 kc. mark. Tune the external oscillator to 1400 kc. Adjust the broadcast band oscillator trimmer to maximum response.

Next adjust the antenna section trimmer for maximum output.

The alignment frequencies are as follows:

Longwave Band — 900 meters (333 kc.)
 Broadcast Band — 214 meters (1,400 kc.)
 Band 1 — 50 meters (6,000 kc.)

BAND 1: Align the Short-wave band in a similar manner using a 400-ohm non-inductive resistor in place of the .0002 mf. condenser. The alignment frequency is 6,000 kc. (50 meters).

THE LONG WAVE ALIGNMENT procedure in the Model G-753 is as follows: Turn the Band Switch to the Long Wave position. The alignment frequency is 333 kc. Adjust the padder condenser at 150 kc. and at the same time rock the gang until at some setting of both padder and gang condenser maximum output is obtained. Use a .0002 mf. condenser in the antenna lead from the external oscillator.

LONG WAVE BAND: Model G-753 (sold only outside the U. S. A.) has a tuning band covering 800 to 2170 meters. Broadcast stations operating on long waves have a limited range, and are located chiefly in Europe. Hence, Model G-753 is not sold in the U. S. A.

SHORT-WAVE BAND: This band covers 44.5 to 126 meters, and is calibrated in both meters and megacycles because some program time-tables show the dial settings in meters, while others use megacycles.

The receiving range on the 49-meter band is about 300 miles during the daytime, and 1,500 miles or more at night.

ANTENNA: Due to the high sensitivity of this receiver, it is recommended that an aerial not over fifty feet long be used.

If you use an ordinary single-wire antenna, connect the terminal to the blade marked "Antenna" on the chassis clip on the chassis to the ground.

TRIMMER CONTROL SWITCH: The trimmer control is at the rear of the chassis. In one position the treble response is increased and in the other position the bass frequencies are emphasized. When tuning in short waves the latter position will probably be found preferable.

BAND SWITCH: The center knob controls the band switch. When this knob is in the counterclockwise position the band switch is in the broadcast position on Model G-752 and in the longwave position on Model G-753. Turning the switch to the right or clockwise on Model G-752 permits reception of shortwave signals and medium wave signals on Model G-753.

CAUTION: When making repairs on the receiver, use only ROSIN CORE SOLDER. NEVER USE SOLDERING PASTE OR ACID FLUXES OF ANY TYPE.

PILOT RADIO CORPORATION
LONG BEACH, CALIF. U.S.A.
SCHEMATIC CIRCUIT & CHASSIS ALIGNMENT FOR MODELS M-2203 & M-2205
SCALE: 1/8" = 1"
DATE: 1/25/40
DRAWN BY: J.F.R.
CHECKED BY: J.F.R.
25140

Voltages: Read tube socket voltages with meter having resistance of at least 1,000 ohms per volt. All voltages measured to chassis.

	Osc.-Det.	I.F.	Det. Amp.	Aud. Output	Rectifier
Tube	6A8	6K7	6Q7	25A6	25Z6
Plate	130	130	50*	180	—
Cathode	2.5	3.5	1	17.	210.
Screen	60	100	—	130	—
Filament	6.3	6.3	6.3	25.	25.

*Voltage measured through plate resistor.
Speaker field voltage, 210 volts.
Anode grid of 6A8, 100 volts.

REALIGNMENT: Should the receiver require realignment, the outlined procedure below should be followed. In the service information sheet, the location and function of the various alignment capacitors are clearly illustrated. For best results an external modulated oscillator with adequate frequency range, and a visual output meter, should be used.

Before connecting the chassis to the power line, reconnect the speaker cable in its socket at the rear of the speaker.

I. F. ALIGNMENT: When aligning the Intermediate Frequency Amplifier, the external oscillator must be set at 456 kc. The Band Switch should be in the position marked "Broadcast", and the tuning condenser should be set at maximum capacity. Connect the "antenna" lead of the external oscillator to the control grid of the type 6K7 tube in the I.F. Amplifier stage through a .1 mfd. fixed condenser. Connect the "ground" lead of the external oscillator to the receiver ground lead. The I.F. alignment capacitors are located at the top of the shielded I.F. Transformers. Rotate the adjusting screw of each capacitor on I.F. Unit No. 2 slowly until maximum output is noted. On completion of this operation, remove the external oscillator leads from the type 6K7 I.F. Amplifier tube and connect it in the same

manner to the control grid at the top of the type 6A8 tube. Now rotate each adjustment screw on I.F. Unit No. 1 for maximum output. During these operations, use the least possible input to prevent broadening of the resonance peaks.

In order to obtain the most accurate realignment of the I.F. Amplifier, it is essential to repeat the alignment process in both I.F. units with the external oscillator leads connected across the control grid of the 6A8 tube.

BROADCAST ALIGNMENT: After the I.F. amplifier is completely realigned, connect the external oscillator leads to the receiver antenna and ground leads with a .0002 mfd. condenser in the antenna lead. Set the Band Switch in the "Broadcast" position and place the tuning control pointer at the 1400 kc. mark. Adjust the broadcast band oscillator trimmer to maximum response. Adjust the signal section trimmer in the same manner. Next adjust the 600 kc. padder condenser. Set the external oscillator at 600 kc. Rotate the receiver tuning control until resonance is indicated. Then rock the tuning control back and forth about this resonance position, and at the same time adjust the padder condenser for the highest resonance peak.

Now repeat the 1400 kc. trimmer adjustment, following in every detail the procedure previously described.

SHORT-WAVE ALIGNMENT: The procedure in aligning the short-wave bands is identical with that for the broadcast with the exception of the adjustment of the padder condenser. The alignment frequency is 16.8 Meters—(17,800 kc.) Turn the Band Switch to the right. Tune the external oscillator to 16.8 meters. Tune the receiver so that the dial pointer is in a position coincidental with the 16.8 meter indication on the dial scale. Adjust the short wave oscillator trimmer for maximum response. Next adjust the signal circuit trimmer for maximum resonance. Repeat all adjustments to assure correct alignment, rocking the gang condenser to right or left for maximum gain.

THE LONG WAVE ALIGNMENT: Procedure in the Model 2205 is similar to the Broadcast section of that receiver. Align at 375 kc. Adjust the padder at 160 kc.

Should it be necessary to remove the band switch assembly, it is advisable to realign the receiver after reinstalling.

MODELS G-576, G-577
MODELS X-2253, X-2255
Alignment

PILOT RADIO CORP.

Model 2255

16 - 550 m. (16,800 - 545 kc.)
750 - 2000 m. (400 - 150 kc.)

FOR 32-VOLT BATTERY OPERATION

(MODEL 2255 IS SOLD OUTSIDE THE U. S. A. ONLY)

REMOVAL OF CHASSIS FROM CABINET:
To remove the chassis from the cabinet proceed as follows:

Be certain that the line cord is removed from the power outlet socket.
Remove the "slip-on" knobs and felt washers from the controls and loosen the set screw on the tuning knob.
Remove the speaker plug from the socket at the rear of the chassis.
Remove the four mounting screws, located underneath the cabinet.

Remove the tuning beam plug from the socket at the front of the chassis.

REALIGNMENT: Should the receiver require realignment, the procedure outlined below should be followed. For best results an external modulated oscillator with adequate frequency range, and a visual output meter, should be used.

Before connecting the chassis to the power line, disconnect the speaker cable in its socket at the rear of the chassis.

The location of the R. F. alignment trimmer condensers is on the side of the band switch. The trimmers in the lower row are those for aligning Band 2. Those in the second row from the bottom are for Band 3. Those in the third row up are for the Broadcast. In the Model 2255 there is an additional row of trimmers located immediately above those for the Broadcast.

The padding condenser is located under the rear section of the chassis in its Model 2255 position. The antenna lead of the Broadcast paddler. Access to the paddler condenser is made through a hole provided in the rear of the chassis frame.

I. F. ALIGNMENT: When aligning the Intermediate Frequency Amplifier, the external oscillator must be set at 416 kc. The Band Selector Switch should be in the position marked "Broadcast", and the tuning condenser should be set at maximum capacity. Connect the "antenna" lead of the external oscillator to the control grid of the type 6D6 tube in the I. F. Amplifier stage through a 1/2 mfd. fixed condenser. Connect the "ground" lead of the external oscillator to the receiver ground lead. The I. F. alignment capacitors are located at the side of the chassis capacitor on I. F. Unit No. 2 slowly until maximum output is noted. On completion of this operation, remove the external oscillator lead from the type 6K7 I. F. control tube and connect it in the same manner to the control grid at the top of the type 6A7 tube.

Now rotate each adjustment screw on I. F. Unit No. 1 for maximum output. During these operations, use the least possible input to prevent broadening of the resonance peaks.

In order to obtain the most accurate realignment of the I. F. amplifier, it is essential to repeat the alignment process in both I. F. Units.

BROADCAST ALIGNMENT: After the I. F. amplifier is completely realigned, connect the external oscillator leads to the receiver antenna and ground leads. Insert a 200 mmf. condenser in series with the antenna lead. Set the Band Selector Switch in the "Broadcast" position and place the tuning control pointer at the 1700 kc. mark. Adjust the broadcast band oscillator trimmer.

CAUTION: When making repairs on the receiver, use only ROSIN CORE SOLDER. NEVER USE SOLDERING PASTE OR ACID FLUXES OF ANY TYPE.

PHONOGRAPH PICK-UP: A jack is provided at the rear of the chassis for plugging in the phonograph pick-up in the normal manner. The high-quality amplifier with which this set is equipped. The pick-up should be of the high-impedance type.

EXTRA SPEAKERS: At the rear of the chassis there is a socket for plugging in an extra speaker, which can be down cellar in the game room. This will give you the equivalent of an extra radio, at the small expense of the extra speaker. We recommend a permanent magnet dynamic speaker of 10,000 ohms. These speakers operate without any field exciting current.

Model 2253

16 - 550 m. (16,800 - 545 kc.)

FOR 32-VOLT BATTERY OPERATION

(MODEL 2253 IS SOLD OUTSIDE THE U. S. A. ONLY)

REMOVAL OF CHASSIS FROM CABINET:
To remove the chassis from the cabinet proceed as follows:

Be certain that the line cord is removed from the power outlet socket.
Remove the "slip-on" knobs and felt washers from the controls and loosen the set screw on the tuning knob.
Remove the speaker plug from the socket at the rear of the chassis.
Remove the four mounting screws, located underneath the cabinet.

Remove the tuning beam plug from the socket at the front of the chassis.

REALIGNMENT: Should the receiver require realignment, the procedure outlined below should be followed. For best results an external modulated oscillator with adequate frequency range, and a visual output meter, should be used.

Before connecting the chassis to the power line, disconnect the speaker cable in its socket at the rear of the chassis.

The location of the R. F. alignment trimmer condensers is on the side of the band switch. The trimmers in the lower row are those for aligning Band 1. Those in the second row from the bottom are for Band 2. Those in the third row up are for the Broadcast. In the Model 2253 there is an additional row of trimmers located immediately above those for the Broadcast.

The padding condenser is located under the rear section of the chassis in its Model 2253 position. The antenna lead of the Broadcast paddler. Access to the paddler condenser is made through a hole provided in the rear of the chassis frame.

I. F. ALIGNMENT: When aligning the Intermediate Frequency Amplifier, the external oscillator must be set at 416 kc. The Band Selector Switch should be in the position marked "Broadcast", and the tuning condenser should be set at maximum capacity. Connect the "antenna" lead of the external oscillator to the control grid of the type 6D6 tube in the I. F. Amplifier stage through a 1/2 mfd. fixed condenser. Connect the "ground" lead of the external oscillator to the receiver ground lead. The I. F. alignment capacitors are located at the side of the chassis capacitor on I. F. Unit No. 2 slowly until maximum output is noted. On completion of this operation, remove the external oscillator lead from the type 6K7 I. F. control tube and connect it in the same manner to the control grid at the top of the type 6A7 tube.

Now rotate each adjustment screw on I. F. Unit No. 1 for maximum output. During these operations, use the least possible input to prevent broadening of the resonance peaks.

In order to obtain the most accurate realignment of the I. F. amplifier, it is essential to repeat the alignment process in both I. F. Units.

BROADCAST ALIGNMENT: After the I. F. amplifier is completely realigned, connect the external oscillator leads to the receiver antenna and ground leads. Insert a 200 mmf. condenser in series with the antenna lead. Set the Band Selector Switch in the "Broadcast" position and place the tuning control pointer at the 1700 kc. mark. Adjust the broadcast band oscillator trimmer.

CAUTION: When making repairs on the receiver, use only ROSIN CORE SOLDER. NEVER USE SOLDERING PASTE OR ACID FLUXES OF ANY TYPE.

PHONOGRAPH PICK-UP: A jack is provided at the rear of the chassis for plugging in the phonograph pick-up in the normal manner. The high-quality amplifier with which this set is equipped. The pick-up should be of the high-impedance type.

EXTRA SPEAKERS: At the rear of the chassis there is a socket for plugging in an extra speaker, which can be down cellar in the game room. This will give you the equivalent of an extra radio, at the small expense of the extra speaker. We recommend a permanent magnet dynamic speaker of 10,000 ohms. These speakers operate without any field exciting current.

Model G-576 G-577
Four Tuning Bands Cover 12.3-566 m. (24,200-330 kc.)

REMOVAL OF CHASSIS FROM CABINET:

To remove the chassis from the cabinet proceed as follows:
Be certain that the line cord is removed from the power outlet socket.

Remove the "slip-on" knobs and felt washers from the controls and loosen the set screw on the tuning knob.
Remove the speaker plug from the socket at the rear of the chassis.
Remove the four mounting screws, located underneath the cabinet.

Remove the tuning beam plug from the socket at the front of the chassis.

REALIGNMENT: Should the receiver require realignment, the procedure outlined below should be followed. For best results an external modulated oscillator with adequate frequency range, and a visual output meter, should be used.

Before connecting the chassis to the power line, disconnect the speaker cable in its socket at the rear of the chassis.

The location of the R. F. alignment trimmer condensers is on the side of the band switch. The trimmers in the lower row are those for aligning Band 1. Those in the second row from the bottom are for Band 2. Those in the third row up are for Band 3. The trimmers in the top row are for the Broadcast band.

The padding condenser is located under the rear section of the band switch. Access to the paddler condenser is made through a hole provided in the rear of the chassis frame.

I. F. ALIGNMENT: When aligning the Intermediate Frequency Amplifier, the external oscillator must be set at 416 kc. The Band Selector Switch should be in the position marked "Broadcast", and the tuning condenser should be set at maximum capacity. Connect the "antenna" lead of the external oscillator to the control grid of the type 6K7 tube in the I. F. Amplifier stage through a 1/2 mfd. fixed condenser. Connect the "ground" lead of the external oscillator to the receiver ground lead. The I. F. alignment capacitors are located at the side of the chassis capacitor on I. F. Unit No. 2 slowly until maximum output is noted. On completion of this operation, remove the external oscillator lead from the type 6K7 I. F. control tube and connect it in the same manner to the control grid at the top of the type 6A8 tube.

Now rotate each adjustment screw on I. F. Unit No. 1 for maximum output. During these operations, use the least possible input to prevent broadening of the resonance peaks.

In order to obtain the most accurate realignment of the I. F. amplifier, it is essential to repeat the alignment process in both I. F. Units.

BROADCAST ALIGNMENT: After the I. F. amplifier is completely realigned, connect the external oscillator leads to the receiver antenna and ground leads. Insert a 200 mmf. condenser in series with the antenna lead. Set the Band Selector Switch in the "Broadcast" position and place the tuning control pointer at the 1700 kc. mark. Adjust the broadcast band oscillator trimmer.

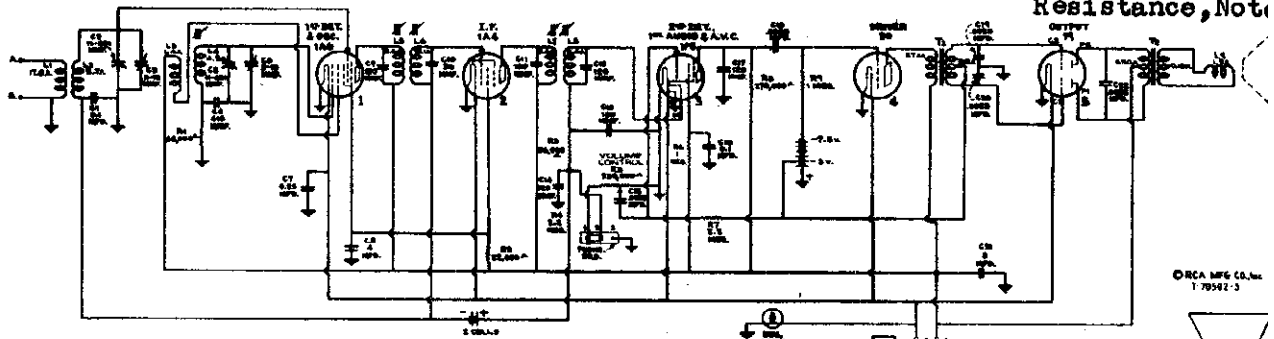

CAUTION: When making repairs on the receiver, use only ROSIN CORE SOLDER. NEVER USE SOLDERING PASTE OR ACID FLUXES OF ANY TYPE.

PHONOGRAPH PICK-UP: A jack is provided at the rear of the chassis for plugging in the phonograph pick-up in the normal manner. The high-quality amplifier with which this set is equipped. The pick-up should be of the high-impedance type.

EXTRA SPEAKERS: At the rear of the chassis there is a socket for plugging in an extra speaker, which can be down cellar in the game room. This will give you the equivalent of an extra radio, at the small expense of the extra speaker. We recommend a permanent magnet dynamic speaker of 10,000 ohms. These speakers operate without any field exciting current.

Measured with all batteries at normal voltage—Tuned to approximately 1,000 kc—
No signal being received—Volume control optional

Radiotron Socket Voltages

CAUTION: Do not attempt to measure voltages on control grids of RCA-1A6 or RCA-1A4, with any conventional voltmeter, due to presence of bias cells. See "Caution" under "Service data" for method of measuring these cells.

Note: Two voltage values are shown for some readings. The higher value shown in parenthesis with asterisk (*) indicates operating conditions without voltmeter loading. The lower value is the actual measured voltage and differs from the higher value because of the additional loading of the voltmeter through the high series circuit resistance.

Radiotron Plate Current Readings

I-F Adjustments

The four adjustment screws (attached to molded magnetite cores) of the two i-f transformers (one on top and one on bottom of each i-f transformer) are located as shown by figures 3 and 6. Each circuit must be aligned to a basic frequency of 460 kc.

Connect the "Ant." output of the test-oscillator to the control grid of the RCA-1A6 through a .001 mfd. capacitor. Connect the test oscillator "Gnd." terminal to the ground terminal of the receiver chassis. Tune the test oscillator to 460 kc. Adjust the receiver tuning control to a point, within its range, where no interference is encountered either from broadcast stations or short stator of oscillator tuning condenser C5 to ground, eliminating local (heterodyne) oscillator signals.

Adjust the two magnetite core screws L8 and L7 of the second i-f transformer to produce maximum (peak) indicated receiver output. Then, adjust the two magnetite core screws L6 and L5 of the first i-f transformer for maximum (peak) receiver output as shown by the indicating device. It is advisable to repeat the adjustment of all i-f magnetite core screws to assure that the interaction between them has not disturbed the original adjustments. Remove temporary jumper, stator C5 to ground, if used.

R-F Adjustments

Calibrate the tuning dial by adjusting the dial pointer to the extreme low-frequency end calibration mark (530 kc) on dial scale while the gang tuning condenser plates are in their full-mesh position. Reduce output of test oscillator to minimum. Set receiver dial pointer to 600 kc. Tune the test oscillator to 600 kc and increase its output until an indication is obtained on the output indicator.

Adjust oscillator magnetite core screw L4 (top of oscillator coil) so that maximum (peak) indication is shown by the output indicator.

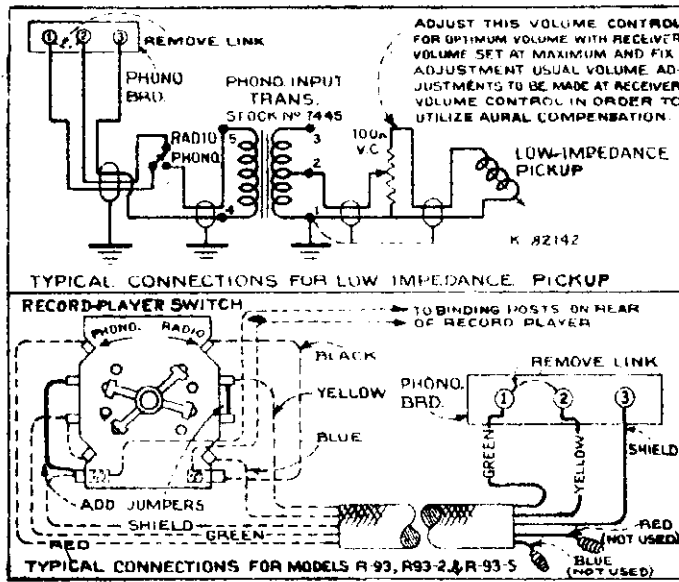

Set receiver dial pointer to 1,500 kc. Tune test oscillator to 1,500 kc. Adjust the oscillator and antenna trimmers C6 and C3 for maximum (peak) indicated output.

Tune test oscillator to 600 kc and adjust receiver to pick up this signal near 600 kc. Readjust the oscillator magnetite core screw L4 for maximum (peak) indicated output while rocking the receiver gang tuning condenser back and forth through this signal.

Repeat adjustments of C6 and C3 as above to correct for any changes in the oscillator tuning caused by the adjustment of L4.

RCA MFG. CO., INC.

MODEL 5BT
Phono Data
Notes, Parts

Caution: The two bias cells are used only for the purpose of supplying bias potential and should never be measured with an ordinary voltmeter or other device which draws any current. A simple check on these cells may be made by connecting a milliammeter in the plate circuit of the RCA-1A4 tube and noting the plate current reading. Then remove the two bias cells, being careful that the spring contact clips do not short-circuit them during removal. Connect a 2-volt battery between the + and - 2v. (- battery to grid side) terminals of the bias cell board, and again note the plate current reading. If the first reading obtained (with bias cells) is more than 40% from the latter reading (with 2-volt battery), the bias cells should be replaced. This 40% difference is equivalent to a change of approximately 25% battery voltage.

Voltage, Alignment

RCA MFG. CO., INC.

Figure 4—Radiotron Socket Voltages, Coil, and Trimmer Locations

Measured at 115 volts, 60-cycle supply—Tuned to approximately 1,000 kc ("Standard Broadcast")—
No signal being received—Volume control minimum

Note: Two voltage values are shown for some readings. The value shown in parentheses with asterisk (*) indicates operating conditions without voltmeter loading. The other value (generally lower) is the actual measured voltage and differs from the value shown in parentheses because of the additional loading of the voltmeter through the high series circuit resistance.

Voltage values as specified should hold within $\pm 20\%$ when the receiver is normally operative at its rated line voltage. To duplicate the conditions under which the voltages were measured requires a 1,000-ohm-per-volt d-c meter, having ranges of 10, 50, 250, and 500 volts. Use the nearest range above the specified measured voltage. A-c voltages were measured with a corresponding a-c meter.

Alignment Procedure

Calibrate the tuning dial by adjusting dial pointer to the extreme low-frequency end calibration mark on the "Standard broadcast" dial scale with the two-gang tuning condenser in full-mesh position.

Perform alignment in proper order tabulated below, starting with No. 1 and following all operations across, then No. 2, etc.

Cathode-ray alignment is preferable; the connections to the chassis are shown on figure 3. If an output indicator is used, connect it across the loudspeaker voice-coil and advance the receiver volume control to full-volume position.

Connect the "low" output terminal of the test oscillator to

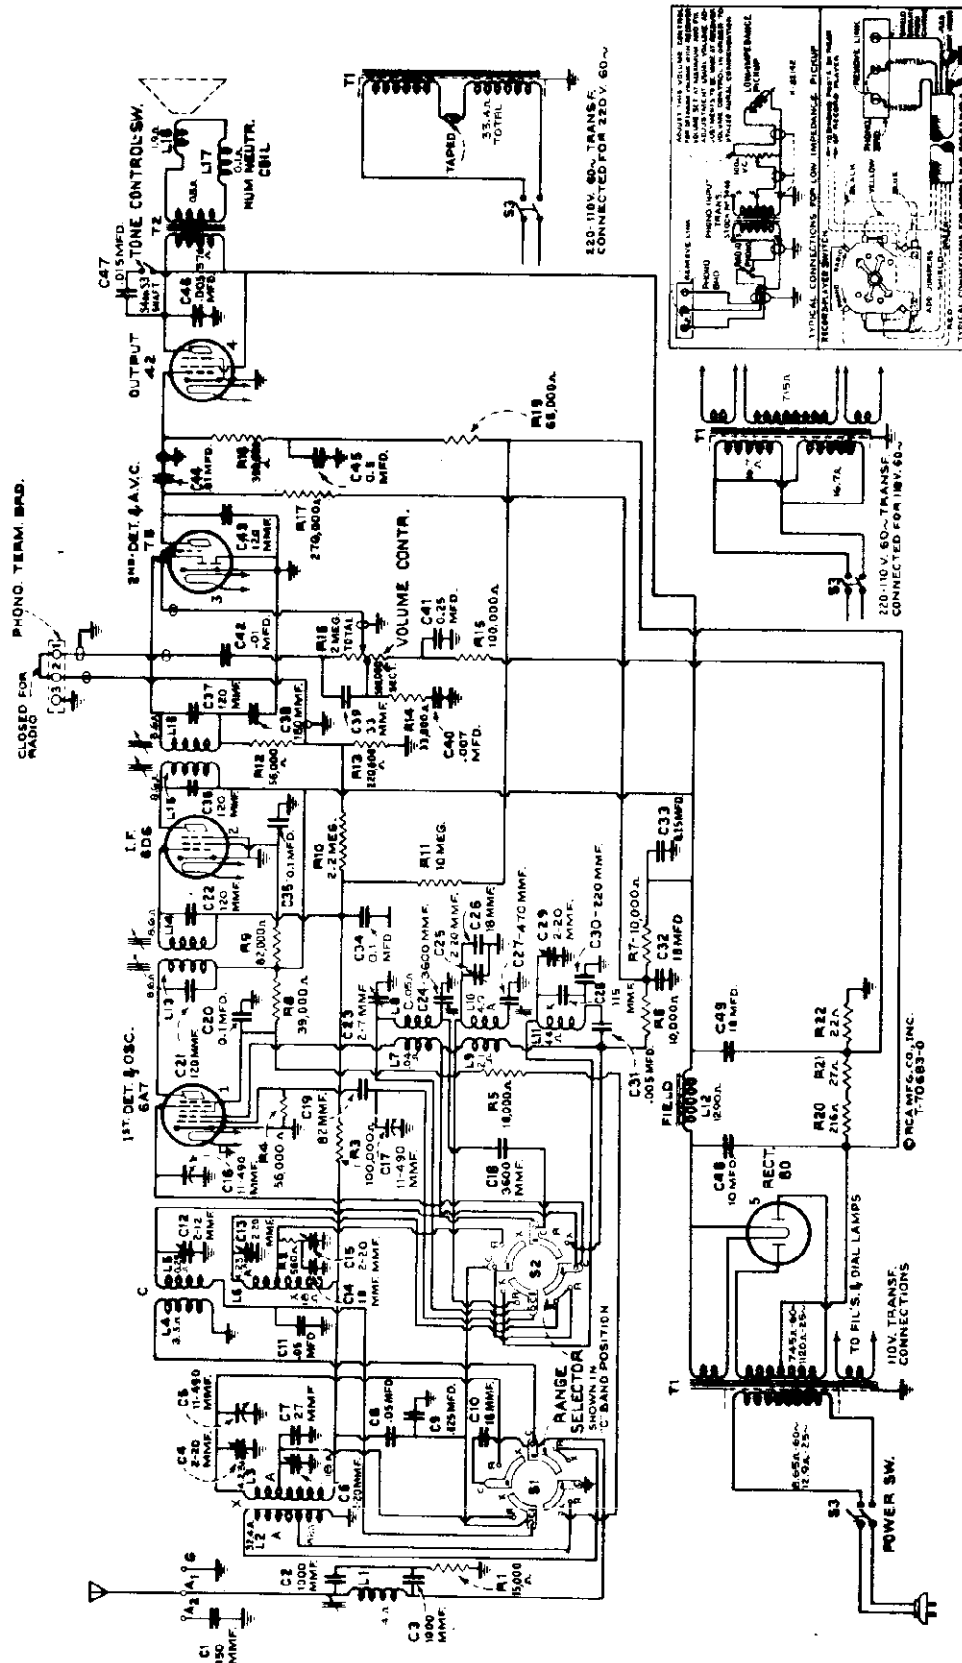

the receiver chassis for all alignment operations. Regulate the output of the test oscillator so that minimum signal is applied to the receiver to obtain an observable output indication. This will avoid a-v-c action.

The term "Dummy antenna" means the device which must be connected between the "high" test-oscillator output and the point of connection to the receiver in order to obtain ideal alignment. "No signal, 550-750 kc" means that the receiver should be tuned to a point between 550 and 750 kc where no signal is received from a station or the local (heterodyne) oscillator.

For further details on alignment, refer to booklet "RCA Victor Receiver Alignment."

Order of Alignment	Test Oscillator			Receiver Dial Setting	Circuit to Adjust	Adjustment Symbols	Adjust to Obtain
	Connection to Receiver	Dummy Antenna	Frequency Setting				
1	6D6 i-f Grid Cap	.001 Mfd.	460 kc	No signal 550-750 kc	2nd i-f Trans.	L10 and L11	Max. (peak)

MODEL 5T4
Alignment

RCA MFG. CO., INC.

Alignment Procedure

the test oscillator to 600 kc and set receiver dial pointer to 600 kc (500 meters). Adjust output of test oscillator until a slight indication of output is visible.

- (d) Adjust the oscillator magnetite core screw L10 (top of oscillator coil) so that maximum (peak) indicated output results.
- (e) Set receiver dial pointer to 1,500 kc (200 meters). Tune the test oscillator to 1,500 kc. Carefully adjust the oscillator, detector, and antenna trimmers C25, C13 and C4 respectively so that each brings about maximum (peak) indicated output.
- (f) Tune the test oscillator to 600 kc. Adjust the receiver to pick up this signal disregarding the dial reading at which it is best received. Adjust oscillator magnetite core screw L10 (top of oscillator coil), simultaneously rocking the tuning control of the receiver backward and forward through the signal, until maximum (peak) output results from the combined operations. After completing this adjustment, the trimmers C25, C13 and C4 should be re-adjusted as in (e) to correct for any change in the oscillator high-frequency tuning which has been caused by the preceding adjustment.

"X" Bend

- (g) Adjust receiver range selector to band "X" position and set receiver tuning control to a dial reading of 350 kc or 857.14 meters (19.75 on "C" scale). Tune test oscillator to 350 kc and adjust oscillator, detector, and antenna trimmers C29, C15 and C6, respectively, for maximum indicated receiver output.
- (h) Set receiver to 175 kc or 1,714.28 meters (7.4 on "C" scale) and tune test oscillator to 175 kc. Adjust screw L11 for maximum indicated output, simultaneously rocking tuning control of the receiver backward and forward through the signal.
- (i) The adjustment of C29, C15 and C6 should now be repeated at 350 kc as described in (g) to compensate for any changes caused by the low-frequency adjustment L11.

Loudspeaker

Centering of the loudspeaker voice coil is made in the usual manner with three narrow paper feelers after first removing the front paper dust cover. This may be removed by softening its cement with a very light application of acetone, using care not to allow the acetone to flow down into the air gap. The dust cover may be cemented back in place with ambroid upon completion of adjustment.

receiver output, as shown by the indicating device. During these adjustments, regulate the test oscillator output so that the indication is always as low as possible. By doing so, broadness of tuning due to a.v.c. action will be avoided. It is advisable to repeat the adjustment of all i-f magnetite core screws to assure that the interaction between them has not disturbed the original adjustment. Remove temporary jumper, stator C17 to chassis-ground if used.

R-F Adjustments

Calibrate the tuning dial by adjusting the scale pointer to the extreme right-hand end calibration mark, on any scale, while the three-gang tuning condenser plates are in full mesh.

Wave-Trap Adjustment

Attach the "Ant" output of the test oscillator to the receiver "A1" terminal through a 200 mmfd. (important) capacitor. The ground connections remain connected together. Leave the test oscillator adjusted to 460 kc. Adjust range selector to band "A" position. Then adjust the wave-trap screw to the point which causes maximum suppression (minimum output) of the 460 kc signal.

"C" Bend

- (a) Attach the "Ant" output of the test oscillator to the receiver "A1" terminal through a 300-ohm resistor, leaving the "Gnd" of the oscillator connected to the receiver chassis.
- Adjust range selector to band "C" position. Set receiver dial pointer to 20,000 kc (20 on scale).
- (b) Tune test oscillator to 20,000 kc. Set oscillator trimmer C23 to minimum capacity (plunger full out), and detector trimmer C12 to maximum capacity (plunger full in). Slowly push in oscillator trimmer C23 until maximum (peak) output is reached. Two peaks may be found. Adjust C23 to the peak with minimum capacity (plunger near out) for maximum indication. Tighten lock nut. Slowly pull out plunger of detector trimmer C12 until maximum (peak) indicated output is reached while slightly rocking the gang tuning condenser back and forth through the signal. Two peaks may be found with this circuit. The peak with maximum capacity (plunger near in) should be used. Tighten lock nut.

"A" Bend

- (c) Attach the "Ant" output of the test oscillator to the receiver "A1" terminal through a 200 mmfd. capacitor, leaving the "Gnd" of the oscillator connected to the receiver chassis. Adjust range selector to band "A" position. Reduce output of test oscillator to a minimum. Tune

There are ten alignment trimmers provided in the antenna transformer, detector, and oscillator coil tuned circuits. The i-f transformer, low-frequency oscillator, and wave-trap adjustments are made by means of screws attached to molded magnetite cores. All of these circuits have been accurately adjusted during manufacture and should remain properly aligned unless affected by abnormal conditions or altered during servicing. Loss of sensitivity, improper tone quality, and poor selectivity are the usual indications of improper alignment.

The correct performance of this receiver can only be obtained when the aligning has been done with adequate and reliable apparatus. The manufacturer of this receiver has available for sale, through its distributors and dealers, a complete assortment of such service equipment as may be needed for the alignment operation.

A test oscillator, such as the RCA Stock No. 9595, is required as a source of the specified alignment frequencies. Visual indication of receiver output during the adjustment is necessary and should be accomplished by the use of an indicator such as the RCA Stock No. 4317 Neon Output Indicator.

The procedure outlined below should be followed in adjusting the various trimmer capacitors and molded cores:

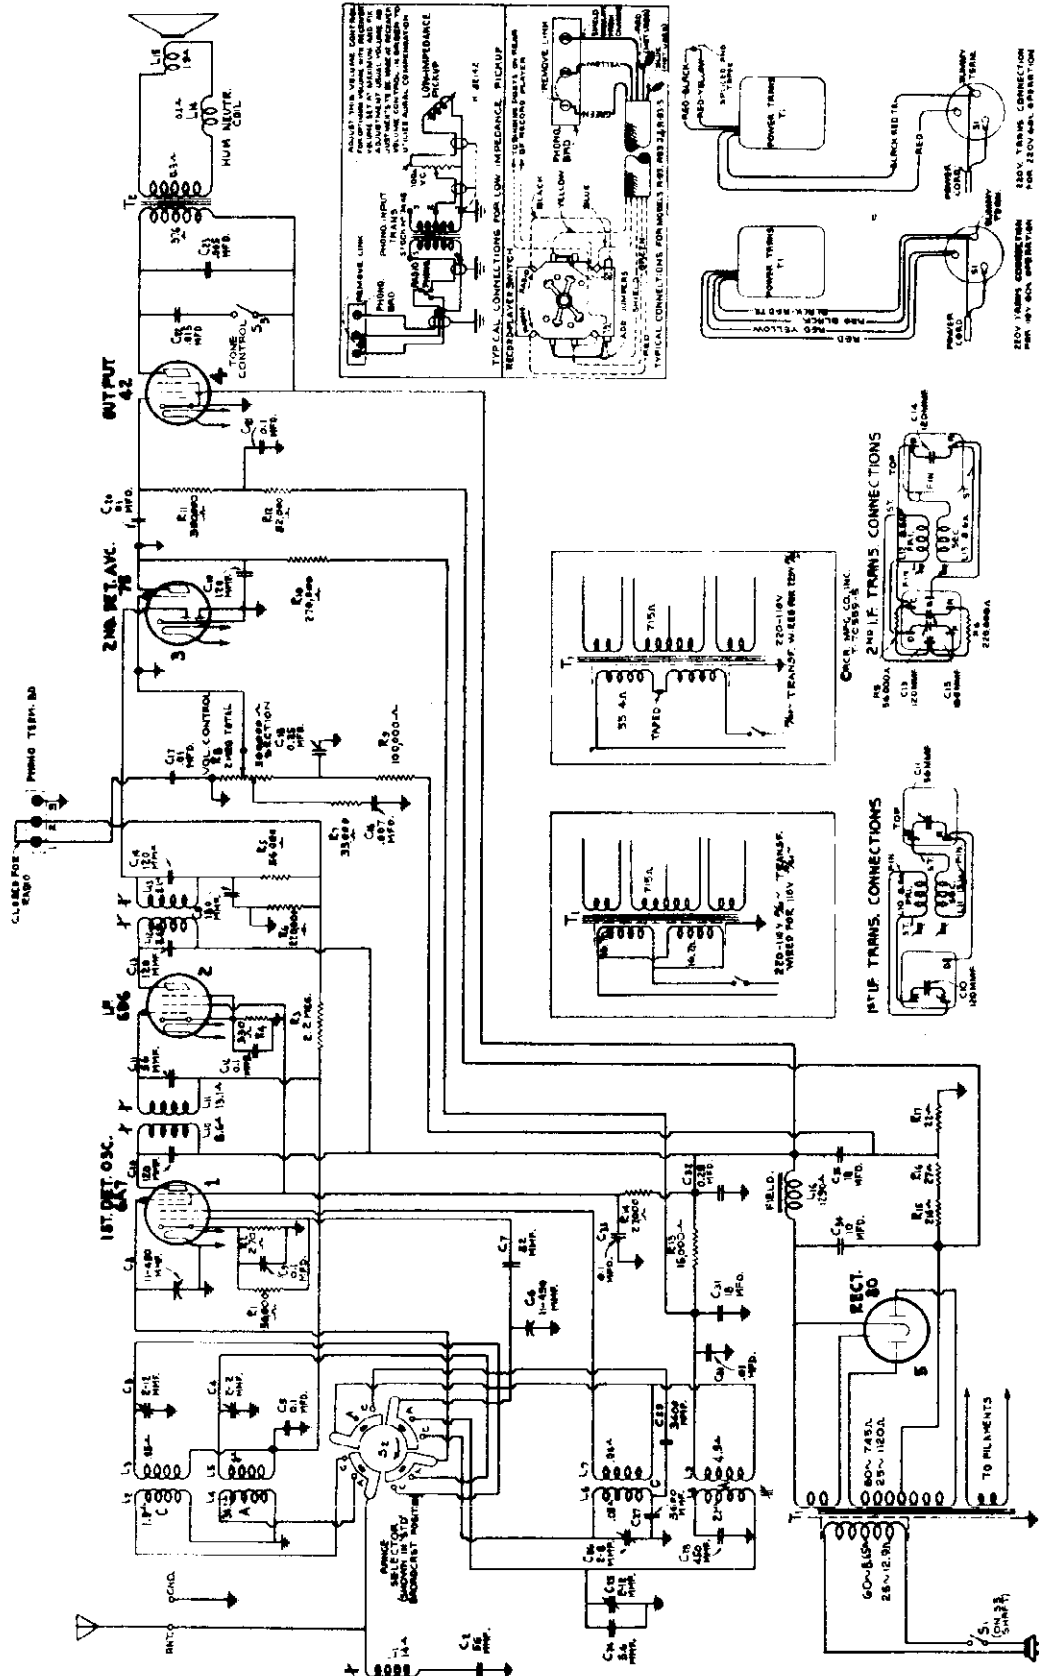

I-F Adjustments

The four adjustment screws (attached to molded magnetite cores) of the two i-f transformers (one on top and one on bottom of each i-f transformer) are located as shown by figures 3 and 6. Each circuit must be aligned to a basic frequency of 460 kc. To do this, attach the output indicator across the loudspeaker voice coil.

Connect the "Ant" output of the test oscillator to the control grid of the RCA-6A7 through a .001 mfd. capacitor. Connect the test oscillator "Gnd" terminal to the ground terminal of the receiver chassis. Tune the oscillator to 460 kc. Advance the receiver volume control to its full-on position and adjust the receiver tuning control to a point, within its range, where no interference is encountered from local broadcast stations or from the local (heterodyne) oscillator. To eliminate signals from the local oscillator short stator of C17 to chassis-ground. Increase the output of the test oscillator until a slight indication is present on the output indicator. Adjust the two magnetite core screws of the second i-f transformer L16 and L15 to produce maximum (peak) indicated receiver output. Then adjust the two magnetite core screws L14 and L13 of the first i-f transformer for maximum (peak)

Alignment Procedure

There are five alignment trimmers provided in the antenna transformer and oscillator coil tuned circuits. The i-f transformer and wave-trap adjustments are made by means of screws attached to molded magnetic cores. All of these circuits have been accurately adjusted during manufacture and should remain properly aligned unless affected by abnormal conditions or altered during servicing. Loss of sensitivity, improper tone quality, and poor selectivity are the usual indications of improper alignment.

The correct performance of this receiver can only be obtained when the aligning has been done with adequate and reliable apparatus. The manufacturer of this receiver has available for sale, through its distributors and dealers, a complete assortment of such service equipment as may be needed for the alignment operation.

A test oscillator, such as the RCA Stock No. 9955, is required as a source of the specified alignment frequencies. Visual indication of receiver output during the adjustment is necessary and should be accomplished by the use of an indicator such as the RCA Stock No. 4317 Neon Output Indicator.

The procedure outlined below should be followed in adjusting the various trimmer capacitors and molded cores:

I-F Adjustments

The four adjustment screws (attached to molded magnetic cores) of the two i-f transformers (one on top and one on bottom of each i-f transformer) are located as shown by figures 3 and 6. Each circuit must be aligned to a basic frequency of 460 kc. To do this, attach the output indicator across the loudspeaker voice coil.

Connect the output of the test oscillator to the control grid of the RCA 6A7 through a .001 mfd. capacitor. Connect the test oscillator "Grid" terminal to the ground terminal of the receiver chassis. Tune the oscillator to 460 kc. Advance the receiver volume control to its full-on position and adjust the receiver tuning control to a point, within its range, where no interference is encountered from local broadcast stations or from the local (heterodyne) oscillator. To eliminate signals from the local oscillator short stator of C6 to chassis-ground. Increase the output of the test oscillator until a slight indication is present on the output indicator. Adjust the two magnetic core screws of the second i-f transformer L13 and L12 to produce maximum (peak) indicated receiver output. Then adjust the two magnetic core screws L11 and L10 of the first i-f transformer for maximum (peak) receiver output as shown by the indicating device. During these adjustments, regulate the test oscillator output so that the indication is always as low as possible. By doing so, broadness of tuning due to a.v.c. action will be avoided. It is advisable to repeat the adjustment of all i-f magnetic core screws to assure that the interaction between them had not disturbed the original adjustment.

R-F Adjustments

Calibrate the tuning dial by adjusting the scale pointer to the extreme end calibration mark (beyond 55 on dial) while the two-gang tuning condenser plates are in full mesh.

Wave-Trap Adjustment

Attach the output of the test oscillator to the receiver "Antenna" terminal through a 200 mfd. (important) capacitor. The ground connections remain connected together. Leave the test oscillator tuned to 460 kc. Adjust range selector to "Short wave" (C) position. Then adjust the wave-trap screw to the point which causes maximum suppression (minimum received) of the 460 kc. signal.

"Standard Broadcast" Band

(a) Adjust range selector to "Standard broadcast" (A) position. Reduce output of test oscillator to a minimum. Tune the test oscillator to 600 kc and set receiver dial pointer to 460 kc. Adjust output of test oscillator until a slight indication of output is visible.

(b) Adjust the oscillator magnetic core screw L5 (top of oscillator coil) so that maximum (peak) indicated output results.

(c) Set receiver dial pointer to 1,700 kc. Tune the test oscillator to 1,700 kc. Carefully adjust the oscillator and antenna trimmers C25 and C4 respectively so that each brings about maximum (peak) indicated output.

(d) Tune the test oscillator to 600 kc. Adjust the dial reading at which it is best received. Adjust oscillator magnetic core screw L8 (top of oscillator coil) for maximum (peak) output while rocking gang tuning condenser. After completing this adjustment, the trimmers C25 and C4 should be readjusted as in (c) to correct for any change in the oscillator high-frequency tuning which has been caused by the preceding adjustment.

"Short Wave" Band

(e) Connect the "Ant." output of the test oscillator to the "Antenna" terminal through a 300-ohm resistor, leaving the "Grid" of the oscillator connected to the receiver chassis.

(f) Adjust range selector to its "Short wave" (C) position. Set receiver dial pointer to 20,000 kc. Tune test oscillator to 20,000 kc. Set oscillator trimmer C26 to minimum capacity (plunger full out), and antenna trimmer C3 to maximum capacity (plunger full in). Slowly push in oscillator trimmer C26 until maximum (peak) output is reached. Two peaks may be found. Adjust C26 to the peak with minimum capacity (plunger near out) for maximum indication. Tighten lock nut. Slowly pull out plunger of antenna trimmer C3 until maximum (peak) indicated output is reached while slightly rocking the gang tuning condenser back and forth through the signal. Two peaks may be found with this circuit. The peak with maximum capacity (plunger near in) should be used. Tighten lock nut.

Loudspeaker

Centering of the loudspeaker voice coil is made in the usual manner with three narrow paper feelers after first removing the front paper dust cover. This may be removed by softening its cement with a very light application of acetone, using care not to allow the acetone to flow down into the air gap. The dust cover may be cemented back in place with ambroid upon completion of adjustment.

RCA MFG. CO., INC.

Phonograph Attachment.—A terminal board is provided for connecting a phonograph into the audio-amplifying circuit. RCA Victor Models R-93, R-93-2, or R-93-S Record Players should be connected as follows: Remove link between terminals 1 and 2 on receiver. Connect green wire in Radio-Record switch cable to terminal 1, yellow to terminal 2, and shield extension to terminal 3. Tape unused red and blue leads separately. Connect a 2-conductor twisted cable between the Record Player binding posts and the screw terminals on Radio-Record switch.

Alignment Procedure

Calibrate the tuning dial by adjusting dial pointer to the horizontal center line (between the two dial scales) with the two-gang tuning condenser in full-mesh position. Two screws are provided on the dial hub for this adjustment.

Perform alignment in proper order tabulated below, starting with No. 1 and following all operations across, then No. 2, etc.

Cathode-ray alignment is preferable; the connections to the chassis are shown on figure 3. If an output indicator is used, connect it across the loudspeaker voice-coil and advance the receiver volume control to full-volume position.

Connect the "low" output terminal of the test oscillator to the receiver chassis for all alignment operations. Regulate

the output of the test oscillator so that minimum signal is applied to the receiver to obtain an observable output indication. This will avoid a-v-c action.

The term "Dummy antenna" means the device which must be connected between the "high" test-oscillator output and the point of connection to the receiver in order to obtain ideal alignment. "No signal, 550-750 kc" means that the receiver should be tuned to a point between 550 and 750 kc where no signal is received from a station or the local (heterodyne) oscillator.

For further details on alignment, refer to booklet "RCA Victor Receiver Alignment."

4868	Capacitor—.005 Mfd. (C28)	12796	Switch—Range switch (S2)
5148	Capacitor—.007 Mfd. (C21)	13309	Switch—Tone control and power switch (S1, S3)
11315	Capacitor—.015 Mfd. (C27)	12801	Transformer—First I. F. transformer complete (L10, L11, C15, C16)
4858	Capacitor—.01 Mfd. (C10, C22, C25)	12653	Transformer—Second I. F. transformer complete (L12, L13, C17, C18, C19, R6, R8)
4841	Capacitor—0.1 Mfd. (C2, C14, C26)	12644	Transformer—Power transformer, 105-125 volts, 50-60 cycles (T1)
4840	Capacitor—0.25 Mfd. (C23)	12645	Transformer—Power transformer, 105-125 volts, 25-60 cycles (T1)
5170	Capacitor—0.25 Mfd. (C13)	13869	Transformer—Power transformer, 110 and 220 volts, 50-60 cycles (T1)
11240	Capacitor—10 Mfd. (C29)	12654	Trap—Wave-trap complete (L1)
5212	Capacitor—18 Mfd. (C12, C30)	13144	Volume control (R11)
12797	Coil—Antenna coil and shield (L2, L3, L4, L5)		REPRODUCER ASSEMBLIES
12798	Coil—Oscillator coil and shield (L6, L7, L8, L9)	12641	Board—3-contact reproducer terminal board
13679	Condenser—2-gang variable tuning condenser (C3, C4, C6)	12640	Bracket—Output transformer mounting bracket
5119	Connector—3-contact female connector for speaker cable	12812	Coil—Field coil (L16)
12006	Core—Adjustable core and stud for Stock Nos. 12653 and 12801	11469	Coil—Neutralizing coil (L14)
12664	Core—Adjustable core and stud for Stock No. 12654	12642	Cone—Reproducer cone and dust cap (L15)
13868	Dial—Station selector dial	5118	Connector—3-contact male speaker cable connector
13680	Drive—Vernier drive for variable condenser	9699	Reproducer—Complete
13314	Indicator—Station selector indicator pointer	11253	Transformer—Output transformer (T2)
5226	Lamp—Dial lamp, 6.3 volts	11886	Washer—Spring washer to hold field coil securely
13674	Resistor—18 ohms, carbon type, 1/2 watt (R17)		MISCELLANEOUS ASSEMBLIES
13819	Resistor—270 ohms, wire wound, 1.1 watts (R16)	12038	Band—Rubber band for tuning tube
12759	Resistor—15,000 ohms, carbon type, 1/2 watt (R2)	13615	Bracket—Tuning tube mounting bracket and clamp
12011	Resistor—27,000 ohms, carbon type, 1 watt (R3)	12785	Crystal—Station selector escutcheon and crystal
11364	Resistor—33,000 ohms, carbon type, 1/4 watt (R9)	12742	Escutcheon—Tuning tube escutcheon
5029	Resistor—56,000 ohms, carbon type, 1/4 watt (R1)	12699	Knob—Large station selector knob
11282	Resistor—56,000 ohms, carbon type, 1/10 watt (R8)	12700	Knob—Small (vernier) station selector knob
11365	Resistor—82,000 ohms, carbon type, 1/4 watt (R13)	11347	Knob—Volume control, tone control or range switch knob
5145	Resistor—100,000 ohms, carbon type, 1/4 watt (R10)	11377	Screw—Chassis mounting screw and washer assembly
11396	Resistor—220,000 ohms, carbon type, 1/10 watt (R6)	4982	Spring—Retaining spring for knob, Stock No. 12699
11323	Resistor—270,000 ohms, carbon type, 1/4 watt (R12)	11349	Spring—Retaining spring for knob, Stock Nos. 11347 and 12700
11847	Resistor—390,000 ohms, carbon type, 1/4 watt (R14)		
12013	Resistor—1 meg., carbon type, 1/10 watt (R15)		
11626	Resistor—2.2 meg., carbon type, 1/4 watt (R5, R7)

RCA VICTOR MODEL 6K2 (Second Production) WITH MAGNETITE CORE I-F TRANSFORMERS

FOR DATA ON MODEL 6K2 (1st Prod.), SEE
PAGES 7-41 TO 7-43 IN RIDER'S VOL. VII

These receivers are similar to Model 6K2 (first production) except for the i-f transformers, loudspeaker, and a few component parts. Visual inspection of the i-f transformers will readily identify these receivers. Service Data for Model 6K2 are directly applicable to these receivers except the information contained herein. The primary adjustments for the i-f transformers are located on the bottom of the transformers while the secondary adjustments are located on top.

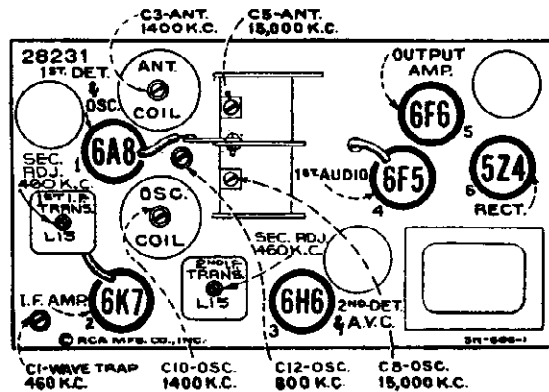

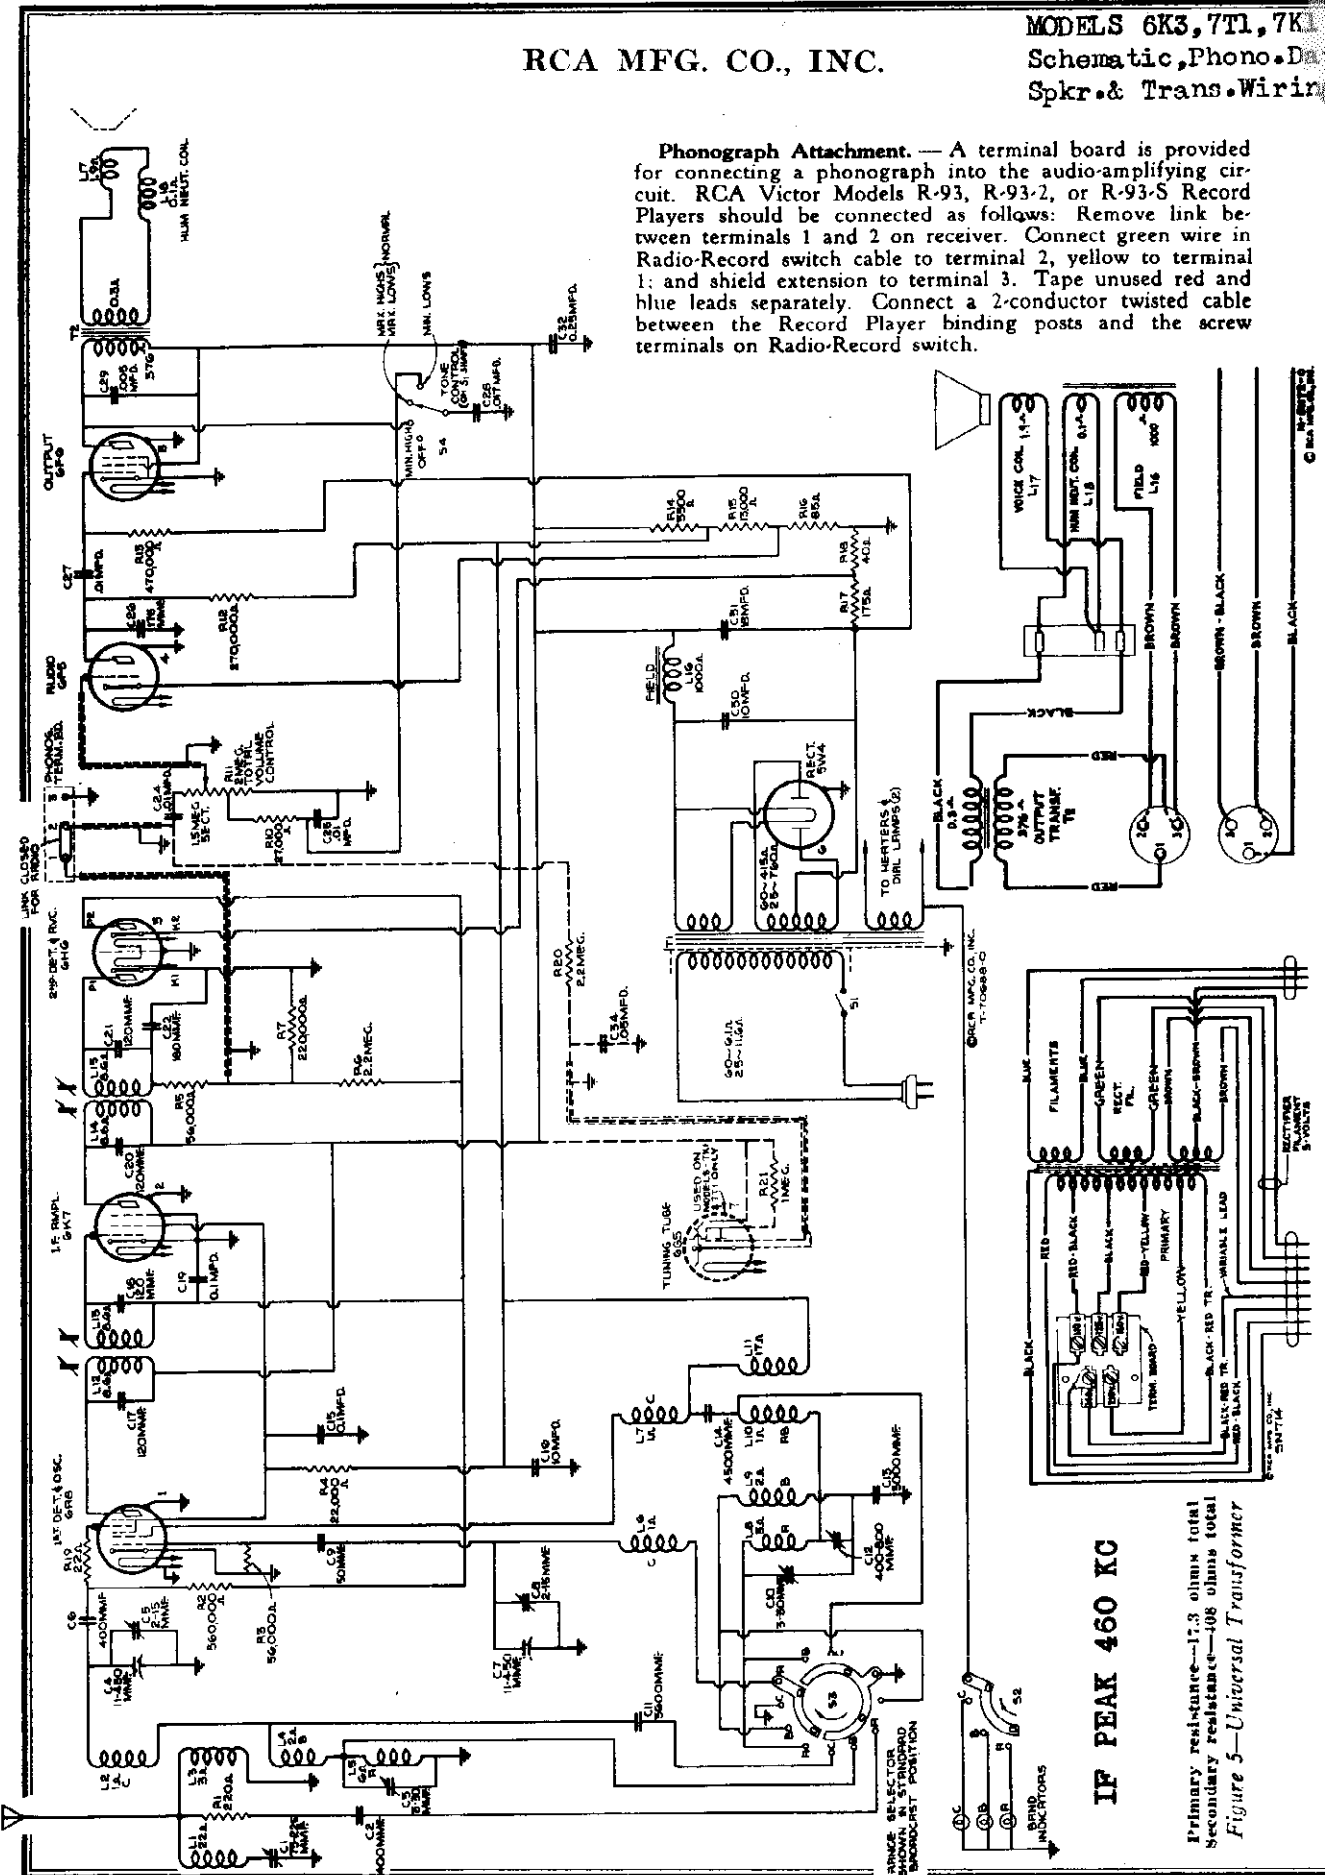

Figure 1—Radiotron, Coil, and Trimmer Locations
(Model 6K2, Second Production)

REPLACEMENT PARTS

Insist on genuine factory tested parts, which are readily identified and may be purchased from authorized dealers

Stock No.	DESCRIPTION	Stock No.	DESCRIPTION
RECEIVER ASSEMBLIES			
12930	Board—Antenna and ground terminal board.	11398	Resistor—220,000 ohms—Carbon type—1/10 watt—(R7).
12717	Board—Phonograph terminal board.	11453	Resistor—270,000 ohms—Carbon type—1/10 watt—(R12).
12772	Bracket—Top dial lamp socket bracket.	11452	Resistor—470,000 ohms—Carbon type—1/10 watt—(R13).
5237	Bushing—Variable tuning condenser mounting bushing assembly.	11597	Resistor—560,000 ohms—Carbon type—1/10 watt—(R2).
11350	Cap—Grid contact cap used on resistor—Stock No. 11624.	11626	Resistor—2.2 megohms—Carbon type—1/4 watt—(R6).
12511	Cap—Grid contact cap.	12008	Shield—i. f. transformer shield for Stock Nos. 13106 and 13107.
11256	Capacitor—Adjustable trimmer—(C1).	12607	Shield—First i. f. transformer shield top.
11465	Capacitor—Adjustable trimmer—(C12).	12581	Shield—Second i. f. transformer shield top.
11289	Capacitor—50 Mmfd.—(C9).	11603	Shield—Coil shield for Stock Nos. 11617 and 11618.
12946	Capacitor—133 Mmfd.—(C17, C18, C20, C21).	12735	Shield—Dial lamp shield.
11623	Capacitor—175 Mmfd.—(C26).	12771	Socket—Dial lamp socket—Located at top of dial scale.
12406	Capacitor—180 Mmfd.—(C22).	11199	Socket—Dial lamp socket.
11290	Capacitor—400 Mmfd.—(C2, C6).	11195	Socket—5-contact 5Z4 Radiotron socket.
11682	Capacitor—3000 Mmfd.—(C13).	11198	Socket—7-contact 6F5, 6H6 Radiotron socket.
11621	Capacitor—3600 Mmfd.—(C11).	11196	Socket—8-contact 6A8, 6F6 or 6K7 Radiotron socket.
11287	Capacitor—4500 Mmfd.—(C14).	12007	Spring—Retaining spring for core Stock No. 12006.
4866	Capacitor—005 Mfd.—(C29).	12769	Switch—Range switch—(S2, S3).
11395	Capacitor—.01 Mfd.—(C24).	12668	Tone Control—Control and power switch—(R9, S1).
4858	Capacitor—.01 Mfd.—(C25, C27).	13106	Transformer—First i. f. transformer—(L12, L13, C17, C18).
11315	Capacitor—.015 Mfd.—(C33).	13107	Transformer—Second i. f. transformer—(L14, L15, C20, C21, C22, R5, R7).
12670	Capacitor—.035 Mfd.—(C28).	11848	Transformer—Power transformer—105-125-volt, 50-60-cycle—(T1).
4841	Capacitor—0.1 Mfd.—(C19).	11849	Transformer—Power transformer—105-125-volt, 25-40-cycle—(T1).
11414	Capacitor—0.1 Mfd.—(C15).	11850	Transformer—Power transformer—105-250-volt, 40-60-cycle—(T1).
5179	Capacitor—0.25 Mfd.—(C32).	11391	Trap—Wave trap—(L1, C1).
11367	Capacitor—10 Mfd.—(C16).	13144	Volume control—(R11).
11240	Capacitor—10 Mfd.—(C30).	REPRODUCER ASSEMBLIES	
5212	Capacitor—18 Mfd.—(C31).	12641	Board—Reproducer terminal board.
11617	Coil—Antenna coil less shield—(L2, L3, L4, L5, C3, R1, L11, C10).	12640	Bracket—Output transformer mounting bracket and clamp.
11618	Coil—Oscillator coil less shield—(L6, L7, L8, L9, L10, L11, C10).	13600	Coil—Field coil—(L16).
13597	Condenser—2-gang variable tuning condenser—(C4, C5, C7, C8).	11469	Coil—Neutralizing coil—(L18).
5119	Connector—3-contact female connector for speaker cable.	12667	Cone—Reproducer cone complete—(L17).
12006	Core—Adjustable core and stud for Stock No. 13106 and 13107.	5118	Connector—3-contact male connector for speaker cable.
12792	Dial—Station selector dial.	9766	Reproducer complete.
13598	Drive—Variable tuning condenser vernier drive.	11253	Transformer—Output transformer—(T2).
13599	Foot—Chassis mounting foot and bracket.	11886	Washer—Spring washer to hold field coil securely.
12770	Holder—Dial scale holder and lamp bracket assembly less bracket for top dial lamp socket.	MISCELLANEOUS ASSEMBLIES	
12712	Indicator—Station selector indicator pointer.	12666	Cover—Reproducer cover assembly.
5226	Lamp—Dial lamp—6.3 volt.	12698	Crystal—Station selector crystal and escutcheon.
12718	Mask—Dial light diffuser complete with red, orange and green-colored screen.	11582	Knob—Range switch knob.
11466	Resistor—Voltage divider resistor—comprising one 3,500-ohm, one 15,000-ohm, one 85-ohm, one 40-ohm and one 175-ohm sections—(R14, R15, R16, R17, R18).	12699	Knob—Large station selector knob.
11624	Resistor—22 ohms—Flexible type complete with grid contact cap—(R19).	12700	Knob—Small (vernier) station selector knob.
11620	Resistor—220 ohms—Carbon type—1/10 watt—(R1).	11347	Knob—Tone control or volume control knob.
8070	Resistor—22,000 ohms—Carbon type—1/2 watt—(R4).	11210	Screw—Chassis mounting screw assembly.
11400	Resistor—27,000 ohms—Carbon type—1/4 watt—(R10).	11349	Spring—Retaining spring for knob—Stock No. 11347, No. 11582 and No. 12700.
11282	Resistor—56,000 ohms—Carbon type—1/10 watt—(R5).	4982	Spring—Retaining spring for knob—Stock No. 12699.
12286	Resistor—56,000 ohms—Insulated—1/4 watt—(R3).		

Phonograph Attachment. — A terminal board is provided for connecting a phonograph into the audio-amplifying circuit. RCA Victor Models R-93, R-93-2, or R-93-S Record Players should be connected as follows: Remove link between terminals 1 and 2 on receiver. Connect green wire in Radio-Record switch cable to terminal 2, yellow to terminal 1; and shield extension to terminal 3. Tape unused red and blue leads separately. Connect a 2-conductor twisted cable between the Record Player binding posts and the screw terminals on Radio-Record switch.

IF PEAK 460 KC

Primary resistance—17.3 ohms total
Secondary resistance—108 ohms total

MODELS 6K3, 7T1, 7K1
Socket, Trimmers
Voltage, Alignment

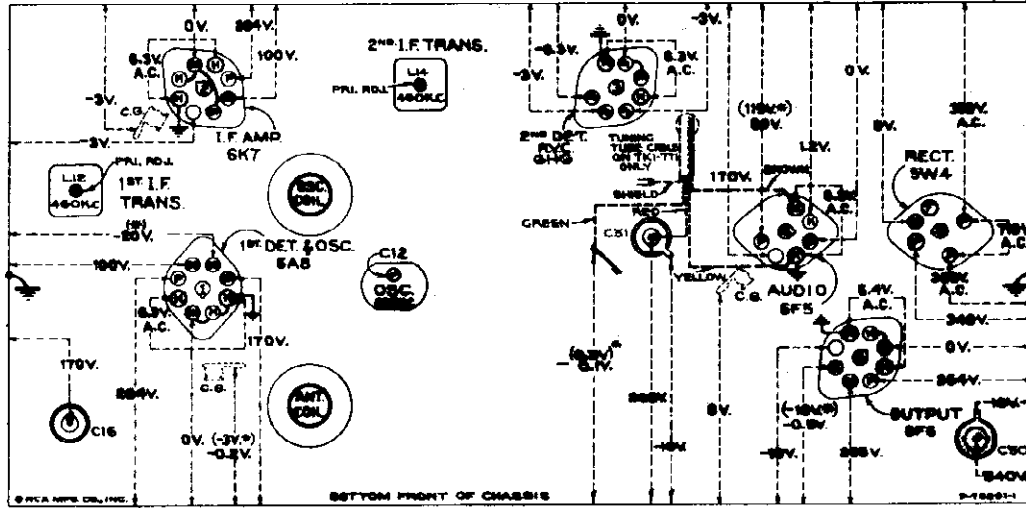

Figure 4—Radiotron Socket Voltages, Coil, and Trimmer Locations
Measured at 115 volts, 60-cycle supply—Tuned to approximately 1,000 kc ("Standard broadcast")—
No signal being received—Volume control minimum

Loudspeaker.—Centering of the loudspeaker is made in the usual manner with three narrow paper feelers after first removing the front dust cover. This may be removed by softening its cement with a light application of acetone, using care not to allow the acetone to flow into the air gap. The dust cover should be cemented back in place with ambroid upon completion of adjustment.

Alignment Procedure

Calibrate the tuning dial by adjusting dial pointer to the low-frequency (end) calibration mark on "Standard broadcast" scale with the gang tuning condenser plates in full-mesh position. This is a fraction adjustment.

Perform alignment in proper order tabulated below, starting with No. 1 and following all operations across, then No. 2, etc. Adjustment locations are shown by figures 1 and 4.

Cathode-ray alignment is preferable; the connections to the chassis are shown on figure 3. If an output indicator is used, connect it across the loudspeaker voice-coil and advance the receiver volume control to full-volume position.

Connect the "low" output terminal of the test oscillator to the receiver chassis for all alignment operations. Regulate

the output of the test oscillator so that minimum signal is applied to the receiver to obtain an observable output indication. This will avoid a-v-c action.

The term "Dummy antenna" means the device which must be connected between the "high" test-oscillator output and the point of connection to the receiver in order to obtain ideal alignment. "No signal, 550-750 kc" means that the receiver should be tuned to a point between 550 and 750 kc where no signal or interference is received from a station or local (heterodyne) oscillator.

For further details on alignment, refer to booklet "RCA Victor Receiver Alignment."

Order of Alignment	Test Oscillator			Receiver Dial Setting	Circuit to Adjust	Adjustment Symbols	Adjust to Obtain
	Connection to Receiver	Dummy Antenna	Frequency Setting				
1	6K7 i-f Grid Cap	.001 Mfd.	460 kc	No signal 550-750 kc	2nd i-f Trans.	L14 and L15	Max. (peak)
2	6A8 Det. Grid Cap	.001 Mfd.	460 kc	No signal 550-750 kc	1st i-f Trans.	L12 and L13	Max. (peak)
3	Ant. Post	200 Mmfd.	460 kc	No signal 550-750 kc	Wave Trap	C1	Minimum Output
4	Ant. Post	300 Ohms	15,000 kc	15,000 kc	"C" Osc.	C8	Max (peak)*
5	Ant. Post	300 Ohms	15,000 kc	Rock thru 15,000 kc	"C" Ant.	C6	Max. (peak)
6	Ant. Post	200 Mmfd.	600 kc	600 kc	L-F Osc.	C18	Max. (peak)
7	Ant. Post	200 Mmfd.	1,400 kc	1,400 kc	H-F Osc.	C10	Max. (peak)
8	Ant. Post	200 Mmfd.	1,400 kc	1,400 kc	"A" Ant.	C3	Max. (peak)
9	Ant. Post	200 Mmfd.	600 kc	Rock thru 600 kc	L-F Osc.	C12	Max. (peak)
10	Ant. Post	200 Mmfd.	1,400 kc	1,400 kc	H-F Osc.	C10	Max. (peak)
11	Ant. Post	200 Mmfd.	1,400 kc	1,400 kc	"A" Ant.	C3	Max. (peak)

* Use maximum capacity peak if two peaks can be obtained.

Radiotron Cathode Current Readings
Measured with Milliammeter Connected at Tube Socket Cathode Terminals Under Conditions Similar to Those of Voltage Measurements

(1) RCA-6A8—1st Det.—Osc.	12.3 ma.
(2) RCA-6K7—1st Amp.	9.8 ma.
(3) RCA-6H6—2nd Det. and A.V.C.	0.2 ma.
(4) RCA-6F5—Audio Driver	34.0 ma.
(5) RCA-5W4—Power Amplifier	76.0 ma.*
(6) RCA-6G5—Tuning Tube	2.0 ma.

* Cannot be measured at socket.

Note: Two voltage values are shown for some readings. The value shown in parentheses with asterisk (*) indicates operating conditions without voltmeter loading. The other value (generally lower) is the actual measured voltage and differs from the value shown in parentheses because of the additional loading of the voltmeter through the high series circuit resistance.

Figure 1—Radiotron, Coil, and Trimmer Locations

MODELS 6K3, 7T1, 7K1

Data, Parts

RCA MFG. CO., INC.

These receivers are of the superheterodyne type and have many distinctive features. Model 6K3 is a six-tube console model employing a 12-inch loudspeaker. Models 7T1 and 7K1 are table and console models respectively having similar

chassis to Model 6K3 except for the addition of a tuning tube "Magic Eye": the former has an 8-inch loudspeaker while the latter has a 12-inch loudspeaker.

FREQUENCY RANGES

- "Standard Broadcast" (A)..... 540—1,625 kc
- "Medium Wave" (B)..... 1,625—5,700 kc
- "Short Wave" (C)..... 5,700—18,000 kc

ALIGNMENT FREQUENCIES

- "Standard Broadcast" (A)..... 600 kc (osc.), 1,400 kc (osc. and ant.)
- "Medium Wave" (B)..... None required
- "Short Wave" (C)..... 15,000 kc (osc. and ant.)

Intermediate Frequency..... 460 kc

RADIOTRON COMPLEMENT

- (1) RCA-6A8..... First Detector—Oscillator
- (2) RCA-6K7..... Intermediate Amplifier
- (3) RCA-6H6..... Second Detector—A.V.C.

- (4) RCA-6F5..... Audio Voltage Amplifier
- (5) RCA-6F6..... Audio Power Amplifier
- (6) RCA-5W4..... Full-Wave Rectifier
- (7) RCA-6G5—(Models 7T1 and 7K1 only) Tuning Tube

Pilot Lamps (5)..... 7T1 and 7K1, Mazda No. 40, 6.3 volts, 0.15 amp.; 6K3, Mazda No. 46, 6.3 volts, 0.25 amp.

POWER SUPPLY RATINGS

- Rating A..... 105-125 volts, 50-60 cycles, 90 watts
- Rating B..... 105-125 volts, 25-60 cycles, 90 watts
- Rating C..... 100-130/140-160/195-250 volts, 40-60 cycles, 90 watts

POWER OUTPUT

- Undistorted..... 2.0 watts
- Maximum..... 4.5 watts

LOUDSPEAKER

- Type..... Electrodynamic
- Impedance (v.c.)..... 2.2 ohms at 400 cycles

13597	Condenser—2-gang variable tuning condenser (C4, C5, C7, C8)	9771	Reproducer complete—Model 7T1
5119	Connector—3-contact female connector for speaker cable	9766	Reproducer complete—Models 6K3 and 7K1
12006	Core—Adjustable core and stud for Stock Nos. 13106 and 13107	11253	Transformer—Output transformer (T2)
13682	Dial—Station selector dial	11886	Washer—Spring washer to hold field coil securely
13598	Drive—Variable tuning condenser vernier drive	MISCELLANEOUS ASSEMBLIES	
13599	Foot—Chassis mounting foot and bracket	12038	Band—Rubber band for tuning tube
12770	Holder—Dial scale holder and lamp bracket assembly less bracket for top dial lamp socket	13615	Bracket—Tuning tube mounting bracket and clamp
12712	Indicator—Station selector indicator pointer	12698	Crystal—Station selector crystal and escutcheon
4340	Lamp—Dial lamp—Models 7T1 and 7K1 only	12742	Escutcheon—Tuning tube escutcheon
5226	Lamp—Dial lamp—Model 6K3 only	12699	Knob—Large station selector knob
13683	Mask—Dial light diffuser complete with colored screen	12700	Knob—Small (vernier) station selector knob
11466	Resistor—Voltage divider resistor—comprising one 3,500-ohm, one 13,000-ohm, one 85-ohm, one 40-ohm and one 175-ohm sections (R14, R15, R16, R17, R18)	11347	Knob—Tone control, range switch or volume control knob
11624	Resistor—22 ohms—Flexible type complete with grid contact cap (R19)	11377	Screw—Chassis mounting screw assembly—Used on Model 7T1
11620	Resistor—220 ohms—Carbon type—1/10 watt (R1)	11210	Screw—Chassis mounting screw assembly—Used on Models 6K3 and 7K1
8070	Resistor—22,000 ohms—Carbon type—1/2 watt (R4)	11349	Spring—Retaining spring for knob—Stock Nos. 11347 and 12700
11400	Resistor—27,000 ohms—Carbon type—1/2 watt (R10)	4982	Spring—Retaining spring for knob—Stock No. 12699
12286	Resistor—56,000 ohms—Insulated—1/2 watt (R3)		
11282	Resistor—56,000 ohms—Carbon type—1/10 watt (R5)		
11398	Resistor—220,000 ohms—Carbon type—1/10 watt (R7)		
11453	Resistor—270,000 ohms—Carbon type—1/10 watt (R12)		
11452	Resistor—470,000 ohms—Carbon type—1/10 watt (R13)		
11397	Resistor—560,000 ohms—Carbon type—1/10 watt (R2)		

First Edition

RCA MFG. CO., INC.

MODEL 6T5
Schematic, Socket
Trimmers, Spkr. Wirin

FOR PARTS LIST, SEE INDEX

FREQUENCY RANGES
 "Standard Broadcast" (A) 530-1,900 kc
 "Short Wave" (C) 5,800-21,600 kc
 Intermediate Frequency 460 kc

Pilot Lamp (1)
 Mazda No. 46, 6.3 volts, 0.25 ampere

Figure 4—Loudspeaker Wiring

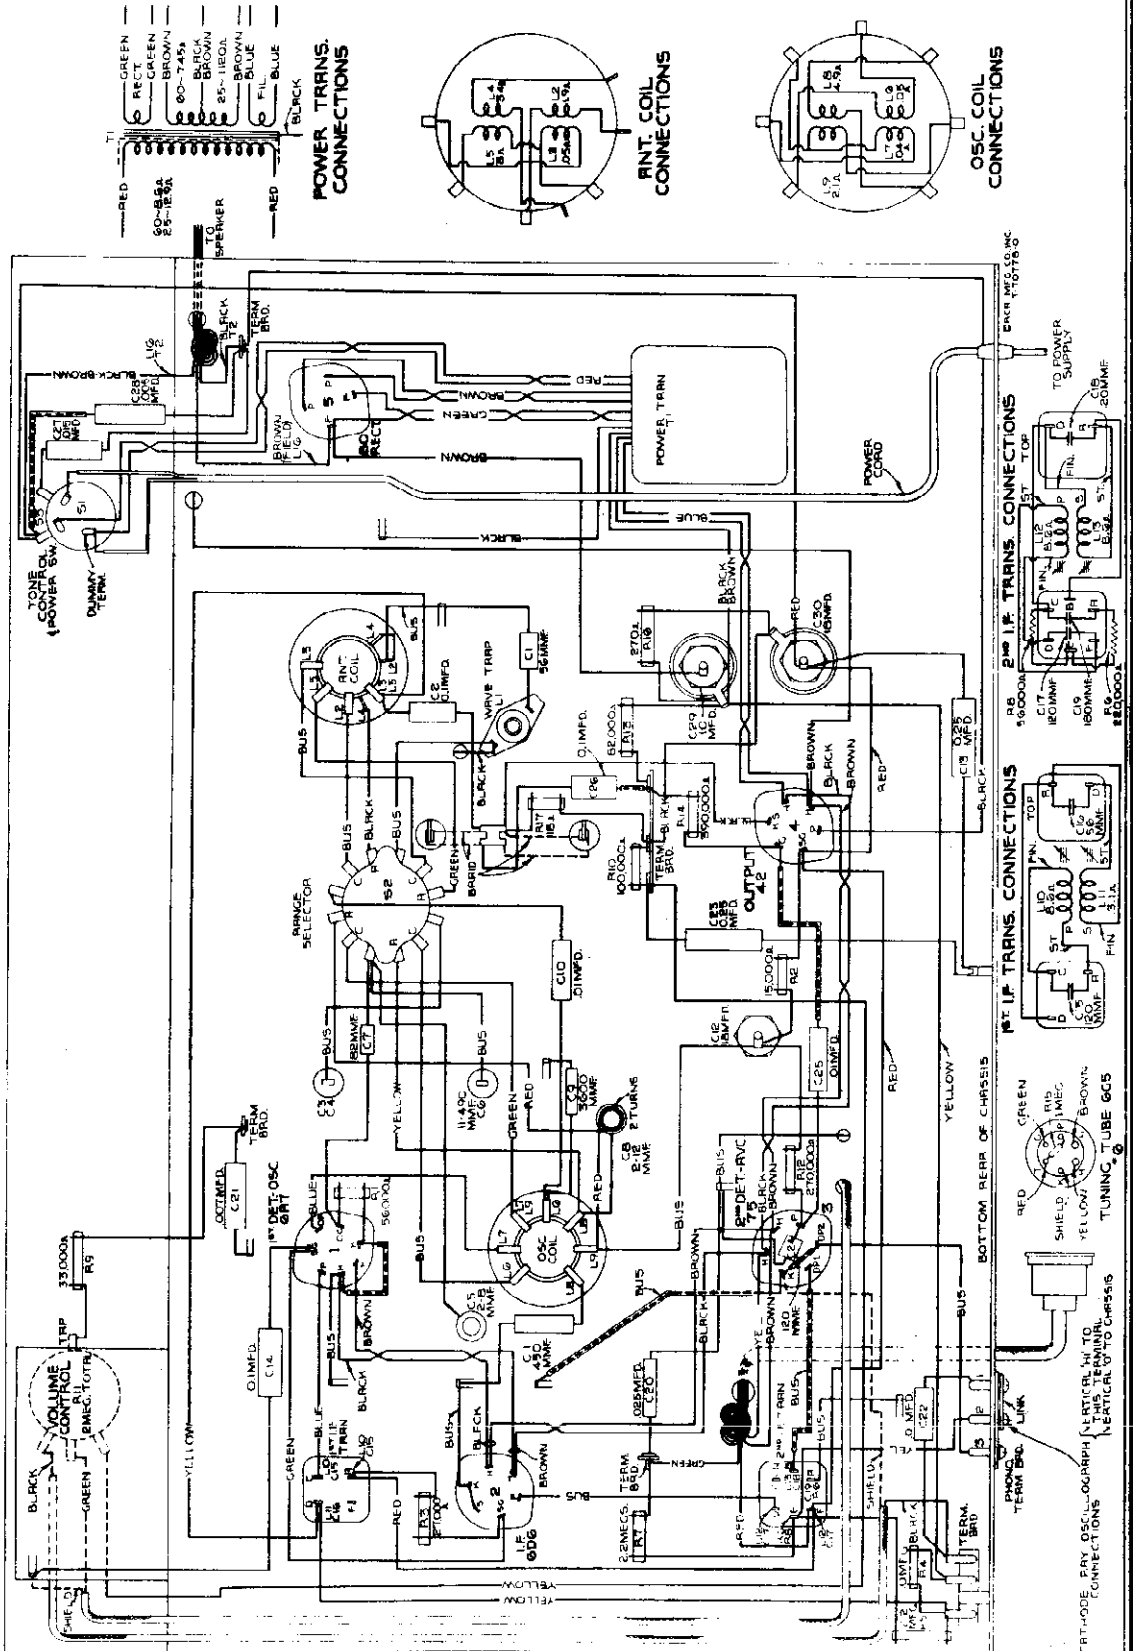

MODEL 6T5
Chassis Wiring

RCA MFG. CO., INC.

POWER SUPPLY RATINGS
 Rating A 105-125 volts, 50-60 cycles, 75 watts
 Rating B 105-125 volts, 25-60 cycles, 75 watts
 Rating C 100-125/200-250 volts, 50-60 cycles, 75 watts
LOUDSPEAKER
 Undistorted 2.0 watts
 Maximum 4.5 watts
POWER OUTPUT RATING
 Type Electrodynamic
 Voice Coil Impedance 2 1/4 ohms at 400 cycles

ALIGNMENT FREQUENCIES

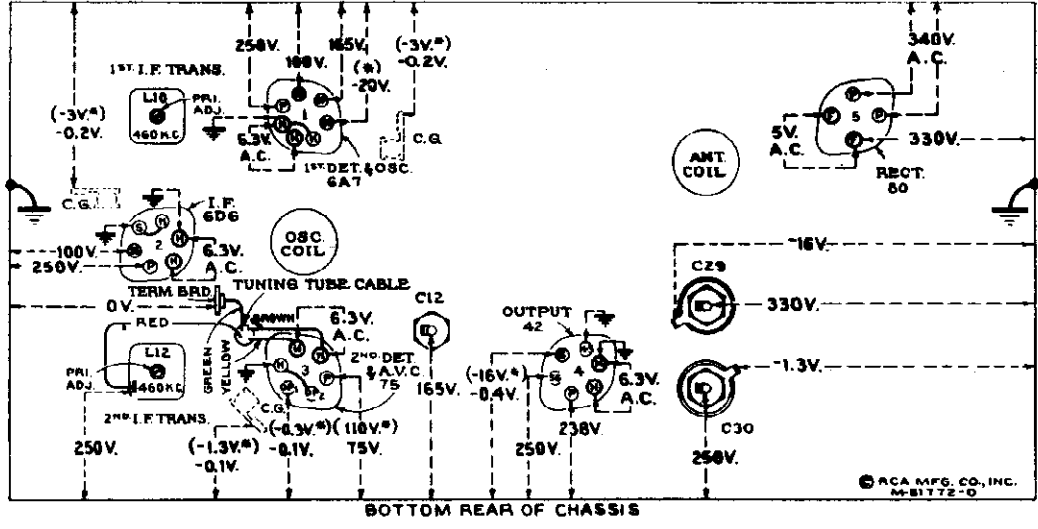

"Standard Broadcast" (A) 600 kc (osc.), 1,700 kc (osc., ant.)
 "Short Wave" (C) 20,000 kc (osc., ant.)

VERTICAL IN TO TERMINALS
 VERTICAL OUT TO CHASSIS

RCA MFG. CO., INC.

MODEL CT5
Voltage
Alignment

Note: Two voltage values are shown for some readings. The value shown in parentheses with asterisk (*) indicates operating conditions without voltmeter loading. The other value (generally lower) is the actual measured voltage and differs from the value shown in parentheses because of the additional loading of the voltmeter through the high series circuit resistance.

Figure 5—Radiotron Socket Voltages, Coil, and Trimmer Locations

Measured at 115 volts, 60-cycle supply—Tuned to approximately 1,000 kc ("Standard broadcast")—No signal being received—Volume control minimum

Radiotron Cathode Current Readings	
Measured with Milliammeter Connected at Tube Socket Cathode Terminals Under Conditions Similar to Those of Voltage Measurements	
(1) RCA-6A7—1st Det.—Osc.	11.0 ma.
(2) RCA-6D6—I-F Amp.	10.0 ma.
(3) RCA-75—2nd Det., A.V.C. and A.F.	0.22 ma.
(4) RCA-42—Power Amplifier	42.0 ma.
(5) RCA-80—Rectifier	66.0 ma.*
(6) RCA-6A5—Tuning Tube	2.0 ma.

(* Cannot be measured at socket.)

Phonograph Attachment.—A terminal board is provided for connecting a phonograph into the audio-amplifying circuit. RCA Victor Models R-93, R-93-2, or R-93-S Record Players should be connected as follows: Remove link between terminals 1 and 2 on receiver. Connect green wire in Radio-Record switch cable to terminal 1, yellow to terminal 2, and shield extension to terminal 3. Tape unused red and blue leads separately. Connect a 2-conductor twisted cable between the Record Player binding posts and the screw terminals on Radio-Record switch.

Alignment Procedure

Connect the "low" output terminal of the test oscillator to the receiver chassis for all alignment operations. Regulate the output of the test oscillator so that minimum signal is applied to the receiver to obtain an observable output indication. This will avoid a-v-c action. The term "Dummy antenna" means the device which must be connected between the "high" test-oscillator output and the point of connection to the receiver in order to obtain ideal alignment. "No signal, 550-750 kc" means that the receiver should be tuned to a point between 550 and 750 kc where no signal or interference is received from a station or local (heterodyne) oscillator. For further details on alignment, refer to booklet "RCA Victor Receiver Alignment."

Order of Alignment	Test Oscillator		Receiver Dial Setting	Circuit to Adjust	Adjustment Symbols	Adjust to Obtain
	Connection to Receiver	Dummy Antenna				
1	6D6 I-F Grid Cap	.001 Mfd.	No Signal 550-750 kc	2nd I-F Trans.	L12 and L13	Max. (peak)
2	6A7 Det. Grid Cap	.001 Mfd.	No Signal 550-750 kc	1st I-F Trans.	L10 and L11	Max. (peak)
3	Ant. Post	200 Mmfd.	No Signal S-W Band	Wave Trap	L1	Minimum Output
4	Ant. Post	300 Ohms	20,000 kc	"C" Osc.	C5	Max. (peak)*
5	Ant. Post	300 Ohms	Rock Thru 20,000 kc	"C" Ant.	C3	Max. (peak)†
6	Ant. Post	200 Mmfd.	600 kc	"A" L-F Osc.	L8	Max. (peak)
7	Ant. Post	200 Mmfd.	1,700 kc	"A" H-F Osc.	C8	Max. (peak)
8	Ant. Post	200 Mmfd.	600 kc	"A" L-F Osc.	L8	Max. (peak)
9	Ant. Post	200 Mmfd.	1,700 kc	"A" H-F Osc.	C8	Max. (peak)

* Use minimum capacity peak.
† Use maximum capacity peak.

Notes

RCA MFG. CO., INC.

Pilot Lamps (5) Mazda No. 46, 6.3 volts, 0.25 amperes

POWER SUPPLY RATINGS

Rating	Voltage	Cycles	TOTAL RADIO AND PHONOGRAPH	
			RADIO	PHONOGRAPH
Rating A-6	105-125 volts	60 cycles	95 watts	120 watts
Rating A-5	105-125 volts	50 cycles	95 watts	120 watts
Rating B-2	105-125 volts	25 cycles	95 watts	120 watts
Rating C-6	105-130/140-160/200-250 volts	60 cycles	95 watts	120 watts
Rating C-5	105-130/140-160/200-250 volts	50 cycles	95 watts	120 watts

Alignment

The r-f and i-f adjustments on this instrument should be performed as outlined under "Alignment" in "Technical Information and Service Data" for Model 7U, substituting the magnetite-core symbols L15, L14, L13 and L12 for the trimming capacitor symbols C21, C20, C18 and C17 respectively in "I-F Adjustments." FOR DATA ON MODEL 7U, SEE RCA

Phonograph VOLUME VII.

The phonograph motor is of the governor induction type and is designed to be simple and foolproof. Occasionally, however, certain adjustments may be required. These adjustments are illustrated and explained in Figures 4 and 5. Application of oil to the felt pad which rubs against the governor disc will insure smooth operation.

Pickup adjustments are the same as outlined for Model 7U.

Resistance and Voltage Measurements

Voltage and resistance measurements for this receiver are the same as for Model 7U (Figures 4 and 7), with the following exception:

The resistance value shown on Figure 4, between the plate and capacitor C31 terminals of the RCA-6A8 first-detector and oscillator, and the RCA-6K7 i-f amplifier, should be 8.6 ohms instead of 13 ohms.

Figure 4—Details of 60-Cycle Motor

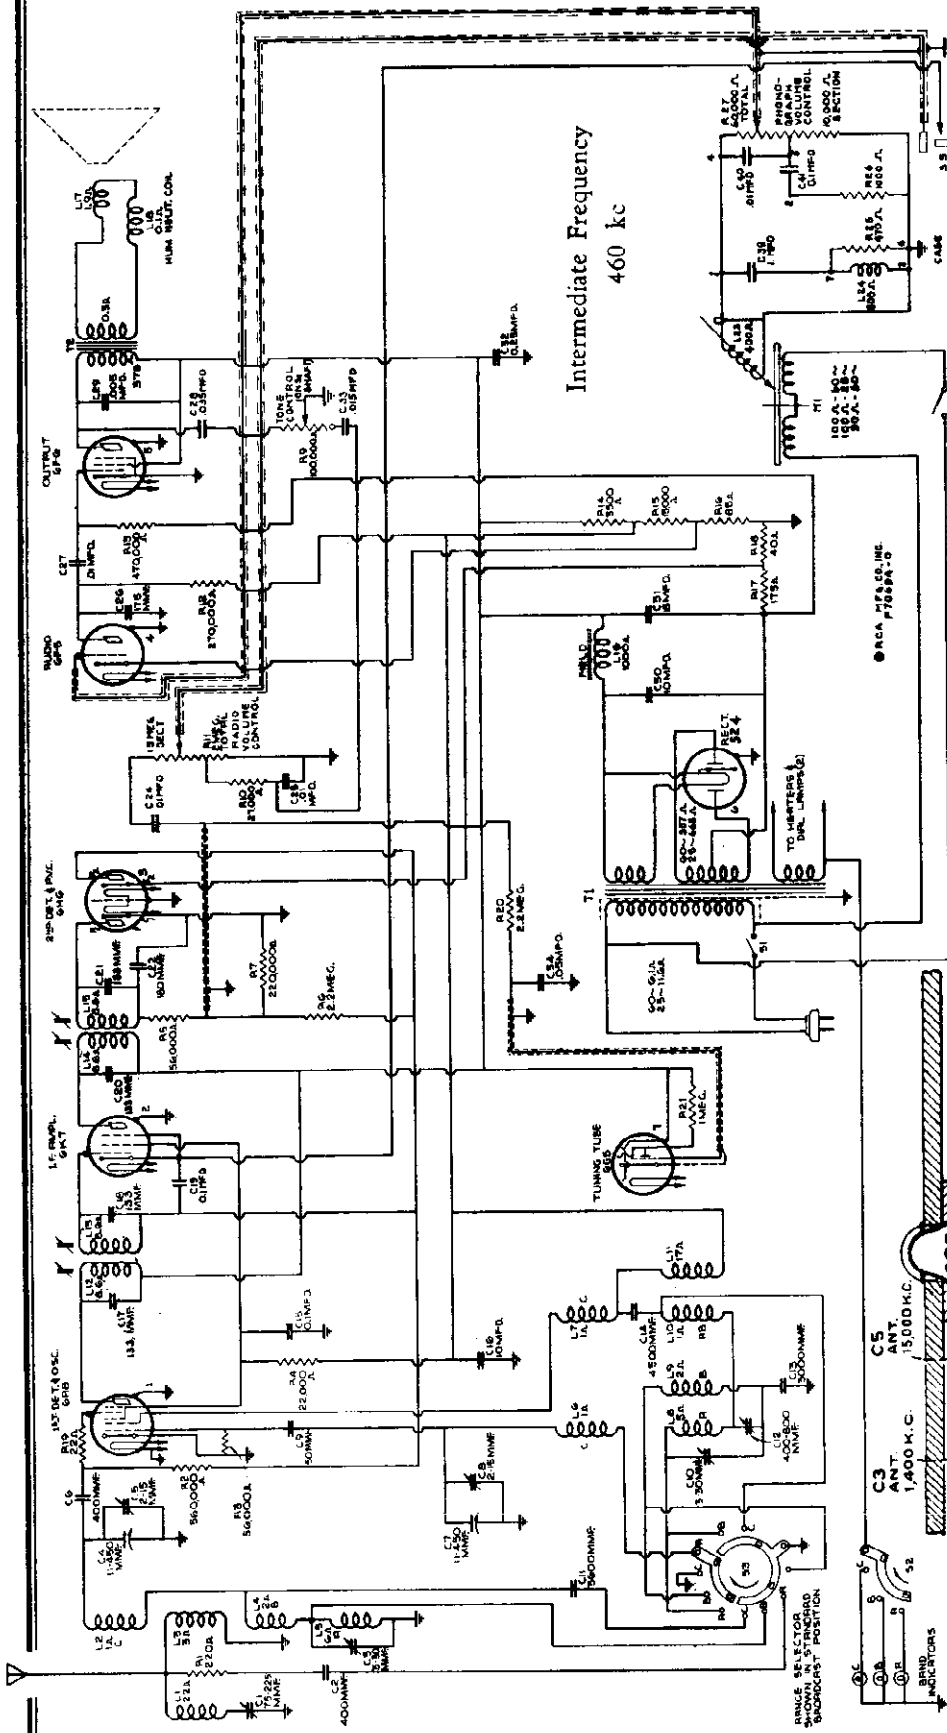

Figure 5—Details of 25- or 50-Cycle Motor

Parts

Stock No.	DESCRIPTION	List Price	Stock No.	DESCRIPTION	List Price	Stock No.	DESCRIPTION	List Price
12030	RECEIVER ASSEMBLIES		11282	Resistor—50,000 ohms, carbon type, 1/10 watt—Package of 5 (R3)	.75	10174	Spring—Complete set of springs for station clock—Package of 2 sets	.50
5237	Board—Antenna and ground terminal	\$0.20	12286	Resistor—30,000 ohms, unglazed, 1/4 watt—Package of 5 (R2)	1.00	3322	Switch—Automatic brake switch (S4)	.75
11888	Bushing—Variable condenser mounting	.43	11398	Resistor—20,000 ohms, carbon type, 1/10 watt—Package of 5 (R7)	.75	11731	PICKUP AND ARM ASSEMBLIES	
12032	Cable—Tuning lamp cable and socket	1.06	11453	Resistor—20,000 ohms, carbon type, 1/10 watt—Package of 5 (R12)	.75	11732	Armature—Pickup armature	.64
11350	Cap—Grid contact cap—Package of 5	.90	11452	Resistor—470,000 ohms, carbon type, 1/10 watt—Package of 5 (R13)	.75	4543	Coil—Pickup coil (L23)	.60
11286	Cap—Grid contact cap—Package of 5	.15	11397	Resistor—500,000 ohms, carbon type, 1/10 watt—Package of 5 (R2)	.75	13579	Damper—Pickup damper block complete with damper plate	1.10
12046	Capacitor—30 Mmfd. (C9)	.26	12013	Resistor—1 megohm, carbon type, 1/10 watt—Package of 5 (R21)	.75	11951	Screw—Needle holding screw—Package of 40	7.85
11623	Capacitor—175 Mmfd. (C26)	.20	11626	Resistor—2.2 megohms, carbon type, 1/4 watt—Package of 5 (R6, R20)	\$1.00	12641	Board—Terminal board assembly	\$0.15
12406	Capacitor—180 Mmfd. (C22)	.26	12607	Shield—First I. F. transformer shield	.30	12640	Bracket—Output transformer mounting bracket	.18
11290	Capacitor—400 Mmfd. (Cz, C6)	.25	12581	Shield—Second I. F. transformer shield	.30	11660	Coil—Field coil (L16)	1.75
11622	Capacitor—3,000 Mmfd. (C13)	.36	11603	Shield—Coil shield for Stock Nos. 11617 and 11618	.36	11669	Coil—Neutralizing coil (L18)	1.75
11621	Capacitor—3,500 Mmfd. (C11)	.38	12735	Shield—Dial lamp shield—Package of 5	.25	12667	Coil—Reproducer cone (L17)	1.00
11287	Capacitor—4,500 Mmfd. (C14)	.30	12008	Shield—I. F. transformer shield for Stock Nos. 13106 and 13107	.25	5118	Connector—3-contact male connector for reproducer	.25
4668	Capacitor—.005 Mfd. (C29)	.20	11199	Socket—Dial lamp socket	.26	5119	Connector—3-contact female connector for reproducer cable	.25
11315	Capacitor—.015 Mfd. (C33)	.20	11381	Socket—Dial lamp socket, located at top	.14	9766	Reproducer complete	7.25
11395	Capacitor—.01 Mfd. (C24)	.18	11195	Socket—5-contact 5Z4 Radiotron socket	.45	11856	Transformer—Output transformer (T2) with primary winding used to hold field coil securely—Package of 5	1.56
4836	Capacitor—.05 Mfd. (C34)	.20	11198	Socket—7-contact 6E5 or 6H6 Radiotron socket	.15	13576	Motor—105-125 volts, 50-cycle motor complete (M1)	.20
11414	Capacitor—.01 Mfd. (C25, C27)	.25	11196	Socket—8-contact 6A8, 6F6 or 6K7 Radiotron socket	.15	13577	Motor—105-125 volts, 50-cycle motor complete	18.80
5170	Capacitor—.25 Mfd. (C32)	.22	12007	Spring—Retaining spring for core, Stock No. 12006—Package of 10	.36	13578	Motor—105-125 volts, 25-cycle motor complete	25.20
11240	Capacitor—10 Mfd. (C30)	1.08	12769	Switch—Range switch (S2, S3)	1.21	13583	Regulator—Motor speed regulator for motor only	25.20
5212	Capacitor—.18 Mfd. (C31)	1.16	11868	Transformer—Power transformer, 100-250 volts, 40-57 cycles (T1)	1.22	11762	Box—Used needle box	.25
11465	Capacitor—Adjustable trimmer (C12)	.44	13106	Transformer—First I. F. transformer (L12, L13, C17, C18)	1.22	11996	Bracket—Tuning lamp mounting bracket	.25
11256	Capacitor—Adjustable trimmer for wave trap, Stock No. 11391 (C1)	.44	13107	Transformer—Second I. F. transformer (L14, L15, C20, C21, C22, R3, R7)	1.40	12030	Cable—2-conductor shielded cable, approx. 18 inches long, connects phonograph volume control to compensator pack	.22
11617	Coil—Antenna coil less shield (L2, L3, L4, L5, C3, R1)	1.68	11848	Transformer—Power transformer, 100-125 volts, 50-60 cycles (T1)	2.06	12031	Cable—3-conductor shielded cable, approx. 19 inches long, complete with 4-contact female connector, contacts phonograph volume to receiver	.32
11818	Coil—Oscillator coil less shield (L6, L7, L8, L9, L10, L11, C10)	2.22	11849	Transformer—Power transformer, 100-250 volts, 40-57 cycles (T1)	4.40	11272	Clamp—Cable clamp for phonograph volume control cable, Stock No. 12030	1.04
13597	Condenser—2-gang variable tuning condenser (C4, C5, C7, C8)	4.55	11850	Transformer—Power transformer, 105-250 volts, 40-57 cycles (T1)	8.00	11760	Compensator—Phonograph compensator pack comprising one 470-ohm and one 1,000-ohm resistors, one .01 Mfd. and one .1 Mfd. and one 1 Mfd. capacitors and one 25 Henry reactor, L24, C39, C40, C41, R25, R26	.10
4573	Connector—2-contact female connector for motor cable, receiver section		13144	VOLUME MOTOR BOARD ASSEMBLIES	1.00	4153	Connector—4-contact female connector for cable, Stock No. 12031	3.85
5119	Connector—3-contact female connector for chassis reproducer cable		4577	Connector—2-contact male connector for motor leads	.30	12666	Cover—Reproducer cover	.45
6123	Connector—4-contact male connector for cable, Stock No. 12032		13575	Escutcheon—Motor speed regulator escutcheon for 25 or 50-cycle motors	.25	12698	Escutcheon—Station selector escutcheon	.65
12006	Core—Adjustable core and stud for Stock Nos. 13106 and No. 13107	\$0.30	13665	Lever—Brake mechanism actuating lever, fast to protruding pin on base of 5 screw—Motor mounting screw assembly for 60-cycle motor only—Package of 3	.85	12742	Escutcheon—Tuning tube escutcheon	1.02
13598	Drive—Variable tuning condenser vernier drive	.25	13574	Screw—Motor mounting screw assembly, for 25 or 50-cycle motors only—Package of 3	.85	11347	Knob—Phonograph volume control, receiver volume control, or range switch	.22
13599	Font—Chassis mounting foot and bracket assembly—Package of 2	.80	11750	Screw—No. 4-40 x 9/32, cone pointed, headless set screw for lever, Stock No. 13065—Package of 10	.22	12699	Knob—Large station selector knob—Package of 5	.75
12770	Holder—Dial scale holder and lamp bracket assembly	.55	13582	Brake—Automatic brake and switch complete	2.65	11210	Screw—Chassis mounting screw assembly, comprising one screw, one washer, and one lockwasher—Package of 4	.68
12712	Indicator—Station selector indicator pointer	.22	4577	Connector—2-contact male connector for brake switch power supply leads	.30	4982	Spring—Retaining spring for large knob in Stock No. 11349	.50
4540	Lamp—Dial lamp—Package of 5	.60	3994	Cover—Switch cover and screw	.26	11349	Screw—Retaining spring for small knob in Stock Nos. 12699, 11347 and 11582—Package of 5	.25
12718	Mask—Dial light diffuser complete with red, orange and green-colored screen	.40				11695	Turnable—Complete Phonograph volume control and switch (R27, S5)	2.48
11466	Resistor—220 ohms, carbon type, 1/10 watt—Package of 5 (R1)	.75						
11624	Resistor—22,000 ohms, carbon type, 1/4 watt—Package of 5 (R6)	1.00						
11620	Resistor—220 ohms, carbon type, 1/10 watt—Package of 5 (R1)	.75						
8070	Resistor—22,000 ohms, carbon type, 1/4 watt—Package of 5 (R6)	1.00						
11460	Resistor—27,000 ohms, carbon type, 1/4 watt—Package of 5 (R10)	1.00

maximum suppression (minimum indicated output) of the 460 kc. signal.

"Short Wave" Band

Connect the "Ant." output of the test oscillator to the receiver antenna terminal "A1" through a 100-ohm resistor, leaving the ground connections as before. Place the receiver range selector to its "Short wave" (C) position and set the dial pointer to 20,000 kc. Adjust test oscillator to 20,000 kc. Adjust the oscillator trimmer C14 to produce maximum (peak) output. Two positions of this trimmer may be found which produce maximum output. The position of minimum capacitance (plunger near out) should be used. Tighten lock nut. Adjust the antenna trimmer C7 to produce maximum (peak) output while slightly rocking the gang tuning condenser back and forth through the signal. Two positions may be found on this trimmer which produce maximum output. The position of maximum capacitance (plunger near in) should be used. Tighten lock nut. Check for image signal by changing the receiver dial setting to 19,080 kc. If the oscillator trimmer C14 has been correctly adjusted, the image signal will be received at this position. No adjustments should be made while checking for the image signal.

"Medium Wave" Band

Connections for test oscillator remain the same as for "Short Wave" (C) Band. Adjust the test oscillator to 6,000 kc. Place receiver range selector to "Medium Wave" (B) position and set receiver dial pointer to 6,000 kc. Then adjust the two trimmers C16 and C8 of the oscillator and antenna coils so that each produces maximum (peak) indicated receiver output. Tighten trimmer lock nuts.

"Standard Broadcast" Band

Change test oscillator connections by substituting 200 mmfd. condenser for the 300-ohm resistor. Adjust test oscillator and set receiver dial pointer to 1,500 kc. Place receiver range selector to "Standard Broadcast" (A) position.

Then adjust the two trimmers, C17 and C9, of the oscillator and antenna coils so that each produces maximum (peak) receiver output. Shift the test oscillator frequency to 600 kc. Tune the receiver to pick up this signal near 600 kc., disregarding the dial reading at which it is best received. Then adjust the oscillator magnetite core screw L11 simultaneously rocking the receiver tuning control backward and forward through the signal until maximum receiver output results from these combined operations. The adjustments at 1,500 kc. should then be repeated to correct for any change which may have been caused by the 600 kc. oscillator adjustment. Tighten lock nuts on C17 and C9.

Loudspeaker.—Centering of the loudspeaker voice coil is made in the usual manner with three narrow paper feelers after first removing the front paper dust cover. This may be removed by softening its cement with a very light application of acetone, using care not to allow the acetone to flow down into the air gap. The dust cover may be cemented back in place with ambroid upon completion of adjustment.

Alignment Procedure

The low-frequency oscillator tracking (600 kc.), wave-trap, and i-f transformer adjustments are made by means of six screws attached to molded magnetite cores. The remaining adjustments in the antenna and oscillator circuits are made with six plunger-type air-dielectric trimming capacitors and require the use of an RCA Stock No. 12636 Adjusting Tool. Before adjusting the plunger-type trimmers, they must be unlocked by loosening their hexagon lock nuts. The lock nuts should be tightened upon completion of adjustments. For location of these adjustments refer to figures 3 and 5.

A standard test oscillator, such as the RCA Stock No. 9955, will be required as a source of signal at the specified alignment frequencies. Means for indication of the receiver output during alignment; is also necessary to show when the correct point of adjustment is reached. The RCA Stock No. 4317 Neon Glow Indicator is designed for this purpose.

Attach the output indicator across the loudspeaker voice coil. Advance the receiver volume control to its maximum position, letting it remain in such position for all adjustments. For each adjusting operation, regulate the test-oscillator output control so that the signal level is as low as possible and still be observable at the receiver output. Use of such small signal will obviate broadness of tuning which would otherwise result from a v.c. action on a strong signal.

I-F Adjustments

Connect the "Ant." output of the test oscillator to the grid cap of the RCA-6L7 through a .001 mfd. capacitor. Connect the test oscillator "Gnd." terminal to the ground terminal of the receiver chassis. Place the receiver range selector in its "Standard Broadcast" (A) position and set receiver dial pointer to a position of no extraneous signals near 600 kc. Ground stator of local oscillator tuning condenser C23 to eliminate local oscillator signals. Adjust the test oscillator to 460 kc.

Adjust the two magnetite core screws L16 and L15 of the second i-f transformer to produce maximum (peak) indicated receiver output. Then adjust the two magnetite core screws L14 and L13 of the first i-f transformer for maximum (peak) receiver output as shown by the indicating device. It is advisable to repeat the adjustment of all i-f magnetite core screws to assure that the interaction between them has not disturbed the original adjustments. Remove temporary chassis ground from exciter stator C23.

R-F Adjustments

Calibrate the tuning dial by adjusting the scale pointer to the extreme low-frequency end calibration mark (530 kc.) on "Standard Broadcast" scale while the gang tuning condenser plates are in their full-mesh position. Alignment should be made in sequence of "Wave trap," "Short wave," "Medium wave," and "Standard Broadcast."

Wave-Trap Adjustment

Attach the "Ant." output of the test oscillator to the receiver antenna terminal "A1" through a 200-mmf. (impedance) capacitor. The ground connections remain connected together. Leave the test oscillator adjusted to 460 kc. and range selector in "Standard Broadcast" position as before. Then adjust the wave-trap screw L1 to the point which causes

Resistance Measurements

****Before making any resistance measurements, remove the four bias cells and connect jumpers on bias-cell board as shown. Also, remove the "C" battery and connect the two leads (-7½ v. and -3 v.) to chassis ground. After measurements are completed, remove jumpers from bias-cell board and then carefully insert bias cells. Next, insert "C" battery and restore leads to their respective positions.**

back and forth through the signal. Two peaks may be found with this circuit. The peak with maximum capacity (plunger near in) should be used. Tighten lock nut. Check the image frequency by changing the receiver dial setting to 19,060 kc. The test oscillator signal should be faintly received at this position indicating that the adjustment of C44 has been correctly made. No adjustments should be made while checking for this image signal.

"Medium Wave" Band

(k) Place receiver range selector to its "Medium wave" position with the receiver dial pointer set to 6,000 kc. Tune the test oscillator to 6,000 kc. Adjust the oscillator air trimmer C46 for maximum (peak) amplitude of output as shown by the waves on the oscillograph screen. Two peaks may be found. The peak obtained with minimum capacity (plunger near out) should be used. Tighten lock nut. Adjust antenna air trimmer C4 for maximum (peak) output. Tighten lock nut.

"Wave-Trap" Adjustment

(l) Connect the output of the test oscillator to the antenna terminal "A1" through a 200-mmf. (important) capacitor. Place receiver range selector in "Standard broadcast" position. Set the receiver dial to a position of no extraneous signals near 600 kc. Tune the test oscillator to 460 kc. Adjust the wave-trap magnetic core screw to the point which causes minimum amplitude of output (maximum suppression of signal) as shown by the waves on the oscillograph.

"Standard Broadcast" Band

(m) Reduce output of test oscillator to minimum. Set receiver dial pointer to 600 kc. Tune the test oscillator to 600 kc and increase its output until a deflection is noticeable on the oscillograph screen.

(n) Adjust oscillator magnetic core screw L20 (top of oscillator coil) so that maximum (peak) amplitude of output is shown on the oscillograph screen.

(o) Set receiver dial pointer to 1,500 kc. Tune test oscillator to 1,500 kc. Adjust the oscillator and antenna air trimmers C47 and C5 for maximum (peak) output.

(p) Set test oscillator to 600 kc and tune receiver to pick up this signal near 600 kc. Re-adjust the oscillator magnetic core screw L20 for maximum (peak) output while rocking the receiver gang tuning condenser back and forth through this signal.

(q) Repeat adjustments in (p) above to correct for any changes in the oscillator tuning caused by the adjustment of L20. Tighten lock nuts on C47 and C5 after each is adjusted.

Antenna and Ground Terminals

These receivers are equipped with an antenna-ground terminal board having three terminals. These terminals are marked "A," "A1," and "G," the latter being the ground terminal.

(e) Increase the frequency of the test oscillator by slowly turning its tuning control until two separate, distinct, and similar waves appear on the screen. If only one wave appears, increase the "Freq." control on the oscillograph to obtain two waves. These waves will be identical in shape, totally disconnected, and appear in reversed positions. They will have a common base line, which is discontinuous. Adjust the "Freq." and "Sync." controls of the oscillograph to make them remain motionless on the screen. Continue increasing the test oscillator frequency until these forward and reverse curves move together and overlap, with their highest points exactly coincident. This condition will be obtained at a test oscillator setting of approximately 375 kc.

(f) With the images established as in (e), re-adjust the two magnetic core screws on the third $\frac{1}{2}$ transformer so that they cause the curves on the oscillograph screen to become exactly coincident throughout their lengths and have maximum amplitude.

(g) Without altering the adjustments of the apparatus, shift the "Ant." output of the test oscillator along with the .05-mfd. capacitor to the grid cap of the RCA-1A4 first $\frac{1}{2}$ tube (with grid lead in place). Adjust the two second $\frac{1}{2}$ transformer magnetic core screws L10 and L9 so that they cause the forward and reverse curves to become coincident throughout their lengths and have maximum amplitude.

(h) Shift the "Ant." output of the test oscillator along with the .05-mfd. capacitor to the grid cap of the RCA-1A6 first detector tube. Adjust the two magnetic core screws L24 and L23 of the first $\frac{1}{2}$ transformer so that they cause the forward and reverse curves to become coincident and have maximum amplitude. The composite wave, obtained in this manner represents the resonance characteristic of the total $\frac{1}{2}$ system. Lack of symmetry or irregularity of the resultant image will indicate the presence of a defect in the $\frac{1}{2}$ system.

R-F Adjustments

Calibrate the pointer of the tuning dial by adjusting it to the extreme low-frequency end of dial scale (330 kc) with the plates of the gang tuning condenser in full mesh. Alignment must be made in the sequence of "Short wave" band, "Medium wave" band, "Wave-trap," and "Standard broadcast" band.

"Short Wave" Band

(i) Connect the "Ant." output of the test oscillator to the antenna terminal "A1" through a 300-ohm resistor. Remove the plug of the frequency-modulator cable from test-oscillator jack. Turn test-oscillator modulation switch to "On." Shift the oscillograph "Timing" switch to "Int.".

(j) Set receiver range selector to its "Short wave" position and dial pointer to 20,000 kc. Adjust the test oscillator to 20,000 kc. Adjust oscillator air trimmer C44 until maximum (peak) amplitude of output is reached. Two peaks may be found. The peak with minimum capacity (plunger near out) should be used. Tighten lock nut. Adjust antenna air trimmer C3 until maximum (peak) amplitude of output is reached while slightly rocking the gang tuning condenser.

This type of alignment is possible through use of apparatus such as the RCA Stock No. 9536 Frequency Modulator and the RCA Stock No. 9545 Cathode-Ray Oscillograph. If this equipment is not available, an approximate alignment may be performed by the output-indicator method with an instrument such as the RCA Stock No. 4317 Neon Glow Indicator attached across the loudspeaker voice coil. Alignment by this method is similar to the cathode-ray method outlined below except that the receiver volume control should be at maximum, and the test oscillator sweeping operations omitted. The $\frac{1}{2}$ adjustments should be made so that the test-oscillator frequency can be shifted 2 kc above and below the 460 kc alignment frequency with little change in output. The $\frac{1}{2}$ adjustments should be peaked.

Cathode-Ray Alignment

Make alignment apparatus connections shown on figure 4. Remove the plug of the frequency modulator cable from the test oscillator jack. Connect the receiver chassis to a good external ground. Connect oscillograph "Vertical" input terminals as indicated on figure 2. Set oscillograph power switch to "On" and adjust "Intensity" and "Focus" controls to give a clearly defined spot, or line, on the screen. Set oscillograph "Ampl. A" switch to "On." "Vertical gain" control full-clockwise. "Ampl. B" switch to "Timing" switch to "Int." Place the "Sync." control, "Freq." control, and "Horizontal gain" control about their mid-positions. For each of the following adjustments, the test oscillator output must be regulated so that the image obtained on the oscillograph screen will be of the minimum size for accurate observation. The receiver volume control setting is optional.

I-F Adjustments

(a) Connect the "Ant." output of the test oscillator to the grid cap of RCA-1A4 second $\frac{1}{2}$ tube (with grid lead in place) through a .05-mfd. capacitor, with "Onid." to receiver chassis. Tune the test oscillator to 460 kc, place its modulation switch to "On" and its output switch to "Hi."

(b) Turn on the receiver and test oscillator. Increase the output of the test oscillator until a deflection is noticeable on the oscillograph screen. The figures obtained represent several waves of the detected signal, the amplitude of which may be observed as an indication of output. Cause the wave image formed (400-cycle waves) to be spread completely across the screen by adjusting the "Horizontal gain" control. The image should be synchronized and made to remain motionless by adjusting the "Sync." and "Freq." controls.

(c) Adjust the two magnetic core screws L12 and L11 (see figures 5 and 7) of the third $\frac{1}{2}$ transformer (one on top and one on bottom) to produce maximum vertical deflection of the oscillographic image. This adjustment places the transformer in exact resonance with the 460-kc signal. The sweeping operation should follow using the frequency modulator. Shift the oscillograph "Timing" switch to "Ext." Insert plug of frequency-modulator cable in test-oscillator jack. Turn the test-oscillator modulation switch to "Off." Turn on the frequency modulator and place its sweep-range switch to "Hi."

The signal entering the antenna circuit is coupled to control grid No. 1 of the RCA-1A6 through a tuned r-f transformer. This transformer is tapped to provide correct inductance for the band being used, and at the same time selecting the proper winding which serves as the primary and shorts out the unused coils to prevent any interaction which might otherwise occur. The locally generated oscillator signal is fed to control grid No. 2 of the RCA-1A6 through capacitor C51. Separate windings are employed in the oscillator stage for each band. The unused portion of the oscillator coil are shorted out when not in use. The output of the first-detector stage is fed through a two-stage i-f amplifier, consisting of two RCA-1A4's and three i-f transformers, to the diode portion of the RCA-1F6. Such an i-f amplifier arrangement provides excellent selectivity and gain, while its design gives increased fidelity due to its flat-top characteristic. The audio frequency secured by the detection process develops a voltage across resistors R4 and R5. The voltage developed across R5 is applied as a v.c. bias to the first detector and i-f tubes. The arm of the volume control R3 selects a portion of the audio voltage, which is applied to the control grid of the RCA-1F6 for voltage amplification. The output of this stage is resistance-capacitance coupled to the RCA-30 driver tube. The output of the driver stage is transformer coupled to the chassis of this push-pull output stage using RCA-49's. The output of this push-pull stage is transformer coupled to the permanent magnet dynamic loudspeaker. A tertiary winding on the output transformer shunted by C37 provides sharp cutoff of the high audio frequencies. A continuously variable high-frequency tone control R21 in series with C75 provides manual high-frequency tone control.

Models 8BT6 and 8BK6 obtain their plate supply from a vibrator-type power unit. The vibrator together with the power transformer T3 combine the functions of generating alternating current and rectification. Filter chokes and capacitors are built into this unit to eliminate interference (noise) which would otherwise be introduced into the receiver circuits.

Caution: The four bias cells are used only for the purpose of supplying bias potential and should never be measured with an ordinary voltmeter or other device which draws any current. A simple check on these cells may be made by connecting a milliammeter in the plate circuit of either RCA-1A4 tube and noting the plate current reading. Then remove the two bias cells (3 and 4), being careful that the spring contact clips do not short-circuit them during removal. Connect a 4-volt battery between the + and - 4v. terminals of the bias cell board, and again note the plate current reading. If the first reading obtained (with bias cells) is more than 40% from the latter reading (with 4-volt battery), all bias cells should be replaced. This 40% difference is equivalent to a change of approximately 2.5% battery voltage.

Alignment Procedure

There are seven alignment adjustments provided in the antenna and oscillator coil tuned circuits. Six of these adjustments are plunger type air trimmers and require use of an RCA Stock No. 12636 Adjusting Tool. The i-f transformer adjustments are made by means of screws attached to shielded magnetic cores. The cathode-ray method of alignment is preferred due to the flat-top i-f characteristics of these receivers.

MODEL S 8T2, 8T11, 8K11
Circuit Data, Alignment
Transformer Wiring

RCA MFG. CO., INC.

"Medium Wave" Band

(e) Change the receiver range selector to its "Medium wave." (A) band position and set the receiver tuning control to a dial reading of 1,500 kc. Turn the test oscillator to 1,500 kc and regulate its output to produce a slight indication on the receiver output indicating device.

(f) Adjust the high-frequency trimmers of the oscillator, detector, and antenna coils, C20, C49 and C6 respectively, to the points at which each produces maximum indicated receiver output.

(g) Shift the test-oscillator frequency to 600 kc and tune the receiver to pick up this signal, disregarding the dial reading at which it is best received.

(h) Adjust the low-frequency trimmer C22 of the oscillator coil, simultaneously rocking the tuning control of the receiver backward and forward through the signal, until maximum indicated receiver output results from these combined operations. The adjustment of C19, C15 and C8 should be corrected at 15,000 kc as in (b), (c), and (d); also C20, C49 and C6 should be corrected at 1,500 kc, as in (f) to compensate for any changes caused by the adjustment of the low-frequency oscillator coil trimmer C22.

"Long Wave" Band

(i) Change receiver band selector to "Long wave" (X) band and set receiver tuning control to a dial reading of 300 kc. Tune test oscillator to 300 kc and adjust oscillator, detector, and antenna trimmers C30, C48 and C55, respectively, for maximum indicated receiver output.

(j) Set receiver to 175 kc and tune test oscillator to 175 kc. Adjust trimmer C31 for maximum indicated output, simultaneously rocking tuning control of the receiver backward and forward through the signal.

(k) The adjustment of C30, C48 and C55 should now be repeated at 300 kc as described in (i) to compensate for any changes caused by the adjustment of the low-frequency trimmer C31.

D. C. Resistance Values
110 volts, 50-60 cycles • 110 ohms, 25 cycles
Primary, 5.34 ohms

Secondary, 430 ohms

Figure 7—Standard Transformer

the output of the test oscillator until a slight indication is apparent on the output indicator. Adjust the two trimmers C28 and C27 of the second i-f transformer to produce maximum (peak) indicated receiver output. Then, adjust the two trimmers, C26 and C24, of the first i-f transformer for maximum (peak) receiver output as shown by the indicating device. During these adjustments, regulate the test oscillator output so that the receiver output indication is always as low as possible. By doing so, broadness of tuning, due to a v.c., action will be avoided. It is advisable to repeat the adjustment of all i-f trimmers a second time to assure that the inter-actment between them has not disturbed the original adjustment.

R-F Trimmer Adjustments

The eleven trimmers associated with the r.f. first detector, and oscillator tuned circuits have their locations shown by figures 3 and 5. The three trimmers which are at all times directly in shunt with the variable tuning condensers necessitate that the "Short wave" (C) band be aligned first. The range selector switch should, therefore, be turned to its "Short wave" position for the first adjustments. Leave the output indicator connected to the output system.

Calibrate the dial by rotating the tuning control until the variable condenser plates are in their full-mesh (maximum capacity) position and adjust the dial pointer so that its end points to the horizontal graduation (520 kc) at the low-frequency end of the "Medium wave" (A) dial scale.

Wave-Trap Adjustment

Connect the test oscillator to the antenna and ground terminals of the receiver, leaving it tuned to 460 kc. Adjust the wave-trap trimmer C45 for maximum suppression of the 460 kc signal. An increase in test-oscillator output may be necessary before the point of minimum output (maximum suppression of signal) is obtained.

"Short Wave" Band

(a) Adjust the test oscillator to 15,000 kc and set the receiver tuning control to a dial reading of 15,000 kc.

(b) Adjust trimmer C19 on the oscillator section of the variable condenser to the point at which it produces maximum indicated receiver output. Two points may be found, each of which produces such a maximum. The one of maximum trimmer capacitance is correct and should be used. The local (heterodyne) oscillator will be 460 kc below the signal frequency at this adjustment point.

(c) Adjust trimmer C15 of the detector section of the variable condenser, simultaneously rocking the receiver tuning control backward and forward through the 15,000 kc input signal, until maximum receiver output results from these combined operations.

(d) With the receiver tuning control set to 15,000 kc adjust trimmer C8 on the antenna section of the variable condenser to the point which produces maximum (peak) indicated receiver output.

accurately tuned to the incoming signal. This tube consists of an amplifier section and a cathode-ray section built in the same glass envelope. Correct tuning of the receiver to the incoming carrier is evidenced by the minimum width of the dark sector of the tuning tube.

Rectifier

The power required for operation of this receiver is supplied through transformer T1. This transformer has an efficient electrostatic shield between its primary and secondary windings. This shield prevents interference which is on the power-supply circuit from entering the receiver and conversely reduces the tendency of the receiver to re-radiate into the power circuit. An RCA-5Z4 furnishes the d.c. voltages necessary for plate, screen, cathode, and grid potentials. The field winding of the loudspeaker is used as a reactor in the filter circuit from which it simultaneously receives its magnetizing current.

Alignment Procedure

Precise alignment is vital to the proper functioning of this receiver. There are four trimming adjustments provided in the i-f system, five in the oscillator coil system, three in the detector coil system, and three in the antenna coil system. Each of these trimmers has been accurately adjusted during manufacture and should remain properly aligned unless affected by abnormal conditions of climate or have been altered for service purposes. Incorrect alignment is usually evidenced by a loss of sensitivity, improper tone quality, and poor selectivity. These indications will generally be present together.

The correct performance of these receivers can only be obtained when the alignment is performed with adequate and reliable test apparatus and in the sequence given. The manufacturer of these instruments has a complete assortment of such service equipment available for sale through its dealers and distributors.

A test oscillator (signal generator) is required as a source of the specified alignment frequencies. Visual indication of the receiver output during the adjustments is necessary to enable the serviceman to obtain an accuracy of alignment which is not possible by listening to the signal. The RCA Stock No. 9395 Full-Range Test Oscillator and the RCA Stock No. 4317 Neon Output Indicator are especially suitable and fulfill the above requirements.

The following procedure should be adhered to in adjusting the various trimmer capacitors.

I-F Trimmer Adjustments

The four trimmers of the two i-f transformers are located as shown by figure 6. Each must be aligned to a basic frequency of 460 kc. To do this, attach the output indicator across the voice-coil circuit. Attach the receiver chassis to a good external ground. Connect the output of the test oscillator between the control-grid of the RCA-6A8 first-detector tube and chassis-ground through a .001 mfd. capacitor. Tune the test oscillator to 460 kc. Advance the receiver volume control to its full-on position and adjust the receiver tuning control to a point where no interference is encountered from broadcast stations, or short stator of oscillator tuning capacitor C18 to chassis eliminating local oscillator signals. Increase

The conventional Superheterodyne type of circuit, consisting of an r-f stage, a combined first-detector-oscillator stage, a single i-f stage, a diode-detector-automatic-volume-control stage, an audio voltage-amplifier stage, an audio power-output stage, and a high-voltage rectifier power-supply stage is used.

Tuned Circuit

The antenna coil system and the detector coil system each consist of two series-connected primary and three series-connected secondary windings to provide three ranges of tuning. The oscillator coil system is wound on a single form. A range selector switch (S1) is used for connecting the various sections of these three coil systems into the circuit to provide operation on the band desired. The coils are tuned by a variable three-section gang condenser having trimmer capacitors in shunt with each section. There are additional trimmer capacitors across the section of each coil used for the "Medium wave" (A) band as well as the "Long wave" (X) band. A series trimmer is also associated with the "Medium wave" (A) and "Long wave" (X) band oscillator coils.

The intermediate-frequency amplifier system consists of an RCA-6K7 in a transformer-coupled circuit. This stage operates at a basic frequency of 460 kc. Each winding of both i-f transformers (input and output) is tuned by an adjustable trimmer.

Detector and A.V.C.

The modulated signal as obtained from the output of the i-f stage is detected by an RCA-6H6 twin-diode tube (No. 1 di de). The audio frequency secured by this process is transferred to the a-f system for amplification and final reproduction. The d.c. voltage which results from detection of the signal is used for automatic volume control. This voltage, which develops across resistor R8, is applied as automatic control-grid bias to the r-f, first-detector, and i-f tubes through a suitable resistance filter circuit. The No. 2 diode of the RCA-6H6 is used to supply residual bias for the controlled tubes under conditions of little or no signal. This diode, under such conditions, draws current which flows through resistors R10 and R8, thereby maintaining the desired minimum operating bias on such tubes. On application of signal energy above a certain level, however, the auxiliary bias-diode ceases to draw current and the a.v.c. diode takes over the biasing function.

Audio System

The manual volume control consists of an acoustically tapered potentiometer in the audio circuit between the output of the detector diode and the input grid of the audio-voltage-amplifier tube. This control has a tone compensating filter connected to it so that the correct aural balance will be obtained at different volume settings.

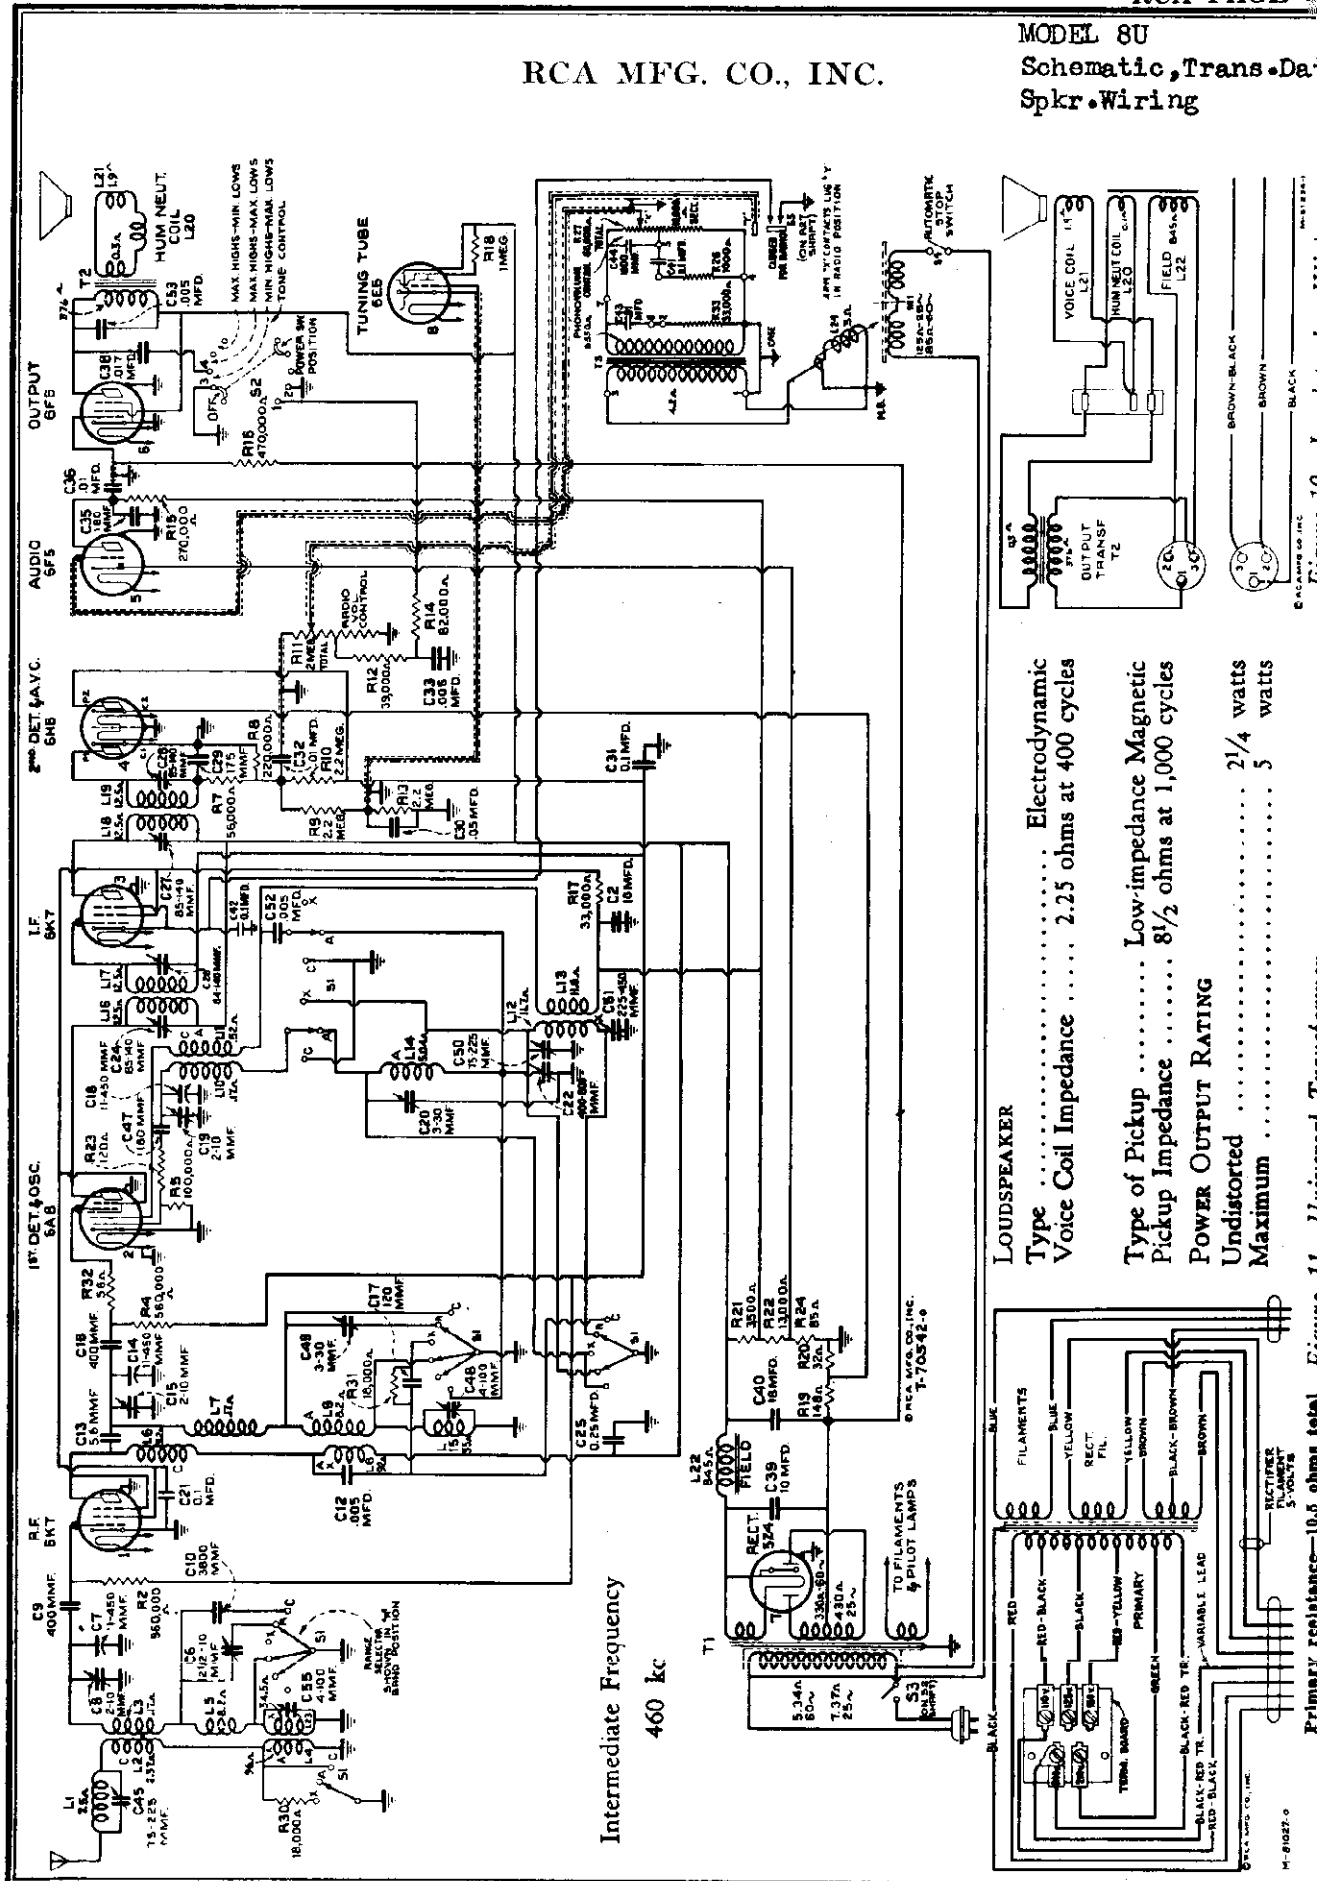

Resistance-capacitance coupling is used between the first-audio stage and the power-output stage. The output of the power amplifier is transformer-coupled into the dynamic loudspeaker. High-frequency tone control is effected by a capacitor across the plate circuit of the output tube. Speech-music control is effected by a resistor connected to the compensated volume control circuit. Control of tone is obtained by means of the switch (S').

"Magic Eye"

An RCA-6E5 cathode-ray tuning tube is used as a means of visually indicating when the receiver is

which are at all times directly in shunt with the variable tuning condensers necessitate that the "Short wave" (C) band be aligned first. The range selector switch should, therefore, be turned to its "Short wave" position for the first adjustments. Leave the output indicator connected to the output system.

Calibrate the dial by rotating the tuning control until the variable condenser plates are in their full mesh (maximum capacity) position and adjust the dial pointer so that its end points to the horizontal graduation (520 kc) at the low-frequency end of the "Medium wave" (A) dial scale.

"Wave-Trap" Adjustment

Connect the test oscillator to the antenna and ground terminals of the receiver, leaving it tuned to 460 kc. Adjust the wave-trap trimmer C45 for maximum suppression of the 460 kc signal. An increase in test-oscillator output may be necessary before the point of minimum output (maximum suppression of signal) is obtained.

"Short Wave" Band

- (a) Adjust the test oscillator to 15,000 kc and set the receiver tuning control to a dial reading of 15,000 kc.
- (b) Adjust trimmer C19 on the oscillator section of the variable condenser to the point at which it produces maximum indicated receiver output. Two points may be found, each of which produces such a maximum. The one of maximum trimmer capacitance is correct and should be used. The local (heterodyne) oscillator will be 460 kc below the signal frequency at this adjustment point.
- (c) Adjust trimmer C15 of the detector section of the variable condenser, simultaneously rocking the receiver tuning control backward and forward through the 15,000 kc input signal, until maximum receiver output results from these combined operations.
- (d) With the receiver tuning control set to 15,000 kc adjust trimmer C8 on the antenna section of the variable condenser to the point which produces maximum (peak) indicated receiver output.

"Medium Wave" Band

- (e) Change the receiver range selector to its "Medium wave" (A) band position and set the receiver tuning control to a dial reading of 1,500 kc. Tune the test oscillator to 1,500 kc and regulate its output to produce a slight indication on the receiver output indicating device.
- (f) Adjust the high-frequency trimmers of the oscillator, detector, and antenna coils, C20, C49, and C5 respectively, to the points at which each produces maximum indicated receiver output.
- (g) Shift the test-oscillator frequency to 600 kc and tune the receiver to pick up this signal, disregarding the dial reading at which it is best received.
- (h) Adjust the low-frequency trimmer C22 of the oscillator coil, simultaneously rocking the tuning control of the receiver backward and forward through the signal, until maximum indicated receiver output results from these combined operations. The adjustment of C19,

quence given. The manufacturer of this instrument has a complete assortment of such service equipment available for sale through its dealers and distributors. Two methods of alignment are applicable. One method requires the cathode-ray oscilloscope, while the other requires a voltmeter or glow-type indicator. The oscilloscope method is advantageous in that the indication is in the form of a wave-image which represents the resonance characteristic of the tuned circuits. Alignment by this method should be performed with equipment such as an RCA Stock No. 9545 Cathode-Ray Oscilloscope and an RCA Stock No. 9558 Frequency Modulator. For the output indicator method an instrument such as an RCA Stock No. 4317 should be used. Either of the above methods requires a reliable test oscillator for the source of alignment frequencies such as the RCA Stock No. 9595 Test Oscillator. Cathode-ray alignment is similar to the output indicator alignment outlined below, except as follows: The frequency modulator should be used to sweep the test oscillator signal when aligning the i-f amplifier and the low-frequency oscillator series trimmers. It will only be necessary to first adjust the trimmers to peak response, as outlined below, without the frequency modulator connected. Then, interconnect the test oscillator with the frequency modulator and re-tune the test oscillator (increase frequency) until the forward and reverse curves coincide at their highest points. Next, adjust the trimmers until the curves coincide through-out their length and have maximum amplitude. The proper place for connection of the oscilloscope input to the receiver is indicated on the Chassis Wiring Diagram (figure 3). The high-frequency trimmer on all three bands should be adjusted for maximum (peak) amplitude of the image.

I-F Trimmer Adjustments

The four trimmers of the two i-f transformers are located as shown by figure 5. Each must be aligned to the basic frequency of 460 kc. To do this, attach the output indicator across the voice-coil circuit. Attach the receiver chassis to a good external ground. Connect the output of the test oscillator between the control-grid of the RCA-6A8 first-detector tube and chassis-ground through a .001 mfd. capacitor. Tune the test oscillator to 460 kc. Advance the receiver volume control to its full-on position and adjust the receiver tuning control to a point where no interference is encountered from broadcast stations or short station of oscillator tuning capacitor C18 to chassis eliminating local oscillator signals. Increase the output of the test oscillator until a slight indication is apparent on the output indicator. Adjust the two trimmers, C28 and C27 of the second i-f transformer to produce maximum (peak) indicated receiver output. Then, adjust the two trimmers, C25 and C24, of the first i-f transformer for maximum (peak) receiver output as shown by the indicating device. During these adjustments, regulate the test-oscillator output so that the receiver output indication is always as low as possible. By doing so, broadcast tuning, due to a.v.c., action will be avoided. It is advisable to repeat the adjustment of all i-f trimmers a second time to assure that the inter-connection between them has not disturbed the original adjustment.

R-F Trimmer Adjustments

The eleven trimmers associated with the r-f, first detector, and oscillator tuned circuits, have their locations shown by figures 1 and 5. The three trimmers

they are applied to the grid of the RCA-6E5 audio amplifier stage through the compensated phonograph volume control R27. This phonograph volume control also incorporates switches for transferring from mono to record reproduction. In the radio position, arm "X" of the phonograph volume control contacts radio volume control R11 to the grid of the RCA-6E5 audio amplifier; also, switch S5 closes which completes the cathode circuit of the RCA-6K7 i-f amplifier stage. In the phonograph position, switch S5 opens and arm "X" of the phonograph volume control disconnects from lug "1" and moves onto the phonograph volume control resistance as shown by figure 2.

"Magic Eye"

An RCA-6E5 cathode-ray tuning tube is used as a means of visually indicating when the receiver is accurately tuned to the incoming signal. This tube consists of an amplifier section and a cathode-ray section built in the same glass envelope. Correct tuning of the receiver to the incoming carrier is evidenced by the minimum width of the dark sector of the tuning tube.

Rectifier

The power required for operation of this receiver is supplied through transformer T1. This transformer has an efficient electrostatic shield between its primary and secondary windings. This shield prevents interference which is on the power-supply circuit from entering the receiver and conversely reduces the tendency of the receiver to re-radiate into the power circuit. An RCA-5Z4 furnishes the d-c voltages necessary for plate, screen, cathode, and grid potentials. The field winding of the loudspeaker is used as a reactor in the filter circuit from which it simultaneously receives its magnetizing current.

Phonograph Mechanism

An improved manually-operated phonograph mechanism is used in this model. The 12-inch turntable will accommodate either the 10-inch or the 12-inch phonograph records. The turntable rotates at a speed of 78 r.p.m. A speed regulator is provided for accurate adjustment of this speed. It is important that a machine of any particular rating be operated at the frequency and voltage for which it is rated. Attempts to operate at ratings other than specified for the particular instrument may result in damage to both the phonograph motor and the radio receiver. An automatic switch is provided to turn "off" the phonograph motor at the completion of record play when the eccentric-type inside groove record is used.

Alignment Procedure

Precise alignment is vital to the proper functioning of this receiver. There are four trimming adjustments provided in the i-f system, five in the oscillator coil system, three in the detector coil system, and three in the antenna coil system. Each of these trimmers has been accurately adjusted during manufacture and should remain properly aligned unless affected by abnormal conditions of climate or have been altered for service purposes. Incorrect alignment is usually evidenced by loss of sensitivity, improper tone quality, and poor selectivity. These indications will generally be present together.

The correct performance of this receiver can only be obtained when the alignment is performed with adequate and reliable test apparatus and in the se-

The conventional superheterodyne type of circuit consisting of an r-f stage, a combined first-detector-oscillator stage, a single i-f stage, a diode-detector-amplifier-volume-control stage, an audio voltage-reducer stage, an audio power-output stage, and a tuning indicator "Magic Eye" stage, is used.

Tuned Circuits

The antenna coil system and the detector coil system each consist of two series-connected primary and three series-connected secondary windings to provide the three ranges of tuning. The oscillator coil system is wound on a single form. A range selector switch (S1) is used for connecting the various sections of these three coil systems into the circuit to provide operation on the band desired. The coils are tuned by a variable three-section gang condenser having trimmer capacitors in shunt with each section. There are additional trimmer capacitors across the section of each coil used for the "Medium wave" (A) band as well as the "Long wave" (X) band. A series trimmer is also associated with the "Medium wave" (A) and "Long wave" (X) band oscillator coils.

The intermediate-frequency amplifier system consists of an RCA-6K7 in a transformer-coupled circuit. This stage operates at a basic frequency of 460 kc. Each winding of both i-f transformers (input and output) is tuned by an adjustable trimmer.

Detector and A.V.C.

The modulated signal as obtained from the output of the i-f stage is detected by an RCA-6H6 twin-diode tube (No. 1 diode). The audio frequency secured by this process is transferred to the a-f system for amplification and final reproduction. The d-c voltage which results from detection of the signal is used for automatic volume control. This voltage, which develops across resistor R8, is applied as automatic control bias to the r-f, first-detector, and i-f tubes through a suitable resistance filter circuit. The No. 2 diode of the RCA-6H6 is used to supply residual bias for the controlled tubes under conditions of little or no signal. This diode, under such conditions, draws current which flows through resistors R10 and R8, thereby maintaining the desired minimum operating bias on such tubes. On application of signal energy above a certain level, however, the auxiliary bias-diode ceases to draw current and the a.v.c. diode takes over the biasing function.

Audio System

The manual volume control consists of an acoustically tapered potentiometer in the audio circuit between the output of the detector diode and the input grid of the audio-voltage-amplifier tube. This control has a tone compensating filter connected to it so that the correct aural balance will be obtained at different volume settings.

Resistance-capacitance coupling is used between the first-audio stage and the power-output stage. The output of the power amplifier is transformer-coupled into the dynamic loudspeaker. High-frequency tone control is effected by a capacitor across the plate circuit of the output tube. Speech-music control is effected by a resistor connected to the compensated volume control circuit. Control of tone is obtained by means of the switch (S2).

Phonograph Circuit

The electrical impulses generated in the pickup L24 are boosted in the step-up transformer T3, after which

PRICES SUBJECT TO CHANGE WITHOUT NOTICE

the pickup has received normal care because the magnet and pole pieces are one unit and the magnetic circuit remains practically closed at all times. When the pickup has been mishandled, subjected to a strong a.c. field, jolted, or dropped, there may be an appreciable loss of magnetic strength, in which case it will be necessary to re-magnetize the entire structure. To do this, it will be necessary to first remove the pickup mechanism from the tone arm, and then remove the magnet assembly. Place the magnet assembly on the poles of a standard pickup magnetizer such as the RCA Stock No. 9549 Pickup Magnetizer and charge the magnet in accordance with the instructions accompanying the magnetizer. It is preferable to check the polarity of the pickup magnet and to re-magnetize it so that the same polarity is maintained.

Loudspeaker

Centering of the loudspeaker voice coil is made in the usual manner with three narrow paper feelers after first removing the front paper dust cover. This may be removed by softening its cement with a very light application of acetone, using care not to allow the acetone to flow down into the air gap. The dust cover should be cemented back in place with ambroid upon completion of adjustment.

Universal Transformer

The transformer used on some models of this receiver is adaptable to several ranges of voltages as given under Rating C of Electrical Specifications. Its schematic and wiring are shown by figure 11. Terminals are provided at the top of the transformer case for changing the primary connections to suit the voltage being used. Note that a 110-volt tap is brought out separately for supplying a phonograph motor.

the centering spring-clamp by means of the screw C, allowing the centering spring to remain in the position at which the armature is exactly centered between the pole pieces. With a little practice, the correct adjustment of the armature may be readily obtained. The air gap between the pole pieces and the armature should be kept free from dust, filings, and other such foreign materials which would obstruct the movement of the pickup armature.

Damping Block

The viscoloid block which is attached to the back end of the armature shank serves as a mechanical filter to eliminate undesirable resonances and to cause the frequency response to be uniform. Should it be necessary to replace this damping block, it may be done by removing screw D and the cover support bracket from the mechanism and taking off the old viscoloid block. The surface of the armature which is in contact with the viscoloid should be thoroughly

Figure 9—Special Soldering-Iron Tip

cleaned with fine emery cloth. Then insert the new block so that it occupies the same position as it did originally. Make certain that the block is in correct vertical alignment with the armature. The hole in the new viscoloid block is somewhat smaller than the diameter of the armature in order to permit a snug fit. With the viscoloid aligned on the armature, screw D and the cover support bracket should then be replaced. Heat should be applied to the armature (viscoloid side) so that the viscoloid block will fuse at the point of contact and become rigidly attached to the armature. A special-tip soldering iron constructed as shown in figure 9 will be found very useful in performing this operation. The iron should be applied only long enough to slightly melt the block and cause a small bulge on both sides.

Replacing Coil

Whenever there is defective operation due to an open or shorted pickup coil, this coil should be replaced. The method of replacement will be obvious upon inspection of the pickup assembly and by study of the cut-away illustrations. Make sure that the new coil is properly centered with the hole in the support strip and glued securely in that position. It is important to re-adjust the armature as previously explained after re-assembly of the mechanism. Only rosin core solder should be used for soldering the coil leads in the pickup. This same type of solder should be used when necessary for soldering the centering spring to the armature.

Magnetizing

Loss of magnetization will not usually occur when

C13, and C8 should be corrected at 15,000 kc as in (b), (c), and (d); also C20, C49, and C6 should be corrected at 1,500 kc as in (f) to compensate for any changes caused by the adjustment of the low-frequency oscillator coil trimmer C22.

Long Wave Band

- (e) Change receiver hand selector to "Long wave" (X) band and set receiver tuning control to a dial reading of 300 kc. Tune test oscillator to 300 kc and adjust oscillator, detector, and antenna trimmers C50, C48, and C55, respectively, for maximum indicated receiver output.
- (f) Set receiver to 175 kc and tune test oscillator to 175 kc. Adjust trimmer C51 for maximum indicated output, simultaneously rocking tuning control of the receiver backward and forward through the signal.
- (g) The adjustments of C50, C48, and C55 should now be repeated at 300 kc as described in (f) to compensate for any changes caused by the adjustment of the low-frequency trimmer C51.

Phonograph Mechanism

The phonograph motor is of the governor induction type and designed to be simple and foolproof. Under normal operating conditions, service difficulties should be negligible. Occasionally, however, certain adjustments may be required. These adjustments are illustrated and explained in figure 8. Application of oil to the felt pad which rubs against the governor disc will insure smooth operation.

Magnetic Pickup

The pickup used in the phonograph unit is of an improved design. The horseshoe magnet is rigidly welded to the pole pieces and is irremovable. There is a centering spring attached to the armature to maintain proper adjustment and to provide a limiting effect on the movement of the armature. The frequency response is substantially uniform over a wide range. Service operations which may be necessary on the pickup are as follows:

Centering Armature

Refer to figure 7 showing the pickup inner structure. The armature is shown in its proper relation to the magnet pole pieces, i. e., exactly centered. Whenever this centering adjustment has been disturbed, the screws A, B, and C should be loosened and the armature clamp adjusted to the point where the vertical axis of the armature is at right angles to the horizontal axis of the pole pieces, and centered between them. This centering operation may be facilitated by inserting a small rod or nail into the armature needle hole, using it as a lever to test the angular movement of the armature. The limitations of the movement in each direction will be caused by the armature striking when there is equal angular displacement of the armature and adjustment rod or nail to each side of the vertical axis of the magnet and coil assembly. The screws A and B should then be secured, observing care not to disturb the adjustment of the armature clamp. Then place the pickup in a vise and secure

 SN 1573-1

RCA MFG. CO., INC.

Table with columns: Stock No., DESCRIPTION, List Price. Contains parts like capacitors, resistors, coils, and connectors.

Adjust the high-frequency trimmers of the oscillator, detector, and antenna coils, C26, C49, and C5 respectively, to the points at which each produces maximum indicated receiver output.

- (f) Adjust the low-frequency trimmer C22 of the oscillator coil, simultaneously rocking the tuning control of the receiver backward and forward through the signal, until maximum indicated receiver output results from these combined operations. The adjustment of C19, C15, and C8 should be corrected at 15,000 kc as in (b), (c), and (d); also C20, C49, and C6 should be corrected at 1,500 kc, as in (i) to compensate for any changes caused by the adjustment of the low-frequency oscillator coil trimmer C22.

Long Wave Band

- (i) Set receiver to 175 kc and tune test oscillator to 175 kc. Adjust trimmer C51 for maximum indicated output, simultaneously rocking tuning control of the receiver backward and forward through the signal. The adjustment of C50, C48, and C55 should now be repeated at 300 kc, as described in (i) to compensate for any changes caused by the adjustment of the low-frequency trimmer C21.

two trimmers, C26 and C27 of the second i-f transformer to produce maximum (peak) indicated receiver output. Then, adjust the two trimmers, C26 and C24, of the first i-f transformer for maximum (peak) receiver output as shown by the indicating device. During these adjustments, regulate the test-oscillator output so that the receiver output indication is always as low as possible. By doing so, broadness of tuning, due to a.v.c. action will be avoided. It is advisable to repeat the adjustment of all i-f trimmers a second time to assure that the interaction between them has not disturbed the original adjustment.

R-F Trimmer Adjustments

The eleven trimmers associated with the r-f, first detector, and oscillator tuned circuits have their locations shown by figures 1 and 3. The three trimmers which are at all times directly in alignment with the variable tuning condensers necessitate that the "Short wave" (C) band be aligned first. The range selector switch should, therefore, be turned to its "Short wave" position for the first adjustments. Leave the output indicator connected to the output system. Calibrate the dial by rotating the tuning control until the variable condenser plates are in their full-mesh (maximum capacity) position and adjust the dial pointer so that its end points to the horizontal graduation (520 kc) at the low-frequency end of the "Medium wave" (A) dial scale.

Wave-Trap Adjustment

Connect the test oscillator to the antenna and ground terminals of the receiver, leaving it tuned to 460 kc. Adjust the wave-trap trimmer C45 for maximum suppression of the 460 kc signal. An increase in test-oscillator output may be necessary before the point of minimum output (maximum suppression of signal) is obtained.

"Short Wave" Band

- (a) Adjust the test-oscillator to 15,000 kc, and set the receiver tuning control to a dial reading of 15,000 kc.
(b) Adjust trimmer C19 on the oscillator section of the variable condenser to the point at which it produces maximum indicated receiver output. Two points may be found, each of which produces such a maximum. The one of maximum trimmer capacitance is correct and should be used. The local (heterodyne) oscillator will be 460 kc below the signal frequency at this adjustment point.
(c) Adjust trimmer C15 of the detector section of the variable condenser, simultaneously rocking the receiver tuning control backward and forward through the 15,000 kc input signal until maximum receiver output results from these combined operations.
(d) With the receiver tuning control set to 15,000 kc adjust trimmer C8 on the antenna section of the variable condenser to the point which produces maximum (peak) indicated receiver output.

"Medium Wave" Band

- (e) Change the receiver range selector to its "Medium wave" (A) band position and set the receiver tuning control to a dial reading of 1,500 kc. Tune the test oscillator to 1,500 kc and regulate its output to produce a slight indication on the receiver output indicator.

Alignment Procedure

Precise alignment is vital to the proper functioning of this receiver. There are four trimming adjustments provided in the i-f system, five in the oscillator coil system, three in the detector coil system, and three in the antenna coil system. Each of these trimmers has been accurately adjusted during manufacture and should remain properly aligned unless affected by abnormal conditions of climate or have been altered for service purposes. Incorrect alignment is usually evidenced by loss of sensitivity, improper tone quality, and poor selectivity. These indications will generally be present together. The correct performance of this receiver can only be obtained when the alignment is performed with adequate and reliable test apparatus and in the sequence given. The manufacturer of this instrument has a complete assortment of such service equipment available for sale through its dealers and distributors. Two methods of alignment are applicable. One method requires the cathode-ray oscillograph, while the other requires a voltmeter or glow-type indicator. The oscillographic method is advantageous in that the indication is in the form of a wave-image which represents the resonance characteristic of the tuned circuits. Alignment by this method should be performed with equipment such as an RCA Stock No. 9545 Cathode-Ray Oscillograph and an RCA Stock No. 9558 Frequency Modulator. For the output indicator method an instrument such as an RCA Stock No. 4317 should be used. Either of the above methods requires a reliable test oscillator for the source of alignment frequencies such as the RCA Stock No. 9595 Test Oscillator. Cathode-ray alignment is similar to the output indicator alignment outlined below, except as follows: The frequency modulator should be used to sweep the test oscillator signal when aligning the i-f amplifier and the low-frequency oscillator series trimmers. It will only be necessary to first adjust the trimmers to peak response, as outlined below, without the frequency modulator connected. Then, interconnect the test oscillator with the frequency modulator and re-tune the test oscillator (increase frequency) until the forward and reverse curves coincide at their highest points. Next, adjust the trimmers until the curves coincide through-out their length and have maximum amplitude. The proper place for connection of the oscillograph input to the receiver is indicated on the Chassis Wiring Diagram (figure 3). The high-frequency trimmers on all three bands should be adjusted for maximum (peak) amplitude of the images.

I-F Trimmer Adjustments

The four trimmers of the two i-f transformers are located as shown by figure 5. Each must be aligned to a basic frequency of 460 kc. To do this, attach the output indicator across the voice-coil circuit. Connect the test oscillator to the antenna section of the control grid of the RCA-6A8 first-detector tube and chassis ground through a .001 mfd. capacitor. Tune the test oscillator to 460 kc. Advance the receiver volume control to its full-on position and adjust the receiver tuning control to a point where no interference is encountered from broadcast stations, or short station of oscillator tuning capacitor C18 to chassis eliminating local oscillator signals. Increase the output of the test oscillator until a slight indication is apparent on the output indicator. Adjust the

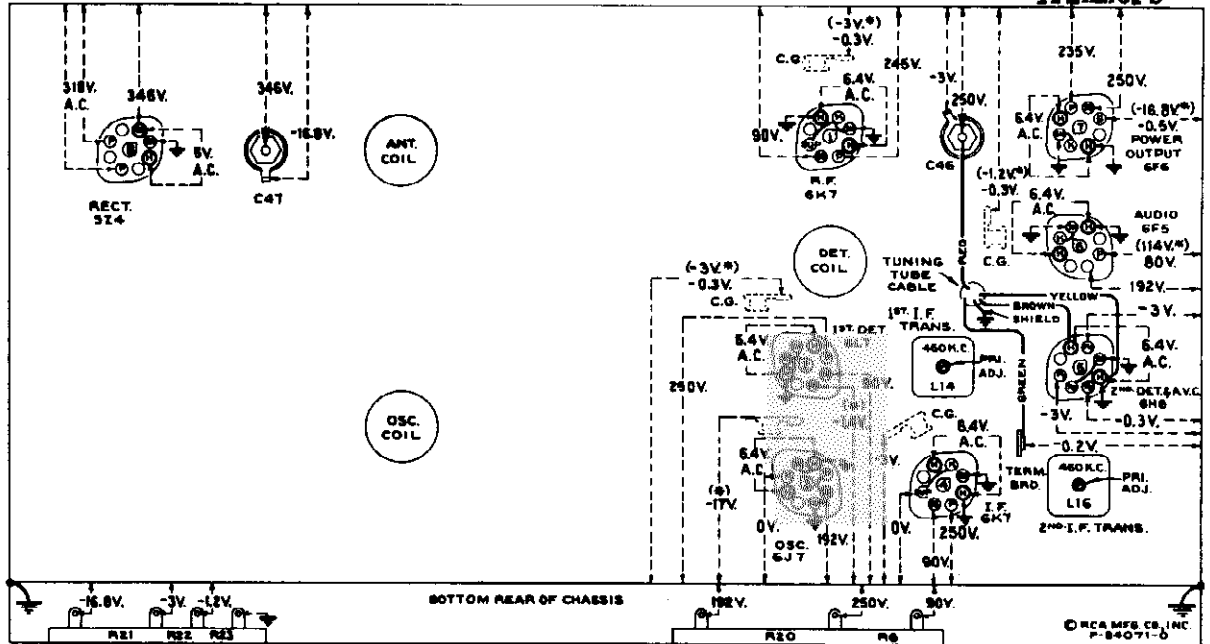

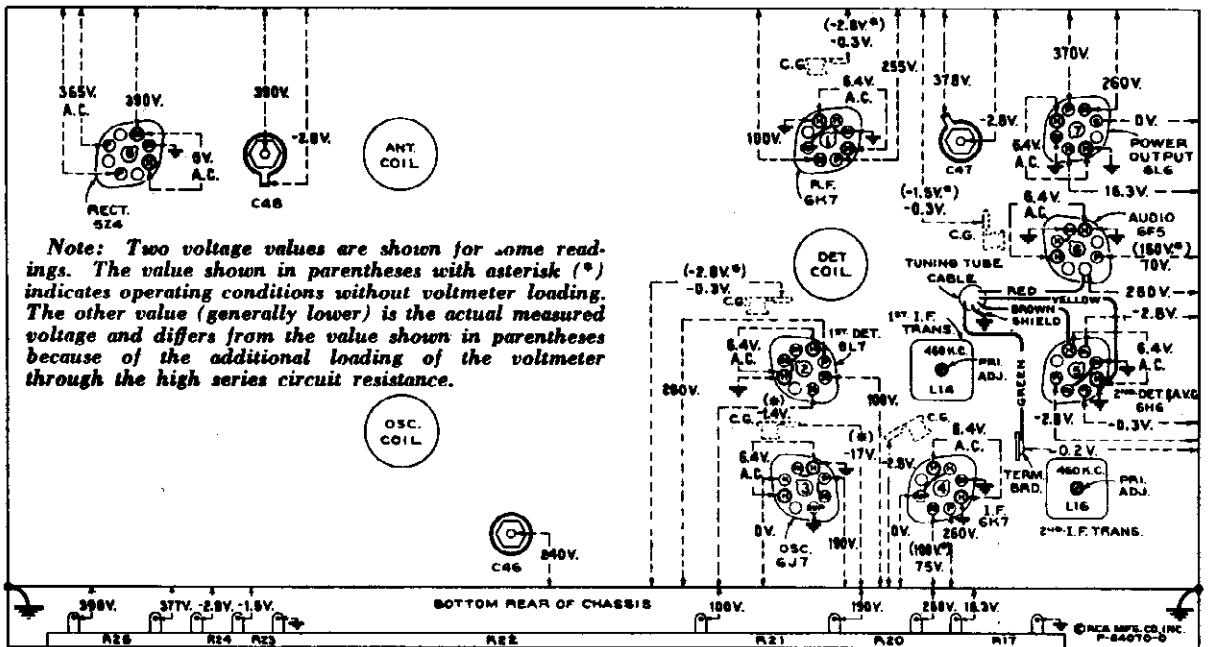

Figure 6—Radiotron Socket Voltages and I-F Trimmer Locations (Model 9K1)

Note: Two voltage values are shown for some readings. The value shown in parentheses with asterisk (*) indicates operating conditions without voltmeter loading. The other value (generally lower) is the actual measured voltage and differs from the value shown in parentheses because of the additional loading of the voltmeter through the high series circuit resistance.

MODELS 9K1, 9K3
Alignment, Trimmers

RCA MFG. CO., INC.

Alignment Procedure

Calibrate the tuning dial by adjusting dial pointer to the low-frequency (end) calibration mark on "Standard broadcast" scale with the gang tuning-condenser plates in full-mesh position. This is a friction adjustment.

Perform alignment in proper order, tabulated below, starting with No. 1 and following all operations across, then No. 2, etc. Adjustment locations are shown on Figures 5, 6, 7, and 9.

Cathode-ray alignment is preferable; the connections to the chassis are shown in Figures 2 and 4. If an output indicator is used, connect it across the loudspeaker voice-coil and advance the receiver volume control to full-volume position.

Connect the "low" output terminal of the test oscillator to the receiver chassis for all alignment operations. Regulate the output of the test oscillator so that minimum signal is applied to the receiver to obtain an observable output indication. This will avoid a-v-c action.

The term "Dummy antenna" means the device which must be connected between the "high" test-oscillator output and the point of connection to the receiver in order to obtain ideal alignment. "No signal, 550-750 kc" means that the receiver should be tuned to a point between 550 and 750 kc where no signal or interference is received from a station or local (heterodyne) oscillator.

For further details on alignment, refer to booklet "RCA Victor Receiver Alignment."

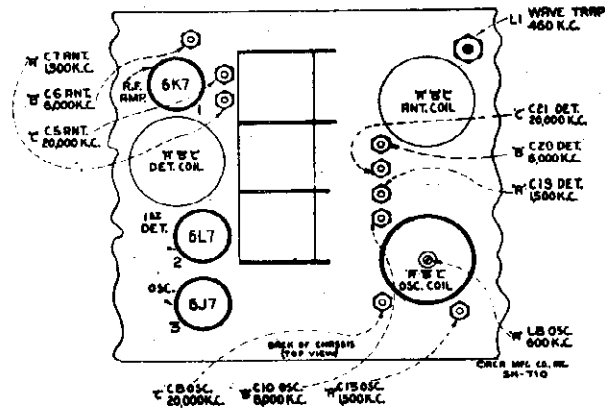

Figure 5—R-F Trimmer Locations

Note.—The locations of C20 and C21 are interchanged on some chassis of Model 9K1.

Order of Alignment	Test Oscillator			Receiver Dial Setting	Circuit to Adjust	Adjustment Symbols	Adjust to Obtain

15	"A1" Ant. Term.	200 Mmfd.	1,500 kc	1,500 kc	"A" Ant.	C7	Max. (peak)

* Use minimum capacity peak if two peaks can be obtained.

† Use maximum capacity peak if two peaks can be obtained.

‡ After this adjustment, check for image signal by shifting receiver dial to 19,080 kc.

RCA MFG. CO., INC.

General Description

These receivers each employ a nine-tube, three-band superheterodyne circuit. Model 9K1 uses an RCA-6F6 power-output tube, delivering a maximum output of 4.5 watts, while Model 9K3 uses an RCA-6L6 beam-power-output tube, delivering a maximum output of 12.5 watts. The tuning range for each model is continuous from 530 to 23,000 kc, which includes the standard broadcast band and the important short-wave bands at 49, 31, 25, 19, 16, and 13 meters, along with channels assigned for police, aviation, and amateur communication.

Features of design include an r-f amplifier stage; magnetite-core adjusted i-f transformers, wave-trap, and low-frequency oscillator tracking; full automatic volume control; phonograph terminal board; "Magic Eye" tuning tube; 12-inch electrodynamic loudspeaker; new plunger-type, air-dielectric trimming capacitors; aural-compensated audio volume control; continuous high-frequency tone control; and a two-point low-frequency tone control. In addition, Model 9K3 has a cabinet incorporating the "Magic Voice."

Service Data

The various diagrams of this booklet contain such information as will be needed to isolate causes for defective operation if such develops. The ratings of the resistors, capacitors, coils, etc., are indicated adjacent to the symbols signifying these parts on the diagrams. Identification titles such as R1, L1, C1, etc., provide reference between the illustrations and Replacement Parts List. The coils, transformer windings, and reactors are rated in terms of d-c resistance to permit continuity checks.

Phonograph Attachment.—A terminal board is provided for connecting a phonograph into the audio-amplifying circuit. RCA Victor Models R-93, R-93-2, R-93-A, or R-94 Record Players should be connected as follows: Remove the two links from the phonograph terminal board. Connect green wire in Radio-Record switch cable to terminal 2; yellow to terminal 1; red to terminal 4; and both the blue lead and shield to terminal 3. Connect a 2-conductor twisted cable between the Record Player binding posts and the screw terminals on Radio-Record switch.

Loudspeaker.—Centering of the loudspeaker is made in the usual manner with three narrow paper feelers

after first removing the front dust cover. This may be removed by softening its cement with a light application of acetone, using care not to allow the acetone to flow into the air gap. The dust cover should be cemented back in place with ambroid upon completion of adjustment.

Selector Dial (Model 9K3).—Figure 10 illustrates the relation of the various parts of the dial mechanism when in its "Standard broadcast" position with the range switch likewise turned to its "Standard broadcast" position. In re-assembling the dial after repairs, see that the gears are meshed in accordance with the diagram, at the same time noting that the range switch is in its "Standard broadcast" position and the lever attached to the range-switch shaft placed in the position shown.

To adjust the dial mechanism, set the range switch to its "Standard broadcast" position. Place a straight-edge across the center of the dial so that its edge is even with the lower (end) marking at both the low-frequency and high-frequency ends of the dial. Under such conditions the straight-edge should be parallel with the top of the chassis base. If the straight-edge is not parallel with the top of the chassis base, loosen the nut on the rear of the roller link pivot stud and move the stud up or down until the link roller moves the dial to the desired position so that the end calibration marks obtain the position mentioned above. Tighten the nut on the roller link pivot stud.

Set the gang tuning condenser to its maximum capacity position. Adjust the dial pointer to the low-frequency (end) mark on "Standard broadcast" scale. This is a friction adjustment.

With the gang tuning condenser plates still in full mesh, loosen the two set screws on the vernier-dial hub. Rotate the vernier dial until the "0" marking is in a vertical plane above the center of the shaft. Tighten set screws.

Antenna and Ground Terminals.—These receivers are equipped with an antenna-ground terminal board having three terminals. These terminals are marked "A2," "A1," and "G," the latter being the ground terminal and should always be connected to a good external ground. The transmission-line leads of the RCA RK-40A antenna system should be connected to terminals "A2" and "A1." The receiver coupling units of the RCA RK-40 and the RCA Spider-Web antenna systems should be connected to terminals "A1" and "G." Connect a single-wire antenna to terminal "A1."

12607	Shield—Top shield for I. F. transformer, Stock No. 12652	12800	Core—Adjustable core and stud for Stock No. 12709
12581	Shield—Top shield for I. F. transformer, Stock No. 12653	13653	Dial—Station selector dial scale (Model 9K1 only)
13652	Shutter—Dial scale holder and shutter assembly complete with link (Model 9K1 only)	12870	Dial—Vernier dial and disc assembly (Model 9K3 only)
11195	Socket—5-contact 5Z4 Radiotron socket	13651	Drive—Variable tuning condenser vernier drive with pinion gear (Model 9K1 only)
11198	Socket—7-contact 6F5, 6H6, 6K7, or 6L7 Radiotron socket	12712	Indicator—Station selector indicator pointer (Model 9K1 only)
11196	Socket—8-contact 6F6, 6J7, or 6L6 Radiotron socket	5226	Lamp—Dial lamp, 6.3 volts
11222	Socket—Dial lamp socket (Model 9K1, all sockets) (Model 9K3, upper right or lower left socket)	12868	Link—Range switch and band indicator operating link, complete with set screws (Model 9K3 only)
13095	Socket—Upper left or lower right dial lamp socket (Model 9K3 only)	13683	Mask—Dial scale mask, complete with colored screens (Model 9K1 only)
11381	Socket—Tuning tube socket and cover	DRIVE ASSEMBLIES (Model 9K3 Only)	
12007	Spring—Retaining spring for core, Stock Nos. 12006, 12664, or 12800	10705	Ball—5/32-inch diameter steel ball for planetary drive
12849	Spring—Tension spring for dial shutter link (Model 9K1 only)	10941	Ball—1/8-inch diameter steel ball for planetary drive bearing
13648	Switch—Range switch (S1, S2, S3) (Model 9K1 only)	12904	Bushing—Plate and bushing assembly for planetary drive mounting
13839	Switch—Range switch (S1, S2, S3) (Model 9K3 only)	12905	Coupling—Flexible coupling and shaft assembly, complete
13649	Tone control (R18) (Model 9K1 only)	12899	Dial—Band indicating dial and cam assembly
12921	Tone control—High-frequency tone control (R18) (Model 9K3 only)	12909	Drive—Variable tuning condenser drive, complete—including mounting bracket, drive, dial scale and indicator, less vernier dial, Stock No. 12870, and link, Stock No. 12868
12860	Tone control—Low-frequency tone control switch and power switch (S4, S5) (Model 9K3 only)	12906	Gear—Anti-lash drive gear, complete
12652	Transformer—First I. F. transformer, complete (L14, L15, C28, C29)	12910	Gear—Sector gear and link assembly for band selector
12653	Transformer—Second I. F. transformer, complete (L16, L17, C32, C33, C34, R8, R9)	12908	Indicator—Station selector indicator pointer
12918	Transformer—Power transformer, 105-125 volts, 50-60 cycles (T1) (Model 9K1 only)	8051	Link—Link and roller assembly, complete with spring
12857	Transformer—Power transformer, 105-125 volts, 25-60 cycles (T1) (Model 9K1 only)	12911	Screen—Dial lamp screen and light diffuser
11211	Transformer—Power transformer, 105-125 volts, 50-60 cycles (T1) (Model 9K3 only)	4669	Screw—Set screw for flexible coupling or gear, Stock Nos. 12905 and 12906
11212	Transformer—Power transformer, 105-125 volts, 25-60 cycles (T1) (Model 9K3 only)	12901	Shaft—Direct drive shaft and pinion gear for planetary drive
11213	Transformer—Power transformer, 100-250 volts, 40-60 cycles (T1) (Model 9K3 only)	12900	Shaft—Vernier drive shaft for planetary drive
12654	Trap—Wave trap, complete (L1)	12903	Spring—Tension spring for planetary drive bearing
13647	Volume control and power switch (R11, S4) (Model 9K1 only)	12907	Spring—Tension spring for gear, Stock No. 12906
12861	Volume control (R11) (Model 9K3 only)	8052	Spring—Tension spring for link, Stock No. 8051
RECEIVER ASSEMBLIES		MISCELLANEOUS ASSEMBLIES (Model 9K1 Only)	
12706	Arm—Hub and arm assembly complete with set screws for operating shutter link (located on range-switch shaft) (Model 9K1 only)	11996	Bracket—Tuning tube mounting bracket and clamp
12806	Board—3-contact antenna and ground terminal board	12666	Cover—Reproducer field coil and yoke cover
12863	Board—4-contact and 2-link phonograph terminal board	12698	Crystal—Station selector escutcheon and crystal
12929	Bracket—Mounting bracket for L. F. tone control or volume control (Model 9K3 only)	12742	Escutcheon—Tuning tube escutcheon
5237	Bushing—Variable condenser mounting bushing assembly	12699	Knob—Large station selector knob
13656	Button—Plug button for top of detector coil shield, Stock No. 12799	12700	Knob—Small (vernier) station selector knob
11625	Cable—Tuning tube cable and socket	11347	Knob—Range switch, tone control, or volume control knob

Details, Notes

ADJUST AND TIGHTEN NUT SO AS TO PROVIDE APPROXIMATELY $\frac{1}{32}$ " BETWEEN SLOT IN LINK AND SCREW. WHEN BUMPER IS IN CONTACT WITH STOP BRACKET.

TO ADJUST RISE AND SWING OF TONE ARM — WITH MANUAL INDEX LEVER IN 12" POSITION AND ROLLER ON MAIN LEVER A ENGAGED IN CAM AT HALF CYCLE POSITION AS SHOWN, AND SWITCH STOP SCREW C, ADJUST EYEBOLT D SO NEEDLE POINT (ORANGE SPARK) IS $1\frac{1}{16}" + 1/32"$ — .000 ABOVE TURNABLE FELT. AT THE SAME TIME ADJUST SCREW C SO THAT NEEDLE LANDS AT A RADIUS OF $5\frac{13}{16}" + 1/16"$ — .000 FROM CENTER OF TURNABLE SPINDLE. THIS ADJUSTMENT CAN BE FACILITATED BY USING 7 TWELVE-INCH RECORDS (NOT WARPED) WHICH MEASURES $1\frac{1}{16}"$ TOTAL. ANY ADJUSTING RISE TO $3/8"$ TO $3/4"$ ABOVE RIM OF TOP RECORD. LANDING RADIUS $5\frac{13}{16}" + 1/16"$ — .000.

ADJUST NEEDLE HEIGHT BY MEANS OF TRIP ROD UNTIL NEEDLE POINT OF AN "ORANGE SHANK" NEEDLE IS $1/16" + .010$ BELOW TOP SURFACE OF THE RUBBER PICKUP REST.

ADJUST SCREW UNTIL FRICTION WILL JUST FORCE FINGER TO MOVE TRIP PAWL (WITH COVER REMOVED)

TO ADJUST MANUAL INDEX FINGER. PLACE MANUAL INDEX LEVER IN THE POSITION SHOWN. SET MANUAL INDEX FINGER TO FORCE TRIP PAWL AGAINST STOP PIN. TIGHTEN SET SCREW.

ADJUST AUTOMATIC SWITCH AS FOLLOWS. PLACE MANUAL INDEX LEVER IN POSITION SHOWN AND WITH SWITCH IN TRIPPED POSITION, ADJUST IT UNTIL THE CONTACT POINTS ARE OPENED $.020" \pm .001$ AS INDICATED (TURNABLE REMOVED)

ADJUST SCREW SO EJECTOR TIP IS DIRECTLY ABOVE SPINDLE

IF ROLLER FAILS TO ROLL BACK DURING AUTOMATIC CYCLE, ADJUST SCREW UPWARD TO PROVIDE A GREATER INCLINE DURING THE CYCLE. DO NOT ADJUST SO HIGH AS TO CAUSE EJECTOR TIP TO FAIL TO TOUCH TOP OF TURNABLE FELT AT HIGHEST POINT.

END OF EJECTOR TIP FIBER CENTER SHOULD BE FLUSH WITH EJECTOR TIP.

EJECTOR TIP SHOULD ROTATE FREELY

Figure 9—Automatic Record Changer Adjustments

to the input of the i-f system, i.e., to the RCA 6L7 first-detector grid cap, through a .001-mfd. capacitor (with grid lead in place). Regulate the test-oscillator output so that the amplitude of the oscillographic image is approximately the same as used for adjustment (f) above.

(h) The two first i-f transformer magnetite core screws L25 and L26 (one on top and one on bottom) should then be adjusted so that they cause the forward and reverse curves to become coincident throughout their lengths and have maximum amplitude. The composite wave obtained in this manner represents the lack of characteristic of the total i-f system. Lack of symmetry or irregularity of the resultant image will indicate the presence of a defect in the i-f system.

R-F Adjustments

Make receiver dial adjustments as outlined by "Selector dial," figure 12. Alignment must be made in sequence of "Wave-trap," "Ultra short wave" band, "Short wave" band, "Medium wave" band, "Standard broadcast" band, and "Long wave" band.

"Wave-Trap" Adjustment

(a) Connect the output of the test oscillator to the antenna terminal "A1" through a 200-mmf. (important) capacitor. Remove the plug of the frequency-modulator cable from the test-oscillator jack. Turn test-oscillator modulation switch to "On." Shift the oscillograph "Timing" switch to "Int." Place receiver range selector in "Standard broadcast" position. Set the receiver dial to a position of no extraneous signals near 600 kc. Tune the test oscillator to 460 kc. Adjust the wave-trap magnetite core screw to the point which causes minimum amplitude of output (maximum suppression of signal) as shown by the waves on the oscillograph. An increase of the test-oscillator output may be necessary before this point of minimum amplitude, obtained by correct adjustment of wave-trap screw, becomes apparent on oscillograph screen.

"Ultra Short Wave" Band

(b) Connect the "Ant." output of the test oscillator to the antenna terminal "A1" of the receiver through a 300-ohm resistor. Set the receiver range selector to its "Ultra short wave" position and its dial pointer to 37,000 kc. Adjust the test oscillator to 19,000 kc. The third harmonic of 19,000 kc is used for this adjustment. If the modulation on the oscillograph screen is not sufficient for the following adjustments at 37,000 kc, the vertical-input terminals of the cathode-ray oscillograph may be connected thus: "Hi" to the plate contact of the RCA-6L6 power-output tube socket with the "V" terminal to chassis-ground. The receiver should be turned off while making this connection since the plate potential is impressed across the oscillograph input and a severe shock will result if contact is made between these two points. If this connection is made, advance the receiver volume control to its maximum position. Adjust oscillator air-trimmer C23 for maximum (peak) output. Two positions, each producing maximum output, may be found. The position of minimum capacitance (plunger near out) should be used. This places the receiver

a clearly defined spot, or line, on the screen. Set oscillograph "Ampl. A" switch to "On." "Vertical gain" control full-clockwise, "Ampl. B" switch to "Tuning." "Range" switch to No. 2 position, and aligned, so as to cause the circuit to resonate within the range of the trimmer. An increase in the capacity-to-ground of the trimmer will be required if the iron output when the air-trimmer plunger is fully-in, while a decrease in the capacity-to-ground will be required if the brass end of the tuning wand causes an increase in signal output when the air-trimmer plunger is fully-out.

I-F Adjustments

(a) Turn range selector to its "Standard broadcast" (A) position and tune receiver to a position of no extraneous signals near 600 kc. Connect the "Ant." output of the test oscillator to the grid cap of RCA-6K7 i-f tube (with grid lead in place) through a .001-mfd. capacitor, with "Grid" to receiver chassis. Tune the test oscillator to 460 kc and place its modulation switch to "On" and its output switch to "Hi."

(b) Turn on the receiver and test oscillator. Increase the output of the test oscillator until a deflection is noticeable on the oscillograph screen. The figures obtained represent several waves of the detected signal, the amplitude of which may be observed as an indication of output. Cause the wave-image formed (400-cycle waves) to be spread completely across the screen by adjusting the "Horizontal gain" control. The image should be synchronized and made to remain motionless by adjusting the "Sync." and "Freq." controls.

(c) Adjust the two magnetic core screws L27 and L26 (see figures 4 and 11) of the second i-f transformer (one on top and one on bottom) to produce maximum vertical deflection of the oscillographic image. This adjustment places the transformer in exact resonance with the 460-kc signal. The sweeping operation should follow using the frequency modulator. Shift the oscillograph "Timing" switch to "Ext." Insert plug of frequency-modulator cable in test-oscillator jack.

(d) Turn the test-oscillator modulation switch to "Off." Turn on the frequency modulator and place its sweep-range switch to "Hi." Increase the frequency of the test oscillator by slowly turning its tuning control until two separate, distinct, and similar waves appear on the screen. If only one wave appears, increase the "Freq." control on the oscillograph to obtain two waves. These waves will be identical in shape, totally disconnected, and appear in reversed positions. They will have a common base line, which is discontinuous. Adjust the "Freq." and "Sync." controls of the oscillograph to make them remain motionless on the screen. Continue increasing the test-oscillator frequency until these forward and reverse curves move together and overlap, with their highest points exactly coincident. This condition will be obtained at a test-oscillator setting of approximately 37.5 kc.

(e) With the images established as in (d), re-adjust the two magnetic core screws L27 and L26 on the second i-f transformer so that they cause the curves on the oscillograph screen to become exactly coincident throughout their lengths and have maximum amplitude.

(f) Without altering the adjustments of the apparatus, shift the "Ant." output of the test oscillator

specive air-trimmer capacitance should be increased (plunger pushed in). If the range of the air trimmer is not sufficient to give the desired results, the lead-dress may be changed in the particular circuit being aligned, so as to cause the circuit to resonate within the range of the trimmer. An increase in the capacity-to-ground of the trimmer will be required if the iron output when the air-trimmer plunger is fully-in, while a decrease in the capacity-to-ground will be required if the brass end of the tuning wand causes an increase in signal output when the air-trimmer plunger is fully-out.

Precautionary Dressing of Leads for "Magic Beam" Alignment
(Refer to Figure 3)

1. Keep blue lead A of S1 to antenna coil L25 dressed away from chassis, coil shield, coil, and other leads.
2. Blue lead from C10 to S1 should be as short as possible.
3. Keep blue lead A of S2 to detector coil L18-19 clear of chassis, coil shield, coil, and other leads.
4. Keep spaghetti lead C6 to X of S1 apart from spaghetti lead C5 to A of S1, and from chassis.

Lead "A"

1. Keep green lead terminal S1 to antenna coil tap L4 away from chassis, coil shield, and coil.
2. Lead C8 to X of S1 and from chassis.

Lead "C"

Lead from C19 to oscillator coil L7 should be maintained as short and straight as possible.

Two methods of alignment are applicable—one requires use of the cathode-ray oscillograph, and the other requires a voltmeter or glow-type indicator. The cathode-ray alignment method is advantageous in that the indication provided is in the form of a wave-image which represents the resonance characteristics of the circuit being tuned. This method is preferred because of the i-f characteristics of these receivers. This type of alignment is possible through use of apparatus such as the RCA Stock No. 9458 Frequency Modulator and the RCA Stock No. 9443 Cathode-Ray Oscillograph. If this equipment is not available, an approximate alignment may be performed by the output-indicator method with an instrument such as the RCA Stock No. 4317 Neon Glow Indicator attached across the loudspeaker voice coil. Alignment by this method is similar to the cathode-ray method outlined below except that the receiver volume control should be at maximum, the trimmers adjusted to peak response (with the exception of the wave-trap) and the test-oscillator sweeping operations omitted. Either of these methods require the use of a reliable test oscillator such as the RCA Stock No. 9593.

Cathode-Ray Alignment

Make alignment apparatus connections shown on figure 6. Remove the plug of the frequency-modulator cable from the test-oscillator jack. Connect the receiver chassis to a good external ground. Connect oscillograph "Vertical" input terminals as indicated on figure 11. Set oscillograph power switch to "On" and adjust "Intensity" and "Focus" controls to give

There are seventeen adjustments required for the alignment of the oscillator, first-detector, and antenna-tuned circuits; one adjustment for the wave-trap; and four adjustments for the i-f system. Fifteen of these adjustments are made with plunger-type air trimming capacitors and require the use of an RCA Stock No. 12636 Adjusting Tool. Each of these capacitors has a lock nut for securing the plunger in place after adjustment. The remaining seven adjustments are made by means of screws attached to molded magnetite cores. These cores change the inductance of the particular coils in which they are inserted to provide exact alignment. All of these adjustments are accurately made during manufacture and should remain in proper alignment unless affected by abnormal conditions of climate or purposed alterations for servicing, or unless altered by other means. Loss of sensitivity, improper tone quality, and poor selectivity are the usual indications of improper alignment. Such conditions will usually exist simultaneously. Correct performance of this receiver can only be obtained when these adjustments have been made by a skilled service engineer with the use of adequate and reliable test equipment. The manufacturer of this receiver has such test equipment available for sale through its distributors and dealers.

The extensive frequency range of this receiver necessitates a more or less involved method of alignment. However, if the following directions are carefully applied in the sequence given, normal performance of the instrument will be obtained.

The plunger-type air trimming capacitors have their approximate plunger settings tabulated on figure 7. If the plungers have been disturbed from their original adjustments, they may be roughly set to the specified dimensions prior to alignment.

For alignment, the test-oscillator frequency should be quite accurate. A convenient and reliable means of accurately checking the frequency of test oscillators, receivers, etc., is the RCA Stock No. 9572 Crystal Calibrator.

If the test-oscillator signal cannot be heard as the receiver (heterodyne) oscillator air-trimmer plunger is changed from its minimum-capacity to maximum-capacity position (receiver dial and test oscillator set to the specified frequencies), and the correct oscillator air-trimmer used, it may be an indication that the test-oscillator frequency is outside the range covered by the air-trimmer. Under such conditions, when a more accurate setting of the test oscillator cannot be determined, set the oscillator air-trimmer plungers to the approximate settings given on figure 7. Tune the test oscillator until the signal is heard in the speaker. Each of two test-oscillator settings (the fundamentals or the harmonics of which are 920 kc apart) produce a signal. The low-frequency test-oscillator setting should be used as this places the test-oscillator (signal) frequency 460 kc below the frequency of the receiver heterodyne oscillator.

Holes are provided in the top of the r-f and antenna coil cans on some models to enable a tuning check with the RCA Stock No. 6679 Tuning Wand. The hole in the top of the detector coil can has a catch button which must be removed before insertion of the tuning wand. When the brass end of the wand is inserted in the coil, the inductance of the coil is decreased. If this results in an increase of output, the respective air-trimmer capacitance should be decreased (plunger pulled out). If inserting the iron end of the tuning wand causes an increase in output, resulting from an increase of inductance of the coil, the re-

RCA MFG. CO., INC.

C6, again, to produce maximum amplitude of the images and best coincidence throughout their lengths.
(k) Re-tune the receiver to approximately 175 kc so that the forward and reverse waves appear on the oscillograph screen. Adjust the oscillator magnetic core screw L10 to produce maximum (peak) amplitude of the waves, disregarding the fact that the two images may or may not come together.
(l) Shift the receiver dial setting to 350 kc without altering any other adjustments (frequency modulator still in operation). Adjust air-trimmers C18, C38, and C6, respectively, to produce maximum amplitude and best coincidence for any waves. These adjustments compensate for any changes caused by the adjustment of the magnetic core screw L10. Tighten lock nuts on C18, C38, and C6, respectively, after each is adjusted.

Selector Dial

Figure 12 illustrates the relation of the various parts of the dial mechanism when in its "Standard broadcast" position with the range switch likewise turned to its "Standard broadcast" position. In re-assembling the dial after repairs, see that the gears are meshed in accordance with the diagram at the same time noting that the range switch in its "Standard broadcast" position and the lever attached to the range-switch shaft placed in the position shown.

To adjust the dial mechanism, set the range switch to its "Standard broadcast" position. Place a straight-edge across the center of the dial so that its edge is even with the lower (end) marking at both the low-frequency and high-frequency ends of the dial. Under such conditions the straight-edge should be parallel with the top of the chassis base. If the straight-edge is not parallel with the top of the chassis base, loosen the nut on the rear of the roller link pivot stud and move the stud up or down until the link roller moves the dial to the desired position so that the end calibration marks obtain the position mentioned above. Tighten the nut on the roller link pivot stud.

Set the gang tuning condensers to its maximum capacity position. Adjust the dial pointer to the low-frequency (end) mark on "Standard broadcast" scale. This is a friction adjustment.

With the gang tuning condenser plates still in full mesh, loosen the two set screws on the vernier-dial hub. Rotate the vernier dial until the "0" marking is in a vertical plane above the center of the shaft. Tighten set screws.

Antenna and Ground Terminals

These receivers are equipped with an antenna-ground terminal board having three terminals. These terminals are marked "A1," "A1," and "G," the latter being the ground terminal and should always be connected to a good external ground. The transmission line leads of the RCA RK40A antenna system should be connected to terminals "A1" and "A1." The receiver coupling units of the RCA RK40 and the RCA Spider-Web antenna systems should be connected to terminals "A1" and "G." Connect a single-wire antenna to terminal "A1."

Magnetic Pickup

The pickup used in the phonograph unit is of an improved design. The horseshoe magnet is rigidly

tion and insert plug of the frequency-modulator cable in test-oscillator jack. Turn test-oscillator modulation switch to "Off." Re-tune the test oscillator (increase frequency) until the forward and reverse waves appear on the oscillograph screen and become coincident at their highest points. This will occur at a test-oscillator setting of approximately 600 kc. Adjust trimmer C16, C37, and C3, again, setting each to the point which produces the best coincidence and maximum amplitude of the images.

(h) Remove the plug of the frequency-modulator cable from the test-oscillator jack. Turn test-oscillator modulation switch to "On." Set oscillograph "Timing" switch to "Int." Tune test oscillator to 200 kc (200-400-kc range). Tune receiver for maximum response to this signal at a dial reading of approximately 600 kc. The third harmonic of the 200-kc signal is used for this adjustment. Shift oscillograph "Timing" switch to "Ext." Insert the plug of the frequency-modulator cable in test-oscillator jack. Turn test-oscillator modulation switch to "Off." Re-tune the test oscillator (increase frequency) until the forward and reverse waves show on the oscillograph screen. This will occur at a test-oscillator setting of approximately 250 kc. Disregarding the fact that the two images may or may not come together, adjust the oscillator magnetic core screw L9 (top of large oscillator coil can) to produce maximum (peak) amplitude of the images. Shift the oscillograph "Timing" switch to "Int." Re-move the plug of the frequency-modulator cable from the test-oscillator jack. Turn the test-oscillator modulation switch to "On." Repeat adjustments in (g) above to compensate for any changes caused by the adjustment of L9 core, tightening lock nuts on C16, C37, and C3, respectively, after each is adjusted.

"Long Wave" Band

(i) Shift the oscillograph "Timing" switch to "Int." Remove the plug of the frequency-modulator cable from the test-oscillator jack. Turn the test-oscillator modulation switch to "On." Place receiver range selector to its "Long wave" position. Set the receiver dial pointer to 175 kc. Tune the test oscillator to 175 kc and increase its output until a deflection is noticeable on the oscillograph screen. Adjust oscillator magnetic core screw L10 (located on top of small oscillator coil can) so that maximum (peak) amplitude of output is shown on the oscillograph screen.

(j) Set receiver dial pointer to 350 kc. Tune test oscillator to 350 kc. Adjust the oscillograph, detector, and antenna air-trimmers C18, C38, and C6 to produce maximum (peak) output as shown by the waves on the oscillograph screen. With out disturbing the connections, shift the oscillograph "Timing" switch to "Ext." Place the frequency-modulator sweep-range switch to its "Hi" position and insert plug of frequency-modulator cable in test-oscillator jack. Turn test-oscillator modulation switch to "Off." Re-tune the test oscillator (decrease frequency) until the forward and reverse waves show on the oscillograph screen and become coincident at their highest points. This will occur at a test-oscillator setting of approximately 198 kc. This setting places the test-oscillator frequency to 175 kc. The second harmonic is now used for the 350 kc adjustment. Adjust air-trimmers C18, C38, and

wave" band.

"Short Wave" Band

(d) Set the receiver range selector to its "Short wave" position and its dial pointer to 20,000 kc. Adjust the test oscillator to 20,000 kc. If the vertical input cathode-ray connections were changed for adjustment (b) above, they should be restored to their original position as shown on figure 11. Adjust oscillator air-trimmer C13 until maximum (peak) output is reached. Two peaks may be found with this circuit. The peak with minimum capacitance (plunger near out) should be used. Tighten lock nut. Adjust detector air-trimmer C35 until maximum (peak) output is reached, while slightly rocking the gang tuning condenser back and forth through the signal. Two peaks may be found with this circuit. The peak with maximum capacitance (plunger near in) should be used. Tighten lock nut. Adjust antenna air-trimmer C3 until maximum (peak) output is reached while slightly rocking the gang tuning condenser back and forth through the signal. The peak with minimum capacitance (plunger near in) should be used. Tighten lock nut. Adjust antenna air-trimmer C3 until maximum (peak) output is reached while slightly rocking the gang tuning condenser back and forth through the signal. Two peaks may be found with this circuit. The peak with maximum capacitance (plunger near in) should be used. Tighten lock nut. Check the image frequency by changing the receiver dial setting to 19,000 kc. The image signal should be received at this position indicating that the adjustment of C13 has been correctly made. No adjustments should be made while checking for the image signal.

Medium Wave" Band

(e) Place receiver range selector to its "Medium wave" position with its dial pointer set to 6,000 kc. Tune the test oscillator to 6,000 kc. Adjust oscillator air-trimmer C14 to produce maximum (peak) output as shown by the waves on this oscillograph. Two peaks may be found with this circuit. The peak with minimum capacitance (plunger near out) should be used. Tighten lock nut. Adjust the detector air-trimmer C36 for maximum (peak) output while slightly rocking the gang tuning condenser back and forth through the signal. Two peaks may be found with this circuit. The peak with maximum capacitance (plunger near in) should be used. Tighten lock nut. Adjust antenna air-trimmer C4 to produce maximum (peak) output. Tighten lock nut.

"Standard Broadcast" Band

(f) Remove the 300-ohm resistor from between the test-oscillator "Ant" post and receiver antenna terminal "A1" and insert a 200-mmd. capacitor in its place. Place receiver range selector to "Standard broadcast" position with receiver dial pointer set to 600 kc. Tune the test oscillator to 600 kc. Adjust oscillator magnetic core screw L9 (top of large oscillator coil can) for maximum (peak) output as shown by the waves on the oscillograph screen.

(g) Set receiver dial pointer to 1,500 kc. Tune test oscillator to 1,500 kc (1,500-3,100-kc range) and increase its output to produce a registration on the oscillograph screen. Carefully adjust the oscillator, detector, and antenna air-trimmers C16, C37 and C5, respectively, to produce maximum (peak) output as shown by the waves on the oscillograph screen. Shift the oscillograph "Timing" switch to "Ext." Place the frequency-modulator sweep-range switch to its "Lo" position

heterodyne oscillator 460 kc higher in frequency than the incoming signal. Tighten lock nut. Adjust the detector air-trimmer C39, while slightly rocking the gang tuning condenser back and forth through the signal, for maximum (peak) output. Two peaks may be found on this trimmer. The peak of maximum capacitance (plunger near in) should be used. Tighten lock nut. Adjust the antenna air-trimmer C10 for maximum (peak) output while slightly rocking the gang tuning condenser back and forth through the signal. Two peaks may be found on this trimmer which produce maximum output. The peak with maximum capacitance (plunger near in) should be used. Tighten lock nut. Check the image frequency by changing the receiver dial setting to 56,000 kc. If the image signal is received at this position, the adjustment of the oscillator air-trimmer C23 has been correctly made. No adjustments should be made while checking for the image signal.

(c) Re-tune receiver for maximum response to 57,000 kc (not image response) without disturbing test-oscillator adjustments. Change test oscillator to 6,800-14,000 kc range. Tune test oscillator until signal is heard in speaker; should occur at approximately 14,240 kc, fourth harmonic of test oscillator used. Two test-oscillator settings (250 kc apart) will produce a signal at this point. The lower frequency test-oscillator setting should be used, as this places the test oscillator harmonic 460 kc below the frequency of the receiver heterodyne oscillator. Tune receiver for maximum response at a dial setting of approximately 28,500 kc (image should tune in at a dial setting approximately 27,580 kc) without altering test-oscillator adjustment. Test-oscillator second harmonic of 14,290 kc is used for the following check. Check calibration of receiver dial. A receiver-dial reading of less than 28,500 kc indicates that the inductance of the oscillator secondary coil L11 is too low and should be increased. If the receiver dial reading is greater than 28,500 kc, the inductance of L11 is too high and should be decreased. If it is necessary to change the inductance of L11, first remove bottom cover of "Magic Brain" and then set receiver dial pointer to 28,500 kc. To decrease inductance, move the grounded ends (straps) of L11 and L12 (see figure 5) nearer chassis. Do not allow straps to touch chassis except where connected. To increase inductance, move the straps farther away from chassis. Adjust position of straps till maximum (peak) output results. The alignment of the detector tuned circuit should next be checked at 28,500 kc without changing either the receiver or test oscillator adjustments. An increase of output when the brass end of a tuning wand is brought near L22 indicates that L22 is too high in inductance, while an increase when the iron end is brought near the coil indicates that the inductance is too low. The inductance of L22 may be varied by changing the spacing between the grounded end (strap) of L22 and the strap connected from C41 to connect on S2 (figure 3). An increase of spacing will increase the inductance, while a decrease of spacing will decrease the inductance. Adjust the spacing until maximum (peak) output results. Replace "Magic Brain" bottom cover and repeat adjustments in (b) prior to those of "Short

welded to the pole pieces and is irremovable. There is a centering spring attached to the armature to maintain proper adjustment and to provide a limiting effect on the movement of the armature. The frequency response is substantially uniform over a wide range. Service operations which may be necessary on the pickup are as follows:

Centering Armature

Refer to figure 13 showing the pickup inner structure. The armature is shown in its proper relation to the magnet pole pieces, i.e., exactly centered. Whenever this centering adjustment has been disturbed, when screws A, B, and C should be loosened and the armature clamp adjusted to the point where the vertical axis of the pole pieces, and centered between them. This centering operation may be facilitated by inserting a small rod or nail into the armature needle hole, using it as a lever to test the angular movement of the armature. The limitations of the movement in each direction will be caused by the armature striking the pole pieces. The proper adjustment is obtained when there is equal angular displacement of the armature and adjustment rod or nail to each side of the vertical axis of the magnet and coil assembly. The screws A and B should then be secured, observing care not to disturb the adjustment of the armature clamp. Then place the pickup in a vise and secure the centering spring-clamp by means of the screw C, allowing the centering spring to remain in the position at which the armature is exactly centered between the pole pieces. With a little practice, the correct adjustment of the armature may be readily obtained. The air gap between the pole pieces and the armature should be kept free from dust, filings, and other such foreign materials which would obstruct the movement of the pickup armature.

Damping Block

The viscoloid block which is attached to the back end of the armature shank serves as a mechanical filter to eliminate undesirable resonances and to cause the frequency response to be uniform. Should it be necessary to replace this damping block, it may be done by removing screw D and the cover support bracket from the mechanism and taking off the old viscoloid block. The surface of the armature which is in contact with the viscoloid should be thoroughly cleaned with fine emery cloth. Then insert the new block so that it occupies the same position as it did originally. Make certain that the block is in correct vertical alignment with the armature. The hole in the new viscoloid block is somewhat smaller than the diameter of the armature in order to permit a snug fit. With the viscoloid aligned on the armature, screw D and the cover support bracket should then be replaced. Heat should be applied to the armature (viscoloid side) so that the viscoloid block will fuse at the point of contact and become rigidly attached to the armature. A special soldering iron constructed as shown in figure 14 will be found very useful in performing this operation. The iron should be applied only long enough to slightly melt the block and cause a small bulge on both sides.

Replacing Coil

Whenever there is defective operation due to an open or shorted pickup coil, this coil should be replaced. The method of replacement will be obvious upon inspection of the pickup assembly and by study of the cut-away illustrations. Make sure that the new

coil is properly centered with the hole in the support strip and glued securely in that position. It is important to re-adjust the armature as previously explained after re-assembly of the mechanism. Only loose core solder should be used for soldering the coil leads to the pickup. This same type of solder should be used when necessary for soldering the centering spring to the armature.

Magnetizing

Loss of magnetization will not usually occur when the pickup has received normal care because the magnet and pole pieces are one unit and the magnetic circuit remains practically closed at all times. When the pickup has been mishandled, subjected to a strong ac field, jolted, or dropped, there may be an appreciable loss of magnetic strength, in which case it will be necessary to re-magnetize the entire structure. To do this, it will be necessary to first remove the pickup mechanism from the tone arm, and then remove the magnet assembly. Place the magnet assembly on the poles of a standard pickup magnetizer such as the RCA Stock No. 9549 Pickup Magnetizer and charge the magnet in accordance with the instructions accompanying the magnetizer. It is preferable to check the polarity of the pickup magnet and to re-magnetize it so that the same polarity is maintained.

Automatic Record Ejector

The record changing mechanism is designed to be simple and fool-proof. Under normal operating conditions, service difficulties should be negligible. Occasionally, however, certain adjustments may be required. These adjustments are illustrated and explained in figure 9.

It is important when servicing the automatic mechanism, to have it placed on a level support. It is also important to refrain from forcing the mechanism if there is a tendency to bind or jam, since bent levers and possibly broken parts may result.

The tip of the record ejector is adjustable in relation to the turntable spindle, the two being exactly coaxial when properly adjusted. To align the tip, remove the rubber spacer of the ejector assembly, loosen the ejector tip retaining nut and slide the tip assembly to the position where it is in true-line with the axis of the turntable spindle. This adjustment may be simplified by placing several records on the turntable, depressing the spindle through the top record hole and lining up the ejector tip in the spindle hole of the record.

To insure that the ejector tip rotates freely, apply a slight amount of oil to the shank of the tip at the point where it is in contact with the ball bearing.

Loudspeaker

Centering of the loudspeaker voice coil is made in the usual manner with three narrow paper feelers after first removing the front paper dust cover. This may be removed by softening its cement with a very light application of acetone using care not to allow the acetone to flow down into the air gap. The dust cover may be cemented back in place with ambroid upon completion of adjustment.

Refer to figure 13 showing the pickup inner structure. The armature is shown in its proper relation to the magnet pole pieces, i.e., exactly centered. Whenever this centering adjustment has been disturbed, when screws A, B, and C should be loosened and the armature clamp adjusted to the point where the vertical axis of the pole pieces, and centered between them. This centering operation may be facilitated by inserting a small rod or nail into the armature needle hole, using it as a lever to test the angular movement of the armature. The limitations of the movement in each direction will be caused by the armature striking the pole pieces. The proper adjustment is obtained when there is equal angular displacement of the armature and adjustment rod or nail to each side of the vertical axis of the magnet and coil assembly. The screws A and B should then be secured, observing care not to disturb the adjustment of the armature clamp. Then place the pickup in a vise and secure the centering spring-clamp by means of the screw C, allowing the centering spring to remain in the position at which the armature is exactly centered between the pole pieces. With a little practice, the correct adjustment of the armature may be readily obtained. The air gap between the pole pieces and the armature should be kept free from dust, filings, and other such foreign materials which would obstruct the movement of the pickup armature.

The viscoloid block which is attached to the back end of the armature shank serves as a mechanical filter to eliminate undesirable resonances and to cause the frequency response to be uniform. Should it be necessary to replace this damping block, it may be done by removing screw D and the cover support bracket from the mechanism and taking off the old viscoloid block. The surface of the armature which is in contact with the viscoloid should be thoroughly cleaned with fine emery cloth. Then insert the new block so that it occupies the same position as it did originally. Make certain that the block is in correct vertical alignment with the armature. The hole in the new viscoloid block is somewhat smaller than the diameter of the armature in order to permit a snug fit. With the viscoloid aligned on the armature, screw D and the cover support bracket should then be replaced. Heat should be applied to the armature (viscoloid side) so that the viscoloid block will fuse at the point of contact and become rigidly attached to the armature. A special soldering iron constructed as shown in figure 14 will be found very useful in performing this operation. The iron should be applied only long enough to slightly melt the block and cause a small bulge on both sides.

Whenever there is defective operation due to an open or shorted pickup coil, this coil should be replaced. The method of replacement will be obvious upon inspection of the pickup assembly and by study of the cut-away illustrations. Make sure that the new

mary L18. In the "Short wave" (C) band, L16 is the secondary. The ground of the coil system is now between L16 and L17. L17 is used as the primary and is resonated to the proper frequency by capacitor C34. In addition, L15 acts as a high-frequency primary which resonates above 20 mc and improves the gain at the high-frequency end of the "Short wave" band. Coils L19 and L18 are shorted by the range selector. L21 is effectively r-f bypassed in this position by capacitor C32. In the "Ultra short wave" (D) band, L22 is the secondary, or grid coil, and consists of approximately a single turn of silver plated strap around a 7/8-inch coil form. The primary coils, L21 and L15 are in series on this band, with L21 acting as a low-frequency primary and L15 as a high-frequency primary. L16 is shunted by L22 instead of being shorted directly by the range selector. Any inductive effect of L16 is thus eliminated. L19, L18, and L17 are shorted directly by the range selector. Separate windings, with the exception of L23, are employed in the oscillator stage for each position of the range selector. L23 (inductively coupled to L11 and L12) is placed in the oscillator plate circuit to provide additional feed-back when operating receiver on the "Ultra short wave" (D) band. This coil is effectively r-f bypassed by capacitor C12, when range selector is in the "Short wave" (C) position, to prevent undesirable reactions. Its effect on the remaining bands is negligible. The inherent stability of the oscillator circuit provides minimum frequency drift which is especially advantageous for high-frequency reception. The locally generated signal is capacitance coupled to grid No. 3 of the RCA-6L7 first detector.

A single-wire antenna, or a doublet antenna, when connected to the proper input terminals of the receiver, is coupled to the control grid of the RCA-6K7 r-f amplifier tube through the tuned r-f transformer consisting of L6, L5, L4, L3, and L2 (except when range selector is in "Ultra short wave" position). The primary coil L13 of the "Ultra short wave" (D) band tuned r-f transformer remains in the antenna circuit at all times. A unique method of switching is used. In the "Long wave" (X) band, L6 becomes the primary with L5, L4, L3, and L2 as secondary. In the "Standard broadcast" (A) band, L5 becomes the primary with L4, L3, and L2 as secondary (L6 shorted out). In the "Medium wave" (B) band, L4 becomes the primary with L3 and L2 as secondary (L6 and L5 shorted out). In the "Short wave" (C) band, L3 becomes the primary with L2 as secondary (L6, L5, L4, and tap on L4 shorted out). The tap on L4 is provided to prevent interaction with L3 and L2 when operating receiver in "Short wave" band. In the "Ultra short wave" (D) band, L6, L5, L4, and L3 are shorted out and grounded, and secondary L14 is placed in shunt with L2. The latter connection prevents undesirable interaction of L2 with L14. This method of switching reduces the total number of coils and leads, and results in having a low-loss primary and secondary winding for each band with high efficiency of operation.

The band switching of the detector circuits is similar to that of the antenna circuits. Coils L15, L21, and L20 are always connected in series with the plate circuit of the RCA-6K7 r-f amplifier tube. In the "Long wave" (X) band, L19, L18, L17, and L16 are connected in series as the secondary circuit. The ground of the coil system is at the low end of L19. L20 acts as the primary which transfers energy to the secondary L19. Capacitor C33 resonates primary L20 at the proper frequency. In the "Standard broadcast" (A) band, L18, L17, and L16 are connected in series as the secondary circuit. The ground of the coil system is now between L18 and L19. L19 is used as the primary and is resonated at the proper frequency by capacitors C34 and C35 which are in shunt with this coil. Capacitor C33 is connected to transfer energy to the primary coil L19. In the "Medium wave" (B) band, L17 and L16 are connected in series as the secondary. The ground of the coil system is now between L17 and L18. L18 is used as the primary and is resonated at the proper frequency by capacitor C34 which is in shunt with this coil. L19 is shorted by the range selector. Capacitor C33 transfers the r-f energy from the plate circuit to the pri-

13127	Transformer—Phonograph input transformer—Comprising one transformer, three choke coils, three capacitors and four resistors (T3, L43, L44, L45, C80, C81, C82, R40, R41, R42, R43).	6.40
13126	Volume Control—Phonograph volume control and switch (R39, S8).	1.50

"Magic Brain"
 The new "Magic Brain" is constructed as a separate, self-contained, completely shielded, five-band, oscillator-detector antenna-tuning unit which plugs into the main chassis.

RCA VICTOR MODEL 10K1 and MODEL 10T (Second Production)

TECHNICAL INFORMATION AND SERVICE DATA

These receivers are similar to Models 10T (first production) and 10K except for slight changes in the filter and bleeder circuits, loudspeakers, power transformers, and a few component parts. The loudspeakers, for the Model 10T second and first productions may be identified by the stampings RL63E1 and RL63D2 respectively. Model 10T (second production) chassis may be identified by visual inspection of the resistor assembly at the rear bottom of chassis. In the second production the assembly is comprised of one 4,700-ohm and one 4,100-ohm section (R38, R39), while the assembly in the first production consists of a single 17,000-ohm section R34. Model 10T (second production)

has the 20 mfd. capacitor C76 at the bottom left rear of chassis omitted. Service data for Models 10T and 10K is directly applicable to these receivers except for the data contained herein. Power Supply Ratings (A, B and C)—135 watts. Undistorted and Maximum Power Outputs—7 and 10 watts. Cabinet Dimensions (height, width, and depth) Model 10K1—41, 29, and 14 3/4 inches. Weights (net and shipping) Model 10K1—91 and 135 pounds. Resistance Diagram and Cathode Current Readings to be disregarded. Universal Power Transformer resistances (pri. and sec.)—7.4 and 240 ohms total.

MODEL 13K
Dial Change Mechanism
Notes, Socket, Trimmers

Phonograph Terminal Board

A terminal board is provided for connecting a phonograph into the audio amplifying circuit. Typical methods of connecting a low-impedance pickup, or the RCA Victor Models R-93, R-93-2, and R-93-S Record Players are shown on the Schematic Diagram (figure 2).

Selector Dial

Figure 12 illustrates the relation of the various parts of the dial mechanism when in its "Standard broadcast" position with the range switch likewise turned to its "Standard broadcast" position. In re-assembling the dial after repairs, see that the gears are meshed in accordance with the diagram, at the same time noting that the range switch is in its "Standard broadcast" position and the lever attached to the range-switch shaft placed in the position shown.

To adjust the dial mechanism, set the range switch to its "Standard broadcast" position. Place a straight-edge across the center of the dial so that its edge is even with the lower (end) marking at both the low-frequency and high-frequency ends of the dial. Under such conditions the straight-edge should be parallel with the top of the chassis base. If the straight-edge is not parallel with the top of the chassis base, loosen the nut on the rear of the roller link pivot stud and move the stud up or down until the link roller moves the dial to the desired position so that the end calibration marks obtain the position mentioned above. Tighten the nut on the roller link pivot stud.

Set the gang tuning condenser to its maximum capacity position. Adjust the dial pointer to the low-frequency (end) mark on "Standard broadcast" scale. This is a friction adjustment.

With the gang tuning condenser plates still in full mesh, loosen the two set screws on the vernier-dial hub. Rotate the vernier dial until the "0" marking is in a vertical plane above the center of the shaft. Tighten set screws.

Figure 12—Selector Dial Change Mechanism

MODEL 13K
Alignment, Page 1
Oscillograms

RCA MFG. CO., INC.

Figure 6-1-F Alignment Oscillograph Curves
A—Correct curve showing proper i-f alignment as obtained with fidelity control counter-clockwise.
B—Incorrect curve similar to A showing improper alignment of i-f system caused by one or more circuits being slightly detuned.
C—Correct showing broadening of curve A obtained when fidelity control is rotated fully clockwise.
D—Incorrect curve showing broadening of curve B obtained when fidelity control is rotated fully clockwise.

Cathode-Ray Alignment

Make alignment apparatus connections shown on figure 5. Remove the plug of the frequency-modulator cable from the test-oscillator jack. Connect the receiver chassis to a good external ground. Connect oscillograph "Vertical" input terminals as indicated on figure 3. Set oscillograph power switch to "On" and adjust "Intensity" and "Focus" controls to give a clearly defined spot, or line, on the screen. Set oscillograph "Ampl. A" switch to "On," "Vertical gain" control full-clockwise. "Ampl. B" switch to "Timing," "Range" switch to No. 2 position, and "Timing" switch to "Int." Place the "Sync" control "Freq." control, and "Horizontal gain" control to about their mid-positions. For each of the following adjustments, the test-oscillator output must be regulated so that the image obtained on the oscillograph screen will be of the minimum size for accurate observation. The receiver volume-control setting is optional.

I-F Adjustments

- (a) Turn range selector to its "Standard broadcast" (A) position and tune receiver to a position of no extraneous signals near 600 kc. Set fidelity control to counter-clockwise position. Connect the "Ant." output of the test oscillator to the grid cap of RCA-6K7 second i-f tube (with grid lead in place) through a .001-mfd. capacitor, with "Grid" to receiver chassis modulation switch to "On" and its output switch to "Hi."
- (b) Turn on the receiver and test oscillator. Increase the output of the test oscillator until a deflection is noticeable on the oscillograph screen. The figures obtained represent several waves of the detected signal, the amplitude of which may be observed as an indication of output. Cause the wave-image formed (400-cycle waves) to be spread completely across the screen by adjusting the "Horizontal gain" control. The image should be synchronized and made to remain motionless by adjusting the "Sync." and "Freq." controls.
- (c) Adjust the two magnetic core screws L30 and L29 (see figures 1 and 10) of the third i-f transformer (one on top and one on bottom) to produce maximum vertical deflection of the oscillographic image. This adjustment places the transformer in exact resonance with the 460 kc signal.
- (d) The sweeping operation should follow using the frequency modulator. Shift the oscillograph "Timing" switch to "Ext." Insert plug of frequency-modulator cable in test-oscillator jack. Turn the test-oscillator modulation switch to "Off." Turn on the frequency modulator and place its sweep-frequency switch to "Hi."
- (e) Increase the frequency of the test oscillator by slowly turning its tuning control until two separate, distinct, and similar waves appear on the screen. If only one wave appears, increase the "Freq." control on the oscillograph to obtain two waves. These waves will be identical in shape, totally disconnected, and appear in reversed positions. They will have a common

lators, receivers, etc., is the RCA Stock No. 9572 Crystal Calibrator.

If the test-oscillator signal cannot be heard as the receiver (heterodyne) oscillator air-trimmer plunger is changed from its minimum-capacity to maximum-capacity position (frequency dial and test oscillator set to the specified frequency), and the correct oscillator air-trimmer used) it may be an indication that the test-oscillator frequency is outside the range covered by the air-trimmer. Under such conditions, when a more accurate setting of the test oscillator cannot be determined, set the oscillator air-trimmer plungers to the approximate settings given on figure 7. Tune the test oscillator until the signal is heard in the speaker. Each of two test-oscillator settings (the fundamentals or the harmonics of which are 920 kc apart) produce a signal. The lower-frequency test-oscillator setting should be used as this places the test-oscillator (air-trimmer) frequency 460 kc below the frequency of the receiver heterodyne oscillator.

Holes are provided in the top of the r-f and antenna-coil cans on some models to enable a tuning check with the RCA Stock No. 6679 Tuning Wand. The hole in the top of the detector coil can has a catch button which must be removed before insertion of the tuning wand. When the brass end of the wand is inserted in the coil, the inductance of the coil is decreased. If this results in an increase of output, the respective air-trimmer capacitance should be decreased (plunger pulled out). If inserting the iron end of the tuning wand causes an increase in output, resulting from an increase of inductance of the coil, the respective air-trimmer capacitance should be increased (plunger pushed in). If the range of the air-trimmer is not sufficient to give the desired results, the lead-dress may be changed in the particular circuit being aligned, so as to cause the circuit to resonate within the range of the trimmer. An increase in the capacity-to-ground of the circuit will be required if the iron end of the tuning wand causes an increase of signal output when the air-trimmer plunger is full-out, while a decrease in the capacity-to-ground will be required if the brass end of the tuning wand causes an increase in signal output when the air-trimmer plunger is full-out.

Two methods of alignment are applicable—one requires use of the cathode-ray oscillograph, and the other requires a voltmeter or glow-type indicator. The cathode-ray alignment method is advantageous in that the indication provided is in the form of a wave-image which represents the resonance characteristics of the circuit being tuned. This method is preferred because of the i-f characteristics of this receiver. This type of alignment is possible through use of apparatus such as the RCA Stock No. 9545 Cathode-Ray Oscillograph. If this equipment is not available, an approximate alignment may be performed by the output-indicator method with an instrument such as the RCA Stock No. 4517 Neon Glow Indicator attached across the loud-speaker voice coil. Alignment by this method is similar to the cathode-ray method outlined below except that the receiver volume control should be at maximum, the trimmers adjusted to peak response (with the exception of the wave-trap) and the test-oscillator sweeping operations omitted. Either of these methods require the use of a reliable test oscillator such as the RCA Stock No. 9595.

Alignment Procedure

There are seventeen adjustments required for the alignment of the oscillator, first-detector, and antenna-circuits; one adjustment for the wave-trap; and six adjustments for the i-f system. Fifteen of these adjustments are made with plunger-type air-trimming capacitors and require the use of an RCA Stock No. 12636 Adjusting Tool. Each of these capacitors has a lock nut for securing the plunger in place after adjustment. The remaining nine adjustments are made by means of screws attached to molded magnetic cores. These cores change the inductance of the particular coils in which they are inserted to provide exact alignment. All of these adjustments are accurately made during manufacture and should remain in proper alignment unless affected by abnormal conditions of climate or purported alterations for servicing, or unless altered by other means. Loss of sensitivity, improper tone quality, and poor selectivity are the usual indications of improper alignment. Such conditions will usually exist simultaneously. Correct performance of this receiver can only be obtained when these adjustments have been made by a skilled service engineer with the use of adequate and reliable test equipment. The manufacturer of this receiver has such test equipment available for sale through its distributors and dealers.

The extensive frequency range of this receiver necessitates a more or less involved method of alignment. However, if the following directions are carefully applied in the sequence given, normal performance of the instrument will be obtained.

The plunger-type air-trimming capacitors have their approximate plunger settings tabulated on figure 7. If the plungers have been disturbed from their original adjustments, they may be roughly set to the specified dimensions prior to alignment.

In performing services on the "Magic Brain", the leads should be restored to their original positions, and the lead-dress is important for proper operation and dial calibration.

Precautionary Dressing of Leads for "Magic Brain" Alignment

(Refer to Figure 4)

Band "X"

1. Keep blue lead A of S1 to antenna coil L4-5, dressed away from chassis and from yellow lead X of S1 to antenna coil L4-6.
2. Bus lead from C10 to S1 should be as short as possible.
3. The green lead A of S2 to detector coil L18-19 clear of chassis coil shield, to any other leads.
4. Keep spaghetti lead C6 to X of S1, apart from spaghetti lead of C5 to A of S1, and from chassis.

Band "A"

1. Keep green lead terminal S1 to antenna coil tap L4 chassis, coil shield, and coil.
2. Keep spaghetti lead C5 to A of S1 apart from spaghetti lead C6 to X of S1 and from chassis.

Band "C"

Lead from C10 to oscillator coil L7 should be maintained as short and straight as possible. For alignment, the test-oscillator frequency should be quite accurate. A convenient and reliable means of accurately checking the frequency of test oscil-

oscillator, detector, and antenna air-trimmers C16, C37, and C3, respectively to produce maximum (peak) output as shown by the waves on the oscillograph screen. Shift the oscillograph "Timing" switch to "Ext." Place the frequency-modulator sweep-range switch to its "Le" position and insert plug of the frequency-modulator cable in test-oscillator jack. Turn test-oscillator modulation switch to "Off." Re-tune the test oscillator (increase frequency) until the forward and reverse waves show on the oscillograph screen and become coincident at their highest points. This will occur at a test-oscillator setting of approximately 1,680 kc. Adjust air-trimmers C16, C37, and C3 again, setting each to the point which produces the best coincidence and maximum amplitude of the images.

(h) Remove the plug of the frequency-modulator cable from the test-oscillator jack. Turn test-oscillator modulation switch to "On." Set oscillograph "Timing" switch to "Int." Tune test oscillator to 200 kc (200-400-kc range). Tune receiver for maximum response to this signal at a dial reading of approximately 600 kc. The third harmonic of the 200-ke signal is used for this adjustment. Shift oscillograph "Timing" switch to "Ext." Insert the plug of the frequency-modulator cable in test-oscillator jack. Turn test-oscillator modulation switch to "Off." Re-tune the test oscillator (increase frequency) until the forward and reverse waves show on the oscillograph screen. This will occur at a test-oscillator setting of approximately 230 kc. Disregarding the fact that the two images may or may not come together, adjust the oscillator magnetite core screw L9 (top of large oscillator coil can) to produce maximum (peak) amplitude of the images. Shift the oscillograph "Timing" switch to "Int." Remove the plug of the frequency-modulator cable from the test-oscillator jack. Turn the test-oscillator modulation switch to "On." Repeat adjustments in (g) above to compensate for any changes caused by the adjustment of L9 core, tightening lock nuts on C16, C37, and C3, respectively, after each is adjusted.

"Long Wave" Band

(i) Shift the oscillograph "Timing" switch to "Int." Remove the plug of the frequency-modulator cable from the test-oscillator jack. Turn the test-oscillator modulation switch to "On." Place receiver range selector to its "Long wave" position. Set the receiver dial pointer to 175 kc. Tune the test oscillator to 175 kc and increase its output until a deflection is noticeable on the oscillograph screen. Adjust oscillator magnetite core screw L10 (located on top of small oscillator coil can) so that maximum (peak) amplitude of output is shown on the oscillograph screen.

(j) Set receiver dial pointer to 350 kc. Tune test oscillator to 350 kc. Adjust the oscillator, detector, and antenna air-trimmers C18, C38, and C6 to produce maximum (peak) output as shown by the waves on the oscillograph screen. Without disturbing the connections, shift the oscillograph "Timing" switch to "Ext." Place the frequency-modulator sweep-range switch to its "Hi" position and insert plug of frequency-modulator cable in test-oscillator jack. Turn test-oscillator modulation switch to "Off." Re-tune the test oscillator (decrease frequency) until the

spacing between the grounded end (strap) of L22 and the strap connected from C41 to control on S2 (figure 4). An increase of spacing will increase the inductance, while a decrease of spacing will decrease the inductance. Adjust the spacing until maximum (peak) output results. Replace "Magic Brain" bottom cover and repeat adjustments in (b) prior to those of "Short wave" band.

"Short Wave" Band

(k) Set the receiver range selector to its "Short wave" position and its dial pointer to 20,000 kc. Adjust the test oscillator to 20,000 kc. Adjust oscillator air-trimmer C13 until maximum (peak) output is reached. Two peaks may be found with this circuit. The peak with maximum capacitance (plunger near out) should be used. Tighten lock nut. Adjust detector air-trimmer C35 until maximum (peak) output is reached, while slightly rocking the gang tuning condenser back and forth through the signal. Two peaks may be found with this circuit. The peak with maximum capacitance (plunger near in) should be used. Tighten lock nut. Adjust antenna air-trimmer C3 until maximum (peak) output is reached while slightly rocking the gang tuning condenser back and forth through the signal. Two peaks may be found with this circuit. The peak with maximum capacitance (plunger near in) should be used. Tighten lock nut and forth through the signal. Two peaks may be found with this circuit. The peak with maximum capacitance (plunger near in) should be used. Tighten lock nut. Two peaks may be found with this circuit. The peak with maximum capacitance (plunger near in) should be used. Tighten lock nut. Check the image frequency by changing the receiver dial setting to 19,080 kc. The image signal should be adjusted at this position indicating that the adjustment of C3 has been correctly made. No adjustments should be made while checking for the image signal.

"Medium Wave Band"

(l) Place receiver range selector to its "Medium wave" position with its dial pointer set to 6,000 kc. Tune the test oscillator to 6,000 kc. Adjust oscillator air-trimmer C14 to produce maximum (peak) output as shown by the waves on the oscillograph. Two peaks may be found with this circuit. The peak with minimum capacitance (plunger near out) should be used. Tighten lock nut. Adjust the detector air-trimmer C36 for maximum (peak) output while slightly rocking the gang tuning condenser back and forth through the signal. Two peaks may be found with this circuit. The peak with maximum capacitance (plunger near in) should be used. Tighten lock nut. Adjust antenna air-trimmer C4 to produce maximum (peak) output. Tighten lock nut.

"Standard Broadcast" Band

(m) Remove the 300-ohm resistor from between the test-oscillator "Ant" post and receiver antenna terminal "A1" and insert a 300-mfd capacitor in its place. Place receiver range selector to "Standard broadcast" position with receiver dial pointer set to 600 kc. Tune the test oscillator to 600 kc. Adjust oscillator coil can for maximum (peak) output as shown by the waves on the oscillograph screen.

(n) Set receiver dial pointer to 1,500 kc. Tune test oscillator to 1,500 kc (1,500-3,100-ke range) and increase its output to produce a registration on the oscillograph screen. Carefully adjust the

Adjust oscillator air-trimmer C23 for maximum (peak) output. Two positions, each producing maximum output, may be found. The position of minimum capacitance (plunger near out) should be used. This places the receiver heterodyne oscillator 460 kc higher in frequency than the incoming signal. Tighten lock nut. Adjust the detector air-trimmer C39, while slightly rocking the gang tuning condenser back and forth through the signal, for maximum (peak) output. Two peaks may be found on this trimmer. The peak of maximum capacitance (plunger near in) should be used. Tighten lock nut. Check the image frequency by changing the receiver dial setting to 56,080 kc. If the image signal is received at this position, the adjustment of the oscillator air-trimmer C23 has been correctly made. No adjustments should be made while checking for the image signal.

(c) Re-tune receiver for maximum response to the 37,000 kc input signal (not image response) without disturbing test-oscillator adjustments. Change test oscillator to 6,800-14,000 kc range. Tune test oscillator until signal is heard in speaker (should occur at approximately 14,250 kc, fourth harmonic of test oscillator used). Two test-oscillator settings (230 kc apart) will produce a signal at this point. The lower frequency test-oscillator setting should be used as this places the test-oscillator harmonic 460 kc below the frequency of the receiver heterodyne oscillator. Tune receiver for maximum response at a dial setting of approximately 28,500 kc (image should tune in at a dial setting approximately 27,580 kc) without altering test-oscillator adjustment. Test oscillator second harmonic of 14,250 kc is used for the following check. Check calibration of receiver dial. A receiver-dial reading of less than 28,500 kc indicates that the inductance of the oscillator secondary coil L11 is too low and should be increased. If the receiver dial reading is greater than 28,500 kc, the inductance of L11 is too high and should be decreased. If it is necessary to change the inductance of L11, first remove bottom cover of "Magic Brain" and then set receiver dial pointer to 28,500 kc. To decrease inductance, move the grounded ends (straps) of L11 and L12 (see figure 4) nearer chassis. Do not allow straps to touch chassis except where connected. To increase inductance, move the straps farther away from chassis. Adjust position of straps until maximum (peak) output results. The alignment of the detector tuned circuit should not be checked at 28,500 kc without changing either the receiver or test-oscillator adjustments. An increase of output when the brass end of a tuning wand is brought near L22 indicates that L22 is too high in inductance, while an increase when the iron end is brought near the coil indicates that the inductance is too low. The inductance of L22 may be varied by changing the

tus, shift the "Ant" output of the test oscillator to the input of the *f* system, i.e., to the grid cap of the RCA-9L7 first-detector, (with grid lead in place) through a .001-mfd. capacitor. Regulate the test-oscillator output so the amplitude of the oscillographic image is approximately the same as used for adjustment (h) above.

(g) The two first *f*-transformer magnetite core screws L25 and L24 (one on top and one on bottom) should then be adjusted so that they cause the forward and reverse waves to coincide throughout their lengths and have maximum amplitude.

(k) Note width of oscillographic image at a point which is 50% of maximum amplitude. Turn receiver fidelity control to extreme clockwise position. Note width of oscillographic image at a point which is 50% of maximum amplitude. Under normal conditions the latter measurement should be approximately 60% greater in width than the former measurement. The image should also appear slightly double humped. These conditions indicate proper broadening of the band width of the *f* amplifier. Turn range selector to "Medium wave" (B) band and note increase of amplitude. The amplitude should increase several times. It may be necessary to decrease output of test oscillator to keep image on screen. Turn receiver fidelity control to extreme counter-clockwise position and proceed to "R-F Adjustments."

R-F Adjustments

Make receiver dial adjustments as outlined by "Selector dial," figure 12. Alignment must be made in sequence of "Wave trap," "Ultra short wave" band, "Short wave" band, "Medium wave" band, "Standard broadcast" band, and "Long wave" band.

"Wave Trap" Adjustment

(a) Connect the "Ant" output of the test oscillator to the antenna terminal "A1" through a 200-mfd. (important) capacitor. Remove the plug of the frequency-modulator cable from the test-oscillator jack. Turn test-oscillator modulation switch to "On." Shift the oscillograph "Timing" switch to "Int." Place receiver range selector in "Standard broadcast" position. Set the receiver dial to a position of no extraneous signals near 600 kc. Tune the test oscillator to 460 kc. Adjust the wave-trap magnetite core screw L1 to the point which causes minimum amplitude of output (maximum suppression of signal) as shown by the waves on the oscillograph. An increase of the test-oscillator output may be necessary before this point of minimum amplitude, obtained by correct adjustment of wave-trap screw, becomes apparent on oscillograph screen.

"Ultra Short Wave" Band

(b) Connect the "Ant" output of the test oscillator to the antenna terminal "A1" of the receiver through a 300-ohm resistor. Set the receiver range selector to its "Ultra short wave" position and its dial pointer to 57,000 kc. Adjust the test oscillator to 19,000 kc. The third harmonic of 19,000 kc is used for this adjustment.

The prices quoted above are subject to change without notice.

forward and reverse waves show on the oscillograph screen and become coincident at their highest points. This will occur at a test-oscillator setting of approximately 198 kc. This setting places the test-oscillator frequency to 175 kc. The second harmonic is now used for the 350 kc. adjustment. Adjust air trimmers C18, C36, and C6, again, to produce maximum amplitude of the images where they best coincide throughout their lengths.

(k) Re-tune the receiver to approximately 175 kc so that the forward and reverse waves appear on the oscillograph screen. Adjust the oscillator magnetron core screw L10 to produce maximum (peak) amplitude of the waves, disregarding the fact that the two images may or may not come together.

(l) Shift the receiver dial setting to 350 kc without altering any other adjustments (frequency modulator still in operation). Adjust air-trimmers C18, C36, and C6, respectively, to produce maximum amplitude and best coincidence for any waves. These adjustments compensate for any changes caused by the adjustment of the magnetron core screw L10. Tighten lock nuts on C18, C36, and C6, respectively, after each is adjusted.

Loudspeaker

Centering of the loudspeaker voice coil is made in the usual manner with three narrow paper feelers after first removing the front paper dust cover. This may be removed by softening its cement with a very light application of acetone using care not to allow the acetone to flow down into the air gap. The dust cover may be cemented back in place with ambroid upon completion of adjustment.

Antenna and Ground Terminals

These receivers are equipped with an antenna-ground terminal board having three terminals. These terminals are marked "A2," "A1," and "G," the latter being the ground terminal and should always be connected to a good external ground. The transmission-line leads of the RCA RK-40A antenna system should be connected to terminals "A2" and "A1." The receiver coupling units of the RCA RK-40 and the RCA SpiderWeb antenna systems should be connected to terminals "A1" and "G." Connect a single-wire antenna to terminal "A1."

General Description

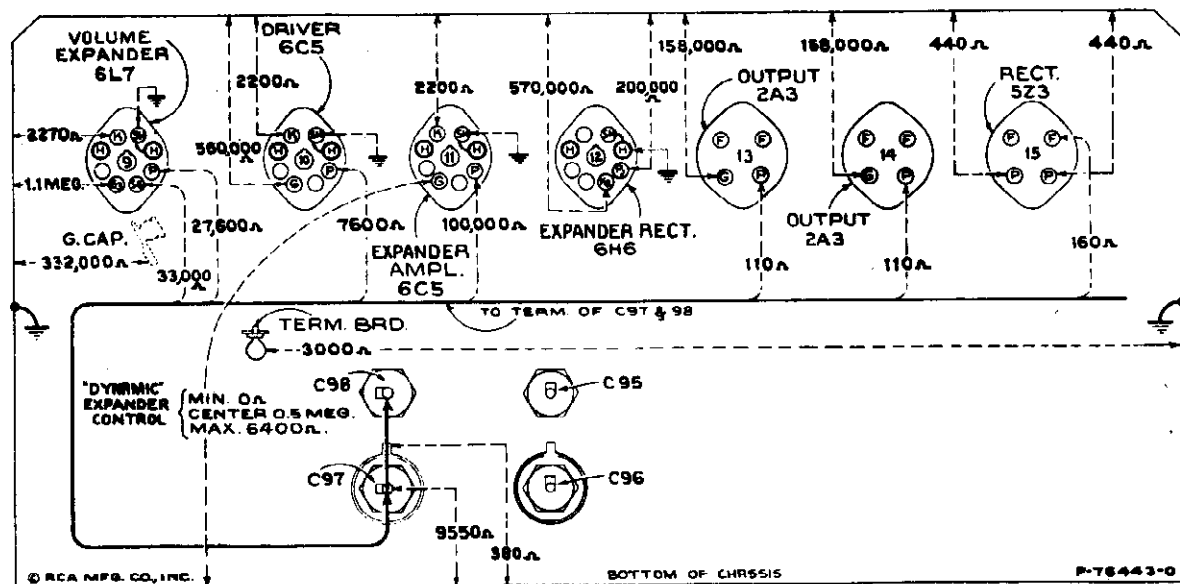

The Model 15U Phonograph-Radio Combination employs all of the latest developments in the art of record and radio reproduction. A few of the design features include higher-fidelity reproduction from both records and radio; the revolutionary dynamic expander; "Magic Brain"; improved automatic record

changer; selector dial; "Magic Voice"; magnetite-core i-f transformers, wave-trap, and low-frequency oscillator tracking adjustments; new plunger-type air trimmers; and a super 12-inch electrodynamic loudspeaker with aluminum voice coil and high-frequency tone diffuser.

switch either position

Resistance Measurements

The resistance values shown between Radiotron socket contacts, grid caps, resistors, and terminals to chassis ground or other pertinent point on figure 10, permit a rapid continuity check of the circuits. The use of this diagram in conjunction with the Schematic Circuit Diagram, figure 1, and Wiring Diagrams, figures 2, 4, and 5, will permit the location of certain troubles which might otherwise be difficult to ascertain. Each value as specified should hold within $\pm 20\%$. Variations in excess

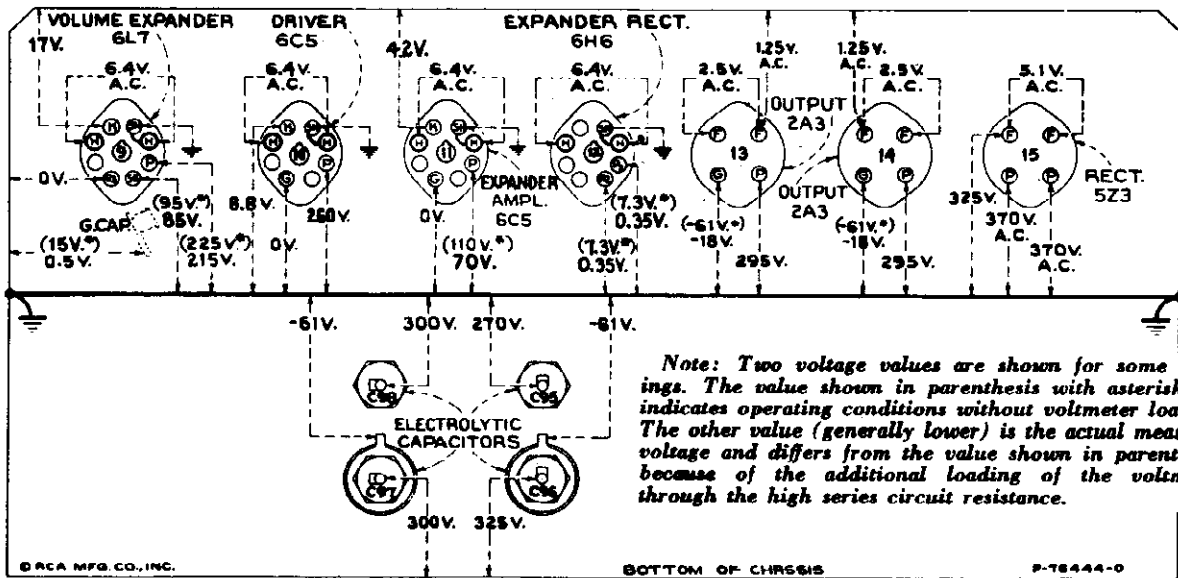

of this limit will usually be indicative of trouble in circuit under test. When measuring the resistance between points of the circuit and ground, it will be necessary to connect the negative terminal of the resistance meter to chassis-ground. If the polarity of the resistance meter is not known, it may be readily ascertained by connecting a d-c voltmeter of indicated polarity across the terminals of the device.

MODEL 15U
Automatic Record Changer
Details, Notes

ADJUST TRIP ROD TO OBTAIN 1/16" CLEARANCE FROM MOTOR BOARD.

ADJUST SCREW UNTIL FRICTION WILL JUST FORCE FINGER TO MOVE TRIP PAWL (WITH COVER REMOVED)

TO ADJUST MANUAL INDEX FINGER - PLACE MANUAL INDEX LEVER IN THE POSITION SHOWN - SET MANUAL INDEX FINGER TO FORCE TRIP PAWL AGAINST STOP PIN - TIGHTEN SET SCREW.

ADJUST AUTOMATIC SWITCH AS FOLLOWS - PLACE MANUAL INDEX LEVER IN POSITION SHOWN AND WITH SWITCH IN TRIPPED POSITION, ADJUST IT UNTIL THE CONTACT POINTS ARE OPENED .020" ± .010 AS INDICATED (TURNABLE REMOVED)

ADJUST SCREW UNDER FRONT END OF TONE-ARM BRACKET SO THAT FORCE REQUIRED TO JUST LIFT THE NEEDLE FROM RECORD IS 72 ± 3 GRAMS (2.5 OUNCES). WEIGHT MEASURED WITH SCALE HOOKED UNDER NEEDLE SCREW.

ADJUSTING SCREW
EJECTOR TIP
FIBER CENTER
RUBBER SILENCER
EJECTOR TIP
RETAINING NUT
EJECTOR TIP SHOULD ROTATE FREELY

TO ADJUST RISE AND SWING OF TONE ARM - WITH MANUAL INDEX LEVER IN 12" POSITION AND ROLLER ON MAIN LEVER A ENGAGED IN CAM AT HALF CYCLE POSITION AS SHOWN, ADJUST STOP SCREW C, ADJUST EYEBOLT D UNTIL LIFT STOP 'E' CONTACTS SLIDE AT THE SAME TIME ADJUST SCREW C SO THAT NEEDLE LANDS AT A RADIUS OF 537/16" + 1/16" - .000 FROM CENTER OF TURNABLE SPINDLE.

WITH MOTOR BOARD LEVEL, BRING POINTER ON SPACER IN LINE WITH SCREW AS SHOWN. IF NEEDLE SLIDES OVER SEVERAL GROOVES, ROTATE SPACER COUNTER-CLOCKWISE UNTIL NOT FAR ENOUGH TO PREVENT NEEDLE FROM FEEDING INTO FIRST GROOVE AUTOMATICALLY.

ADJUST SCREW SO EJECTOR TIP IS DIRECTLY ABOVE SPINDLE

ADJUST EJECTOR TIP WITH RUBBER SILENCER REMOVED

(Lubricate motor bearings with light machine oil)

IF ROLLER FAILS TO ROLL BACK DURING AUTOMATIC CYCLE, ADJUST SCREW UPWARD TO PROVIDE A GREATER INCLINE DURING THE CYCLE. DO NOT ADJUST SO HIGH AS TO CAUSE EJECTOR TIP TO FAIL TO TOUCH TOP OF TURNABLE FELT AT HIGH-EST POINT.

END OF EJECTOR TIP FIBER CENTER SHOULD BE FLUSH WITH EJECTOR TIP.

Figure 13—Automatic Record Changer Adjustments

Alignment Procedure

There are seventeen adjustments required for the alignment of the oscillator, first-detector and antenna circuits; one adjustment for the wave-trap; and six adjustments for the i-f system. Fifteen of these adjustments are made with plunger-type air-trimmer capacitors and require the use of an RCA Stock No. 12646 Adjusting Tool. Each of these capacitors has a lock out for securing the plunger in place after adjustment. The remaining nine adjustments are made by means of screws attached to milled magnetic cores. These cores change the inductance of the particular coils in which they are inserted to provide exact alignment. All of these adjustments are accurately made during manufacture and should remain in proper alignment unless affected by abnormal conditions of climate or other means. Loss of sensitivity, improper tone quality, and poor selectivity are the usual indications of improper alignment. Such conditions will usually exist simultaneously. Correct performance of this receiver can only be obtained when these adjustments have been made by a skilled service engineer with the use of adequate and reliable test equipment. The manufacturer of this receiver has such test equipment available for sale through its distributors and dealers.

The extensive frequency range of these receivers necessitates a more or less involved method of alignment. However, if the following directions are carefully applied in the sequence given, normal performance of the increments will be obtained.

The plunger-type air-trimmer capacitors have their approximate plunger settings tabulated on figure 8. If the plungers have been disturbed from their original adjustments, they may be roughly set to the specified dimensions prior to alignment.

In performing services on the "Magic Brain", the leads should be restored to their original positions, since the lead-dress is important for proper operation and dial calibration.

Precautionary Dressing of Leads for "Magic Brain" Alignment
(Refer to Figure 4)

1. Keep blue lead A of S1 to antenna coil L4-5 dressed away from chassis, and from yellow lead X of S1 to antenna coil L5-6.
 2. Bus lead from G10 to S1 should be as short as possible.
 3. Keep blue lead A of S1 to detector coil L18-19 clear of chassis, and third coil of S1.
 4. Keep spaghetti lead C6 to X of S1 apart from spaghetti lead C5 to A of S1, and from chassis.
- Lead "A"**
1. Keep green lead terminal S1 to antenna coil tap L4 away from chassis, coil shield, and coil.
 2. Keep spaghetti lead C5 to A of S1 apart from spaghetti lead C6 to X of S1, and from chassis.

Lead "X"

If for alignment, the test-oscillator frequency should be quite accurate. A convenient and reliable means of accurately checking the frequency of test oscillators, meters, etc., is the RCA Stock No. 9572 Crystal Calibrator.

If the test-oscillator signal cannot be heard as the speaker (heterodyne) oscillator air-trimmer plunger is changed from its minimum-capacity to maximum-capacity position (receiver dial and test oscillator set to the specified frequencies, and the correct oscillator

on figure 2. Set oscillograph power switch to "On" and adjust "Intensity" and "Focus" controls to give a clearly defined spot, or line, on the screen. Set oscillograph "Amp. A" switch to "On." Vertical gain control full-clockwise, "Amp. B" switch to "Timing." "Range" switch to No. 2 position, and "Timing" switch to "Int." Place the "Sync." control, and "Horizontal gain" control to about their mid-positions. For each of the following adjustments, the test-oscillator output must be regulated so that the image obtained on the oscillograph screen will be of the minimum size for accurate observation. The receiver volume-control setting is optional.

I-F Adjustments

- (a) Set "Fidelity" control to counter-clockwise position, "Radio-Phono" switch to "Radio," and "Range Selector" to "Standard Broadcast" band. Connect the "Ant." output of the test oscillator to the grid cap of RCA-6K7 second i-f tube (with grid lead in place) through a .001-mfd. capacitor, with "Grid" to receiver chassis. Tune the test oscillator to 460 kc and place its modulation switch to "On" and its output switch to "Hi."
- (b) Turn on the receiver and test oscillator. Increase the output of the test oscillator until a deflection is noticeable on the oscillograph screen. The figures obtained represent several waves of the detected signal, the amplitude of which may be observed as an indication of output. Cause the wave-image formed (400-cycle waves) to be spread completely across the screen by adjusting the "Horizontal gain" control. The image should be synchronized and made to remain motionless by adjusting the "Sync." and "Freq." controls.
- (c) Adjust the two magnetic core screws L29 and L28 (see figures 3 and 11) of the third i-f transformer (one on top and one on bottom) to produce maximum vertical deflection of the oscillographic image. This adjustment places the transformer in exact resonance with the 460-kc signal.
- (d) The sweeping operation should follow using the frequency modulator. Shift the oscillograph "Timing" switch to "Ext." Insert plug of frequency-modulator cable in test-oscillator jack. Turn the test-oscillator modulation switch to "Off." Turn on the frequency modulator and place its sweep-range switch to "Hi."
- (e) Increase the frequency of the test oscillator by slowly turning its tuning control until two separate, distinct, and similar waves appear on the screen. If only one wave appears, increase the "Freq." control on the oscillograph to obtain two waves. These waves will be identical in shape, totally disconnected, and appear in reversed positions. They will have a common base line, which is discontinuous. Adjust the "Freq." and "Sync." controls of the oscillograph to make them remain motionless on the screen. Continue increasing the test-oscillator frequency until these forward and reverse curves move together and overlap with their highest points exactly coincident. This condition will be obtained at a test-oscillator setting of approximately 575 kc.
- (f) With the images established as in (e), readjust the two magnetic core screws L29 and L28 on the third i-f transformer so that they cause the

curves on the oscillograph screen to become exactly coincident throughout their lengths and have maximum amplitude.

(g) Without altering the adjustments of the apparatus, shift the "Ant." output of the test oscillator to the grid cap of the RCA-6K7 first i-f tube (with grid lead in place), through a .001-mfd. capacitor. Regulate the test-oscillator output so that the amplitude of the oscillographic image is approximately the same as used for adjustment (f) above.

(h) The two second i-f transformer magnetic core screws L27 and L26 (one on top and one on bottom) should then be adjusted so that they cause the forward and reverse curves to become coincident throughout their lengths and have maximum amplitude.

(i) Without altering the adjustments of the apparatus, shift the "Ant." output of the test oscillator to the input of the i-f system, i.e., to the grid cap of the RCA-6L7 first-detector, (with grid lead in place) through a .001-mfd. capacitor. Regulate the test-oscillator output so that the amplitude of the oscillographic image is approximately the same as used for adjustment (h) above.

(j) The two first i-f transformer magnetic core screws L25 and L24 (one on top and one on bottom) should then be adjusted so that they cause the forward and reverse waves to become coincident throughout their lengths and have maximum amplitude.

(k) Note width of oscillographic image at a point which is 50% of maximum amplitude. Turn receiver fidelity control to extreme clockwise position. Note width of oscillographic image at a point which is 50% of maximum amplitude. Under normal conditions the latter measurement should be approximately 60% greater in width than the former measurement. The image should also appear slightly double humped. These conditions indicate proper broadening of the band width of the i-f amplifier. Turn range selector to "Medium wave" (B) band and note increase of amplitude. The amplitude should increase several times. It may be necessary to decrease output of test oscillator to keep image on screen. Turn receiver fidelity control to extreme counter-clockwise position and proceed to "R-F Adjustments."

R-F Adjustments

Make receiver dial adjustments as outlined by "Selector dial," figure 14. Alignment must be made in sequence of "Wave-trap," "Ultra short wave band," "Short wave" band, "Medium wave" band, "Standard broadcast" band, and "Long wave" band.

"Wave-Trap" Adjustment

(a) Connect the "Ant." output of the test oscillator to the antenna terminal "A1" through a 200-mmf. (important) capacitor. Remove the plug of the frequency-modulator cable from the test-oscillator jack. Turn test-oscillator modulation switch to "On." Shift the oscillograph "Timing" switch to "Int." Place receiver range selector in "Standard broadcast" position. Set the receiver dial to a position of no extraneous signals near 600 kc. Tune the test oscillator to 450 kc. Adjust the wave-trap magnetic core screw L1 to the point which causes minimum amplitude of output (maximum suppression of signal) as shown

Cathode-Ray Alignment

Make alignment apparatus connections shown on figure 6. Remove the plug of the frequency-modulator cable from the test-oscillator jack. Connect the receiver chassis to a good external ground. Connect oscillograph "Vertical" output terminals as indicated

by the waves on the oscillograph. An increase of the test-oscillator output may be necessary before this point of minimum amplitude, obtained by correct adjustment of wave-trap screw, becomes apparent on oscillograph screen.

"Ultra Short Wave" Band

(b) Connect the "Ant." output of the test oscillator to the antenna terminal "A1" of the receiver through a 300-ohm resistor. Set the receiver range selector to its "Ultra short wave" position and its dial pointer to 57,000 kc. Adjust the test oscillator to 19,000 kc. The third harmonic of 19,000 kc is used for this adjustment.

Adjust oscillator air-trimmer C23 for maximum (peak) output. Two positions, each producing maximum output, may be found. The position of minimum capacitance (plunger near out) should be used. This places the receiver heterodyne oscillator 460 kc higher in frequency than the incoming signal. Tighten lock nut. Adjust the detector air-trimmer C19, while slightly rocking the gang tuning condenser back and forth through the signal, for maximum (peak) output. Two peaks may be found on this trimmer. The peak of maximum capacitance (plunger near in) should be used. Tighten lock nut. Adjust the antenna air-trimmer C10 for maximum (peak) output while slightly rocking the gang tuning condenser back and forth through the signal. Two peaks may be found on this trimmer which produce maximum output. The peak with maximum capacitance (plunger near in) should be used. Tighten lock nut. Check the image frequency by changing the receiver dial setting to 56,080 kc. If the image signal is received at this position, the adjustment of the oscillator air-trimmer C13 has been correctly made. No adjustments should be made while checking for the image signal.

(c) Re-tune receiver for maximum response to 57,000 kc (see image response). Without disturbing test-oscillator adjustments, change test oscillator to 6,600-14,000 kc range. Tune test oscillator until signal is heard in speaker (should occur at approximately 14,250 kc, fourth harmonic of test oscillator used). Two test-oscillator settings (230 kc apart) will produce a signal at this point. The lower frequency test-oscillator setting should be used, as this places the test oscillator harmonic 460 kc below the frequency of the receiver heterodyne oscillator. Tune receiver for maximum response at a dial setting of approximately 28,500 kc (image should tune in at a dial setting approximately 27,580 kc) without altering test-oscillator adjustment. Test oscillator second harmonic of 14,250 kc is used for the following check. Check calibration of receiver dial. A receiver-dial reading of less than 28,500 kc indicates that the inductance of the oscillator secondary coil L11 is too low and should be increased. If the receiver dial reading is greater than 28,500 kc, the inductance of L11 is too high and should be decreased. If it is necessary to change the inductance of L11, first remove bottom cover of "Magic Brain" and then set receiver dial pointer to 28,500 kc. To decrease inductance, turn the grounded ends (straps) of L11 and L12 (see figure 4) nearer chassis. Do not allow straps to touch chassis except where connected. To increase inductance, move the straps farther away from chassis. Adjust post-

tion of straps until maximum (peak) output results. The alignment of the detector tuned circuit should next be checked at 28,500 kc without changing either the receiver or test oscillator adjustments. An increase of output when the band end of a tuning wave is brought near 4.22 indicates that L22 is too high in inductance, while an increase when the iron end is brought near the coil indicates that the inductance is too low. The inductance of L22 may be varied by changing the spacing between the grounded end (strap) of L22 and the strap connected from C41 to contact on S2 (figure 4). An increase of spacing will increase the inductance, while a decrease of spacing will decrease the inductance. Adjust the spacing until maximum (peak) output results. Replace "Magic Brain" bottom cover and repeat adjustments in (b) prior to those of "Short Wave" Band.

"Short Wave" Band

(d) Set the receiver range selector to its "Short wave" position and its dial pointer to 20,000 kc. Adjust the test oscillator to 20,000 kc. Adjust oscillator air-trimmer C13 until maximum (peak) output is reached. Two peaks may be found with this circuit. The peak with minimum capacitance (plunger near out) should be used. Tighten lock nut. Adjust detector air-trimmer C35 until maximum (peak) output is reached, while slightly rocking the gang tuning condenser back and forth through the signal. Two peaks may be found with this circuit. The peak with maximum capacitance (plunger near in) should be used. Tighten lock nut. Adjust antenna air-trimmer C3 until maximum (peak) output is reached while slightly rocking the gang tuning condenser back and forth through the signal. Two peaks may be found with this circuit. The peak with maximum capacitance (plunger near in) should be used. Tighten lock nut. Check the image frequency by changing the receiver dial setting to 19,080 kc. The image signal should be received at this position indicating that the adjustment of C13 has been correctly made. No adjustments should be made while checking for the image signal.

"Medium Wave" Band

(e) Place receiver range selector to its "Medium wave" position with its dial pointer set to 6,000 kc. Tune the test oscillator to 6,000 kc. Adjust oscillator air-trimmer C14 to produce maximum (peak) output as shown by the waves on the oscillograph. Two peaks may be found with this circuit. The peak with minimum capacitance (plunger near out) should be used. Tighten lock nut. Adjust the detector air-trimmer C16 for maximum (peak) output while slightly rocking the gang tuning condenser back and forth through the signal. Two peaks may be found with this circuit. The peak with maximum capacitance (plunger near in) should be used. Tighten lock nut. Adjust antenna air-trimmer C4 to produce maximum (peak) output. Tighten lock nut.

"Standard Broadcast" Band

(f) Remove the 300-ohm resistor from between the test-oscillator "Ant." post and receiver antenna terminal "A1" and insert a 200-mmf. capacitor in its place. Place receiver range selector to

"Standard broadcast" position with receiver dial pointer set to 600 kc. Tune the test oscillator to 600 kc. Adjust oscillator magnetic core screw L9 (top of large oscillator coil can) for maximum (peak) output as shown by the waves on the oscillograph screen.

(g) Set receiver dial pointer to 1,500 kc. Tune test oscillator to 1,500 kc (1,500-3,100-kc range) and increase its output to produce a registration on the oscillograph screen. Carefully adjust the oscillator, detector, and antenna air-trimmers C16, C17, and C3, respectively, to produce maximum (peak) output as shown by the waves on the oscillograph screen. Shift the oscillograph modulator sweep-range switch to its "Lo" position and insert plug of the frequency-modulator cable in test-oscillator jack. Turn test-oscillator modulation switch to "Off". Re-tune the test oscillator (increase frequency) until the forward and reverse waves show on the oscillograph screen and become coincident at their highest points. This will occur at a test-oscillator setting of approximately 1,680 kc. Adjust trimmers C16, C17, and C3 again, setting each to the point which produces the best coincidence and maximum amplitude of the images.

(h) Remove the plug of the frequency-modulator cable from the test-oscillator jack. Turn test-oscillator modulation switch to "On". Set test-oscillator "Timing" switch to "Int.". Tune test oscillator to 200 kc (200-400-kc range). Tune receiver for maximum response to this signal at a dial reading of approximately 600 kc. The third harmonic of the 200-kc signal is used for this adjustment. Shift oscillograph "Timing" switch to "Ext.". Insert the plug of the frequency-modulator cable in test-oscillator jack. Turn test-oscillator modulation switch to "Off". Re-tune the test oscillator (increase frequency) until the forward and reverse waves show on the oscillograph screen. This will occur at a test-oscillator setting of approximately 230 kc. Disregarding the fact that the two images may or may not come together, adjust the oscillator magnetic core screw L9 (top of large oscillator coil can) to produce maximum (peak) amplitude of the images. Shift the oscillograph "Timing" switch to "Int.". Remove the plug of the frequency-modulator cable from the test-oscillator jack. Turn the test-oscillator modulation switch to "On". Repeat adjustments in (g) above to compensate for any changes caused by the adjustment of L9 core, tightening lock nuts on C16, C17, and C3, respectively after each is adjusted.

"Long Wave" Band

(i) Shift the oscillograph "Timing" switch to "Int.". Remove the plug of the frequency-modulator cable from the test-oscillator jack. Turn the test-oscillator modulation switch to "On". Place receiver range selector to its "Long wave" position. Set the receiver dial pointer to 175 kc. Tune the test oscillator to 175 kc and increase its output until a deflection is noticeable on the oscillograph screen. Adjust oscillator magnetic core screw L10 (located on top of small oscillator coil can) to that maximum (peak) amplitude of output is shown on the oscillograph screen.

(j) Set receiver dial pointer to 350 kc. Tune test oscillator to 350 kc. Adjust the oscillator detector, and antenna air-trimmers C18, C38, and

C6 to produce maximum (peak) output as shown by the waves on the oscillograph screen. Without disturbing the connections, shift the oscillograph "Timing" switch to "Ext.". Place the frequency-modulator sweep-range switch to its "Hi" position and insert plug of frequency-modulator cable in test-oscillator jack. Turn test-oscillator modulation switch to "Off". Re-tune the test oscillator (decrease frequency) until the forward and reverse waves show on the oscillograph screen and become coincident at their highest points. This will occur at a test-oscillator setting of approximately 198 kc. This setting places the test-oscillator frequency to 175 kc. The second harmonic is now used for the 350 kc adjustment. Adjust air-trimmers C18, C38, and C6, again, to produce maximum amplitude of the images and best coincidence throughout their lengths.

(k) Re-tune the receiver to approximately 175 kc so that the forward and reverse waves appear on the oscillograph screen. Adjust the oscillator magnetic core screw L10 to produce maximum (peak) amplitude of the waves, disregarding the fact that the two images may or may not come together.

(l) Shift the receiver dial setting to 350 kc without altering any other adjustments (frequency modulator still in operation). Adjust air-trimmers C18, C38, and C6, respectively, to produce maximum amplitude and best coincidence of the waves. These adjustments compensate for any changes caused by the adjustment of the magnetic core screw L10. Tighten lock nuts on C18, C38, and C6, respectively, after each is adjusted.

Dynamic Amplifier Adjustments

It is essential that correct voltages and currents exist at the RCA-6L7 audio expander stage in order that the expanding function may take place in the proper manner. A screw-driver adjustment is accordingly provided to regulate the RCA-6L7 control grid. No. 3 bias to the correct operating value. Two methods of adjustment are applicable. Either method requires a normal voltage of 300 volts across the filter output. The one to be preferred (a) requires the use of an RCA Stock No. 9633 Beat-Frequency Oscillator or the equivalent, a 100-ohm resistor, a 200-ohm resistor, and a 1,000-ohm-per-volt a.c. voltmeter (rectifier-type) having a "low" range of 1.0 volt and a "high" range of 240 volts or greater. The less accurate method (b) requires the use of an RCA Stock No. 12353 Split-Plate Adapter and a suitable d.c. milliammeter. Both of these procedures are outlined below. CAUTION: Before using either method, be sure that power-supply fuse is in proper position for the line voltage.

(a) Preferred Method

Turn power switch off. Connect the 200-ohm and the 100-ohm resistors in series between the beat-frequency oscillator terminals (upper "250" and "CT") with the 100-ohm resistor connected to "CT". Calibrate the beat-frequency oscillator, adjust it to 1,000 cycles, and reduce its output. Connect the 1,000-ohm-per-volt a.c. voltmeter (1-volt range) to the beat-frequency oscillator terminals (upper "250" and "CT"). Remove the male plug from the receptacle on the shielded cable running be-

MODEL 15U

Alignment, Page 3
Notes, Oscillograms

RCA MFG. CO., INC.

mechanism from the tone arm, and then remove the magnet assembly. Place the magnet assembly on the poles of a standard pickup magnetizer such as the RCA Stock No. 9549 Pickup Magnetizer and charging the magnet in accordance with the instructions accompanying the magnetizer. It is preferable to check the polarity of the pickup magnet and to remagnetize it so that the same polarity is maintained.

Automatic Record Ejector

The record changing mechanism is designed to be simple and fool-proof. Under normal operating conditions, service difficulties should be negligible. Occasionally, however, certain adjustments may be required. These adjustments are illustrated and explained in figure 13.

It is important when servicing the automatic mechanism, to have it placed on a level support. It is also important to refrain from forcing the mechanism if there is a tendency to bind or jam, since bent levers and possibly broken parts may result.

The tip of the record ejector is adjustable in relation to the turntable spindle, the two being coaxial when properly adjusted. To align the tip, remove the rubber silencer of the ejector assembly, loosen the ejector tip retaining nut and slide the tip assembly to the position where it is in true-line with the axis of the turntable spindle. This adjustment may be depressed by placing several records on the turntable, depressing the spindle through the top record hole and lining up the ejector tip in the spindle hole of the record.

To insure that the ejector tip rotates freely, apply a slight amount of oil to the shank of the tip at the point where it is in contact with the ball bearing.

Figure 7-1-F Alignment Oscillogram Curves

- A—Correct curve showing proper i-f alignment as obtained with fidelity control counter-clockwise.
- B—Incorrect curve similar to A showing improper alignment of i-f system caused by one or more circuits being slightly detuned.
- C—Correct showing broadening of curve. A obtained when fidelity control is rotated fully clockwise.
- D—Incorrect curve showing broadening of curve B, obtained when fidelity control is rotated fully clockwise.

ing a small rod or nail into the armature needle hole using it as a lever to test the angular movement of the armature. The limitations of the movement in each direction will be caused by the armature striking the pole pieces. The proper adjustment is obtained when there is equal angular displacement of the armature and adjustment rod or nail to each side of the vertical axis of the magnet and coil assembly. The screws A and B should then be secured, observing care not to disturb the adjustment of the armature clamp. Then place the pickup in a vise and secure the centering spring-clamp by means of the screw C, allowing the centering spring to remain in the position at which the armature is exactly centered between the pole pieces. With a little practice, the correct adjustment of the armature may be readily obtained. The air gap between the pole pieces and the armature should be kept free from dust, filings, and other such foreign materials which would obstruct the movement of the pickup armature.

Damping Block

The viscoloid block which is attached to the back end of the armature shank serves as a mechanical filter to eliminate undesirable resonances and to cause the frequency response to be uniform. Should it be necessary to replace this damping block, it may be done by removing screw D and the cover support bracket from the mechanism and taking off the old viscoloid block. The surface of the armature which is in contact with the viscoloid should be thoroughly cleaned with fine emery cloth. Then insert the new block so that it occupies the same position at it did originally. Make certain that the block is in correct vertical alignment with the armature. The hole in the new viscoloid block is somewhat smaller than the diameter of the armature in order to permit a snug fit. With the viscoloid aligned on the armature, screw D and the cover support bracket should then be replaced. Heat should be applied to the armature (viscoloid side) so that the viscoloid block will fuse at the point of contact and become rigidly attached to the armature. A special-tip soldering iron connected as shown in figure 16 will be found very useful in performing this operation. The iron should be applied only long enough to slightly melt the block and cause a small bulge on both sides.

Resoldering Coil

Whenever there is defective operation due to an open or shorted pickup coil, this coil should be replaced. The method of replacement will be obvious upon inspection of the pickup assembly and by study of the cut-a-way illustrations. Make sure that the new coil is properly centered with the hole in the support strip and glued securely in that position. It is important to re-adjust the armature as previously explained after re-assembly of the mechanism. Only rosin core solder should be used for soldering the coil leads in the pickup. This same type of solder should be used when necessary for soldering the centering spring to the armature.

Magnetizing

Loss of magnetization will not usually occur when the pickup has received normal care because the magnet and pole pieces are one unit and the magnetic circuit remains practically closed at all times. When the pickup has been mishandled, subjected to a strong a-c field, jolted, or dropped, there may be an appreciable loss of magnetic strength, in which case it will be necessary to re-magnetize the entire structure. To do this, it will be necessary to first remove the pickup

cover may be cemented back in place with ambroid upon completion of adjustment.

Antenna and Ground Terminals

These receivers are equipped with an antenna-ground terminal board having three terminals. These terminals are marked "A2," "A1," and "G," the latter being the ground terminal and should always be connected to a good external ground. The transmission-line leads of the RCA RK-40A antenna system should be connected to terminals "A2" and "A1." The receiver coupling units of the RCA RK-40 and the RCA Spider-Web antenna systems should be connected to terminals "A1" and "G." Connect a single-wire antenna to terminal "A1."

Selector Dial

Figure 14 illustrates the relation of the various parts of the dial mechanism when in its "Standard broadcast" position with the range switch likewise turned to its "Standard broadcast" position. In re-assembling the dial after repairs, see that the gears are meshed in accordance with the diagram at the same time noting that the range switch is in its "Standard broadcast" position and the lever attached to the range switch shaft placed in the position shown.

To adjust the dial mechanism, set the range switch to its "Standard broadcast" position. Place a straight-edge across the center of the dial so that its edge is even with the lower (end) marking at both the low-frequency and high-frequency ends of the dial. Under such conditions the straight-edge should be parallel with the top of the chassis base. If the straight-edge is not parallel with the top of the chassis base, loosen the nut on the rear of the roller link pivot stud and move the stud up or down until the link roller moves the dial to the desired position so that the end calibration marks obtain the position mentioned above. Tighten the nut on the roller link pivot stud.

Set the gear tuning condenser to its maximum capacity position. Adjust the dial pointer to the low-frequency (end) mark on "Standard broadcast" scale. This is a friction adjustment.

With the gang tuning condenser plates still in full mesh, loosen the two set screws on the vernier-dial hub. Rotate the vernier dial until the "0" marking is in a vertical plane above the center of the shaft. Tighten set screws.

Magnetic Pickup

The pickup used in the phonograph unit is of an improved design. The horseshoe magnet is rigidly welded to the pole pieces and is irremovable. There is a centering spring attached to the armature to maintain proper adjustment and to provide a limiting effect on the movement of the armature. The frequency response is substantially uniform over a wide range. Service operations which may be necessary on the pickup are as follows.

Centering Armature

Refer to figure 15, showing the pickup inner structure. The armature is shown in its proper relation to the magnet pole pieces, i.e., exactly centered. Whenever this centering adjustment has been disturbed, the screws A, B, and C should be loosened and the armature clamp adjusted to the point where the vertical axis of the armature is at right angles to the horizontal axis of the pole pieces, and centered between them. This centering operation may be facilitated by insert-

between the input transformer T2 and the compensator pack (see figure 12). Connect beat-frequency oscillator terminal "CT" to the large pin on the male plug. Connect the junction of the 200-ohm and the 100-ohm resistors to the small pin on the male plug.

Adjust beat-frequency oscillator output until the voltmeter reads exactly 1.0 volt. Remove the voltmeter leads from beat-frequency oscillator terminals without disturbing any of the oscillator adjustments. Place the voltmeter to its 250-volt or greater range and connect it between the plate prongs of the two RCA-2A3 power-output tubes. Connections to the tube prongs may be made by stripping approximately 1/2 inch of insulation from the ends of two short leads of rubber-covered wire, wrapping one bare end around each plate prong (being careful not to allow the bare ends to short on the chassis when the tubes are placed in their sockets), and connecting the voltmeter to these leads. CAUTION: Do not touch these plate connections after the power is turned on since the potential at these points is rather high and carelessness might result in a serious shock.

Set the "Dynamic amplifier" and "Fidelity control" to their extreme counter-clockwise positions. Set the "Phonograph volume" control to its extreme clockwise position. Turn on the power switch and allow a few minutes for the instrument to become stabilized. Adjust the expander-bias control R46, on rear apron of amplifier (see figure 3), until the voltmeter reads 195 volts. Turn "Phonograph volume" control to extreme counter-clockwise position. Transfer lead from the junction of the 200-ohm and the 100-ohm resistors to the beat-frequency oscillator (upper "250V") terminal without disturbing any of the oscillator adjustments. Adjust "Phonograph volume" control until the voltmeter reads 50 volts. Turn the "Dynamic amplifier" control to its extreme clockwise position allowing maximum expansion to take place. The voltmeter should now read not less than 130 volts if the expander circuit is operating correctly. Failure to do so indicates a defect in the system and the usual service procedure should be followed.

(b) **Alternate Method**

Turn power switch off. Place RCA Stock No. 12353 Split-Plate Adapter under the RCA-6L7 audio-volume expander. Connect a suitable d-c milliammeter to the adapter. Turn both the "Phonograph volume" and the "Dynamic amplifier" controls to their extreme counter-clockwise positions. Turn on power switch and allow a few minutes for the instrument to become stabilized. Adjust expander bias control R46, on rear apron of amplifier (see figure 3), to give 1.0 milliamperes of plate current with no signal input; to the dynamic amplifier.

Loudspeaker

Centering of the loudspeaker voice coil is made in the usual manner with three narrow paper feelers after first removing the front paper dust cover. This may be removed by softening its cement with a very light application of acetone using care not to allow the acetone to flow down into the air gap. The dust

- Pilot Lamps (2)** Mazda 2.0 volts, .06 ampere
- BATTERIES REQUIRED**
 "A," one plug-in, 2 1/2-volt Air Cell, or one 2-volt storage battery; "B," three 45-volt, heavy-duty, plug-in type B batteries; "C," one 7 1/2-volt C battery tapped at —1 1/2, —3, and —4 1/2 volts, and three bias cells (Stock No. 12681).
- CURRENT CONSUMPTION**
 "A" at 2 volts (pilot lamps off) 0.56 ampere
 "A" at 2 volts (pilot lamps on) 0.68 ampere
 "B" at 135 volts 19 milliamperes
 Fuse Rating 1/2 ampere
- POWER OUTPUT**
 Undistorted 1.2 watts
 Maximum 2.2 watts
- LOUDSPEAKER**
 Type Permanent-Magnet Dynamic
 Voice Coil Impedance 2.2 ohms at 400 cycles

RCA MFG. CO., INC.

Calibrate the tuning dial by adjusting main dial pointer to the low-frequency (end) calibration mark on dial with the gang tuning-condenser plates in full-mesh position; then adjust the small (vernier) pointer to "O." These are friction adjustments.

Perform alignment in proper order, tabulated below, starting with No. 1 and following all operations across, then No. 2, etc. Adjustment locations are shown on figures 1 and 4.

Cathode-ray alignment is highly preferable; the connections to the chassis are shown on figure 3. If an output indicator is used, connect it across the loudspeaker voice-coil and advance the receiver volume control to full-volume position. Connect the "low" output terminal of the test oscillator to

the receiver "G" (ground) terminal for all alignment operations. Regulate the output of the test oscillator so that minimum signal is applied to the receiver to obtain an observable output indication. This will avoid a-v-c action.

The term "Dummy antenna" means the device which must be connected between the "high" test-oscillator output and the point of connection to the receiver in order to obtain ideal alignment. "No signal, 550-750 kc" means that the receiver should be tuned to a point between 550 and 750 kc where no signal or interference is received from a station or local (heterodyne) oscillator.

For further details on alignment, refer to booklet "RCA Victor Receiver Alignment."

Order of Alignment	Test Oscillator			Receiver Dial Setting	Circuit to Adjust	Adjustment Symbols	Adjust to Obtain
	Connection to Receiver	Dummy Antenna	Frequency Setting				
1	1A4 I-F Grid Cap	.001 Mfd.	460 kc	No Signal 550-750 kc	2nd I-F Trans.	L13 & L14	Max. (peak)

9	Ant. Term.	200 Mmfd.	1,500 kc	Rock thru 1,500 kc	"A" H-F Osc.	C15	Max. (peak)

* Use minimum capacity peak if two peaks can be obtained.

‡ After this adjustment, check for image signal by shifting receiver dial to 19,080 kc.

Figure 4—Radiotron Socket Voltages, Coil, and Trimmer Locations

Measured with all batteries at normal voltage—Tuned to approximately 1,000 kc—

No signal being received—Volume control minimum

**CAUTION: Do not attempt to measure voltage on control grid of the 1C6 with any conventional voltmeter due to presence of bias cells.

Note: Two voltage values are shown for some readings. The higher value shown in parenthesis with as-

terisk (*) indicates operating conditions without voltmeter loading. The lower value is the actual measured voltage and differs from the higher value because of the additional loading of the voltmeter through the high series circuit resistance.

Precautionary Lead Dress.—(1) Twisted leads from filament switch to power plug must be dressed against bottom of end shield and fastened with tape. (2) Keep leads of C18 as short as possible. (3) Lead from L1 to C5-C6 should be 3/4 inches long. (4) Lead from L1-L2 to range switch should be 1 1/8 inches long. (5) Keep lead from range switch to C10-C11 as short as possible. (6) Keep lead from range switch to L6 as short as possible. (7) Yellow lead from 2nd i.f. transformer to phonograph terminal board must be dressed away from other wiring.

Phonograph Attachment.—A terminal board is provided for connecting a phonograph into the audio amplifying circuit. RCA Victor Model R-93-S Record Player should be connected as follows: Remove link between terminals 1 and 2 on terminal board. Connect green wire in Radio-Record switch cable to terminal 1, yellow to terminal 2, and shield extension to terminal 3. Tape unused red and blue leads separately. Connect a 2-conductor twisted cable between the Record Player binding posts and the screw terminals on Radio-Record switch.

Bias Cells.—Three bias cells are used only for the purpose of supplying bias potential to the 1C6 first-detector-oscillator tube. These cells should never be measured with an ordinary voltmeter or other device which draws any current. A simple check on these cells may be made by connecting a milliammeter in the plate circuit of the 1C6 tube and noting the plate current reading. Then carefully remove the cells and substitute a battery potential of 2.7 volts in their place and note the new reading on the milliammeter. If the first reading obtained (with bias cells) is more than 40% from the latter reading (with 2.7-volt battery), the bias cells should be replaced. This 40% difference is equivalent to a change of approximately 25% battery voltage.

Operation With CV-8 Pak-O-Powr.—These receivers may readily be operated from an RCA CV-8 Pak-O-Powr, in which case, a six-volt storage battery replaces the "A" and "B" batteries listed under "Batteries required." When using the CV-8, one cell (2 volts) of the storage battery supplies filament voltage to the tubes, while the other two cells (4 volts) supplies power for the CV-8. When installing, the seven prong CV-8 receptacle plugs into the seven prong plug on the rear apron of the receiver chassis and the four battery leads clip on terminals of the storage battery as follows: Red to +6 V.; Blue to +4 V.; Yellow to +4 V.; and brown (fused lead) to -V. The two four-volt leads (Blue and Yellow) should make separate connections to the same battery strap to avoid vibrator buzz which might otherwise result if these two leads are joined together or touch each other. Observe extreme care that proper connections are made to the battery, as a wrong connection will burn out the tubes. The green lead (originally connected to -3 v. on the "C" battery) should be shifted to the -4.5 volt tap. The other "C" battery connections remain unchanged.

The following changes under "Electrical specifications" become effective when employing the CV-8; "A" battery current drain at 6 volts, 1.65 amperes. Fuse rating, 5 amperes. Undistorted output, 1.3 watts. Maximum output, 1.8 watts. Under "Service data," the following voltages apply to the RCA-19 power-output tube. Either plate to chassis, 180 volts. Either grid to chassis, -4 1/2 volts. Plate current (either plate), 1.6 ma.

When servicing, the CV-8 chassis should be insulated from the receiver chassis to avoid vibrator buzz.

RCA MFG. CO., INC.

Alignment Procedure

Calibrate the tuning dial by adjusting dial pointer to the center horizontal line with the gang tuning-condenser plates in full-mesh position. This is a screw-driver adjustment.

Perform alignment in proper order, tabulated below, starting with No. 1 and following all operations across, then No. 2, etc. Adjustment locations are shown on figures 1 and 4.

Cathode-ray alignment is preferable; the connections to the chassis are shown on figure 3. If an output indicator is used, connect it across the loudspeaker voice-coil and advance the receiver volume control to full-volume position.

Connect the "low" output terminal of the test oscillator to the receiver chassis for all alignment operations. Regulate

the output of the test oscillator so that minimum signal is applied to the receiver to obtain an observable output indication. This will avoid a-v-c action.

The term "Dummy antenna" means the device which must be connected between the "high" test-oscillator output and the point of connection to the receiver in order to obtain ideal alignment. "No signal, 550-750 kc" means that the receiver should be tuned to a point between 550 and 750 kc where no signal or interference is received from a station or local (heterodyne) oscillator.

For further details on alignment, refer to booklet "RCA Victor Receiver Alignment."

Order of Alignment	Test Oscillator			Receiver Dial Setting	Circuit to Adjust	Adjustment Symbols	Adjust to Obtain
	Connection to Receiver	Dummy Antenna	Frequency Setting				
1	6D6 Grid Cap	.001 Mfd.	460 kc	No Signal 550-750 kc	2nd I-F Trans.	L7	Max. (peak)
2	6A7 Grid Cap	.001 Mfd.	460 kc	No Signal 550-750 kc	1st I-F Trans.	L5 and L6	Max. (peak)
3	Ant. Lead (blue)	200 Mmfd.	1,500 kc	1,500 kc	"A" Osc.	C5*	Max. (peak)
4	Ant. Lead (blue)	200 Mmfd.	1,500 kc	1,500 kc	"A" Ant.	C1	Max. (peak)

* Tighten capacitor C6 on bottom of gang (under chassis) for maximum capacity before adjusting C5.

Figure 1—Radiotron, Coil, and Trimmer Locations

Figure 4—Radiotron Socket Voltages, Coil, and Trimmer Locations
 Measured at 115 volts, 60-cycle supply—Tuned to approximately 1,000 kc ("Broadcast")—
 No signal being received—Volume control minimum

Note: Two voltage values are shown for some readings. The value shown in parentheses with asterisk (*) indicates operating conditions without voltmeter loading. The other value (generally lower) is the actual measured voltage and differs from the value shown in parentheses because of the additional loading of the voltmeter through the high series circuit resistance.

Voltage values as specified should hold within $\pm 20\%$ when the receiver is normally operative at its rated line voltage. To duplicate the conditions under which the voltages were measured requires a 1,000-ohm-per-volt d-c meter, having ranges of 10, 50, 250, and 500 volts. Use the nearest range above the specified measured voltage. A-c voltages were measured with a corresponding a-c meter.

RCA MFG. CO., INC.

General Description

This receiver employs a superheterodyne circuit, the arrangement of which is shown on figure 2. Its design includes magnetite-core adjusted i-f transformers; automatic volume control; resistance-coupled audio system; and a 5-inch, electrodynamic loudspeaker.

RADIOTRON COMPLEMENT

- (1) RCA-6A7 First Detector—Oscillator
- (2) RCA-6D6 Intermediate Amplifier
- (3) RCA-75 Second Det., A-F Amp. and A.V.C.
- (4) RCA-41 Audio Power Amplifier
- (5) RCA-80 Full-Wave Rectifier

Service Data

The various diagrams of this booklet contain such information as will be needed to isolate causes for defective operation if such develops. The ratings of the resistors, capacitors, coils, etc., are indicated adjacent to the symbols signifying these parts on the diagrams. Identification titles such as

R1, L1, C1, etc., provide reference between the illustrations and Replacement Parts List. The coils, transformer windings, and reactors are rated in terms of d-c resistance to permit continuity checks.

Precautionary Lead Dress—(1) The green RCA-75 grid cap lead should be twisted with the yellow lead to the volume control to maintain proper position for prevention of hum pickup. (2) The green lead from oscillator coil L3 to tuning condenser C4 should be kept free from chassis. (3) Keep power cord and red primary leads of power transformer away from the green RCA-41 grid lead to prevent hum pickup. (4) Red lead from electrolytic capacitor C19 to RCA-80 socket should be dressed between power transformer and chassis apron to prevent hum pickup.

Phonograph Attachment—See Schematic Circuit Diagram, figure 2.

Loudspeaker—Centering of the loudspeaker voice coil is made in the usual manner with three narrow paper feelers.

REPLACEMENT PARTS

Insist on genuine factory tested parts, which are readily identified and may be purchased from authorized dealers.

MODEL 85T1

Alignment, Socket Trimmers, Voltage

RCA MFG. CO., INC.

Alignment Procedure

Calibrate the tuning dial by adjusting dial pointer to the center horizontal line with the gang tuning-condenser plates in full-mesh position. This is a screw-driver adjustment.

Perform alignment in proper order, tabulated below, starting with No. 1 and following all operations across, then No. 2, etc. Adjustment locations are shown on figures 1 and 4.

Cathode-ray alignment is preferable; the connections to the chassis are shown on figure 3. If an output indicator is used, connect it across the loudspeaker voice-coil and advance the receiver volume control to full-volume position.

Connect the "low" output-terminal of the test oscillator to the receiver chassis for all alignment operations. Regulate

the output of the test oscillator so that minimum signal is applied to the receiver to obtain an observable output indication. This will avoid a-v-c action.

The term "Dummy antenna" means the device which must be connected between the "high" test-oscillator output and the point of connection to the receiver in order to obtain ideal alignment. "No signal, 550-750 kc" means that the receiver should be tuned to a point between 550 and 750 kc where no signal or interference is received from a station or local (heterodyne) oscillator.

For further details on alignment, refer to booklet "RCA Victor Receiver Alignment."

Order of Alignment	Test Oscillator			Range-Selector	Receiver Dial Setting	Circuit to Adjust	Adjustment Symbols	Adjust to Obtain
	Connection to Receiver	Dummy Antenna	Frequency Setting

5	Ant. Lead (blue)	200 Mmfd.	600 kc	"A" Left	600 kc	"A" Osc.	L8	Max. (peak)

† Use maximum capacity peak if two peaks can be obtained.

* Use minimum capacity peak if two peaks can be obtained.

‡ After this adjustment, check for image signal by shifting receiver dial to 15,920 kc.

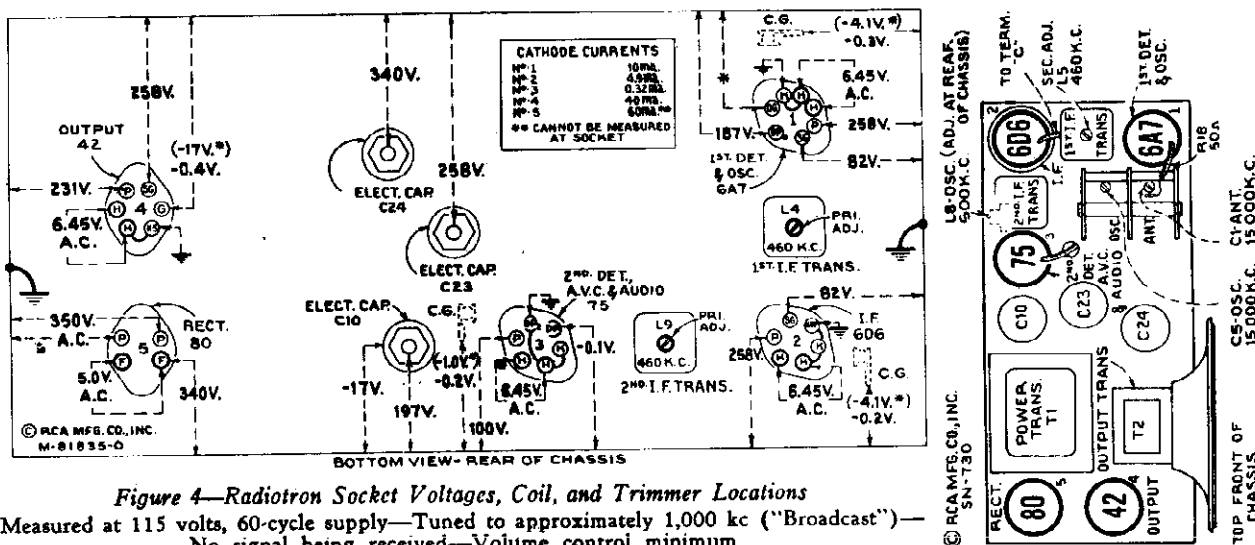

Figure 4—Radiotron Socket Voltages, Coil, and Trimmer Locations

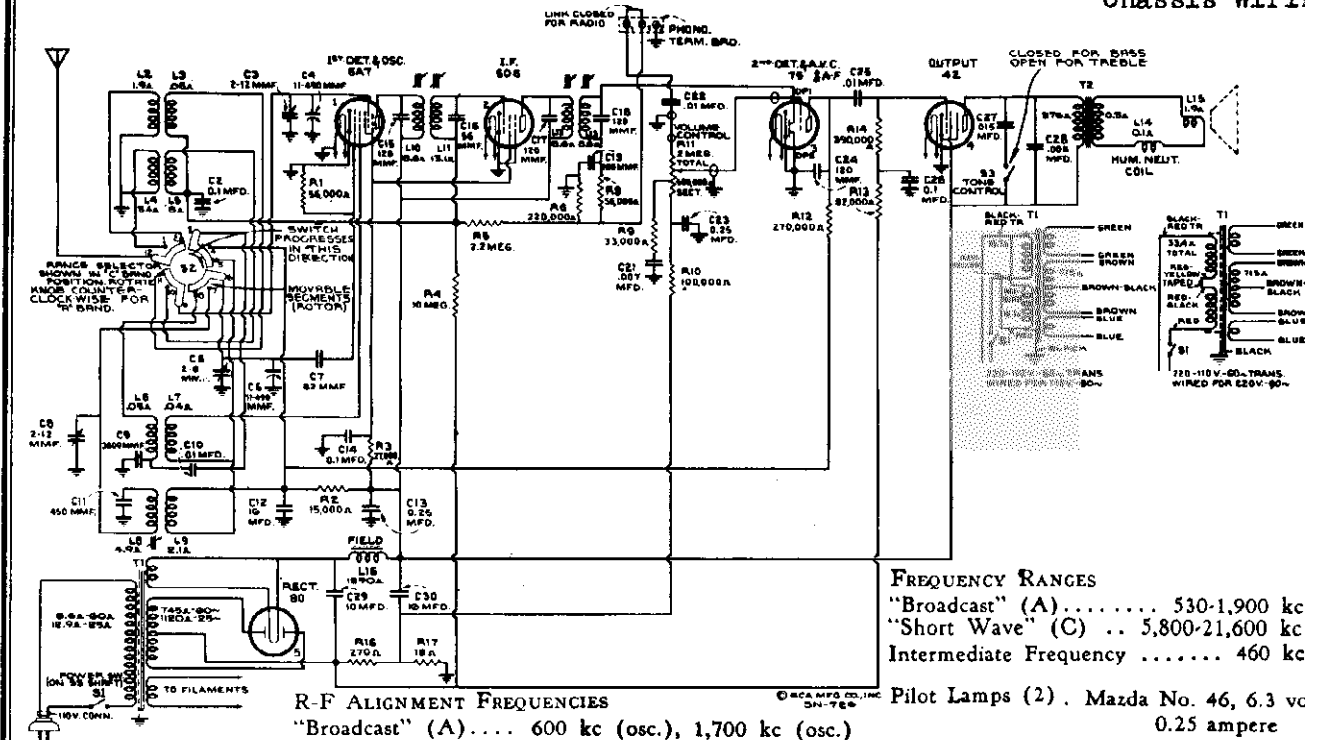

Measured at 115 volts, 60-cycle supply—Tuned to approximately 1,000 kc ("Broadcast")—No signal being received—Volume control minimum

Note: Two voltage values are shown for some readings. The value shown in parentheses with asterisk (*) indicates operating conditions without voltmeter loading. The other value (generally lower) is the actual measured voltage and differs from the value shown in parentheses because of the additional loading of the voltmeter through the high series circuit resistance.

Voltage values as specified should hold within ±20% when the receiver is normally operative at its rated line voltage. To duplicate the conditions under which the voltages were measured requires a 1,000-ohm-per-volt d-c meter, having ranges of 10, 50, 250, and 500 volts. Use the nearest range above the specified measured voltage. A-c voltages were measured with a corresponding a-c meter.

Alignment Procedure

Calibrate the tuning dial by adjusting dial pointer to the low-frequency (end) calibration mark on "Broadcast" scale with the gang tuning-condenser plates in full-mesh position. This is a friction adjustment.

Perform alignment in proper order, tabulated below, starting with No. 1 and following all operations across, then No. 2, etc. Adjustment locations are shown on figures 1 and 4.

Cathode-ray alignment is preferable; the connections to the chassis are shown on Figure 3. If an output indicator is used, connect it across the loudspeaker voice-coil and advance the receiver volume control to full-volume position.

Connect the "low" output terminal of the test oscillator

to the receiver chassis for all alignment operations. Regulate the output of the test oscillator so that minimum signal is applied to the receiver to obtain an observable output indication. This will avoid a-v-c action.

The term "Dummy antenna" means the device which must be connected between the "high" test-oscillator output and the point of connection to the receiver in order to obtain ideal alignment. "No signal, 550-750 kc" means that the receiver should be tuned to a point between 550 and 750 kc where no signal or interference is received from a station or local (heterodyne) oscillator.

For further details on alignment, refer to booklet "RCA Victor Receiver Alignment."

8	Ant. Post	200 Mmfd.	1,700 kc	1,700 kc	"A" H-F Osc.	C8	Max. (peak)

* Use minimum capacity peak.
† Use maximum capacity peak.

Precautionary Lead Dress.—(1) Keep leads of C2 and C9 as short as possible. (2) Dress leads from power transformer and a-c switch away from antenna coil and associated wiring. (3) Red lead from range selector "ter 4" to oscillator coil L9 should have two tight turns around trimming capacitor C8.

Phonograph Attachment.—A terminal board is provided for connecting a phonograph into the audio-amplifying circuit. RCA Victor Models R-93, R-93-A, R-93-2, R-93-S, or

terminal 2; and shield extension to terminal 3. Tape unused red and blue leads separately. Connect a 2-conductor twisted cable between the Record Player binding posts and the screw terminals on Radio-Record switch.

Loudspeaker.—Centering of the loudspeaker is made in the usual manner with three narrow paper feelers after first removing the front dust cover. This may be removed by softening its cement with a light application of acetone, using care not to allow the acetone to flow into the air gap. The dust cover should be cemented back in place with ambroid upon completion of adjustment.

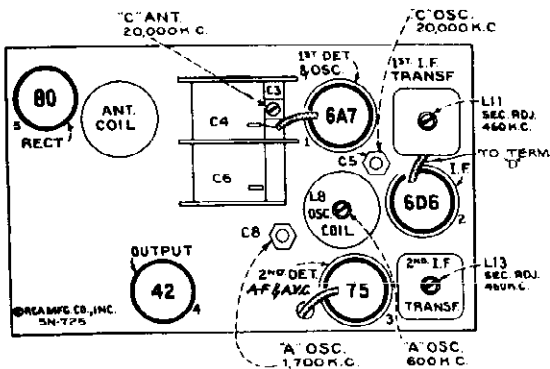

Figure 1—Radiotron, Coil, and Trimmer Locations

R-94 Record Players should be connected as follows: Remove link between terminals 1 and 2 on receiver. Connect green wire in Radio-Record switch cable to terminal 1, yellow to

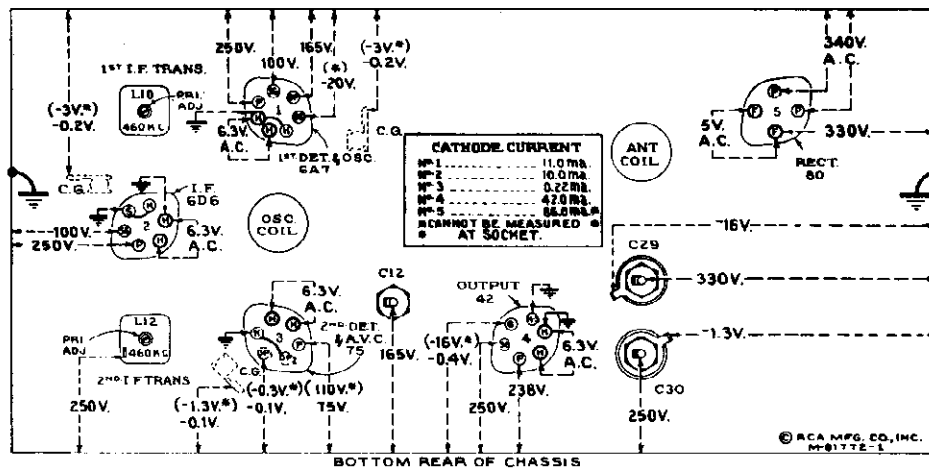

Figure 4—Radiotron Socket Voltages, Coil, and Trimmer Locations
Measured at 115 volts, 60-cycle supply—Tuned to approximately 1,000 kc ("Broadcast")—
No signal being received—Volume control minimum

Note: Two voltage values are shown for some readings. The value shown in parentheses with asterisk (*) indicates operating conditions without voltmeter loading. The other value (generally lower) is the actual measured voltage and differs from the value shown in parentheses because of the additional loading of the voltmeter through the high series circuit resistance.

Voltage values as specified should hold with in $\pm 20\%$ when the receiver is normally operative at its rated line voltage. To duplicate the conditions under which the voltages were measured requires a 1,000-ohm-per-volt d-c meter, having ranges of 10, 50, 250, and .500 volts. Use the nearest range above the specified measured voltage. A-c voltages were measured with a corresponding a-c meter.

14415	Foot—Chassis mounting foot and bracket assembly	14418	Cap—Fuse holder male cap
30085	Gear—Indicator drive gear and hub assembly and pointer stem and gear assembly	4288	Clip—Battery clips, one marked "+" and one unmarked
14405	Holder—Bias cell holder	12827	Connector—2-contact male connector for battery cable
14341	Idler—Station selector drive belt idler	14409	Connector—7-contact female connector for battery cable
14344	Indicator—Station selector indicator pointer	14396	Escutcheon—Station selector escutcheon and crystal
14382	Indicator—Vernier indicator pointer	3743	Fuse—1/4 ampere (F1)
14028	Lamp—Dial lamp	14269	Knob—Volume control, tone control or range switch knob
14404	Nut—Jamb nut for air trimmer capacitors	14359	Knob—Station selector knob
14340	Pulley—Station selector drive belt pulley and knob shaft	14418	Insulator—Fuse holder insulating sleeve
14351	Reflector—Dial reflector and lamp bracket assembly	14418	Resistor—0.33 ohms flexible resistor—1/2 watt, complete with clip (R17)
14119	Resistor—2.2 ohms, flexible type, 3 watt (R15, R2)	11210	Screw—Chassis mounting screw and washer for Model 86BK
11283	Resistor—1,200 ohms, carbon type, 1/2 watt (R10)	11377	Screw—Chassis mounting screw and washer for Model 86BT
15144	Resistor—2,700 ohms, carbon type, 1/2 watt (R4)	4284	Spring—Fuse holder tension spring
11305	Resistor—22,000 ohms, carbon type, 1/2 watt (R5)	4282	Spring—Retaining spring for knob
14284	Resistor—22,000 ohms, carbon type, 1/10 watt (R7)	14270	Spring—Retaining spring for knob Stock No. 14359

The following changes under "Electrical specifications" become effective when employing the CV-8, "A" battery current drain at 6 volts, 1.65 amperes. Fuse rating, 5 amperes. Undersized output, 1.3 watts. Maximum output, 1.8 watts. Under "Service data," the following voltages from the receiver chassis to avoid vibrator buzz.

apply to the RCA-19 power-output tube. Either plate to chassis, 180 volts. Either grid to chassis, —4 1/2 volts. Plate current (either plate), 1.6 ma. When servicing the CV-8 chassis should be insulated from the receiver chassis to avoid vibrator buzz.

Precautionary Lead Dress.—(1) Twisted leads from filament switch to power plug must be dressed against bottom of end shield and fastened with tape. (2) Lead from terminal No. 6 of S3 to chassis must be as short as possible and in same chassis lance as C15-C34. (3) Keep lead from terminal No. 9 of S3 to L7-L16 as short as possible. (4) Keep lead from L7 to C11 as short as possible. (5) Keep lead from C10 to C11 as short as possible. (6) Keep leads of C41 as short as possible. (7) Keep lead from terminal No. 20 of S2 to C13 as short as possible.

Phonograph Attachment.—A terminal board is provided for connecting a phonograph into the audio amplifying circuit. RCA Victor Model R-93-S Record Player should be connected as follows: Remove link between terminals 1 and 2 on terminal board. Connect green wire in Radio-Record switch cable to terminal 1, yellow to terminal 2, and shield extension to terminal 3. Tape unused red and blue leads separately. Connect a 2-conductor twisted cable between the Record Player binding posts and the screw terminals on Radio-Record switch.

Loudspeaker.—Centering of the loudspeaker is made in the usual manner with three narrow paper feelers after first removing its cement with a light application of acetone, softening its cement with a light application of acetone, using care not to allow the acetone to flow into the air gap. The dust cover should be cemented back in place with ambroid upon completion of adjustment.

Bias Cells.—Three bias cells are used only for the purpose of supplying bias potential to the IC6 first-detector-oscillator tube. These cells should never be measured with an ordinary voltmeter or other device which draws any current. A simple check on these cells may be made by connecting a milliammeter in the plate circuit of the IC6 tube and noting the plate current reading. Then carefully remove the cells and substitute a battery potential of 2.7 volts in their place and note the new reading on the milliammeter. If the first reading obtained (with bias cells) is more than 40% from the latter reading (with 2.7-volt battery), the bias cells should be replaced. This 40% difference is equivalent to a change of approximately 2.5% battery voltage.

Operation With CV-8 Pak-O-Power.—These receivers may readily be operated from an RCA CV-8 Pak-O-Power, in which case, a six-volt storage battery replaces the "A" and "B" batteries listed under "Batteries required." When using the CV-8, one cell (2 volts) of the storage battery supplies filament voltage to the tubes, while the other two cells (4 volts) supplies power for the CV-8. When installing, the seven prong CV-8 receptacle plugs into the seven prong plug on the rear apron of the receiver chassis and the four battery leads clip on terminals of the storage battery as follows: Red to +6 V.; Blue to +4 V.; Yellow to +4 V.; and brown (fused lead) to -V. The two four-volt leads (Blue and Yellow) should make separate connections to the same battery strap to avoid vibrator buzz which might otherwise result if these two leads are joined together or touch each other. Observe extreme care that proper connections are made to the battery, as a wrong connection will burn out the tubes. The green lead (originally connected to -3 v. on the "C" battery) should be shifted to the -4.5 volt tap. The other "C" battery connections remain unchanged.

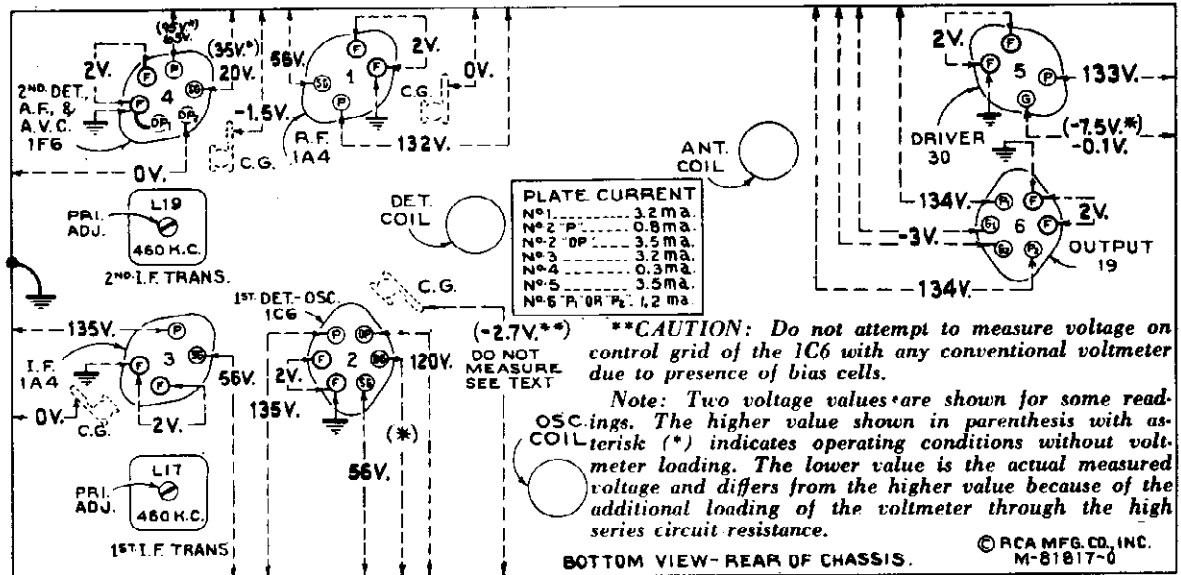

Figure 4—Radiotron Socket Voltages, Coil, and Trimmer Locations
Measured with all batteries at normal voltage—Tuned to approximately 1,000 kc—
No signal being received—Volume control minimum

Alignment Procedure

Calibrate the tuning dial by adjusting main dial pointer to the low-frequency (end) calibration mark on dial with the gang tuning-condenser plates in full-mesh position; then adjust the small (vernier) pointer to "O." These are friction adjustments.

Perform alignment in proper order, tabulated below, starting with No. 1 and following all operations across, then No. 2, etc. Adjustment locations are shown on figures 1 and 4.

Cathode-ray alignment is highly preferable; the connections to the chassis are shown on figure 3. If an output indicator is used, connect it across the loudspeaker voice-coil and advance the receiver volume control to full-volume position.

Connect the "low" output terminal of the test oscillator to

the receiver "G" (ground) terminal for all alignment operations. Regulate the output of the test oscillator so the minimum signal is applied to the receiver to obtain an observable output indication. This will avoid a-v-c action.

The term "Dummy antenna" means the device which must be connected between the "high" test-oscillator output and the point of connection to the receiver in order to obtain ideal alignment. "No signal, 550-750 kc" means that the receiver should be tuned to a point between 550 and 750 kc where no signal or interference is received from a station or local (heterodyne) oscillator.

For further details on alignment, refer to booklet "RC: Victor Receiver Alignment."

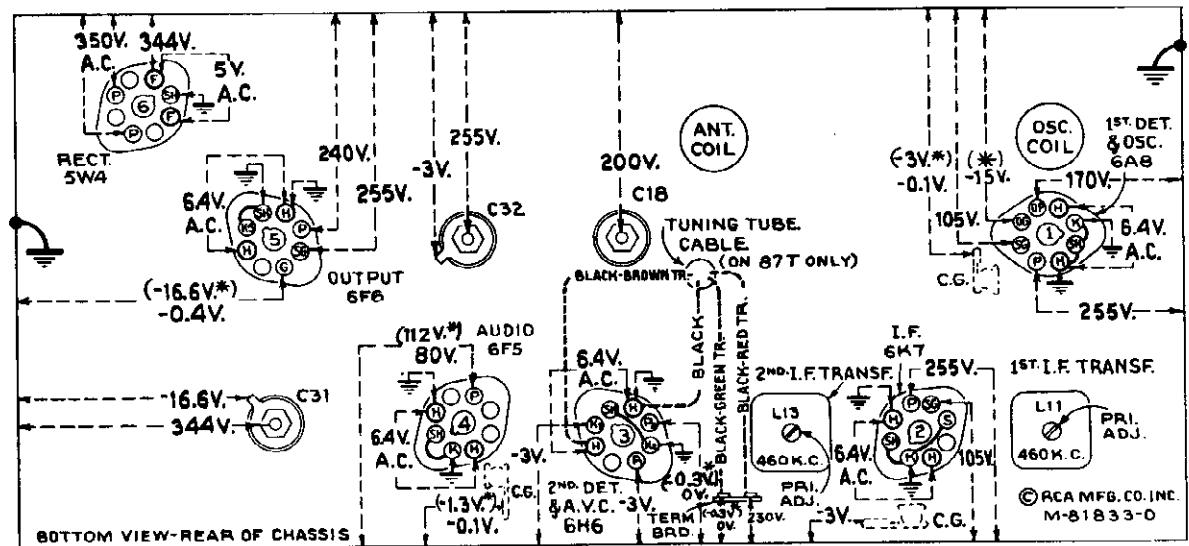

Figure 4—Radiotron Socket Voltages, Coil, and Trimmer Locations (Models 86T, 86T1, and 87T)

Measured at 115 volts, 60-cycle supply—Tuned to approximately 1,000 kc ("Standard Broadcast")—
No signal being received—Volume control minimum

Note: Two voltage values are shown for some readings. The value shown in parentheses with asterisk (*) indicates operating conditions without voltmeter loading. The other value (generally lower) is the actual measured voltage and differs from the value shown in parentheses because of the additional loading of the voltmeter through the high series circuit resistance.

Voltage values as specified should hold within $\pm 20\%$ when the receiver is normally operative at its rated line voltage. To duplicate the conditions under which the voltages were measured requires a 1,000-ohm-per-volt d-c meter, having ranges of 10, 50, 250, and 500 volts. Use the nearest range above the specified measured voltage. A-c voltages were measured with a corresponding a-c meter.

Alignment
Voltage

RCA MFG. CO., INC.

Alignment Procedure

Calibrate the tuning dial by adjusting dial pointer to the center horizontal line with the gang tuning-condenser plates in full-mesh position. This is a screw-driver adjustment.

Perform alignment in proper order, tabulated below, starting with No. 1 and following all operations across, then No. 2, etc. Adjustment locations are shown on figures 1 and 4.

Cathode-ray alignment is preferable; the connections to the chassis are shown on figure 3. If an output indicator is used, connect it across the loudspeaker voice-coil and advance the receiver volume control to full-volume position.

Connect the "low" output terminal of the test oscillator to the receiver chassis for all alignment operations. Regulate

the output of the test oscillator so that minimum signal is applied to the receiver to obtain an observable output indication. This will avoid a-v-c action.

The term "Dummy antenna" means the device which must be connected between the "high" test-oscillator output and the point of connection to the receiver in order to obtain ideal alignment. "No signal, 550-750 kc" means that the receiver should be tuned to a point between 550 and 750 kc where no signal or interference is received from a station or local (heterodyne) oscillator.

For further details on alignment, refer to booklet "RCA Victor Receiver Alignment."

Order of Alignment	Test Oscillator			Range-Selector	Receiver Dial Setting	Circuit to Adjust	Adjustment Symbols	Adjust to Obtain
	Connection to Receiver	Dummy Antenna	Frequency Setting					
1	6D6 I-F Grid Cap	.001 Mfd.	460 kc	"A" Left	No Signal 550-750 kc	2nd I-F Trans.	L8	Max. (peak)

5	Ant. Lead (blue)	200 Mmfd.	600 kc	"A" Left	600 kc	"A" Osc.	L8	Max. (peak)

† Use maximum capacity peak if two peaks can be obtained.

* Use minimum capacity peak if two peaks can be obtained.

‡ After this adjustment, check for image signal by shifting receiver dial to 15,920 kc.

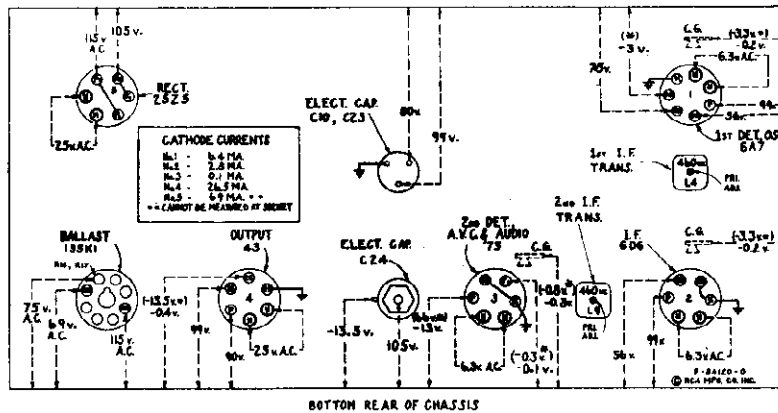

Figure 4—Radiotron Socket Voltages, Coil, and Trimmer Locations

Measured at 115 volts, 60-cycle supply—For 115-volt d-c supply approximately 10% lower, except heater voltage which remains the same—Tuned to approximately 1,000 kc ("Standard Broadcast") -No signal being received—Volume control minimum.

Note: Two voltage values are shown for some readings. The value shown in parentheses with asterisk (*) indicates operating conditions without voltmeter loading. The other value (generally lower) is the actual measured voltage and differs from the value shown in parentheses because of the additional loading of the voltmeter through the high series circuit resistance.

Voltage values as specified should hold within ±20% when the receiver is normally operative at its rated line voltage. To duplicate the conditions under which the voltages were measured requires a 1,000-ohm-per-volt d-c meter, having ranges of 10, 50, 250 and 500 volts. Use the nearest range above the specified measured voltage. A-c voltages were measured with a corresponding a-c meter.

Electrical Specifications

Pilot Lamp (1)	Mazda No. 40, 6.3 volts, 0.15 ampere
POWER SUPPLY RATINGS	
A-C Rating	105-125 volts, 50-100 cycles, 58 watts
POWER OUTPUT—(125 volt, A-C supply)	
Undistorted	0.5 watt
Maximum	1.2 watts
LOUDSPEAKER	
Type	6-inch Electrodynamic
D-C Rating 105-125 volts, 58 watts	
POWER OUTPUT—(125 volt, D-C supply)	
Undistorted	0.4 watt
Maximum	1.0 watt
Impedance (V.C.)	{(84003-3) 2.6 ohms } {(84003-4) 3.4 ohms } at 400 cycles

Service Data

CAUTION: The chassis is connected to one side of the power supply. Avoid contact of chassis or parts to external ground when servicing.

The various diagrams of this booklet contain such information as will be needed to isolate causes for defective operation if such develops. The ratings of the resistors, capacitors, coils, etc., are indicated adjacent to the symbols signifying these parts on the diagrams. Identification titles such as R1, L1, C1, etc., provide reference between the illustrations and Replacement Parts List. The coils, transformer windings, and reactors are rated in terms of d-c resistance to permit continuity checks.

Precautionary Lead Dress—(1) Dress power line leads to the on-off switch away from grid connection terminal on volume control to reduce hum pick-up. (2) Keep leads of capacitor C3 as short as possible. (3) Bus lead from range

selector (ter. 6) to oscillator coil tap L6L8 should be maintained 3/2 inches long for proper alignment. (4) Capacitor C25 should be dressed free of adjacent parts to maintain correct alignment at high-frequency end of "A" band. (5) Bus lead from range selector (ter. 3) to antenna coil L1 should be maintained 2 1/4 inches long for proper alignment. (6) The RCA-6A7 grid-cap lead (50-ohm resistor R18) to top of tuning capacitor C2 should be dressed properly to prevent shorts and should be maintained flexible to prevent acoustic howl.

Loudspeaker—Centering of the loudspeaker voice coil is made in the usual manner with three narrow paper feelers.

Operation on 25-Cycle A-C Supply—For 25-cycle operation, install RCA Stock No. 14767 capacitor pack and clamp under chassis below speaker and make connections as shown dotted on figure 3. Use a No. 6-32 machine screw for anchoring clamp in hole provided.

REPLACEMENT PARTS

Insist on genuine factory-tested parts, which are readily identified and may be purchased from authorized dealers.

MODEL 88K

Alignment, Parts

RCA MFG. CO., INC.

Calibrate the tuning dial by adjusting main dial pointer to the low-frequency (end) calibration mark on dial with the gang tuning-condenser plates in full-mesh position; then adjust the small (vernier) pointer to "O." These are friction adjustments.

Perform alignment in proper order, tabulated below, starting with No. 1 and following all operations across, then No. 2, etc. Adjustment locations are shown on figures 1 and 2.

Cathode-ray alignment is highly preferable; the connections to the chassis are shown on figure 4. If an output indicator is used, connect it across the loudspeaker voice-coil and advance the receiver volume control to full-volume position.

Connect the "low" output terminal of the test oscillator to

the receiver "G" (ground) terminal for all alignment operations. Regulate the output of the test oscillator so that minimum signal is applied to the receiver to obtain an observable output indication. This will avoid a-v-c action.

The term "Dummy antenna" means the device which must be connected between the "high" test-oscillator output and the point of connection to the receiver in order to obtain ideal alignment. "No signal, 550-750 kc" means that the receiver should be tuned to a point between 550 and 750 kc where no signal or interference is received from a station or local (heterodyne) oscillator.

For further details on alignment, refer to booklet "RCA Victor Receiver Alignment."

Order of Alignment	Test Oscillator			Range Selector	Receiver Dial Setting	Circuit to Adjust	Adjustment Symbols	Adjust to Obtain
	Connection to Receiver	Dummy Antenna	Frequency Setting					
1	6K7 I-F Grid Cap	.001 Mfd.	460 kc	"A" Left	No Signal 550-750 kc	2nd I-F Trans.	L16 and L17	Max. (peak)
2	6L7 Det. Grid Cap	.001 Mfd.	460 kc	"A"	No Signal 550-750 kc	1st I-F Trans.	L14 and L15	Max. (peak)
3	Ant. Term.	300 Ohms	20,000 kc	"C" Right	20,000 kc	"C" Osc.	C20	Max. (peak) *
4	Ant. Term.	300 Ohms	20,000 kc	"C"	20,000 kc	"C" Det.	C9	Max. (peak) †
5	Ant. Term.	300 Ohms	20,000 kc	"C"	20,000 kc	"C" Ant.	C2	Max. (peak) ‡
6	Ant. Term.	300 Ohms	6,000 kc	"B" Center	6,000 kc	"B" Osc.	C23	Max. (peak) *
7	Ant. Term.	200 Mmfd.	600 kc	"A" Left	600 kc	"A" L-F Osc.	L13	Max. (peak)
8	Ant. Term.	200 Mmfd.	1,500 kc	"A"	1,500 kc	"A" H-F Osc.	C26	Max. (peak)
9	Ant. Term.	200 Mmfd.	600 kc	"A"	600 kc	"A" L-F Osc.	L13	Max. (peak)
10	Ant. Term.	200 Mmfd.	1,500 kc	"A"	1,500 kc	"A" H-F Osc.	C26	Max. (peak)

* Use minimum capacity peak if two peaks can be obtained.

† Use maximum capacity peak if two peaks can be obtained.

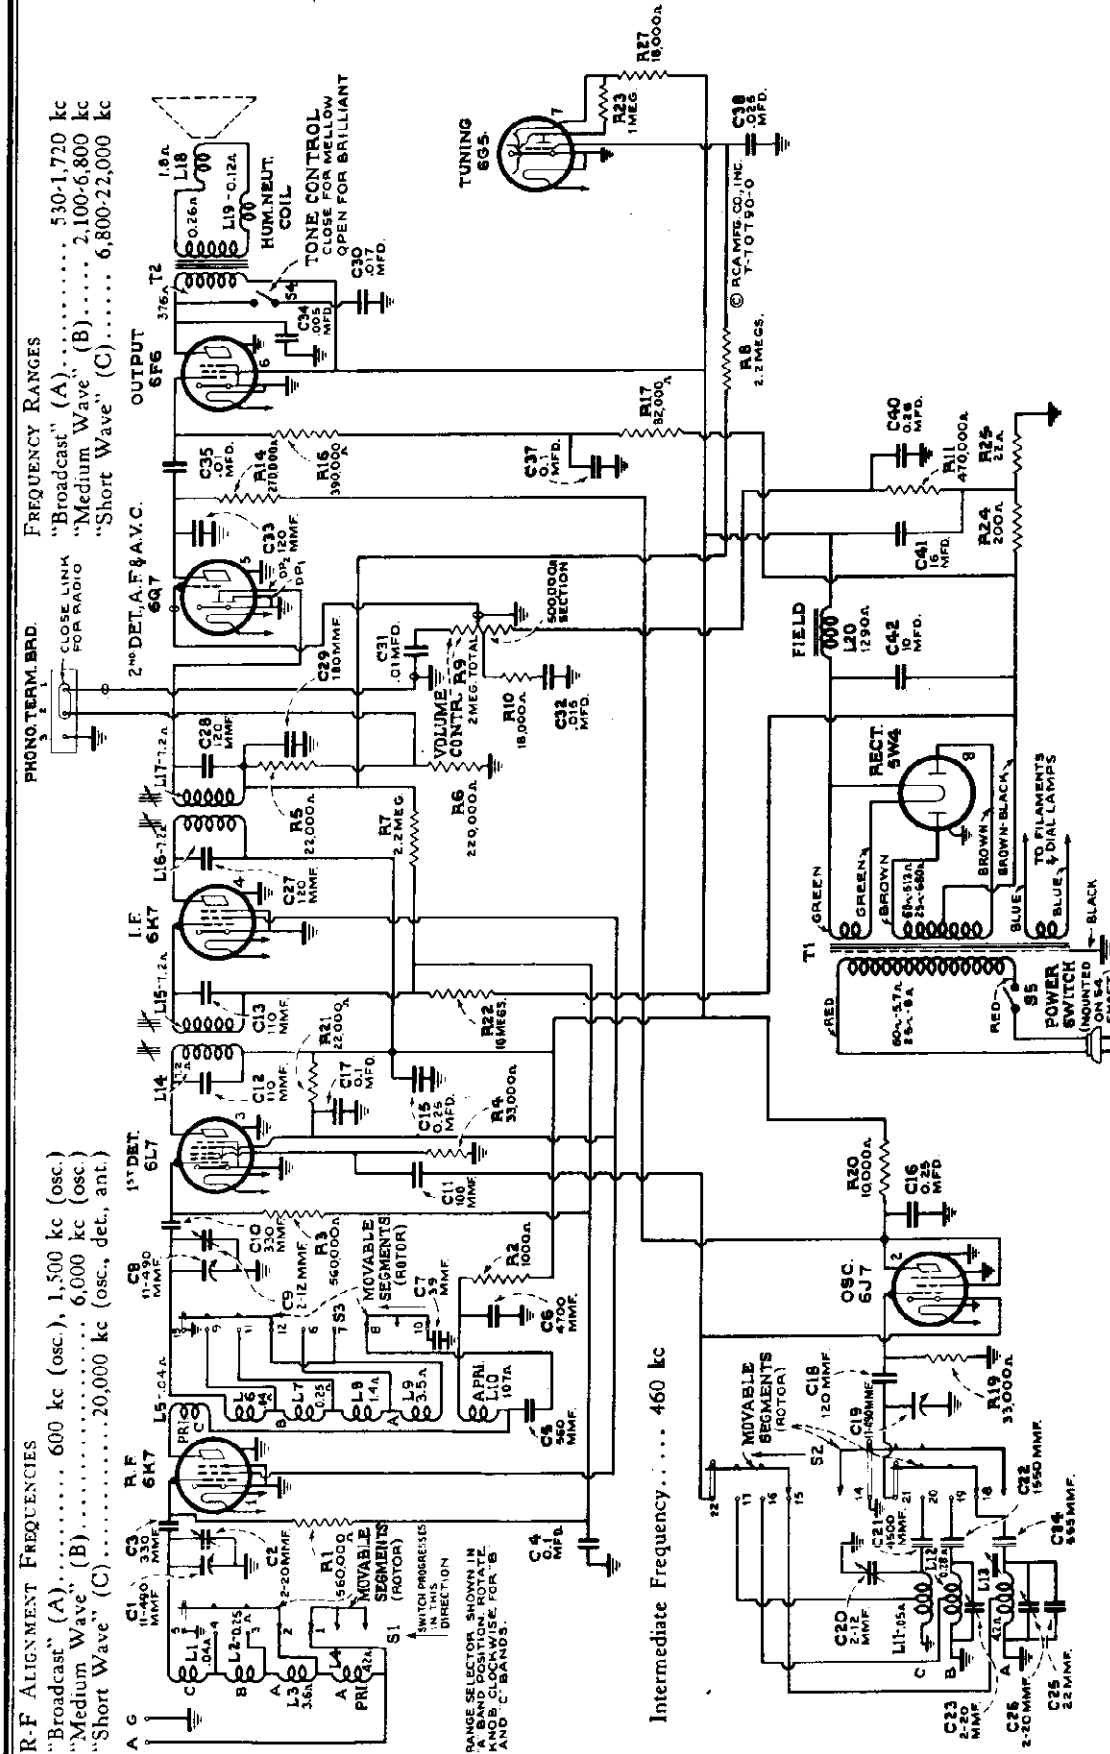

‡ After this adjustment, check for image signal by shifting receiver dial to 19,080 kc.

Service Data

Figure 1—Radiotron, Coil, and Trimmer Locations

Loudspeaker.—Centering of the loudspeaker is made in the usual manner with three narrow paper feelers after first removing the front dust cover. This may be removed by softening its cement with a light application of acetone, using care not to allow the acetone to flow into the air gap. The dust cover should be cemented back in place with ambroid upon completion of adjustment.

Phonograph Attachment.—A terminal board is provided for connecting a phonograph into the audio amplifying circuit. RCA Victor Models R-93, R-93-A, R-93-2, or R-94 Record Players should be connected as follows: Remove link between terminals 1 and 2 on terminal board. Connect green wire in Radio-Record switch cable to terminal 1, yellow to terminal 2, and shield extension to terminal 3. Tape unused red and blue leads separately. Connect a 2-conductor twisted cable between the Record Player binding posts and the screw terminals on Radio-Record switch.

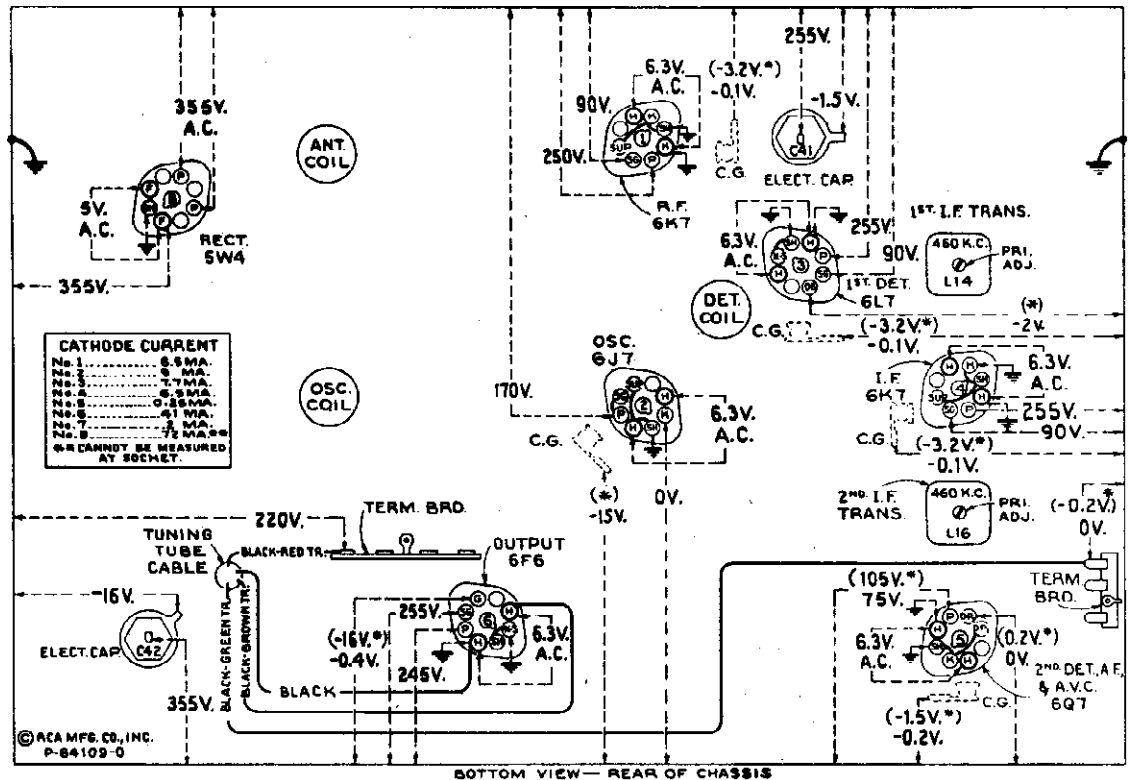

Figure 2—Radiotron Socket Voltages, Coil, and Trimmer Locations

Measured at 115 volts, 60-cycle supply—Tuned to approximately 1,000 kc ("Standard Broadcast")—
No signal being received—Volume control minimum

Notes: Two voltage values are shown for some readings. The value shown in parentheses with asterisk (*) indicates operating conditions without voltmeter loading. The other value (generally lower) is the actual measured voltage and differs from the value shown in parentheses because of the additional loading of the voltmeter through the high series circuit resistance.

Voltage values as specified should hold within $\pm 20\%$ when the receiver is normally operative at its rated line voltage. To duplicate the conditions under which the voltages were measured requires a 1,000-ohm-per-volt d-c meter, having ranges of 10, 50, 250, and 500 volts. Use the nearest range above the specified measured voltage. A-c voltages were measured with a corresponding a-c meter.

RCA MFG. CO., INC.

Introduction

The RCA Victor Record Players Models R-93 (third production), R-93-A (first and second production), R-93-2 Deluxe, R-93-S, and R-94 Deluxe are designed to provide record reproduction to the owner of a radio receiver by utilizing the audio amplifier system and loudspeaker of the radio receiver. Methods of connecting these record players to the radio receiver are outlined in the Model R-93 Service Notes (third edition) and in this booklet. Model R-93 (first and second production) is listed in the "Specifications" tabulation of this booklet, for convenient reference.

Note

1. (Applies to Model R-93-S only). It is necessary to short the 0.1 mid. blocking capacitor C1 in Model R-93-S (see figure 6) for cases in which the control grid d-c bias, or cathode current flow, would be removed or prevented by this capacitor when the record player switch is thrown to "Phono" position. C1 is provided to permit operation on battery receivers without shorting bias batteries, etc. Cases in which it is necessary to short C1 are indicated in "RCA Victor Receivers—Details of Lead Connections" of this booklet.
2. (Record Player Switch Jumpers) — Some record player switches do not have jumpers J1 and J2 (see figure 3) attached. When the switch is so connected and turned to phonograph position, the voltage developed by the pickup is fed into the radio receiver through the green wire and shield, and at the same time the yellow wire is connected to shield. The jumpers J1 and J2 permit the yellow lead to kill radio by connection to shield. The jumpers should be removed where the yellow lead connects in such a position as to short bias batteries, etc. Check the switch to be used for the method chosen and use the jumpers accordingly. Correct jumper connections are indicated in "RCA Victor Receivers—Details of Lead Connections" of this booklet.

To prevent confusion, replacement parts lists are provided separately in this booklet for Models R-93 (third production), R-93-A (first and second production), R-93-2 Deluxe (first production), R-93-S (first production), and R-94 Deluxe (first production), respectively, and should be consulted whenever making replacements to these various models.

Description and Service Data

MODEL R-93

(Third Production)

(Walnut, Red, White, Black)

The Model R-93 (third production) in colors of Walnut, Red, White, or Black are similar electrically to the original R-93 (first and second production) but may be identified mechanically by the curved tone arm. The original Model R-93 had a straight tone arm. Refer to Model R-93 Service Notes (third edition) Phonograph Motor Service Data (second production motors) for motor details and adjustments.

MAGNETIC PICKUP

The pickup used in the phonograph unit is of an improved design. The horseshoe magnet is rigidly welded to the pole pieces and is irremovable. There is a centering spring attached to the armature to maintain proper adjustment and to provide a limiting effect on the movement of the armature. The frequency response is substantially uniform over a wide range. Service operations which may be necessary on the pickup are as follows:

CENTERING ARMATURE

Refer to figure 1 showing the pickup inner structure. The armature is shown in its proper relation to the magnet pole pieces, i. e., exactly centered. Whenever this centering adjustment has been disturbed it will be necessary to remove the pickup mechanism from the tone arm by removing the needle holding screw and the two mounting screws from the front of the tone arm, holding the pickup assembly to keep it from dropping. Unsolder the two leads from the lugs on the terminal board at the rear of the pickup. Insert a small rod or nail into the armature needle hole and replace the needle holding screw, tightening it to hold the rod securely. If the armature clamping screws A and B have not been disturbed, screw or screws C should be loosened which will permit the armature to be moved from side to side, the rod acting as a lever to perform this operation. The proper adjustment is obtained when the armature is moved to the extreme position on each side (the movement being limited by the armature striking the pole pieces) and then brought to the mid position between these two extremes. Screw or screws C should then be tightened. The armature position should then be central between the pole pieces and at right angles to them. With a little practice, the correct adjustment of the armature will be obtained. The air gap between the pole pieces and the armature should be kept free from dust, filings, and other foreign material which would obstruct the movement of the pickup armature.

DAMPING BLOCK

The viscoloid damping block which is attached to the front end of the armature shank serves as a mechanical filter to eliminate undesirable resonances and to cause the frequency response to be uniform. Should it be necessary to replace this damping block, the pickup mechanism should be removed from the tone arm as explained above. Remove screw D and the damping block from the pickup assembly. Make sure that the shaft of the armature which contacts the viscoloid is clean. Then insert the new damping block so that it occupies the same position as that of the original block, and is in correct vertical alignment with the armature. The hole in the block is somewhat smaller than the diameter of the armature in order to permit a snug fit. With the damping block properly aligned on the armature, screw D with its washer should then be replaced. Heat should be applied to the armature (viscoloid side) so that the damping block will fuse at the point of contact and become rigidly attached to the armature. A special-tip soldering iron, constructed as shown in Model R-93 Service Notes (third edition) figure 8, will be found very useful in performing this operation. The iron should be applied only long enough to slightly melt the block, causing a small bulge on both sides.

REPLACING COIL

Whenever there is defective operation due to an open or shorted pickup coil, this coil should be replaced. Remove the pickup mechanism and terminal board as described above. Remove screws A and B and the magnet assembly. Remove the bakelite coil support (with coil attached) and insert the new coil support assembly in its place, after which replace the magnet assembly and center the armature as described above, then reassemble the remainder of the unit. Only rosin core solder should be used for soldering the coil leads and pickup leads to the pickup terminal board. This same type of solder should be used when necessary for soldering the centering spring to the armature.

MAGNETIZING

Loss of magnetization will not usually occur when the pickup has received normal care because the magnet and pole pieces are one unit and the magnetic circuit remains practically closed at all times. When the pickup has been mishandled, subjected to a strong a-c field, jolted, or dropped, there may be an appreciable loss of magnetic strength, in which case it will be necessary to remagnetize the entire structure. To do this, it will be necessary to first remove the pickup mechanism from the tone arm, and then remove the magnet assembly. Place the magnet assembly on the poles of a standard pickup magnetizer such as the RCA Stock No. 95-49 Pickup Magnetizer and charging the magnet in accordance with the instructions accompanying the magnetizer. It is preferable to check the polarity of the pickup magnet and to remagnetize it so that the same polarity is maintained.

MODEL R-93-A

(First and Second Production)

(Walnut)

The cabinet of the Model R-93-A is similar to that of the Model R-93 Walnut finish. This model incorporates an acoustic compensated volume control, see figure 3. Model R-93-A (first production) and Model R-93-A (second production) differ only in the pickup construction, the essential difference being in the armature centering spring and spring clamps. Reference to pickup details, figures 1 and 2 will reveal the fact that the armature centering spring is respectively "V" and "T" shaped for the Model R-93-A (first and second productions). Refer to "Model R-93 (third production)" and figures 1 and 2 for pickup adjustments.

The motor differs slightly in construction and mounting details from that used in the Model R-93 (second production). Refer to figure 4 for motor details. Refer to Model R-93 Service Notes (third edition) for motor coil connections.

MODEL R-93-2 DELUXE

(Walnut)

Model R-93-2 Deluxe is finished in walnut and is electrically identical to Model R-93 (third production), however, the cabinet is larger in size and has a hinged lid which may be closed while playing the records. The turntable is 10 inches in diameter. The motor differs slightly in construction from that used in the Model R-93 (second production). Refer to figure 5 for motor details and to Model R-93 Service Notes (third edition) for motor coil connections.

RCA MFG. CO., INC.

MODELS R-93-S, R-94

Notes
Details of Connections
for Receivers

MODEL R-93-S

(Walnut)

Model R-93-S has a spring wound motor and is primarily intended for use with battery receivers. The pickup and tonearm are identical to those described in "Model R-93 (third production)," therefore the adjustments will be the same. Reference to the Schematic diagram figure 6 will show a capacitor C1 in series with one of the leads to the binding posts. The purpose of C1 is to permit operation on battery receivers without shorting bias batteries, etc. Observe Note 1 under "Introduction" when making connections to radio receivers.

MOTOR

The drive motor is of simple design and substantial construction. It should require little or no service if properly maintained. Attention to lubrication of the moving parts and occasional cleaning of the mechanism will go far to prevent faulty operation. Should it become necessary to repair the motor, the following procedure should be applied referring to figure 7:

REMOVING MOTOR FROM CABINET—Remove the winding key. To dismount the motor, unscrew the spindle cap with a screwdriver and remove turntable, slightly tapping the spindle while exerting an upward lift on the turntable. Remove the bottom cover from the cabinet. Loosen the screw holding the speed regulating lever and remove the latter. The four nuts holding motor to motor board should then be loosened to permit removal of motor assembly.

Caution—Allow the motor mechanism to run down completely before attempting adjustment, repairs, or replacement.

REPLACING MAIN SPRING—In case of main spring failure the entire spring barrel and gear should be replaced. Remove spring barrel spindle screw by unscrewing to right. Remove the "C" washer and two pillar screws holding bottom plate. Remove plate and intermediate spindle shaft. Replace main spring barrel, intermediate spindle shaft, and bottom plates.

WINDING SHAFT SPRING—This spring functions as a friction ratchet. It may be removed by first removing pin holding winding gear on shaft, removing shaft, and then the screw holding the spring.

GOVERNOR ADJUSTMENTS—The mesh of the worm and fibre gears is adjusted by rotation of the eccentric spindle bearings. The adjustments should be made so that the worm meshes properly with the fibre gear and rotates freely without binding. The bearings should be accurately aligned with each other. The minimum of spindle end play which permits smooth operation should be used.

SPEED REGULATOR LEVEL—After assembly, adjust the speed regulator until the turntable rotates at 78 r.p.m.; then loosen the speed regulator screw and set pointer to center of speed indicator scale; tighten screw and re-check turntable speed.

LUBRICATION—All moving parts of the motor should be thoroughly cleaned and lubricated every six months to prevent excess wear and improper operation. A small amount of grease should be applied to the worm gear of the governor, the gear of the winding shaft, and on the small pinion gear. All other points should be lubricated with a drop of light oil. All motor parts should be covered with a light film of oil to prevent rusting.

MODEL R-94 DE LUXE

(Walnut)

The Model R-94 Deluxe cabinet is finished in walnut and has a hinged lid which may be closed while playing the records. This model incorporates an acoustic compensated volume control, see figure 3. An improved type of pickup is used, the construction of which is illustrated in figure 2. Refer to "Model R-93 (third production)" and figure 2 for pickup adjustments.

MOTOR—The phonograph motor is of the governor induction type and is designed to be simple and foolproof. Occasionally, however, certain adjustments may be required. These adjustments are illustrated and explained in figure 8. Application of oil to the felt pad which rubs against the governor disc will insure smooth operation.

LOUDSPEAKER

Centering of the loudspeaker is made in the usual manner with three narrow paper feelers after first removing the front dust cover. This may be removed by softening its cement

with a light application of acetone, using care not to allow the acetone to flow into the air gap. The dust cover should be cemented back in place with ambroid upon completion of adjustment.

Automatic Record Changer Adjustment, Assembly

ADJUST THE LOWERMOST REST POSITION OF THE TONE ARM SO THAT THE NEEDLE POINT RESTS IN A PLANE 1/16" BELOW THE PLANE OF THE TOP OF THE TURNTABLE BY MEANS OF SCREW "4".

ADJUST THE RISE OF THE TONE ARM SO THAT THE NEEDLE POINT RISES 1/16" ABOVE THE TOP OF THE TURNABLE DURING CYCLE. THIS ADJUSTMENT IS MADE BY MEANS OF THE SCREW AND LOCK NUTS "1" (STK-4203) ON THE CABLE LEVER.

TO ADJUST THE LANDING POSITION OF THE NEEDLE, FIRST LOCATE NEEDLE "4" FROM CENTER OF THE TURNABLE SPINDLE. THEN WITH THE LOCATING LEVER AGAINST THE STOP PIN "1" AND THE PIN "2" ON THE TRIP LEVER CONTACTING, THE LOCATING LEVER TIGHTEN THE BLUNT SCREW "3" ON TONE ARM SUPPORT AND RUN DEVICE THROUGH CYCLE TO A CHECK WHEN CONTACT ADJUSTMENT IS MADE TO TONE ARM SUPPORT. CONE POINTED SCREW "4" (STK-4199) ON TONE ARM SUPPORT.

ADJUST THE REST POSITION OF THE MAIN LEVER BY MEANS OF THE NUT "1" ON THE BUMPER BARCKET "2", THAT THE MAIN LEVER "3", CLEAR THE CLEARANCE FROM THE MAIN LEVER TO THE NEAREST POST DETENT LEVER. NOTE THAT THE PIN "1" AT LEAST 1/16" WHEN THE ABOVE CONDITIONS EXIST.

TO ADJUST RECORD POSTS: PLACE RECORD POSTS TO THE SPINDLE SO THAT IT RESTS ON THE LOWER SHELF OF THE ROT. HUB. MOVE STATIONARY RECORD POST TO A POSITION WHERE IT IS CONCENTRICALLY MOUNTED WITH THE TURNABLE AND THE BEVELED SHELF PROTRUDES UNDER THE RECORD TABLE. TIGHTEN HEXAGON SCREW "1" LOCATED UNDER MOTOR BOARD, WITH RECORD STILL ON LOWER SHELF OF ROTATING HUB ADJUST SCREW "2" (STK-4198) SO THAT THE BEVELED TONGUE ON THE SEPARATING CLAY SLIP WHEN THE RECORD BY 1/8". THESE ADJUSTMENTS SHOULD BE MADE ONLY WHEN THE COMPLETE UNIT IS RESTING ON THE FOUR MOTOR BOARD BUSHINGS.

TO ADJUST TRIP LEVER SCREW "1" (STK-4199) AND FRICTION LEVER TO MOVE TRIP PAWL. TO ADJUST PICK-UP SCREW "3" FROM CENTER OF SPINDLE, ADJUST NUT "1" SO THAT THE BLADE ON SWITCH IS JUST CONTACTING PIN "1".

Pick-up & Motor Details
Voltage, Notes, Socket
Adjustments

Figure 1—Details of Motor

Figure 2—Details of Pickup

Figure 4—Radiotron Locations

Replacing Coil.—Whenever there is defective operation due to an open or shorted pickup coil, this coil should be

replaced. Remove the pickup mechanism and terminal board as described above. Remove screws A and B and the magnet assembly. Remove the bakelite coil support (with coil attached) and insert the new coil support assembly in its place, after which replace the magnet assembly and center the armature as described above, then re-assemble the remainder of the unit. Only rosin core solder should be used for soldering the coil leads and pickup leads to the pickup terminal board. This same type of solder should be used when necessary for soldering the centering spring to the armature.

Magnetizing.—Loss of magnetization will not usually occur when the pickup has received normal care because the magnet and pole pieces are one unit and the magnetic circuit remains practically closed at all times. When the pickup has been mishandled, subjected to a strong a-c field, jolted, or

Figure 5—Tone Arm and Motor Switch Adjustments (Model R-96)

dropped, there may be an appreciable loss of magnetic strength, in which case it will be necessary to remagnetize the entire structure. To do this, it will be necessary to first remove the pickup mechanism from the tone arm, and then remove the magnet assembly. Place the magnet assembly or the poles of a standard pickup magnetizer such as the RCA Stock No. 9549 Pickup Magnetizer and charge the magnet in accordance with the instructions accompanying the magnetizer. It is preferable to check the polarity of the pickup magnet and to remagnetize it so that the same polarity is maintained.

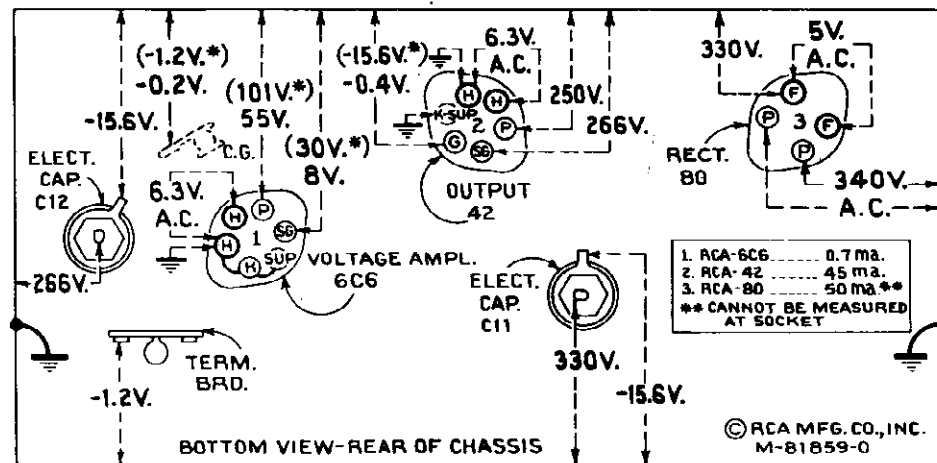

Figure 6—Radiotron Socket Voltages

Measured at 115 volts, 60-cycle supply—Volume control minimum

Note: Two voltage values are shown for some readings. The value shown in parentheses with asterisk () indicates operating conditions without voltmeter loading. The other value (generally lower) is the actual measured voltage and differs from the value shown in parentheses because of the additional loading of the voltmeter.*

Voltage values as specified should hold within $\pm 20\%$ when instrument is normally operative at its rated line voltage. To duplicate the conditions under which the voltages were measured requires a 1,000-ohm-per-volt d-c meter, having ranges of 10, 50, 250, and 500 volts. Use the nearest range above the specified measured voltage. A-c voltages were measured with a corresponding a-c meter.

MODELS R-96, R-97

Notes

RCA MFG. CO., INC.

General Description

The Model R-97 Electric Phonograph consists of a three-tube audio amplifier, an eight-inch dust-proof electrodynamic loudspeaker, and an automatic record changer combined in a hinged-top table-type cabinet. Its design includes a phonograph compensation pack, resistance-coupled audio system, self-starting constant-speed motor, improved magnetic pickup, and a tone control. The phonograph mechanism will play a

series of eight 10-inch records (changes seven) or repeat 12-inch records. It may be operated manually if desired.

The Model R-96 Electric Phonograph is identical to Model R-97 electrically, has a manually operated turntable, and a slightly different cabinet design.

The circuit arrangement of either instrument is shown on figure 8.

AUTOMATIC RECORD CHANGER

(Model R-97)

The record changing mechanism is designed to be simple and fool-proof. Certain adjustments may be required occasionally. The adjustments are illustrated and explained in figures 1 and 7.

It is important when servicing the automatic mechanism, to have it placed on a level support. It is also important to refrain from forcing the mechanism if there is a tendency to bind or jam, since bent levers and possible broken parts may result.

CAUTION.—Do not leave records stacked on the record holder posts, when not in use, as they are liable to warp, particularly so in warm climates.

MOTOR ADJUSTMENTS

The phonograph motors are of the governor induction type and are designed to be simple and foolproof. Occasionally, however, certain adjustments may be required. These adjustments are illustrated and explained in figure 1. Application of oil to the felt pad which rubs against the governor disc will insure smooth operation.

MAGNETIC PICKUP

The pickup used is of an improved design. The horseshoe magnet is rigidly welded to the pole pieces and is irremovable. There is a centering spring attached to the armature to maintain proper adjustment and to provide a limiting effect on the movement of the armature. The frequency response is substantially uniform over a wide range. Service operations which may be necessary on the pickup are as follows:

Centering Armature.—Refer to figure 2 showing the pickup inner structure. The armature is shown in its proper relation to the magnet pole pieces, i. e., exactly centered. Whenever this centering adjustment has been disturbed it will be necessary to remove the pickup mechanism from the tone arm by removing the needle holding screw and the two mounting screws from the front of the tone arm, holding the pickup assembly to keep it from dropping. Unsolder the two leads from the lugs on the terminal board at the rear of the pickup. Insert a small rod or nail into the armature needle hole and replace the needle holding screw, tightening it to hold the rod securely. If the armature clamping screws

A and B have not been disturbed, screws C should be loosened which will permit the armature to be moved from side to side, the rod acting as a lever to perform this operation. The proper adjustment is obtained when the armature is moved to the extreme position on each side (the movement being limited by the armature striking the pole pieces) and then brought to the mid position between these two extremes. Screws C should then be tightened. The armature position should then be central between the pole pieces and at right angles to them. With a little practice, the correct adjustment of the armature will be obtained. The air gap between the pole pieces and the armature should be kept free from dust, filings, and other foreign material which would obstruct the movement of the pickup armature.

Damping Block.—The viscoloid damping block which is attached to the front end of the armature shank serves as a mechanical filter to eliminate undesirable resonances and to cause the frequency response to be uniform. Should it be necessary to replace this damping block, the pickup mechanism should be removed from the tone arm as explained above. Remove screw D and the damping block from the pickup assembly. Make sure that the shaft of the armature

Figure 3—Special Soldering-Iron Tip

which contacts the viscoloid is clean. Then insert the new damping block so that it occupies the same vertical position as that of the original block, and is in correct vertical alignment with the armature. The hole in the block is somewhat smaller than the diameter of the armature in order to permit a snug fit. With the damping block properly aligned on the armature, screw D with its washer should then be replaced. Heat should be applied to the armature (viscoloid side) so that the damping block will fuse at the point of contact and become rigidly attached to the armature. A special-tip soldering iron, constructed as shown in figure 3, will be found very useful in performing this operation. The iron should be applied only long enough to slightly melt the block, causing a small bulge on both sides.

Alignment, Socket Trimmers

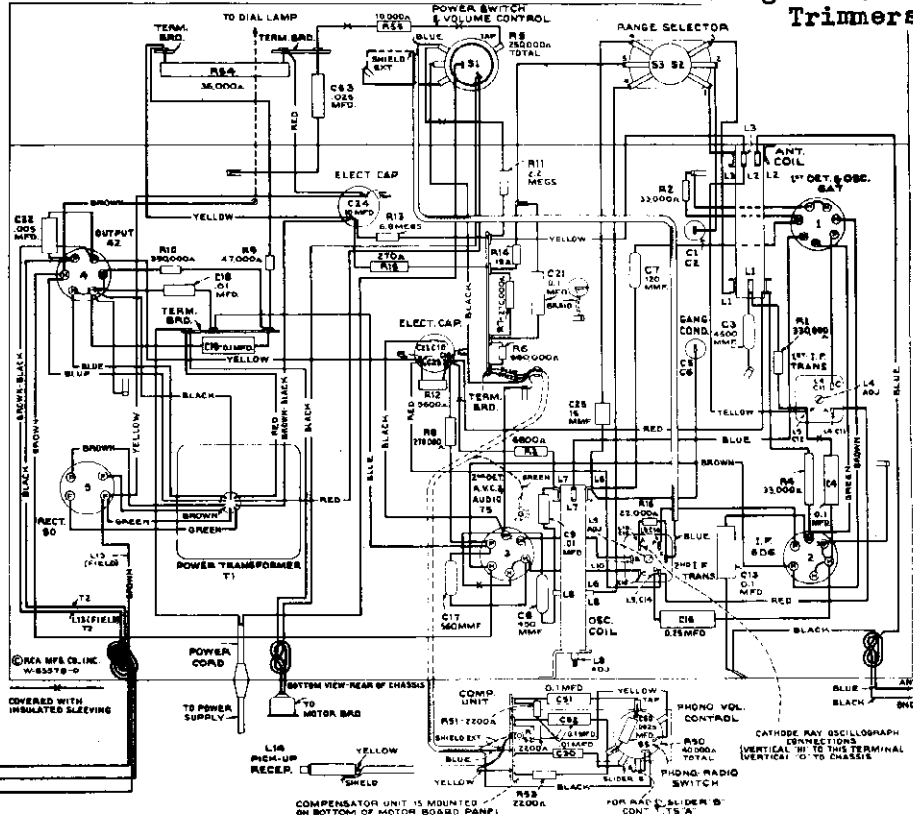

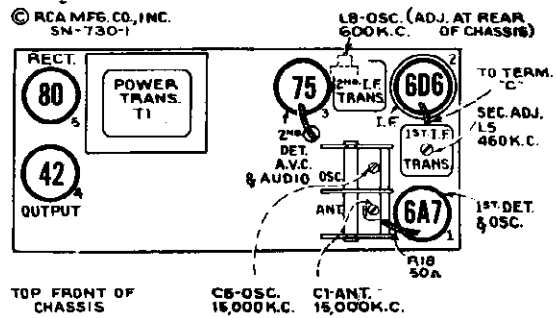

Figure 3—Chassis Wiring Diagram (Model U-103)

Alignment Procedure

Calibrate the tuning dial by adjusting dial pointer to the center horizontal line with the gang tuning-condenser plates in full-mesh position. This is a screw-driver adjustment.

Figure 11—Radiotron, Coil, and Trimmer Locations

Perform alignment in proper order, tabulated below, starting with No. 1 and following all operations across, then No. 2, etc. Adjustment locations are shown on figures 9, 10, and 11.

Cathode-ray alignment is preferable; the connections to the chassis are shown on figures 2 and 3. If an output indicator is used, connect it across the loudspeaker voice-coil and advance the receiver volume control to full-volume position.

Connect the "low" output terminal of the test oscillator to the receiver chassis for all alignment operations. Regulate the output of the test oscillator so that minimum signal is applied to the receiver to obtain an observable output indication. This will avoid a-v-c action.

The term "Dummy antenna" means the device which must be connected between the "high" test-oscillator output and the point of connection to the receiver in order to obtain ideal alignment. "No signal, 550-750 kc" means that the receiver should be tuned to a point between 550 and 750 kc where no signal or interference is received from a station or local (heterodyne) oscillator.

Order of Alignment	Test Oscillator			Range-Selector	Receiver Dial Setting	Circuit to Adjust	Adjustment Symbols	Adjust to Obtain
	Connection to Receiver	Dummy Antenna	Frequency Setting					
1	6D6 I-F Grid Cap	.001 Mfd.	460 kc	"A" Left	No Signal 550-750 kc	2nd I-F Trans.	L9	Max. (peak)
2	6A7 Det. Grid Cap	.001 Mfd.	460 kc	"A" Left	No Signal 550-750 kc	1st I-F Trans.	L4 and L5	Max. (peak)
3	Ant. Lead (blue)	300 Ohms	15,000 kc	"C" Right	15,000 kc	"C" Osc.	C5	Max. (peak)†
4	Ant. Lead (blue)	300 Ohms	15,000 kc	"C" Right	Rock Through 15,000 kc	"C" Ant.	C1	Max. (peak)*‡
5	Ant. Lead (blue)	200 Mmfd.	600 kc	"A" Left	600 kc	"A" Osc.	L8	Max. (peak)

* Use minimum capacity peak if two peaks can be obtained. † Use maximum capacity peak if two peaks can be obtained. ‡ After this adjustment, check for image signal by shifting receiver dial to 15,920 kc.

Automatic Record Changer
Adjustments, Details

ADJUST THE LOWER MOST REST POSITION POINT RESTS IN A PLANE $1/32"$ BELOW THE PLANE OF SCREW 'H'.

TO ADJUST RECORD POSTS: SO THAT IT RESTS ON THE LOWER SHELF OF THE ROT. HUB, MOVE STATIONARY RECORD POST TO POSITION WHERE RECORDS CAN BE LOCATED UNDER THE RECORD/TAPE TABLE. THE RECORD SCREW IS LOCATED UNDER MOTOR BOARD, WITH RECORD STILL ON LOWER SHELF OF ROTATING HUB ADJUST SCREW 'C' (STK*14188) SO THAT THE BEVELED TONGUE ON THE SEPARATING CRAM CLEARS THE RECORD BY $1/8"$ TO $3/8"$. THESE ADJUSTMENTS SHOULD BE MADE ONLY WHEN THE COMPLETE UNIT IS RESTING ON THE FOUR MOTOR BOARD BUSHINGS.

ADJUST THE REST POSITION OF THE MAIN LEVER BY MEANS OF THE NUT 'D' ON THE BUMPER BRACKET SO THAT THE MAIN LEVER ROLLER CAMEARNS THE NEAREST POSITION. ALSO NOTE THAT THE DETENT LEVER CLEARS THE PIN 'E' AT LEAST $1/16"$ WHEN THE ABOVE CONDITIONS EXIST.

ADJUST THE RAISE OF THE TONE ARM SO THAT THE NEEDLE POINT RISES $1/16"$ ABOVE THE TOP OF THE 15 TURNS .190 O.D. THE SCREW AND LOCK NUTS 'P' (STK*14205) ON THE CABLE LEVER.

TO ADJUST THE LANDING POSITION OF THE NEEDLE FIRST LOCATE NEEDLE $1/16"$ FROM CENTER OF THE TURNABLE SPINDLE THEN WITH THE LOCATING LEVER RISE TO CONTACT IN THE RECORDING LEVER TIGHTEN THE BALL JOINT SCREW 'G' ON TONE ARM SUPPORT AND RUN DEVICE THROUGH CYCLE RS A CHECK WHEN CORRECT ADJUSTMENT IS OBTAINED TIGHTEN CONE POINTED SCREW 'H' (STK*14195) ON TONE ARM SUPPORT.

ADJUST TRIP LEVER SCREW 'J' (STK*14205) UNTIL FRACTION LEVER TO MOVE TRIP PAWL.

Figure 4—
Automatic Record Changer Adjustments
(Model U-103)

TO ADJUST PICK-UP SHORTING SWITCH SET PICK-UP NEEDLE $1/16"$ FROM CENTER OF SPINDLE. ADJUST NUT 'L' SO THAT THE BLADE ON SWITCH IS JUST CONTACTING PIN 'M'.

Automatic Record Mechanism
(Model U-103)

The record changing mechanism is designed to be simple and fool-proof. Certain adjustments may be required occasionally. The adjustments are illustrated and explained in figures 4 and 5.

Figure 5—Details of Motor
(Model U-103)

It is important when servicing the automatic mechanism, to have it placed on a level support. It is also important to refrain from forcing the mechanism if there is a tendency to bind or jam, since bent levers and possible broken parts may result.

CAUTION.—Do not leave records stacked on the record holder posts, when not in use, as they are liable to warp, particularly so in warm climates.

MAGNETIC PICKUP

The pickup used in the phonograph unit is of an improved design. The horseshoe magnet is rigidly welded to the pole pieces and is irremovable. There is a centering spring attached to the armature to maintain proper adjustment and to provide a limiting effect on the movement of the armature. The frequency response is substantially uniform over a wide range. Service operations which may be necessary on the pickup are as follows:

Centering Armature.—Refer to figure 6 showing the pickup inner structure. The armature is shown in its proper relation to the magnet pole pieces, i. e., exactly centered. Whenever this centering adjustment has been disturbed it will be necessary to remove the pickup mechanism from the tone arm by removing the needle holding screw and the two mounting screws from the front of the tone arm, holding the pickup assembly to keep it from dropping. Unsolder the two leads from the lugs on the terminal board at the rear of the pickup. Insert a small rod or nail into the armature needle hole and replace the needle holding screw, tightening it to hold the rod securely. If the armature clamping screws A and B have not been disturbed, screws C should be loosened which will permit the armature to be moved from side to side, the rod acting as a lever to perform this operation. The proper adjustment is obtained when the armature is moved to the extreme position on each side (the movement being

Figure 6—Details of Pickup

limited by the armature striking the pole pieces) and the brought to the mid position between these two extreme Screws C should then be tightened. The armature position should then be central between the pole pieces and at right angles to them. With a little practice, the correct adjustment of the armature will be obtained. The air gap between the pole pieces and the armature should be kept free from dust filings, and other foreign material which would obstruct the movement of the pickup armature.

Damping Block.—The viscoloid damping block which is attached to the front end of the armature shank serves as a mechanical filter to eliminate undesirable resonances and cause the frequency response to be uniform. Should it be necessary to replace this damping block, the pickup mechanism should be removed from the tone arm as explained above. Remove screw D and the damping block from the pickup assembly. Make sure that the shaft of the armature which contacts the viscoloid is clean. Then insert the new damping block so that it occupies the same position as that of the original block, and is in correct vertical alignment with the armature. The hole in the block is somewhat smaller than the diameter of the armature in order to permit a snug fit. With the damping block properly aligned on the armature, screw D with its washer should then be replaced. Heat should be applied to the armature (viscoloid side) so that the damping block will fuse at the point of contact and become rigidly attached to the armature. A special-tip soldering iron, constructed as shown in figure 8 will be found very useful in performing this operation. The iron should be applied long enough to slightly melt the block, causing a small bulge on both sides.

Replacing Coil.—Whenever there is defective operation due to an open or shorted pickup coil, this coil should be replaced. Remove the pickup mechanism and terminal board as described above. Remove screws A and B and the magnet assembly. Remove the bakelite coil support (with coil attached) and insert the new coil support assembly in its place after which replace the magnet assembly and center the armature as described above, then re-assemble the remainder of the unit.

Magnetizing.—In case it becomes necessary to re-magnetize the unit, first remove the pickup mechanism from the tone arm, and then remove the magnet assembly. Place the ma-

Schematic, Notes

RCA MFG. CO., INC.

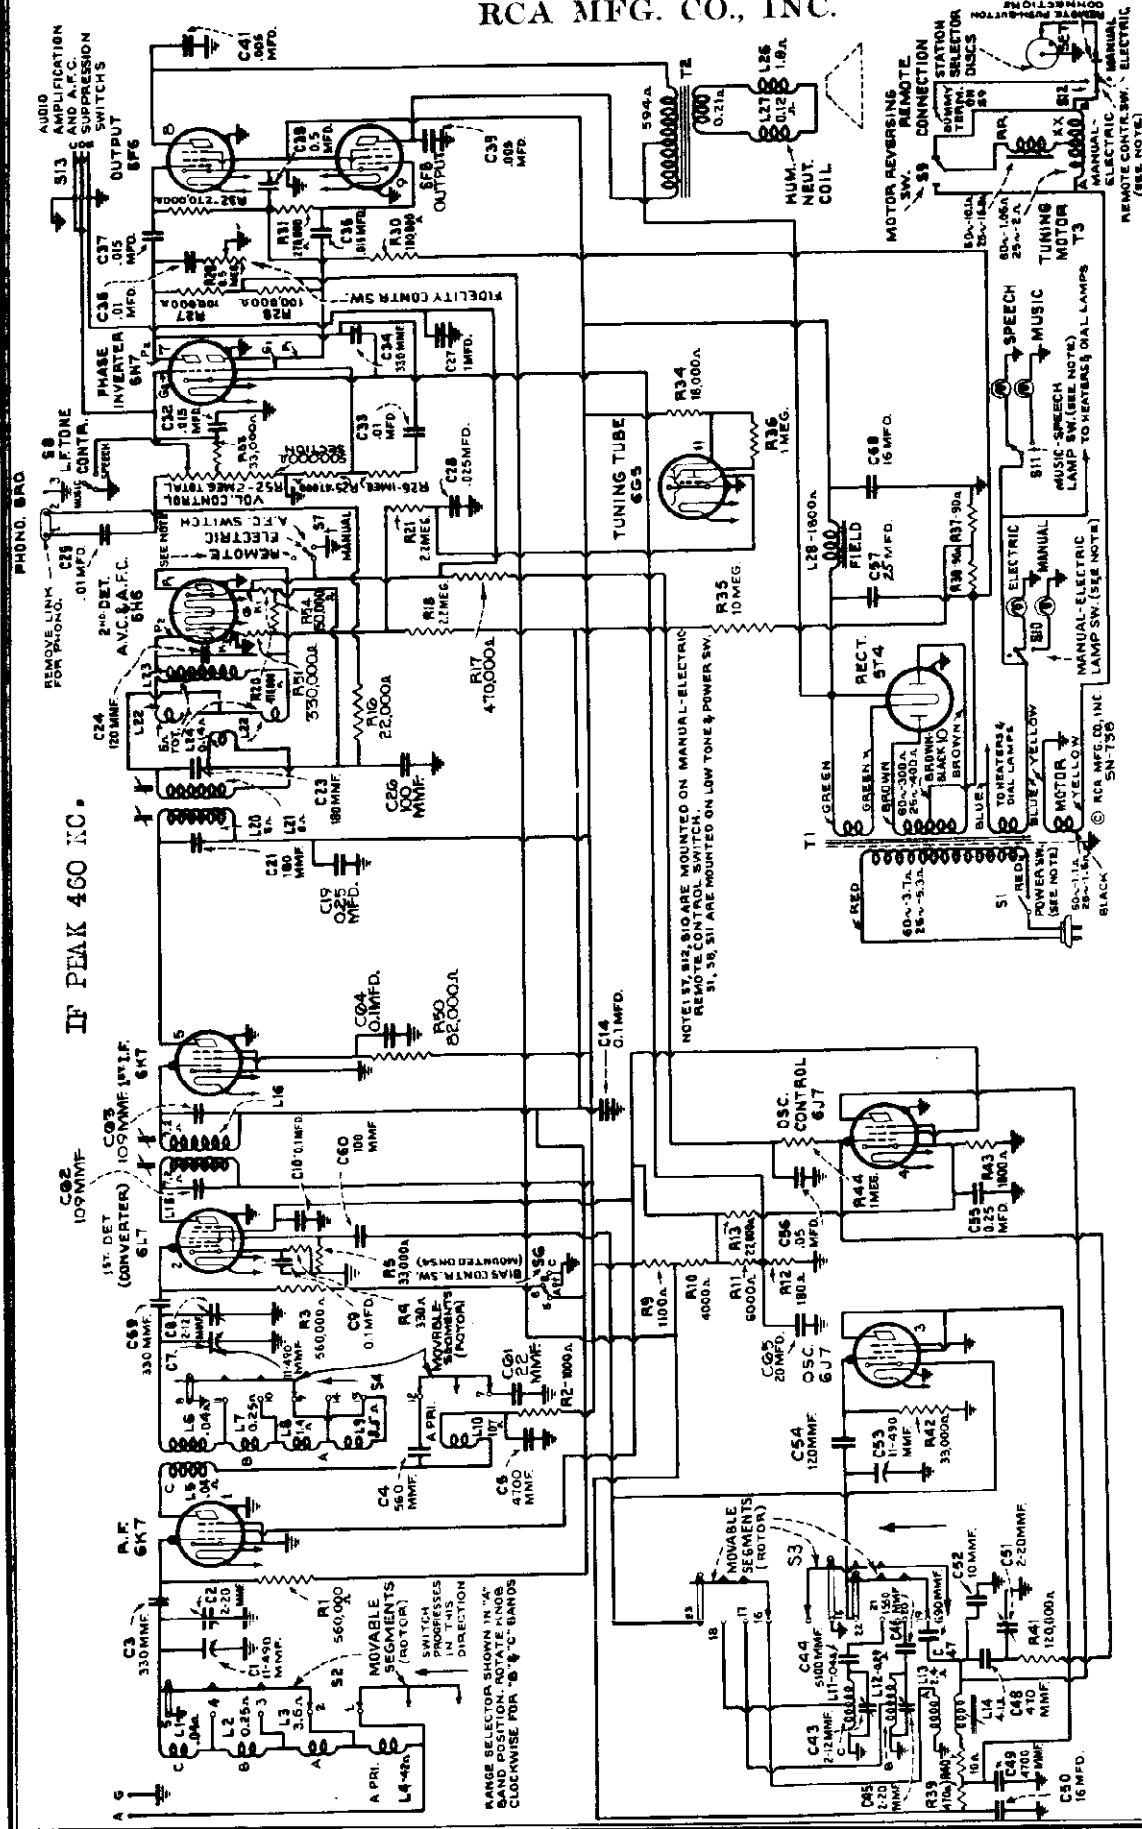

Figure 1—Schematic Circuit Diagram

This receiver employs an eleven-tube, three-band, "Magic Brain" superheterodyne circuit. Features of design include "Electric Tuning" with push-button operation; automatic frequency control; "cumulative-wound" antenna and detector coils; tuned r-f amplifier; magnetic-core adjusted i-f transformers and low-frequency "A" oscillator tracking; straight-board; "Magic Eye" tuning tube; twelve-inch electrodynamic loudspeaker; plunger-type, air-dielectric trimming capacitors; aural-compensated volume control; tone control; "Music-Speech" switch; audio phase inverter; and push-pull power output stage. In addition, this model has a cabinet incorporating the "Sonic Arc" Magic Voice.

MODEL 811K
Socket, Trimmers

RCA MFG. CO., INC.

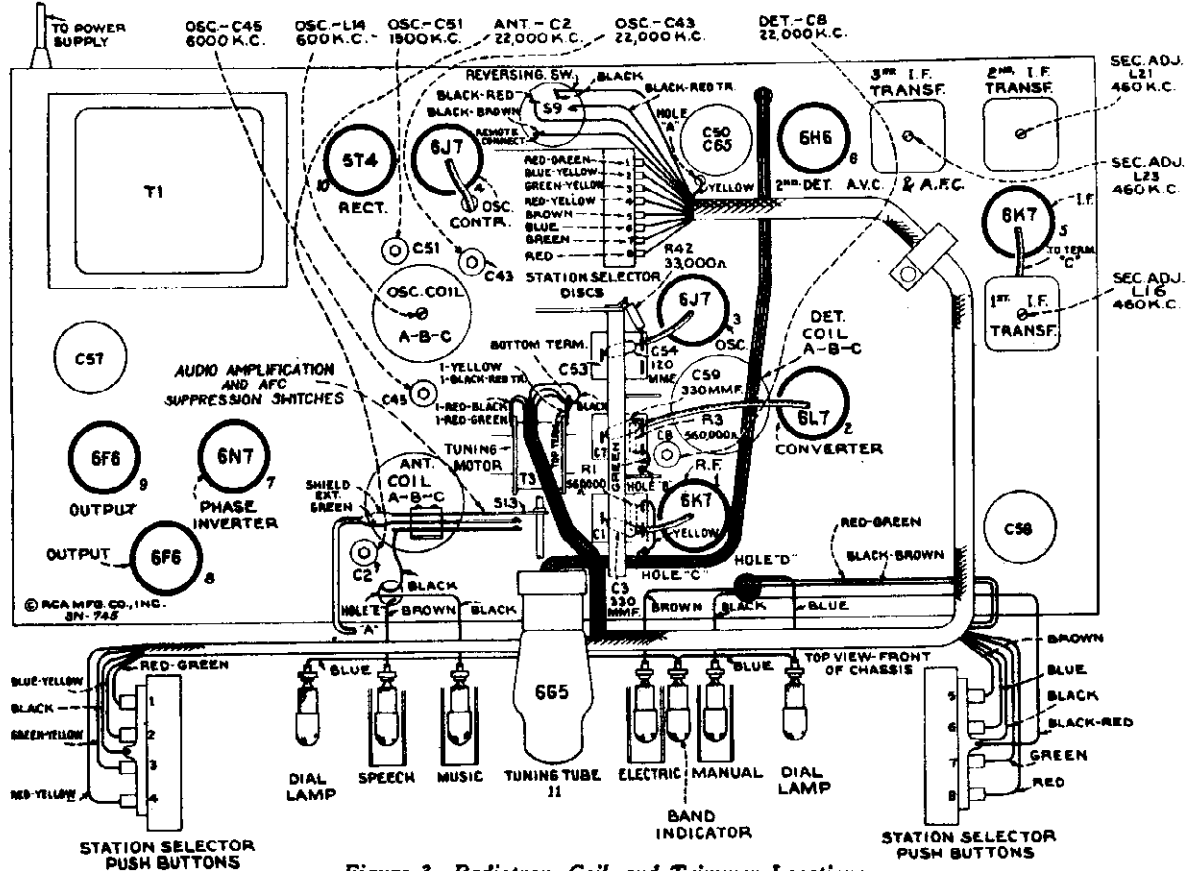

Figure 3—Radiotron, Coil, and Trimmer Locations

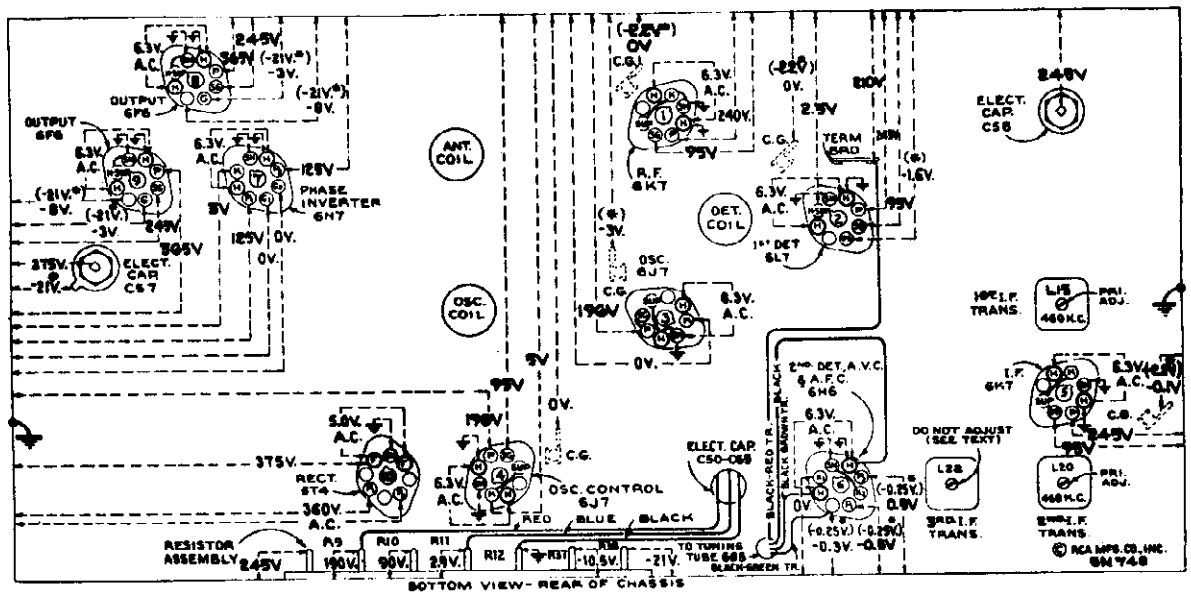

Figure 4—Radiotron Socket Voltages, Coil, and Trimmer Locations

Measured at 115 volts, 60-cycle supply—Tuned to approximately 1,000 kc ("Broadcast")—"Manual" control—No signal being received—Volume control minimum—Tone control optional

Note: Two voltage values are shown for some readings. The value shown in parentheses with asterisk (*) indicates operating conditions without voltmeter loading. The other value (generally lower) is the actual measured voltage and differs from the value shown in parentheses because of the additional loading of the voltmeter.

Voltage values as specified should hold within $\pm 20\%$ when the receiver is normally operative at its rated line voltage. To duplicate the conditions under which the voltages were measured requires a 1,000-ohm-per-volt d-c meter, having ranges of 10, 50, 250, and 500 volts. Use the nearest range above the specified measured voltage. A-c voltages were measured with a corresponding a-c meter.

board; "Magic Eye" tuning tube; twelve-inch electrodynamic loudspeaker; plunger-type, air-dielectric trimming capacitors; two-point aural-compensated volume control; fidelity control; low-frequency tone control; audio phase inverter; and push-pull power output stage. In addition, this model has a cabinet incorporating the "Sonic Arc" Magic Voice.

General Description

This receiver employs a twelve-tube, three-band, "Magic Brain" superheterodyne circuit. Features of design include "Electric Tuning" with push-button operation; automatic frequency control; "cumulative-wound" antenna and detector coils; tuned r-f amplifier; magnetic-core adjusted i-f transformers and low-frequency "A" oscillator tracking; two-stage i-f amplifier; automatic volume control; phonograph terminal

Voltage

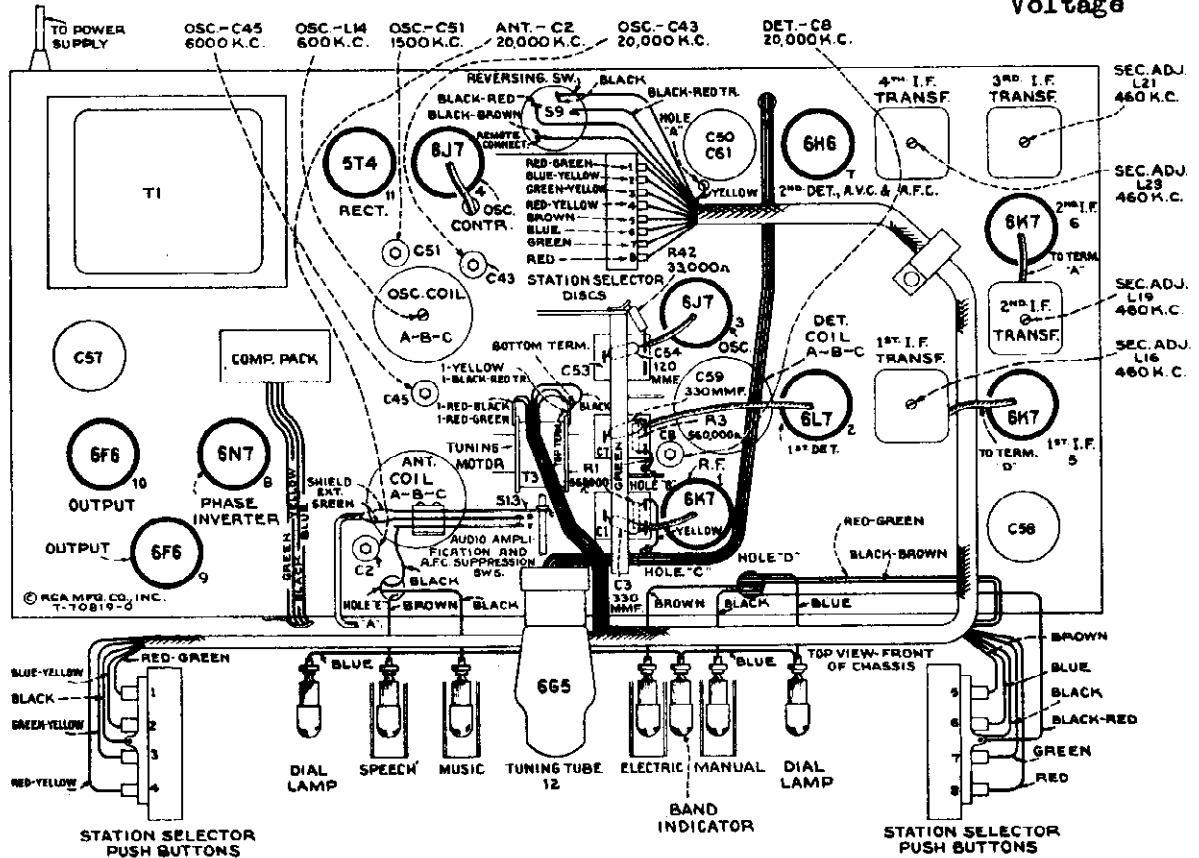

Figure 3—Radiotron, Coil, and Trimmer Locations

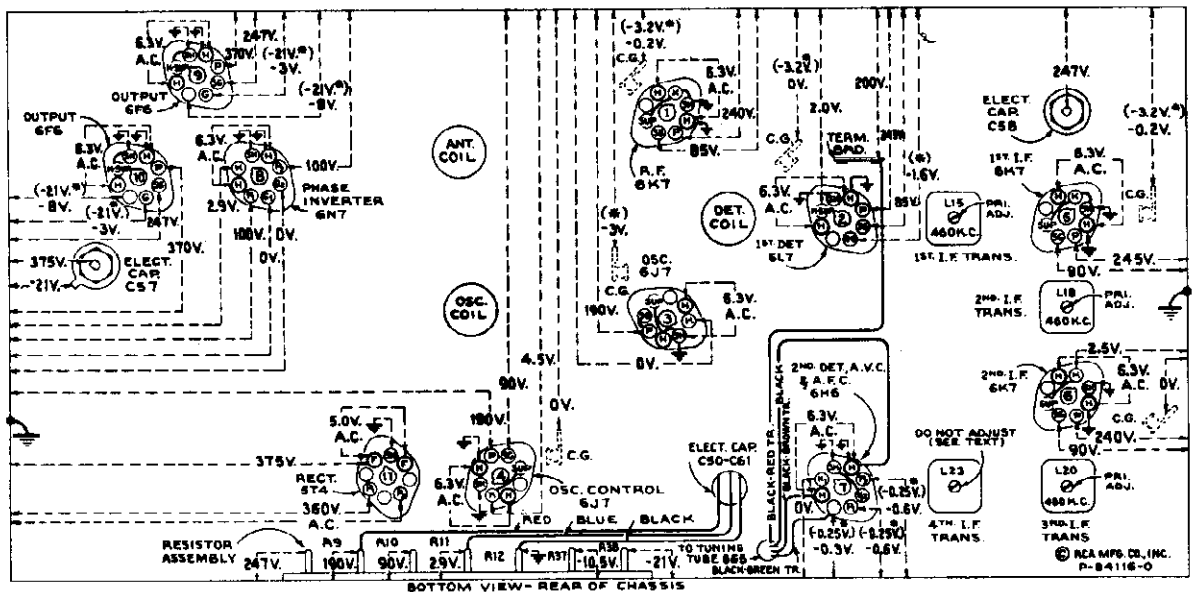

Figure 4—Radiotron Socket Voltages, Coil, and Trimmer Locations

Measured at 115 volts, 60-cycle supply—Tuned to approximately 1,000 kc ("Broadcast")—"Manual" control—No signal being received—Volume control minimum—Fidelity control optional

Note: Two voltage values are shown for some readings. The value shown in parentheses with asterisk (*) indicates operating conditions without voltmeter loading. The other value (generally lower) is the actual measured voltage and differs from the value shown in parentheses because of the additional loading of the voltmeter.

Voltage values as specified should hold within $\pm 20\%$ when the receiver is normally operative at its rated line voltage. To duplicate the conditions under which the voltages were measured requires a 1,000-ohm-per-volt d-c meter, having ranges of 10, 50, 250, and 500 volts. Use the nearest range above the specified measured voltage. A-c voltages were measured with a corresponding a-c meter.

ceiver antenna "A" terminal. With the "Manual-Electric-Remote" switch in "Manual" (right) position, tune in a strong local station near 600 kc or the low-frequency end of the "A" band as accurately as possible by means of the tuning knob. Then, by adjusting the "zero-beat" tuning knob midway between the two points where the eye just appears to start to open. This will place the generated rf carrier signal frequency exactly in the center of the rf amplifier response curve (should be 460 kc if amplifier was properly aligned) and is the frequency to which the a-f-c discriminator (4th if transformer) should be tuned to resonance. Although the tuning knob is in the "zero-beat" position, the grid stop lead of the RCA-6K7, 1st rf amplifier tube, adjust the test-oscillator output to maximum, turn test-oscillator frequency "down" of, and carefully zero-beat the test-oscillator frequency (approximately 460 kc) with the rf carrier signal. Avoid placing the test-oscillator lead nearer to the grid cap lead than specified above, as doing so will tend to detune the rf amplifier. It may be necessary to reduce the local station frequency to approximately 500 kc in order to tune in the grounding antenna "A" terminal to chassis in order to create the zero-beat adjustment.

Throw "Manual-Electric-Remote" switch to "Electric" (center) position. A high whistle or beat note will now be heard. Turn the magnetic core screw L13 (top of 4th if transformer) slowly clockwise. As this screw is turned, the beat note will first increase to a high audio frequency and will then decrease to a zero-beat and then increase in fre-

quency again. The point of exact zero-beat is the position for correct adjustment of the discriminator. Zero-beat should also call zero when the "Manual-Electric-Remote" switch is thrown back to "Manual" position. The adjustment is now

ALIGNMENT PROCEDURE

and if adjustments are balanced below. Adjustment locations are shown on figures 3 and 4. Cathode-ray alignment is preferable; the connections to the chassis are shown on figure 2. If an output indicator is used, connect it across the loudspeaker voice-coil and advance the receiver volume control to full-volume position. Connect the "low" output terminal of the test oscillator to the receiver chassis for all alignment operations. Repeat steps 1 through 13, but do not adjust the test-oscillator output until the receiver is in an observable output condition. This will avoid a-v-c action. The term "Dummy antenna" means the device which must be connected between the "high" test-oscillator output and the point of connection to the receiver in order to obtain ideal alignment. No signal, 350-750 kc, means that the receiver should be tuned to a point between 350 and 750 kc where no signal or interference is received from a station or local broadcast station. For further details on alignment, refer to booklet "RCA Victor Receiver Alignment."

MODEL 45 Selective System
Schematic, Data

**MODEL 35
COMMON TALK SYSTEM**
OPERATION - To talk, press the button located on top of either unit or any outlying station unit; to listen, just release the button. When one unit is spoken into, all other stations will respond if buttons are in their normal positions.
To place the system into operation, connect cord to 110-120 volts AC or DC (check polarity for DC operation). To turn current on, operate toggle switch and note that pilot lamp is on. Insert one end of cable in socket located at rear of master station cabinet. Insert the plug on the other end of the cable into the socket marked "IN" of 1st station unit. A second station unit is connected by running the second cable from the "OUT" socket of the first station unit to the "IN" socket of the second. A third and fourth unit may be connected in the same fashion by the use of extra cables and station units.

WARNING - The amplifier chassis or the shields of the cable must not touch any grounded object such as radiators, conduit, water pipes, etc.
For distances over 100 feet use open wire system in stead of the twisted cables to reduce capacity.

OPERATION - First position "C" of selector switch is referred to as normal. Switch must be returned to "C" after all conversations are completed so that outlying stations may call. To call from MASTER unit operate selector to desired station; now press button to talk and release to listen. The party on the other end may talk or listen without manual effort. When the conversation is completed return "C" to normal selector position. TO CALL MASTER STATION - The party must HOLD the push button in down position thruout conversation, unless operator switches connection at master unit, in which case the button may be released. The TALK and LISTEN condition is under any condition controlled at MASTER station.
BUSY SIGNAL - When a party at any outlying station calls while the circuit is busy, he hears only that half of conversation originating at the calling station as a busy signal, and is expected to release the button and make his call later. If the busy conversation is on a selected circuit, another party calling will neither get a response nor create interference to the busy parties.

The R.F., Mixer and oscillator coils are located in the large square shields on the right end of the chassis. Trimmers for these circuits are mounted along the end of the chassis, beneath the coils in the following order: R.F. short wave, mixer short wave, oscillator broadcast, oscillator medium wave, oscillator short wave. From front to rear. The R.F., broadcast and mixer broadcast trimmers are mounted on the range switch assembly. Oscillator pads are located at the back of the variable condenser. The pad nearest the end of the chassis is for the broadcast band and the medium wave is next. Trimmers for the I.F. transformers are adjustable thru holes in the I.F. transformer shield cans. The I.F. frequency is 450 K.C.

7-SC Cable & 18T Term. Box
Wiring, Data

WIRING INSTRUCTIONS FOR M-50 TYPE INTER-COMMUNICATION SYSTEM USING 18-T TERMINAL BLOCK AND 7-SC CABLE

The 7-SC cable is a seven conductor cable with each conductor individually shielded. The shields are all bonded together and connected to a ground lug on the M-50 chassis and to "0" terminal on the 18-T block. The shields are used as the common or voice return circuit from the various secondary units. The conductors of the cable are connected to the selector switch "voice" terminals as shown in the upper section of the drawing. The conductors are color coded and are connected so that the brown wire of the upper cable goes to #1 terminal of the upper row of switches and to #1 terminal of the "A" terminal box strip, etc. At the bottom of the drawing is shown the switch lever positions which correspond to the terminal box strip numbers.

The 18-T terminal box provides two strips called "A" strip and "B" strip, of nine terminals numbered from 0 to 8 each, which provide terminating points for all voice and call-back lines for twelve secondary units. The terminals "1" to "6" inclusive on each strip are the voice line terminals, only one secondary being connected to each terminal. The "0" terminals on each strip are the common ground or voice return terminals for all secondary units connected to the strip, as well as common ground for the call-back voice line if a call-back type of secondary is used. The "7" terminal on the "B" strip is the call-back voice line terminal for all call-back type secondaries. The terminals "7" and "8" on the "A" strip may be used for the call-back power terminals for all call-back type secondaries.

NOTE: The call-back power wires from the master unit to terminals "7" and "8" of "A" strip are not installed at the factory. To illustrate a representative system using 1 - M-50 master unit, 4 - S-50 secondary units and 2 - SC-50 secondary call-back units, the connections are as follows:

Referring to Dwg. No. 6 of the secondary units, the "0" terminals on all secondaries are connected to "0" on the "A" strip. The "1" terminals on each secondary is connected to "1-2-3-4-5-6" (as required) on the "A" strip; one secondary only to each terminal. Terminals "2" of the SC-50 call-back secondaries are both connected to terminal "7" of "B" strip. Terminals #3 of the two SC-50 secondary units are both connected to terminal "7" of "A" strip and terminal #4 of both secondaries are connected to terminal "8" of "A" strip. The connections for additional secondary units, if used, are carried out in the same respective manner.

**WIRING:**

Two single-conductor shielded wires and a well insulated twisted pair are required for connections between the M-50 master unit and each SC-50 call back secondary unit. Referring to drawing No. 4, the insulated twisted pair of wires are connected to terminals E and (D-F) of the master unit selector key and are run to terminals No. 3 and 4 of SC-50 call back unit. One shielded connector is connected to terminal B of the selector key and run to terminal 2 of the secondary unit. The other shielded wire is connected to either terminals A or C of the selector key (as required) and to terminal one of the secondary unit. The shield of both shielded wires is connected to the ground lug G, of the selector key and to the zero terminal of the secondary unit. These connections, it will be noted, provide for turning on the plate supply of the master unit and for bridging around the selector keys in order to effect call back regardless of the position of these selector keys.

M-50 Master Unit

Additional selector keys may be installed on the M-50 master unit at any time, by removing the front switch cover-plate, cutting out the paper "knock-out" and installing the additional key switch in any of the five openings that are provided in the mounting plate. The key switch is fastened to the rear of the mounting plate with the grounding lug (G) (See drawing No. 1) at the lower left, looking at the rear of the unit. The necessary screws for mounting are furnished with each switch. When extra key switches are installed, certain common circuits must be connected from the original switch to all the additional switches added in multiple. The common leads are the amplifier output, which connects to the left hand center (B) terminal of each switch, and two leads which are used to break the plate circuit return of the amplifier, one lead connecting to the center right (E) terminal of each switch and the other lead connecting both the top and bottom right hand (D and F) terminals of each switch.

A cable clamp is provided on the chassis of the M-50 master unit, under which the leads to the switches should be clamped at the time they are installed.

MODEL M-70

Installation, Operation

REMLER COMPANY, LTD.

INSTRUCTIONS FOR INSTALLATION AND OPERATION OF REMLER M-70 MULTIPLE MASTER INTER-COMMUNICATION SYSTEM

The M-70 inter-communication unit is equipped with a relay which automatically arranges the terminal connections of the unit to enable it to operate as either a master station or a secondary station.

Whenever the M-70 station is not in use; that is, when the A.C. switch is turned off or when the selector keys are all in neutral, the station becomes a secondary unit with the secondary unit terminals connecting to two terminals, "M" (marked "zero" and "1") located on the back of the unit. From these two "M" or pickup terminals, a shielded line must be run to the selector keys of every other M-70 station desiring to call this particular unit.

When the M-70 station is turned on and the selector keys thrown to call a secondary station, the relay converts the unit to a master station, enabling conversation to be held with the unit selected by the selector key; provided the called station is not in use. If the M-70 station called is carrying on a conversation at the time, a busy hum will be heard. If the station called has previously been called by another unit, the noise of this conversation will be heard indicating that the unit is in use.

The M-70 master station unit is equipped at the factory with one X-50 selector key which permits immediate hookup with two other M-70 master stations, two S-50 secondary stations, or one M-70 and one S-50. When more than two secondary stations are used in the system, extra station selector keys, type X-50, are required. Each additional key will accommodate two additional stations, either M-70 or S-50.

For the necessary wiring between units, we recommend the use of a single conductor shielded wire covered by a cloth braid. This wire is known as our type 1-SC. In multiple station systems it is usually preferable to use a multi-conductor cable from the selector keys of the M-70 unit to a conveniently mounted terminal block on the wall or floor near where the unit will be used. This cable (known as type 7-SC) consists of seven individually shielded wires, covered by a cloth braid, and may be purchased in any length desired. A wall mounting terminal block consisting of hardwood base, sufficient screw terminals for a complete thirteen station system and sheet metal protective cover is available completely assembled, or furnished in disassembled kit form at a lower price.

When wiring the M-70 units a shielded line should be connected to the "M" or pickup terminals of the unit, secured under the cable clamp provided, and run to every other station in the system desiring to call this unit. The shield must be connected to the "0" terminal and the hot wire connected to terminal "1". A separate wire need not be run to each other station, the one wire may be run consecutively from one station to the next with individual connecting wires tapped off this line at each unit.

The shielded line from each individual station unit must be soldered to the terminals of the desired selector key of the M-70 master. The shield should be connected to the ground lug "G" (see drawing No. 1) and the insulated or "hot" wire should be connected to the upper left ("A" terminal) or lower left ("C" terminal) of the selector key, when viewed from the back of the unit.

S-50 secondary stations are wired in the same manner, a shielded line being run from this secondary station to the selector key terminals of each M-70 master desiring to call this secondary. The shield is connected to terminal "0" and the hot wire to terminal "1" of the S-50 secondary unit.

INSTRUCTIONS FOR INSTALLATION AND OPERATION OF REMLER M-50 MULTIPLE STATION INTER-COMMUNICATION SYSTEM

The M-50 master station unit is equipped at the factory with one 1-50 two-station selector key which permits immediate hookup with two S-50 or SC-50 secondary units. When more than two secondary stations are used in the system, extra station selector keys, type X-50, are required; each key will control two stations.

NOTE: The station selector key installed at the factory has wired to terminals "A" and "C" (See drawing No. 7), a short length of 1-SC cable. The lines from the secondary units may be spliced to this cable.

The wiring which is required between station units consists of one single-conductor and shield voice line from the master station to each secondary station. We recommend for this wiring the use of our type 1-SC cable. The shield of the 1-SC cable is connected to terminal zero on the secondary unit (See drawing No. 8). The conductor of the cable is connected to terminal No. 1. The shield acts as one conductor and the insulated wire as the second conductor. These lines are then run to the M-50 master unit selector keys. On the M-50 unit the shields of the cable are soldered to ground lug "G" on the selector key (See drawing No. 7) and the insulated conductors are soldered to lugs "A" or "C". The lugs "A" and "C" are the voice terminals of the selector key and one secondary unit may be connected to each lug; that is, for every X-50 selector key two secondary units may be used.

Additional X-50 selector keys may be installed on the M-50 master unit at any time, by removing the front switch cover-plate, cutting out the paper "knock-out" and installing the additional key switch in any of the five openings that are provided in the mounting plate. The key switch is fastened to the rear of the mounting plate with the grounding lug (G) (See drawing No. 7) at the lower left, looking at the rear of the unit. The necessary screws for mounting are furnished with each switch. When extra key switches are installed, certain switch circuits must be connected from the original switch to all the additional switches added in multiples. The common leads are the common voice line which connects to the left hand center (S) terminal of each switch, and two leads which are used to break the plate circuit return of the amplifier, known as the call-back power lines, one lead connecting to the center right (E) terminal of each switch and the other lead connecting both the top and bottom right hand (D and F) terminals of each switch.

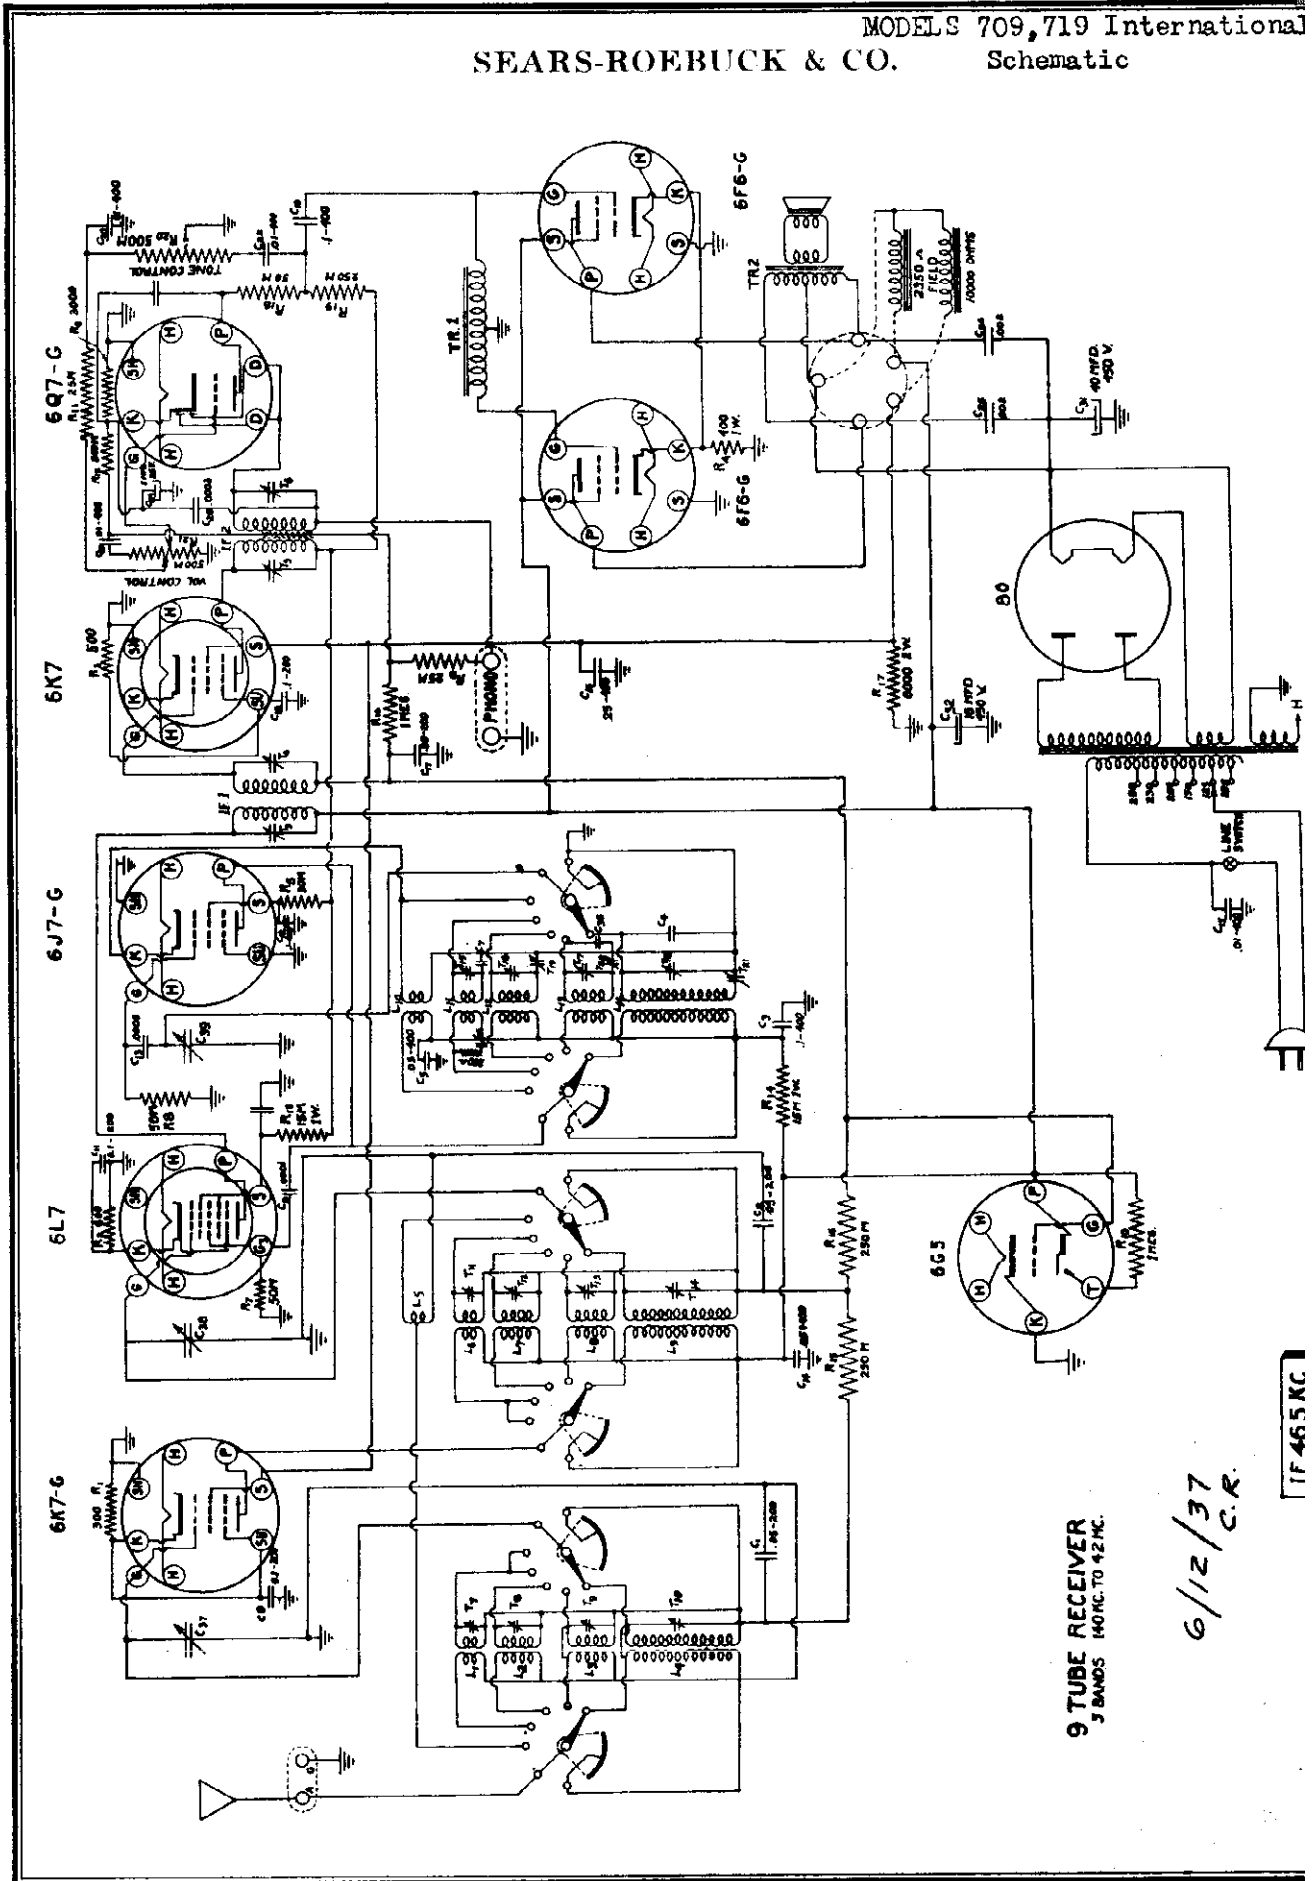

If desired, a multiple conductor cable, our type 7-SC may be soldered to the terminals of the selector keys and to the terminals of a connecting block, our type 18-1, as shown on drawing No. 4. The terminal block may be mounted wherever convenient near the master unit. The shielded lines from the secondary stations may then be connected to this terminal block as described on Drawing No. 4. A cable clamp is provided on the chassis of the M-50 master unit, under which the leads to the switches should be clamped at the time they are installed.

OPERATION:

After the system has been connected it may be placed in operation by turning the small rotary A.C. power switch knob, which is on the front of the M-50 unit, to the clockwise position. The pilot lamp on the front panel will glow, indicating that the power is on. When it is desired to communicate with a secondary station, the selector key should be thrown to that secondary station's position as indicated on the designation plate. After this selection is made, the talk-listen switch, which is operated by the lever on the extreme lower right of the cabinet, is depressed while speaking. When an answer is wanted, release the talk-listen switch lever which will automatically assume the receiving position so that the secondary unit may reply. When the communication is completed, the station selector key should be returned to the center or neutral position. When the key is in this neutral position the plate supply current is disconnected and the unit is silent. Located on the rear of the cabinet is the volume control knob. This knob should be adjusted to the desired volume level at the time of installation and should require no further attention.

NOTE: For installation information on the SC-50 and SMC-50 call-back type secondary units see drawing No. 8.

FIG. 4

NOTES ON ALIGNMENT

It is assumed that if an alignment procedure becomes necessary that the service man has an oscillator capable of accurately covering the range of the receiver and that a meter output indicator is used.

The I. F. Stages are aligned in the usual manner by feeding 485 KC into the grid of the 6L7 tube.

Follow Figure 4 and Figure 5 showing trimmer locations and alignment frequency.

Always adjust the oscillator first in any particular band.

Use as low an output as possible from the test oscillator in making the various adjustments.

After trimming at the high frequency end of the dial and adjusting the padding condenser at the other end, always recheck the settings of the trimmer at the high frequency end of the dial.

BE SURE THAT THE ALIGNMENT SIGNAL IS THE TRUE FUNDAMENTAL AND NOT A HARMONIC. Check for image frequency in the usual manner.

BEFORE STARTING ALIGNMENT CHECK POSITION OF TUNING HAND AND MAKE CERTAIN THAT IT IS EXACTLY STRAIGHT ACROSS ON THE FIRST CALIBRATION LINE WHEN THE CONDENSERS ARE AT MAXIMUM CAPACITY ROTATION.

TUBE SOCKETS ARE VIEWED FROM UNDER SIDE OF CHASSIS. VOLTAGE READINGS AT INDICATED SOCKET PRONGS ARE TO CHASSIS. ALIGNMENT IS TO BE MADE AT THE FREQUENCIES SHOWN AT THE TRIMMER CONDENSERS. WHERE NO VOLTAGE READING IS SHOWN AT SOCKET PRONG, IT INDICATES A VERY LOW READING.

MARCH 16, 1936.

SCHEMATIC - MODELS 1919 - 1929 - 1982A - 1999 (345X)

MODELS 1919, 1929, 1982A
 1999, 345X Chassis
 Chassis, Alignment, Data
 Sensitivity

SEARS-ROEBUCK & CO.

C1, C2, C3, C4, L1, L2, T1, T2 ARE MOUNTED ON TOP OF THE CHASSIS
 LOCATIONS OF PARTS - MODELS 1919-1929-1982A-1999

ALIGNMENT PROCEDURE
IP Alignment

1. Connections:

Connect the ground lead of the test oscillator to the receiver chassis. Connect the output lead of the test oscillator, in series with a .1 mfd condenser, to the positions mentioned below for alignment. Connect the output meter, in series with a .5 mfd condenser, across the loud speaker terminals.

2. Receiver Settings:

Turn the Wave Band switch to the BROADCAST position and the Station Selector to about 550 kc. Turn the receiver Volume Control all the way on and the Tone Control to its brilliant position (clockwise).

3. Alignment:

(a) Set the test oscillator to 175 kc. Connect its output (through the .1 mfd condenser) to the control grid cap of the 1A4 tube and peak the IP output transformer. The IP output transformer is the one without a grid lead, mounted at the back of the chassis.

(b) Change the test oscillator output connection to the control grid of the 1C6 tube and peak the IP input transformer. This is the transformer with a grid lead, mounted alongside of the Variable Condenser.

(c) Change the test oscillator output connection back to the 1A4 tube and repeat operation "A". Then change the connection back to the 1C6 tube and repeat operation "B". Always keep the receiver Volume Control turned all the way on and the test oscillator output at its lowest possible value.

BROADCAST BAND ALIGNMENT

1. Connections:

The ground lead of the test oscillator is left connected to the receiver chassis as for IP alignment. Disconnect the .1 mfd condenser from the output lead of the test oscillator. In its stead a .0002 mfd mica condenser is to be connected from the antenna lead of the receiver to the output lead of the test oscillator.

2. Receiver Settings:

Turn the Wave Band switch to the BROADCAST position, the Volume Control all the way on, and the Tone Control to its brilliant position (clockwise).

3. Alignment:

(a) Set the test oscillator to 1610 kc. Open the variable condenser all the way and peak the broadcast oscillator trimmer, C7.

(b) Set the test oscillator to 1400 kc and tune in its signal. Then peak the broadcast antenna trimmer, C1, and the broadcast translator trimmer, C2. The antenna trimmer is the one on the variable condenser section nearest the dial. The translator trimmer is accessible through the hole in top of the translator shield can, mounted behind the volume control.

(c) Set the test oscillator to 800 kc and tune in its signal. Then adjust the broadcast oscillator padder, C8. The variable should be rocked a degree or two during the adjustment.

(d) Repeat the 1610 kc adjustment, then the 1400 kc adjustment, and then the 800 kc adjustment for greater accuracy. Always keep the receiver Volume Control all the way on and the test oscillator output at its lowest possible value.

(e) Check the dial calibration by setting the test oscillator to 1000 kc and tuning in its signal. If necessary, turn the dial pointer to 1000 kc, being careful that the variable condenser is not allowed to turn.

SHORT WAVE ALIGNMENT

1. Connections:

Connections remain the same as for Broadcast Band alignment except that the .0002 mfd condenser in series with the test oscillator output lead is disconnected and a 400 ohm resistor connected in its stead.

2. Receiver Settings:

Turn the Wave Band switch to the SHORT WAVE position. The Volume Control is to be left all the way on and the Tone Control in its brilliant position, as for Broadcast Band alignment.

3. Alignment:

(a) Set the test oscillator to 14,000 kc and tune in its signal. Peak the short wave translator trimmer, C5. The variable should be rocked a degree or two during the adjustment. If two peaks can be found at two different settings of the trimmer, use the adjustment in which the trimmer is screwed further out (lesser capacity).

(b) The calibration of this band may be varied by shifting the gray lead that runs from one of the short wave oscillator coil lugs to one of the mounting lugs. If this lead is shifted to change calibration, the 14,000 kc adjustment should be repeated.

SENSITIVITIES

The following figures are given as an indication of the approximate sensitivities that should be had at various points in the receiver. It is necessary to have a test oscillator with an accurately calibrated attenuator so that its power output can be known. The output meter is to be connected, in series with a .5 mfd condenser across the loud speaker terminals. An output meter reading of 50 volts should be obtained for each of the input voltages shown for the frequencies listed.

The Volume Control of the receiver must be all the way on and the Tone Control turned all the way to the right. The ground lead of the test oscillator is to be connected to the chassis and the output lead of the test oscillator connected in series with the value of condenser or resistor, shown in the following list for the particular frequency at which the measurement is being made.

INPUT POINT	DUMMY ANTENNA	FREQUENCY	MICROVOLTS
Translator Grid	.1 mfd.	175 kc.	55 *
IP Grid	.1 mfd.	175 kc.	3500 *
Translator Grid	.1 mfd.	1000 kc.	120
Stator, Ant. Cond.	.1 mfd.	1000 kc.	340
Antenna Lead	.00025 mfd.	600 kc.	50
Antenna Lead	.00025 mfd.	1000 kc.	30
Antenna Lead	.00025 mfd.	1400 kc.	45
Antenna Lead	400 ohms	6000 kc.	45
Antenna Lead	400 ohms	10000 kc.	20
Antenna Lead	400 ohms	14000 kc.	20

* With Wave Band Switch in BROADCAST position and dial pointer at 550 KC.

SILVERTONE MODELS 1919, 1929, 1982A, 1999

General Description:

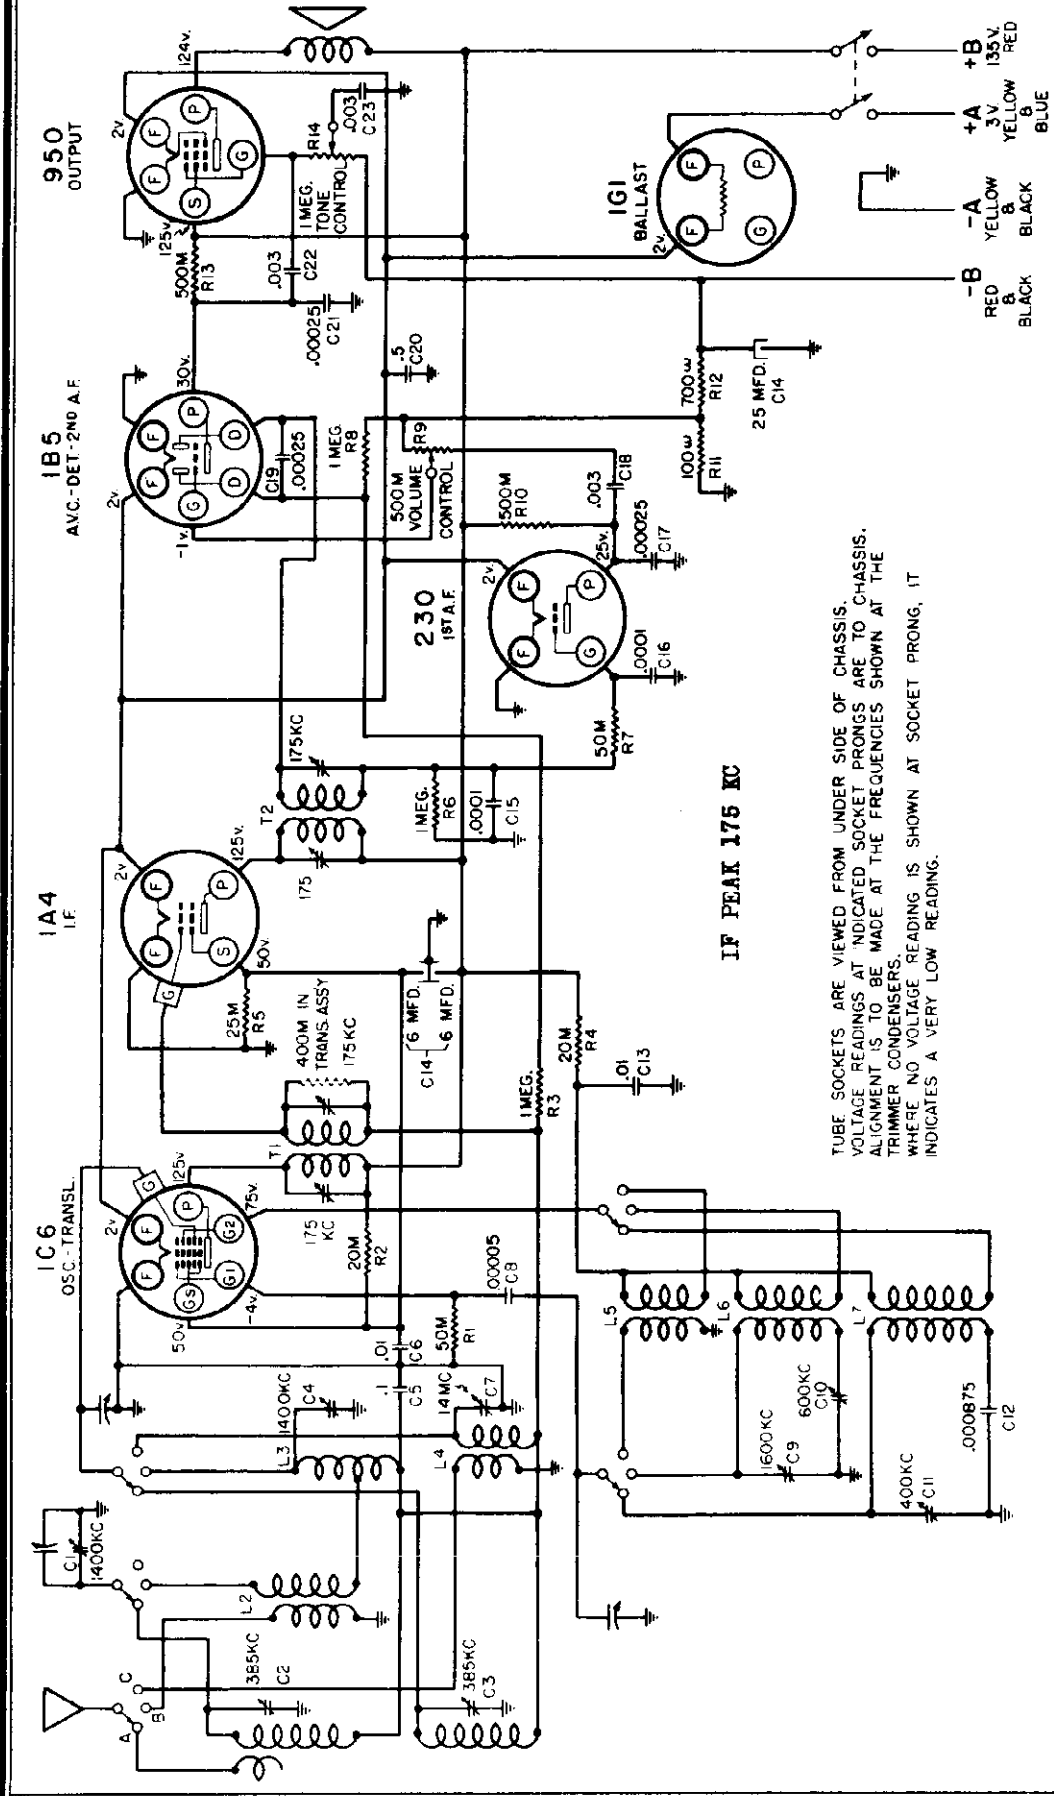

Although these receivers have the same model numbers as the ones described in Service Manual #7, Fall 1935 Series, they use a different chassis and have a different tube complement. The chassis used in the models described in Manual #7 can be identified through the fact that they are rubber stamped "345". The chassis used in the models described in the present Manual are rubber stamped "345X".

The Circuit:

These receivers are six tube battery powered superheterodynes, having a BROADCAST range and a FOREIGN Short Wave range. A filament Ballast tube is used to maintain the filament voltage at its proper value with a three volt dry cell block or an air cell "A" supply. If a two volt storage battery is used for "A" supply, the Ballast tube should be replaced by a Catalog #5022 adapter.

The diode current flowing through the 1 megohm resistor, R3, provides AVC voltage for the 1C6 and 1A4 tubes. The 100 ohm resistor, R11, provides residual bias.

SEARS-ROEBUCK & CO.

TUBE SOCKETS ARE VIEWED FROM UNDER SIDE OF CHASSIS.
VOLTAGE READINGS AT INDICATED SOCKET PRONGS ARE TO CHASSIS.
ALIGNMENT IS TO BE MADE AT THE FREQUENCIES SHOWN AT THE
TRIMMER CONDENSERS.
WHERE NO VOLTAGE READING IS SHOWN AT SOCKET PRONG, IT
INDICATES A VERY LOW READING.

Color Code Of The Electrolytic Condenser, C14:

- Black - Common, grounded
- Brown - Minus 25 mfd.
- Red - Plus 6 mfd.
- Blue - Plus 6 mfd.

These receivers are six tube battery powered superhetero-
dynes. In addition to the BROADCAST range they incorporate a
WEATHER Band and a Foreign SHORT WAVE range.

- B RED & BLACK
- A YELLOW & BLACK
- +A YELLOW & BLUE
- +B RED & RED

MODELS 1947, 1948

Chassis, Trimmers
Alignment, Sensitivity

SEARS-ROEBUCK & CO.

ALIGNMENT PROCEDURE

IF Alignment:

1. Connect the high scale of the output meter, in series with a .5 mfd condenser, across the loud speaker terminals. Connect the ground lead of the test oscillator to the chassis. Turn the Wave Band switch to the BROADCAST position and the Station Selector to about 1000 kc. During all of the alignment procedure the Volume Control of the receiver must be on full, the Tone Control in its brilliant position (fully clockwise) and the output from the test oscillator kept at its lowest possible value.
2. Connect the output lead of the test oscillator, in series with a .1 mfd condenser, to the control grid of the 1A4 tube. Set the test oscillator to 175 kc and peak the IF output transformer. This transformer is the square can unit mounted behind the Variable Condenser.
3. Change the test oscillator output connection to the control grid of the 1C6 tube and peak the IF input transformer. (Leave the .1 mfd condenser connected in series with the test oscillator lead.) The IF input transformer is the square can unit with grid lead, mounted alongside of the Variable Condenser.
4. Change the test oscillator connection back to the 1A4 tube and recheck the IF output transformer adjustment. Then change the test oscillator connection to the 1C6 tube and recheck the IF input transformer adjustment.

RF Alignment; Broadcast Band B:

1. Leave the output meter connected across the loud speaker terminals and the ground lead of the test oscillator connected to the chassis, as for IF alignment. Connect the output lead of the test oscillator, in series with a .00025 mfd mica condenser, to the green antenna lead of the receiver. During all of the alignment the Volume Control must be turned on full, the Tone Control in its brilliant position and the output power from the test oscillator kept at its lowest possible value.
2. Turn the Wave Band switch to the "B" (BROADCAST) position. Open the Variable Condenser plates all the way. Set the test oscillator to 1600 kc and adjust the broadcast oscillator trimmer, C9, for maximum output meter reading.
3. Set the test oscillator to 1400 kc and tune in its signal. Then peak the broadcast antenna and translator trimmers. The antenna trimmer is the one mounted on the variable condenser section nearest the dial. The translator trimmer is accessible through the hole in the top of the round shield can mounted on top of the chassis, next to the IF input transformer. The variable should be rocked back and forth a degree or two while making the adjustments.
4. Set the test oscillator to 600 kc and tune in its signal. Peak the broadcast oscillator padder, C10. The variable should be rocked during the adjustment.
5. Repeat the 1600 kc and then the 1400 and 600 kc adjustments for greater accuracy.

RF Alignment; Long Wave Band A:

1. The Broadcast band must have been aligned before the Long Wave band. The output meter and test oscillator connections are the same as for Broadcast band alignment. Keep the receiver Volume Control on full, the Tone Control brilliant, and the test oscillator output power at the lowest possible value.
2. Turn the Wave Band switch to the "A" position. Set the test oscillator to 400 kc. Open the variable condenser plates all the way and adjust the long wave oscillator trimmer, C11, for maximum output meter reading.
3. Set the test oscillator to 385 kc and tune in its signal. Then peak the preselector trimmers, C2 and C3.
4. Repeat the 400 kc and then the 385 kc adjustments for greater accuracy. Always keep the receiver Volume Control on full, the Tone Control in its brilliant position, and the test oscillator output at the lowest possible value consistent with a satisfactory output meter reading.

Short Wave Band C:

1. Remove the .00025 mfd condenser, used in series with the test oscillator output lead for previous alignment. Replace this condenser with a 400 ohm carbon resistor. Turn the Wave Band switch to the "C" position. All other connections and settings remain the same as for previous alignment.
2. Set the test oscillator to 14,000 kc and tune in its signal. Then peak the short wave translator trimmer, C7. The variable should be rocked a degree or two during the adjustment. If two peaks can be obtained at two different settings of the trimmer, use the one in which the trimmer is screwed further out (lesser capacity).

SENSITIVITIES

The following figures are given as an indication of sensitivities that should be had at various points in the receiver. It is necessary to have a test oscillator with an accurately calibrated attenuator so that its power output can be known. The output meter is to be connected, in series with a .3 mfd condenser, across the loud speaker terminals. An output meter reading of 8 1/2 volts should be obtained for each of the input voltages shown for the frequencies listed.

The Volume Control of the receiver must be all the way on and the Tone Control turned all the way to the right. The ground lead of the test oscillator is to be connected to the chassis and the output lead of the test oscillator connected in series with the value of condenser or resistor shown in the list for the particular frequency at which the measurement is being made.

MODEL 1970

Alignment, Socket Trimmers, Voltage

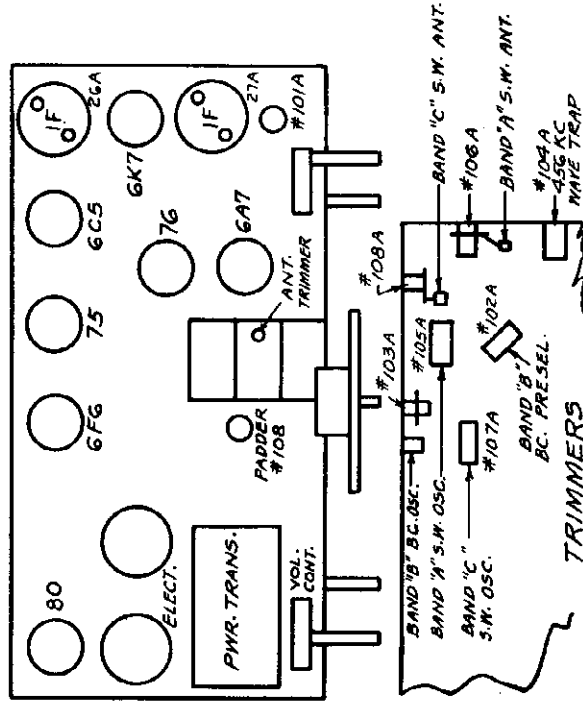

SEARS-ROEBUCK & CO.

10- Set band switch on position "C" (all the way to the left.) Still using 400 ohms in series with the antenna, apply a 14 MC signal. Adjust dial to 14 MC. Adjust Band "C" oscillator trimmer for maximum response. If two points of response are noted, the correct adjustment is the one obtained when the least capacity is used (condenser open.) Adjust Band "C" antenna trimmer for maximum response, remembering that the point obtained with the antenna trimmer practically closed is the correct one.

VOLTAGES MEASURED FROM POINT TO CHASSIS, USING A 1000-ohm-per-volt meter. (Line: 120 volts A.C.)

750 volt scale	100 volt scale	10 volt scale	FILAMENT
6A7 265 V	100 V	2.8 V	6.1 V AC
78 120 V	100 V	3.1 V	6.1 V AC
6K6 265 V			6.1 V AC
6C5			6.1 V AC
78 190 V			6.1 V AC
6F6 250 V	265 V	Filament to chassis	6.1 V AC
80 265 V			

* Does not indicate true grid voltage due to high resistance of grid circuit.

ALIGNMENT OF RECEIVER

1- Connect the test oscillator through a .1 mfd condenser to the control grid cap of the 6A7 tube, without removing the grid cap and being certain the shield cap is in place. The red and black wires coming from the receiver are connected together and connected to the ground lead of the test oscillator.

2- Connect the output meter to the voice coil of the speaker.

3- Advance volume control all the way on and turn tone control to "high" position.

4- Set the test oscillator to 456 KC and adjust the I F trimmer condensers for maximum output, using the weakest possible signal from the test oscillator in order to make the AVC action of the receiver inoperative. If the signal from the test oscillator is strong enough to produce more than a readable indication on the output meter then incorrect results may be obtained.

5- If, for any reason, the test oscillator cannot be controlled to give the desired low indication on the output meter, then it is permissible to slightly retard the volume control.

6- Set band switch of the receiver to position "B" (all the way to the right). Remove the test oscillator output lead from the grid of the 6A7 tube and connect it through a .00025 mfd condenser (instead of the .1mfd condenser) to the green antenna lead of the receiver. Tune the receiver to read 1400 KC on the dial and adjust the test oscillator to 1400 KC. When the signal is tuned in adjust the broadcast oscillator trimmer (see Fig.) for maximum response. Then adjust the broadcast prescaler trimmer for maximum response. Then adjust the one trimmer located on the top of the center section of the variable condenser, in the same manner.

7- Apply a 600 KC signal to the antenna and tune this signal on the receiver. Adjust the padder condenser for maximum response. To make this adjustment it is necessary to tune the receiver back and forth past the signal at the same time that the padder is being carefully adjusted.

8- Apply a strong 456 KC signal to the antenna. Adjust the wave trap for minimum signal. (If the code interference is experienced with the receiver after all alignment adjustments have been made, then the wave trap should be adjusted to reduce the code interference to a minimum).

9- Set band switch on position "A" (center position). Connect a 400-ohm resistor between the test oscillator and receiver antenna lead, in place of the .00025 mfd condenser. Apply a 4 MC signal and tune in this signal for maximum response. Adjust antenna trimmer (see Fig.) to identify "Band 'A' - SW - Antenna trimmer" for maximum response. (Note: Maximum response may be had with the trimmer either practically open or practically closed. The closed position is the correct one.)

	16000 KC.	16000 KC.	400 Ohm	Ant. Lead	C5, C3	50

IMPORTANT ALIGNMENT NOTES

* Before attempting to align the receiver check to see that the dial pointer coincides with the horizontal dividing line of the scale when the gang condenser is in full mesh, and adjust if necessary.

After adjusting the I.F. trimmers C18, C19, C20 and C21, go back and repeat the adjustment, since the setting of each trimmer will have some effect on the others.

** When aligning the broadcast band at 600 KC. it is necessary to adjust trimmer C11 while slowly rocking the gang condenser through a small distance. Rocking the gang is essential if maximum sensitivity is to be obtained.

*** When aligning the short wave bands, care should be observed in adjusting trimmers C6 and C5, since, two possible adjustments of these trimmers will result in signal peaks. The proper peak is that which occurs with the trimmer screw farthest out.

ARRANGEMENT OF TUBES

LOCATIONS OF PARTS UNDER CHASSIS

TUBE SOCKETS ARE VIEWED FROM UNDER SIDE OF CHASSIS. VOLTAGE READINGS AT INDICATED SOCKET PRONGS ARE TO CHASSIS. ALIGNMENT IS TO BE MADE AT THE FREQUENCY SHOWN AT THE TRIMMER CONDENSER. WHERE NO VOLTAGE READING IS SHOWN AT SOCKET PRONG, IT INDICATES A VERY LOW READING. VOLUME CONTROL TO BE ON FULL.

FREQUENCY RANGE: Broadcast ----- 545-1750 kc
POWER SUPPLY: 105-125 volts; 50-60 cycle; 40 watts

ALIGNMENT: Tune in a 1400 kc sig. & adjust trimmer for max. response. Vol. Cont. setting is reduced to give a low vol. level. Rock var. cond. a degree or two during adjustment. Trimmer is accessible when chassis is in cabinet, thru a hole in plate at bottom of cab. An insulated screw driver should be used. **CAUTION:** An auto-transf. is used instead of the usual power transf. having separate primary & secondary windings. The chassis may be above gnd. potential and care must thus be taken NOT to allow any grounded object to come in contact with the chassis while it is plugged into the line. The chassis is insulated from cabinet metal bottom cover with rubber grommets.

FIGURES AT CATHODES INDICATE CATHODE CURRENT IN MILLIAMPERES

ELIMINATING WHISTLE AT 930 KC:

A whistle, due to a beat between the second harmonic (930 kc) of the 465 kc IF, and a 930 kc signal may be experienced. In localities where the 930 kc station is one that is frequently listened to, it will be desirable to shift the whistle to some other point where it will not be objectionable. This can be done by shifting the IF frequency of the receiver.

Determine at what point between 900 kc and 960 kc the whistle will be least objectionable. Dividing this frequency by two will give the new IF frequency to which the receiver should be aligned. For example, if it is determined that a whistle at 915 kc would not be objectionable, the IF should be realigned at $915/2$ or 457.5 kc.

Align the IF at the new frequency and then realign the rest of the receiver as described under, "ALIGNMENT PROCEDURE".

SET DEAD AT 2 MC ON BAND "F":

In original production receivers the 50M ohm resistor, R3, was connected to ground. In later production chassis, rubber stamped with the letter, "A", or a subsequent letter, the resistor connection was made to the cathode of the 6D8G tube. This prevents failure to oscillate at 2 mc on the Police Band with certain 6D8G tubes. Trouble of this sort in the field with earlier production receivers can be corrected by changing the oscillator tube or preferably by changing the connection of R3 to the cathode of the 6D8G tube.

WAVE-TRAP TO ELIMINATE INTERFERENCE FROM SHIP OR AIRPORT TRANSMITTERS:

In locations near ship transmitters or airports or air beacon stations, code interference may be experienced. Part #1013114256 wave-trap is designed to eliminate such interference.

Mount the trap, by means of two wood screws, at any convenient place on the chassis shelf or cabinet where it will be near the antenna terminal of the receiver. Connect the yellow lead of the wave-trap to the antenna downlead. Connect the green lead of the wave-trap to the antenna terminal of the receiver. Cut off any excess length of green wire from the trap so that the green lead from the wave-trap to the chassis is as short as possible. The yellow lead from the wave-trap should be run so that it is as far as possible from the green lead. Connect one of the black leads from the wave-trap to the ground terminal of the receiver. Connect the other wave-trap black lead to the ground used for the installation.

The trap is pre-tuned to the IF frequency so that normally no further adjustment is necessary. However, should interference still be experienced, tune the receiver between approximately 550 and 600 kc. Then adjust the wave-trap, by means of the trimmer screw at the bottom of the container, until the interference is eliminated. Addition of the trap will reduce the sensitivity of the receiver around 600 kc by approximately 50%. The customer should be forewarned of this to avoid complaints of reduced sensitivity.

Chassis 104127

DATE: - Oct. 25, 1936 IF PEAKED AT 456 KC

Before connecting this receiver, be sure that the power supply to be used is of proper voltage; that is, 6 volts, direct current. It is recommended that a standard six volt storage battery is used for this purpose. It is important, however, to make sure that the red wire of the battery cable is connected to the Positive (+) terminal of the storage battery and the black wire connected to the Negative (-) terminal.

Align Short Wave Before Broadcast band as indicated in chart.

IMPORTANT ALIGNMENT NOTES

Before attempting to align the receiver, check to see that the dial pointer coincides with the horizontal dividing line of the scale when the gang condenser is in full mesh.

After adjusting the I.F. trimmers, go back and repeat the adjustment, since the setting of each trimmer will have some effect on the others.

When aligning the broadcast band at 600 KC. it is necessary to adjust trimmer C-16 while slowly rocking the gang condenser through a small distance. Rocking the gang is essential if max. sensitivity is to be obtained.

When aligning the short wave band, care should be taken in adjusting the oscillator trimmer on the variable condenser, since two possible adjustments of these trimmers will result in signal peaks. The proper peak is that which occurs with the trimmer screw farthest out.

"F"	15 mc (rock)	15 mc	400 ohms	Antenna Lead	C2	15
"F"	6 mc	6 mc	400 ohms	Antenna Lead	-	80

IMPORTANT ALIGNMENT NOTES

Where indicated by the word, "Rock", the variable should be rocked back and forth a degree or two while making the adjustment.

The figures given in the "Microvolts" column are only approximate.

The alignment procedure should be repeated stage by stage, in the original order, for greatest accuracy. Always keep the output from the test oscillator at its lowest possible value to make the AVC action of the receiver ineffective.

After the alignment procedure has been completed, tune in a broadcast station at about 900 kc and, if necessary, shift the dial pointer to the station's frequency marking on the dial.

ELIMINATING WHISTLE AT 930 KC:

A whistle, due to a beat between the second harmonic (930 kc) of the 465 kc IF, and a 930 kc signal may be experienced. In localities where the 930 kc station is one that is frequently listened to, it will be desirable to shift the whistle to some other point where it will not be objectionable. This can be done by shifting the IF frequency of the receiver.

Determine at what point between 900 kc and 960 kc the whistle will be least objectionable. Dividing this frequency by two will give the new IF frequency to which the receiver should be aligned. For example, if it is determined that a whistle at 915 kc would not be objectionable, the IF should be realigned at 915/2 or 457.5 kc.

Align the IF at the new frequency and then realign the rest of the receiver as described under, "ALIGNMENT PROCEDURE".

WAVE-TRAP TO ELIMINATE INTERFERENCE FROM SHIP OR AIRPORT TRANSMITTERS:

In locations near ship transmitters or airports or air beacon stations, code interference may be experienced. Part #1013114256 wave-trap is designed to eliminate such interference.

Mount the trap, by means of two wood screws, at any convenient place on the chassis shelf or cabinet where it will be near the antenna terminal of the receiver. Connect the yellow lead of the wave-trap to the antenna downlead. Splice the green lead of the wave-trap to the green antenna lead of the receiver. Cut off any excess length of wire from the trap and from the chassis antenna lead so that the green lead from the wave-trap to the chassis is as short as possible. The yellow lead from the wave-trap should be run so that it is as far as possible from the green lead. Splice one of the black leads from the wave-trap to the black ground lead of the receiver. Connect the other wave-trap black lead to the ground used for the installation.

The trap is pre-tuned to the IF frequency so that normally no further adjustment is necessary. However, should interference still be experienced, tune the receiver between approximately 550 and 600 kc. Then adjust the wave-trap, by means of the trimmer screw at the bottom of the container, until the interference is eliminated. Addition of the trap will reduce the sensitivity of the receiver around 600 kc by approximately 50%. The customer should be forewarned of this to avoid complaints of reduced sensitivity.

"P"	15 mc	15 mc	400 ohms	Antenna Terminal	C5, C16	5
"P"	6 mc	6 mc	400 ohms	Antenna Terminal	None	60

IMPORTANT ALIGNMENT NOTES

Values shown under, "Microvolts" are approximate.

Where indicated by the word, "Rock", the variable should be rocked back and forth a degree or two during the adjustment.

The alignment procedure should be repeated band by band to secure greater accuracy. In particular, the WEATHER band alignment may have to be repeated several times since the adjustments have an effect on each other.

After the alignment has been completed, check the calibration by tuning in a broadcast station at about 900 kc. Adjust the dial pointer to the station's frequency, if necessary.

Always keep the output from the signal generator at its lowest possible value.

WAVE-TRAP TO ELIMINATE INTERFERENCE FROM SHIP OR AIRPORT TRANSMITTERS:

In locations near ship transmitters or airports or air beacon stations, cede interference may be experienced. Part #101511-256 wave-trap is designed to eliminate such interference.

Mount the trap, by means of two wood screws, at any convenient place on the chassis shelf or cabinet where it will be near the antenna terminal of the receiver. Connect the yellow lead of the wave-trap to the antenna downlead. Connect the green lead of the wave-trap to the antenna terminal of the receiver. Cut off any excess length of green wire from the trap so that the green lead from the wave-trap to the chassis is as short as possible. The yellow lead from the wave-trap should be run so that it is as far as possible from the green lead. Splice one of the black leads from the wave-trap to the black ground lead of the receiver. Connect the other wave-trap black lead to the ground used for the installation.

The trap is pre-tuned to the IF frequency so that normally no further adjustment is necessary. However, should interference still be experienced, tune the receiver between approximately 550 and 600 kc. Then adjust the wave-trap, by means of the trimmer screw at the bottom of the container, until the interference is eliminated. Addition of the trap will reduce the sensitivity of the receiver around 800 kc by approximately 80%. The customer should be forewarned of this to avoid complaints of reduced sensitivity.

ELIMINATING WHISTLE AT 950 KC:
 A whistle, due to a beat between the second harmonic (950 kc) of the 465 kc IF and a 950 kc signal may be experienced. In localities where the 950 kc station is one that is frequently listened to, it will be desirable to shift the whistle to some other point where it will not be objectionable. This can be done by shifting the IF frequency of the receiver. Determine at what point between 900 kc and 960 kc the whistle will be least objectionable. Dividing this frequency by two will give the new IF frequency to which the receiver should be aligned. For example, if it is determined that a whistle at 915 kc would not be objectionable, the IF should be realigned at 915/2 or 457.5 kc.

Align the IF at the new frequency and then realign the rest of the receiver as described under, "ALIGNMENT PROCEDURE".
BATTERY REPLACEMENT:
 The dry "A" battery should be replaced when its voltage drops to 1.8 volts under load. The "B" batteries should be replaced when the voltage of the 45 volt block has dropped to 34 volts, under load.

Schematic, Voltage, Data

THE FILAMENT CIRCUIT:

These models may be used with either a 4½ volt dry "A" battery or a 4 volt storage battery without requiring any changes in connections.

Since the tubes have two volt filaments and the "A" supply is four volts, the filaments are connected in a series parallel arrangement. The two 1J6G tubes are connected in parallel with each other to form one group. All of the other tubes except the 1H6G are connected in parallel to form a second group. These two groups are then connected in series across the "A" supply. The 1H6G tube is connected in series with the two resistors, R10 and R11, of 18.6 ohms each, across the "A" supply. A simplified diagram of the filament circuit is shown below.

POWER SUPPLY:

- "A" Battery (4½ volt dry) . . . 1 - #5032P
- "A" Battery (4 volt storage) . . . 1 - #5049
- "B" Batteries 2 - #5138P

- "A" Drain 0.54 amperes
- "B" Drain (no signal) 23 ma

A	17 mc (rock)	17 mc	400 ohms	Ant. Term.	C7	Translator	6
A	6 mc	6 mc	400 ohms	Ant. Term.	-	-	25

IMPORTANT ALIGNMENT NOTES

Where indicated by the word, "Rock", the variable should be rocked back and forth a degree or two while making the adjustment.
 (*) Two peaks will be found at two different settings of the trimmer. The correct one is the one in which the trimmer is screwed further out (lesser capacity).
 (**) Adjust the calibration at 18 mc by pushing the yellow lead that comes from the center section of the variable either nearer to or away from the variable.
 It is advisable to repeat the entire alignment procedure band by band and in the original order to insure greater accuracy.
 Always keep the output power from the test oscillator at its lowest possible value. This will prevent the AVC action of the receiver from interfering with accurate alignment. As the sensitivity is increased by alignment, the generator output power should be reduced correspondingly.
 Values shown under, "Microvolts", are only approximate.

"FOR"	6 mc	6 mc	400 ohms	Ant. Term.	-	-	175

IMPORTANT ALIGNMENT NOTES

Where indicated by the word, "Rock", the variable should be rocked back and forth a degree or two while making the adjustment.

Always keep the output from the signal generator at its lowest possible value to prevent the AVC action of the receiver from interfering with accurate alignment. As the receiver sensitivity is increased through alignment, the output from the generator should be decreased to compensate.

ELIMINATING WHISTLE AT 930 KC:

A whistle, due to a beat between the second harmonic (930 kc) of the 465 kc IF, and a 930 kc signal may be experienced. In localities where the 930 kc station is one that is frequently listened to, it will be desirable to shift the whistle to some other point where it will not be objectionable. This can be done by shifting the IF frequency of the receiver.

Determine at what point between 900 kc and 960 kc the whistle will be least objectionable. Dividing this frequency by two will give the new IF frequency to which the receiver should be aligned. For example, if it is determined that a whistle at 915 kc would not be objectionable, the IF should be realigned at 915/2 or 457.5 kc.

Align the IF at the new frequency and then realign the rest of the receiver as described under, "ALIGNMENT PROCEDURE".

WAVE-TRAP TO ELIMINATE INTERFERENCE FROM SHIP OR AIRPORT TRANSMITTERS:

The trap is pre-tuned to the IF frequency so that normally no further adjustment is necessary. However, should interference still be experienced, tune the receiver between approximately 550 and 800 kc. Then adjust the wave-trap, by means of the trimmer screw at the bottom of the container, until the interference is eliminated. Addition of the trap will reduce the sensitivity of the receiver around 600 kc by approximately 50%. The customer should be forewarned of this to avoid complaints of reduced sensitivity.

MODELS 4450, 4550

Socket, Trimmers, Chassis
Sensitivity Notes, Data

SEARS-ROEBUCK & CO.

OPERATION OF THE 6G5 OR 6N5 TUNING EYE TUBE:

The type 6G5 or 6N5 tuning eye tube, used in this receiver, operates over a signal input range about three times greater than can be handled by the 6E5 tube, used in some of last years receivers. With the 6E5 tube, if the circuits are designed so that the tube responds to a moderately weak signal, it will overlap with strong signals. Any signal stronger than that required to close the eye cannot be tuned accurately by the eye. The 6G5 or 6N5 tube provides an even more sensitive indication for weak signals than the 6E5 and will not overlap except under extreme local conditions.

However, the range of signal input over which the receiver must work is so great that even this 6G5 or 6N5 variable mu tube cannot completely satisfy all conditions. In addition to the limitations of the tube itself, there are variations between receivers, even though they be of the same model, that affect the signal required to close the eye. If several tubes are available to choose from, it may be possible to select one that will operate more satisfactorily in a particular location.

Turning right: 10:1; 50:1
Turning right: "WEA", "AM", "POL", "FOR"
Turning right: volume increase. Pushing down, illuminate dial and actuate tuning eye.

FREQUENCY RANGES:
Band "WEA" - - - - - 220-400 kc
Band "AM" - - - - - 540-1750 kc
Band "POL" - - - - - 1750-5850 kc
Band "FOR" - - - - - 5.8-17.5 mc

OPERATING CONTROLS:
1. Right knob - - - Selectivity Control
2. Next to right knob - "On-Off" Switch and Tone Control
3. Middle knob - - - Station Selector
4. Next to left knob - Wave Band Switch
5. Left knob - - - - - Volume

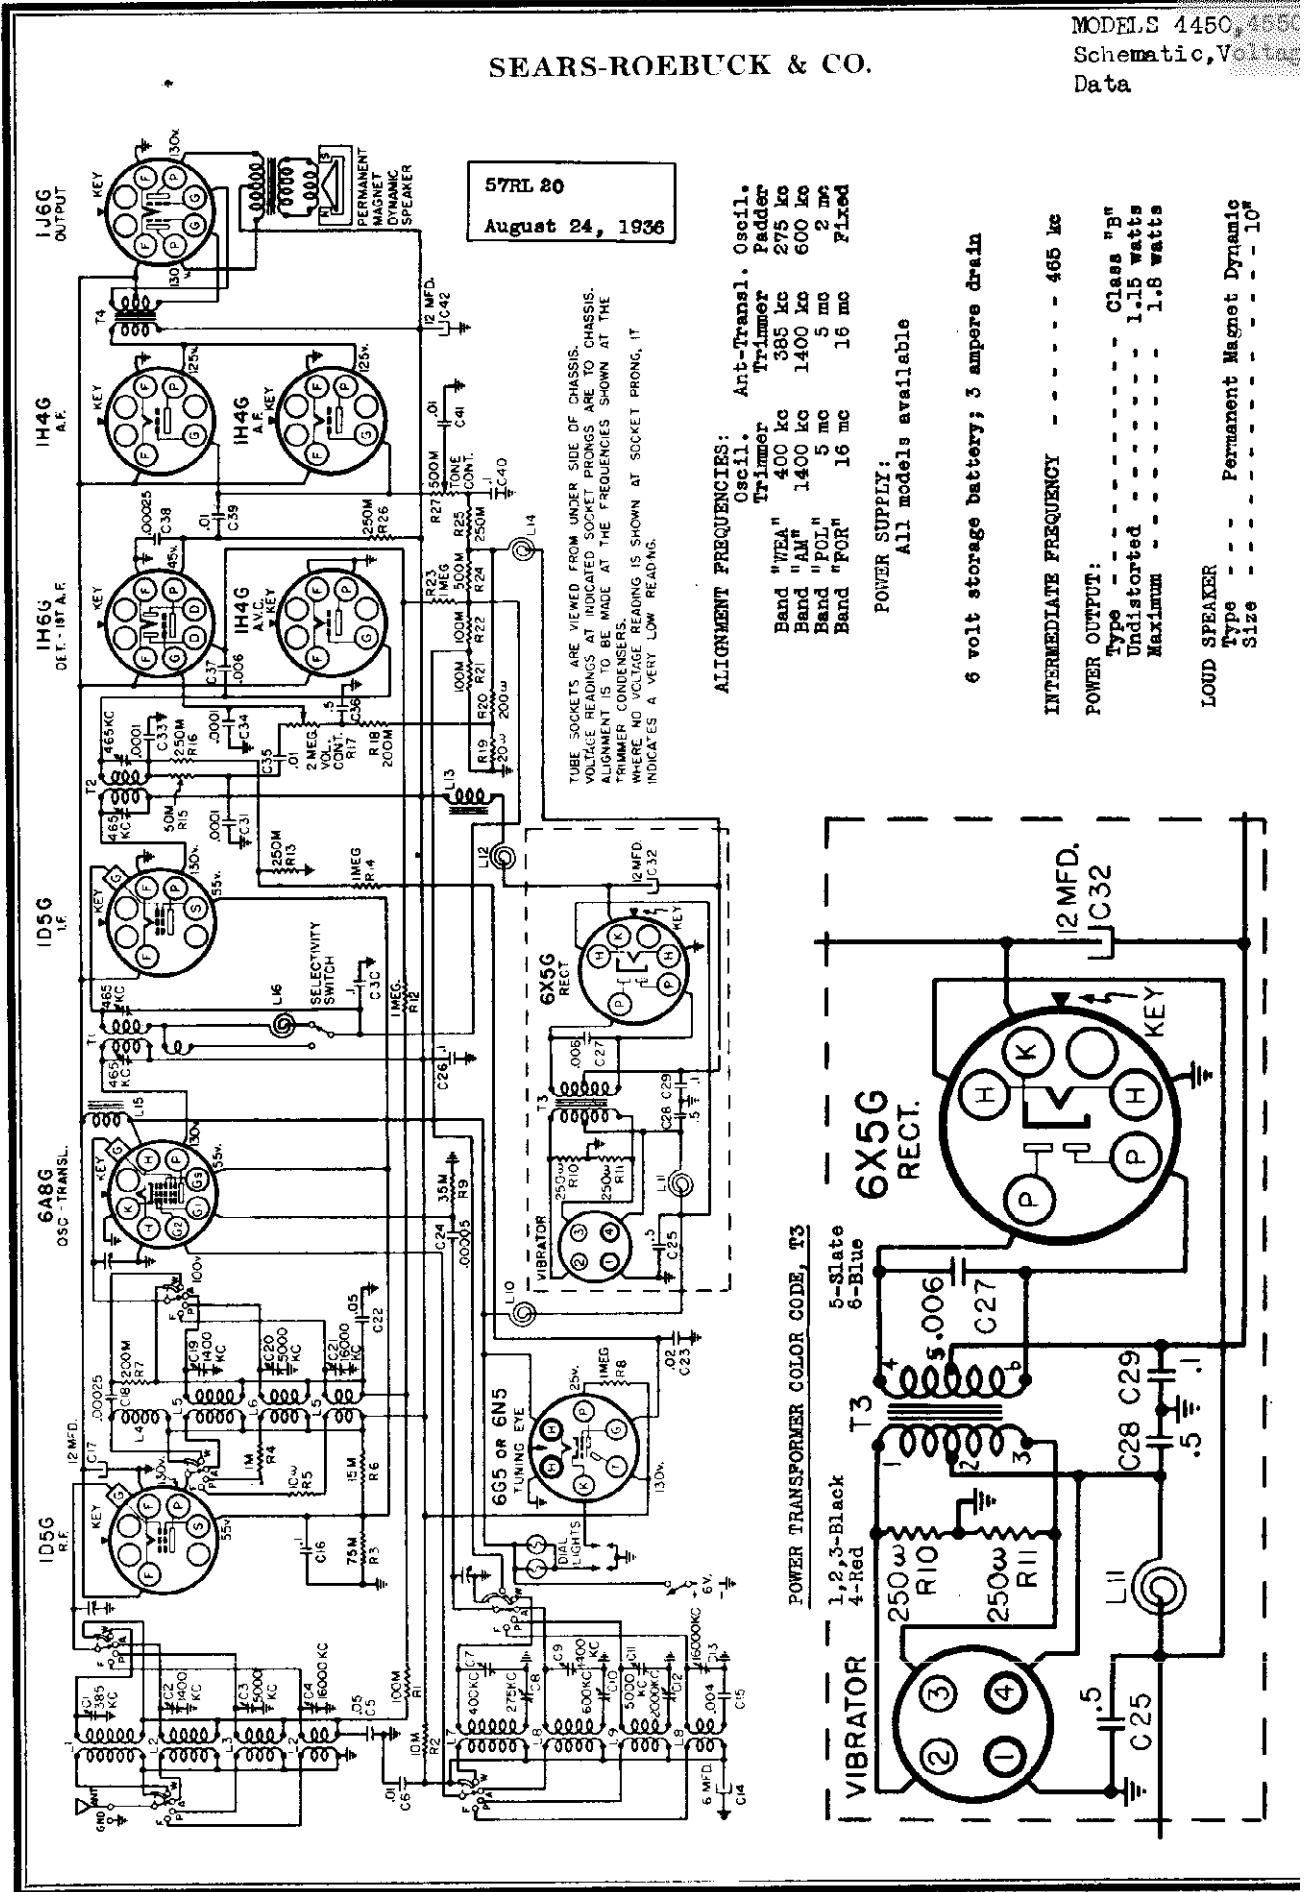

CHASSIS FEATURES:
Number RF stages - - - - - One
Number IF stages - - - - - One
Antenna - - - - - Conventional

VARIABLE SELECTIVITY:

Variable Selectivity is obtained by a two position switch. It changes the selectivity of the IF input transformer, T1, by connecting or disconnecting coupling turns between primary and secondary. The coil, L16, compensates for the loss of inductance when the coupling turns are disconnected, thereby keeping the transformer tuned to 465 kc.

SEARS-ROEBUCK & CO.

ALIGNMENT PROCEDURE

PRELIMINARY:

- Output meter connections - - - - - Across speaker voice coil leads
- Output meter reading to indicate .5 watts output - - - - - 1.05 volts
- Dummy antenna value to be in series with generator output - - - - - See chart below
- Connection of generator output lead - - - - - See chart below
- Connection of generator ground lead - - - - - Receiver chassis
- Generator modulation - - - - - 30%, 400 cycles
- Position of volume control - - - - - Fully clockwise
- Position of tone control - - - - - Fully clockwise
- Position of selectivity control - - - - - Fully clockwise
- Position of dial pointer - - To fall on second line from right, of ornamental lines running from tuning eye toward dial center, when variable is fully meshed.

WAVE BAND SWITCH POSITION	POSITION OF DIAL POINTER	GENERATOR FREQUENCY	DUMMY ANTENNA	GENERATOR CONNECTION	TRIMMERS ADJUSTED (IN ORDER SHOWN)	APPROXIMATE MICROVOLTS
"AM"	550 kc	465 kc	.1 mfd.	6AG Grid	T2, T1	-
"AM"	1400 kc	1400 kc	.0002 mfd.	Antenna Terminal	C9, C2, C19	15
"AM"	600 kc (rock)	600 kc	.0002 mfd.	Antenna Terminal	C10	30
"WEA"	Fully clockwise	400 kc	.0002 mfd.	Antenna Terminal	C7	50
"WEA"	385 kc	385 kc	.0002 mfd.	Antenna Terminal	C1	80
"WEA"	275 kc (rock)	275 kc	.0002 mfd.	Antenna Terminal	C8	175
"POL"	5 mc	5 mc	400 ohms	Antenna Terminal	C11, C3, C20	40
"POL"	2 mc (rock)	2 mc	400 ohms	Antenna Terminal	C12	65
"FOR"	16 mc	16 mc	400 ohms	Antenna Terminal	C13, C4, C21	30
"FOR"	6 mc	6 mc	400 ohms	Antenna Terminal	-	125

These models use a six volt storage battery for the "A" supply. A plug-in vibrator used with a step-up transformer and 6X5G rectifier tube furnishes the plate and screen voltage.

THE DIAL LIGHT AND TUNING EYE SWITCH:

Pushing down on the Volume Control knob actuates a switch to illuminate the dial. Pushing further down on the knob actuates another switch to cause the Tuning Eye to function. When the knob is released, both the dial light and the Tuning Eye become disconnected.

IMPORTANT ALIGNMENT NOTES

Where indicated by the word, "Rock", the variable should be rocked back and forth a degree or two while making the adjustment.

After completing the alignment for each band repeat it in the original order, for greater accuracy. This is particularly necessary for the Weather Band as the adjustments affect each other. Always keep the output power from the generator at its lowest possible value to prevent the AVC action of the set from interfering with accurate alignment.

After the alignment procedure has been completed, tune in a station at about 900 kc. If necessary, shift the dial pointer so that it indicates the station's frequency on the dial.

Values shown under, "Microvolts", are only approximate.

ELIMINATING WHISTLE AT 930 KC:

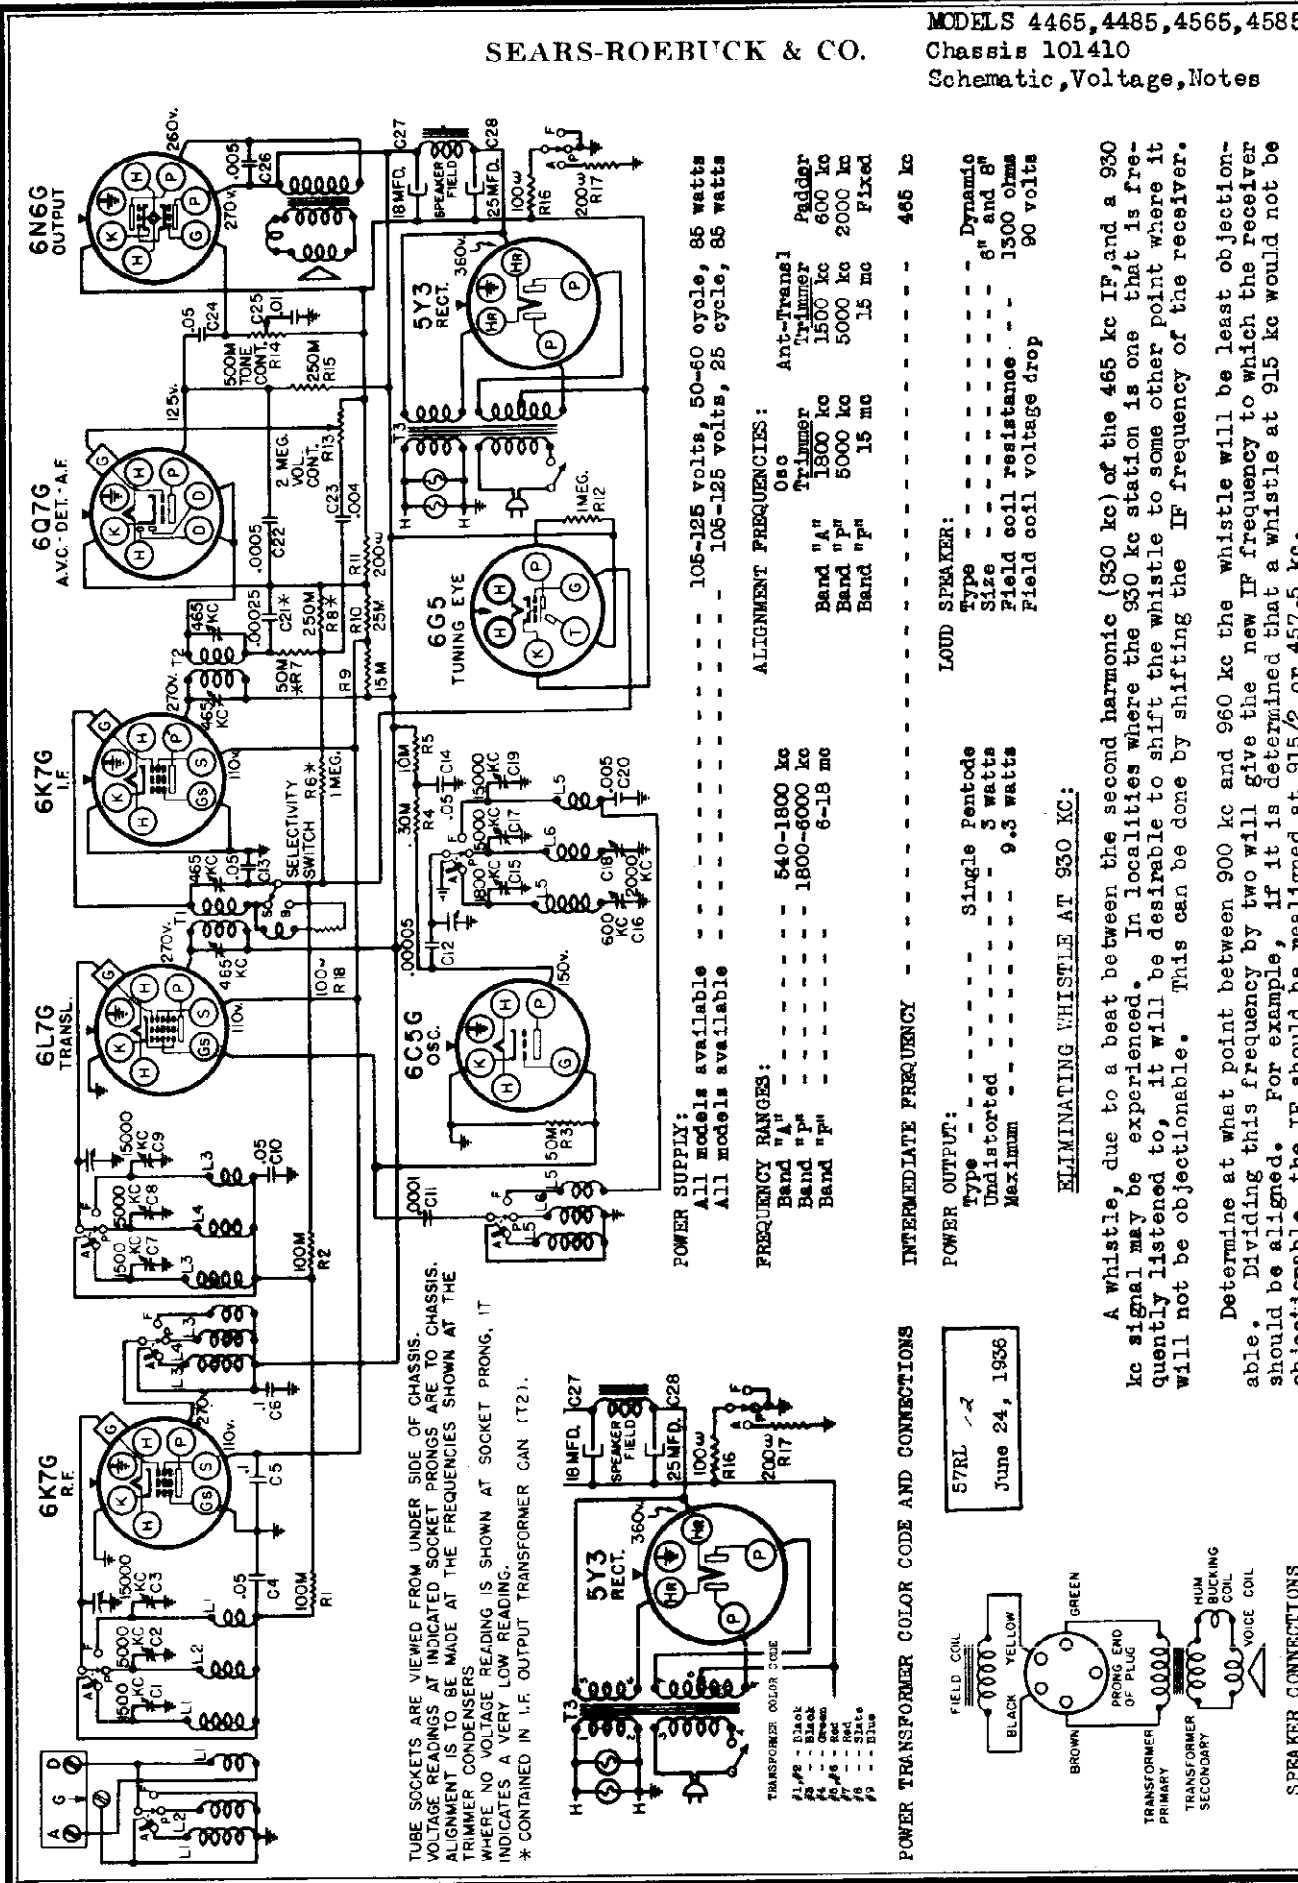

A whistle, due to a beat between the second harmonic (930 kc) of the 465 kc IF, and a 930 kc signal may be experienced. In localities where the 930 kc station is one that is frequently listened to, it will be desirable to shift the whistle to some other point where it will not be objectionable. This can be done by shifting the IF frequency of the receiver.

Determine at what point between 900 kc and 960 kc the whistle will be least objectionable. Dividing this frequency by two will give the new IF frequency to which the receiver should be aligned. For example, if it is determined that a whistle at 915 kc would not be objectionable, the IF should be realigned at 915/2 or 457.5 kc.

Align the IF at the new frequency and then realign the rest of the receiver as described under, "ALIGNMENT PROCEDURE".

Distortion Elimination
Sensitivity, Data SEARS-ROEBUCK & CO.

SUBJECT: ELIMINATING DISTORTION AT LOW VOLUME
Chassis in Which This Change May Be Necessary:

Chassis which are rubber stamped with the letter "P" after the number 101-410, on the Chassis Identification Sticker, are the only ones in which this change may be necessary. Chassis with any other rubber stamped letter or with no letter are not affected.

Chassis with the rubber stamped letter "H" have a 50 mfd. condenser, C26, connected from the high side of the volume control to the movable arm. If distortion, occurring only at low volume levels, is encountered, this 50 mfd. condenser should be removed from the circuit.

SUBJECT: APPROXIMATE AVERAGE SENSITIVITY IN MICROVOLTS FOR .5 WATTS OUTPUT
SUBJECT: PREVENTION OF MOTORBOATING

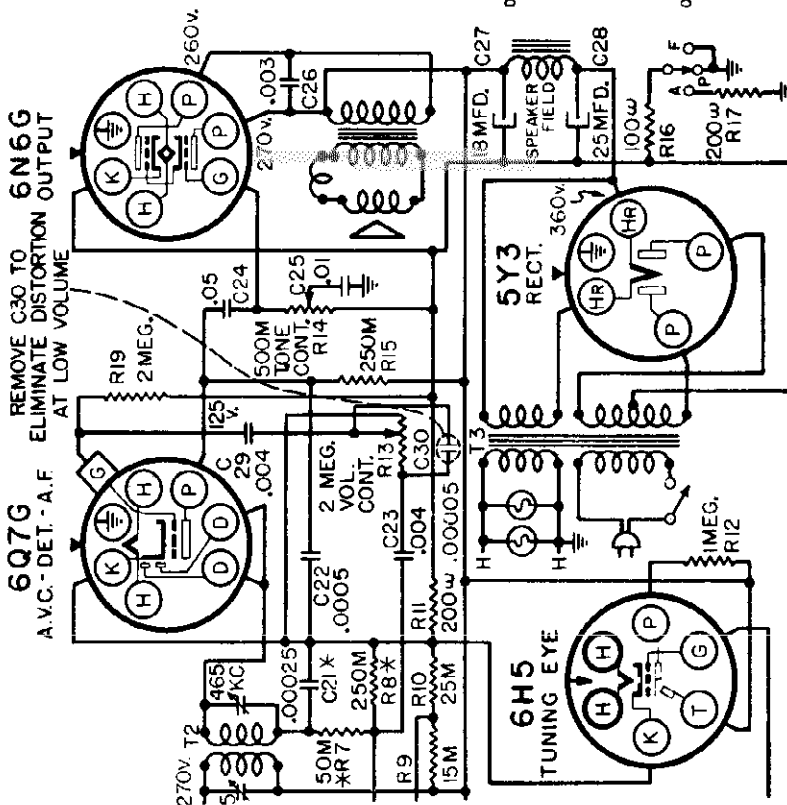

APPROXIMATE AVERAGE SENSITIVITY IN MICROVOLTS FOR .5 WATTS OUTPUT:

The generator connections and the receiver settings are to be as described in Service Instructions #5741 12, for this model. The generator modulation is to be 50% at 400 cycles.

Band	Frequency	Microvolts
"A"	600 kc	25
"A"	1000 kc	15
"A"	1600 kc	12
"A"	1800 kc	30

Phono Jack Connections
Interference Elimination
Notes

SEARS-ROEBUCK & CO.

CONNECTING A PHONOGRAPH PICK-UP JACK OR AN EARPHONE JACK:

A hole, plugged with a brass insert, will be found at the rear of the chassis. This hole is provided for the installation of either a phono pick-up jack or an earphone jack. The circuits are shown in the illustration below. The additional condensers are .05 mfd. 200 volts. The part number of the jack is 1011813685.

CONSOLE SPEAKERS:

In later production, the speaker of Console Models was mounted on felt cushions instead of being screwed directly to the baffle. For shipping purposes this cushion mounting is made rigid by screwing the two wooden strips, that hold the felt cushions, tightly to the baffle. To secure the advantage of the felt cushions and to insure best tone, the screws at each end of the two wooden strips should be loosened about one turn, thereby allowing the speaker to have a non-rigid mounting.

CONDENSER DRIVE:

A front bearing bracket was provided for the condenser drive shaft in later production to correct trouble due to alignment of the condenser drive. This misalignment causes the rear bearing to slip and provide insufficiently rigid support for the drive shaft. This bracket, part #1014618006, can be added when necessary to units not having it originally. It is mounted between the dial and the dial mounting bracket by means of the lower two dial mounting screws.

REPLACEMENT OF THE OSCILLATOR TUBE:

There are two types of 6G5 tubes, one shielded and the other unshielded. They can be told apart easily by appearance. The shielded type has a perforated mesh screen surrounding the other elements. This screen is about an inch in diameter and comes very close to the inside of the bulb. The unshielded type does not have this perforated mesh screen. The plates of the tube, of solid metal and about 3/8" diameter, is visible. It is important that only the unshielded type 6G5G, without the perforated mesh screen, be used in the oscillator socket. Use of the shielded type will upset band "F" calibration and interfere with proper performance.

THE WAVE SWITCH:

Two different types of Wave Switches have been used. They can be told apart by the construction of the index plate and indexing arm. In one type, part #102716389, the indexing arm has two ball bearings that contact against the stop of the index plate. In the other type, part #102716385, the index arm is in the shape of a flat "g" spring with a small roller and shaft at each end of the arm, to contact the stops of the index plate. Individual parts for the Wave Switches may be bought separately and are so listed in the Parts List. #1 contact plate is the one nearest the knob end of the shaft. #2 plate is the next one and #3 plate is the one farthest from the knob end of the shaft.

CONNECTION OF THE 6G5 CATHODE:

Examine the plate colored cathode lead of the 6G5 tuning eye tube. If it is connected to the cathode of the 6N6G it should be removed from there and connected instead to the cathode of the 6Q7G. The latter connection is the correct one and is shown in the portion of the schematic on the other side of this page. An indication of the incorrect connection is that the volume will increase if the 6G5 tube is removed from its socket.

WAVE-TRAP TO ELIMINATE INTERFERENCE FROM SHIP OR AIRPORT TRANSMITTERS:

In locations near ship transmitters or airports or air beacon stations, extra interference may be experienced. Part #1013116455 wave-trap is designed to eliminate such interference. It can be ordered from Colonial Radio Corporation, 284 Reno Street, Buffalo, N. Y. Use Purchase Order blank, form F5284. The retail selling price is \$1.00.

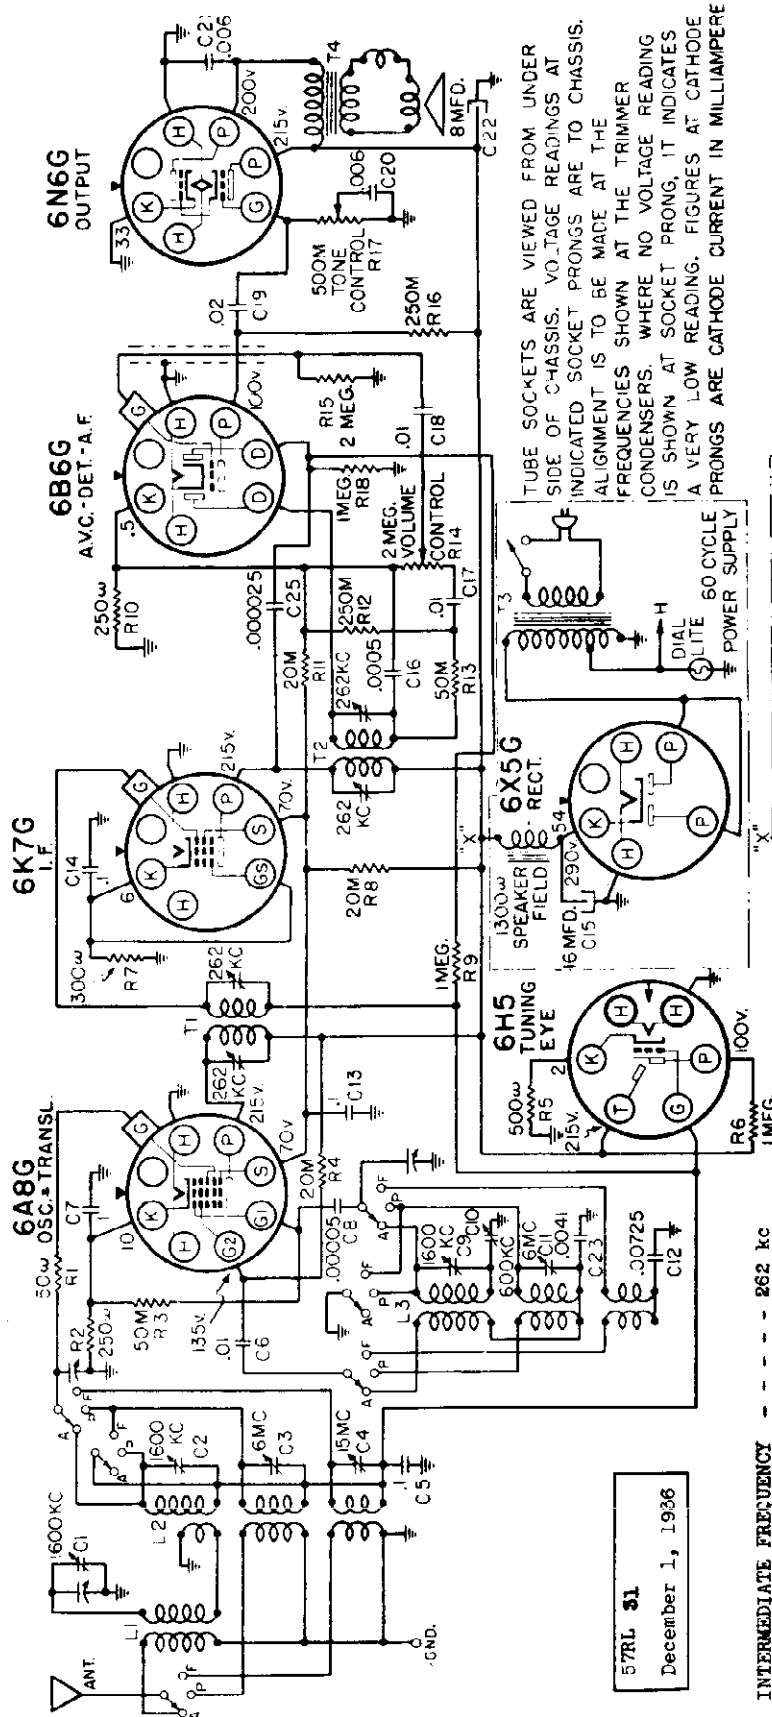

Mount the trap, by means of two wood screws, at any place on the chassis shelf or cabinet where it will be near the antenna terminals of the receiver. Connect the yellow lead of the trap to the terminal marked "YELL", on the terminal block at the rear of the chassis. Connect the black lead of the trap to the ground terminal on the chassis. Any connection should be cut off the wave-trap lead to the ground terminal on the chassis. The antenna or speaker connections to the receiver are not to be changed in any way.

The trap is pre-tuned to the IF frequency so that normally no further adjustment is necessary. However, should interference still be experienced, tune the receiver between approximately 580 and 600 kc. Then adjust the wave-trap by means of the trimmer screw at the bottom of the condenser, until the interference is eliminated. Addition of the trap will reduce the sensitivity of the receiver around 600 kc by approximately 50%. The customer should be forewarned of this to avoid complaints of reduced sensitivity.

Alignment, Sensitivity Notes

SEARS-ROEBUCK & CO.

DIFFERENCES BETWEEN 25 CYCLE AND 60 CYCLE POWER SUPPLY:

The 6X56 rectifier tube is used as a half wave rectifier for 60 cycle supply. Full wave rectification is used for 25 cycle supply.

OPERATION OF THE 6HS TUNING EYE TUBE:

The type 6HS tuning eye tube, used in this receiver, operates over a signal input range about three times greater than can be handled by the 6E5 tube, used in some of last year's receivers. With the 6E5 tube, if the circuits are designed so that the tube responds to a moderately weak signal, it will overlap with strong signals. Any signal stronger than that required to close the eye cannot be tuned accurately by the eye. The 6HS tube provides an even more sensitive indication for weak signals than the 6E5 and will not overlap except under extreme local conditions.

However, the range of signal input over which the receiver must work is so great that even the 6HS tuning eye tube cannot completely satisfy all conditions. In addition to the limitations of the tube itself, there are variations between receivers, even though they be of the same model, that affect the signal required to close the eye. If several tubes are available to choose from, it may be possible to select one that will operate more satisfactorily in a particular location.

INSTALLING A WAVE-TRAP:

In locations near ship transmitters or airports or air beacon stations, code interference may be experienced. Part #1012114477 wave-trap is designed to eliminate this type of interference. These traps may be ordered from Colonial Radio Corporation, 254 Rano Street, Buffalo, N. Y., using Purchase Order blank, form FE284. The retail selling price of the #1012114477 wave-trap is \$1.00. Be sure to mention the part number when ordering the wave-trap.

Mount the trap, by means of two wood screws, at any convenient place on the chassis shelf or cabinet where it will be near the antenna terminal of the receiver. Connect the green lead of the trap to the antenna terminal of the receiver. (The location of the antenna will also remain connected to this antenna terminal of the receiver.) Connect the black lead of the trap to ground.

The traps act as a series resonant circuit across antenna and ground. The traps are pre-tuned to the IF frequency so that ordinarily no further adjustment will be necessary. However, if interference still is experienced, tune the trap by means of the trimmer screw at the bottom of the container, until the interfering signal is eliminated.

IMAGE ADJUSTMENT

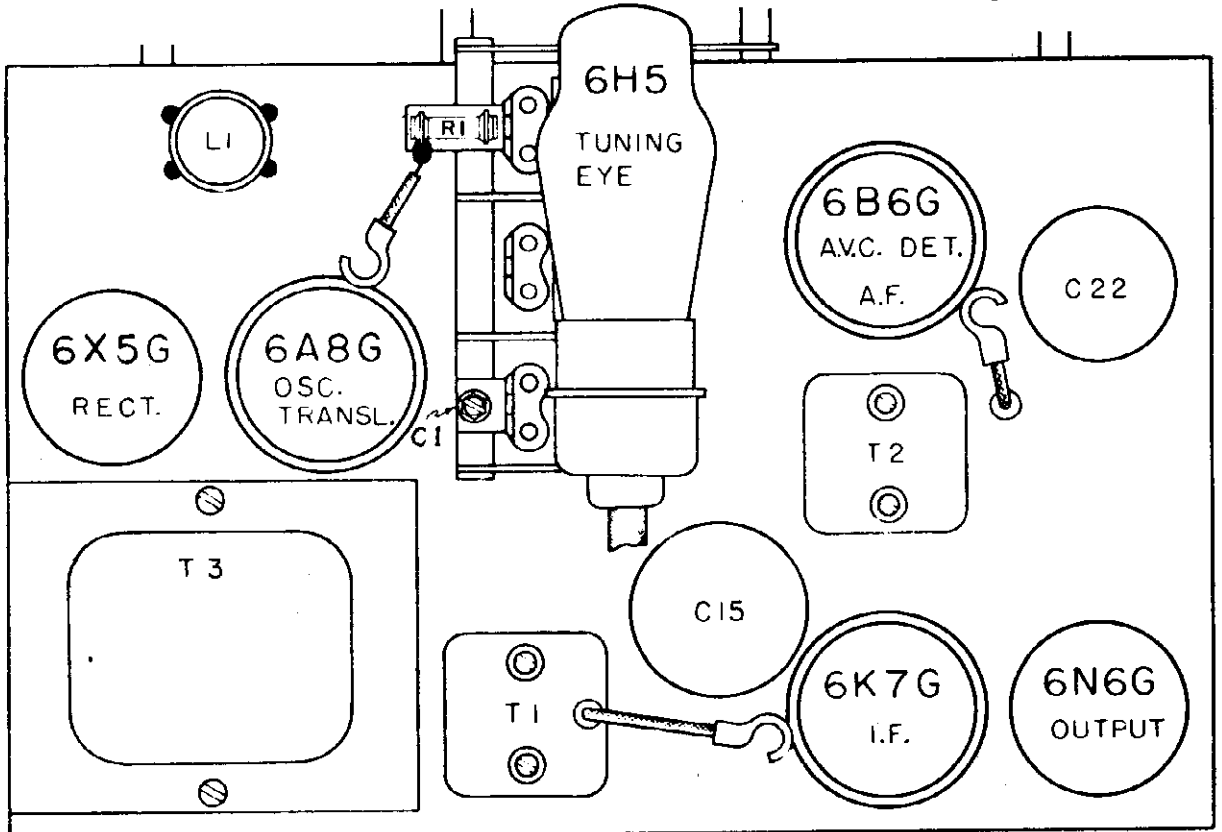

Set the generator to 1584 kc and tune in the signal lags at about 1000 kc on the receiver. The generator should be adjusted for high output (.1 volts). There is a lead coming from L1 through a hole in the chassis to the wave switch. Adjust the position of this lead under the chassis for minimum image response.

IMPORTANT ALIGNMENT NOTES

- Where indicated by the word, "rock", the variable should be rocked back and forth a degree or two while making the adjustment.
- It is advisable to repeat the entire alignment procedure band by band and in the original order to insure greater accuracy.
- Always keep the output from the test oscillator at its lowest possible value. As the sensitivity is increased by alignment, the generator output should be reduced correspondingly.
- After the alignment procedure has been completed, tune in a broadcast signal at about 1000 kc. If necessary, shift the dial pointer so that it indicates this frequency.
- Values shown under, "Microvolts", are only approximate.

SEARS-ROEBUCK & CO.

Data

GENERAL INFORMATION

The sensitivity is automatically increased on bands "P" and "F" by removal of the residual bias furnished by the resistor, R14. This resistor is connected in the circuit only when the Wave Band switch is in position "A". Contacts on the Wave Band switch automatically perform this switching.

Variable selectivity is obtained by a two position switch. It changes the selectivity of the IF input transformer by connecting or disconnecting coupling turns between primary and secondary.

ELIMINATING WHISTLE AT 930 KC:

A whistle, due to a beat between the second harmonic (930 kc) of the 465 kc IF, and a 930 kc signal may be experienced. In localities where the 930 kc station is one that is frequently listened to, it will be desirable to shift the whistle to some other point where it will not be objectionable. This can be done by shifting the IF frequency of the receiver.

Determine at what point between 900 kc and 960 kc the whistle will be least objectionable. Dividing this frequency by two will give the new IF frequency to which the receiver should be aligned. For example, if it is determined that a whistle at 915 kc would not be objectionable, the IF should be realigned at 915/2 or 457.5 kc.

Align the IF at the new frequency and then realign the receiver as described under, "ALIGNMENT PROCEDURE".

ELIMINATING HUM

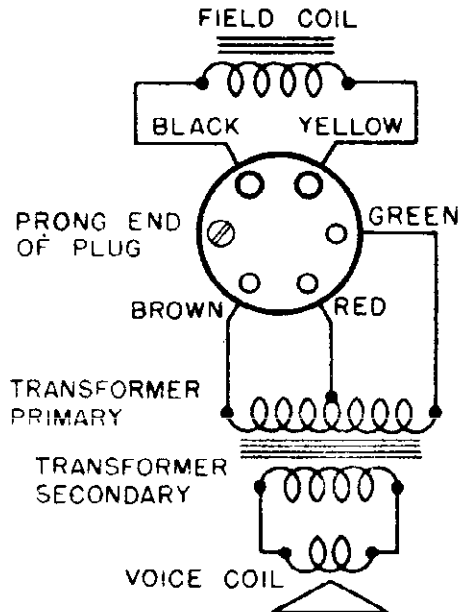

Excessive hum may be caused by a faulty 6C5G phase changer tube. Such tubes may test O.K. in a tube tester but cause hum due to leakage between the heater and cathode. If excessive hum is encountered, try changing the 6C5G phase changer tube.

Under certain conditions reversing the line plug will eliminate hum.

Interference Elimination

WAVE-TRAP TO ELIMINATE INTERFERENCE FROM SHIP OR AIRPORT TRANSMITTERS:

In locations near ship transmitters or airports or air beacon stations, code interference may be experienced. Part #1013115433 wave-trap is designed to eliminate such interference. It can be ordered from Colonial Radio Corporation, 254 Rano Street, Buffalo, N. Y. Use Purchase Order blank, form F5284. The retail selling price is \$1.00.

Mount the trap, by means of two wood screws, at any place on the chassis shelf or cabinet where it will be near the antenna terminals of the receiver. Connect the yellow lead of the trap to the terminal marked, "DBL", on the terminal block at the rear of the chassis. Connect the black lead of the trap to the ground terminal on the chassis. Any excess length should be cut off the wave-trap leads so that they are as short as possible. The antenna or doublet connections to the receiver are not to be changed in any way.

The trap is pre-tuned to the IF frequency so that normally no further adjustment is necessary. However, should interference still be experienced, tune the receiver between approximately 550 and 600 kc. Then adjust the wave-trap, by means of the trimmer screw at the bottom of the container, until the interference is eliminated. Addition of the trap will reduce the sensitivity of the receiver around 600 kc by approximately 50%. The customer should be forewarned of this to avoid complaints of reduced sensitivity.

"FOR"	6 mc	6 mc	400 ohms	Antenna Terminal	-	40

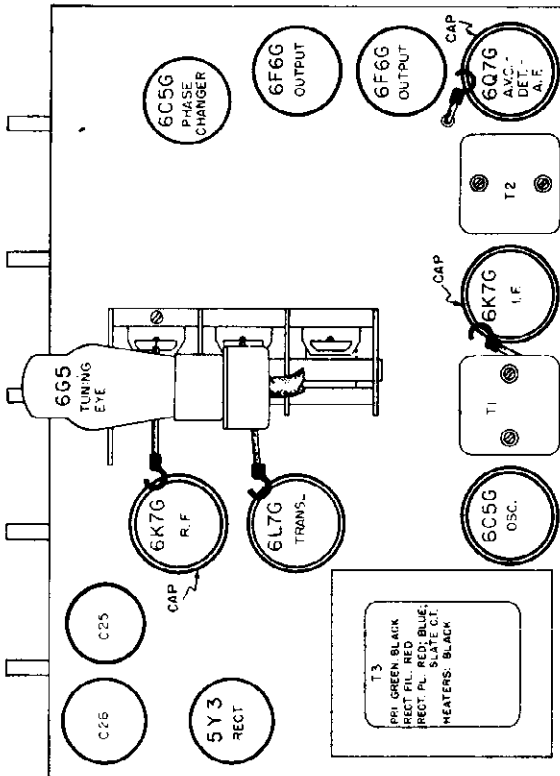

IMPORTANT ALIGNMENT NOTES

(*) If two peaks can be obtained at two different settings of the trimmer adjusting screw, use the adjustment in which the trimmer is screwed further out (lesser capacity). Where indicated by the word, "Rook", the variable should be rooked back and forth a degree or two while making the adjustment.

Each step of the alignment should be repeated in its original order for greater accuracy. Always keep the output from the generator at its lowest possible value, to prevent the AVO action of the set from interfering with accurate alignment.

The shield plate that covers the coil assembly should be left in place while making the alignment adjustments. The trimmer screws are accessible through the holes in the shield. Only the dummy antenna indicated in the chart for any particular band should be used. Remove the dummy antenna used for alignment of any other band.

After the alignment procedure has been completed, tune in a station at about 900 kc. If necessary, shift the dial pointer to the station's frequency on the dial.

IMPORTANT ALIGNMENT NOTES

Where indicated by the word, "Rock", the variable should be rocked back and forth a degree or two while making the adjustment.
 * Two peaks will be found at two different settings of the trimmer. Use the one in which the trimmer is screwed further in (greater capacity).
 ** Use a bakelite screw-driver in making these two adjustments. These adjustments should not be touched after this band has been lined up.
 Repeat the entire alignment step by step in the original order for greater accuracy. Always keep the generator output power at its lowest possible value. This will prevent the AVC action of the receiver from interfering with accurate alignment.
 The shield covering the coils at the bottom of the chassis should be left in place during the alignment. The trimmer condensers are accessible through the holes in the shield.

Only the dummy antenna indicated in the chart for any particular band should be used. Disconnect the dummy antenna used for alignment of any other band.
 After the alignment procedure has been completed, tune in a station at about 900 kc. If necessary, shift the dial pointer to the exact frequency of the station.
 After the alignment has been completed, the A.F.C. adjustment should be made as follows:

A.F.C. ADJUSTMENT

CAUTION: The right hand knob must be in the "B" (broad) position for operations 1 through 5. Two signal generators are necessary to make the adjustments. The Volume and Tone Controls must be turned all the way to the right. The generator ground connection is to be made to the chassis.
 1. Set one signal generator to 1050 kc and 5000 microvolts output. Connect its output to the "AM" terminal of the set, through a .0002 mfd. condenser.
 2. Tune the receiver for maximum output (at 1050 kc). Then switch the signal generator modulation switch to the "off" position.
 3. Short the movable arm to the toothed disc with a piece of wire. The Flash Tuning light should become illuminated.

4. Set the second signal generator to 465 kc and 10,000 microvolts output. Connect its output, in series with a .000015 mfd. condenser to the control grid of the 6L7G tube.
 5. Carefully turn the variable condenser until "zero beat" note is heard (with right hand knob in "BROAD" position).
 6. Turn the right hand knob to the "FLASH" position (fully clockwise). Then adjust the discriminator unit, to, for "zero beat". The correct setting will be obtained at about the center of its trimmer range. The adjustment is a very sharp one.
 7. Turn the right hand knob to the "SHARP" and then to the "BROAD" positions. The receiver still should be in the "SHARP" and "BROAD" positions if the A.F.C. is properly adjusted. If it does not, carefully repeat operation #6.
 8. The A.F.C. can be checked for "pull in" in the following manner. Remove the signal generator connection from the 6L7G grid. Switch on the modulation of the 1050 kc generator and set the generator to give 5000 microvolts output. Reduce the Volume Control setting of the receiver to give 1.5 volts reading on the output meter. Increase the signal generator frequency until the output meter reads .5 volt. Note the frequency of the signal generator at this output meter reading. Then decrease the signal generator frequency from 1050 kc until the output meter again reads .5 volt and note the signal generator frequency. If the A.F.C. is operating properly, the signal generator can be shifted 15 to 20 kc either side of 1050 kc before the output meter reading is reduced from 1.5 volts to .5 volt.

DIAL DRIVE REPLACEMENT PARTS

tion. Bend the end of the slip, opposite the call letters, over one of the celluloid tabs so that the call letters will be under the celluloid. See Fig. 3. Then place the tab end and call letter slip under the holder at the outside edge of the dial at a point opposite the end of the dial pointer. The call letters will then be illuminated whenever the dial pointer is opposite them (and the radio is switched to the AMERICAN band and the right hand knob is in the "FLASH" position).

8. In the same manner, insert the proper call letter slip and a celluloid tab for each of the other stations selected. (These tabs can be pulled out and the call letters of other stations inserted at any time should you wish to change the selection of stations.)

9. Replace the glass in the cabinet front panel. Hold it centered in the scotchbion with one hand inserted at the top and the other at the bottom. Press the glass into the scotchbion, pressing the remainder of the rim into the plastic. It may be helpful to tip the cabinet back against the wall to prevent the possibility of the glass falling out during the operation.

10. If two of the selected stations are powerful ones and close together in frequency (10 to 50 kc) the receiver may go from one to the other. If the stations are far apart, or if the selected frequency is very low, the receiver will stay on the one station. To correct this, bend down the originally bent up tab of the station and instead bend up the two adjacent teeth which are further apart.

HOW THE A.F.C. - FLASH TUNING CIRCUITS OPERATE:

The I.F. frequency of the receiver is 455 kc. If a station is tuned in exactly, then the oscillator frequency is 465 kc higher than the station's frequency, creating an I.F. of 465 kc. However, if the receiver is tuned, for example, 5 kc lower than the station's frequency, the oscillator frequency will be 5 kc lower and the resultant I.F. will be 460 kc. Similarly, if the receiver is tuned 5 kc higher than the station's frequency, the resultant I.F. will be 470 kc. The I.F. is fed to the discriminator transformer, T3. By means of the tuned circuits of the discriminator transformer, I.F. higher than 465 kc is fed through one 500Ω discriminator tube, T4, and frequencies lower than 465 kc are fed through the other 500Ω discriminator tube, T5. The polarity and value of the voltage drops, with respect to ground, across these two resistors depend upon the extent to which the I.F. is higher or lower than 465 kc. This voltage, developed upon the discriminator circuit, is fed to the control grid of the 6J7G Automatic Frequency Control tube to control the oscillator frequency, as described in the following paragraph.

The oscillator coil inductance, L5, determines the oscillator frequency for any given position of the variable condenser. If another inductance were connected in parallel to it, the total inductance would be lessened and the oscillator frequency would increase. The combination of the 6J7G A.F.C. tube together with the condensers, C50, C51 and the resistor, R11, have the effect of an inductance in parallel with the inductance, L5. This is so for the following reason:

In an inductance the phase relations between the voltage across it and the current through it are such that the voltage leads the current by 90 degrees. The phase relations of the voltage and current in the plate circuit of the 6J7G tube are such that the voltage leads the current by 90 degrees. Therefore, this combination acts as an inductance in parallel to the inductance L5. The extent to which it does so is determined by the value of the voltage impressed on the control grid of the 6J7G tube. This voltage is obtained from the discriminator circuit as previously described. The effect of this equivalent parallel inductance is to change the AMERICAN band oscillator frequency. By properly choosing the value of the variable condenser, the amount of voltage impressed on the control grid of the oscillator frequency circuit can be made to compensate almost exactly for the change in inductance which the station, in the station's selected position, presents which is equivalent to perfect tuning. Providing the station is selected between 465 kc and 480 kc, the A.F.C. can take hold. As mentioned previously, this is within 15 kc of the station for strong stations, but decreases for weaker stations.

The A.F.C. tube is connected in the circuit all the time and on all bands. However, the voltage from the discriminator circuit is fed to its control grid only on the AMERICAN band and when the Variable Selectivity - Flash Tuning knob is turned to the "FLASH" position. On all other bands and positions of the Selectivity - Flash Tuning knob the control grid bias of the 6J7G tube is fixed. Therefore, it corrects the I.F. frequency only on the AMERICAN band.

The Flash Tuning mechanism consists essentially of the toothed disc at the rear of the variable condenser and the relay, 17. The function of the toothed disc is to operate the relay when the variable condenser is turned to the various pre-selected stations. The relay contacts close the Flash Tuning light circuit, illuminating the station's call letters. At the same time they remove the high negative bias which blocks off the audio, keeping the receiver silent until the pre-selected station is tuned in.

The relay coil normally is energized. It is short circuited by the bent up tooth of the disc contacting the movable arm. This is why the Flash Tuning light flashes for a second or so when the receiver is first turned on -- the rectifier has not heated sufficiently to furnish current to energize the relay.

THE AUTOMATIC FREQUENCY CONTROL - FLASH TUNING:

These models incorporate a completely new feature, Automatic Frequency Control - Flash Tuning. This double feature, which is designed to operate only on the AMERICAN band, does several things. The Automatic Frequency Control removes the necessity for accurate tuning. Depending upon the strength of the station, it is necessary to tune only within 15 kc or less of the station's frequency. The Automatic Frequency Control then will "take hold" and tune the station far more accurately than can be done manually. This is done entirely with radio circuits, no moving parts being involved.

The Flash Tuning mechanism greatly simplifies tuning. It is necessary merely to turn the dial pointer to the station's call letters. The call letters then will become illuminated and, by virtue of the A.F.C., the station will automatically be tuned in exactly. Until the station's position is reached, the receiver is completely silent. As soon as the station is selected, the circuits of the A.F.C. Flash Tuning feature work is given after the following instructions for setting up the Flash Tuning feature.

SETTING UP:

1. The glass in the cabinet front panel must be removed to allow insertion of the station call letters, as described later. This glass is held in place by a split ring (the split is at the top). See Fig. 1. The tool illustrated is furnished in the same envelope with the instructions. Use the screw-driver end of this tool to remove the split ring by prying out one of its ends, as indicated in Fig. 1. Be very careful not to insert the tool so deep that it touches the glass, else the glass may become chipped.

The glass can be removed by placing the hand on it and tipping the cabinet forward. Take care during the operation not to allow the split ring to fly out or the glass to drop and break.

2. Make a list of the broadcasting stations to which you desire to have the FLASH Tuning mechanism respond. These stations must be local stations or strong stations at medium distance that give reliable daylight reception. A sheet containing the call letters of broadcasting stations is furnished in the same envelope with the Instruction Leaflet. Cut out the station's call letters of the selected stations. The short vertical lines before and after the station's call letters and the long horizontal lines will serve as a guide along which to cut. When properly done, these cut slips will be a trifle over 1/4" long and 1/4" wide.

3. Turn the Flash Tuning and Selectivity Switch knob to the "REAR" position. Then tune in the first station on your list of selected stations.

4. Leaving your station tuned in, go to the rear of the radio. You will see a semi-circular toothed disc, as illustrated in Fig. 2. There is also a flat spring arm, with a small rectangular projection on its end, that comes near the teeth of the semi-circular disc. The station's call letters are still resting on the teeth of the semi-circular disc. The rounded projection of the spring arm, which touches the semi-circular disc, is directly under the rounded projection of the spring arm. Mark this tooth with a pencil. Note that there is a double row of teeth and either the tooth that faces you or the tooth that faces the front of the radio may be bent up, depending upon which one is nearer the rounded projection of the spring arm. After you have marked the tooth, turn off the radio. Then tune away from the station (with the Station Selector knob, not the movable arm) and bend this marked tooth straight up, using the slotted end of the tool provided. See Fig. 2. It is important that the slot of the tool fit as far down as possible on the tooth before bending. This is necessary so that the complete tooth will be bent up instead of just part of the tooth. When this is properly done, the projection of the spring arm will touch the bent up tooth when the toothed disc is rotated by turning the Station Selector knob.

5. Turn the radio on again and tune in the next station on your list of selected stations. Mark the tooth that is under the projection of the spring arm when this station is tuned in. Turn off the radio, tune away from the station so that the spring arm will be in the way and bend up this marked tooth, using the tool provided. Proceed in the same manner for each of the other stations on your selected list. Turn off the radio each time before bending up the tooth. Otherwise a slight spark may occur, although there is no danger of shock. When properly done, the spring arm will touch each of the teeth that has been bent up but will not touch any of the other teeth, as the Station Selector knob is turned.

6. Turn the Flash Tuning and Selectivity Switch knob to the "FLASH" position. Now again tune in the first station on your selected list. As its position is reached, the bent up tooth will touch the spring arm and a light will flash on the dial at a position opposite the end of the dial pointer.

7. A small envelope containing celluloid tabs is furnished in the same large envelope with the instructions. Select the cut out slip bearing the call letters of your chosen station.

SEARS-ROEBUCK & CO.

MODELS 4488, 4588
 MODELS 4488A, 4588A
 Interference Elimination
 Phono.Pickup Jack Data

INSTALLING A JACK FOR THE USE OF EARPHONES AND PHONOGRAPH PICK-UP:

There is a hole, plugged with a brass insert, at the rear of the chassis. This hole is provided so that a jack can be installed for earphones or phono pickup connections. The schematic section shows the connections. With the connections as shown, the loud speaker will not operate when the earphones are plugged in. The earphones are plugged in the connections to the two plugs furthest from the frame of the chassis. Otherwise the earphone plug must be removed from its jack when loud speaker reception is wanted. If the jack is wired as a phono-graph pick-up jack, the right hand knob of the receiver must not be in the "FLASH" position when phono-graph operation is wanted. It may be put in either the "B" or "SHARP" position. The Volume and Tone Controls of the receiver will function for phono-graph reproduction.

AFTERCA CONNECTIONS:

There is a terminal board at the rear of the chassis marked "AF", "TEL", "GND", indicating antenna, doublet, and ground, respectively. The "TEL" terminal is left unconnected when a conventional antenna is used. When a doublet is used, one wire of the twisted pair is connected to the "AF" terminal and the other doublet wire is connected to the "TEL" terminal.

VARIABLE SELECTIVITY:

Variable Selectivity is obtained by connecting or disconnecting coupling turns between primary and secondary of the IF input transformer, P1. In the "SHARP" position of the right hand knob, the coupling turns are connected and the selectivity is increased, thereby increasing the high frequency audio response of the receiver.

REPLACEMENT OF THE OSCILLATOR TUBE:

There are two types of 6055 tubes, one shielded and the other unshielded. They can be sold apart easily by appearance. The shielded type has a perforated mesh screen surrounding the other elements. This screen is about an inch in diameter and comes very close to the inside of the bulb. The unshielded type does not have this perforated mesh screen. The plate is unshielded and is connected to the "A" terminal of the 6055 socket. The unshielded type is used in the 6055 socket. Use of the shielded type will upset the calibration of the Foreign bands and interfere with proper performance.

THE AVC CIRCUIT:

The voltage drop across the 500K ohm resistor, R2, is fed to the control grids of the 6N70 and 6N73 tubes to provide AVC. The drop across this resistor is also used in the discriminator circuit as described previously. The audio voltage across the resistor is coupled to the AF stages through the condenser, C37.

OPERATING CONTROLS:

1. Left knob - "On-Off" Switch and Volume
2. Next to left knob - Wave Band Switch
3. Middle knob - Station Selector
4. Next to right knob - Tone Control
5. Right knob - Selectivity Control

Fig. 4

WAVE-TRAP TO ELIMINATE INTERFERENCE FROM SHIP OR AIRPORT TRANSMITTERS:

In locations near ship transmitters or airports or air beacon stations, odds inter-ference may be experienced. A wave-trap is designed to eliminate such inter-ference. It is recommended that you contact the Radio Shack, Buffalo, N. Y. Use Purchase Order blank, form P0284. The retail selling price is \$1.00.

Mount the trap, by means of two wood screws, at any place on the chassis shelf or cabinet where it will be near the antenna terminals of the receiver. Connect the yellow lead of the trap to the terminal marked, "TEL", on the terminal block at the rear of the chassis. The other lead of the trap should be connected to the ground terminal of the chassis. The antenna lead length should be cut off the leads to the trap, if possible. The antenna or doublet connections to the receiver are not to be changed in any way.

Fig. 3

The trap is re-tuned to the IF frequency so that normally no further adjustment is necessary. However, should interference still be experienced, tune the receiver between approximately 550 and 600 Kc. Then adjust the wave-trap, by means of the trimmer screw at the bottom of the condenser, until the interference is eliminated. Addition of the trap will reduce the sensitivity of the receiver around 600 Kc by approximately 50%. The customer should be forewarned of this to avoid complaints of reduced sensitivity.

ELIMINATING WHISTLE AT 930 KC:

A whistle, due to a beat between the second harmonic (450 Kc) of the 465 Kc IF and a 900 Kc signal may be experienced in the vicinity of 930 Kc. This whistle is objectionable. It will be desirable to shift the whistle to some other point where it will not be objectionable. This can be done by shifting the IF frequency of the receiver.

Determine at what point between 900 Kc and 940 Kc the whistle will be least objectionable. Shifting this frequency by two will give the new IF frequency to which the receiver should be aligned. For example, if it is determined that a whistle at 915 Kc would not be objectionable, the IF should be realigned at 915/2 or 457.5 Kc. Try to keep the new IF frequency as near 465 Kc as possible.

Align the IF at the new frequency and then realign the antenna, translator, and oscillator stages. When re-adjust the A.F.C. according to the procedure described in this Manual, but setting the signal generator to the new IF frequency instead of 465 Kc.

In addition, certain circuit changes are required when relay type #5 is installed. The .02 mfd. 500 volt condenser is connected from the spring arm that contacts the teeth of the contact disc to the movable arm. A .1 mfd. 500 volt condenser is connected from the contact disc to the stationary arm. These condensers are C06 and C07 in the Schematic Section, Fig. 1. Fig. 2 shows how the condensers should be mounted.

CORRECTING DIAL DRIVE SLIPPAGE:

Dial drive slippage may be due to the movable arm being set too close to the beehive disc. The arm will then press unnecessarily hard against the bent up teeth of the condenser too hard to turn. If this appears to be the case, the adjusting screw on the movable arm should be loosened and the arm re-set so that it does not press too hard against the teeth.

ELIMINATING INTERFERENCE OF STATION OTHER THAN CHOSEN A.F.C. STATION:

The following condition sometimes occurs. Normally, a station that has been set up on the beehive disc will be heard whenever the dial pointer is turned to its call letters. It sometimes happens though that the station will only be heard if it is approached from one end of the dial, but an adjacent station will be heard if approached from the other end of the dial. This is due to the fact that the proper tooth was not selected carefully enough for the station when the dial was set. The remedy is to put the receiver in the "SHARPER" position, tune in the desired station very carefully, and to be sure to turn up the tooth that is under the projection of the contacting arm.

CORRECTING FAULTY A.F.C. TUNING:

Normally, when the receiver is in the "Flash" tuning position, a station will not be heard until the "Flash" tuning light operates. If the tuning is faulty, the station may be heard before its call letters become illuminated and may continue to be heard after the pointer has been turned past the station's position and the "Flash" tuning light has gone out. If this type of trouble is encountered, it can be corrected by making the circuit changes shown in Fig. 3. This will insure that the new connections to the tubes remain in place. The A-1 tubes are to be broken. The cathode connections of the tubes remain the same. The .500 mfd. 500 volt condenser, C08, is to be connected directly from the suppressor terminal of the 6E70 IP tube socket to ground. The suppressor of the 6E70 IP tube is to be connected to the 400 ohm .01 mfd. capacitor, C09, shown in Fig. 3. These changes increase the tuning action by putting a negative biasing voltage on the suppressor of the IP and IF tubes.

NOTE: In extreme cases, that is if the receiver is located near a very powerful station, tuning may be still unsatisfactory on that station even after the changes mentioned in the preceding paragraph have been made. If desired, in such extreme cases the tuning can be further improved by changing the value of R03 from 5000 ohms (9500 ohms in some sets) to 10000 ohms. This is done by changing the amount of "thump" or "click" that occurs when tuning stations in or out. Since this change is only for extreme cases, the 1000 ohm resistor is not included in the kit.

CORRECTING TOO HIGH MINIMUM VOLUME:

Sometimes, with the Volume Control set to its lowest position, the volume still is too high. This will occur in sets with the "Flash" tuning position. To correct this, examine the lead that runs from the "Flash" tuning position to the IP transformer. This lead must not be permitted to come close to the grid terminal of the 6C6G phase changer tube socket. There should be at least 1/2" clearance between the lead and the 6C6G grid terminal. In later production, this lead was covered with copper tape and the 6C6G grid terminal. In later production, this shielding also prevents reoperation which may occur under conditions of such shielding. This shielding also prevents reoperation, so, must be realigned. In addition, the condenser, C03, connected to the shieldable arm of the Volume Control, should be changed from .01 mfd. to .06 mfd. to help reduce minimum volume. It is advisable to cover the shielding with insulating tubing.

If the center tap lug of the Volume Control is grounding to the chassis, it will prevent the volume from going to a low value. Examine this lug to be sure that it is not grounding to the chassis.

There have been instances of defective Volume Controls caused by arcing of the switch turning the resistance element. Controls have been improved, eliminating this condition and it will not occur in replacement controls.

CORRECTING MICROPHONICS:

Trouble may be experienced in the Model 101419 (not the 101412A) due to a microphone 6E70 tube. This is particularly true of 6E70 tubes having a yellow colored Silver-tone label. Tubes with a Gray label are of different manufacture and are less microphonic. However, to correct this, use the 6E70 tube instead of a 6E70 tube will correct microphonics. 6E70 tubes having a yellow label are of different manufacture and are less microphonic. The circuit changes, converting the 101412 into a 101412A, are described in the following paragraph.

As shown in the Schematic Section, Fig. 4, the connection of C44 is changed to the other side of R20. The 400 ohm, 1/3 watt resistor, R42, is added. The value of R20 is changed to 10000 ohms. In the illustration, the solid lines indicate the original 101412 connections. *R42* indicates original connections to be broken. Dotted lines show new 101412A connections.

CHASSIS DESIGNATION IF THE CHANGES MENTIONED IN THIS SUPPLEMENT HAVE ALREADY BEEN MADE:

Chassis in which all the changes mentioned in this Supplement have been made at the factory will be indicated by the letter, "P", on a subsequent letter rubber stamped on the chassis Identification Sticker at the rear of the chassis. Accordingly, do not attempt to make any of these changes on chassis marked with the letter, "P", or subsequent letter.

- To Correct Relay Trouble
 - (1) - 1/2 mfd. 500 volt condenser
 - (1) - .02 mfd. 500 volt condenser
 - (1) - .1 mfd. 500 volt condenser
- To Correct Faulty A.F.C. Tuning
 - (1) - .5000 ohm, 1/3 watt resistor
 - (1) - .1 mfd. 500 volt condenser
- To Correct Too High Minimum Volume
 - (1) - .06 mfd. 500 volt condenser
- To Replace 6E70 Tube With 6E70 Tube
 - (1) - .5000 ohm, 1/3 watt resistor
 - (1) - .1 mfd. 500 volt condenser

CORRECTING RELAY TROUBLE:

Relay trouble usually is indicated by one or more of the following symptoms:

1. Flash Tuning light stays on at all times.
2. Receiver does not operate in "Flash" position.
3. Flash Tuning light does not light (although this may be due to a burnt out bulb).
4. Radio remains muted even though not in "Flash" position.

The Service Instructions, E7E1 22, for this Model describe two types of relay and one type of coil that the second type should be used to correct these troubles. The original type of relay being used in the kit is of the first type. A third type of relay, part #101531556, has been developed and will be the one supplied for replacement purposes even though the original one was type #1 or type #2. The tabulation below shows how the three types of relay can be identified.

Relay Type Number

- | | |
|----|---|
| #1 | No shield cover. |
| | Shield cover but no paint spot on shield cover. |
| | Yellow paint spot on shield cover. |
| #2 | Red paint spot on cover. |
| | Red and green paint spot on cover. |
| #3 | Blue paint spot on cover. |

Relay type #1 was the first one used and most of the relay trouble probably will be experienced with this type. Relay type #2 is considerably improved and should give very much less trouble than type #1. It has the same coil construction as type #1 but has a different contact arrangement. Relay type #3 has the same contact arrangement as type #2 but has considerably stiffer springs and heavier contact pressure. It also requires a different coil requiring 66 milliamperes to operate this relay instead of the 60 milliamperes minimum required for type #1 and #2.

THE TYPE #3 RELAY SHOULD BE INSTALLED IN THE EVENT OF ANY RELAY TROUBLE WITH EITHER TYPE #1 OR TYPE #2 RELAY.

Replacing Relay Types #1 or #2 with Type #3:

The connections to the terminals of the type #3 relay remain the same for the new type #3. The connections from type #1 to #3 are: Consider the terminal to be numbered from 1 to 5 with terminal 5 the one nearest the coil. The lead that originally connected to terminal 1 of the type #1 relay is to be connected to terminal 5 of the type #3 relay. The original terminal 2 connection is to be changed to terminal 4. The original terminal 3 connection, to terminal 1. The original terminal 4 connection, to terminal 2. The original terminal 5 connection to terminal 5.

Changes

CHANGE IN CONNECTIONS AND OPERATION OF THE FLASH TUNING - SELECTIVITY SWITCH (RIGHT HAND KNOB):

The right hand knob has three positions marked, "SHARP", "B" (BROAD); "FLASH". In all of the sets using a relay and in the first production of these using a transformer the relay was operated in the conventional manner in the "SHARP" and "B" positions. In the "FLASH" position, the A.F.C. and Flash Tuning circuits were connected. In later production sets using the transformer, the operation and connections of the A.F.C. - Selectivity Switch have been changed so that the radio operates in the conventional manner only in the "SHARP" position. In the "B" position, the A.F.C. is connected and Selectivity is **SHARP**. In the "FLASH" position, the A.F.C. also is connected and Selectivity is **SHARP**. In other words, in later production there are two A.F.C. positions with a choice of broad or sharp selectivity. There is one non-A.F.C. position with sharp selectivity.

With the original connection of the A.F.C. switch, providing only broad selectivity in the "FLASH" position, difficulty may be encountered in some locations due to adjacent channel interference or heterodyne whistles. In such difficulty is encountered in sets having the original connection, the switch may be changed to provide the two selectivity positions for A.F.C. Flash Tuning. Fig. 1 shows the switch connection changes for sets using the relay. Fig. 2 shows the switch connection changes for sets having an A.F.C. transformer. Note that former sets the original #10 connection is removed entirely from the switch. In transformer sets the original #10 connection is removed entirely. In addition, in sets of all types (101412, 101412A, 101412B), a .1 mfd. condenser must be shunted across the .05 mfd. condenser, C8. See the Locations of Parts diagram. In later production of Model 101412B, embodying the two A.F.C. - Selectivity positions, a .15 mfd. condenser is used for C8.

MODELS 4488, 4488B, 4588, 4588A, 4588B

SUBJECT: A.F.C. INACCURACY DUE TO DIFFERENCE IN LINE VOLTAGE

The setting of the teeth for A.F.C. stations is affected by the voltage of the power supply line. For example, suppose the stations to be set up at the Retail Store on a 120 volt line. If the radio is then delivered to the customer's home and the voltage there is considerably lower, say 105 volts, the A.F.C. settings will not be correct. The shift may amount to three or four kilocycles.

Accordingly, if the A.F.C. stations are not set up at the customer's home, care must be taken to see that the line voltage at the time the stations are set up is the same as the average line voltage at the customer's home. It may be necessary to use a series resistor or a booster transformer to duplicate the line voltage conditions that exist at the customer's home.

SUBJECT: CIRCUIT CHANGES TO ELIMINATE ANY JUMP CHANNEL INTERFERENCE IN MODELS 4488-4588-4588A-4488A-4488B-4588B

The 101412 and 101412A chassis, described in Service Instructions 57RL 23 and in Supplement #1, use a relay to accomplish the various switching required by the Automatic Frequency Control - Flash Tuning feature. In later production of this Model the circuit was changed, eliminating the relay. A transformer is used in place of the relay to accomplish the same results. Such chassis are identified by the number, 1014123.

The simplified diagram below shows how the transformer is used to mute the receiver and to operate the Flash Tuning light.

The A.F.C. transformer is a step-up transformer. Its primary is connected, in series with the Flash Tuning light bulb, across the heater winding of the power transformer. The toothed disc and contacting arm is connected across the primary of the A.F.C. transformer, as shown. The operation then is as follows: When the contacting arm is not engaging a tooth on the disc, the power transformer heater voltage is impressed in series with the Flash Tuning light bulb, upon the primary of the A.F.C. transformer. At this time the Flash Tuning light bulb, its impedance is too high to allow current to flow through the primary of the A.F.C. transformer. The voltage across the diode plates of the 607G tube is stepped up in the secondary and rectified by the diode plates of the 607G tube. This diode voltage (approximately 40 volts) is applied to the diode plates of the RF and IF tubes and to the secondary of the second AF tube, to provide muting. These are the conditions that exist when the right hand knob is turned to a Flash position and the receiver is tuned between Flash stations.

When the receiver is tuned to a Flash station, the contacting arm touches the tooth bent up for the station. This short circuits the primary of the A.F.C. transformer, with the impedance of this primary removed from the circuit the full voltage of the heater winding is impressed across the Flash Tuning light bulb causing it to light. Since the A.F.C. primary is short circuited, no voltage is developed across its secondary, thereby removing the muting bias. The receiver then is in operating condition and receives the station selected for flash tuning.

In the original sets using a relay, one set of contacts on the relay was used to prevent the A.F.C. from operating until the bent up tooth contacted the movable arm. This was necessary to prevent a strong station from being "pulled over" from an adjacent channel as the receiver was tuned through it, since the receiver was alive up to the audio stage. When the A.F.C. transformer is used in place of the relay, this "pull over" cannot occur because the receiver is made inoperative right at its input by muting of the RF tube.

IMPORTANT NOTE IN SETTING UP A.F.C. STATIONS:

IT IS VERY IMPORTANT THAT THE RECEIVER BE TUNED ON FOR TWENTY MINUTES BEFORE SETTING UP A.F.C. STATIONS ON THE TUNING DISC. IF STATIONS ARE SET UP WITH THE RECEIVER WARM, FREQUENCY DRIFT MAY CHANGE THE ACCURACY AND RELIABILITY OF THE SETTING WHEN THE RECEIVER WARMS UP.

"VOL"	11 mc (0)	11 mc	400 ohms	Ant. Term.	C36	Gas. Pad. 60

IMPORTANT ALIGNMENT NOTES

Waves indicated by (i) the variable should be rocked back and forth a degree or two while making the adjustment.

* Two peaks will be found at two different settings of the trimmer. Use the one in which the trimmer is screwed further in (greater capacity).

** Use a bakelite screw-driver in making these two adjustments. These adjustments should not be touched after this band has been lined up.

Repeat the entire alignment step by step in the original order for greater accuracy. Always keep the generator output power at its lowest possible value. This will prevent the AFC action of the receiver from interfering with accurate alignment.

The shield covering the coils at the bottom of the chassis should be left in place during the alignment. The trimmer condensers are accessible through the holes in the shield.

Only the dummy antenna indicated in the chart for any particular band should be used. Disconnect the dummy antenna used for alignment of any other band. No connection is to be made to the doublet terminal.

After the alignment has been completed, the A.F.C. adjustment should be made as follows:

A.F.C. ADJUSTMENT

CAUTION! The right hand knob must be in the "SHARP" position for operations 1 through 5. It is preferable to have two signal generators to make the adjustments. However, if two generators are not available, a broadcast station of approximately 1000 kc can be used for just capable of giving satisfactory results. The station chosen should be of medium strength. That is, one which will give a good signal but not be so strong that the volume control knob will be turned all the way to the right. The generator ground connection is to be made to the chassis.

1. Set one signal generator (or the broadcast station) to 1000 kc and 5000 microvolts output. Connect its output to the "air" terminal of the set, through a .0002 mfd. condenser.

2. Tune the receiver for maximum output (at 1000 kc). Then switch the signal generator modulation switch to the "off" position.

3. Short the movable arm to the toothed disc with a piece of wire. The Flash Tuning light should become illuminated.

4. Set the second signal generator to 485 kc and 10,000 microvolts output. Connect its output in series with a .00015 mfd. condenser to the control grid of the 6L70 tube. Turn the modulation switch to the "off" position.

5. Carefully turn the variable condenser until "zero beats" note is heard (with right hand knob in "SHARP" position).

6. Turn the right hand knob to the "FLASH" position (fully clockwise). Then adjust the discriminator unit, τ , for "zero beats". The correct setting will be obtained at about the center of the trimmer range. The adjustment is a very sharp one.

7. Turn the right hand knob to the "SHARP" and then to the "BROAD" positions. The receiver will sound more beat notes in the "SHARP" and "BROAD" positions if the A.F.C. is properly adjusted. If it does not, carefully repeat operation #6.

8. The A.F.C. can be checked for "pull in" in the following manner. Remove the signal generator connection from the 6L70 grid. (Two generators must be used.) Switch on the modulation of the 1000 kc generator and set the generator to give 5000 microvolts output. Reduce the frequency of the 485 kc generator until the output meter reading is about 1000 microvolts. Increase the signal generator frequency until the output meter reading is about 10,000 microvolts. The volume of the signal generator at this output meter reading. Then decrease the signal generator frequency until the output meter again reads .5 volt and note the signal generator frequency. If the A.F.C. is operating properly, the signal generator can be shifted 15 to 20 kc either side of 1000 kc before the output meter reading is reduced from 1.5 volts to .5 volt.

IMPORTANT NOTE ABOUT SETTING UP A.F.C. STATIONS ON ADJACENT CHANNELS:

In paragraph #10 under "SETTING UP THE AUTOMATIC FREQUENCY CONTROL" in the Service Instructions, the suggestion is made that if adjacent channel stations are selected the two lead function apart be used instead of the correct ones for the stations. For example, suppose the station to be selected is 710 kc and the correct function is "VOL" and "VOL" corresponding to 700 kc and 710 kc. Instead of using "VOL" and "VOL", the "VOL" and "VOL" would be bent up instead. The purpose of this is to prevent the receiver from tuning to one station to the other as the air signal strength varies. This suggestion will be helpful only if the station is sufficiently strong. Otherwise the mistuning will affect the tone quality. It is best to select, for A.F.C. tuning, stations at least 20 kc apart in frequency.

CHANGE IN PROCEDURE FOR REMOVING DIAL GLASS FOR SETTING UP FLASH TUNING STATION CALIBRATIONS

The Service Instructions for this model describe how to remove the dial glass by taking off the split retaining ring that holds it. In receivers using the 10L4PB chassis this procedure has been simplified by using an escutcheon with the dial glass moulded into it. It is held in place in the front of the cabinet by four screws. Accordingly, it is necessary merely to remove these four screws in order to take off the moulded escutcheon and dial glass.

CHANGE IN PROCEDURE FOR REMOVING PICK-UP JACK OPERATOR:

The Service Instructions for this model state that if a phonograph pick-up jack is used the right hand knob must be in either the "SHARP" position. This is true only for the 10L4PB chassis. In receivers using the A.F.C. position (Flash), in later production receivers using the A.F.C. position (Flash), or in receivers using the A.F.C. position (Flash) changed to provide these two positions, the right hand knob must be in the "SHARP" position for phonograph operation. This must be done, of course, to remove the muting from the audio tube, permitting phonograph reproduction.

REVISED ALIGNMENT PROCEDURE:

PREAMBLER:

Output meter connections - - - - - Across speaker voice coil
 Output meter reading to indicate .5 watts output - - - - - 2.5 volts
 Dummy antenna value to be in series with generator output - - - - - See chart below

OPERATING FEATURES:

Fidelity Range ----- 100 - 3000 cycles
Tone Control ----- None
Sensitivity Control ----- None
Automatic Volume Control ----- None

An attached antenna wire is supplied with the receiver. It should be uncoiled and extended as far from the radio as possible. If interference between stations is encountered, uncoil the antenna only far enough to obtain satisfactory reception, free of interference. In locations remote from broadcasting stations additional pick-up can be had by connecting the end of the antenna to a conventional outdoor antenna lead-in.

THE FILAMENT CIRCUIT AND POWER SUPPLY:

The filaments of all of the tubes are connected in series. Accordingly, if any one tube burns out the others will not light. It is necessary to replace only the burned out tube; the others then will light. A resistor, built into the line cord, reduces the line voltage to the value required by the tube filaments.

There is an AC-DC switch, accessible from the bottom of the cabinet and operated with a screw-driver. This switch must be in the proper position for AC or DC operation, as shown on the label at the bottom of the cabinet. If the receiver is operated from DC, the polarity of the line cord plug must be correct. If the receiver fails to operate after allowing a minute or two for the tubes to become heated, turn the plug half way around and re-insert it in its receptacle.

The line cord must not be shortened or altered in any way. To do so would affect the value of resistance built into it.

CAUTION:

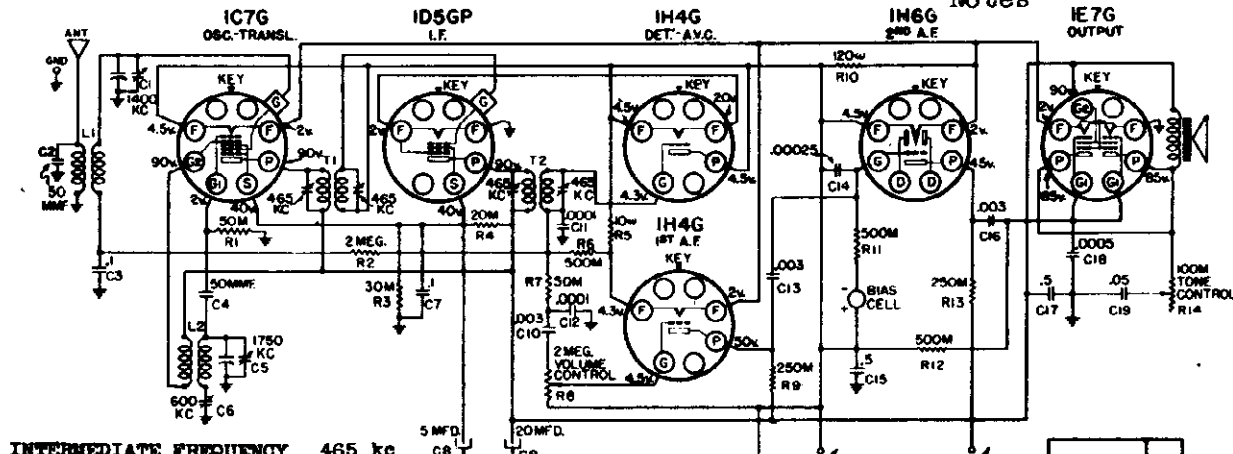

Under certain conditions, the chassis may be above ground potential by a value equal to the line voltage. For this reason, care must be taken not to allow any grounded object to come in contact with the chassis while the power cord is plugged into the line. The chassis is insulated from the metal bottom cover of the cabinet by means of rubber grommets.

 ALIGNMENT IS TO BE MADE AT THE FREQUENCIES SHOWN AT THE
 TRIMMER CONDENSERS.
 WHERE NO VOLTAGE READING IS SHOWN AT SOCKET PRONG, IT
 INDICATES A VERY LOW READING.

WAVE-TRAP TO ELIMINATE INTERFERENCE FROM SHIP OR AIRPORT TRANSMITTERS:

In locations near ship transmitters or airports or air beacon stations, code interference may be experienced. Part #1013114256 wave-trap is designed to eliminate such interference.

Mount the trap, by means of two wood screws, at any convenient place on the chassis shelf or cabinet where it will be near the antenna terminal of the receiver. Connect the yellow lead of the wave-trap to the antenna download. Splice the green lead of the wave-trap to the green antenna lead of the receiver. Cut off any excess length of wire from the trap and from the chassis antenna lead so that the green lead from the wave-trap to the chassis is as short as possible. The yellow lead from the wave-trap should be run so that it is as far as possible from the green lead. Splice one of the black leads from the wave-trap to the black ground lead of the receiver. Connect the other wave-trap black lead to the ground used for the installation.

The trap is pre-tuned to the IF frequency so that normally no further adjustment is necessary. However, should interference still be experienced, tune the receiver between approximately 550 and 600 kc. Then adjust the wave-trap, by means of the trimmer screw at the bottom of the container, until the interference is eliminated. Addition of the trap will reduce the sensitivity of the receiver around 600 kc by approximately 50%. The customer should be forewarned of this to avoid complaints of reduced sensitivity.

THE FILAMENT CIRCUIT:

Since the tube filaments are rated at two volts and the "A" supply is four volts, a series parallel arrangement is used for the tube filament circuit. Accordingly, if any one tube burns out its companion tube will also be affected. It is necessary to replace only the burned out tube. A simplified circuit of the filament connections is shown below.

BATTERY CONNECTIONS:

- A- Black and yellow
- B- Yellow and blue
- C- Red and black
- D- 90B

SPEAKER ADJUSTMENT:

There are two adjusting screws at the rear of the speaker, as shown in the illustration. Speaker rattles can be corrected by turning the screws in or out until the rattle is eliminated.

ELIMINATING WHISTLE AT 930 KC:

A whistle, due to a beat between the second harmonic (930 kc) of the 465 kc IF, and a 930 kc signal may be experienced. In localities where the 930 kc station is one that is frequently listened to, it will be desirable to adjust the whistle to some other point where it will not be objectionable. This can be done by shifting the IF frequency of the receiver.

Determine at what point between 900 kc and 960 kc the whistle will be least objectionable. Dividing this frequency by two will give the new IF frequency to which the receiver should be aligned. For example, if it is determined that a whistle at 915 kc would not be objectionable, the IF should be realigned at 915/2 or 457.5 kc.

Align the IF at the new frequency and then realign the rest of the receiver as described under "ALIGNMENT PROCEDURE".

BATTERY REPLACEMENT:

The dry "A" battery should be replaced when its voltage drops to 3.4 volts, under load. The "B" batteries should be replaced when the total voltage has dropped to 88 volts, under load.

THE BIAS CELL:

The bias cell is filled with thick liquid. When the receiver is in its normal position the bias cell will be mounted on its side, which is the correct position, so that the liquid will come into contact with the carbon block and the inside of the seal container. However, the receiver may be stood on its end when working on it on the bench. In this position the liquid will cause severe distortion. Accordingly, the necessary precaution should be observed when working on the receiver on the service bench.

IMPORTANT ALIGNMENT NOTES

The variables should be rotated back and forth a degree or two while making the 900 kc adjustment. The alignment procedure should be repeated in the original order, step by step, to insure greater accuracy. Always keep the output power from the generator at its lowest possible value to prevent the ATC of the receiver from interfering with accurate alignment. After the alignment has been completed, check the calibration by tuning in a broadcast station at about 900 kc. Adjust the dial pointer to the station's frequency, if necessary.

SUBJECT: ELIMINATING OSCILLATION

Oscillation may occur due to variations in tubes. To overcome such oscillation, connect a .003 condenser from the line side of the switch to the chassis. This condenser may be of at least 800 volts rating, or higher. Preferably 800 volts. This condenser is C13 in the Schematic section below, and has been added in later production sets.

ALIGNMENT PROCEDURE

The receiver need not be taken out of the cabinet for alignment.

Either a broadcast signal of about 1400 kc or a test oscillator signal may be used. If a broadcast signal is used, the antenna of the receiver should be extended as in a normal installation. If a test oscillator signal is used, a wire should be connected to the test oscillator terminal on the back of the receiver's antenna wire. The generator ground connection should be connected to ground.

Tune in the 1400 kc signal and adjust the trimmer for maximum loud speaker response. This can be done most accurately if the Volume Control setting is reduced to give a low volume level. The variable should be rocked a degree or two during the adjustment. The location of this trimmer is shown in the Location of Parts Diagram. It is accessible, when the chassis is in the cabinet, through the hole in the plate at the bottom of the cabinet.

IMAGE ADJUSTMENT

Set the generator to 1524 kc and tune in the signal image at about 1000 kc on the receiver. The generator should be adjusted for high output (11 volts). There is a lead running from LI through a hole in the chassis to the wave switch. Adjust the position of this lead under the chassis for minimum image response.

IMPORTANT ALIGNMENT NOTES

Where indicated by the word, "Rock", the variable should be rocked back and forth a degree or two while making the adjustment. It is advisable to repeat the entire alignment procedure band by band and in the original order to insure greater accuracy.

Always keep the output from the test oscillator at its lowest possible value. As the sensitivity is increased by alignment, the generator output should be reduced correspondingly. This will prevent the AVC from interfering with accurate alignment.

After the alignment procedure has been completed, tune in a broadcast signal at about 500 kc. If necessary, shift the dial pointer so that it indicates this frequency.

Values shown under, "Microvolts", are only approximate.

WAVE-TRAP TO ELIMINATE INTERFERENCE FROM SHIP OR AIRPORT TRANSMITTERS:

Mount the trap, by means of two wood screws, at any place on the chassis shelf or cabinet where it will be near the antenna terminals of the receiver. Connect the yellow lead of the trap to the terminal marked, "DBL", on the terminal block at the rear of the chassis. Connect the black lead of the trap to the ground terminal of the chassis. Any excess length should be cut off the leads so that they are as short as possible. The antenna or doublet connections to the receiver are not to be changed in any way.

The trap is pre-tuned to the IF frequency so that normally no further adjustment is necessary. However, should interference still be experienced, tune the receiver between approximately 550 and 600 kc. Then adjust the wave-trap, by means of the trimmer screw at the bottom of the container, until the interference is eliminated. Addition of the trap will reduce the sensitivity of the receiver around 600 kc by approximately 50%. The customer should be forewarned of this to avoid complaints of reduced sensitivity. See DW65.

ELIMINATING WHISTLE AT 930 KC:

A whistle, due to a beat between the second harmonic (930 kc) of the 465 kc IF, and a 930 kc signal may be experienced. In localities where the 930 kc station is one that is frequently listened to, it will be desirable to shift the whistle to some other point where it will not be objectionable. This can be done by shifting the IF frequency of the receiver.

Determine at what point between 900 kc and 960 kc the whistle will be least objectionable. Dividing this frequency by two will give the new IF frequency to which the receiver should be aligned. For example, if it is determined that a whistle at 915 kc would not be objectionable, the IF should be realigned at $915/2$ or 457.5 kc. Try to keep the new IF frequency as near 465 kc as possible.

Align the IF at the new frequency and then realign the antenna, translator, and oscillator stages. Then re-adjust the A.P.C. according to the procedure described in this Manual, but setting the signal generator to the new IF frequency instead of 465 kc.

MODEL 4587
Alignment, Sensitivity
Jack Installation

8. Turn the receiver for maximum output (at 1060 kc). Then switch the signal generator modulation switch to the "off" position.
9. Short the variable arm to the touched disc with a piece of wire. The Flash Tuning light should become illuminated.
4. Set the second signal generator to 445 kc and 10,000 microvolts output. Connect its output, in series with a .00005 mfd. condenser to the control grid of the 6L7G tube.
5. Carefully turn the variable condenser until "zero beat" note is had (with right hand knob in "BROAD" position).
6. Turn the right hand knob to the "FLASH" position (fully clockwise). Then adjust the discrimination unit for "zero beat". The correct setting will be obtained at about the center of 75 trimer range. The adjustment is a very sharp one.
7. Turn the right hand knob to the "SHARP" and then to the "BROAD" positions. The receiver still should give zero beat in the "SHARP" and "BROAD" positions if the A.P.C. is properly adjusted. If it does not, carefully repeat operation #6.
8. The A.P.C. can be checked for "pull in" in the following manner. Remove the signal generator connection from the 6L7G grid. Switch on the modulation of the 1060 kc generator and set the generator to give 5000 microvolts output. Reduce the Volume Control setting of the receiver to give 1.5 volts reading on the output meter. Increase the signal generator frequency until the output meter reads .5 volt. Note the signal generator frequency from 1060 kc with the output meter reading .5 volt and note the signal generator frequency from 1060 kc with the output meter reading 1.5 volt and note the signal generator frequency. If the A.P.C. is operating properly, the signal generator can be shifted 15 to 80 kc either side of 1060 kc before the output meter reading is reduced from 1.5 volts to .5 volt.

INSTALLING A JACK FOR THE USE OF EARPHONES AND PHONOGRAPH PICK-UP:

There is a hole, plugged with a brass insert, at the rear of the chassis. This hole is provided so that a jack can be installed for earphone or phonograph pick-up connections. The schematic section shows the connections. With the connections as shown, the loud speaker will not operate when the earphones are plugged in. If it is desired to have the loud speaker operate at the same time the earphones are plugged in, the earphone plug must be turned from its jack when loud speaker reception is wanted. Otherwise the earphone plug must be turned from its jack when loud speaker reception is wanted. If the jack is wired as a phone jack pick-up jack, the right hand knob of the receiver must not be in the "FLASH" position when phonograph operation is wanted. It may be put in either the "B" or "SHARP" position. The Volume and Tone Controls of the receiver will function for phonograph reproduction.

- ALIGNMENT PROCEDURE**

 - Output meter reading to indicate .5 watts output ----- -1.1 volts
 - Dummy antenna value to be in series with generator output ----- See chart below
 - Connection of generator output lead ----- See chart below
 - Generator modulation ----- 30%, 400 cycles
 - Approximate average sensitivity in microvolts for .5 watts output ----- See chart below
 - Position of Volume Control ----- Fully on
 - Position of Tune Control ----- Fully clockwise
 - Position of Flash Tuning and Selectivity Switch knob ----- Sharp, fully counter clockwise
 - Position of Mal. Pointer when variable is fully meshed ----- as illustrated below

WAVE BAND	GENERATOR FREQUENCY	GENERATOR OUTPUT	ANTENNA CONNECTION	APPROXIMATE SENSITIVITY IN MICROVOLTS
"A1"	580 kc	.1 mfd.	6L7G Gr-16	75, 71
"A1"	1400 kc	.0008 mfd.	Antenna Terminal C94, C1, C7	15
"A1"	600 kc (peak)	.0008 mfd.	Antenna Terminal C25	20
"P01"	4 mc	400 ohms	Antenna Terminal C28, C2, C8	5
"P01"	1.8 mc (peak)	400 ohms	Antenna Terminal C28	40
"P01"	15 mc	400 ohms	Antenna Terminal C28, C3, C9	5
"P01"	6 mc	400 ohms	Antenna Terminal	60

IMPORTANT ALIGNMENT NOTES

Where indicated by the word, "peak", the variable should be rotated back and forth a degree or two while making the adjustment.

Repeat the entire alignment step by step in the original order for greater accuracy. Always keep the generator output at its lowest possible value. This will prevent the AVC section of the receiver from interfering with accurate alignment.

The shield covering the coils at the bottom of the chassis should be left in place during the alignment. The trimmer condensers are accessible through the holes in the shield. Only the dummy antenna indicated in the chart for any particular band should be used. Disconnect the dummy antenna used for alignment of any other band.

After the alignment has been completed, the A.P.C. adjustment should be made as follows:

A.P.C. ADJUSTMENT

The right hand knob must be in the "B" (broad) position for operations 1 through 5. Two signal generators are necessary to make the adjustments. The Volume and Tone Controls must be turned all the way to the right. The generator ground connection is to be made to the chassis.

1. Set one signal generator to 1060 kc and 5000 microvolts output. Connect its output to the "A1" terminal of the set, through a .0008 mfd. condenser.

MODEL 4587

the dial pointer. The call letters will then be illuminated whenever the dial pointer is opposite the "Flash" position (and the radio is switched to the AMERICAN band and the right hand knob is in the "FLASH" position).

8. In the same manner insert the proper call letter slip and a celluloid tab for each of the other stations selected. (These tabs can be pulled out and the call letters of other stations inserted at any time should you wish to change the selection of stations.)

9. Replace the glass in the cabinet front panel. Hold it centered in the southeasth with one hand, insert one end of the split ring in place as shown in Fig. 4 and continue pressing the remainder of the ring into place until it is completely seated. It may be helpful to tip the cabinet back against the wall to prevent the possibility of the glass falling out during the operation.

10. If two of the selected stations are powerful ones and close together in frequency (10 to 20 kc) the receiver set 50 from one to the other. If they are widely spaced, adjust their relative strength varies with the time of day. To correct this, bend down the originally bent up for the two stations and instead bend up the two adjacent teeth which are further apart.

HOW THE A.F.C. - FLASH TUNING CIRCUITS OPERATE:

The I. P. frequency of the receiver is 465 kc. If a station is tuned in exactly, the oscillator frequency is 465 kc higher than the station's frequency. If the station's frequency is 5 kc lower, the oscillator frequency will be 5 kc lower and the resultant I.P. will be 470 kc. Similarly, if the receiver is tuned 5 kc higher than the station's frequency, the resultant I.P. will be 470 kc. The I.P. is fed to the discriminator transformer, T3. By means of the tuned circuits of the discriminator transformer, I.P. higher than 465 kc is fed through one of the diode plates of the 6B6G tube and frequencies lower than 465 kc are fed through the other diode plate of the 6B6G tube. The resultant diode current creates voltage drops across the 800K ohm resistors, R20 and R21. The polarity and value of the voltage drops with respect to ground, across these two resistors depend upon the extent to which the I.P. is higher or lower than 465 kc. This voltage, developed by the discriminator circuit, is fed to the control grid of the 6A7G automatic frequency control tube to control the oscillator frequency, as described in the following paragraph.

The oscillator coil inductance, L5, determines the oscillator frequency for any given position of the variable condenser. If another inductance were connected in parallel to it, the total inductance would be lessened and the oscillator frequency would increase. The combination of the 6A7G A.F.C. tube together with the condensers, C15, C17 and the resistor, R11, having the effect of an inductance in parallel with the inductance, L5. This is so for the following reason:

In an inductance the phase relations between the voltage across it and the current through it are such that the voltage leads the current by 90 degrees. The phase relations of the voltage and current in the plate circuit of the 6A7G tube are such that the voltage leads the current by 90 degrees. Therefore, this combination acts as an inductance in parallel to the inductance L5. The extent to which it does so is determined by the value of the voltage impressed on the control grid of the 6A7G tube. This voltage is obtained from the discriminator circuit as previously described. The effect of this equivalent parallel inductance is to change the AMERICAN band oscillator frequency. By properly choosing constants, this oscillator frequency change can be made to compensate almost exactly for the oscillator frequency error due to inexact tuning. In this way, the I.P. is always 465 kc, which is equivalent to perfect tuning, provided the station is approached nearly enough so that the A.F.C. can take hold. As mentioned previously, this is within 15 kc of the station for strong stations, but decreases for weaker stations.

The A.P.C. tube is connected in the circuit all the time and on all bands. However, the voltage from the discriminator circuit is fed to its control grid only on the AMERICAN band and when the variable Selectivity-Flash tuning knob is turned to the "FLASH" position. On all other bands and positions of the Selectivity-Flash tuning knob the control grid bias of the 6A7G tube is fixed. Therefore, it corrects the I.P. frequency only on the AMERICAN band.

The Flash tuning mechanism consists essentially of the toothed disc at the rear of the variable condenser and the relay, L7. The function of the toothed disc is to operate the relay when the variable condenser is turned to the various pre-selected stations. The relay contacts close the Flash tuning light circuit, illuminating the station's call letters. At the same time they remove the high negative bias which blocks off the audio, keeping the receiver silent until the pre-selected station is tuned in.

The relay coil normally is energized. It is short circuited by the bent up tooth of the disc preceding the movable contact. This is why the Flash tuning light flashes for a second or so after the station is turned on -- the rectifier has not heated sufficiently to furnish current to energize the relay.

GENERAL INFORMATION

THE AUTOMATIC FREQUENCY CONTROL - FLASH TUNING:

These models incorporate a completely new feature, Automatic Frequency Control - Flash tuning. This double feature, which is designed to operate only on the AMERICAN band, does away with the "beat" phenomenon which has troubled so many of our accurate tuning devices during the past few years. On the AMERICAN band, it is necessary to tune only 15 kc or less from the strength of the station. On the other bands, it is necessary to "take hold" and tune the station far more accurately than can be done manually. This is done entirely with radio circuits, no moving parts being involved.

The Flash tuning mechanism greatly simplifies tuning. It is necessary merely to turn the dial pointer to the station's call letters. The call letters then will become illuminated and, by virtue of the A.F.C., the station will automatically be tuned in exactly. Until the station's position is reached, the receiver is completely silent. A description of how the circuits of the A.F.C. - Flash tuning feature work is given after the following instructions for setting up the Flash tuning feature.

SETTING UP:

1. The glass in the cabinet front panel must be removed to allow insertion of the station call letters, as described later. This glass is held in place by a split ring (the split is at the top). See Fig. 1. The tool illustrated is furnished in the same envelope with the Instructions. Use the screw-driver end of this tool to remove the split ring by prying out one of its ends, as indicated in Fig. 1. Be very careful not to insert the tool so deep that it touches the glass, else the glass may become chipped.

The glass can be removed by placing the hand on it and tipping the cabinet forward. Take care during the operation not to allow the split ring to fly out or the glass to drop and break.

2. Make a list of the broadcasting stations to which you desire to have the FLASH TUNING mechanism respond. These stations must be local stations or strong stations at medium distance that give reliable daylight reception. A sheet containing the call letters of broadcasting stations is furnished in the same envelope with the Instruction Leaflet. Cut out the call letters of the selected stations. The short vertical lines before and after the station's call letters and the long horizontal lines will serve as a guide along which to cut. When properly done, these cut slips will be a trifle over 1/4" long and 1/4" wide.

3. Turn the Flash tuning and Selectivity Switch knob to the "FLASH" position. Then tune in the first station on your list of selected stations.

4. Leaving your station tuned in, go to the rear of the radio. You will see a small circular toothed disc, as illustrated in Fig. 2. There is also a flat spring arm with a small rounded projection, as illustrated in Fig. 2. The teeth of this small circular disc which touch the toothed disc are the teeth of the station tuned in. Carefully note which tooth on the small circular disc is directly under the rounded projection of the spring arm. Mark this tooth with a pencil. Note that there is a double row of teeth and either the tooth that faces you or the tooth that faces the front of the radio may be bent up, depending upon which one is nearer the rounded projection of the spring arm. After you have marked the tooth, turn off the radio. Then tune away from the station (with the Station Selector knob, not the movable arm) and bend this marked tooth straight up, using the slotted end of the tool provided. See Fig. 2. It is important that the slot of the tool fit as far down as possible on the tooth before bending. This is necessary so that the complete tooth will be bent up instead of just part of the tooth. When this is properly done, the projection of the spring arm will touch the bent up tooth when the toothed disc is rotated by turning the Station Selector knob.

5. Turn the radio on again and tune in the next station on your list of selected stations. Mark the tooth that now is under the projection of the spring arm when this station is tuned in. Turn off the radio, tune away from the station so that the spring arm will be in the way and bend up this marked tooth, using the tool provided. Proceed in the same manner for each of the other stations on your selected list. Turn off the radio each time before bending up the tooth. Otherwise a slight spark may occur, although there is no danger of shock. When properly done, the spring arm will touch each of the teeth that has been bent up but will not touch any of the other teeth, as the Station Selector knob is turned.

6. Turn the Flash tuning and Selectivity Switch knob to the "FLASH" position. Now again tune in the first station on your selected list. As its position is reached, the bent up tooth will touch the spring arm and a light will flash on the dial at a position opposite the end of the dial pointer.

7. A small envelope containing celluloid tabs is furnished in the same large envelope with the Instructions. Select the cut out slip bearing the call letters of your chosen station. Bend the end of the slip, opposite the call letters, over one of the celluloid tabs so that the call letters will be under the celluloid. See Fig. 3. Then place the tab and call letter slip under the holder at the outside edge of the dial at a point opposite the end of

MODEL 4587

Dial Data, Flash Tuning Notes

SEARS-ROEBUCK & CO.

The FLASH TUNING lamp (the one that moves around the outer edge of the dial and flashes on for the station call letters) is accessible for replacement through a small removable cover at the top of the dial housing. (Accessible from the rear of the radio.) This cover snaps on the top of the dial housing and can be removed with the fingers or by means of a screw driver, as shown in Fig. 7. Turn the Station Selector knob so that the dial pointer is straight up. The lamp shade can then be removed by grasping the end of it and pulling it up through the opening in the dial housing. The lamp can then be removed and replaced. When pulling the lamp shade back, the narrow slit in it must face the front of the dial so that the light will fall on the dial. The arm that carries the flash tuning lamp must coincide with the dial pointer. If it does not, it can be moved to coincide with the dial pointer. It is not necessary to remove the cover at the top of the dial housing (with the chassis out of the radio) if the light is only slightly out of line with the pointer. It can be made to coincide by turning the lamp shade slightly.

The BAND INDICATOR lamp (the one that lights up the three Wave Band designations) circuit contains a special resistor that reduces the voltage to this lamp so that it probably never will burn out. Should replacement of the BAND INDICATOR lamp ever be necessary, the chassis will be taken out of the cabinet and the dial removed in order to gain access to the lamp. This procedure is described in the following paragraph. For replacement of any of the lamps use only the same type as supplied originally.

Loosen the set screws in the knobs at the front of the radio and remove the knobs. Remove the four screws that are under the shelf on which the chassis rests. Remove the single screw that is in the speaker plug and pull out the speaker plug from the back of the radio. The chassis then can be taken out of the cabinet. Rotate the Station Selector shaft (the middle one) to the right until the dial pointer goes as far as it can go. Carefully note the exact position of the dial pointer on the dial. Then pull the dial pointer off of its shaft. Next carefully bend up the metal tabs that hold the dial in the dial housing. Bend the tabs only slightly. Do not pull them down. If the tabs are bent too far up, they may not fit into the dial housing when re-assembled. The tabs are bent too far up if they do not fit into the dial housing when re-assembled. The tabs are bent too far up if they do not fit into the dial housing when re-assembled. Pull the lamp socket and replace the lamp. The shield will be accessible. Pull the band designator lamp and replace the lamp. The shield must be put back on so that the band designator lamp is properly illuminated. When re-assembling, leave the Station Selector shaft turned all the way to the right. This is done before pulling the dial pointer off of its shaft. Then push the dial pointer back on its shaft so that it comes to the same position on the dial as was noted for it before it was pulled off of its shaft.

ANTENNA CONNECTIONS:

There is a terminal board at the rear of the chassis marked "LAMP", "DIAL", "AMP", indicating antenna, doublet, and ground, respectively. The "DIAL" terminal is left unconnected when a conventional antenna is used. When a doublet is used, one wire of the twisted lead is connected to the "AMP" terminal and the other downlead wire is connected to the "DIAL" terminal.

VARIABLE SELECTIVITY:

Variable Selectivity is obtained by connecting or disconnecting coupling turns between primary and secondary of the IF input transformer. In the "DIAL" position of the right hand control knob, the coupling turns are disconnected and the selectivity becomes sharp. In the "B" position (broad) the coupling turns are connected and selectivity is broadened, thereby increasing the high frequency audio response of the receiver.

REPLACEMENT OF THE OSCILLATOR TUBE:

There are two types of 6C50 tubes, one shielded and the other unshielded. They can be told apart easily by appearance. The shielded type has a perforated mesh screen surrounding the cathode filament. This screen is about an inch in diameter and comes very close to the tube of the tube. The unshielded type does not have this perforated mesh screen. The plate of the unshielded type is about 1/8" diameter, is visible. It is important that only the unshielded type 6C50 with the perforated mesh screen, be used in the oscillator socket. Use of the shielded type will upset the calibration of the Foreign band and interfere with proper performance.

THE AVC CIRCUIT:

The voltage drop across the 500K ohm resistor, R21, is fed to the control grids of the 6AV6 and 6Y70 tubes to provide AVC. The drop across this resistor is also used in the discriminator circuit as described previously. The audio voltage across the resistor is coupled to the AF stages through the condenser, C51.

IF THE A.F.C. - FLASH TUNING MECHANISM DOES NOT OPERATE PROPERLY:

If the A.F.C. Flash Tuning mechanism does not operate properly, first check the toothed disc and spring arm. The spring arm should touch each of the teeth that have been bent up and should not touch any of the other teeth, as the Station Selector knob is turned. To adjust the spring arm, so that it does touch only the bent up teeth, proceed as follows. Loosen the screw marked, "Adjusting Screw", in Fig. 2, which will permit the spring arm to be tipped so that it does make contact only with the bent up teeth. Then tighten the adjusting screw.

Another likely cause of improper A.F.C. - Flash Tuning operation is the relay. A small amount of dust may interfere with proper closing of the contacts. Remove the contacts and pass a strip of plain paper back and forth between them. The traces of relay the contacts. The earlier type is part #101381497. It can be identified through the fact that the relay coil leads are black. The later type relay is part #1013815558. Its leads are colored. This later type will be supplied for replacement. The earlier type relay is shown schematically in Fig. 5. The later type, in Fig. 6. The proper sequence of operation for the contacts is indicated under each illustration. If necessary, slightly bend the contacts so that they do operate in the sequence indicated. The tension of the springs should be such that they relay closes with a current of 50 milliamperes. This can be tested by connecting the relay in series with a six volt storage battery, a 100 ohm rheostat, and a milliammeter of the proper range.

REPAIRING THE DIAL LAMPS:

There are three lamps in the dial mechanism. The lamp that illuminates the dial is in the center of the dial. It can be removed for replacement by pulling the small handle that projects from the rear center of the dial housing. (Accessible from the back of the radio.) When putting the lamp holder back into place, be careful that it is not pushed in too far. The dial pointer should be pushed off of its shaft. Position the lamp so that the dial is illuminated to the best advantage.

REVISED ALIGNMENT PROCEDURE:

PRELIMINARY:

- Output meter connections ----- Across speaker voice coil
- Output meter reading to indicate .5 watts output ----- 1.1 volts
- Dummy antenna value to be in series with generator output ----- See chart below
- Connection of generator output lead ----- See chart below
- Generator modulation ----- 50%, 400 cycles
- Approximate average sensitivity in microvolts for .5 watts output ----- See chart below
- Position of Volume Control ----- Fully on
- Position of Tone Control ----- Fully clockwise
- Position of Flash Tuning and Selectivity Switch Knob ----- Sharp, fully counter clockwise
- Position of Dial Pointer when variable is fully meshed ----- As illustrated below

WAVE BAND POSITION OF DIAL SWITCH POSITION	GENERATOR FREQUENCY	DUMMY ANTENNA CONNECTION	TRIMMERS ADJUSTED (IN ORDER)	TRIMMER FUNCTION	APPROXIMATE MICROVOLTS
"AM"	550 kc	.1 mfd.	T2, T1	IF Output IF Input	-
"AM"	1400 kc	.0002 mfd.	C24, C2, C10	Osc., Ant., Translator*	50
"AM"	800 kc *	.0002 mfd.	C31	Osc. Pad.	50
"POL"	4 mc	400 ohms	C25, C3, C11	Osc., Ant., Translator	6
"POL"	1.8 mc *	400 ohms	C28	Osc. Pad.	40
"FOR"	Var. Fully Open	400 ohms	C26	Osc.	-
"FOR"	15 mc	400 ohms	C4, C12	Ant., Transl.	5
"FOR"	6 mc	400 ohms	-	-	60

IMPORTANT ALIGNMENT NOTES

* Where indicated by (*) the variable should be rocked back and forth a degree or two while making the adjustment.

Repeat the entire alignment step by step in the original order for greater accuracy. Always keep the generator output power at its lowest possible value. This will prevent the AVC action of the receiver from interfering with accurate alignment.

The shield covering the coils at the bottom of the chassis should be left in place during the alignment. The trimmer condensers are accessible through the holes in the shield.

Only the dummy antennas indicated in the chart for any particular band should be used. Disconnect the dummy antenna used for alignment of any other band.

After the alignment has been completed, the A.F.C. adjustment should be made as follows:

A.F.C. ADJUSTMENT

CAUTION: The right hand knob must be in the "SHARP" position for operations 1 through 5. It is preferable to have two signal generators to make the adjustments. However, if two generators are not available, a broadcast station of approximately 1050 kc can be used for one of the generators. However, the station chosen must be of medium strength that is, one just capable of giving adequate reception in the neighborhood of the receiver. The station selected, the volume and tone controls, be turned all the way to the right. The generator ground connection is to be made to the chassis.

1. Set one signal generator (or the broadcast station) to 1050 kc and 5000 microvolts output. Connect its output to the "ANT" terminal of the set, through a .0002 mfd. condenser.
2. Tune the receiver for maximum output (at 1050 kc). Then switch the signal generator modulation switch to the "off" position.
3. Short the movable arm to the toothed disc with a piece of wire. The Flash Tuning light should become illuminated.
4. Set the second signal generator to 485 kc and 10,000 microvolts output. Connect its output, in series with a .0002 mfd. condenser to the control grid of the 6L7G tube. Turn the modulation switch to the "off" position.
5. Carefully turn the variable condenser until "zero beat" note is had (with right hand knob in "SHARP" position).
6. Turn the right hand knob to the "FLASH" position (fully clockwise). Then adjust the discriminator unit, T5, for "zero beat". The correct setting will be obtained at about the center of T5 trimmer range. The adjustment is a very sharp one.
7. Turn the right hand knob to the "SHARP" and then to the "BROAD" positions. The receiver still should give zero beat in the "SHARP" and "BROAD" positions if the A.F.C. is properly adjusted. If it does not, carefully repeat operation #6.
8. The A.F.C. can be checked for "pull in" in the following manner. Remove the signal generator connection from the 6L7G grid. (Two generators must be used.) Switch on the modulation of the 1050 kc generator and set the generator to give 5000 microvolts output. Reduce the Volume Control setting of the receiver to give 1.5 volts reads on the output meter. Increase the signal generator frequency until the output meter reads .5 volt. Note the frequency of the signal generator at this output meter reading. Then decrease the signal generator frequency from 1050 kc until the output meter again reads .5 volt and note the signal generator frequency. If the A.F.C. is operating properly, the signal generator can be varied 15 to 20 kc either side of 1050 kc before the output meter reading is reduced from 1.5 volts to .5 volt.

INCREASED FREQUENCY RANGE:

It will be noticed that the frequency range of the Police band of the Model 101011A has been extended to approximately 5 megacycles and the frequency range of the Foreign band to approximately 18 megacycles.

CHANGE IN PROCEDURE FOR REMOVING DIAL GLASS FOR SETTING UP FLASH TUNING STATION CALL LETTERS

The Service Instructions for this model describe how to remove the dial glass by taking off the split retaining ring that holds it. In receivers using the 101011A chassis this procedure has been simplified by using an escutcheon with the dial glass moulded into it. It is held in place in the front of the cabinet by four screws. Accordingly, it is necessary merely to remove these four screws in order to take off the moulded escutcheon and dial glass.

CHANGE IN PHONOGRAPH PICK-UP JACK OPERATION:

The Service Instructions for this model state that if a phonograph pick-up jack is used the right hand knob must be in either the "SP" or "SHARP" position. This is true only for those receivers that are wired to have the one A.F.C. position ("FLASH"). In later production receivers having the two A.F.C. positions ("SP" and "FLASH") or in receivers that are changed to provide these two positions, the right hand knob must be in the "SHARP" position for phonograph operation. This must be done, of course, to remove the mating from the first audio tube, permitting phonograph reproduction.

MODELS 4587, 4587A

Changes

SEARS-ROEBUCK & CO.

With the original connection of the A.F.C. switch, providing only broad selectivity in the "FLASH" position, difficulty may be encountered in some locations due to adjacent channel interference or heterodyne whistles. If such difficulty is encountered in sets having the original connection, the circuit may be changed to provide the two selectivity positions for A.F.C. - Flash Tuning. Fig. 1 shows the switch connection changes for sets using the relay. Fig. 2 shows the switch connection changes for sets having an A.F.C. transformer. Note that in relay sets the original #10 connection is removed entirely from the switch. In transformer sets the original #11 connector is removed entirely. In addition, in relay sets (101411), a .1 mfd. condenser must be shunted across the .05 mfd. condenser, 64. In transformer sets (101411A), the .05 mfd. condenser that must be shunted is 61. See the locations of parts diagram. In later production of Model 101411A, embodying the two A.F.C. - Selectivity positions, a .15 mfd. condenser is used for 64.

FIG. 2

IMPORTANT NOTE ABOUT SETTING UP A.F.C. STATIONS ON ADJACENT CHANNELS:

In paragraph #10 under, "SETTING UP THE AUTOMATIC FREQUENCY CONTROL", in the Service Instructions, the suggestion is made that if adjacent channel stations are selected the two teeth further apart be used instead of the correct ones for the stations. For example, suppose a 700 kc and a 710 kc station is to be selected. Instead of bending up the teeth corresponding to 700 kc and 710 kc, the teeth corresponding to approximately 687 kc and 713 kc would be bent up instead. The purpose of this is to prevent the receiver from jumping from one station to the other as their signal strengths vary. This suggestion will be helpful on stations 25 and 26 kc apart. In later production of Model 101411A, the teeth are spaced some quality. It is best to select, for A.F.C. tuning, stations at least 50 kc apart in frequency.

SUBJECT: CIRCUIT CHANGE TO ELIMINATE ADJACENT CHANNEL INTERFERENCE IN MODELS 4587-4587A
ELIMINATION OF THE RELAY:

The 101411 chassis (Model 4587) described in Service Instructions 578L 2E and in Supplement #1, uses a relay to accomplish the various switching required by the Automatic Frequency Control. Flash tuning required in later production of this model, the circuit was changed, eliminating the relay transformer in place of the relay to accomplish the same results. Such chassis are identified by the number, 101411A (Model 4587A).

The simplified diagram below shows how the transformer is used to mute the receiver and to operate the Flash Tuning light.

The A.F.C. transformer is a step-up transformer. Its primary is connected in series with the flash tuning light bulb, across the heater winding of the power transformer. The toothed disc and contacting arm is connected across the primary of the A.F.C. transformer. The operation then is as follows: When the contacting arm is not engaging a bent-up tooth on the disc, the power transformer heater voltage is impressed, in series with the flash tuning light bulb, upon the primary of the A.F.C. transformer. Although current flows through the primary, its impedance is too high to pass sufficient current to light the flash tuning light bulb. The voltage impressed on the A.F.C. transformer primary is stepped up in the secondary and rectified by one of the diode plates of the 6HG tube. This diode voltage (approximately 60 volts) is applied to the suppressors of the RF and IF tubes and to the control grid of the first AF tube, to provide muting. These are the conditions that exist when the right hand knob is turned to a flash position and the receiver is tuned between flash stations.

When the receiver is tuned to a flash station, the contacting arm touches the tooth bent up for the station. This short circuits the primary of the A.F.C. transformer. With the impedance of this primary removed from the circuit the full voltage of the heater winding is impressed across the flash tuning light bulb causing it to light. Since the A.F.C. primary is short circuited, no voltage is developed across its secondary, thereby removing the muting bias. The receiver then is in operating condition and receives the station selected for flash tuning.

In the original sets using a relay, one set of contacts on the relay was used to prevent the A.F.C. from operating until the bent up tooth contacted the movable arm. This was necessary to prevent a strong station from being "pulled over" from an adjacent channel as the receiver was tuned through it, since the receiver was alive up to the audio stage. When the A.F.C. transformer is used in place of the relay, this pull over cannot occur because the receiver is made inoperative right at its input by muting of the RF tube.

IMPORTANT NOTE IN SETTING UP A.F.C. STATIONS:

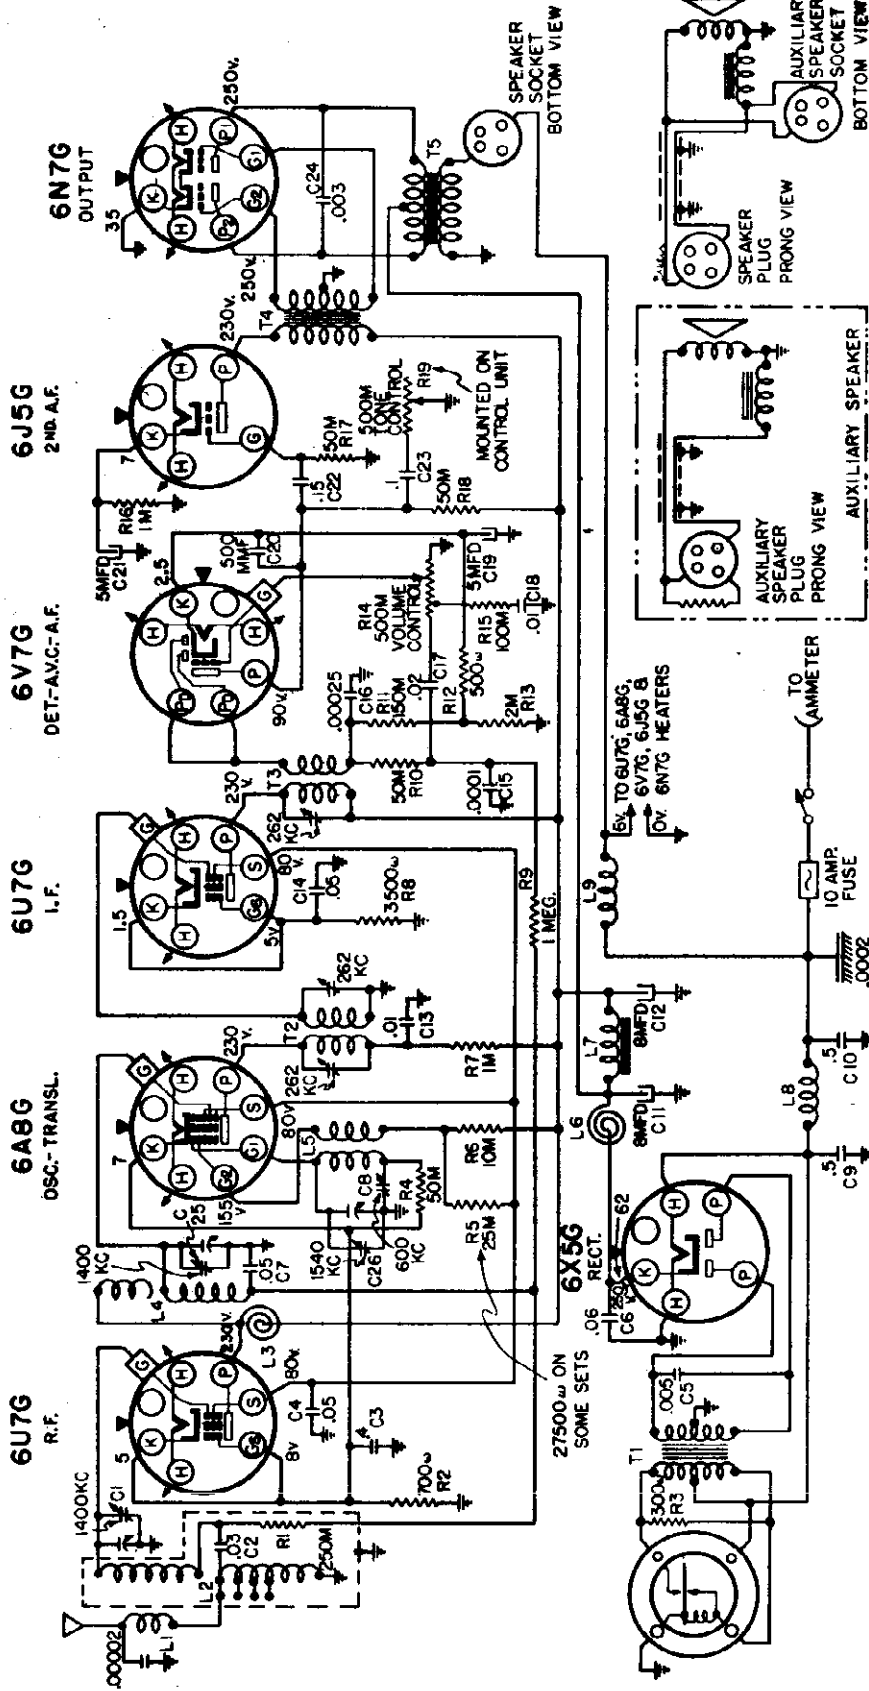

IT IS VERY IMPORTANT THAT THE RECEIVER BE TUNED ON FOR TWENTY MINUTES BEFORE SETTING UP A.F.C. STATIONS ON THE TOOTHED DISC. IF STATIONS ARE SET UP WITH THE RECEIVER "COLD", FREQUENCY DRIFT MAY CHANGE THE ACCURACY AND RELIABILITY OF THE SETTING WHEN THE RECEIVER WARMENS UP.

CHANGE IN CONNECTIONS AND OPERATION OF THE FLASH TUNING - SELECTIVITY SWITCH (RIGHT HAND KNOB):

The right hand knob has three positions marked, "SHARP"; "B" (BROAD); "FLASH". In all of the sets using a relay and in the first production of those using a transformer the receiver operated in the conventional manner in the "SHARP" and "B" positions. In the "FLASH" position, the A.F.C. and flash tuning circuits were connected. In later production sets using the transformer, the operation and connections of the A.F.C. - Selectivity Switch have been changed so that the radio operates in the conventional manner only in the "SHARP" position. In the "B" position, the A.F.C. is connected and selectivity is broad. In the "FLASH" position, the A.F.C. also is connected and selectivity is sharp. In other words, in latest production there are two A.F.C. positions with a choice of broad or sharp selectivity. There is one non-A.F.C. position with sharp selectivity.

ALIGNMENT PROCEDURE

PRELIMINARY:

- Output meter connections Across loud speaker voice coil
- Output meter reading to indicate 1 watt 1.05 volts
- Average sensitivity in microvolts for 1 watt output See chart below
- Generator ground lead connection Receiver chassis
- Dummy antenna value to be in series with generator output See chart below
- Connection of generator output lead See chart below
- Generator modulation 30%, 400 cycles
- Position of Volume Control Fully on
- Position of Tone Control Fully clockwise (treble)
- Position of Antenna Tap #3 hole
- The Chassis must be in its case although the covers may be removed during the alignment procedure.

TRIMMER ADJUSTMENTS (IN ORDER SHOWN)	GENERATOR FREQUENCY	DUMMY ANTENNA CONNECTION	TRIMMER FUNCTION	APPROXIMATE MICROVOLTS
Closed	288 kc	.1 mfd.	IF	800
Fully Open	1540 kc	.0003 mfd. Antenna Conn.	Osc. Trim.	1
1400 kc	1400 kc	.0003 mfd. Antenna Conn.	Ant. Transl.	1
800 kc (peak)	800 kc	.0003 mfd. Antenna Conn.	Padder	2

IMPORTANT ALIGNMENT NOTES

The variable should be rotated back and forth a degree or two while making the 800 kc adjustment.
 The alignment procedure should be repeated in the original order, step by step, to insure greater accuracy.
 Always keep the output power from the generator at its lowest possible value to prevent the AVC of the receiver from interfering with accurate alignment.

MODEL 7143
Schematic, Voltage
Socket, Trimmers,
Alignment

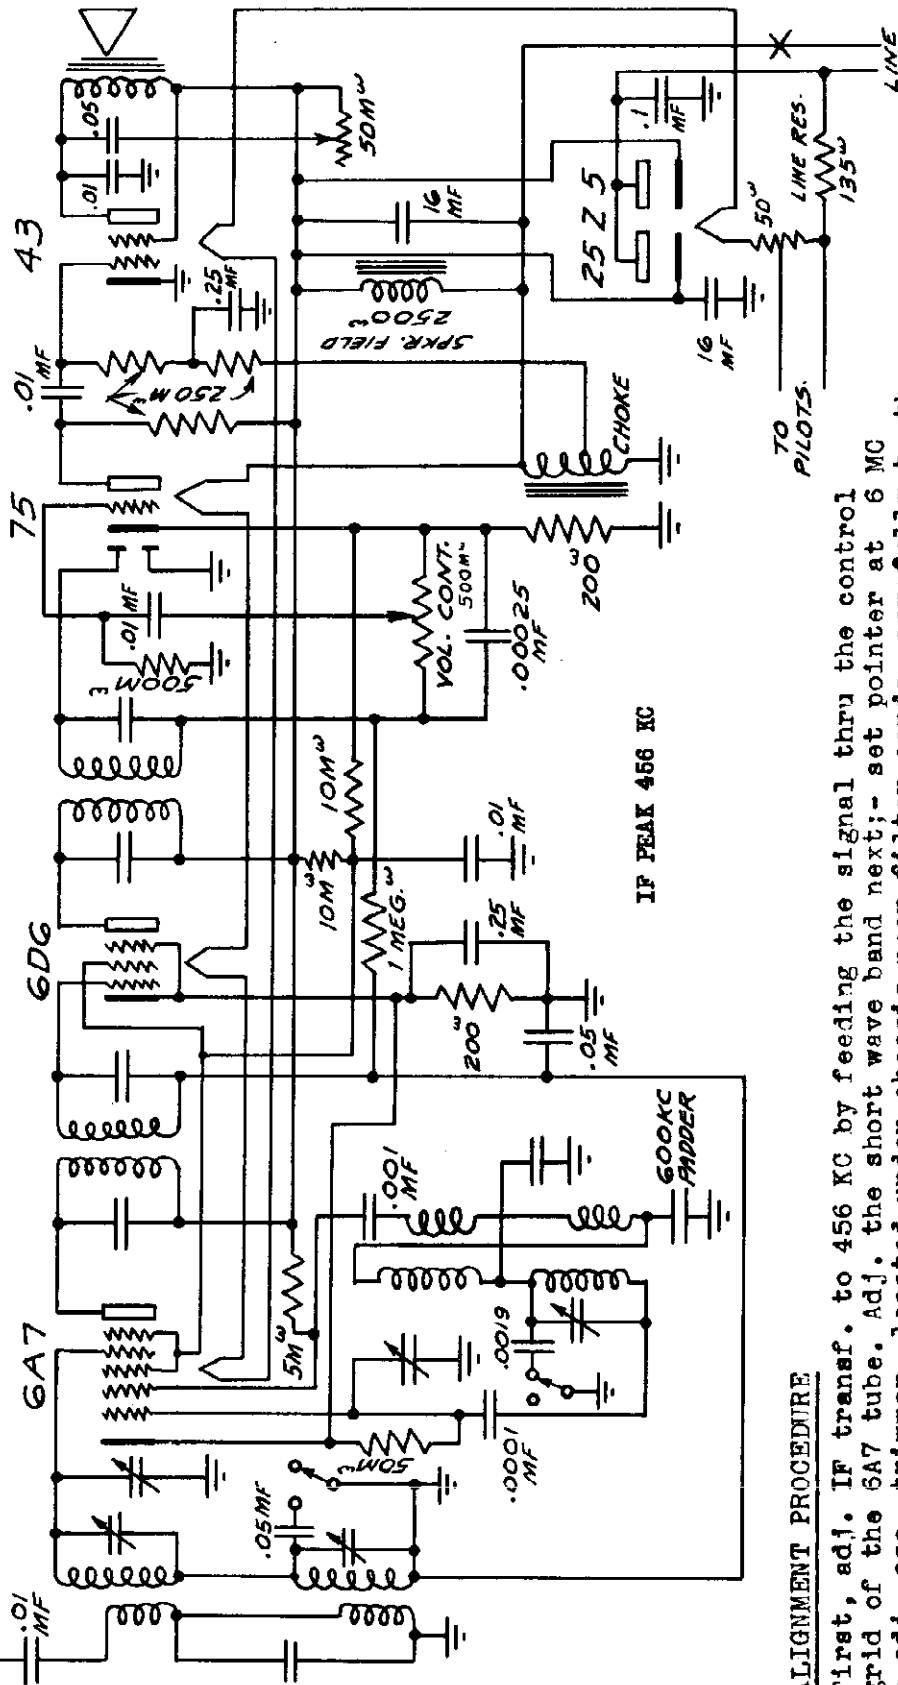

To align or rebalance set, proceed as follows:

- 1 - Remove 56 oscillator tube and peak I.F. transformers at 456 KC, which note may be applied at the 57 control grid.
- 2 - Replace 56 tube, and with variable condenser all the way open, adjust the oscillator trimmer to 1712 KC, then balance inter-stage and antenna trimmers to maximum output.
- 3 - Apply a 600 KC signal at the antenna and rock variable condenser back and forth across signal, adjusting low frequency padder to maximum output.
- 4 - Go back and recheck at 1712 KC.
- 5 - Change band switch to short wave and tune gang condenser to 31 meters and adjust antenna and RF trimmer condensers found underneath chassis to maximum noise level. Check oscillator short wave trimmer with gang condenser tuned at different frequencies.

MODEL 7172X
Schematic
Alignment

SEARS-ROEBUCK & CO.

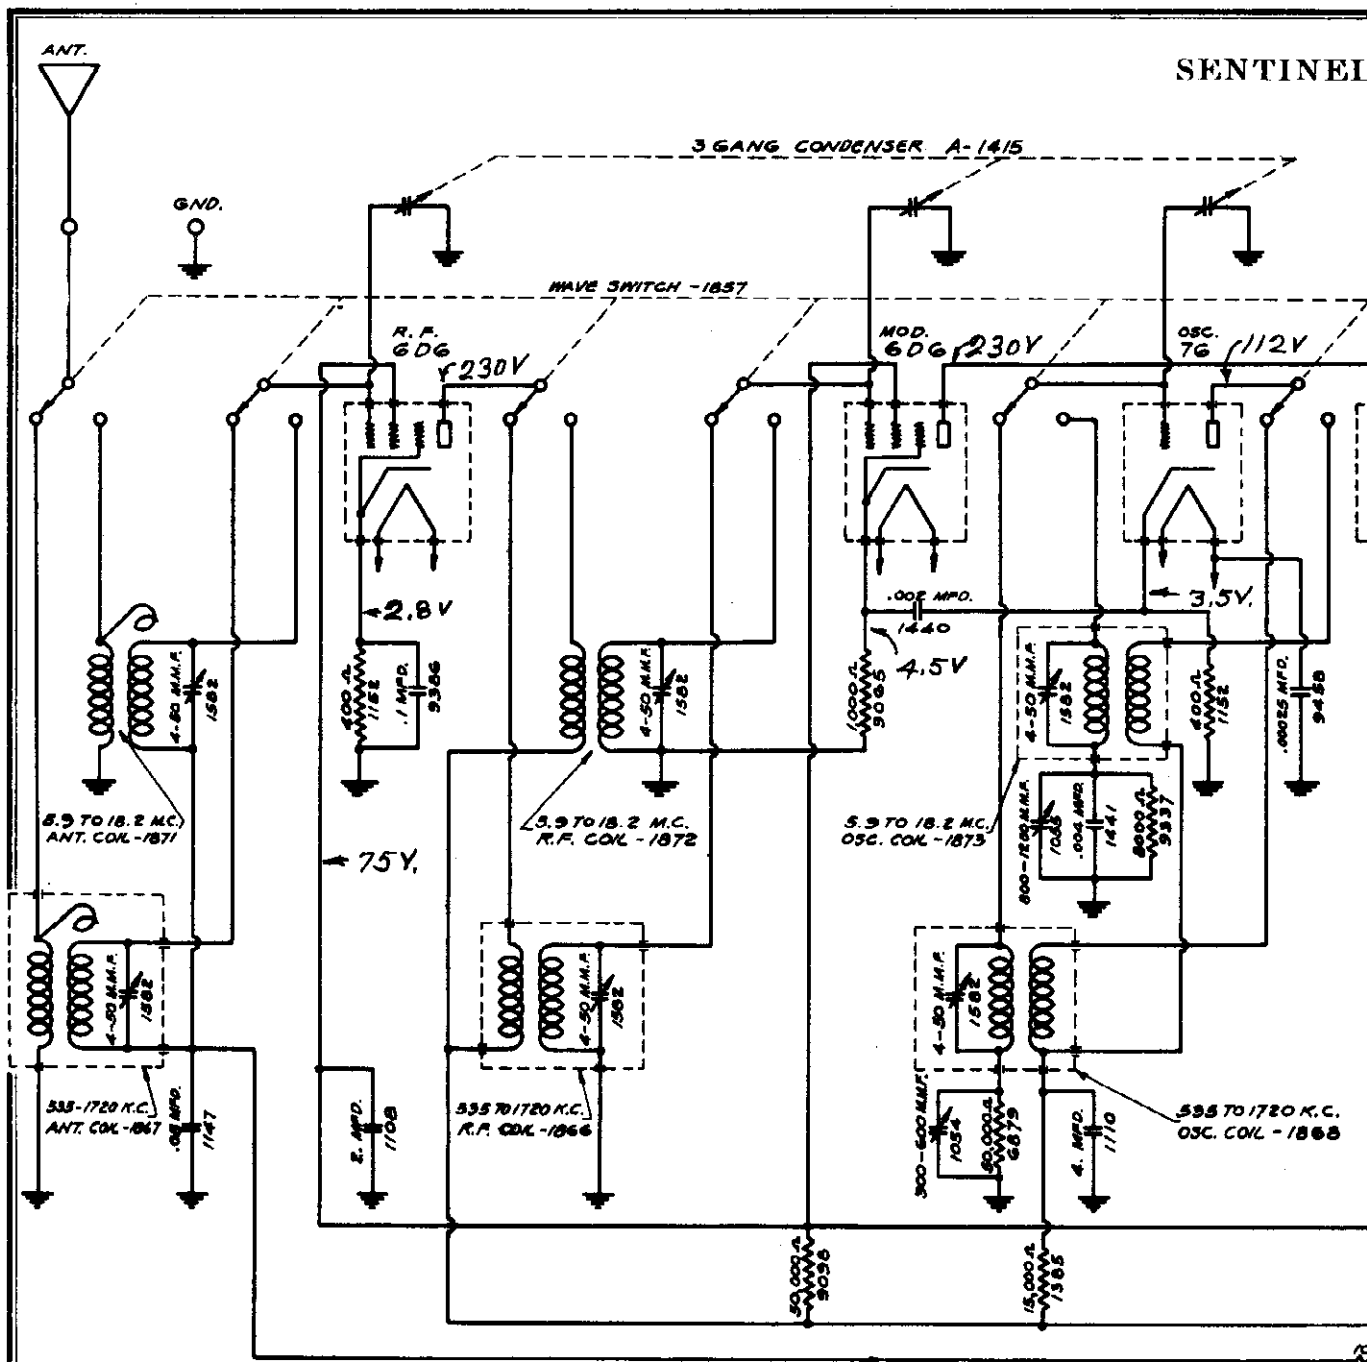

ALIGNMENT PROCEDURE

First, adj. IF transf. to 456 KC by feeding the signal thru the control grid of the 6A7 tube. Adj. the short wave band next; - set pointer at 6 MC & adj. osc. trimmer, located under chassis near filter conds. carefully to the fundamental rather than image (fund. is second peak as you adj. from max. cap.); then adj. the short wave ant. trimmer, located on top of chassis near var. cond., for max. signal; next dial across short wave band checking it at 2.5 and 4 MC to see that it does not stop oscillating. If this should occur, try changing 6A7 tubes to find one that will oscillate at 2.2 MC. If you experience any difficulty in finding a satisfactory tube, it may be necessary to use separate bias on 6A7 (200 ohm res. and .1/4 mfd cond.) in order to use the tubes available.

Now, set band switch to broadcast position and adj. padder at about 600 Kc for max. gain, rocking the var. cond. with each adj. of the padder - then with gang all the way open, adj. B.C. osc. trimmer located under chassis near outer edge, to 1717 KC and set B.C. ant. trimmer located on top of chassis near outer edge, for maximum gain.

This set is designed to operate on 105-125 volts AC-DC

DO NOT CONNECT A GROUND TO THIS SET.

FOREIGN - Dial and generator at 18 MC, adjust the oscillator trimmer for maximum peak. Dial and generator at 15 MC, adjust the R-F and antenna trimmers to maximum sensitivity. Dial and generator at 6.5 MC, pad the trimmer for maximum peak while rocking the variable condenser.

MODEL 10MF

Schematic, Voltage Alignment

SENTINEL

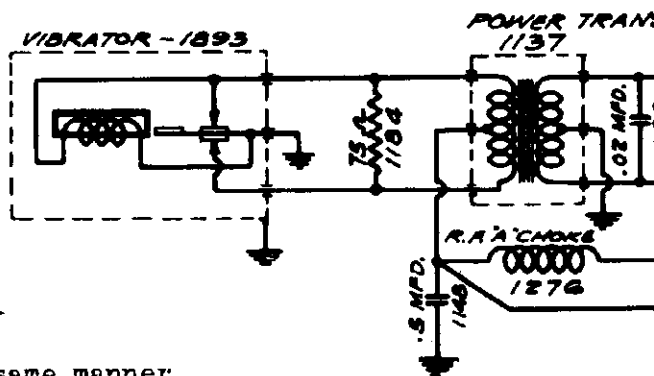

I.F. ALIGNMENT:

1. Attach high side of test oscillator output to control grid of 6A7, leaving control grid disconnected. Connect a 1 megohm resistor from control grid to chassis. Connect GND side of the oscillator to the chassis.
2. Set test oscillator at 370 KC (must be accurate), adjust output of oscillator so that a convenient reading is obtained on the output meter.
3. Align 1st I.F. transformer by turning one of the trimmer screws up and down until maximum reading is obtained on output meter, then adjust other trimmer screw for maximum sensitivity.
4. Adjust 2nd I.F. transformer in the same manner.

NOTE:

1. I.F. = 370 K.C.
2. ALL NUMBERS SHOWN RELATIVE TO PARTS ARE OUR PART NUMBERS
3. NUMBERS SHOWN WITH PREFIX "A" ARE COMPLETE ASSEMBLIES.

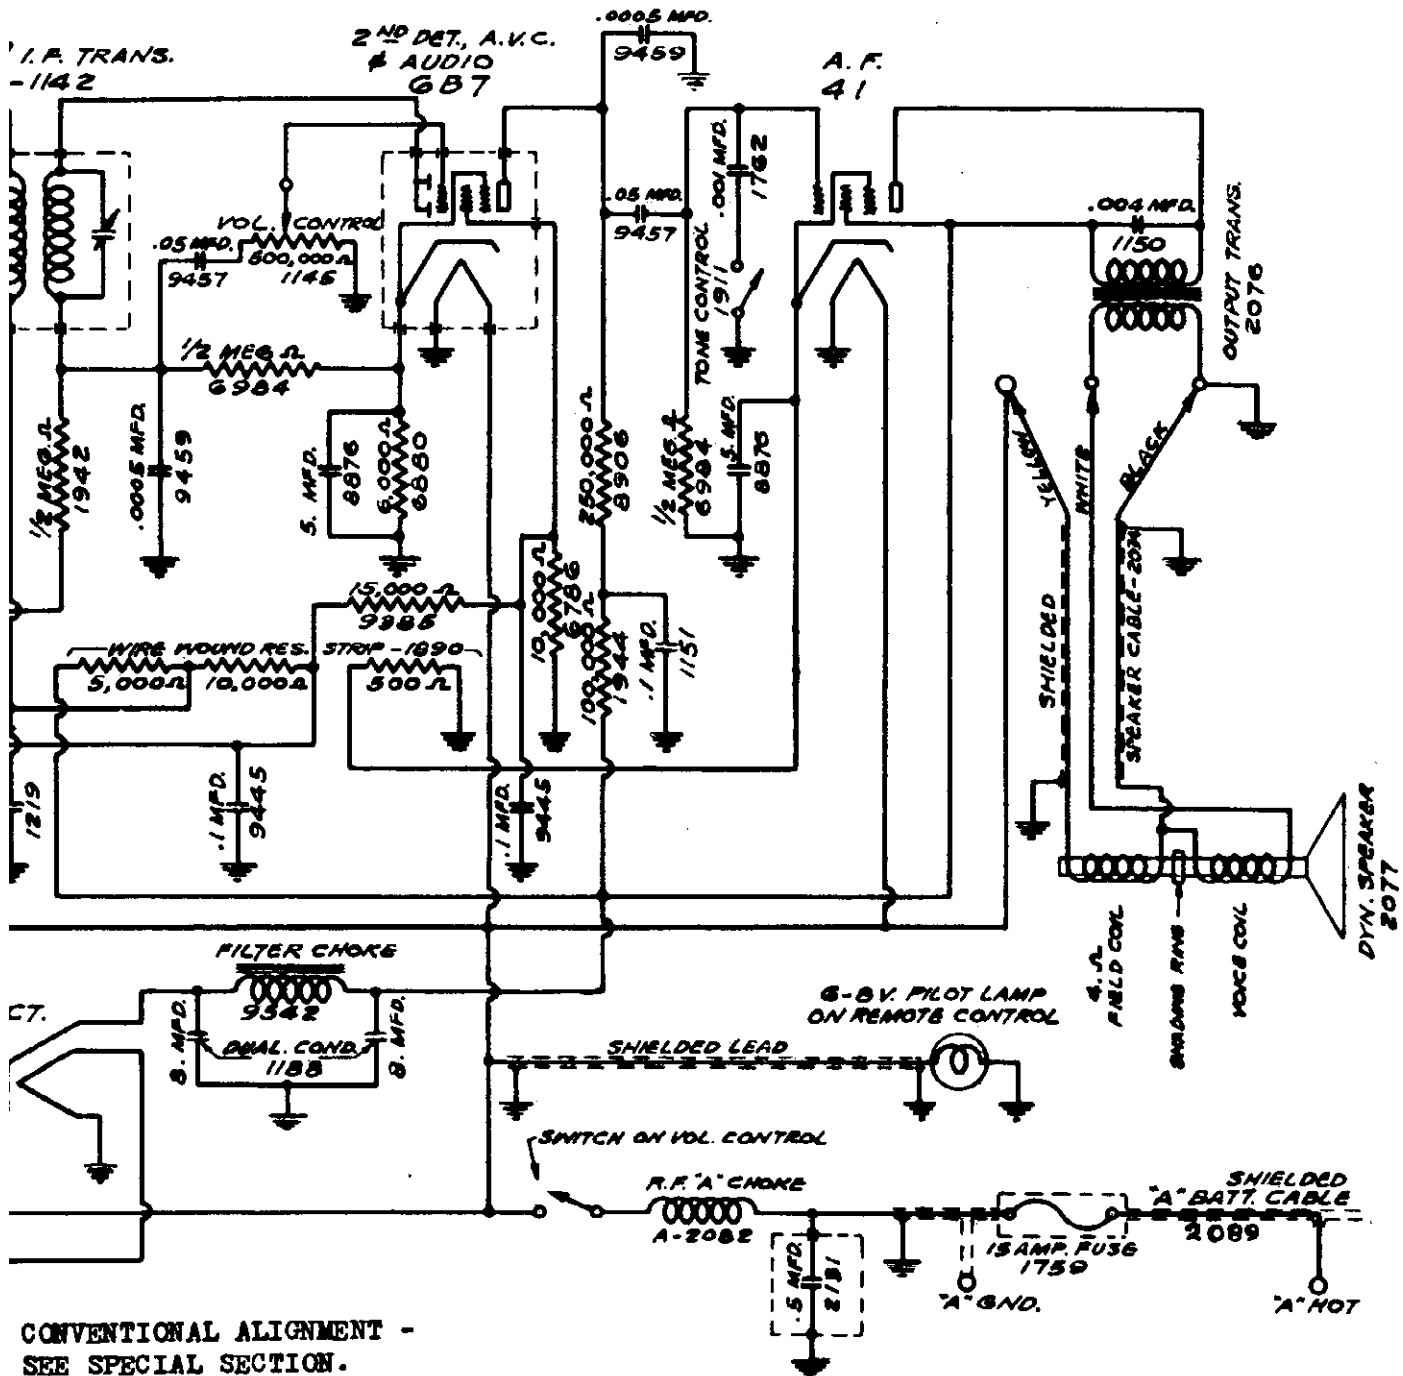

TO ALIGN VARIABLE CONDENSER:

It is necessary to remove receiver chassis from set housing to align variable gang and padding condensers.

1. Properly connect the remote control head, shafts, and adjust the dial needle on the dial face from the back so that the dial calibration is correct.
2. Connect the high output side of test oscillator to ANT. and GND. to chassis.
3. Tune the receiver dial and set the test oscillator frequency to 1400 KC. Bring the 1400 KC signal to maximum output by adjusting trimmer located on top of oscillator section (front section) of gang condenser. Next adjust the antenna section (rear section) for maximum 1400 KC signal sensitivity.
4. Tune receiver dial and set test oscillator to approximately 600 KC and while rocking gang condenser adjust the 600 KC padding condenser, which is located and accessible thru the hole in the left hand side of chassis, for maximum output.

84	RECTIFIER	6	-	210	-	comperative only.

MODEL 30A
Schematic, Parts
Alignment, Voltage

SENTINEL RADIO CORP.

BAND SELECTOR SWITCH

THIS RECEIVER IS DESIGNED FOR TWO FREQUENCY BANDS. BROADCAST BAND FROM 1720 TO 540 KC. POLICE, AIRCRAFT AND AMATEUR BAND 1.5 MC. TO 4 MC. SWITCH TO LEFT POSITION FOR SHORT WAVE AND TO THE RIGHT FOR THE BROADCAST BAND.

CONVENTIONAL ALIGNMENT
(see special section)

FOUR TUBE AC RECEIVER
1000 TO 540 KILOCYCLES

NOTE: GENERALLY THE REAR GANG CONDENSER SECTION TRIMMER HAS TO BE ADJUSTED TO MINIMUM CAPACITY.

NOTE: 1. ALL NUMBERS SHOWN RELATIVE TO PARTS ARE OUR PART NUMBERS. 2. NUMBERS SHOWN WITH PREFIX 'A' ARE COMPLETE ASSEMBLIES.

VOLTAGE TABLE

LINE VOLTAGE	: 115
VOLUME CONTROL	: FULL ON
WAVE BAND	: BROADCAST
TUBE	
606	RADIO FREQUENCY
606	DETECTOR
L2	OUTPUT
80	RECTIFIER

READ ALL VOLTAGES FROM SOCKET PRONG TO GROUND UNLESS OTHERWISE SPECIFIED. (EXCEPT FILAMENT)
** READ FROM 375 OHM RESISTOR #1267 TO GROUND.

* COMPARATIVE VOLTAGE IS NOT TRUE VOLTAGE APPLIED.

TO ALIGN THE VARIABLE CONDENSER: IT IS IMPORTANT WHEN ALIGNING TO FOLLOW THE PROCEDURE CAREFULLY, OTHERWISE THE RECEIVER WILL LACK SENSITIVITY AND THE DIAL CALIBRATION WILL BE INCORRECT.

1. CONNECT THE HIGH OUTPUT SIDE OF THE OSCILLATOR TO THE RECEIVER ANTENNA LEAD AND THE GROUND TO THE CHASSIS.
2. PLACE THE BAND SELECTOR SWITCH FOR OPERATION ON THE BROADCAST BAND, TUNE THE RECEIVER TO EXACTLY 1000 KILOCYCLES ON THE DIAL AND SET THE TEST OSCILLATOR FREQUENCY TO 1000 KILOCYCLES. THEN BRING IN THE 1000 KILOCYCLE SIGNAL TO MAXIMUM OUTPUT BY ADJUSTING THE TRIMMER CONDENSERS LOCATED ON TOP OF THE GANG CONDENSER.
3. SET THE BAND SELECTOR SWITCH FOR OPERATION ON THE SHORT WAVE BAND, TUNE THE RECEIVER DIAL TO EXACTLY 1.5 MEGACYCLES AND SET THE TEST OSCILLATOR TO THIS FREQUENCY. THEN ADJUST THE TRIMMER CONDENSER MOUNTED ON THE COIL LOCATED UNDERNEATH THE CHASSIS FOR MAXIMUM SENSITIVITY. RECK GANG CONDENSER WHEN MAKING THIS ADJUSTMENT.

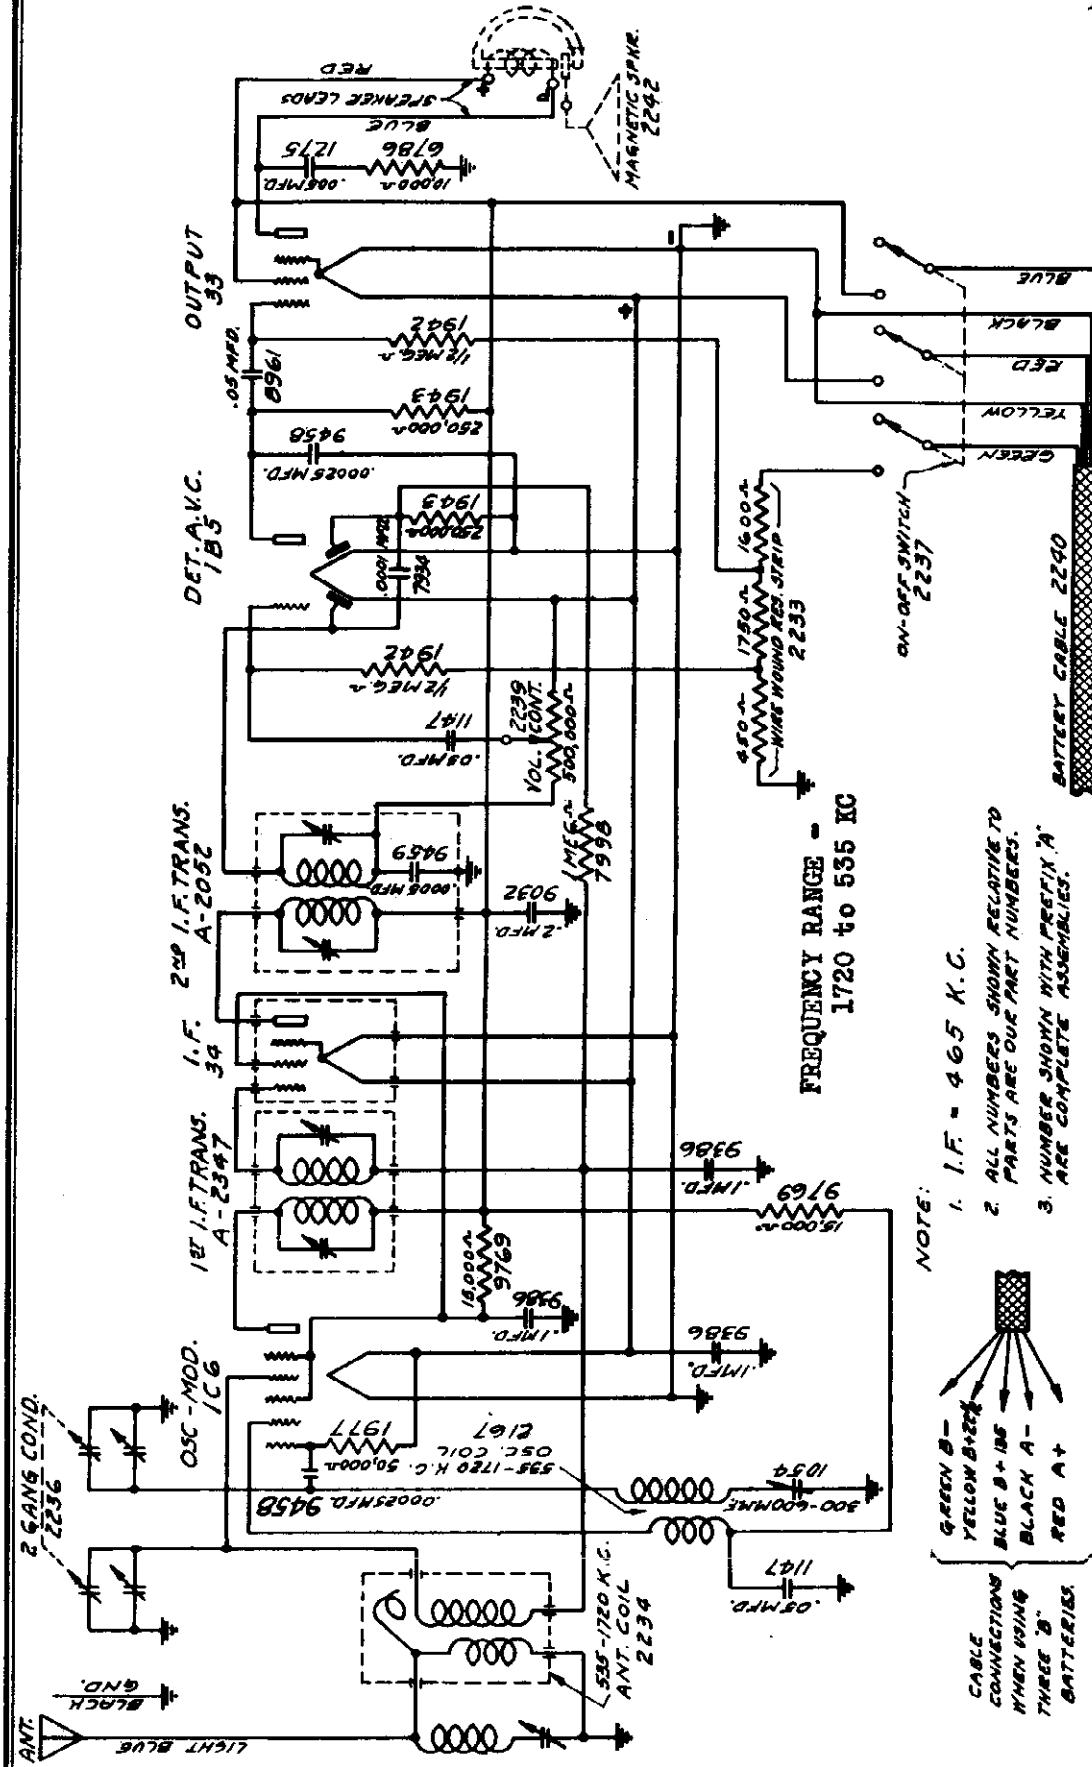

LIST PRICE

1267	WIRE WOUND RESISTOR STRIP	\$.20

FREQUENCY RANGE -
1720 to 535 KC
2.3 to 6.3 MC

NOTE:
1. I.F. = 465 K.C.
2. ALL NUMBERS SHOWN RELATIVE TO PARTS AND OUR PART NUMBERS.
3. NUMBERS SHOWN WITH PREFIX "A" ARE COMPLETE ASSEMBLIES.

CONVENTIONAL ALIGNMENT - see special section

ALIGNMENT - Peak I-F transformer trimmers at 465 KC. After R-F adjustments, peak the wave trap at 465 KC. BROADCAST BAND - Dial and generator at 1720 KC, peak oscillator trimmer. Dial and generator at 1400 KC, adjust antenna trimmer to maximum peak. Dial and generator at 600 KC, pad oscillator circuit to maximum peak. SHORTWAVE BAND - Dial and generator at 6.3 MC, adjust antenna trimmer to maximum peak. The short wave oscillator circuit is then padded at 2.5 MC. While making padding adjustments, rock the variable condenser.

MODEL 65B

Schematic, Trimmer Voltage, Alignment Parts

Align I-F trimmers at 465 KC. BROADCAST - The dial and generator set at 1720 KC, peak oscillator trimmer, then shift dial and generator to 1400 KC, peak antenna trimmer. Dial and generator at 600 KC, pad oscillator circuit to peak. SHORTWAVE - Dial and generator to 6.5 MC, peak Oscillator trimmer. Dial and generator to 5.8 MC, peak antenna trimmer. No padding of oscillator circuit is required on

the short wave band. When padding the BROADCAST oscillator rock variable condenser. Adjust wavetrap to 465 KC. Repeat all adjustments.

LOCATION OF PADDERS & TRIMMERS IN LEFT HAND (FRONT) BOTTOM OF CHASSIS

INTERMEDIATE ALIGNMENT -

1. Connect generator output to control grid grid cap disconnected, then connect a 1 megohm r modulator grid to chassis ground.
 2. Set generator frequency to 465 KC 9 must
 3. Align 1st I-F transformer by adjusting ea
 4. Adjust 2nd I-F transformer in the
 5. Adjust the I-F regeneration trimme
- chassis for maximum 465 KC signal. If this trimmer causes receiver to oscil ust to point where oscillation just s 1/8 turn. ALIGNMENT OF VARIABLE CON

1. Connect generator thru 250 MMF condense lead and the ground to chassis.
2. Place band selector SW. on 15.8 to 5.6 receiver to exactly 14 MC. Then bring receiver to maximum output by adjusting trimm located on top of gang condenser (OSC section). When adjusting this trimmer, two p mental and image peak will be noticed. Care must be taken that the fundamental is u stment. Back trimmer to minimum capacity, next screw down until 1st peak (fundamen When fundamental peak is obtained adjust trimmer to maximum output at 14 MC.

 (SEE THE SPECIAL SECTION)

PHONOGRAPH: Use a single pole switch mounted as near as possible to the socket, marked "86"; connect one side to green resistor with yellow dot at end attached to yellow wire; connect other side, in series with phonograph pick-up leads, to chassis.

CAUTION: Do not attempt to operate on current other than that noted on instrument. Reverse attachment plug if set does not start operating in a few seconds after being turned on.

INSTALLATION: "ANT" may be fed from indoor or outdoor aerial, radiator, bed springs or any large metal object.

SHORT WAVE: Left hand knob when clear to the left is on Short Wave. A one-quarter inch movement to the right and it is on regular broadcast. Beyond this point it functions as a tone control.

CAUTION: Do not attempt to operate on current other than that noted on instrument. Reverse attachment plug if set does not start operating in a few seconds after being turned on.

INSTALLATION: "ANT" may be fed from indoor or outdoor aerial, radiator, bed springs, or any large metal object, if desired.

CAUTION: Do Not Attempt to Operate on Current Other Than That Noted on Instrument.

INSTALLATION: "Ant" lead may be fed from "BLT-IN-ANT" lead, indoor or out door aerial, radiator, bed springs or any large metal object, if desired.

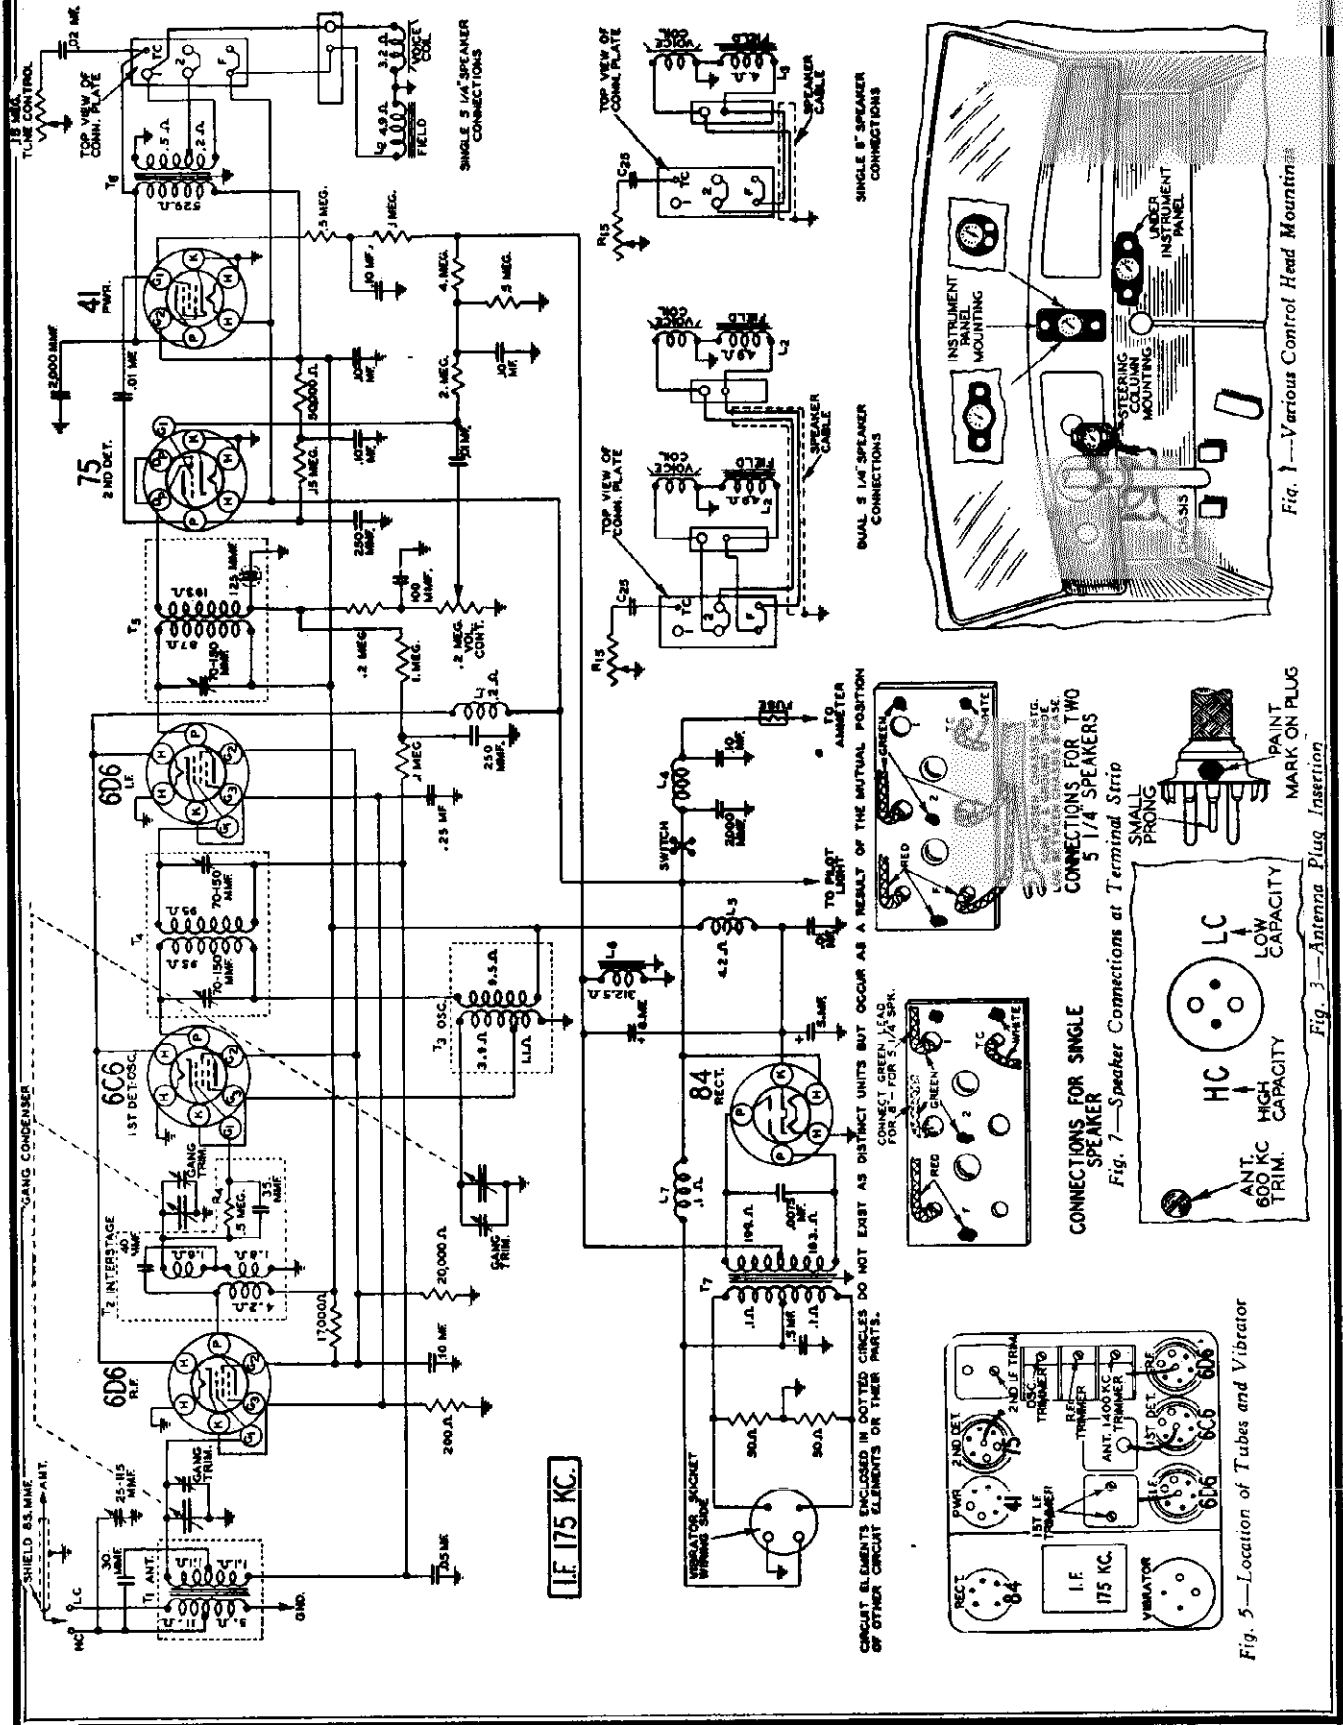

SHORT WAVE: Left hand knob when clear to the left is on Short Wave. A one-quarter inch movement to the right and it is on regular broadcast. Beyond this point it functions as a tone control.

PHONOGRAPH: Use a single pole switch mounted as near as possible to detector socket, connect in series with lead from ground end of grid coil of detector tube. Solder phonograph pickup leads to switch terminals.

SOBOL BROS.

MODEL 6C1 Auto Schematic, Socket Trimmers, Spkr. Data

Series 6C1 6 TUBE AUTOMOBILE RADIO

Set the signal generator for 175 KC and connect the output of the signal generator through a .05 mf. condenser to the stator of the R.F. interstage section of the tuning condenser. Set the volume control at maximum. The chassis should be in the case. Connect the ground lead of the signal generator to the chassis. Attenuate the signal from the signal generator to prevent the levelling off action of the AVC. Then adjust the three IF trimmers until maximum output is obtained—See Fig. 5.

Set the signal generator for 1581 KC. Turn the rotor of the tuning condenser to the full open position. Insert the antenna plug with the mark on the high capacity (HC) side. Connect the shielded antenna lead from the chassis through a 120 mmf. condenser to the antenna post of the signal generator. Adjust the trimmer of the oscillator section of the three gang condenser until maximum output is obtained.

Set the signal generator for 1400 KC. Turn the rotor of the tuning condenser carefully until maximum output is obtained. Adjust the R.F. interstage and antenna 1400 KC trimmers for maximum output. Do not change the setting of the oscillator trimmer.

Then set the signal generator for 600 KC. Tune in this signal and adjust the 600 KC antenna trimmer to maximum (See Fig. 3 for location of this trimmer).

After the alignment procedure is completed, the antenna plug may be withdrawn and reinserted on the LC side if a low capacity (70 mmf.) car antenna is used.

Adjusting Antenna 600 KC Trimmer

Tune in a weak signal at approximately 600 KC with the volume control about three-fourths on. Turn the adjusting screw of the antenna 600 KC trimmer up or down until maximum output is obtained. See Fig. 3 for location of this trimmer.

If the total capacity of the antenna and shielded lead is approximately 200 mmf., which would be the case in a running board or ordinary roof antenna (not metal roof), insert the antenna plug with the mark on the HC side—See Fig. 3.

If the total capacity of the antenna and shielded lead is approximately 70 mmf., such as may be the

case if a "fish pole" antenna is used, insert the antenna plug with the mark on the LC side.

Distributor Suppressor—Remove the high tension lead to the distributor. Insert a distributor suppressor and connect the wire to the other end of the suppressor (See Fig. 6). If this is not practical, cut the high tension lead *close to the distributor* and use a wood screw end type distributor suppressor in this line.

Generator Condenser—The generator condenser is installed at the cut-out as shown in Fig. 6. The lead from the condenser goes to the terminal on the cut-out.

In some of the new cars the cut-out relay is on the front of the dash or in some other location. It will be most convenient to mount this generator condenser at the relay.

Withdraw Antenna Cable Plug

Turn on the radio and start the engine.

If motor noise is heard, proceed as follows:

Shielding High Tension Lead—In some cars, when the coil is mounted on the dash, the high tension lead from the coil must be covered with braided shielding to within about four inches of the distributor and the shield grounded to the motor block or frame.

Bypass Condenser—Try a .25 or .5 mfd. condenser from the ammeter to ground. Try a condenser from the car fuse to ground, switch to ground, windshield wiper connections and various other 6 volt connections to ground, noting what effect these condensers have on the noise pick-up.

Try a .25 or .5 mfd. condenser from the "Hot" side of the coil primary to ground. In some cases this condenser may not help. It can be tried out, however, experimentally.

Spark Plug Suppressors—If motor noise persists, spark plug suppressors must be installed. One suppressor is put on each plug as shown in Fig. 6. These are not regularly supplied with the radio and must be purchased extra. Seventy percent of all cars will not require spark plug suppressors.

Care should be taken that a good mechanical and electrical connection is made between the spark plugs, suppressors and plug wires.

INSTRUCTIONS FOR SONORA PLAYETTE

Note - If a corrective load for records recorded at constant velocity above 250 CPS and constant amplitude below 250 cycles is desired, connect .1 meg ohm resistor and a .01 MFD condenser in series across pickup leads. The volume control on the PLAYETTE must be in the full-on position. The volume control of the radio set or amplifier should be used in this case.

Oil motor regularly, once a month. To oil motor lift turn table so that oil cups are exposed.

Use SAE10 automobile oil. Do not use the oils of the 3-in-1 variety or type, or else life of the bearing will be impaired.

Alignment

(Lavender) and turn dial to receive a signal between 12.5 mc. and 14 mc.

12. Adjust No. 5 Padding Condenser (Op5).
13. Turn dial to receive a signal between 16 mc. and 24 mc.
14. Adjust No. 5 R-F Trimming Condenser (Op5).
15. Re-check all adjustments in order given above.

E. ALIGNING THE ANTENNA EQUALIZING CONDENSER, CA.

The antenna equalizing condenser should always be adjusted when the receiver is installed and with the regular aerial and ground connected. It is the purpose of this condenser to resonate the first tuned circuit with the antenna system to which the receiver is connected, thereby providing a maximum transfer of energy. The procedure of adjustment is as follows:

Turn in a weak distant station or oscillator signal between 1800 and 1400 kilocycles, turn the volume control on full, and rotate the inter-station noise suppressor control knob clockwise as far as it will go. Next, with a hex-socket insulated wrench, turn the hex-nut on the condenser to the position where the volume from the station "tuned-in" or the oscillator signal is the loudest. Once made, this adjustment need not be changed unless the antenna system is altered, the receiver is moved from one location to another, or the other condensers are re-adjusted.

NOTE: When antenna equalizing condenser is adjusted on oscillator signal, adjustment will not hold true when receiver is connected to aerial; this condenser must be aligned to antenna system.

F. INSTRUCTIONS FOR REPLACING DIAL LIGHTS IN MODEL 76, 154, 156.

NOTE: Dial Lights may be changed without removing the chassis.

1. Turn dial to 1600 kc.
2. Loosen set screw located directly over dial light shaft in front of the bevel gear parallel with the variable condenser plates.
3. Turn dial to 1200 kc.
4. Tighten set screw.
5. Turn dial to 1450 kc.
6. Hold dial drum to prevent turning and slide back the dial light ventilation cover.
7. Use a short length of 1/4 inch inside diameter rubber tubing slipped down over the bulb to remove or replace any dial lights.
8. Place dial light ventilation cover in original position.
9. Turn dial to 1200 kc.
10. Loosen set screw.
11. Turn to 1500 kc.
12. Tighten set screw.

to the right or left until the test oscillator harmonic is heard, and readjust for maximum deflection on the output meter.

6. It may be necessary to repeat the entire alignment procedure in order to be sure the adjustments are correct.

NOTE: Exercise great care in making all adjustments. The foregoing adjustments are made on Broadcast Band frequencies and the performance of the Models 75-A, 475-A, 478-A, 75-AX, 475-AX, 478-AX, especially the sensitivity and calibration on short-waves, depends entirely on the accuracy with which they are made.

G. ADJUSTMENT OF THE RADIO-FREQUENCY ADJUSTABLE CONDENSERS.

1. Connect test oscillator leads to Antenna and Ground Posts and adjust oscillator for 172.5 kc. Do not disturb position of control knob.
2. Turn station selector to 1590 kc., where the eighth harmonic of the oscillator should be heard.
3. Adjust the Antenna compensator by turning to the right or left until maximum deflection is obtained on the output meter.
4. Adjust R-F Trimmer condenser for maximum signal response.

D. ADJUSTMENT OF THE RADIO-FREQUENCY TRIMMING CONDENSERS, OSCILLATOR TRIMMING CONDENSER AND PADDING CONDENSERS FOR SHORT WAVE BANDS ON MODELS 76, 154, 156.

NOTE: In the following procedure the Broadcast Band (Green) will be considered as No. 1 Band, the 1.5 to 5.4 Megacycle Band (Red) as No. 2 Band, the 5.4 to 6.8 Megacycle Band (Yellow) as No. 3 Band, the 6.8 to 12.5 Megacycle Band (Orange) as No. 4 Band and the 12.5 to 24 Megacycle Band (Lavender) as No. 5 Band.

1. Set Band Selector Switch on No. 2 Band (Red) and turn dial to 1.75 mc. If test oscillator harmonic cannot be heard, disconnect leads and attach antenna and ground and tune in short-wave signal of approximately this frequency.
2. Adjust No. 2 padding condenser (Op2). (There is no R-F trimmer for this band.)
3. Set Band Selector Switch on No. 3 Band (Yellow) and turn dial to a short-wave signal between 6.0 mc. and 6.9 mc.
4. Adjust No. 3 R-F Trimming Condenser (Op3).
5. Turn dial to receive a signal between 5.4 mc. and 4.2 mc.
6. Adjust No. 5 Padding Condenser (Op5).
7. Set Band Selector Switch on No. 4 Band (Orange) and turn dial to receive a signal between 11 mc. and 12.5 mc.
8. Adjust No. 4 R-F Trimming Condenser (Op4).
9. Turn dial to receive a signal between 6.9 and 6.0 mc.
10. Adjust No. 4 Padding Condenser (Op4).
11. Set Band Selector Switch on No. 5 Band

4. ADJUSTMENT OF INTERMEDIATE FREQUENCY CONDENSERS.

1. Connect test oscillator leads to grid cap of 1st detector type 57 tube and ground. Adjust oscillator to 456 kc.
2. Allow to operate 15 minutes before making any adjustments.
3. Turn Band Selector to Broadcast Band, and rotate volume control, tone control and inter-station noise suppressor clockwise as far as they will go.
4. Turn on test oscillator and adjust attenuator for one-half to three-quarter scale deflection of the output meter.
5. Adjust each pair of intermediate-frequency condensers (three pairs) until maximum deflection of the output meter is obtained with a minimum of signal energy from the test oscillator.

NOTE: If the minimum signal of the oscillator is so great that accurate adjustment of the condensers becomes difficult, it is necessary to decrease the sensitivity of the receiver by turning the inter-station noise suppressor counter-clockwise. Do not turn the volume control knob.

In order to adjust the 1st stage intermediate-frequency condensers on Models 75-A, 475-A, 478-A, 75-AX, 475-AX, 478-AX, it is necessary to remove the copper shield over the I-F transformer (located nearest the Antenna Post) and replace it with a specially prepared shield (SPARTON Part A-7506), which has two holes drilled in the top. A bakelite or insulated screw driver may then be inserted through the holes to reach the condensers. Never attempt to adjust these condensers without this shield in place.

B. ADJUSTMENT OF THE OSCILLATOR TRIMMER AND PADDING CONDENSER.

1. Turn the Station Selector until the variable condenser rotor plates are fully meshed (up against the stop). The dial should now read exactly 540 kc. If it does not, loosen set screws on the rotor shaft and, keeping the rotor plates tight against the stop, turn the dial until the hair-line is exactly on the 540 kc. calibration mark.
2. With the test oscillator leads connected to the antenna and Ground Posts of the receiver, adjust the oscillator frequency to 172.5 kc. Then turn the Station Selector so that the hair-line is exactly on 1890 kc.
3. Turn the oscillator trimmer condenser, O0, to the right or left until the output meter deflection is greatest.

CAUTION: Do not move the Station Selector after it has been set at 1890 kc.

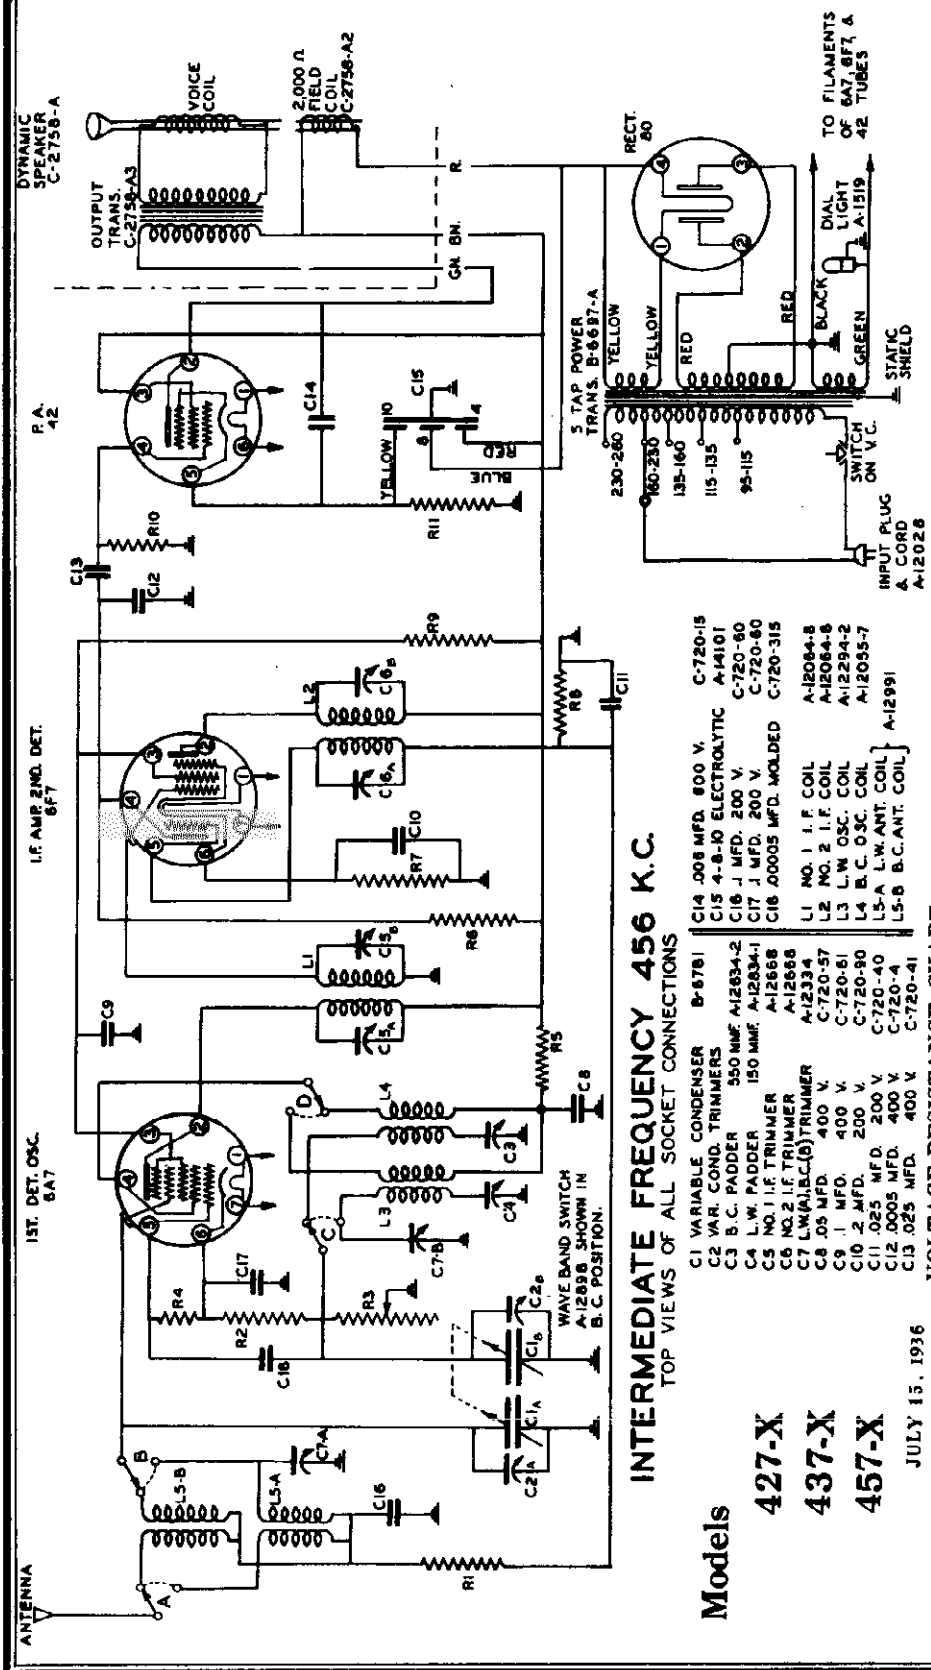

4. Turn the Station Selector so that the hair-line is exactly on 690 kc. This dial setting should bring in the fourth harmonic of the test oscillator. However, if the padding condenser is very much out of adjustment no signal will be heard.

CAUTION: Do not disturb the dial setting of 690 kc.

5. Adjust the padding condenser, P0, by turning

Notes: Voltage and resistance readings are for schematic diagram shown on back of sheet. Allow 15% + or - on all measurements. Always use meter scale which will give greatest deflection within scale limits. All measurements made with Weston Selective Analyzer No. 6A5. Rev. 2.

PARTIAL FRONT VIEW OF CHASSIS

MODELS 427X, 437X, 457X

Socket, Trimmers

Alignment

SPARKS WITHINGTON CO.

FOREWORD: The SPARTON Models 427-X, 457-X and 457-X (Export) are equipped with an adjustable power transformer for operation on various line voltages as indicated under the transformer terminal cover plate.

Before attempting to realign the circuits, be sure that the transformer tap is correctly adjusted for the line voltage to be used. Unless otherwise specified, the adjusting of any condenser consists of turning the adjusting screw or nut to the right or left until the output meter registers the greatest deflection.

Note: For proper alignment of these chassis, the procedure should be followed in the same order as given.

The dial pointer should be exactly parallel with the horizontal line of the dial scale when the condenser plates are fully meshed. If the pointer does not read correctly, remove the dial cover and move the pointer until it shows a correct reading.

A. Alignment of Intermediate-Frequency

1. Turn on receiver and test oscillator and allow both to operate several minutes before attempting to adjust any condenser.

2. Turn the band selector switch to the "Broadcast" position and turn the station selector knob until the rotor plates are completely out of mesh with the stator plates.

3. Connect antenna of test oscillator to grid cap of Type 6A7 1st detector-oscillator tube and ground of test oscillator to chassis frame of receiver. Connect output meter "high tap" from plate terminal of Type 42 tube to ground.

Note: It is advisable to read carefully the operating instructions included with the test oscillator.

4. Tune test oscillator to obtain a signal of 456 kilocycles.

5. Turn the volume control of receiver on full and adjust I-F condensers C5 and C6.

B. Alignment of Broadcast Band

1. Disconnect "antenna" lead of test oscillator from grid cap of Type 6A7 tube and connect it in series with a 150 muf. condenser dummy antenna to the antenna terminal of the chassis.

2. Tune test oscillator and receiver to a wave length of 200 meters (1500 kilocycles) and adjust condenser C2-B (oscillator trimmer) and condenser C2-A (antenna trimmer).

3. Tune test oscillator and receiver to 500 meters (600 kilocycles) and adjust condenser C4 (oscillator padder).

4. Retune test oscillator and receiver to 200 meters and check the adjustments of condensers C2-B and C2-A.

5. Calibration of the broadcast band should also be checked at 350 meters (300 kilocycles).

C. Alignment of Long-Wave Band

1. Turn the band selector switch to the "long-wave" band, tune test oscillator and receiver to a wave length of 870 meters (345 kilocycles) and adjust condenser C7-B (long-wave oscillator trimmer) and condenser C7-A (long-wave antenna trimmer).

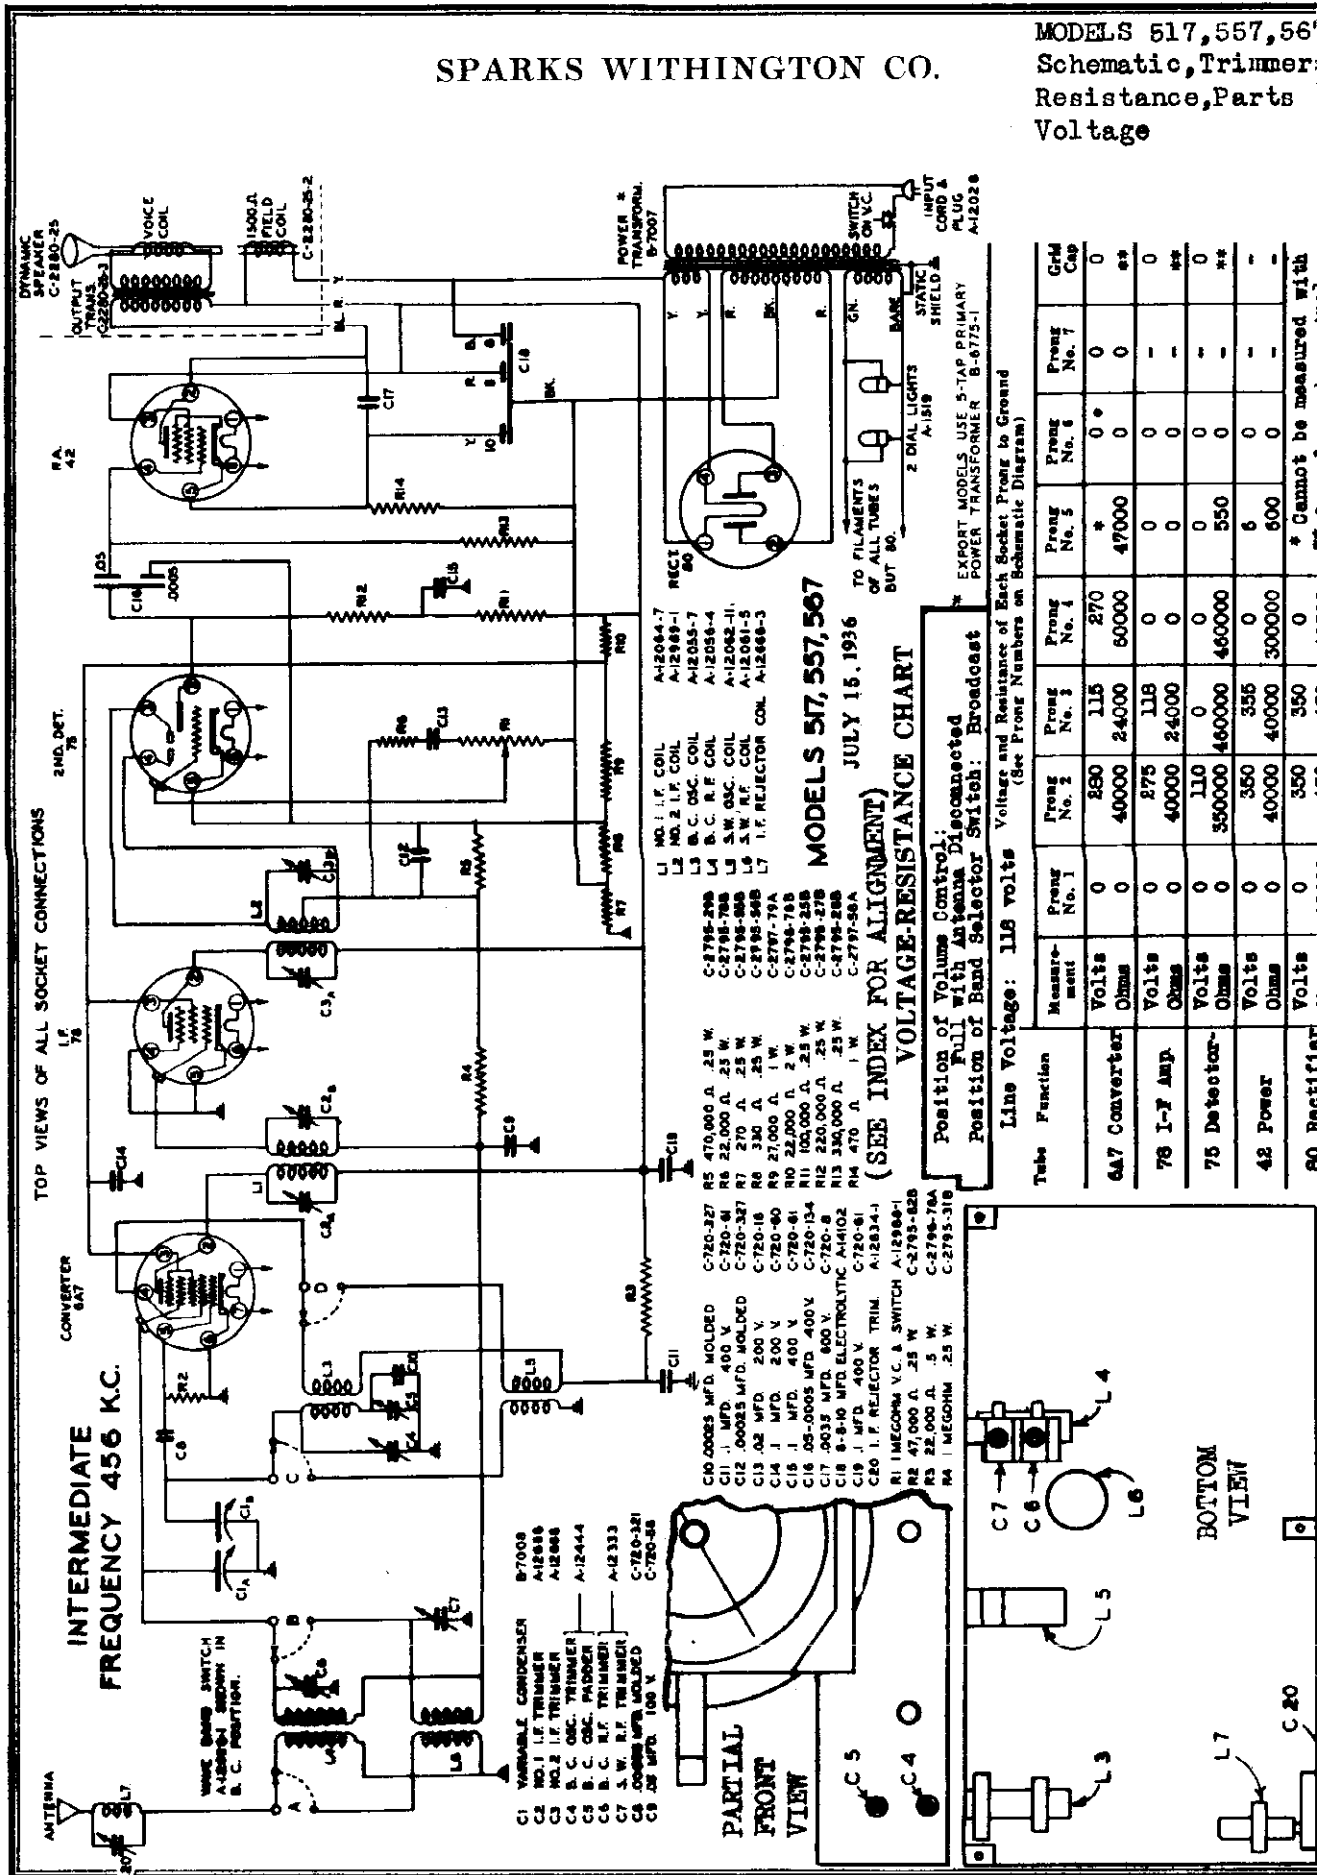

2. Tune test oscillator and receiver to a wave length of 2000 meters (150 kilocycles) and adjust condenser C8 (long-wave oscillator padder).

3. Retune test oscillator and receiver to 870 meters (345 kilocycles) and check the adjustment of condensers C7-B and C7-A.

Caution: All adjustments should be rechecked to assure accuracy and stability of adjustment and calibration.

Alignment

ALIGNMENT FOR MODELS 517, 557, and 567

A. Alignment of Intermediate-Frequency Stages

1. Turn on receiver and test oscillator and allow both to operate several minutes before attempting to adjust any condensers.
2. Turn the band selector switch to the broadcast position and turn the station selector knob until the rotor plates are completely out of mesh with the stator plates.
3. Connect "antenna" of test oscillator to grid cap of Type 6A7 1st detector-oscillator tube and "ground" of test oscillator to chassis frame of receiver. Connect output meter "high tap" from plate of Type 42 tube to ground.

Note: It is advisable to read carefully the operating instructions included with the test oscillator being used in the alignment procedure.

4. Tune test oscillator to obtain a signal of 456 kilocycles.

5. Turn the volume control of receiver on full and adjust I-F condensers C2 and C3 which are reached from the top of the chassis.

Note: Care should be taken when adjusting the I-F stages in order to insure proper and accurate adjustment.

B. Alignment of Broadcast Band

1. Disconnect "antenna" lead of test oscillator from grid cap of 1st detector-oscillator tube Type 6A7 and connect it in series with a 150 mfd. condenser dummy antenna to the antenna terminal of the chassis.

2. Tune test oscillator to a frequency of 456 kilocycles and adjust condenser C20 (reached from back of the chassis) to a point where the output of the receiver is at an absolute minimum.

Note: This condenser is the adjustment for the code rejector circuit and must be very carefully adjusted if best performance of the receiver is to be expected.

3. Tune test oscillator and receiver to a frequency of 1500 kilocycles and adjust condensers C4 (broadcast band oscillator trimmer) and C6 (broadcast antenna trimmer) reached from the bottom of the chassis.

4. Tune test oscillator and receiver to 600 kilocycles and adjust condenser C5 (broadcast oscillator pecker) reached from the front of the chassis.

5. Retune test oscillator and receiver to 1500 kilocycles and check adjustments of condenser C4 and condenser C6. Calibration of the broadcast band should also be checked at 900 kilocycles and 600 kilocycles.

C. Alignment of Short-Wave Band

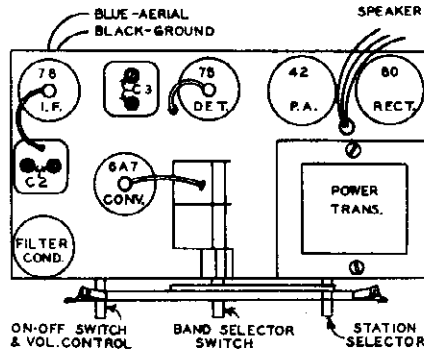

1. Turn the band selector switch to the short wave or "foreign" band.

2. Remove the 150 mfd. condenser from the test oscillator "antenna" lead and replace with a 400 ohm non-inductive resistor dummy antenna.

3. Tune test oscillator and receiver to a frequency of 15,000 kilocycles (15 megacycles) and adjust condenser C7 (short-wave antenna trimmer) reached from the bottom of the chassis.

Caution: On this band care must be taken to adjust this condenser to the fundamental of the 15 megacycle signal and not to the image. The image signal is equal to the fundamental minus twice the intermediate frequency of the receiver.

A set that is adjusted to the image frequency instead of to the fundamental may be

detected by tuning over the band and checking the sensitivity at various points. If a dead spot appears near the center of the band, the adjustable condenser for that band has probably been adjusted to the image instead of to the fundamental.

This type of mis-alignment may also be detected by tuning the test oscillator to a frequency of 15 megacycles and the station selector of the receiver to approximately 15,900 kilocycles. If a strong signal is found approximately at this frequency, it indicates that the band has been adjusted to the image frequency. The normal image frequency for 15,000 kilocycles would be 16,000 kilocycles minus twice 456 kilocycles or approximately 14,100 kilocycles. Therefore, a signal of this frequency may be found with the test oscillator generating a 15,000 kilocycle.

Note: There are no other trimmers for the short-wave or foreign band. However, it is advisable to check the receiver for sensitivity and calibration at both 15,000 kilocycles and 7,500 kilocycles.

Important: All adjustments should be rechecked to assure accuracy and stability of adjustment and calibration.

ALIGNMENT FOR MODELS 537 and 577

A. Alignment of Intermediate-Frequency Stages

1. Turn on receiver and test oscillator and allow both to operate several minutes before attempting to adjust any condensers.

2. Turn the band selector switch to the broadcast "B" position and turn the station selector knob until the rotor plates are completely out of mesh with the stator plates.

3. Connect "antenna" of test oscillator to grid cap of Type 6AG 1st detector-oscillator tube and "ground" of test oscillator to chassis frame of receiver. Connect output meter "high tap" from plate of Type 6FG tube to ground. Note: It is advisable to read carefully the operating instructions included with the test oscillator.

4. Tune test oscillator to obtain a signal of 456 KC.

5. Turn the volume control of receiver on full and adjust I.F. condensers C3 and C2. Note: The intermediate frequency circuits are

quite selective and care must be taken to insure proper adjustment.

6. Connect "antenna" of test oscillator to "A" post on chassis and "ground" of test oscillator to "G" post.

7. Tune test oscillator to 456 KC. and adjust condenser C4 for minimum output.

NOTE: This adjustment is in the code rejector circuit and proper adjustment of this condenser is essential to satisfactory operation of the receiver.

B. Alignment of Broadcast Band

1. Disconnect "antenna" lead of test oscillator from grid cap of first detector-oscillator tube and connect in series with a 150 mfd. condenser dummy antenna to the antenna terminal of the chassis.

2. Tune test oscillator and receiver to a frequency of 1500 KC., and without disturbing the setting of the test oscillator or the station selector, adjust condensers C6 and C5 in the order given.

3. Tune test oscillator and receiver to 600 KC. and adjust condenser C9.

4. Retune test oscillator and receiver to 1500 KC. and check the adjustments of condensers C6 and C5.

5. Calibration of the broadcast band should also be checked at 900 kilocycles and 600 kilocycles.

C. Alignment of Police Band

1. Turn the band selector switch to the Police Band "P".

2. Remove the 150 mfd. condenser from the "antenna" lead of test oscillator and replace with a 400 ohm non-inductive resistor dummy antenna.

3. Tune test oscillator and receiver to 4.5 MC. and adjust condenser C7.

NOTE: There are no other adjustments in this band.

D. Alignment of Foreign Band

1. Turn the band selector switch to the Foreign Band "F".

2. Tune test oscillator and receiver to 15 MC. and adjust condenser C6.

CAUTION: On this band care must be taken to adjust the condenser to the fundamental of the signal and not to the image. The image signal is equal to the fundamental minus twice the intermediate frequency of the receiver.

A set that is adjusted to the image frequency instead of to the fundamental may be detected by tuning over the band and checking the sensitivity at various points. If a dead spot appears near the center of the band, the adjustable condensers for that band have probably been adjusted to the image instead of the fundamental.

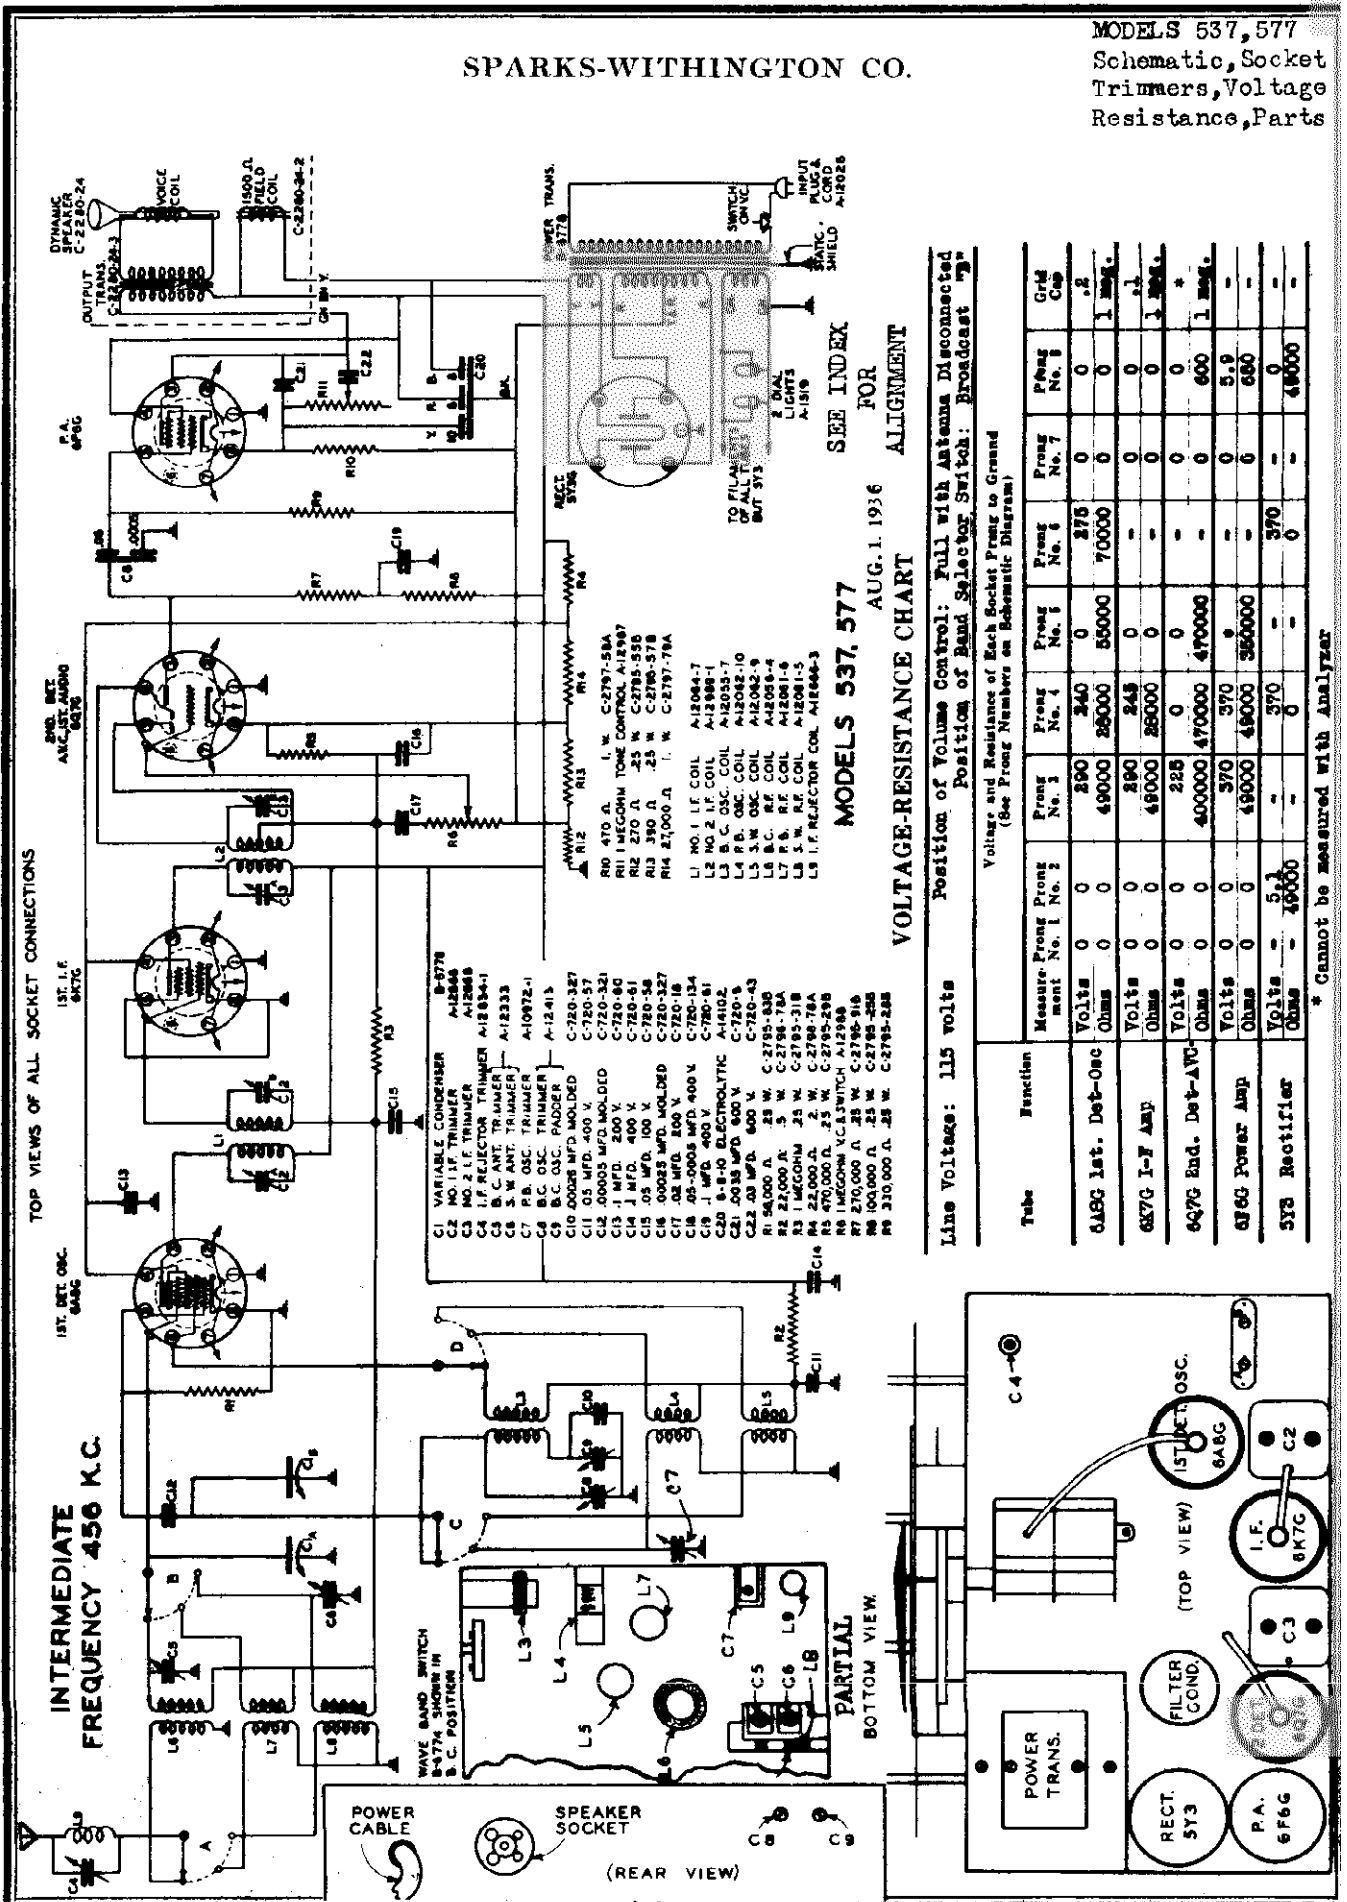

This type of mis-alignment may also be detected by tuning the test oscillator to a frequency of 15 megacycles and the station selector to approximately 15,900 KC. If a strong signal is found approximately at this frequency, it indicates that the band has been adjusted to the image frequency. The normal image frequency for 15,000 kilocycles would be 15,000 KC. minus twice 456 KC. or approximately 14,100 KC. Therefore a signal of this frequency may be found with the test oscillator generating a 15,000 KC. signal.

3. Retune the test oscillator and receiver to 7.5 MC. and check sensitivity and calibration. (There are no other adjustments for this band.)

CAUTION: All adjustments should be rechecked to assure accuracy and stability of adjustment and calibration.

MODELS 617, 667, 617X, 667X

Alignment

SPARKS-WITHINGTON CO.

Foreword: The SPARTON Models 617-X and 667-X are equipped with an adjustable power transformer for operation on various line voltages as indicated under the transformer terminal cover plate.

1. EQUIPMENT REQUIRED

A. Modulated test oscillator (crystal controlled or accurately calibrated) capable of generating frequencies from 345 to 18,000 kilocycles.

B. Output meter.

C. Part A-5732 adjusting wrench.

D. Dummy antennas, consisting of a 200 mmf. condenser and a 100 ohm non-inductive resistor.

2. STEP BY STEP PROCEDURE

NOTE: For proper alignment of these chassis, the procedure should be followed in the same order as given.

With the condenser plates fully meshed, the dial pointer should point to the first calibration marks immediately to the right of the band identification letters "P", "B" and "F". Any necessary correction may be made simply by moving the pointer on the shaft.

A. Alignment of Intermediate-Frequency Stages

(1) Turn on receiver and test oscillator and allow both to operate several minutes before attempting to adjust any condensers.

(2) Turn the band selector switch to the broadcast "B" position and turn the station selector knob until the rotor plates are completely out of mesh with the stator plates.

(3) Connect "antenna" of test oscillator to grid cap of Type 6A8G 1st detector-oscillator tube and "ground" of test oscillator to chassis frame of receiver. Connect output meter "high tap" from plate of Type 6F6G tube to ground. NOTE: It is advisable to read carefully the operating instructions included with the test oscillator.

(4) Tune test oscillator to obtain a signal of 345 KC.

(5) Turn the volume control of receiver on full and adjust I.F. condensers. NOTE: The intermediate frequency circuits are quite selective and care must be taken to insure proper adjustment. (See diagram for I.F. transformer and trimmer locations.)

(6) Connect "antenna" of test oscillator to "A" post on chassis and "ground" of test oscillator to "G" post.

B. Alignment of Broadcast Band

(1) Disconnect "antenna" lead of test oscillator from grid cap of first detector-oscillator tube and connect in series with a 200 mmf. condenser dummy antenna to the antenna terminal of the chassis.

(2) Tune test oscillator and receiver to a frequency of 1500 KC., and without disturbing the setting of the test oscillator or the station selector, adjust condensers C16, C8 and C1 in the order given.

(3) Tune test oscillator and receiver to 600 KC. and adjust condenser C17.

(4) Retune test oscillator and receiver to 1500 KC. and check the adjustments of condensers C16, C8 and C1.

(5) Calibration of the broadcast band should also be checked at 900 kilocycles and 600 kilocycles.

C. Alignment of Police Band

(1) Turn the band selector switch to the Police Band "P".

(2) Remove the 200 mmf. condenser from the "antenna" lead of test oscillator and replace with a 100 ohm non-inductive resistor dummy antenna.

(3) Tune test oscillator and receiver to 4.5 MC. and adjust condensers C19, C9 and C2.

NOTE: There are no other adjustments in this band.

D. Alignment of Foreign Band

(1) Turn the band selector switch to the Foreign Band "F".

(2) Tune test oscillator and receiver to 18 MC. and adjust condensers C20, C10 and C5.

(3) When making these adjustments, the station selector should be moved slightly back and forth in order to obtain maximum gain.

CAUTION: On this band care must be taken to adjust the condensers to the fundamental of the signal and not to the image. The image signal is equal to the fundamental minus twice the intermediate frequency of the receiver.

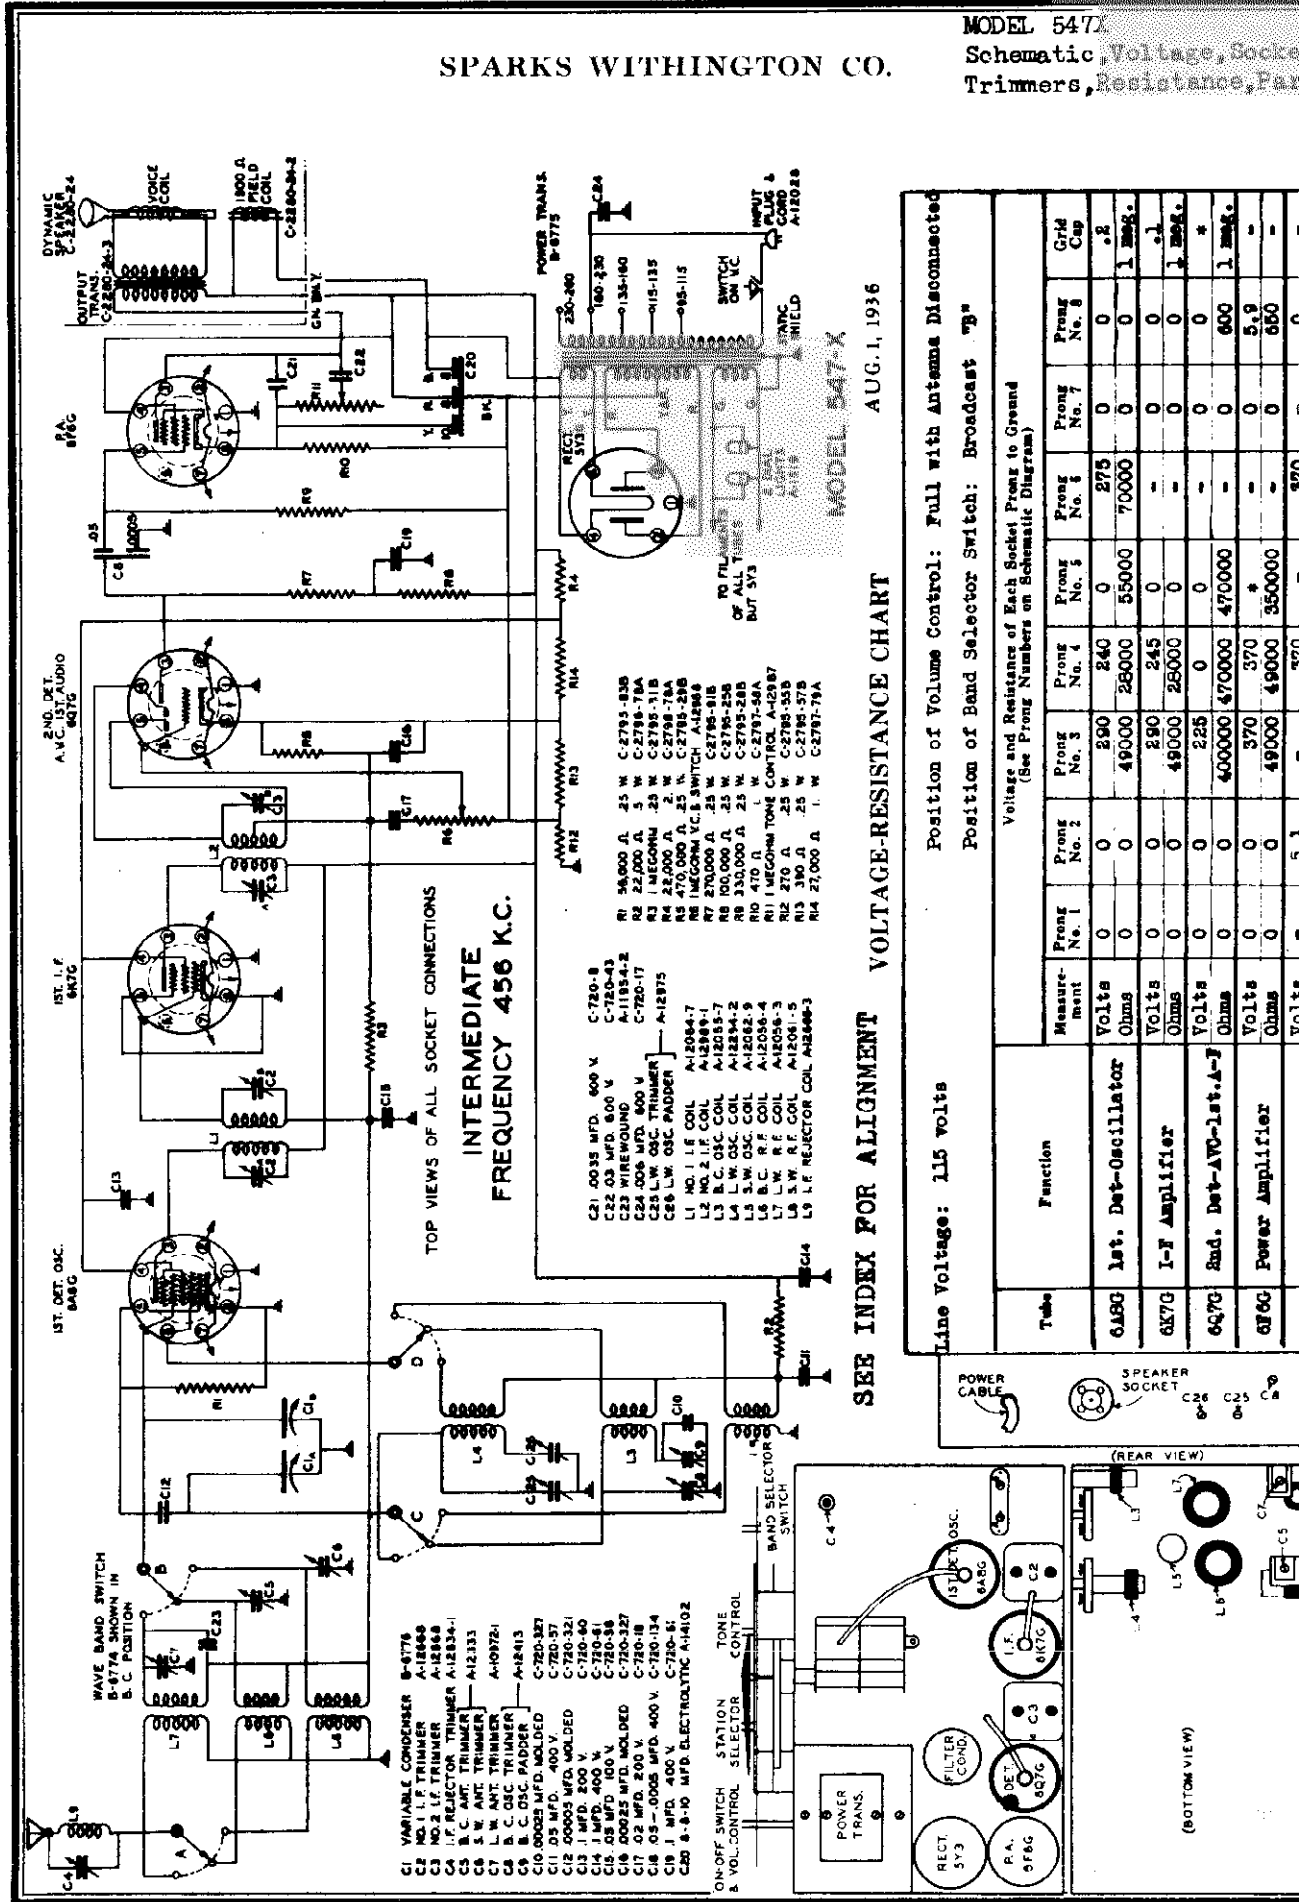

A set that is adjusted to the image frequency instead of to the fundamental may be detected by tuning over the band and checking the sensitivity at various points. If a dead spot appears near the center of the band, the adjustable condensers for that band have probably been adjusted to the image instead of the fundamental.

This type of mis-alignment may also be detected by tuning the test oscillator to a frequency of 15 megacycles and the station selector to approximately 15,700 KC. If a strong signal is found approximately at this frequency, it indicates that the band has been adjusted to the image frequency. The normal image frequency for 15,000 kilocycles would be 15,000 KC. minus twice 345 KC. or approximately 15,300 KC. Therefore a signal of this frequency may be found with the test oscillator generating a 15,000 KC. signal.

CAUTION: All adjustments should be rechecked to assure accuracy and stability of adjustment and calibration.

MODELS .827X, 827XD, 997X

MODEL 1167
 Alignment

ALIGNMENT
MODEL 547X

A. Alignment of Intermediate-Frequency Stages.

(1) Turn on receiver and test oscillator and allow both to operate several minutes before attempting to adjust any condensers.

(2) Turn the band selector switch to the Broadcast Band "B" position and turn the station selector knob until the rotor plates are completely out of mesh with the stator plates.

(3) Connect "antenna" of test oscillator in series with 150 muf. condenser dummy antenna to grid cap of Type 6A8G 1st detector-oscillator tube and "ground" of test oscillator to chassis frame of receiver. Connect output meter "high tap" from plate of Type 6F6G tube to ground. NOTE: It is advisable to read carefully the operating instructions included with the test oscillator.

(4) Tune test oscillator to obtain a signal of 456 kilocycles.

(5) Turn the volume control of receiver on full and adjust IF condensers C3 and C2. NOTE: The intermediate frequency circuits are quite selective and care must be taken to insure proper adjustment.

(6) Disconnect test oscillator "antenna" and 150 muf. condenser from grid cap of 6A8G tube, and connect oscillator "antenna" to antenna post of chassis.

(7) With the test oscillator generating a 456 KC. signal, adjust condenser C4 until a minimum of output is obtained. NOTE: This adjustment is in the code rejector circuit, and care should be taken to see that proper adjustment is made, otherwise the receiver will not operate with maximum efficiency.

B. Alignment of Long-Wave Band

(1) Insert the 150 muf. condenser in series with the "antenna" lead of test oscillator and the antenna terminal of the chassis.

(2) Turn the band selector switch to the long wave "L" position, tune test oscillator and receiver to a wave length of 870 meters (345 KC.) and without disturbing the setting of the test oscillator or the station selector, adjust condensers C25 and C7 in the order given.

(3) Tune test oscillator and receiver to 2000 meters (150 KC.) and adjust condenser C26.

(4) Retune test oscillator and receiver to 345 kilocycles and check the adjustments of condensers C25 and C7.

C. Alignment of Broadcast Band

(1) Turn band selector switch to the broadcast band "B" position.

(2) Tune test oscillator and receiver to a wave length of 200 meters (1500 kilocycles) and adjust condenser C8 (oscillator trimmer) and condenser C5 (antenna trimmer).

(3) Tune test oscillator and receiver to 500 meters (600 kilocycles) and adjust condenser C9 (oscillator padder).

(4) Retune test oscillator and receiver to 200 meters and check the adjustments of condensers C8 and C5.

D. Alignment of Short-Wave Band.

(1) Turn the band selector switch to the short wave band "S" position.

(2) Remove the 150 muf. condenser from "antenna" lead of test oscillator and replace with a 400 ohm non-inductive resistor dummy antenna.

(3) Tune test oscillator and receiver to 20 meters (15 megacycles) and adjust condenser C8.

CAUTION: On this band care must be taken to adjust the condenser to the fundamental of the signal and not to the image. The image signal is equal to the fundamental minus twice the intermediate frequency of the receiver.

A set that is adjusted to the image frequency instead of to the fundamental may be detected by tuning over the band and checking the sensitivity at various points. If a

dead spot appears near the center of the band, the adjustable condensers for that band have probably been adjusted to the image instead of the fundamental.

This type of mis-alignment may also be detected by tuning the test oscillator to a frequency of 15 megacycles and the station selector to approximately 15,900 kilocycles. If a strong signal is found approximately at this frequency, it indicates that the band has been adjusted to the image frequency. The normal image frequency for 15,000 kilocycles would be 15,000 kilocycles minus twice 456 kilocycles or approximately 14,100 kilocycles. Therefore a signal of this frequency may be found with the test oscillator generating a 15,000 kilocycle signal.

ALIGNMENT

MODELS 727X, 727XD, 827X, 827XD, 867, 877X, 987, 997X, and 1167.

A. Alignment of Intermediate-Frequency Stages

NOTE: All of the above models except the Model 1167 employ I-F transformers with two trimmers. The first I-F transformer of the Model 1167 is equipped with a third tuned circuit which results in three trimmers for this I-F stage.

(1) Turn on receiver and test oscillator and allow both to operate several minutes before attempting to adjust any condensers.

(2) Turn the band selector switch to the Broadcast position (with white diamond illuminated) and turn the station selector knob until the rotor plates are completely out of mesh with the stator plates.

(3) Connect "antenna" of test oscillator to the grid cap of a Type 6A8 converter tube and "ground" of test oscillator to chassis frame of receiver. Connect output meter "high tap" from plate of power output tube to ground. Note: It is advisable to read carefully the operating instructions included with the test oscillator.

(4) Tune test oscillator to obtain a signal of 456 kilocycles.

(5) Turn the volume control of receiver on full and adjust I-F trimmers C44, C45 (C41, C42 on Model 987; C59, C60 on Model 1167) which are reached from the top of the chassis. NOTE: The intermediate frequency circuits are quite selective and care must be taken to insure proper adjustment.

B. Alignment of Broadcast Band

(1) Disconnect "antenna" lead of test oscillator from grid cap of converter tube and connect in series with a 200 muf. condenser dummy antenna to the antenna terminal of the chassis.

(2) Tune receiver and test oscillator to a frequency of 1500 kilocycles and adjust condensers C8, C5 and C2 in the order given.

(3) Tune test oscillator and receiver to 600 kilocycles and adjust condenser C11.

(4) Retune test oscillator and receiver to 1500 kilocycles and check the adjustments of condensers C8, C5 and C2.

(5) Calibration of the broadcast band should also be checked at 900 kilocycles and 600 kilocycles.

C. Alignment of Long-Wave Band

(Except Models 867 and 987)

(1) Turn the band selector switch to the long-wave position (yellow diamond illuminated).

(2) Tune test oscillator and receiver to 345 kilocycles and adjust condensers C41, C40 and C38.

(3) Tune test oscillator and receiver to 150 kilocycles and adjust condenser C42.

(4) Retune test oscillator and receiver to 345 kilocycles and check the adjustments of condensers C41, C40 and C38.

D. Alignment of 1st. Short-Wave Band

(1) Turn band selector switch to the 1st short-wave band (red diamond illuminated).

(2) Tune test oscillator and receiver to 6 megacycles and adjust condensers C9, C6 and C5.

(3) Tune test oscillator and receiver to 1.95 megacycles and adjust condenser C12.

(4) Retune test oscillator and receiver to 6 megacycles and check the adjustments of condensers C9, C6 and C5.

E. Alignment of 2nd. Short-Wave Band

(1) Connect the 100 ohm non-inductive dummy antenna resistor in series with the 200 muf. condenser connected between the test oscillator "antenna" lead and the grid cap of the 6A8 converter tube.

(2) Turn the band selector switch to the 2nd short-wave band (blue diamond illuminated).

(3) Tune test oscillator and receiver to 18 megacycles and adjust condensers C10, C7 and C4.

(4) Tune test oscillator and receiver to 6 megacycles and adjust condenser C13.

(5) Retune test oscillator and receiver to 18 megacycles and check adjustments of condensers C10, C7 and C4.

IMPORTANT: To obtain the best sensitivity at 18 megacycles on this band, the dial should be turned back and forth slightly while adjusting the antenna and R.F. trimmers.

CAUTION: On this band care must be taken to adjust the various condensers to the fundamental of the signal and not to the image. The image signal is equal to the fundamental minus twice the intermediate frequency of the receiver. A set that is adjusted to the image frequency instead of to the fundamental may be detected by tuning over the band and checking the sensitivity at various points. If a dead spot appears near the center of the band, the adjustable condensers for that band have probably been adjusted to the image instead of the fundamental.

This type of mis-alignment may also be detected by tuning the test oscillator to a frequency of 15 megacycles and the station selector to approximately 15,900 kilocycles. If a strong signal is found approximately at this frequency, it indicates that the band has been adjusted to the image frequency. The normal image frequency for 15 megacycles or 15,000 kilocycles would be 15,000 kilocycles minus twice 456 kilocycles or approximately 14,100 kilocycles. Therefore a signal of this frequency may be found with the test oscillator generating a 15 megacycle signal.

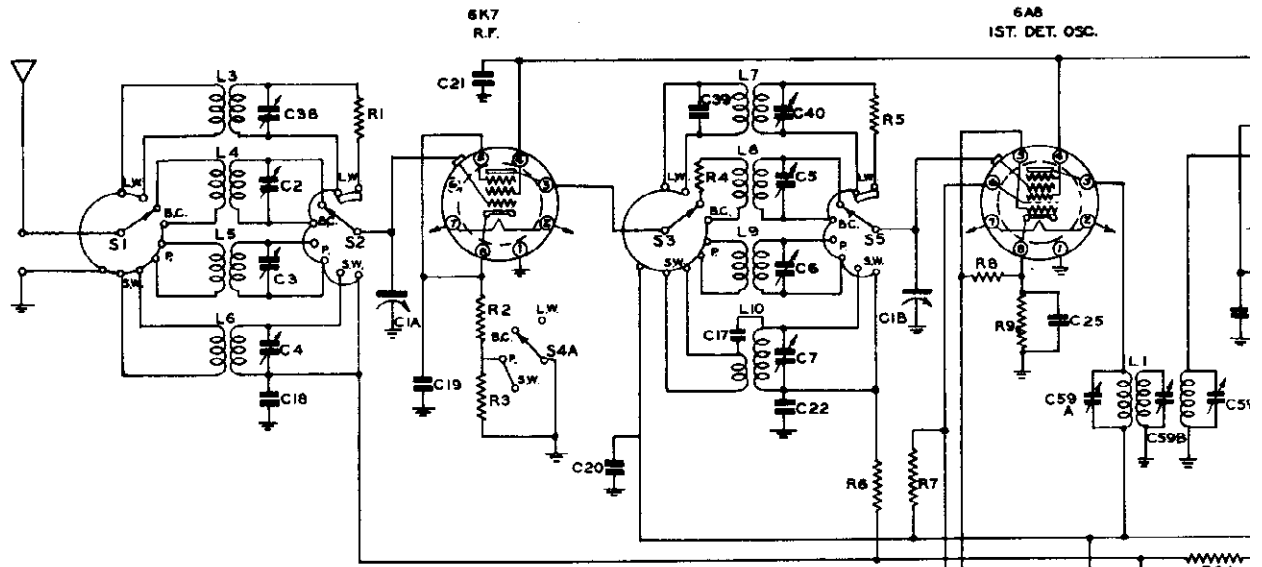

CAUTION: All adjustments should be checked to assure accuracy and stability of adjustment and calibration.

Trimmers, Voltage Change

RANGE SWITCH ON BROADCAST POSITION DIAL TUNED TO 525 KC.
VOLUME CONTROL ON FULL ANTENNA GROUND

SOCKET VOLTAGES

IMPORTANT: Use a high resistance voltmeter of 1000 ohms per volt.
NOTE A: The grid bias for the 6F5 is -1.3 volts measured across resistor 60.
NOTE B: The grid bias for the 6A8, 6K7, and the anode voltage of the A.V.C.

ALIGNMENT

Trimmer Number	Alignment Frequency
1	1st I.F. transformer trimmer..... 456 KC.
2	1st I.F. transformer trimmer..... 156 KC.
3	2nd I.F. transformer trimmer..... 156 KC.
4	2nd I.F. transformer trimmer..... 156 KC.
5	Wave trap trimmer..... 156 KC.
6	Broadcast oscillator shunt trimmer..... 1500 KC.
7	Broadcast antenna shunt trimmer..... 1500 KC.
8	Broadcast detector series trimmer..... 600 KC.
9	Police oscillator shunt trimmer..... 5 MC.
10	Police antenna shunt trimmer..... 5 MC.
11	Police detector shunt trimmer..... 5 MC.
12	Police detector shunt trimmer..... 5 MC.

In receivers having serial numbers below 351,736, resistor 67 is omitted, and the screen grids of the 6K7, R.F. amplifier and the 6A8 receive their current through a 31,000 ohm, 1 watt carbon resistor which is connected to the screen grid of the 6L6. In addition, resistor 66 has a rating of 30,000 ohms, 1 watt and resistor 68 has a rating of 16,000 ohms, 1/4 watt.

NOTE D:
CONNECTOR REMOVED WHEN DOUBLE ANT. IS USED.

PRICES SUBJECT TO CHANGE WITHOUT NOTICE

ALIGNING THE I. F. AMPLIFIER: Turn the volume control to maximum volume position and keep it in this position throughout the entire alignment procedure. Turn the range switch to the broadcast position (fully clockwise).

Connect the test oscillator output leads to the 6A8 control grid and chassis with a .1 mfd. condenser in series with the oscillator output. Set the oscillator to exactly 456 KC. Set the receiver dial at any point where it has no tuning effect on the oscillator signal.

Adjust the four I.F. trimmers, Nos. 1, 2, 3 and 4, for maximum output meter deflection, then repeat the trimmer adjustment.

WAVE-TRAP ADJUSTMENT: The wave-trap adjusting trimmer, No. 5, is located on the back of the chassis. Leave the test oscillator at 456 KC. Connect the oscillator output to the A and G terminals with a 400 ohm resistor in series with the A terminal and oscillator output. Then adjust the wave-trap trimmer No. 5 for minimum output. If some particular station with a frequency near 456 KC. causes code interference, it may be desirable to adjust the wave-trap on the actual frequency of the interfering station.

BROADCAST BAND CALIBRATION AND ALIGNMENT: With the gang condenser in full mesh, the dial pointer should be on the white horizontal line below 530 KC. on the dial scale. Leave the range switch in the extreme clockwise position, and leave the test oscillator connected to the A and G terminals of the receiver through a 400 ohm resistor.

Adjust the test oscillator to exactly 1500 KC. and turn the receiver dial pointer to 1500 KC. on the tuning dial. To calibrate the dial, adjust trimmer No. 6 for maximum output.

Carefully tune the receiver to the signal and adjust trimmers Nos. 7 and 8 for maximum output.

Adjust the test oscillator to 600 KC. and tune the receiver to the signal. Adjust trimmer No. 9 for maximum output. Then try to increase the output meter reading by detuning No. 9 slightly and retuning the receiver dial. If the output goes down, detune the trimmer in the opposite direction. Continue detuning the trimmer and retuning the receiver dial until maximum output meter deflection is secured. This operation is commonly known as "rocking" and when performed as described will give maximum selectivity and sensitivity even though the dial may be slightly off calibration at 600 KC.

BAND NO. 2 CALIBRATION AND ALIGNMENT: Turn the range switch to the center position.

Adjust the test oscillator to exactly 5.0 MC. and turn the receiver dial pointer to exactly 5.0 MC. on the tuning dial.

To calibrate the dial, adjust trimmer No. 10 for maximum output. If two peaks are found, the proper one is that with the trimmer screw farthest out.

Carefully tune the receiver to the signal and adjust trimmers Nos. 11 and 12 for maximum output. Then try to increase the output by detuning No. 12 slightly and retuning the receiver dial. Continue detuning No. 12 and retuning the dial until the output meter deflection is a maximum. Then readjust No. 11 for maximum output.

BAND NO. 3 CALIBRATION AND ALIGNMENT: Turn the range switch to the extreme counter-clockwise position. Be sure the D and G terminals on the antenna terminal strip are connected together.

Set the test oscillator to 16 MC. and turn the receiver dial pointer to exactly 16 MC. on the tuning dial.

To calibrate the dial, adjust trimmer No. 13 for maximum output. Check to see that it has been adjusted to the proper peak by tuning the receiver to approximately 15.1 MC. A repeat signal should be heard at this point. If none is present, even with greatly increased oscillator output, retune the receiver to 16 MC. and adjust trimmer No. 13 to the proper peak with the trimmer screw farther out.

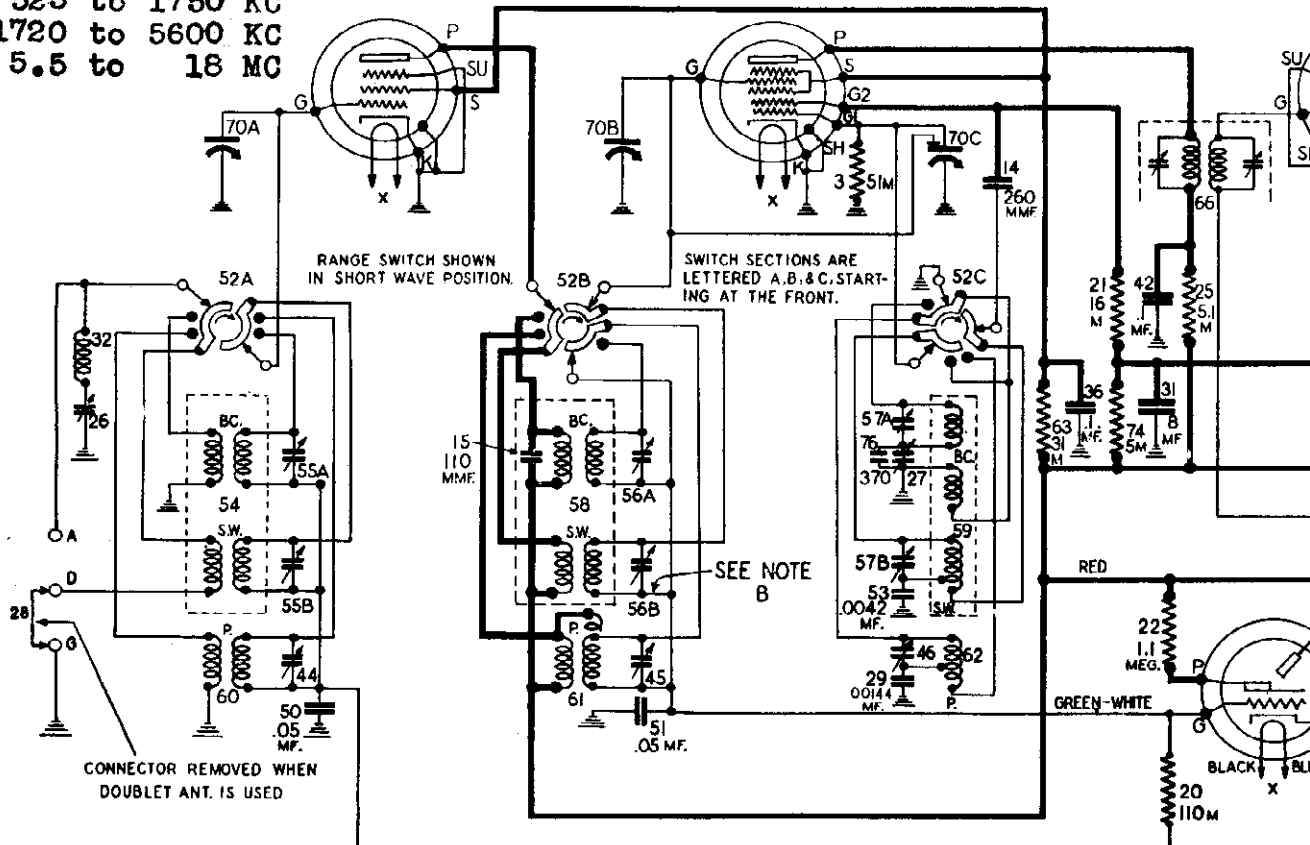

Carefully tune the receiver to the signal and adjust trimmers Nos. 14 and 15 to a peak. Then try to increase the output by detuning No. 15 slightly and retuning the dial until a maximum output meter deflection is secured. Then readjust No. 14 for maximum output. Check the adjustment by tuning the receiver to the image at about 15.1 MC. The image should be much weaker than the 16 MC. signal. If the signal at 15.1 MC. dial setting is equal to or stronger than the 16 MC. signal, trimmer No. 15 is not set to the proper peak. Turn the trimmer in a turn or so, then readjust as above.

IMPORTANT

In aligning this chassis it is absolutely essential to connect a .1 to .25 mfd. condenser in series with the oscillator output lead when aligning the I.F. trimmers. If no condenser is used, the oscillator may short out all bias on the 6A8 and 6K7 tubes which results in improper alignment.

In aligning all other trimmers but the I.F. trimmers, a 400 or 500 ohm carbon resistor must be connected in series with the oscillator output and receiver antenna terminal. Do not omit this resistor or the alignment will be incorrect.

NOTE B: I indicated doe through an 110,000 oh Negative en

Chassis R-148
Alignment Parts

ALIGNMENT OF THE I.F. AMPLIFIER

1. (a) Turn the volume control to maximum volume position and keep it in this position throughout the entire alignment procedure.
- (b) Connect the test oscillator output leads to the 6A8 control grid and the chassis with a .1 or .25 mfd. condenser in series with the oscillator lead to the 6A8 grid.
- (c) Set the test oscillator to exactly 456 KC. Adjust the output of the test oscillator to give about half scale deflection on the output meter.
- (d) Turn the range switch to the extreme clockwise position and set the tuning dial to any point where there is no tuning effect on the oscillator signal.
- (e) Adjust the four I.F. transformer trimmers (trimmers No. 1, 2, 3, and 4) for maximum output meter deflection.
- (f) Repeat the four trimmer adjustments, since the adjustment of each trimmer has some effect on the others.

2. (a) Leave the test oscillator at 456 KC. but connect the oscillator output to the A and G terminals of the receiver with a 400 or 500 ohm carbon resistor in series with the oscillator output and the A terminal.
- (b) Adjust trimmer No. 5 for minimum output. Increase the oscillator output as necessary to obtain a clearly defined point of minimum output. If some particular station with a frequency slightly different than 456 KC. causes code interference, it may be advisable to adjust trimmer No. 5 on the actual frequency of the interfering station.

BAND NO. 1 (BROADCAST) CALIBRATION

3. (a) Check the position of the dial pointer on its shaft by turning the tuning knob until the rotor plates of the gang condenser are in full mesh. The slow-moving dial pointer should then coincide with the low frequency end of the dial scale. If it does not, hold the dial gear and turn the pointer to the correct position.
- (b) Turn the range switch control to the extreme right position. (Clockwise.)
- (c) Connect a 400 or 500 ohm carbon resistor in series with the test oscillator output and the receiver antenna terminal. (Note: This resistor should remain connected for all subsequent adjustments.)
- (d) Ground the receiver.
- (e) Adjust the test oscillator to exactly 1500 KC.
- (f) Tune in the 1500 KC. oscillator signal or a station above 1300 KC. on the dial and determine whether the dial calibration is correct at the high frequency end of the dial. If it is not correct, adjust trimmer No. 6 to give proper calibration. Do not adjust this trimmer if the dial calibration is correct at the high frequency end of the dial.

BAND NO. 1 (BROADCAST) ALIGNMENT

4. (a) With the test oscillator set at 1500 KC. tune the receiver to the signal for maximum output.
- (b) Adjust trimmers No. 7 and 8 for maximum output. Do not touch trimmer No. 6 as this will change the calibration.
- (c) Adjust the test oscillator to exactly 600 KC. and tune the receiver to the signal. Adjust trimmer No. 9 for maximum output. Then try to increase the output by detuning the trimmer and retuning the receiver dial. If this reduces the output, detune the trimmer on the opposite direction. Continue detuning the trimmer and retuning the dial until a maximum output meter deflection is secured. This operation is commonly known as "rocking." The object of this adjustment is to find the combination of trimmer adjustment and tuning condenser position which gives the maximum output. This adjustment should not be changed regardless of whether the dial reads exactly 600 KC. or slightly off 600 KC. for maximum output.
- (d) Check the adjustment of trimmers Nos. 6, 7 and 8 at 1500 KC.

BAND NO. 2 CALIBRATION

5. (a) Turn the range switch to the center position.
- (b) Adjust the test oscillator to exactly 5.0 MC.
- (c) Tune in the 5 MC. oscillator signal at or near 5 MC. on the receiver dial to determine whether the receiver dial calibration is correct at 5 MC. If it is, do not adjust trimmer No. 10. If the calibration is incorrect, set the dial pointer at 5 MC. on the dial, and adjust trimmer No. 10 until the oscillator signal comes in at this point. If there are two peaks, the proper one is that with the trimmer screw farthest out.

BAND NO. 2 ALIGNMENT

6. (a) With the test oscillator set at 5.0 MC., tune the receiver for maximum output.
- (b) Adjust trimmer No. 11 and 12 for maximum output. After this is done try to increase the output meter reading by detuning No. 12 slightly and retuning the receiver dial. If the output goes down, detune the trimmer in the opposite direction. Continue detuning No. 12 and retuning the set until maximum output meter deflection is secured. Then readjust No. 11.

BAND NO. 3 CALIBRATION

7. (a) Turn the range switch to the extreme left (counter clockwise.)
- (b) Be sure that the D and G terminals on the antenna terminal strip are connected together.
- (c) Adjust the test oscillator to exactly 16 megacycles.
- (d) Tune in the 16 MC. oscillator signal at or near 16 MC. on the receiver dial to determine whether the receiver dial calibration is correct at 16 MC. If it is, do not adjust trimmer No. 13. If the calibration is incorrect, set the receiver dial pointer exactly at 16 MC. and adjust trimmer No. 13 until the oscillator signal comes in at this point.
- (e) Check to see that trimmer No. 13 is adjusted to the proper peak by tuning the receiver to approximately 15.1 MC. If a repeat signal is not heard at this point, even with greatly increased oscillator output, retune the receiver to 16.0 MC. and adjust trimmer No. 13 to the proper peak with the trimmer screw farther out.

BAND NO. 3 ALIGNMENT

8. (a) With the test oscillator set at 16 MC. tune the receiver for maximum output.
- (b) Adjust trimmer No. 14 and 15 for maximum output. After this is done, try to increase the output meter deflection by detuning No. 15 slightly and retuning the receiver dial. If this causes the output to drop, detune the trimmer in the opposite direction. Continue detuning No. 15 and retuning the set until the output is at a maximum. Then readjust No. 14.
- (c) Check the adjustment of No. 15 by tuning the receiver to the image at 15.1 MC. and noting if the image is much weaker than the 16 MC. signal. If the signal at 15.1 MC. dial setting is equal to or stronger than the 16 MC. signal, trimmer No. 15 is not set to the proper peak. Turn the trimmer in a turn or so, then readjust as in 8 (b).

MODELS 1301 to 1309

Chassis R-130

STEWART WARNER CORP.

Trimmers, Alignment, Parts

MODEL R-130 CHASSIS (Receiver Models 1301 to 1309)

ALIGNING EQUIPMENT

Experience has definitely shown that a selective radio chassis such as the Stewart-Warner Model R130 cannot be properly aligned by ear or "on the air". An output meter and a high grade modulated service oscillator are absolutely essential.

The oscillator should be capable of generating the frequencies of 456 KC., 600 KC., 1400 KC., and a short wave range extending to 4000 K.C. or more.

When using your oscillator do not rely on calibration curves for frequency determination but check the frequencies by comparison with broadcast station signals.

PRELIMINARY STEPS

To align the R130 chassis proceed as follows:

1. Remove the chassis from the cabinet.
2. Connect the output meter across the primary of the output transformer on the dynamic speaker (red and yellow wires on terminal strip.)
3. Turn the volume control to maximum volume position.

ALIGNMENT OF THE I. F. AMPLIFIER

1. (a) Set the test oscillator to exactly 456 KC.
(b) Connect the output leads of the oscillator to the 6A7 control grid and ground.
(c) Set the range switch (right hand knob) to the broadcast position (fully clockwise). Make certain that no station is tuned in.
(d) Carefully adjust the I.F. transformer trimmers Nos. 1, 2, 3, and 4 for maximum output meter deflection.
(e) Repeat the four trimmer adjustments since the adjustment of each trimmer has some effect on the others.

BROADCAST RANGE CALIBRATION

1. Check the position of the pointer on the condenser shaft by turning the rotor plates of the gang condenser to full mesh by means of the tuning knob. The pointer should then coincide with the heavy horizontal line separating the broadcast and short-wave dial scales. If it does not, remove the dial glass and turn the pointer to the proper position, being careful not to break or bend the pointer.

2. Turn the range switch (right hand knob) to the maximum clockwise position, which is the broadcast setting.

3. To calibrate the set at the high frequency end, use a broadcast station signal between 1300 and 1420 KC. If no such station can be heard, you can use a 1400 KC. signal from your oscillator provided its calibration is accurately known.

- (a) Turn the set dial to the exact frequency setting of the signal (either a station or the oscillator).

- (b) Carefully adjust trimmer No. 5 (broadcast oscillator calibration trimmer) until the signal may be tuned in with maximum volume at its correct frequency setting.

BROADCAST RANGE ALIGNMENT

IMPORTANT

4. Connect a .0001 MICA CONDENSER in series with the test oscillator output and the blue receiver antenna lead. IT IS ABSOLUTELY ESSENTIAL THAT THIS CONDENSER REMAIN CONNECTED FOR ALL BROADCAST AND SHORT WAVE ADJUSTMENTS in order to secure proper alignment of the antenna stage. Do not connect any resistor in series with the .0001 mfd. condenser.

Ground the receiver chassis and connect the oscillator ground lead to the chassis.

5. (a) Set the test oscillator to approximately 1400 KC. and carefully tune the receiver to the signal.

- (b) Adjust trimmers No. 6 and No. 7 (broadcast detector shunt trimmer and broadcast pre-selector shunt trimmer respectively) for maximum output meter reading.

- (c) Retune the receiver and check the adjustments of trimmers No. 6 and No. 7. Do not touch trimmer No. 5 since this will change the calibration.

6. (a) Set the test oscillator to approximately 600 KC. and tune the receiver to the signal.

- (b) Adjust trimmer No. 8 (broadcast oscillator padding trimmer) to get maximum output meter deflection.

- (c) Retune the receiver dial to a peak and readjust trimmer No. 8:

- (d) Continue this procedure of adjusting the trimmer and retuning the set until the output meter reading cannot be increased. This procedure must be followed or the receiver will not be properly aligned.

7. Repeat 5 a, 5 b, and 5 c.

SHORT WAVE RANGE CALIBRATION

1. Turn the receiver range switch to the short wave band position (counter-clockwise).

2. Adjust the test oscillator to exactly 16,000 KC. If you

cannot obtain this frequency on your oscillator, you may use the second harmonic of 8000 KC., or the fourth harmonic of 4000 KC., either of which will give a 16,000 KC. signal.

3. (a) Set the receiver dial at 16.0 MC. on the dial scale and adjust trimmer No. 9 (shortwave oscillator calibration trimmer) until the signal may be tuned in at the correct dial setting with maximum volume. There will be two peaks. The proper one is that with the trimmer screw farthest out.

- (b) To be sure you have not adjusted trimmer No. 9 to the image frequency, check this point by setting the receiver dial to the image frequency, approximately 15.1 MC., and see if the image signal can be heard. (The image frequency is always the signal frequency minus twice the I.F. frequency or in this case $16,000 - 912 = 15,088$ KC. or approximately 15.1 MC.) If no signal can be heard at 15.1 MC. dial setting even with greatly increased test oscillator output, but can be heard at 16.9 MC dial setting, trimmer No. 9 is evidently improperly adjusted to the image frequency and so must be reset to the proper peak with the screw farther out. After readjusting trimmer No. 9, again check to see that the image comes in at 15.1 MC. dial setting and not at 16.9 MC dial setting.

SHORT WAVE RANGE ALIGNMENT

4. (a) Tune the set very carefully to the oscillator frequency, 16.0 MC for maximum output meter reading.

- (b) Adjust trimmer No. 10 (shortwave range detector shunt trimmer) to a peak. After this is done try to increase the output meter reading by detuning trimmer No. 10 slightly and retuning the receiver dial. Continue detuning trimmer No. 10 and retuning the set until maximum output meter deflection is secured.

NOTE: In some cases, the receiver will oscillate when trimmer No. 10 is set with the trimmer screw too far out. This oscillation which can be eliminated by correct adjustment, is normal when the detector circuit is tuned to the receiver oscillator frequency instead of to the correct signal frequency.

If the set seems to motorboat when making the short wave adjustments, reduce the output of the oscillator. This motorboating will stop when an antenna is connected to the set.

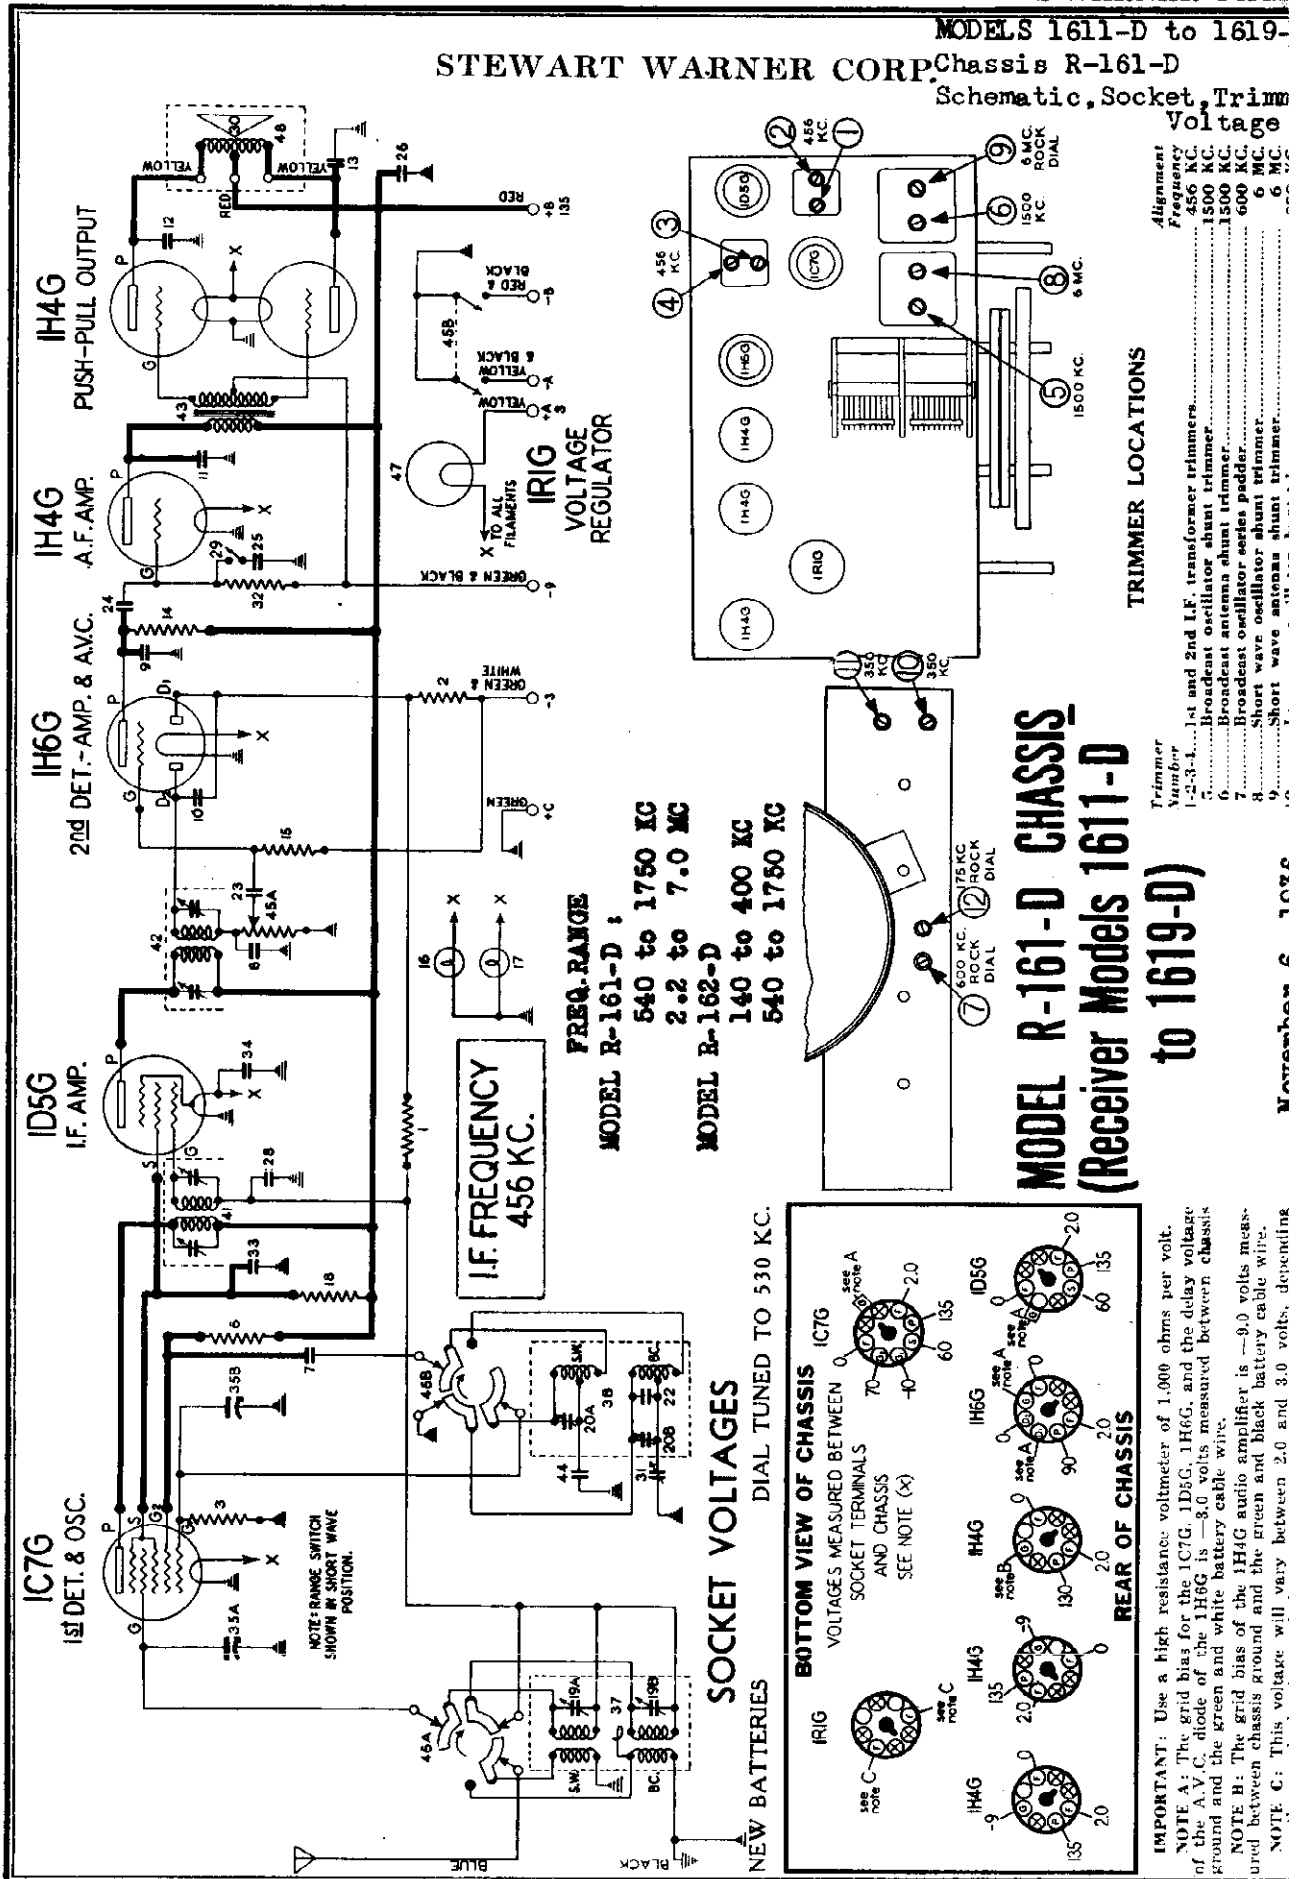

- (c) Check the adjustment of trimmer No. 10 by tuning the receiver to about 15.1 MC. and noting if the image signal at this point is much weaker than the 16 MC. signal. If the signal at the 15.1 MC. dial setting is equal to or stronger than the 16 MC. signal, trimmer No. 10 is not properly adjusted and must be re-adjusted in accordance with 4 (b) with the trimmer screw FARTHER IN.

Alignment, Parts, Notes

CALIBRATION AND ALIGNMENT

ALIGNING EQUIPMENT: For proper alignment, an output meter and an accurately calibrated oscillator with a tuning range from 175 KC. to 6 MC. are required.

Connect the output meter across the plates of the output tubes. Convenient points to make the plate connections are the yellow wires on the speaker terminal strip.

ALIGNING THE I.F. AMPLIFIER: Turn the volume control to maximum volume position and keep it in this position throughout the entire alignment procedure. Turn the range switch to the broadcast position (center position).

Connect the test oscillator output leads to the 1C7G control grid and chassis with a .1 mfd. condenser in series with the oscillator output. Set the oscillator to exactly 456 KC. Set the receiver dial at any point where it has no tuning effect on the oscillator signal.

Adjust the four I.F. trimmers, Nos. 1, 2, 3 and 4, for maximum output meter deflection, then repeat the trimmer adjustment.

BROADCAST BAND CALIBRATION AND ALIGNMENT: With the gang condenser in full mesh, the dial pointer should be on the yellow horizontal line below 530 KC. on the dial scale.

Leave the range switch in the center position. Connect a 400 or 500 ohm carbon resistor in series with the oscillator output and the receiver antenna lead (blue wire in the back of the chassis). Connect the grounded oscillator output wire to the receiver ground lead (black wire in back of chassis).

Adjust the test oscillator to exactly 1500 KC. Tune in the 1500 KC. oscillator signal or a station above 1300 KC. on the dial and determine whether the dial calibration is correct at the high frequency end of the dial. If the calibration is correct, do not adjust the broadcast oscillator shunt trimmer No. 5. If the calibration is incorrect, adjust trimmer No. 5 to give proper calibration.

Carefully tune the receiver to the 1500 KC. oscillator signal and adjust trimmer No. 6 for maximum output.

Adjust the test oscillator to 600 KC. and tune the receiver to the signal. Adjust trimmer No. 7 for maximum output. Then try to increase the output meter reading by detuning No. 7 slightly and retuning the receiver dial. If the output goes down, detune the trimmer in the opposite direction. Continue detuning the trimmer and retuning the receiver dial until maximum output meter deflection is secured. This operation is commonly known as "rocking" and when performed as described will give maximum selectivity and sensitivity even though the dial may be slightly off calibration at 600 KC.

Repeat the adjustment of Nos. 5 and 6 at 1500 KC.

SHORT WAVE BAND CALIBRATION AND ALIGNMENT: Turn the range switch to the short wave band (maximum counter-clockwise position).

Adjust the test oscillator to exactly 6.0 MC.

PRICES SUBJECT TO CHANGE WITHOUT NOTICE

Tune in the 6 MC. oscillator signal at or near 6 MC. on the receiver dial to determine whether the receiver dial calibration is correct at 6 MC. If it is, do not adjust the short wave band oscillator shunt trimmer No. 8. If the calibration is incorrect, set the dial pointer to 6 MC. on the dial, and adjust the oscillator shunt trimmer No. 8 until the oscillator signal comes in at this point. If there are two peaks, the proper one is that with the trimmer screw farthest out.

Carefully tune the receiver to the signal and adjust trimmer No. 9 for maximum output. Then try to increase the output by detuning No. 9 slightly and retuning the receiver. Continue detuning No. 9 and retuning the receiver until the output meter deflection is a maximum.

LONG WAVE BAND CALIBRATION AND ALIGNMENT: Turn the range switch to the long wave band position (maximum clockwise position) and adjust the test oscillator to exactly 350 KC.

Tune in the oscillator signal at or near 350 KC. on the receiver dial to determine whether the dial calibration is correct at this point. If it is, do not adjust trimmer No. 10. If the calibration is incorrect, set the receiver dial pointer to 350 KC. and adjust trimmer No. 10 for maximum output.

Carefully tune the receiver to the signal, then adjust trimmer No. 11 for maximum output.

Adjust the test oscillator to 175 KC. and tune in the signal at or near 175 KC. on the receiver dial. Adjust padder No. 12 for maximum output, then try to increase the output by detuning padder No. 12 and retuning the receiver dial.

Repeat the adjustment of trimmers Nos. 10 and 11 at 350 KC.

USE OF BALLAST PLUG

The Model R-162-D radio chassis is designed to operate with either a large 3 volt dry cell or a 2 1/4 volt Eveready Air Cell. This is possible because the 1R1G tube maintains the proper filament voltage for any battery voltage between 2 and 3 volts. The receiver is also designed to operate from a 2 volt storage cell. However, if this is done it is desirable to omit the 1R1G voltage regulator and insert a special plug in the 1R1G socket which carries our part number 89588 and has a list price of \$0.30.

USE OF B AND C BATTERY PACK

To convert the R-162-D chassis for operation with a plug-in B and C battery unit such as the Burgess No. C90 D6, a special cable terminating in a plug that fits the socket of the B and C pack must be substituted for the regular cable. This special cable carries our part number 89487 and has a list price of \$1.40. The color codes of the old and new cables are identical. There is no green C plus wire on the new cable since the connection is made in the B and C unit.

89588	Ballast tube plug (used in place of 1R1G tube with 2 volt battery)	.30

In order to keep battery drain at a minimum, 60 milliampere dial light bulbs are used. In replacing these, be sure to use the correct type. Do not use ordinary 2.5 volt dial light bulbs as they will cause short life of the "A" battery.

Alignment, Parts, Notes

STEWART WARNER CORP

ALIGNING THE I.F. AMPLIFIER: Turn the volume control to maximum volume position and keep it in this position throughout the entire alignment procedure. Turn the range switch to the broadcast position (center position).

Connect the test oscillator output leads to the 1C7G control grid and chassis with a .1 mfd. condenser in series with the oscillator output. Set the oscillator to exactly 456 KC. Set the receiver dial at any point where it has no tuning effect or the oscillator signal.

Adjust the four I.F. trimmers, Nos. 1, 2, 3 and 4, for maximum output meter deflection, then repeat the trimmer adjustment.

BROADCAST BAND CALIBRATION AND ALIGNMENT:

With the gang condenser in full mesh, the dial pointer should be on the yellow horizontal line below 530 KC. on the dial scale.

Leave the range switch in the center position. Connect a 400 or 500 ohm carbon resistor in series with the oscillator output and the receiver antenna lead (blue wire in the back of the chassis). Connect the grounded oscillator output wire to the receiver ground lead (black wire in back of chassis).

Adjust the test oscillator to exactly 1500 KC. Tune in the 1500 KC. oscillator signal or a station above 1300 KC. on the dial and determine whether the dial calibration is correct at the high frequency end of the dial. If the calibration is correct, do not adjust the broadcast oscillator shunt trimmer No. 5. If the calibration is incorrect, adjust trimmer No. 5 to give proper calibration.

Carefully tune the receiver to the 1500 KC. oscillator signal and adjust trimmer No. 6 for maximum output.

Adjust the test oscillator to 600 KC. and tune the receiver to the signal. Adjust trimmer No. 7 for maximum output. Then try to increase the output meter reading by detuning No. 7 slightly and retuning the receiver dial. If the output goes down, detune the trimmer in the opposite direction. Continue detuning the trimmer and retuning the receiver dial until maximum output meter deflection is secured. This operation is commonly known as "rocking" and when performed as described will give maximum selectivity and sensitivity even though the dial may be slightly off calibration at 600 KC.

Repeat the adjustment of Nos. 5 and 6 at 1500 KC.

SHORT WAVE BAND CALIBRATION AND ALIGNMENT:

Turn the range switch to the short wave band (maximum counter-clockwise position).

Adjust the test oscillator to exactly 6.0 MC.

Tune in the 6 MC. oscillator signal at or near 6 MC. on the receiver dial to determine whether the receiver dial calibration is correct at 6 MC. If it is, do not adjust the short wave band oscillator shunt trimmer No. 8. If the calibration is incorrect, set the dial pointer to 6 MC. on the dial, and adjust the oscillator shunt trimmer No. 8 until the oscillator signal comes in at this point. If there are two peaks, the proper one is that with the trimmer screw farthest out.

Carefully tune the receiver to the signal and adjust trimmer No. 9 for maximum output. Then try to increase the output by detuning No. 9 slightly and retuning the receiver. Continue detuning No. 9 and retuning the receiver until the output meter deflection is a maximum.

LONG WAVE BAND CALIBRATION AND ALIGNMENT:

Turn the range switch to the long wave band position (maximum clockwise position) and adjust the test oscillator to exactly 350 KC.

Tune in the oscillator signal at or near 350 KC. on the receiver dial to determine whether the dial calibration is correct at this point. If it is, do not adjust trimmer No. 10. If the calibration is incorrect, set the receiver dial pointer to 350 KC. and adjust trimmer No. 10 for maximum output.

Carefully tune the receiver to the signal, then adjust trimmer No. 11 for maximum output.

Adjust the test oscillator to 175 KC. and tune in the signal at or near 175 KC. on the receiver dial. Adjust padder No. 12 for maximum output, then try to increase the output by detuning padder No. 12 and retuning the receiver dial.

Repeat the adjustment of trimmers Nos. 10 and 11 at 350 KC.

USE OF BALLAST PLUG

The Model R-162-D radio chassis is designed to operate with either a large 3 volt dry cell or a 2 1/4 volt Eveready Air Cell. This is possible because the 1R1G tube maintains the proper filament voltage for any battery voltage between 2 and 3 volts. The receiver is also designed to operate from a 2 volt storage cell. However, if this is done it is desirable to omit the 1R1G voltage regulator and insert a special plug in the 1R1G socket which carries our part number 89588 and has a list price of \$0.30.

USE OF B AND C BATTERY PACK

To convert the R-162-D chassis for operation with a plug-in B and C battery unit such as the Burgess No. G90 D6, a

special cable terminating in a plug that fits the socket of the B and C pack must be substituted for the regular cable. This special cable carries our part number 89487 and has a list price of \$1.40. The color codes of the old and new cables are identical. There is no green C plus wire on the new cable since the connection is made in the B and C unit.

ANTENNA GROUNDED
DIAL TUNED TO 530 KC.

MODEL R-169 SAME AS MODEL-172 BUT WITHOUT TUNING INDICATOR.

R-172 CHASSIS

November 13, 1936

REAR OF CHASSIS

IMPORTANT: Use a high resistance voltmeter of 1000 ohms per volt.
NOTE A: The grid bias for the 6A8G, 6K7G, and the anode voltage of the AVC section of the 6Q7G is —3 volts measured across resistors 41 and 42.
NOTE B: The grid bias for the audio section of the 6Q7G is —2 volts measured across resistor 41.
NOTE C: The grid bias for the 6K6G output tube is —18 volts meas.

 Alignment, Parts

STEWART-WARNER CORP.

CALIBRATION AND ALIGNMENT

ALIGNING EQUIPMENT: For proper alignment, an output meter and an accurately calibrated oscillator with a tuning range from 262 KC. to 16 MC. are required.

Connect the output meter from the plate of the output tube to chassis. A convenient point to make the plate connection is to the yellow wire on the speaker socket.

ALIGNING THE I. F. AMPLIFIER: Turn the volume control to maximum volume position and keep it in this position throughout the entire alignment procedure. Turn the range switch to the broadcast position (fully clockwise).

Connect the test oscillator output leads to the 6A8 control grid and chassis with a .1 mfd. condenser in series with the oscillator output. Set the oscillator to exactly 262 KC. Set the receiver dial at any point where it has no tuning effect on the oscillator signal.

Adjust the four I.F. trimmers, Nos. 1, 2, 3 and 4, for maximum output meter deflection, then repeat the trimmer adjustment.

BROADCAST BAND CALIBRATION AND ALIGNMENT

With the gang condenser in full mesh, the dial pointer should be on the white horizontal line below 530 KC. on the dial scale. If it does not, hold the dial gear and turn the pointer to the correct position.

Turn the range switch to the extreme clockwise position and connect the test oscillator output to the A and C terminals of the receiver with a 400 ohm carbon resistor in series with the A terminal and the oscillator output.

Adjust the test oscillator to exactly 1500 KC.

Tune in the 1500 KC. oscillator signal or a station above 1300 KC. on the dial and determine whether the dial calibration is correct at the high frequency end of the dial. If the calibration is correct, do not adjust the broadcast oscillator shunt trimmer No. 5. If the calibration is incorrect, adjust trimmer No. 5 to give proper calibration.

Carefully tune the receiver to the signal and adjust trimmers Nos. 6 and 7 for maximum output.

Adjust the test oscillator to 600 KC. and tune the receiver to the signal. Adjust trimmer No. 8 for maximum output. Then try to increase the output meter reading by detuning No. 8 slightly and retuning the receiver dial. If the output goes down, detune the trimmer in the opposite direction. Continue detuning the trimmer and retuning the receiver dial until maximum output meter deflection is secured. This operation is commonly known as "rocking" and when performed as described will give maximum selectivity and sensitivity even though the dial may be slightly off calibration at 600 KC.

POLICE BAND CALIBRATION AND ALIGNMENT

Turn the range switch to the center position. Adjust the test oscillator to exactly 5.0 MC. Tune in the 5 MC. oscillator signal at or near 5 MC. on the receiver dial to determine whether the receiver dial calibration is correct at 5 MC. If it is, do not adjust police band oscillator shunt trimmer No. 9. If the calibration is incorrect, set the dial pointer to 5 MC. on the dial, and adjust the oscillator shunt trimmer No. 9 until the oscillator signal comes in at this point. If there are two peaks, the proper one is that with the trimmer screw farthest out.

Carefully tune the receiver to the signal and adjust trimmer No. 10 for maximum output. Then try to increase the output by detuning No. 10 slightly and retuning the receiver dial. Continue detuning No. 10 and retuning the dial until the output meter deflection is a maximum.

SHORT WAVE BAND CALIBRATION AND ALIGNMENT

Turn the range switch to the extreme counter-clockwise position. Set the test oscillator to 16 MC. Tune in the 16 MC. oscillator signal at 16 MC. on the receiver dial to determine whether the receiver dial calibration is correct at 16 MC. If it is, do not adjust the short wave band oscillator shunt trimmer No. 11. If the calibration is incorrect, set the receiver dial pointer exactly at 16 MC. and adjust the oscillator shunt trimmer No. 11 until the oscillator signal comes in at this point.

Check to see that it has been adjusted to the proper peak by tuning the receiver to approximately 15.5 MC. A repeat signal should be heard at this point. If none is present, even with greatly increased oscillator output, retune the receiver to 16 MC. and adjust trimmer No. 11 to the proper peak with the trimmer screw farther out.

Carefully tune the receiver to the signal and adjust trimmer No. 12 to a peak. Then try to increase the output by detuning the trimmer slightly and retuning the dial until a maximum output meter deflection is secured. Check the adjustment by tuning the receiver to the image at about 15.5 MC. The image should be much weaker than the 16 MC. signal. If the signal at 15.5 MC. dial setting is equal to or stronger than the 16 MC. signal, trimmer No. 12 is not set to the proper peak. Turn the trimmer in a turn or so, then readjust as above.

23	89826	.004 mfd. 750 v. paper condenser	.24

ALIGNING THE I. F. AMPLIFIER: Turn the volume control to maximum volume position and keep it in this position throughout the entire alignment procedure. Turn the range switch to the broadcast position (fully clockwise).

Connect the test oscillator output leads to the 6A8 control grid and chassis with a .1 mfd. condenser in series with the oscillator output. Set the oscillator to exactly 456 KC. Set the receiver dial at any point where it has no tuning effect on the oscillator signal.

Adjust the four I.F. trimmers Nos. 1, 2, 3 and 4, for maximum output meter deflection, then repeat the trimmer adjustment.

BROADCAST BAND CALIBRATION AND ALIGNMENT:

With the gang condenser in full mesh, the dial pointer should be on the white horizontal line below 530 KC. on the dial scale.

Turn the range switch to the extreme clockwise position and connect the test oscillator output to the A and G terminals of the receiver with a 400 ohm carbon resistor in series with the A terminal and the oscillator output.

Adjust the test oscillator to exactly 1500 KC. and turn the receiver dial pointer to 1500 KC. on the tuning dial. To calibrate the dial, adjust trimmer No. 5 for maximum output.

Carefully tune the receiver to the signal and adjust trimmers Nos. 6 and 7 for maximum output.

Adjust the test oscillator to 600 KC. and tune the receiver to the signal. Adjust trimmer No. 8 for maximum output. Then try to increase the output meter reading by detuning No. 8 slightly and retuning the receiver dial. If the output goes down, detune the trimmer in the opposite direction. Continue detuning the trimmer and retuning the receiver dial until maximum output meter deflection is secured. This operation is commonly known as "rocking" and when performed as described will give maximum selectivity and sensitivity even though the dial may be slightly off calibration at 600 KC.

WAVE-TRAP ADJUSTMENT: The wave-trap adjusting trimmer, No. 13, is located on the back of the chassis. Leave the test oscillator connected to the A and G terminals through a 400 ohm resistor and set the oscillator at 456 KC. Then adjust the wave-trap trimmer No. 13 for minimum output. If some particular station with a frequency near 456 KC. causes code interference, it may be desirable to adjust the wave-trap on the actual frequency of the interfering station.

Check the adjustment of trimmers 5, 6, and 7 at 1500 KC.

BAND NO. 2 CALIBRATION AND ALIGNMENT: Turn the range switch to the center position.

Adjust the test oscillator to exactly 5.0 MC. and turn the receiver dial pointer to exactly 5.0 MC. on the tuning dial.

To calibrate the dial, adjust trimmer No. 9 for maximum output. If two peaks are found, the proper one is that with the trimmer screw farthest out.

Carefully tune the receiver to the signal and adjust trimmer No. 10 for maximum output. Then try to increase the output by detuning No. 10 slightly and retuning the receiver dial. Continue detuning No. 10 and retuning the dial until the output meter deflection is a maximum.

BAND NO. 3 CALIBRATION AND ALIGNMENT: Turn the range switch to the extreme counter-clockwise position. Be sure the D and G terminals on the antenna terminal strip are connected together.

Set the test oscillator to 16 MC. and turn the receiver dial pointer to exactly 16 MC. on the tuning dial.

To calibrate the dial, adjust trimmer No. 11 for maximum output. Check to see that it has been adjusted to the proper peak by tuning the receiver to approximately 15.1 MC. A repeat signal should be heard at this point. If none is present, even with greatly increased oscillator output, retune the receiver to 16 MC. and adjust trimmer No. 11 to the proper peak with the trimmer screw farther out.

Carefully tune the receiver to the signal and adjust trimmer No. 12 to a peak. Then try to increase the output by detuning the trimmer slightly and retuning the dial until a maximum output meter deflection is secured. Check the adjustment by tuning the receiver to the image at about 15.1 MC. The image should be much weaker than the 16 MC. signal. If the signal at 15.1 MC. dial setting is equal to or stronger than the 16 MC. signal, trimmer No. 12 is not set to the proper peak. Turn the trimmer in a turn or so, then readjust as above.

**MODEL Firestone R-1431 Auto
Alignment, Parts**

STEWART-WARNER CORP.

The signal picked up by the antenna is carried to the receiver from the lead-in by means of a specially designed transmission line (No. 46 in the diagram). The effect of this transmission line when properly installed is to reduce ignition interference. It accomplishes this result by eliminating a large part of the car chassis from the receiver antenna circuit. **NOTE:** This antenna lead must not be cut, since cutting would destroy its effectiveness in minimizing ignition noise pickup in the antenna circuit.

The signal is fed through an antenna filter to the primary of the antenna transformer. The filter cut-off occurs at a frequency slightly above the broadcast band where it is most effective in removing any ignition interference picked up by the antenna.

The antenna transformer is wound on a special iron core, the effect of which is to diminish noise by increasing the signal to-noise ratio.

The signal is then tuned and amplified in an R. F. stage using a 6D6 tube. Further amplification and frequency conversion to 177.5 KC. take place in the 77 combination first detector and oscillator tube. The 177.5 KC. signal is amplified in the I.F. stage which uses a 6D6 tube and is then rectified in the diode section of the 75 second detector tube.

The rectified current produces a modulated D.C. voltage across the diode load resistor. (No. 4 in the circuit diagram). In order to obtain more quiet tuning between stations, a small detection delay or "squelch" is provided by returning the diode load resistor to the midpoint of the second detector bias resistance. This point is approximately 3/4 volt lower in potential than the cathode.

The audio component of the rectified voltage appears across the 500,000 ohm volume control resistor. Any part or all of this signal may be impressed on the triode section of the 75 tube where audio amplification takes place. The triode section of the 75 is resistance coupled to the 41 output tube. Bias for the 41 tube is obtained by grid return connection to the ungrounded end of the filter choke which is connected in the B-lead.

The modulated drop across resistor No. 4 is filtered and applied to the grid returns of the 6D6 R.F. and I.F. tubes to provide A.V.C.

CALIBRATION AND ALIGNMENT

A good modulated oscillator and a sensitive output meter are necessary for proper calibration and alignment of the R.F. and I.F. stages of this receiver. The output of the test oscillator must be adjustable to give a very weak signal which will not actuate the A.V.C. of the receiver. The output meter must be sensitive enough to give sufficient reading with such a weak signal.

The output meter may be conveniently connected between the chassis and the yellow lead terminal on pilot light and tone control lead socket. You will find that the yellow lead is connected through an .02 mfd. condenser to the plate of the 41 output tube. However, if the output meter is suitable, it should be connected across the speaker voice coil.

During all calibration and alignment adjustments, keep the volume control full on.

I. F. ALIGNMENT

The I.F. trimmers are located on top of the I.F. transformers which may be reached by removing the receiver top cover. Pull out the antenna plug. The test oscillator should be set to exactly 177.5 KC. and connected from the control grid of the 77 to ground. Adjust the test oscillator output to give about half-scale reading of the output meter. Tune the set to make certain that no station signal is tuned in, since this would affect the output meter reading. Adjust all three I.F. trimmers to give maximum output reading.

In adjusting the I.F. transformer trimmers, it is desirable to use a bakelite screw driver or one having only a small metal tip. After the I.F. trimmers have been aligned once, go back and repeat the procedure, since any adjustment of one will affect the others to some extent.

DIAL CALIBRATION

The dial of the control head is calibrated in kilocycles except that one zero is omitted. Sets using the steering column control head or the Ford dash control head are calibrated as follows:

Tune in a station of known frequency between 800 and 1100 KC. Loosen the set screw in the right hand knob and remove the knob. Loosen the set screw in the knob shaft, and by rotating the knob shaft, turn the pointer until it indicates the frequency of the station which has been tuned in. Then re-tighten the set screw and replace the knob.

If the set is used with a dash control head other than that for the Ford, calibrate as follows:

Turn the knob to the right as far as it will go, and then turn it to the end in the other direction. It is necessary

to continue to turn the knob after the dial pointer reaches the end stop, until the knob will turn no farther.

If the set is badly out of calibration, so that when the dial reads correctly at the low frequency end, it is off at the high frequency end, it will be necessary to adjust the oscillator shunt trimmer as explained below. The oscillator shunt trimmer is located on the oscillator section of the gang condenser which can be reached when the receiver bottom cover is removed. Connect a .00025 mfd. mica condenser in series with the output of the test oscillator and the antenna lead of the receiver. This condenser is essential to the proper adjustment of the antenna stage. Set the test oscillator to exactly 600 KC. Tune the receiver to maximum output. If the control head is of the steering column or Ford dash control type, calibrate at the low end of the dial by setting the pointer to read exactly 60 (600 KC.).

Set the test oscillator to exactly 1400 KC. Turn the gang condenser by means of the tuning knob until the dial pointer indicates 140 (1400 KC.). Adjust the oscillator shunt trimmer (on gang condenser section third from shaft end) for maximum output. Adjust the two trimmers nearest the shaft end as explained under R.F. alignment.

R. F. ALIGNMENT

With the test oscillator set to approximately 1400 KC., tune the set very carefully for maximum output.

Adjust the output of the test oscillator to the minimum value which will give sufficient output meter deflection. Adjust the two trimmers nearest to the shaft end of the gang condenser to give maximum output meter reading.

Alignment, Voltage STROMBERG-CARLSON TEL. MFG. CO.

Intermediate Frequency Amplifier Adjustments

The intermediate frequency used in these receivers is 465 kilocycles. In making these I. F. circuit adjustments always align in the following order:

1. Secondary of 2nd I. F. Transformer (Capacitor C-13).
2. Primary of 2nd I. F. Transformer (Capacitor C-12).
3. Secondary of 1st I. F. Transformer (Capacitor C-11).
4. Primary of 1st I. F. Transformer (Capacitor C-10).

Radio Frequency Adjustments

The adjustments of the aligning capacitors used in the radio frequency circuits in this receiver should be very carefully made in the following order and at the frequencies specified below:

1. Oscillator's "C" Band Shunt Aligner at 17 Megacycles (Capacitor C-9).
2. R. F. Interstage "C" Band Shunt Aligner at 17 Megacycles (Capacitor C-6).
3. Antenna "C" Band Shunt Aligner at 17 Megacycles (Capacitor C-3).
4. Oscillator's "B" Band Shunt Aligner at 3.4 Megacycles (Capacitor C-8).
5. R. F. Interstage "B" Band Shunt Aligner at 3.4 Megacycles (Capacitor C-5).
6. Antenna "B" Band Shunt Aligner at 3.4 Megacycles (Capacitor C-2).
7. Oscillator's "A" Band Shunt Aligner at 1.4 Megacycles (Capacitor C-7).
8. R. F. Interstage "A" Band Shunt Aligner at 1.4 Megacycles (Capacitor C-4).
9. Antenna "A" Band Shunt Aligner at 1.4 Megacycles (Capacitor C-1).
10. Oscillator's "A" Band Series Aligner at 0.6 Megacycles (Capacitor, Item No. 41).
11. Oscillator's "A" Band Shunt Aligner at 1.4 Megacycles (Capacitor C-7).
12. R. F. Interstage "A" Band Shunt Aligner at 1.4 Megacycles (Capacitor C-4).
13. Antenna "A" Band Shunt Aligner at 1.4 Megacycles (Capacitor C-1).

NORMAL VOLTAGE READINGS

These voltage readings are obtained by measuring between the various tube socket contacts and the heavy bus wire with the tubes in their respective sockets. The receiver is, therefore, in operation when the measurements are made. The heavy bus wire, which is the negative side of the grid and plate voltages, is plainly marked on the schematic and wiring diagram shown on pages three and four. Figure 2 shows the terminal layout of the sockets with the proper terminal numbers.

Voltages are given for a line voltage of 120 volts, A. C. Allowance should be made for the difference when the line voltage is higher or lower.

IMPORTANT—If the receiver is operated from a direct current power supply circuit, the various voltages measured will be slightly lower than those listed in the table for A. C. operation. A meter having a resistance of 1000 ohms per volt should be used for measuring the D. C. voltages. Voltage values shown are those obtained on the lowest possible scale of a meter having the following ranges: 0-2.5, 0-10, 0-100, 0-250, 0-500, 0-1000 volts except when an asterisk appears after any given voltage value in which case the 1000 volt scale was used.

When the receiver is being operated from an alternating current power supply circuit, it will be necessary to have a high resistance A. C. voltmeter for checking the A. C. voltages.

Tube	Circuit	Cap	Terminals of Sockets								Heater Voltages Between Heater Terminals	
			1	2	3	4	5	6	7	8	Socket Terminal Numbers	Volts
6K7	R. F. Amp.	0	0	12.8	+42	+93	+3.7	0	6.4	+3.7	2-7	6.4
6A8	Mod.—Osc.	0	0	12.8	+100	+64	-4.8	+100	19.2	+1.6	2-7	6.4
6K7	I. F. Amp.	0	0	26	+102	+93	+3.1	0	19.6	+3.1	2-7	6.4
6Q7	Dem.—A.V.C.—Audio	0	0	0	+61*	0	0	+93	6.4	+1.1	2-7	6.4
43	Audio Output	—	26	+100	+103	0	+14.5	53			1-6	27
43	Audio Output	—	53.2	+100	+103	0	+14.5	80.2			1-6	27
25Z5	Rectifier	—	80	116	+108	+108	116	105			1-6	25
Voltage across pilot lamps—28.7 volts.												

A. C. voltages are indicated by italics; when the receiver is operated from a D. C. power supply, D. C. voltages will be obtained in place of the A. C. voltages.
Receiver tuned to 1000 kc., no signal.

26491	Plug (For Tri-Focal Tuning Unit Cable)
26605	Resistor, Type "E", .47 Megohm (Used at Socket of No. 6E5 Tube)
26302	Knob (For Volume Control)
26305	Knob (For Range Switch)
26364	Knob (For Off-On-Tone Control)
26365	Knob (For Large Portion of Tuning Shaft)
26366	Knob (For Vernier Portion of Tuning Shaft)

MODELS 127H, 127M
Alignment, Voltage

STROMBERG-CARLSON TEL. MFG. CO.

Intermediate Frequency Amplifier Adjustments

The intermediate frequency used in these receivers is 465 kilocycles. In making these I. F. circuit adjustments always align in the following order:

1. Secondary of 2nd I. F. Transformer (Capacitor C-13).
2. Primary of 2nd I. F. Transformer (Capacitor C-12).
3. Secondary of 1st I. F. Transformer (Capacitor C-11).
4. Primary of 1st I. F. Transformer (Capacitor C-10).

Radio Frequency Adjustments

The adjustments of the aligning capacitors used in the radio frequency circuits in this receiver should be very carefully made in the following order and at the frequencies specified below:

1. Oscillator's "C" Band Shunt Aligner at 17 Megacycles (Capacitor C-9).
2. R. F. Interstage "C" Band Shunt Aligner at 17 Megacycles (Capacitor C-6).
3. Antenna "C" Band Shunt Aligner at 17 Megacycles (Capacitor C-3).
4. Oscillator's "B" Band Shunt Aligner at 3.4 Megacycles (Capacitor C-8).
5. R. F. Interstage "B" Band Shunt Aligner at 3.4 Megacycles (Capacitor C-5).
6. Antenna "B" Band Shunt Aligner at 3.4 Megacycles (Capacitor C-2).
7. Oscillator's "A" Band Shunt Aligner at 1.4 Megacycles (Capacitor C-7).
8. R. F. Interstage "A" Band Shunt Aligner at 1.4 Megacycles (Capacitor C-4).
9. Antenna "A" Band Shunt Aligner at 1.4 Megacycles (Capacitor C-1).
10. Oscillator's "A" Band Series Aligner at 0.6 Megacycles (Capacitor, Item No. 41).
11. Oscillator's "A" Band Shunt Aligner at 1.4 Megacycles (Capacitor C-7).
12. R. F. Interstage "A" Band Shunt Aligner at 1.4 Megacycles (Capacitor C-4).
13. Antenna "A" Band Shunt Aligner at 1.4 Megacycles (Capacitor C-1).

NORMAL VOLTAGE READINGS

These voltage readings are obtained by measuring between the various tube socket contacts and the heavy bus wire with the tubes in their respective sockets. The receiver is, therefore, in operation when the measurements are made. The heavy bus wire, which is the negative side of the grid and plate voltages, is plainly marked on the schematic and wiring diagram shown on pages three and five. Figure 2 shows the terminal layout of the sockets with the proper terminal numbers.

Voltages are given for a line voltage of 120 volts, A. C. Allowance should be made for the difference when the line voltage is higher or lower.

IMPORTANT—If the receiver is operated from a direct current power supply circuit, the various voltages measured will be slightly lower than those listed in the table for A. C. operation. A meter having a resistance of 1000 ohms per volt should be used for measuring the D. C. voltages. Voltage values shown are those obtained on the lowest possible scale of a meter having the following ranges: 0-2.5, 0-10, 0-100, 0-250, 0-500, 0-1000 volts except when an asterisk appears after any given voltage value in which case the 1000 volt scale was used.

When the receiver is being operated from an alternating current power supply circuit, it will be necessary to have a high resistance A. C. voltmeter for checking the A. C. voltages.

Alignment

NORMAL VOLTAGE READINGS

The various values of voltages listed in the following table are obtained by measuring between the various tube socket contacts and the chassis base, with the tubes in their respective sockets. The receiver is, therefore, in operation when the measurements are made. Figure 1 shows the terminal layout of the sockets with the proper terminal numbers.

Voltages are given for a line voltage of 120 volts, and allowance should be made for differences when the line voltage is higher or lower. A meter having a resistance of 1000 ohms per volt should be used for measuring the D. C. voltages. Voltage values shown are those obtained on the lowest possible scale of a meter having the following ranges: 0-2.5, 0-10, 0-100, 0-250, 0-500, 0-1000 volts except when an asterisk appears after any given voltage value in which case the 1000 volt scale was used.

Table with columns: Tube, Circuit, Cap, Terminals of Sockets (1-8), Heater Voltages Between Heater Terminals (Socket Terminal Number, Volts). Rows include R. F. Amp., Modulator, Oscillator, 1st I. F. Amp., 2nd I. F. Amp., Demodulator, A. V. C., Audio Amp., Audio Output, Tuning Ind., Rectifier, and Speaker.

Voltage across vernier dial pilot lamp—5.3 volts
Receiver tuned to 1000 Kc., no signal. A. C. voltages are indicated by italics.

IMPORTANT—The knob marked "Stations" comes in two parts; the large knurled portion which is used for rapid tuning, and a small knob which is used for the vernier adjustment of the tuning shaft. The large knob marked "Stations" should be placed on the large portion of the tuning shaft so that when the "set" screw of this knob is tightened it will rest on the flat portion of the shaft. Also, do not place this large portion of the knob too tightly against the felt washer and cabinet; place it on the shaft so that there is some degree of freedom between the knob and felt washer and the cabinet. The small (or vernier) portion of this knob should then be pushed on the shaft in the same manner as the other four control knobs. Care should again be taken that this small knob is not forced too tightly against the large tuning knob, as this will cause improper action of the tuning mechanism.

Replacing Fuses If at any time the radio receiver fails to operate (dial lamps fail to light when the "Off-On" switch is turned to the "On" position), first, make sure that the power supply cord has not been removed from the power outlet. Then, if the plug has not been removed, the fuse located in the chassis should be examined. The chassis fuse is located in the inside, rear portion of the base. It is readily accessible by simply removing the rectangular metal cover located on the outside front of the base. Caution: Before removing the "fuse cover" make sure that the "Power Supply Plug" is disconnected from the house current supply. In replacing this fuse see that a fuse of the correct amperage rating is used. The No. 150 Receivers use the Stromberg-Carlson, P.C. 23254 fuse, having a rating of 2 1/2 amperes.

ALIGNMENT DATA FOR MODELS 150 AND 160

All alignment adjustments are accurately made at the factory on this receiver, and ordinarily no readjustments are necessary. However, should it become necessary to make any readjustments, this alignment procedure should be carefully followed.

In making any alignment adjustments always adjust the signal generator's output to the minimum value where a good alignment may still be obtained. Never attempt to make any alignment adjustments using a strong signal. Figure 1 shows the location of all the aligning capacitors used in this receiver.

Intermediate Frequency Amplifier Adjustments

Because of the necessity of obtaining the proper shape of resonance curve of these stages in a high fidelity receiver, it is recommended that unless it is absolutely necessary, no adjustments be made in the factory times adjusters. For this reason, it is best to have these adjustments made at the factory. However, in the case where this cannot be done, the following procedure should be followed.

- Operate the range switch of the receiver to the "A" range position. Set the tuning dial at its extreme low frequency position, and operate the "Tone-Fidelity" control knob so that the receiver is adjusted for the standard facility position as indicated by the fidelity indicator located on the front panel of the receiver. Never attempt to align the I. F. circuits of this receiver with the "Tone-Fidelity" control set at any position other than the standard facility. The I. F. circuits may then be checked for alignment by adjusting the aligning capacitors in the exact order as follows:

- 1. Secondary of 3rd I. F. Trans. (Capacitor C-18).
- 2. Primary of 3rd I. F. Trans. (Capacitor C-17).
- 3. Secondary of 2nd I. F. Trans. (Capacitor C-16).
- 4. Primary of 2nd I. F. Trans. (Capacitor C-15).
- 5. Secondary of 1st I. F. Trans. (Capacitor C-14).
- 6. Primary of 1st I. F. Trans. (Capacitor C-13).

Radio Frequency Adjustments

The alignment of the radio frequency circuits for the various ranges in this receiver should be very carefully made in the order that no instructions are given for aligning the receiver at other than two frequencies for any range. Each receiver is given an exacting check for "tracking" at various frequencies in each range before leaving the factory. It is felt by the manufacturers that should any receiver through accident require a check on the "tracking", it should be returned to the factory, where this may be easily and accurately done.

Alignment of Long-Wave-Weather Range (Also Referred to as "X" Band) Circuits

- 1. Oscillator's "X" Band Shunt Aligning Capacitor at 350 Kilocycles (Capacitor C-12).
- 2. R. F. Interstage "X" Band Shunt Aligning Capacitor at 350 Kilocycles (Capacitor C-8).
- 3. Antenna "X" Band Shunt Aligning Capacitor at 350 Kilocycles (Capacitor C-4).
- 4. Oscillator "X" Band Series Aligning Capacitor at 150 Kilocycles (Capacitor Item 124). When operation No. 4 has been completed repeat operations 1, 2, and 3 again and in the exact order given.

Alignment of Standard Broadcast Range (Also Referred to as "A" Band) Circuits

- 1. Oscillator's "A" Band Shunt Aligning Capacitor at 1500 Kilocycles (Capacitor C-11).
- 2. R. F. Interstage "A" Band Shunt Aligning Capacitor at 1500 Kilocycles (Capacitor C-7).
- 3. Antenna "A" Band Shunt Aligning Capacitor at 1500 Kilocycles (Capacitor C-3).
- 4. "A" Band R. F. Bi-resonator Shunt Aligning Capacitor at 1500 Kilocycles (Capacitor C-19).
- 5. Oscillator "A" Band Series Aligning Capacitor at 500 Kilocycles (Capacitor with screw adjustment. Item 190). When operation No. 5 has been completed repeat operations 1, 2, 3, and 4 again and in the exact order given.

Alignment of Amateur, Police, and Aircraft Range (Also Referred to as "B" Band) Circuits

- 1. Oscillator's "B" Band Shunt Aligning Capacitor at 5 Megacycles (Capacitor C-10).
- 2. R. F. Interstage "B" Band Shunt Aligning Capacitor at 5 Megacycles (Capacitor C-6).
- 3. Antenna "B" Band Shunt Aligning Capacitor at 5 Megacycles (Capacitor C-2).
- 4. Oscillator "B" Band Series Aligning Capacitor at 1.8 Megacycles (Capacitor with nut adjustment. Item 190). When operation No. 4 has been completed repeat operations 1, 2, and 3 again and in the exact order given.

Alignment of Short-Wave-Foreign Range (Also Referred to as "C" Band) Circuits

- 1. Oscillator's "C" Band Shunt Aligning Capacitor at 16 Megacycles (Capacitor C-9).
- 2. R. F. Interstage "C" Band Shunt Aligning Capacitor at 16 Megacycles (Capacitor C-5).
- 3. Antenna "C" Band Shunt Aligning Capacitor at 16 Megacycles (Capacitor C-1).

Alignment of Ultra Short-Wave Range (Also Referred to as "D" Band) Circuits

- 1. The only adjustment which it is necessary to make for bringing the "D" Band Oscillator's circuit into alignment is accomplished by bending the ground loop (shown in Figure 1 as "D" Band Oscillator Circuit Adjustment) either closer to the coil or farther away from the coil. This adjustment should be made with the signal generator set to a frequency of 20 megacycles.
- 2. The only adjustment which it is necessary to make for bringing the "D" Band Antenna's circuit into alignment is accomplished by bending the grid lead loop (shown in Figure 1 as "D" Band Antenna Circuit Adjustment) so as to form either a smaller or larger loop. This adjustment should also be made with the signal generator set to a frequency of 20 megacycles.

Adjustment of 10 Kilocycle Audio Cut-Off Filter

The adjustment of this filter is correctly made at the factory and no additional adjustment is required.

Intermediate Frequency Amplifier Adjustments

The intermediate frequency used in these receivers is 465 kilocycles. In making these I. F. circuit adjustments always align in the following order:

1. Secondary of 3rd I. F. Transformer (Capacitor C-15).
2. Primary of 3rd I. F. Transformer (Capacitor C-14).
3. Secondary of 2nd I. F. Transformer (Capacitor C-13).
4. Primary of 2nd I. F. Transformer (Capacitor C-12).
5. Secondary of 1st I. F. Transformer (Capacitor C-11).
6. Primary of 1st I. F. Transformer (Capacitor C-10).

Radio Frequency Adjustments

The adjustments of the aligning capacitors used in the radio frequency circuits in this receiver should be very carefully made in the following order and at the frequencies specified below:

1. Oscillator's "C" Band Shunt Aligner at 17 Megacycles (Capacitor C-9).
2. R. F. Interstage "C" Band Shunt Aligner at 17 Megacycles (Capacitor C-6).
3. Antenna "C" Band Shunt Aligner at 17 Megacycles (Capacitor C-3).
4. Oscillator's "B" Band Shunt Aligner at 3.4 Megacycles (Capacitor C-8).
5. R. F. Interstage "B" Band Shunt Aligner at 3.4 Megacycles (Capacitor C-5).
6. Antenna "B" Band Shunt Aligner at 3.4 Megacycles (Capacitor C-2).
7. Oscillator's "A" Band Shunt Aligner at 1.4 Megacycles (Capacitor C-7).
8. R. F. Interstage "A" Band Shunt Aligner at 1.4 Megacycles (Capacitor C-4).
9. Antenna "A" Band Shunt Aligner at 1.4 Megacycles (Capacitor C-1).
10. Oscillator's "A" Band Series Aligner at 0.6 Megacycles (Capacitor C-10).
11. Oscillator's "A" Band Shunt Aligner at 1.4 Megacycles (Capacitor C-7).
12. R. F. Interstage "A" Band Shunt Aligner at 1.4 Megacycles (Capacitor C-4).
13. Antenna "A" Band Shunt Aligner at 1.4 Megacycles (Capacitor C-1).

Chassis, Notes

STROMBERG-CARLSON TEL. MFG. CO. MODELS 140H, 140K, 140L, 140KB, 140LB, 140PB, 140OL

The No. 140-H Receiver is furnished with a highly efficient Stromberg-Carlson dynamic speaker and the exclusive "Patent Applied For" Stromberg-Carlson "Tri-Focal Tuning System."

The Nos. 140-K, 140-L, and 140-P Receivers differ from the No. 140-H Receiver in that they are of a fixed high fidelity type. In these receivers the same chassis is used as in the No. 140-H Receiver, including the "Tri-Focal Tuning System" and Selectorlite dial arrangement. In addition to these features the Nos. 140-K, 140-L, and 140-P Receivers are equipped with a Carpinchoe high fidelity dynamic speaker in place of the standard broadcast speaker which is furnished in the No. 140-H Receiver. Audio reproduction is further improved in these three models by employing sound diffusing vanes in front of the loud speaker opening, which distribute the higher pitched tones, thereby providing excellent reproduction in all parts of the room by spreading out these directional frequencies.

In the Nos. 140-L and 140-P Receivers inclusion is made of the exclusive Stromberg-Carlson Acoustical Laboratories' revolutionary new development, the Acoustical Labyrinth. This new device extends the bass response, provides reproduction only from the front of the cabinet, and eliminates all cabinet resonance.

In addition to all of the above features, the No. 140-P Receiver is equipped with a highly efficient single record playing phonograph unit which has an entirely new type of pick-up suspension device.

Alignment, Voltage

STROMBERG-CARLSON TEL. MFG. CO.

ALIGNMENT OF THE AMPLIFIED AUTOMATIC VOLUME CONTROL CIRCUIT

The alignment adjustments for this circuit should only be made after the circuits of the intermediate and radio frequency amplifiers have been aligned. Never align the amplified automatic volume control circuit until the intermediate and radio frequency circuits have been aligned. In making the alignment adjustment of this circuit, the volume control potentiometer should be turned in on the receiver. The strength of this signal should be on the order of approximately 2000 microvolts. The potentiometer is correctly tuned in, the aligning capacitor C-23 and C-22 should be adjusted to the position where a minimum value of signal is obtained from the output of the receiver. These two adjustments should be made in the order given.

Adjustment of 10 Kilocycle Audio Cut-Off Filter

The adjustment of this filter is correctly made at the factory and no additional adjustment is required.

NORMAL VOLTAGE READINGS

The various values of voltages listed in the following table are obtained by measuring between the various tube socket contacts and the chassis base, with the tubes in their respective sockets. The receiver is, therefore, in operation when the measurements are made. Figure 2 shows the terminal layouts of the sockets with the proper terminal numbers.

Voltages are given for a line voltage of 120 volts, and allowances should be made for differences when the line voltage is higher or lower. A meter having a resistance of 1600 ohms per volt should be used for measuring the D. C. voltages. Voltage values shown are those obtained on the lowest possible scale of a meter having the following ranges: 0-2.5, 0-10, 0-100, 0-250, 0-500, 0-1000 volts except when an asterisk appears after any given voltage value in which case the 1000 volt scale was used.

ALIGNMENT DATA

All alignment adjustments are accurately made at the factory on this receiver, and ordinarily no readjustments are necessary. Should it become necessary to make any readjustments, this alignment procedure should be carefully followed.

In making any alignment adjustments always adjust the signal generator's output to the minimum value where a good alignment may still be obtained. Never attempt to make any alignment adjustments using a strong signal.

Figure 3 shows the location of all the aligning capacitors used in this receiver.

Intermediate Frequency Amplifier Adjustments

Because of the necessity of obtaining the proper shape of resonance curve of these stages in a high fidelity receiver, it is recommended that unless it is absolutely essential, these I. F. adjustments be untouched. In the factory these adjustments are made using a special system which allows in operation the lowest amplifier and the resonance curve to be obtained. However, in the case where this cannot be done, the following procedure should be followed.

Operate the range switch of the receiver in the "A" range position. Set the tuning dial at its extreme low frequency position, and operate the receiver at the frequency indicated on the front panel of the receiver. Never attempt to align the I. F. circuits of this receiver with the "Tone-Fidelity" control set at any position other than the standard fidelity. The I. F. circuits may then be checked for alignment by adjusting the aligning capacitors in the exact order as follows:

1. Secondary of 3rd I. F. Trans. (Capacitor C-19).
2. Primary of 3rd I. F. Trans. (Capacitor C-18).
3. Secondary of 2nd I. F. Trans. (Capacitor C-17).
4. Primary of 2nd I. F. Trans. (Capacitor C-16).
5. Secondary of 1st I. F. Trans. (Capacitor C-15).
6. Primary of 1st I. F. Trans. (Capacitor C-14).

Radio Frequency Adjustments

The alignment of the radio frequency circuits for the various ranges in this receiver should be very carefully made in the order and at the frequencies specified.

It will be noted that no instructions are given for aligning the receiver at other than two frequencies for any range. Each receiver is given an exacting check for accuracy at these two frequencies. Through accident or carelessness (leaving the receiver in the "A" range position) it should be returned to the factory, where this may be easily and accurately done.

ALIGNMENT OF LONG-WAVE-WEATHER RANGE (ALSO REFERRED TO AS "X" BAND) CIRCUITS

1. Oscillator's "X" Band Shunt Aligning Capacitor at 350 Kilocycles (Capacitor C-13).
2. R. F. Interstage "X" Band Shunt Aligning Capacitor at 350 Kilocycles (Capacitor C-9).
3. Antenna "X" Band Shunt Aligning Capacitor at 350 Kilocycles (Capacitor C-4).
4. Oscillator "X" Band Series Aligning Capacitor at 150 Kilocycles (Capacitor Item 150). When operation No. 4 has been completed repeat operations 1, 2, and 3 again and in the exact order given.

ALIGNMENT OF STANDARD BROADCAST RANGE (ALSO REFERRED TO AS "A" BAND) CIRCUITS

1. Oscillator's "A" Band Shunt Aligning Capacitor at 1500 Kilocycles (Capacitor C-12).
2. R. F. Interstage "A" Band Shunt Aligning Capacitor at 1500 Kilocycles (Capacitor C-8).
3. Antenna "A" Band Shunt Aligning Capacitor at 1500 Kilocycles (Capacitor C-3).
4. "A" Band, R. F. Bi-resonator Shunt Aligning Capacitor at 1500 Kilocycles (Capacitor C-30).
5. Oscillator "A" Band Series Aligning Capacitor at 600 Kilocycles (Capacitor with screw adjustment, Item 29). When operation No. 5 has been completed repeat operations 1, 2, 3, and 4 again and in the exact order given.

ALIGNMENT OF AMATEUR, POLICE, AND AIRCRAFT RANGE (ALSO REFERRED TO AS "B" BAND) CIRCUITS

1. Oscillator's "B" Band Shunt Aligning Capacitor at 5 Megacycles (Capacitor C-11).
2. R. F. Interstage "B" Band Shunt Aligning Capacitor at 5 Megacycles (Capacitor C-7).
3. Antenna "B" Band Shunt Aligning Capacitor at 5 Megacycles (Capacitor C-2).
4. Oscillator "B" Band Series Aligning Capacitor at 1.8 Megacycles (Capacitor with nut adjustment, Item 29). When operation No. 4 has been completed repeat operations 1, 2, and 3 again and in the exact order given.

ALIGNMENT OF SHORT-WAVE-FOREIGN RANGE (ALSO REFERRED TO AS "C" BAND) CIRCUITS

1. Oscillator's "C" Band Shunt Aligning Capacitor at 16 Megacycles (Capacitor C-10).
2. R. F. Interstage "C" Band Shunt Aligning Capacitor at 16 Megacycles (Capacitor C-6).
3. Antenna "C" Band Shunt Aligning Capacitor at 16 Megacycles (Capacitor C-4).

ALIGNMENT OF ULTRA SHORT-WAVE RANGE (ALSO REFERRED TO AS "D" BAND) CIRCUITS

1. The only adjustment which it is necessary to make for bringing the "D" Band Oscillator's circuit into alignment is accomplished by bending the ground loop (shown in Figure 2 as "D" Band Oscillator Circuit Adjustment) either closer to the coil or farther away from the coil. This adjustment should be made with the signal generator set to a frequency of 20 megacycles.
2. The only adjustment which it is necessary to make for bringing the "D" Band Antenna's circuit into alignment is accomplished by bending the grid lead loop (shown in Figure 2 as "D" Band Antenna Circuit Adjustment) so as to form either a smaller or larger loop. This adjustment should also be made with the signal generator set to a frequency of 20 megacycles.

MISCELLANEOUS PARTS

Piece Number	Part
26250	Cone Assembly (For P-26170 Speaker)
26043	Plug (For Loud Speaker Cable)
26369	Resistor, Type "E", 1 Megohm (Used at Socket of No. 6E5 Tube)
26302	Knob (For "Volume" Control)
26290	Knob (For "Tone-Fidelity" Control)
26305	Knob (For "Stations" Selector Control Shaft)
26306	Knob (For "Vernier" Stations Selector Control Shaft)
26301	Knob (For "Range" Switch)
26300	Knob (For "Off-On" Switch and Bass Control)

MODEL 225 AC-DC
Socket, Chassis

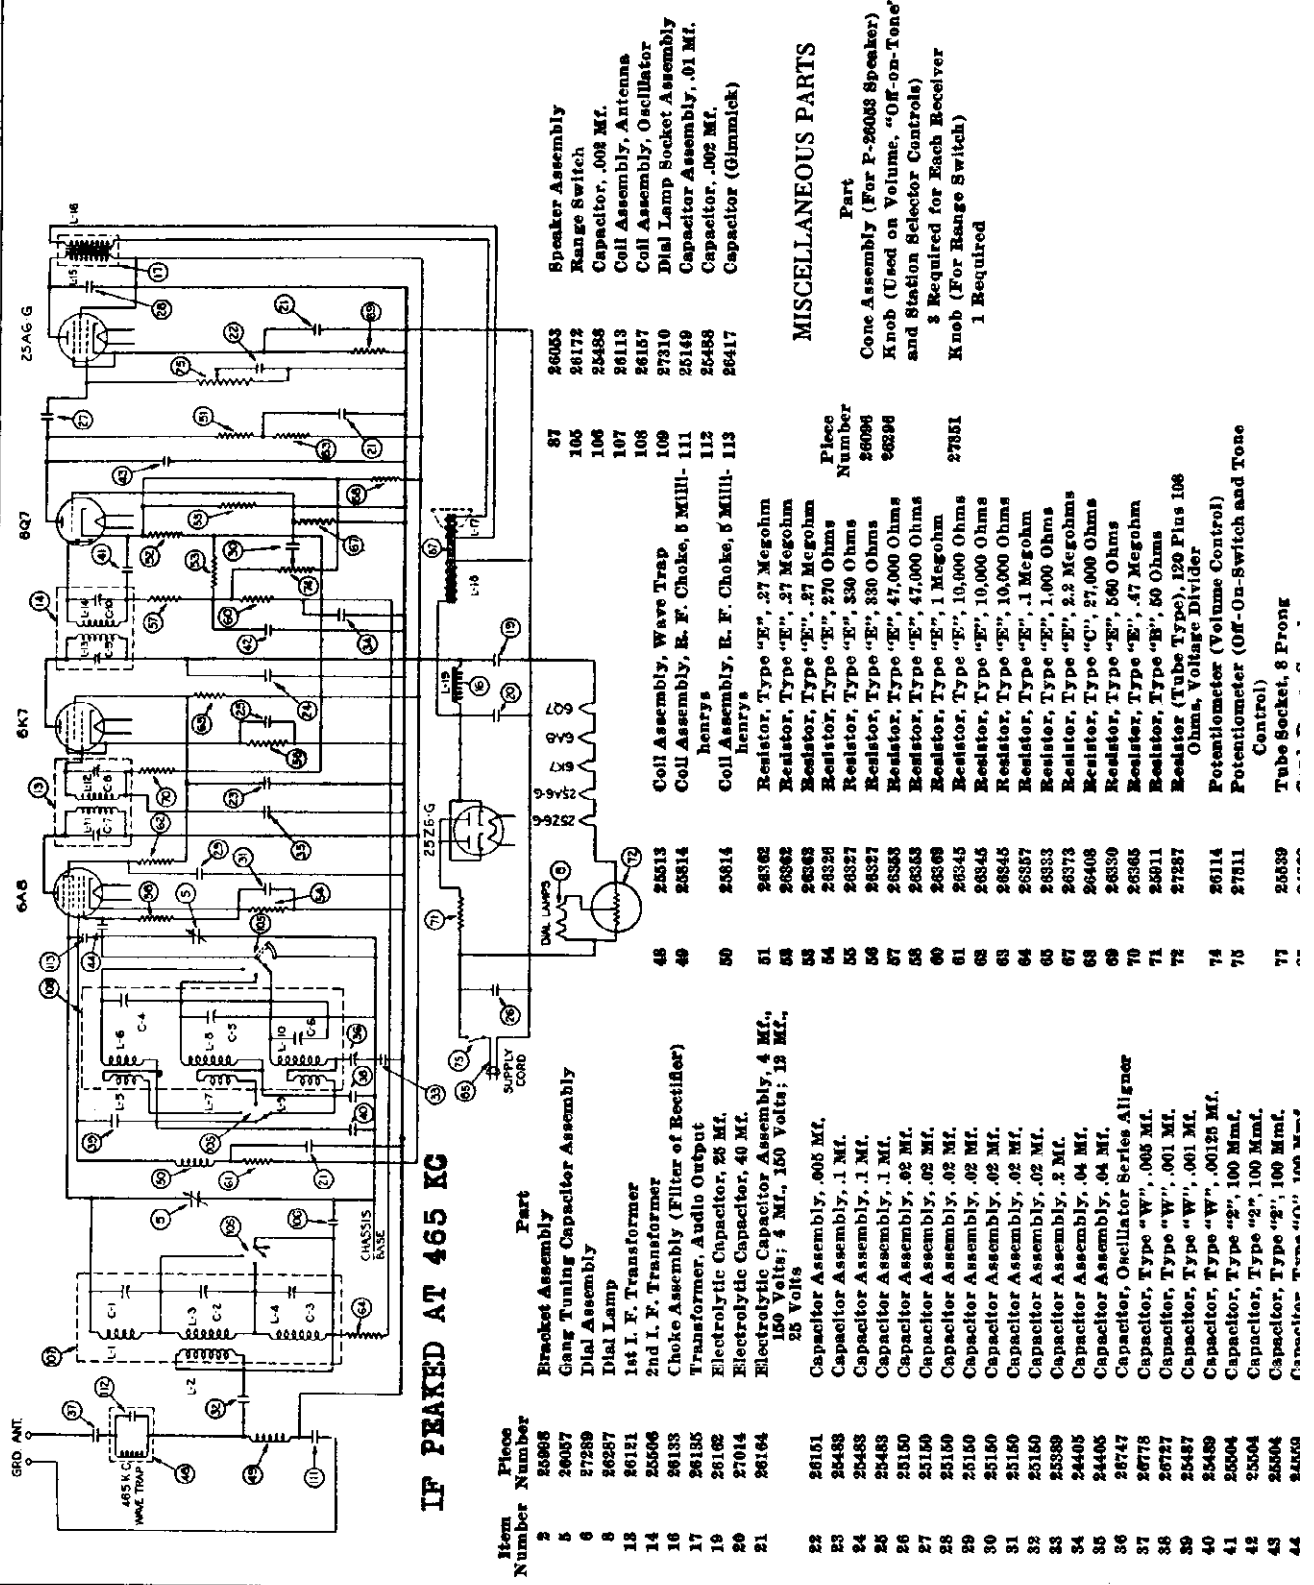

STROMBERG-CARLSON TEL. MFG. CO.

No. 225 Receiver.....50 to 60 Cycles (For AC Operation).....P-27285 Chassis Assembly

CIRCUIT DESCRIPTION

This triple range, superheterodyne receiver has five tubes and may be operated on a power supply circuit of either alternating or direct current at the voltages and frequency (for A. C. operation) specified above.

IF PEAKED AT 465 KC

MODEL 225 AC-DC
Voltage, Alignment
Trimmers, Notes

STROMBERG-CARLSON TEL. MFG. CO.

Voltages are given for a line voltage of 120 volts, A. C. Allowance should be made for the difference when the line voltage is higher or lower.

IMPORTANT—If the receiver is operated from a direct current power supply circuit, the various voltages measured will be slightly lower than those listed in the table for A. C. operation. A meter having a resistance of 1000 ohms per volt should be used for measuring the D. C. voltages. Voltage values shown are those obtained on the lowest possible scale of a meter having the following ranges: 0-2.5, 0-10, 0-100, 0-250, 0-500, 0-1000 volts except when an asterisk appears after any given voltage value in which case the 1000 volt scale was used.

When the receiver is being operated from an alternating current power supply circuit, it will be necessary to have a high resistance A. C. voltmeter for checking the A. C. voltages.

Tube	Circuit	Cap	Terminals of Sockets								Heater Voltages Between Heater Terminals	
			1	2	3	4	5	6	7	8	Socket Terminal Numbers	Volts

Voltage across pilot lamps			13 volts									

A. C. voltages are indicated by italics; when the receiver is operated from a D. C. power supply, D. C. voltages will be obtained in place of the A. C. voltages.
Receiver tuned to 1000 kc., no signal.

Intermediate Frequency Adjustments

The intermediate frequency used in these receivers is 465 kilocycles. In making these I. F. circuit adjustments always align in the following order:

1. Secondary of 2nd I. F. Transformer (Capacitor C-10).
2. Primary of 2nd I. F. Transformer (Capacitor C-9).
3. Secondary of 1st I. F. Transformer (Capacitor C-8).
4. Primary of 1st I. F. Transformer (Capacitor C-7).

Radio Frequency Adjustments

The adjustments of the aligning capacitors used in the radio frequency circuits in this receiver should be very carefully made in the following order and at the frequencies specified below:

1. Oscillator's "C" Band Shunt Aligner at 17 Megacycles (Capacitor C-4).
2. Antenna "C" Band Shunt Aligner at 17 Megacycles (Capacitor C-1).
3. Oscillator's "B" Band Shunt Aligner at 3.4 Megacycles (Capacitor C-5).
4. Antenna "B" Band Shunt Aligner at 3.4 Megacycles (Capacitor C-2).
5. Oscillator's "A" Band Shunt Aligner at 1400 Kilocycles (Capacitor C-6).
6. Antenna "A" Band Shunt Aligner at 1400 Kilocycles (Capacitor C-3).
7. Oscillator's "A" Band Series Aligner at 600 Kilocycles (Capacitor (36)).
8. Oscillator's "A" Band Shunt Aligner at 1400 Kilocycles (Capacitor C-6).
9. Antenna "A" Band Shunt Aligner at 1400 Kilocycles (Capacitor C-3).

Radio Frequency Adjustments

The alignment of the radio frequency circuits of the various ranges in these receivers should be very carefully made and in the order specified.

Alignment of Short Wave Range (Also Referred to as "C" Band)

In aligning the radio frequency circuits for this range, replace the 0.1-microfarad capacitor which was placed in series with the test oscillator's output lead for the I. F. alignments, with a 400-ohm carbon type resistor. This lead should then be connected to the antenna binding post located on the rear of the receiver chassis. The ground terminal (or low side) of the test oscillator should be connected to the ground binding post on the receiver.

1. Operate the Range Switch on the receiver chassis to the "C" range position, and set the test oscillator's frequency and the receiver's tuning dial to 17 megacycles.
2. Adjust the oscillator's "C" band high frequency aligner for maximum output.
3. Adjust the antenna's "C" band high frequency aligner for maximum output, at the same time rotate the gang tuning capacitor back and forth through resonance until maximum output is obtained.

Alignment of Aircraft, Amateur, and Police Range (Also Referred to as "B" Band)

In aligning the radio frequency circuits for this range, use the same artificial antenna (400-ohm carbon type resistor) in series with the output terminal of the test oscillator as was used for aligning the short-wave range.

1. Operate the Range Switch on the receiver chassis to the "B" range position, and set the test oscillator's frequency and the receiver's tuning dial to 3.4 megacycles.
2. Adjust the oscillator's "B" band high frequency aligner for maximum output.
3. Adjust the antenna's "B" band high frequency aligner for maximum output, and at the same time rotate the gang tuning capacitor back and forth through resonance until maximum output is obtained.

Alignment of Standard Broadcast Range (Also Referred to as "A" Band)

In aligning the radio frequency circuits for this range, replace the 400-ohm carbon type resistor in series with the test oscillator's output lead with a 200-micro-microfarad capacitor and align these circuits as follows:

1. Operate the Range Switch to the "A" range position and set the test oscillator's frequency and the receiver's tuning dial to 1.4 megacycles.
2. Adjust the oscillator's "A" band high frequency aligner for maximum output.
3. Adjust the antenna's "A" band high frequency aligner for maximum output.
4. Set the test oscillator's frequency and the receiver's tuning dial to 0.6 megacycles.
5. Adjust the oscillator's "A" band low frequency aligner (series aligner) for maximum output, and at the same time rotate the gang tuning capacitor slightly back and forth through resonance until maximum output is obtained.
6. Reset both the test oscillator's frequency and receiver's tuning dial to 1.4 megacycles and repeat operations Nos. 2 and 3.

24200	R10	Resistor, Type "E", 100,000 Ohms

NORMAL VOLTAGE READINGS

The various values of voltages listed in the following table are obtained by measuring between the various tube socket contacts and the chassis base, with the tubes in their respective sockets. The receiver is, therefore, in operation when the measurements are made. Figure 1, shows the terminal layout of the sockets with the proper terminal numbers.

Voltages are given for a line voltage of 120 volts, and allowance should be made for differences when the line voltage is higher or lower. A meter having a resistance of 1000 ohms per volt should be used for measuring the D. C. voltages. All voltages shown are those obtained on the lowest possible scale of a meter having the 0-500 scale. Voltages of 1000 volts except when an asterisk appears after any given voltage value in which case the 250 volt scale was used.

Tube	Circuit	Terminals of Sockets									
		1	2	3	4	5	6	7	8

5Y4G	Rectifier	—	0	0	385	—	335	—	+340	7-8	4.9
Speaker Socket		—	+340	0	0	+340	+340	—	+220		

Receiver tuned to 1000 Kc., no signal. A. C. voltages are indicated by italics.

In making any alignment adjustments, always adjust the test oscillator's output voltage to the minimum value. A. C. voltage should be measured across the test oscillator's output terminals. Before connecting the test oscillator to any circuit, be sure that the "On-Off" control knob is set for maximum treble response (position where knob is rotated from its maximum counter-clockwise position, slightly clockwise to position where set turns "on"). Figure 1, shows the location of all the aligning capacitors in these receivers.

In making any alignment adjustments on these receivers, it will not be necessary to remove the chassis from the cabinet. The aligning capacitors for the intermediate frequency circuits of these receivers are easily accessible from the rear of the receiver, and the aligning capacitors for the radio frequency circuits are accessible either through the bottom of the cabinet or through the bottom of the cabinet shell depending upon the style of cabinet. See Figure 2.

Dial Adjustment

Before aligning the circuits of any of these receivers, the tuning dial must be properly aligned to track with the gang tuning capacitors. To check whether the dial is set correctly with respect to the gang tuning capacitor, rotate the "Station Selector" knob in a clockwise direction so that the gang tuning capacitor is set to its maximum value. Then, rotate the "Station Selector" knob so that the dial pointer lines up with the vertical middle vertical line located on the three vertical lines located on the glass dial and the vertical lines located on the metal panel of the dial frame. Now, rotate the "Station Selector" knob so that the dial pointer lines up with the horizontal lines located on the metal panel of the dial frame; with the pointer in this position the two horizontal center marks of the glass dial (located at approximately 3.4 megacycles on the right hand scale and 2.16 megacycles on the left hand scale) should be aligned with the vertical lines on the metal panel of the dial frame. Loosen the four clamps which hold the glass dial to the dial pan by slightly loosening the four screws, and shift the glass dial so that a good alignment between the dial pointer, the glass dial, and alignment marks located on the metal pan of the dial frame is obtained for both the horizontal and vertical position of the dial pointer.

Intermediate Frequency Adjustments

The intermediate frequency used in these receivers is 465 kilocycles. In making these circuit adjustments always align the circuits in the order given in these instructions.

1. Operate the "Range" switch of the receiver to the "A" range position. Set the receiver's tuning dial at its extreme low frequency position, and operate the Tone Control knob to the "Normal" position. Rotate the Volume Control knob to its maximum clockwise position (maximum volume).
2. Apply between the chassis base (or ground binding post) of the receiver and the grid of the No. 6A9 modulator-oscillator tube, a modulated signal of 465 kilocycles from the test oscillator, using a 0.1 microfarad capacitor in series with the connection between the output terminal of the test oscillator (or low side) terminal and the grid of the modulator-oscillator tube. The next step should be to connect the chassis base (or ground binding post) terminal of the test oscillator to the ground binding post terminal of the receiver.
3. Now, noting Figure 1, the aligning capacitors for the first and second I. F. transformers, align the I. F. circuits in the following manner:
 Primary of second I. F. transformer.
 Secondary of second I. F. transformer.
 Primary of first I. F. transformer.
 Secondary of first I. F. transformer.
 Adjust the capacitors to obtain maximum reading on the output meter, reducing the output of the test oscillator as required.

Receiver tuned to 1000 Kc., no signal. A. C. voltages are indicated by italics.

ALIGNMENT DATA

All alignment adjustments are accurately made at the factory on these receivers and ordinarily no readjustments are necessary. However, should it become necessary to make any readjustments, this alignment procedure should be carefully followed.

In making any alignment adjustments always adjust the signal generator's output to the minimum value where a good alignment may still be obtained. Never attempt to make any alignment adjustments using a strong signal.

Figure 2 shows the location of all the aligning capacitors used in this receiver.

Intermediate Frequency Amplifier Adjustments

The intermediate frequency used in these receivers is 465 kilocycles. In making these I. F. circuit adjustments always align in the following order:

1. Secondary of 2nd I. F. Transformer (Capacitor C-13).
2. Primary of 2nd I. F. Transformer (Capacitor C-12).
3. Secondary of 1st I. F. Transformer (Capacitor C-11).
4. Primary of 1st I. F. Transformer (Capacitor C-10).

Radio Frequency Adjustments

The adjustments of the aligning capacitors used in the radio frequency circuits in this receiver should be very carefully made in the following order and at the frequencies specified below:

1. Oscillator's "C" Band Shunt Aligner at 17 Megacycles (Capacitor C-7).
2. R. F. Interstage "C" Band Shunt Aligner at 17 Megacycles (Capacitor C-6).
3. Antenna "C" Band Shunt Aligner at 17 Megacycles (Capacitor C-3).
4. Oscillator's "B" Band Shunt Aligner at 3.4 Megacycles (Capacitor C-8).
5. R. F. Interstage "B" Band Shunt Aligner at 3.4 Megacycles (Capacitor C-5).
6. Antenna "B" Band Shunt Aligner at 3.4 Megacycles (Capacitor C-2).
7. Oscillator's "A" Band Shunt Aligner at 1.4 Megacycles (Capacitor C-9).
8. R. F. Interstage "A" Band Shunt Aligner at 1.4 Megacycles (Capacitor C-4).
9. Antenna "A" Band Shunt Aligner at 1.4 Megacycles (Capacitor C-1).
10. Oscillator's "A" Band Series Aligner at 0.8 Megacycles (Capacitor C-23).

STROMBERG-CARLSON TEL. MFG. CO.

CIRCUIT DESCRIPTION

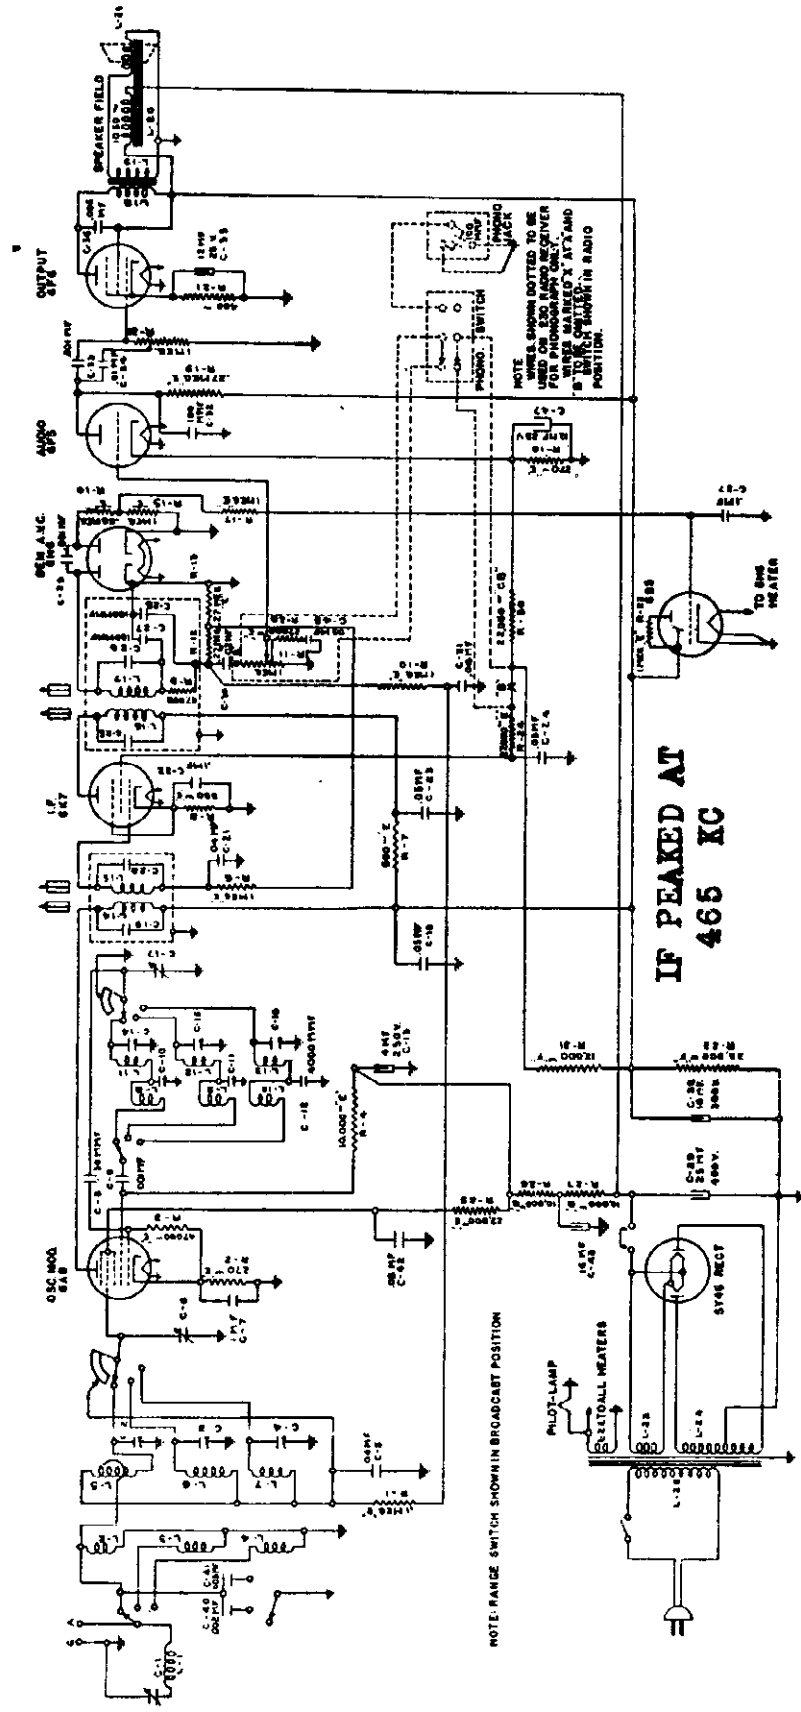

The Stromberg-Carlson No. 229-P Radio Receivers are eight tube, superheterodyne receivers employing metal tubes and a highly efficient dynamic speaker. These receivers have three tuning ranges which are quickly interchangeable by means of a rotary switch, the control knob of which is located on the control panel. Ease and convenience of operation are assured by the vernier drive with its associated double knob. Resonance with a signal is indicated by means of the tuning indicator tube which operates on the cathode-ray principle. The strength of a received signal may be determined by observing the size of the aperture appearing on the target of the tuning indicator tube, the stronger a received signal the greater the reduction in the size of the aperture. A low level bass frequency compensating circuit is also provided in the volume control circuit of these receivers, which operates to give balanced reproduction at any setting of the volume control.

These receivers are also equipped with a single record playing mechanism unit which uses a crystal turn

Alignment, Voltage

exactly centered over the dial alignment lines (black lines) which are located at the extreme low frequency and high frequency ends of the dial. If the alignment lines are not centered over the dial, the tuning dial should be rotated until the illuminated dial indicator line is centered over the illuminated dial indicator line. The two set screws of the dial hub should then be securely tightened.

Intermediate Frequency Adjustments

The intermediate frequency used in these receivers is 465 kilocycles. In making these circuit adjustments always align the circuits in the order given in these instructions.

1. Operate the "range" switch of the receiver to the "A" range position. Set the receiver's tuning dial at its extreme low frequency end. Rotate the tuning dial to the "C" range position. Rotate the Volume Control knob to its maximum clockwise position (maximum volume).
2. Apply between the chassis base (or ground binding post) of the receiver and the grid of the No. 6A8 modulator oscillator tube, a modulated signal of 465 kilocycles from the test oscillator, using a 0.1-microfarad capacitor in series with the connection between the output terminal of the test oscillator and the grid of the No. 6A8 tube. Do not remove the chassis grid lead connecting to this tube. The ground (or low side) terminal of the test oscillator should be connected to either the chassis base or the ground binding post terminal.
3. Now, noting from Figure 1 the aligning adjustments for the first and second I. F. transformers, align the I. F. circuits in the following manner:

- Secondary of second I. F. transformer.
- Primary of second I. F. transformer.
- Secondary of first I. F. transformer.
- Primary of first I. F. transformer.

Adjusting the circuits to obtain maximum reading on the output meter, reducing the output of the test oscillator as required.

Radio Frequency Adjustments

The alignment of the radio frequency circuits of the various ranges in these receivers should be very carefully made and in the order specified.

Alignment of Short Wave Range (Also Referred to as "C" Band)

In aligning the radio frequency circuits for this range, replace the 0.1-microfarad capacitor which was placed in series with the test oscillator lead by a 200-microfarad capacitor. This lead should then be connected to the antenna binding post located on the rear of the receiver chassis. The ground terminal (or low side) of the test oscillator should be connected to the ground binding post on the receiver.

1. Operate the Range Switch on the receiver chassis to the "C" range position, and set the test oscillator's frequency and the receiver's tuning dial to 17 megacycles.
2. Adjust the oscillator's "C" band high frequency aligner for maximum output.
3. Adjust the antenna's "C" band high frequency aligner for maximum output, at the same time rotate the gang tuning capacitor back and forth through resonance until maximum output is obtained.

Alignment of Aircraft, Amateur, and Police Range (Also Referred to as "B" Band)

In aligning the radio frequency circuits for this range, use the same artificial antenna (400-ohm carbon type resistor) in series with the output terminal of the test oscillator as was used for aligning the short-wave range.

1. Operate the Range Switch on the receiver chassis to the "B" range position, and set the test oscillator's frequency and the receiver's tuning dial to five megacycles.
2. Adjust the oscillator's "B" band high frequency aligner for maximum output.
3. Adjust the antenna's "B" band high frequency aligner for maximum output, and at the same time rotate the gang tuning capacitor back and forth through resonance until maximum output is obtained.
4. Set the test oscillator's frequency and the receiver's tuning dial to 1.5 megacycles.
5. Adjust the oscillator's "B" band low frequency aligner (series aligner), and at the same time rotate the gang tuning capacitor back and forth through resonance until maximum output is obtained.
6. Repeat both the test oscillator's frequency and the receiver's tuning dial to 5 megacycles, and repeat operations Nos. 2 and 3.

Alignment of Standard Broadcast Range (Also Referred to as "A" Band)

In aligning the radio frequency circuits for this range, replace the 400-ohm carbon type resistor in series with the test oscillator's output lead with a 200-microfarad capacitor and align these circuits as follows:

1. Operate the Range Switch to the "A" range position and set the test oscillator's frequency and the receiver's tuning dial to 1.4 megacycles.
2. Adjust the oscillator's "A" band high frequency aligner for maximum output.
3. Adjust the antenna's "A" band high frequency aligner for maximum output.
4. Set the test oscillator's frequency and the receiver's tuning dial to 0.6 megacycles.
5. Adjust the oscillator's "A" band low frequency aligner (series aligner) for maximum output, and at the same time rotate the gang tuning capacitor slightly back and forth through resonance until maximum output is obtained.
6. Repeat both the test oscillator's frequency and receiver's tuning dial to 1.4 megacycles and repeat operations Nos. 2 and 3.

Wave Trap Adjustment

In adjusting the wave trap circuit, the "Signal Admission Control" should be set for the most sensitive position (shaft rotated in the most counter-clockwise direction). Set the Range Switch of the receiver to the "A" range position and the tuning dial to 1000 kilocycles. Connect a 200-microfarad capacitor in series with the antenna binding post on the receiver chassis. The ground terminal of the test oscillator should be connected to the ground binding post on the receiver. Then, with the modulated test oscillator set at the frequency of the intermediate amplifier, 465 kilocycles, supply a fairly strong signal to the receiver and adjust the wave trap amplifier until a minimum indication is obtained on the output meter.

In order to obtain maximum performance on the Standard Broadcast Range ("A" Band) of these receivers, a "signal admission control switch" is provided. This control is located on the inside face of the tuning dial base, and has a slotted shaft which protrudes through the base so that it may be adjusted by the use of a screw driver. When either the "B" or "C" ranges are in operation, this signal admission control is automatically cut out of the circuit, allowing the receiver to function at its maximum sensitivity on these two ranges. When operating in the Standard Broadcast Range, maximum sensitivity is obtained when the slotted shaft of this control is in the "signal admission" position, and when in the "wave trap" position, the signal admission control, placed in the receiver in operation, and then adjust this control so that the signal admission control should be made in the event if best results are to be obtained.

The volume control circuit in these receivers is arranged to give balanced reproduction at any setting of the volume control by means of a low level bias frequency compensating network.

A metal guard frame is furnished on these receivers to prevent damage to the chassis components and also to facilitate ease of servicing should this become necessary. Do not turn the chassis over on its guard frame without first removing the tuning indicator unit which is secured to the metal guard frame. To remove the tuning indicator unit from the guard frame, first unscrew the knurled screw which holds the tuning indicator's clamp to the metal guard frame, which will then allow the tuning indicator unit to be removed from the guard frame.

The chassis used in the No. 230 Receivers differ from the chassis used in the No. 231 Receivers only in the type of electrolytic filter capacitors which are used. Two wiring diagrams are, therefore, shown in this book, one for the No. 230 Receiver Chassis, and one for the No. 231 Receiver Chassis.

NORMAL VOLTAGE READINGS

The various values of voltages listed in the following table are obtained by measuring between the various tube socket contacts and the chassis base with the tubes in their respective sockets. The receiver is, therefore, in operation when the measurements are made. Figure 1 shows the terminal layouts of the sockets with the proper terminal numbers.

Voltages are given for a line voltage of 120 volts, and an allowance should be made for differences when the line voltage is higher or lower. A meter having a resistance of 1000 ohms per volt should be used for measuring the D. C. voltages. The following ranges are obtainable on the lowest scale of a meter having the following ranges: 0-25, 0-50, 0-100, 0-250, 0-500, 0-1000 volts.

Tube	Circuit	Terminals of Sockets										
		Cap	1	2	3	4	5	6	7	8	Grid Terminal Terminals	
6A8	Mod.—Osc.	0	0	0	-245	+100	-8	+155	6.1	+2.5	2-7	6.1
6K7	I. F. Amp.	0	0	0	-245	+100	+3	+160	6.1	+3	2-7	6.1
6H6	Dem.—A. V. C.	—	0	0	0	0	0	0	6.1	0	2-7	6.1
6F5	Audio Amp.	0	0	0	-250	+115	+150	+150	6.1	+1.7	2-7	6.1

6G5	Tuning Ind.	—	0	+2.4	0	+250	0	6.1	1-6	6.1		
5Y4G	Rectifier	—	0	0	350	0	350	0	+330	+330	7-8	4.8
Speaker Socket		—	+330	0	0	+330	+330	—	+255			

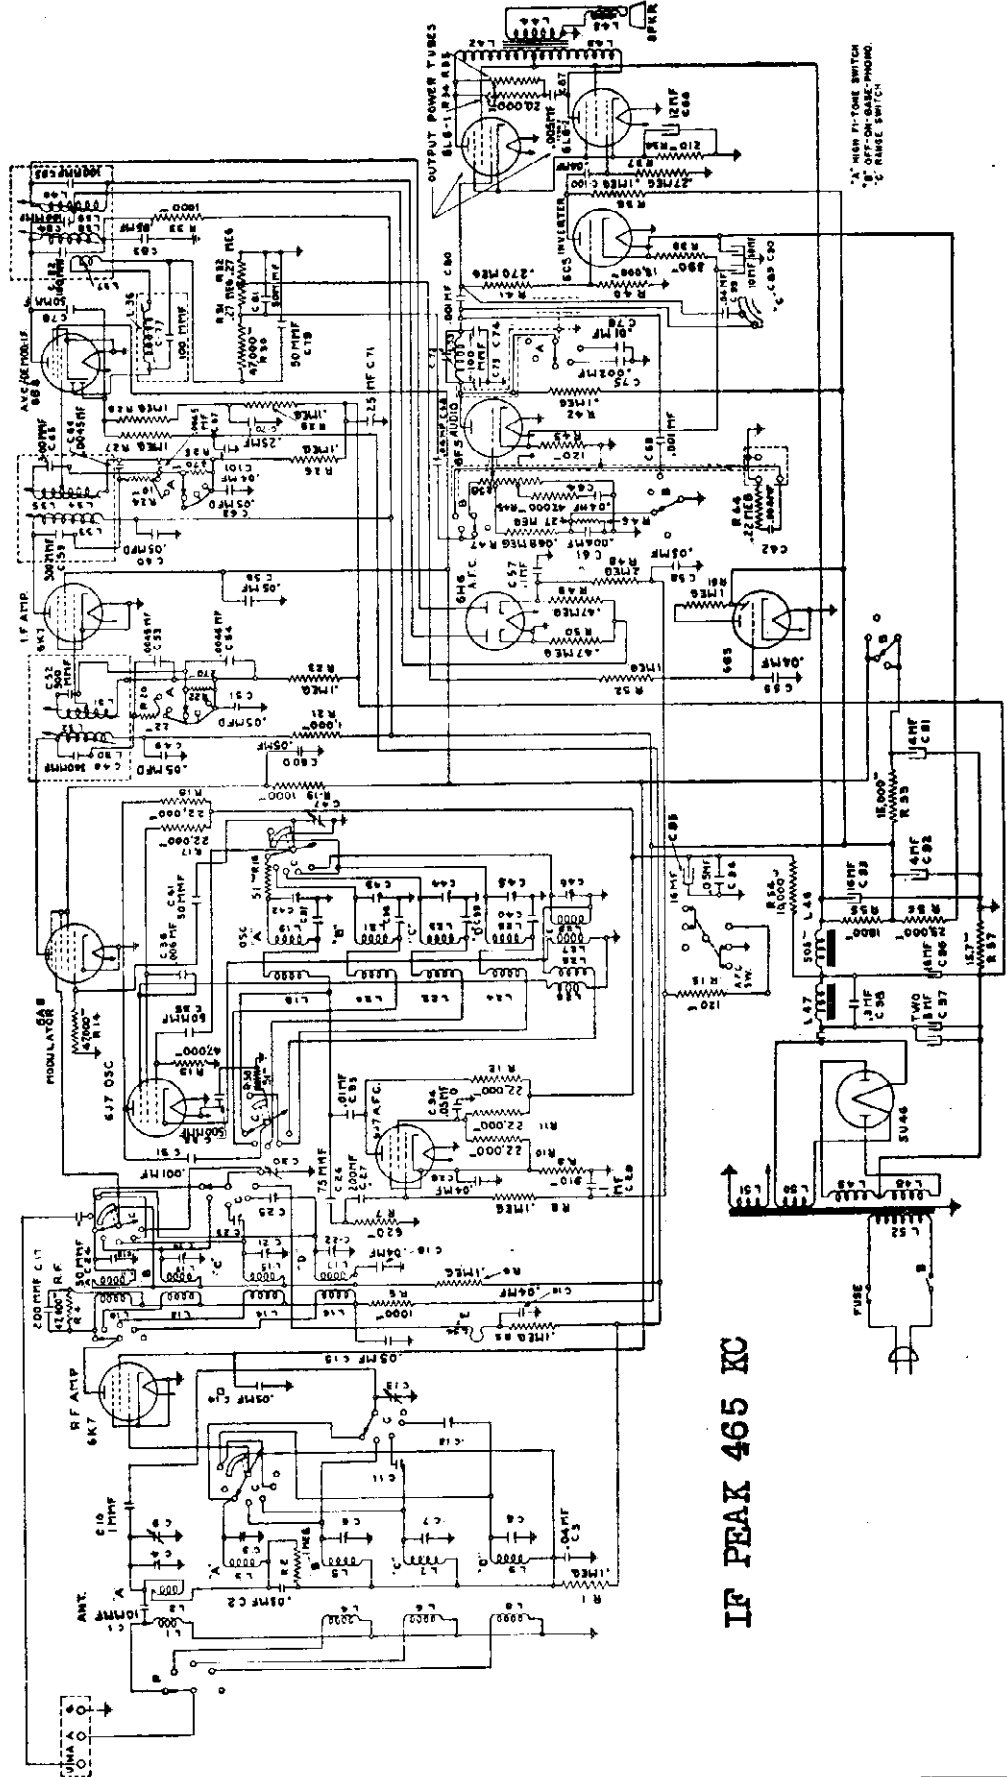

A. C. voltages are indicated by italics. Receiver tuned to 1000 kc., no signal. In making any alignment adjustments, always adjust the test oscillator's output voltage to the minimum value where a good alignment may still be obtained. Never attempt to make any alignment adjustments using a signal admission control switch. The position where such a switch is located from its minimum counter-clockwise position, slightly clockwise to position where set turns "on". Figure 1 shows the location of all the aligning capacitors or adjustments for this receiver.

Except in the case of making any aligning adjustments of the radio frequency circuits in the No. 231-P Receivers, it will not be necessary to remove the chassis in these receivers from their cabinets in order to make any alignment adjustments. If it is necessary to remove the chassis from the cabinet, the radio frequency circuits in the No. 231-P Receivers should be removed from the chassis in the cabinet by means of the chassis removal key. In making any radio frequency circuit alignment adjustments in the No. 231-P Receivers, the chassis should be set at approximately the same position which it occupies when in the cabinet. With the exception of the Nos. 231-F and 231-R Receivers, the alignment adjustments for the intermediate frequency circuits are accessible from the rear of the receiver, and the adjustments for the radio frequency circuits are accessible through the apertures located in the bottom metal base plate of the chassis; these apertures are easily accessible either through the top of the chassis or through the bottom of the chassis. In the No. 231-F and 231-R Receivers, the adjustments for the intermediate frequency circuits are accessible through the bottom of the cabinet while the adjustments for the radio frequency circuits are not accessible until the backs of the cabinets are removed. See Figure 2. Never align any of these receivers without having the metal base plate fastened to the chassis base. In the Nos. 231-F and 231-R Receivers, it is important that the final alignment be made with the chassis mounted in the cabinet.

Dial Adjustment

Before aligning the circuits of these receivers, the tuning dial must be properly aligned to "track" with the gang tuning capacitor. To check whether the dial is set correctly with respect to the gang tuning capacitor, the tuning dial should be rotated until the illuminated dial indicator line shows maximum capacity position. Then, with the receiver turned "on", the illuminated dial indicator line should be

PROCEDURE FOR OBTAINING REPRODUCTION FROM PHONOGRAPH RECORDS

A socket having three contacts is provided on the rear of the chassis base, and is wired to the "Off-On-Bass-Phonograph" switch assembly located on the front of the receiver. A three prong plug is also inserted in the socket so that if at any time it is desired to use an electric pick-up and phonograph unit in conjunction with this receiver, it may readily be accomplished.

In order to obtain the best quality of phonograph reproduction from this receiver, a Stromberg-Carlson No. 10 Record Player is recommended. This record player is equipped with a correctly designed single record playing motor unit, and uses a crystal type pick-up in conjunction with a specially equalized circuit. To attach this instrument to No. 250 Receiver, it is only necessary to remove the three-prong plug furnished with the receiver and insert the three-prong plug which comes with the unit into the three-prong socket located on the rear of the chassis base. Then, the power supply lug of the phonograph unit should be inserted into a suitable power supply receptacle, and the unit will be ready for use.

If the Stromberg-Carlson No. 10 Record Player is not used and the electric pick-up to be used is of the high impedance type, it will be necessary to connect a low capacity shielded cable between the three-prong plug furnished with the receiver and the pick-up. This shielded cable should be of the low capacity type, in order to prevent the excessive cutting of high frequencies which is caused when a shielded cable having high capacity is used. The length of the shielded cable used should be kept as short as possible. If a pick-up of the low impedance type is used, it will be necessary to connect a "matching transformer" between the three-prong plug and the pick-up. The transformer should be located as near to the receiver as possible, in which case it will not be necessary to use a shielded cable.

STROMBERG-CARLSON TEL. MFG. CO. Alignment

Dial Adjustment

When aligning the circuits of these receivers, the tuning dial must be properly aligned to "track" with the... the illuminated dial indicator line. These two set screws of the dial knob should then be securely tightened.

Intermediate Frequency and A. F. C. Circuit Adjustments

The intermediate frequency system employed in this receiver is a complex circuit. The first I. F. amplifier is coupled through the pentode section of the No. 6B7 tube. The second and third I. F. transformers are... the A. F. C. Control knob set at its "On" position.

The intermediate frequency used in these receivers is 465 kilocycles. Because of the necessity of obtaining the proper shape of resonance curve of these stages in a high fidelity receiver, it is recommended that unless it is absolutely essential, these I. F. adjustments be untouched. In the factory these adjustments are made using a visual system which allows the operator to see the exact shape of the resonance curve. For this reason, it is... procedure should be followed:

- 1. Operate the Range Switch of the receiver to the "A" range position, and set the tuning dial to its extreme low frequency position. Set the Fidelity Control to its "Normal" position, the Automatic Frequency Control to its "Off" position, and the F. F. Control to its "On" position... 2. Apply between the chassis base (or ground binding post) of the receiver and the grid of the No. 6A8 modulator tube, a modulated signal of 465 kilocycles from the signal generator, using a 0.1 Mfd. capacitor in series with the connection between the output terminal of the signal generator and the grid of the No. 6A8 tube. Do not remove the chassis grid lead connecting to this tube. The ground (or shield) post terminal of a signal generator should be connected to either the chassis base or the ground binding post terminal.

3. Note, making from Figures 1, the alignment adjustments for the First, Second, Third, and Fourth I. F. Transformers, and the I. F. circuits in the following manner:

- Adjust the third I. F. transformer primary circuit for maximum output.
Adjust the fourth I. F. transformer "Discriminator" circuit midway between the peaks where maximum output is obtained.
Adjust the second I. F. transformer secondary circuit for maximum output.
Adjust the second I. F. primary circuit for maximum output.
Adjust the first I. F. secondary circuit for maximum output.
Adjust the first I. F. primary circuit for maximum output.

Carefully make all the above adjustments, watching carefully the output meter and reduce the output of the test oscillator as required.

To make the final adjustment of the "Discriminator" circuit proceed as follows: This circuit adjustment is made by the A. F. C. control knob which should be set to the "off" position. Before making this adjustment be sure that the I. F. Amplifier is tuned exactly to 465 kilocycles. With the signal generator set to 465 kilocycles, the A. F. C. Control knob is fed into the No. 6A8 Modulator tube. Now observe the reading of the milliammeter which is connected in series with the cathode of the No. 6A7 oscillator control tube. Rotate the A. F. C. Control knob to the "on" position and observe whether there is any difference in the reading of the milliammeter. If the reading is not exactly the same, the alignment of the discriminator is off. If there is any difference in the milliammeter reading while rotating the Automatic Frequency Control knob to the "off" and "on" position, at a rate of about two cycles per second, adjust the "Discriminator" circuit by means of the screw adjustment located on the third I. F. Transformer until the meter reading has the same value regardless of whether the A. F. C. Control knob is set to "off" position. When this condition is obtained the "Discriminator" circuit of these receivers is properly adjusted.

Radio Frequency Adjustments

The alignment of the radio frequency circuits in these receivers should be very carefully made and in the order specified.

When making any aligning adjustments of these circuits, the A. F. C. Control knob should be related to the "off" position, the Fidelity Control knob should be set for "Normal" operation, and the "Off-On-Bass-Photo-graph" Control knob should also be set for "Normal" operation.

Alignment of Ultra-Short Wave Range (Also referred to as "B" Band)

In order to align the circuits of this range, it is desirable to have a signal generator whose high frequency range will go to 60 megacycles. Such equipment, however, is rare and costly, and in most cases it will be necessary to make use of a signal generator whose high frequency range does not extend beyond 20 megacycles, using harmonics of 20 megacycles for aligning this range on 60 megacycles.

In aligning the radio frequency circuits for this range, replace the 0.1 mfd. capacitor which was placed in series with the signal generator's output lead for the I. F. alignment with a 400-ohm carbon type resistor. This lead should then be connected to the antenna binding post marked "U. H. A." located on the rear of the receiver chassis. The antenna terminal (or low bay) of the signal generator should be connected to the ground binding post on the receiver.

1. Operate the Range Switch on the receiver chassis to the "E" range position and set the signal generator's frequency and the receiver's tuning dial to 60 megacycles.

2. Adjust the aligning capacitor C-48 until maximum voltage output is obtained on the output meter.

3. Set the signal generator's frequency and the receiver's tuning dial to 20 megacycles, and adjust the aligning capacitor C-48 until maximum voltage output is obtained on the output meter. The adjustment of this knob is made by disturbing its normally circular shape until it offers the correct inductive effect. If the oscillator does not track with the tuning dial scale at this frequency, it will be necessary to also adjust the oscillator's tuning loop.

4. Reset both the signal generator's frequency and the receiver's tuning dial to 60 megacycles and repeat operation No. 2.

Alignment of Short-Wave Range (Also referred to as "D" Band)

In aligning the radio frequency circuits for this range use the same artificial antenna (400-ohm carbon type) as was used for aligning the "E" range. The receiver's tuning dial should be set to the Ultra-Short Wave Range. Connect the lead to the antenna binding post marked "A," located on the rear of the receiver chassis, and align as follows:

- 1. Operate the Range Switch on the receiver chassis to the "D" range position and set the signal generator's frequency and the receiver's tuning dial to 20 megacycles.
2. Adjust aligning capacitor C-45, C-22, and C-5 respectively, and at the same time rotate the gang tuning capacitor slightly back and forth through resonance until maximum voltage output is obtained on the output meter.
3. Set the signal generator's frequency and the receiver's tuning dial to 11 megacycles and adjust aligning capacitors C-44, C-24, and C-12 respectively, and at the same time rotate the gang tuning capacitor back and forth through resonance until maximum voltage output is obtained on the output meter.
4. Reset both the signal generator's frequency and the receiver's tuning dial to 20 megacycles and repeat operation No. 2.

Alignment of Short-Wave Range (Also referred to as "C" Band)

In aligning the radio frequency circuits for this range use the same artificial antenna and binding post on the receiver chassis as was used for aligning the "D" range.

- 1. Operate the Range Switch on the receiver chassis to the "C" range position and set the signal generator's frequency and the receiver's tuning dial to 10 megacycles.
2. Adjust the aligning capacitors C-44, C-24, and C-7 respectively, and at the same time rotate the gang tuning capacitor back and forth through resonance until maximum voltage output is obtained on the output meter.
3. Set the signal generator's frequency and the receiver's tuning dial to 5 megacycles and adjust the aligning capacitors C-39, C-23, and C-11 respectively, and at the same time rotate the gang tuning capacitor back and forth through resonance until maximum voltage output is obtained on the output meter.
4. Reset both the signal generator's frequency and the receiver's tuning dial to 10 megacycles and repeat operation No. 2.

Alignment of Aircraft Range (Also referred to as "B" Band)

In aligning the radio frequency circuits for this range, use the same artificial antenna and antenna binding post as was used for aligning the "C" range, and align this range as follows:

- 1. Operate the Range Switch on the receiver chassis to the "B" range position and set the signal generator's frequency and the receiver's tuning dial to 4.5 megacycles.
2. Adjust the aligning capacitors C-43, C-20, and C-6 respectively, and at the same time rotate the gang tuning capacitor back and forth through resonance until maximum voltage output is obtained on the output meter.
3. Set the signal generator's frequency and the receiver's tuning dial to 1.8 megacycles and adjust the aligning capacitor C-38 and at the same time rotate the gang tuning capacitor back and forth through resonance until maximum voltage output is obtained on the output meter.
4. Reset both the signal generator's frequency and the receiver's tuning dial to 4.5 megacycles and repeat operation No. 2.

Alignment of Standard Broadcast Range (Also referred to as "A" Band)

In aligning the radio frequency circuits for this range, replace the 400-ohm resistor in series with the signal generator's output with a 200-ohm microfarad capacitor and align this range as follows:

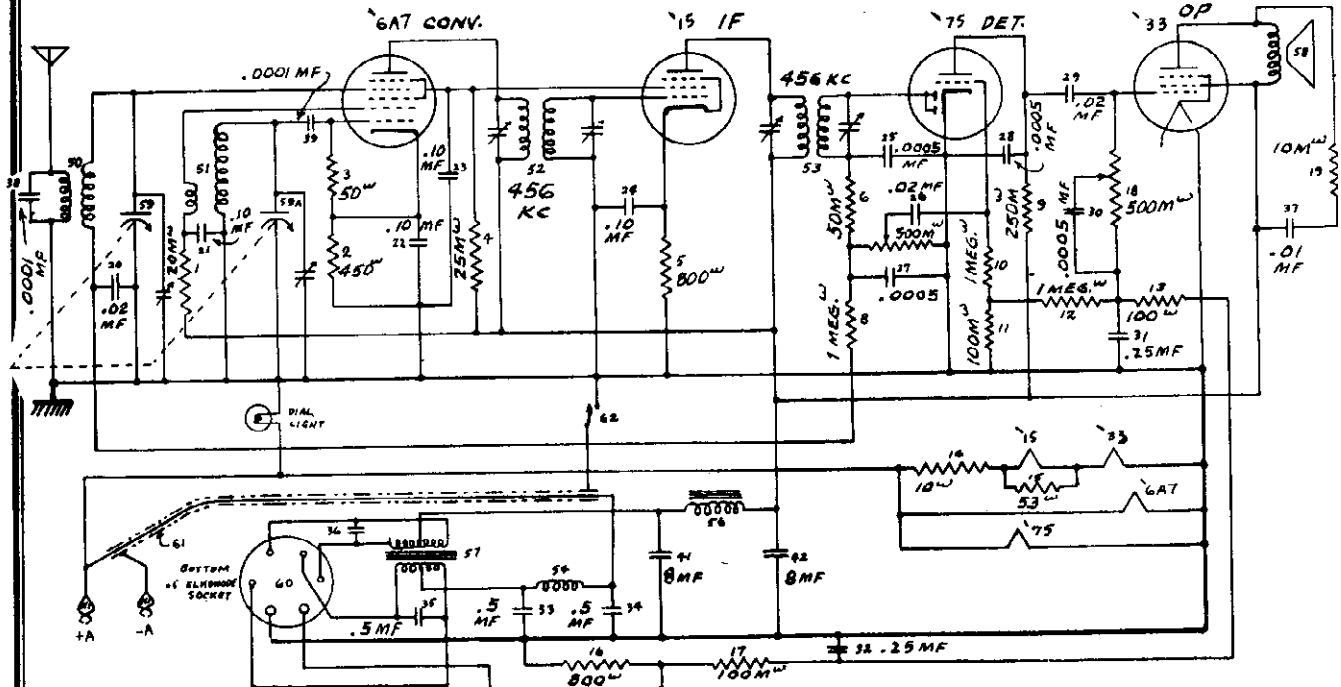

- 1. Operate the Range Switch to the "A" range position and set the signal generator's frequency and the receiver's tuning dial to 15 megacycles (15M kilocycles).
2. Adjust the aligning capacitors C-42, C-19, C-4, and C-5 respectively, and at the same time rotate the gang tuning capacitor back and forth through resonance until maximum voltage output is obtained on the output meter.
3. Set the signal generator's frequency and the receiver's tuning dial to 0.6 megacycles (606 kilocycles) and adjust the aligning capacitor C-37, and at the same time rotate the gang tuning capacitor back and forth through resonance until maximum voltage output is obtained on the output meter.
4. Reset both the signal generator's frequency and the receiver's tuning dial to 1.5 megacycles and repeat operation No. 2.

Adjustment of 10 Kilocycle Audio Cut-Off Filter

The adjustment of this filter is correctly made at the factory and no additional adjustment is required.

- (a) Measured with a voltmeter having a resistance of 30M ohms.
- (b) Measured with a voltmeter having a resistance of 300M ohms.
- (*) 6A7 anode grid volts.

All readings taken with volume control full open and zero signal input to receiver.

"L'TATRO" MODEL M-4616 ALIGNMENT PROCEDURE

ALIGNMENT MUST BE DONE WITH THE AID OF A CORRECTLY CALIBRATED SIGNAL GENERATOR OF RELIABLE MAKE USED IN CONJUNCTION WITH A HIGH RESISTANCE OUTPUT METER. THE LATTER IN SERIES WITH A LARGE PAPER DIELECTRIC CONDENSER SHALL BE CONNECTED FROM PLATE TO SCREEN OF THE OUTPUT TUBE.

I. F. ADJUSTMENT: Connect the ground side of the signal generator to the receiver chassis and the other side through a .005 mfd. condenser to the I.F. tube grid clip. Set the generator at 456 K.C. Using as low an input as possible adjust the trimmer screws on item 53 for maximum response. Next connect the .005 condenser to the 6A7 grid clip and adjust the trimmers on item 52 for maximum output. If double peaks or high output and overloading occur reduce the signal input. SLIGHTLY HIGHER GAIN MAY BE OBTAINED BY NOW READJUSTING THE TRIMMERS ON ITEM 53. THIS SHOULD NOT BE DONE UNLESS ABSOLUTELY NECESSARY AS SOME REGENERATION IS INTRODUCED AND MAY CAUSE EXCESSIVE HISS WHEN A CARRIER IS TUNED IN.

R.F. ADJUSTMENT: Connect the ground side of the signal generator to the receiver chassis and the other side through a .0002 mfd. condenser to the antenna lead. Set receiver dial and signal generator at 1400 K.C. and adjust the trimmer screws on item 51 and 59A for maximum response.

When the above procedure is completed the receiver is correctly aligned and should operate satisfactorily on the air.

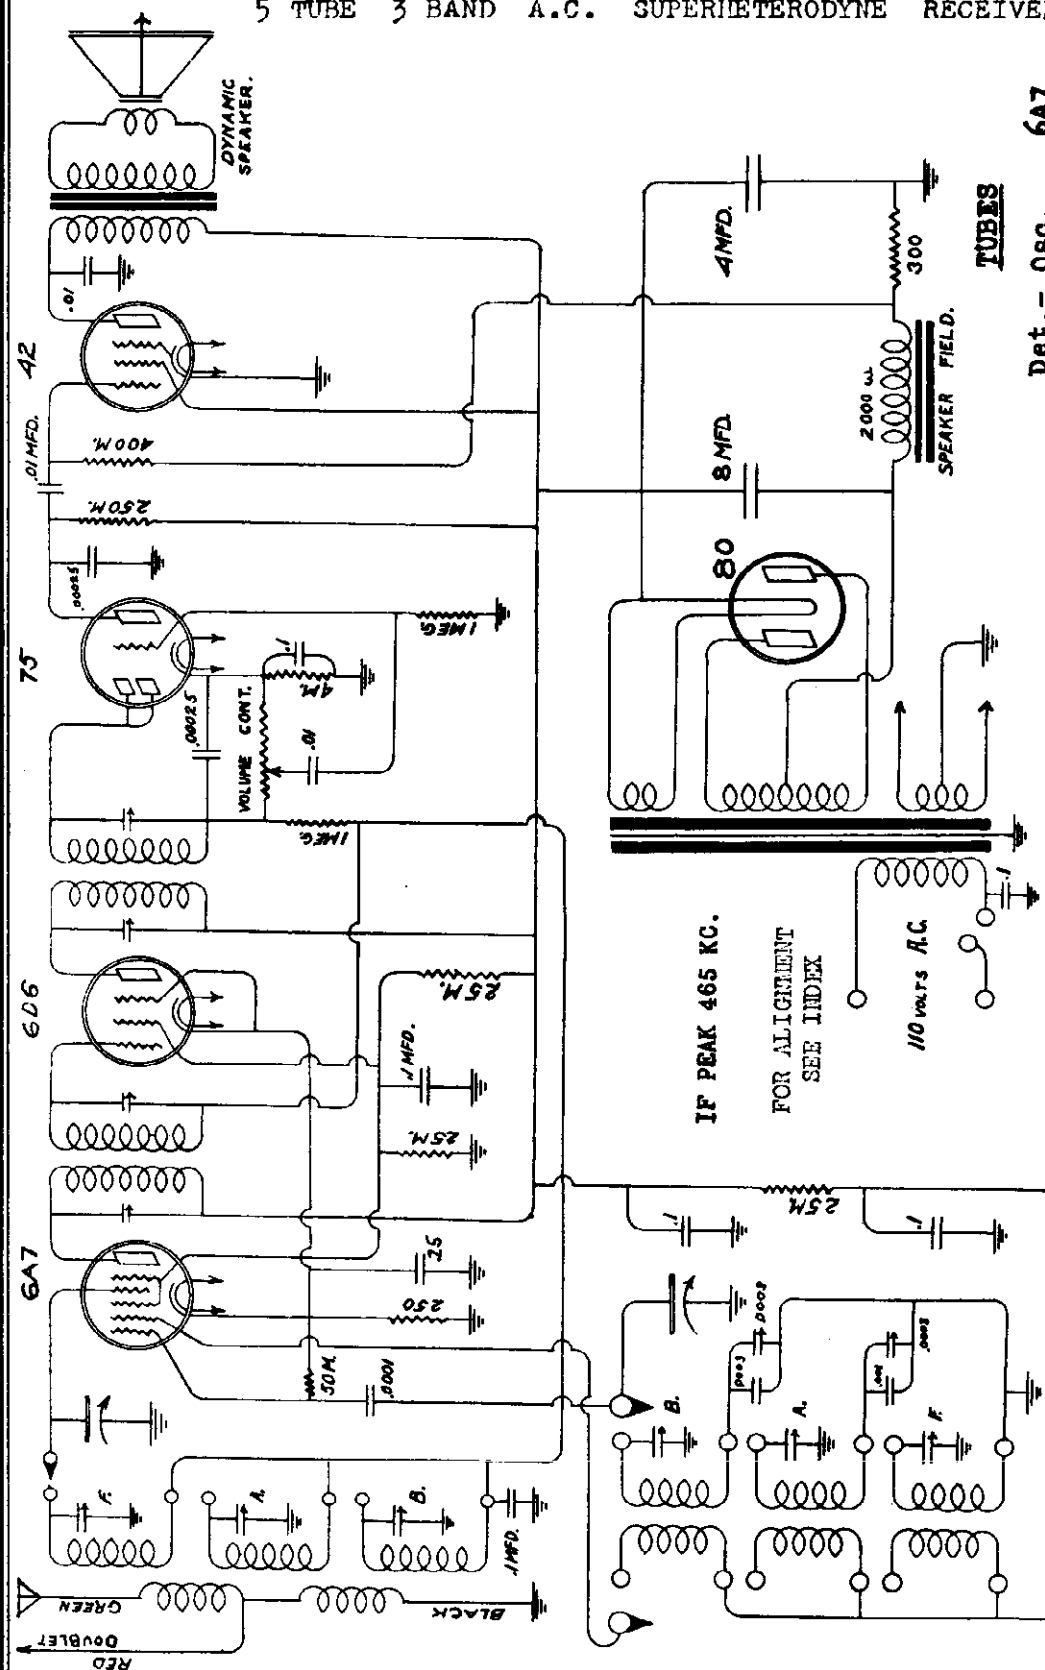

Under normal circumstances the use of a single wire antenna 100 feet long, with lead-in at one end is recommended.

IN ALL ABOVE ALIGNMENT PROCEDURE THE VOLUME AND TONE CONTROLS MUST BE AT MAXIMUM POSITION.

SERVICE NOTES FOR THE CLARION MODELS TC-28 & TC-29
SEVEN TUBE THREE BAND A.C.-D.C. SUPERHETERODYNE RECEIVERS

ALIGNMENT PROCEDURE

Realignment of this receiver should not be attempted except by an experienced service man, and then only after all possible causes of faulty operation have been thoroughly investigated. An accurately calibrated signal generator which will cover the various bands and a suitable output meter for indicating the effects of adjustments are required.

I.F. ADJUSTMENT - The signal generator is set at 465 kc. and its output connected between the control grid of the first detector (6A5) tube and the ground post of the receiver. The oscillator (rear) section of the tuning condenser is short-circuited and the volume control set at maximum. The signal generator output is attenuated as much as possible and the i.f. trimmers adjusted for maximum gain. These trimmers are found in the right hand rear corner of the chassis, on top of the i.f. shield cans.

1400 KC. ADJUSTMENT - The signal generator is set at 1400 kc. and its output connected between the aerial and ground posts of the receiver. It is extremely important that a weak signal be used in order to prevent the a.v.c. action from nullifying the effect of adjustments. The receiver dial is set at the same frequency and with the volume control at maximum, the 1400 kc. trimmer is adjusted for greatest gain. The series padder for this band should now be adjusted by setting the signal generator at 600 kc. and tuning the signal in on the receiver dial. This padder should be adjusted for maximum response while the tuning condenser is rocked slightly back and forth. The 1400 kc. adjustment should then be rechecked.

The location of all the r.f. trimmers are shown on the accompanying sketch.

SHORT WAVE BAND ADJUSTMENT - For this band the oscillator and antenna coil trimmers should be adjusted at 16 megacycles in the manner described above and the series padder adjustment made at 5.7 megacycles.

LONG WAVE BAND ADJUSTMENT - This adjustment is for the model TC-29 only. The oscillator and antenna coil trimmers should be adjusted at 375 kc. as outlined above, and the series padder at 150 kc.

POLICE BAND ADJUSTMENT - This adjustment is for the model TC-28 only. The oscillator and antenna coil trimmers should be adjusted at 3500 kc. and the series padders at 1600 kc.

SERVICE NOTES FOR THE CLARION MODEL TC-6
FIVE TUBE THREE BAND A.C. SUPERHETERODYNE RECEIVER

ALIGNMENT PROCEDURE

Realignment of this receiver should not be attempted unless all other possible causes of faulty operation have been thoroughly investigated, and then only by an experienced service man. An accurately calibrated signal generator which will cover the necessary wave-bands and an output meter for indicating the effect of adjustments are required.

It is essential that in all the following tests the signal generator output be attenuated as much as possible at all times and that the receiver volume control be always set at maximum.

I.F. ALIGNMENT - The signal generator is set at 456 kc. and is connected to the grid of the first detector (6A7) tube. With the oscillator section of the tuning condenser short-circuited the i.f. trimmers are adjusted for maximum output. These may be found on top of the i.f. transformer shield cans in the right hand rear corner of the chassis.

FOREIGN BAND ADJUSTMENT - The high side of the signal generator is connected to the antenna post of the receiver and the low side of the signal generator is connected to the ground post. The receiver and the signal are both tuned to a frequency of 16 mc. with the selector switch in position for this band. The oscillator trimmer is adjusted for maximum receiver output. This trimmer is located on the oscillator coil on the under side of the chassis. It is the right hand one of the three trimmers found here. The antenna preselector for this band is then adjusted in the same manner. This is found on the preselector coil on the top side of the chassis and is the right hand one of the three found here.

AMATEUR BAND ADJUSTMENT - With the band selector switch in position for operation on this band, and the receiver and signal generator both set at 5.4 mc., the procedure outlined above is repeated. The oscillator trimmer for this band is found on the oscillator coil on the under side of the chassis and is the center one of the three. The preselector trimmer is found on the preselector coil on top of the chassis and is the center one of the three.

The signal generator should then be set at 1.7 mc. and the signal tuned in on the dial. The series padder for this band should be adjusted for maximum output while the receiver dial is rocked slightly back and forth. The 5.4 mc. setting should then be rechecked. The padder is located on the right side of the front chassis skirt and is the left hand one of the two located here.

BROADCAST BAND ADJUSTMENT - With the band selector switch in position for operation on this band and the receiver and signal generator both set at 1400 kc. the procedure outlined above is repeated. The oscillator and preselector trimmers are found on the tops of their respective coils and are on the extreme left in each case.

The signal generator should then be set at 600 kc. and the signal tuned in on the dial. The series padder for this band should be adjusted for maximum output while the receiver dial is rocked slightly back and forth. The 1400 kc. adjustment should then be rechecked. The subsequent adjustments have a detuning effect on this circuit. This padder is located on the right hand side of the front chassis skirt and is the right hand one of the two located here.

TRANSFORMER CORP. OF AMER.

SERVICE NOTES FOR THE CLARION MODEL TC-42, 43, 44
TO TUBE 4 BAND A.C. SUPERHETERODYNE RECEIVER

ALIGNMENT PROCEDURE

I.F. ADJUSTMENT - The signal generator is set at 456 kc. and is connected to the grid of the first detector (6A7). With the oscillator section of the tuning condenser short-circuited and the receiver volume control at its maximum position, the i.f. trimmers are adjusted for maximum output. These trimmers may be found on the i.f. transformer shield cans in the rear of the chassis.

16 MEGACYCLE ADJUSTMENT - The high side of the signal generator is connected to the antenna post of the receiver and the low side to the ground post. The receiver and the signal are both tuned to a frequency of 16 mc. with the selector switch in position for band no. 1. The oscillator trimmer condenser is adjusted for maximum receiver output, with the volume control on full and the signal generator adjusted for minimum input. The antenna preselector and first detector trimmers are then adjusted in the order named. These trimmers are located on the tops of the shield cans at the left side of the chassis; reading from front to back, these coils are as follows: - 1. antenna preselector; 2. first detector; 3. oscillator. It will be noted that there are four trimmers on each of these coils. The adjustment screw for the trimmer in the front left hand corner of each is painted red. This denotes the trimmer for the no. 1 band.

5.2 MC. ADJUSTMENT - With the band selector switch in position for operation on band no. 2, and the receiver and signal generator both set at 5.2 mc. the procedure outlined above is repeated. The oscillator trimmer is found on the rear coil can, and is located to the right of the red painted trimmer. The antenna preselector and intermediate coil trimmers are located in the same positions on the corresponding shield cans.

The signal generator is set at 1.7 mc. and the signal tuned in on the dial. The paddler condenser for this band is adjusted for maximum gain while the gang tuning condenser is rocked slightly to the right and left. The 5.2 mc. adjustment should then be rechecked. The 1.7 mc. paddler is located on the sub-base on which the gang tuning condenser is mounted and is the left hand one of the group of three found here.

1400 KC. ADJUSTMENT - The band selector switch is set in position for operation on the no. 3 band. The receiver and signal generator are both set at 1400 kc. and the procedure outlined above is repeated. The oscillator trimmer is found on the rear coil can, and is located diagonally opposite the red painted trimmer. The other trimmers for this band are located in similar positions on the corresponding coil cans.

The signal generator is set at 600 kc. and the signal tuned in on the dial. The paddler condenser for this band is adjusted for maximum response while the gang tuning condenser is rocked slightly to the right and left. The 1400 kc. adjustment should then be rechecked. The 600 kc. paddler is located on the sub-panel on which the gang tuning condenser is mounted and is the center of the three located at this point.

140 KC. ADJUSTMENT - The band selector switch is set in position for operation on band no. 4. The receiver and generator are both tuned to 140 kc. and the procedure outlined above is repeated. The oscillator trimmer is located on the rear coil can. It is the one directly behind the trimmer marked in red. The other trimmers for this band are located in similar positions on the corresponding shield cans.

The signal generator is set at 140 kc. and the signal is tuned in on the dial. The paddler condenser for this band is adjusted for maximum response while the gang tuning condenser is rocked slightly to the right and left. The 140 kc. adjustment should then be rechecked. The 140 kc. paddler is located on the sub-panel on which the tuning condenser is mounted and is the right hand one of this group.

SERVICE NOTES FOR THE CLARION MODEL TC-65
TO TUBE 4 BAND A.C. SUPERHETERODYNE RECEIVER

ALIGNMENT PROCEDURE

I.F. ADJUSTMENT - The signal generator is set at 456 kc. and is connected to the grid of the first detector (6A7). With the oscillator section of the tuning condenser short-circuited and the receiver volume control at its maximum position, the i.f. trimmers are adjusted for maximum output. These trimmers may be found on the i.f. transformer shield cans in the rear of the chassis.

16 MEGACYCLE ADJUSTMENT - The high side of the signal generator is connected to the antenna post of the receiver and the low side to the ground post. The receiver and the signal are both tuned to a frequency of 16 mc. with the selector switch in position for band no. 1. The oscillator trimmer condenser is adjusted for maximum receiver output, with the volume control on full and the signal generator adjusted for minimum input. The antenna preselector and first detector trimmers are then adjusted in the order named. These trimmers are located on the tops of the shield cans at the left side of the chassis; reading from front to back, these coils are as follows: - 1. antenna preselector; 2. first detector; 3. oscillator. It will be noted that there are four trimmers on each of these coils. The adjustment screw for the trimmer in the front left hand corner of each is painted red. This denotes the trimmer for the no. 1 band.

5.2 MC. ADJUSTMENT - With the band selector switch in position for operation on band no. 2, and the receiver and signal generator both set at 5.2 mc. the procedure outlined above is repeated. The oscillator or trimmer is found on the rear coil can, and is located to the right of the red painted trimmer. The antenna preselector and intermediate coil trimmers are located in the same positions on the corresponding shield cans.

The signal generator is set at 1.7 mc. and the signal tuned in on the dial. The paddler condenser for this band is adjusted for maximum gain while the gang tuning condenser is rocked slightly to the right and left. The 5.2 mc. adjustment should then be rechecked. The 1.7 mc. paddler is located on the sub-base on which the gang tuning condenser is mounted and is the left hand one of the group of three found here.

1400 KC. ADJUSTMENT - The band selector switch is set in position for operation on the no. 3 band. The receiver and signal generator are both set at 1400 kc. and the procedure outlined above is repeated. The oscillator trimmer is found on the rear coil can, and is located diagonally opposite the red painted trimmer. The other trimmers for this band are located in similar positions on the corresponding coil cans.

The signal generator is set at 600 kc. and the signal tuned in on the dial. The paddler condenser for this band is adjusted for maximum response while the gang tuning condenser is rocked slightly to the right and left. The 1400 kc. adjustment should then be rechecked. The 600 kc. paddler is located on the sub-panel on which the gang tuning condenser is mounted and is the center of the three located at this point.

140 KC. ADJUSTMENT - The band selector switch is set in position for operation on band no. 4. The receiver and generator are both tuned to 140 kc. and the procedure outlined above is repeated. The oscillator trimmer is located on the rear coil can. It is the one directly behind the trimmer marked in red. The other trimmers for this band are located in similar positions on the corresponding shield cans.

The signal generator is set at 140 kc. and the signal is tuned in on the dial. The paddler condenser for this band is adjusted for maximum response while the gang tuning condenser is rocked slightly to the right and left. The 140 kc. adjustment should then be rechecked. The 140 kc. paddler is located on the sub-panel on which the tuning condenser is mounted and is the right hand one of this group.

Now, remove the oscillator clip from the 6A7 grid and connect it to the antenna terminal marked A₁. Terminals A₂ and G must be connected together by jumper. Set the oscillator to 1406 k.c. (Three tall round cans located to the right of the tuning condenser are as follows: antenna coil, intermediate RF, and Oscillator coil looking from front to rear of chassis.) If the received signal does not come in exactly at this frequency adjust the broadcast oscillator trimmer (trimmer projects through the upper hole in the side of the oscillator can) so that it does. Next adjust the trimmers on the antenna coil and the interstage RF coil (trimmers project through upper hole on right hand side of the antenna and RF coil cans) for maximum output as before. Now set the oscillator to 600 k.c., and tune this in on the receiver. Check for alignment by rotating the padding condenser screw (screw projects through the chassis directly to the left of the oscillator coil can) at the same time rocking the tuning condenser so as to obtain maximum output. Leave this padding set for maximum signal.

SHORT WAVE BAND: Turn the wave band switch to the left. If a short wave oscillator is not available, set the regular broadcast oscillator to 1000 k.c. If the harmonics are sufficiently powerful it should be possible to pick up a signal at points all along the dial one megacycle apart, as for example 6 m.c., 7 m.c., 8 m.c. and 9 m.c.

Tune in signal at approximately 14 m.c. and very carefully adjust the short wave trimmers on the antenna and RF coils (lower openings on right side of front and middle cans) for maximum output. Carefully retune the signal as a re-adjustment of the trimmers may shift the signal slightly on the dial.

NOTE: In all the above adjustments it is imperative that the volume control be set near maximum and that the oscillator be reduced sufficiently so that no more than 15 volts output is obtained. If necessary set the oscillator some distance away and pick up the signal by means of a wire placed near it and connected to the receiver.

Clarion MODEL T C 39

Seven Tube Superheterodyne Receiver

A.C. 105 to 240 Volts, 40 to 60 Cycles

Short Wave	Broadcast Wave
17.5 - 53 Meters	190 - 560 Meters
17000 - 5600 Kilocycles	1580 - 535 Kilocycles

DESCRIPTION:

The Clarion 7 Tube Short Wave and Broadcast A.C. Receiver is adapted for use on A.C. 105 to 240 Volts, 40 to 60 Cycles.

***THIS RECEIVER IS PROVIDED WITH A TAPPED-PRIMARY POWER TRANSFORMER FOR USE ON EITHER 105 TO 125 OR 220 TO 240 VOLTS. BEFORE OPERATING THIS RECEIVER MAKE CERTAIN THAT THE FLEXIBLE LEAD, EXTENDING FROM THE TOP OF THE POWER TRANSFORMER, IS CONNECTED TO THE CORRECT BINDING POST. IF THIS PRECAUTION IS NOT TAKEN POSSIBLE DAMAGE TO THE TRANSFORMER MAY RESULT.**

The tube complement included: 1 - 6D6 as R.F. Amplifier, 1 - 6A7 as First Detector and Oscillator, 1 - 6D6 as I.F. Amplifier, 1 - 76 as Diode Detector and AVC, 1 - 6D6 as A.F. Amplifier, 1 - 42 as Power Output Tube and 1 - 80 Rectifier.

VOLTAGE READINGS:

Readings should be taken with the Volume Control fully on. Use a D.C. Voltmeter having a resistance of 1000 ohms per volt.

	Plate to Ground	Screen to Ground	Cathode to Ground	Suppressor to Ground
6D6 RF Amp.	235	155	3	3
6A7 Det. Osc.	230	155	3	
6D6 IF Amp.	250	155	6	6
76 Second Det.	50	12	0.2	0.2
42 Output	228	234	23	
80 Rectifier	Filament to Ground	250 volts.		
Power Drawn by Receiver	57 Watts.			

ALIGNMENT OF T C 39

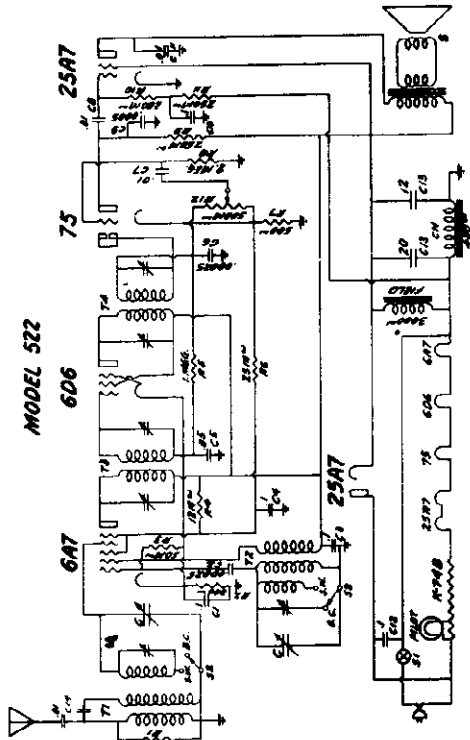

With the wave band switch in the broadcast position (right) connect the oscillator, set at 456 k.c. to the grid of the 6A7 tube (with the grid cap in place) and to the chassis. The volume control should be set at maximum and the oscillator output reduced so as to obtain about 15 volts reading on an output meter (4000 to 8000 ohms) connected across the loud speaker transformer primary (plate and screen prongs of the 42 tube).

Carefully rotate the screws on the tops of the IF transformers (square cans) until the maximum reading is obtained on the output meter. If the output is considerably in excess of 15 volts reduce the oscillator output further.

The object of this is to operate at such a low level that the automatic volume control; the purpose of which is to maintain the signal level constant, does not operate; otherwise this adjustment will appear very broad and it will be impossible to obtain a true alignment of the IF transformers.

OPERATING INSTRUCTIONS

5-TUBE AC-DC Superheterodyne Receiver

This radio is a five-tube Superheterodyne type which operates on AC or DC at 110 volts. It covers two wave bands, as follows:

Standard broadcast and police band -- 540-1750 kc.
 Police, Amateur, American and Foreign
 short wave band -----2400-6300 kc.

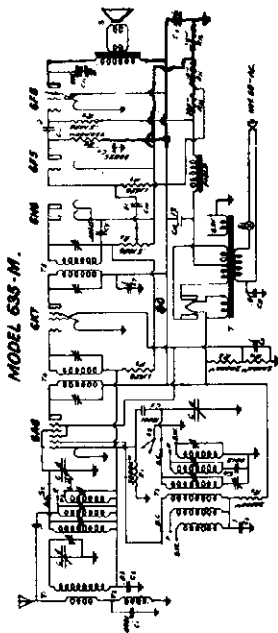

OPERATING INSTRUCTIONS

5-TUBE AC-DC RECEIVER

For Use on 110-115 Volts AC or DC Current Only

This receiver is a five tube tuned-radio-frequency type which operates on either AC or DC current. It will provide very satisfactory entertainment for those who desire a small set.

OPERATING INSTRUCTIONS

6-Tube Superheterodyne AC Receiver
 For use on 110 volts AC only

This radio is a six-tube Superheterodyne type which operates ON AC CURRENT ONLY at a frequency of 60 cycles and at 110 volts. It covers three wave bands, as follows:

- Standard Broadcast band - 540-1750 kc.
- Police and Amateur band - 1660-6600 kc.
- Short wave, American & Foreign - 18-5.5 meg.

6-Volt Storage Battery Receiver

This radio is designed to operate from a 6-volt storage battery. No "B" or "C" batteries are required.

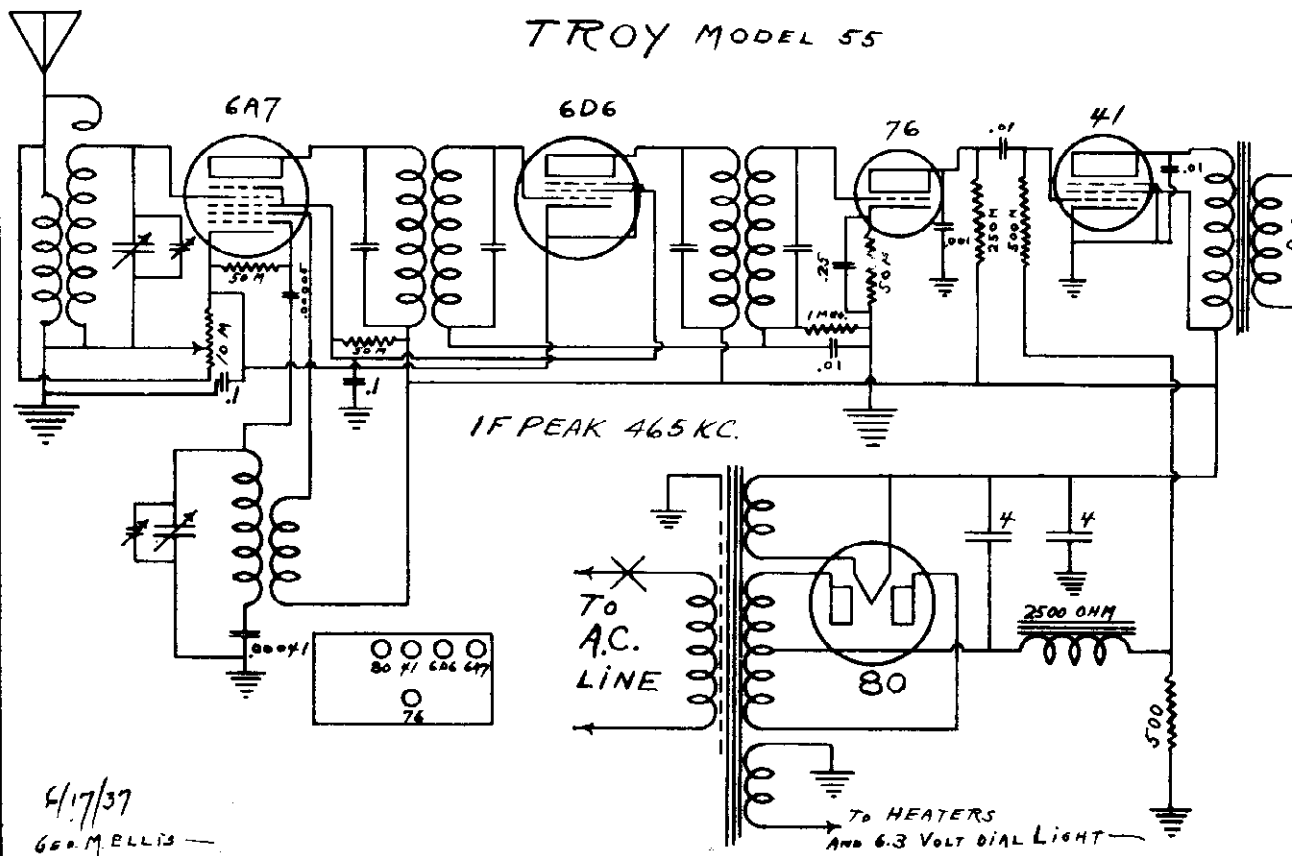

It has two wave bands, having the following coverage:

- Standard broadcast - 540 to 1750 kilocycles
- Foreign short wave - 5.7 to 17 megacycles

TOP VIEW
OF CHASSIS
MODELS 801-802

10. Set the wave-change switch to the ultra-high frequency band (White). Set the test oscillator and dial to 11 meters (27.3 megacycles). Adjust the oscillator trimmer till the signal is brought in. Continue on through to the second peak. The image signal will now be found at 26.5 megacycles if the oscillator trimmer adjustment is correct. Reset the dial to 11 meters and adjust the R.F. and antenna trimmers for maximum response while rocking the gang.

Set the dial and test oscillator to 26 meters and check for sensitivity.

ALIGNMENT PROCEDURE

Realignment of this receiver should never be necessary unless one of the coils has been changed. Lack of sensitivity, selectivity, and poor tone quality may be due to defective tubes, speaker or condensers, insufficient or excessive antenna, open or grounded resistors, etc. If an I.F. tube is replaced, it is necessary to realign the I.F. transformers.

A calibrated oscillator such as Model 180, covering the ranges from 20 to 2,000 meters and an output meter (connected between plate and screen prongs of the 6B6 tube) will be required. Use low values of output to prevent false readings due to the operation of the automatic volume control while aligning.

The output meter may also be connected across the two small prongs of the speaker plug.

INTERMEDIATE STAGE ALIGNMENT

1. Connect the output of the test oscillator to the grid of the 6L7 converter tube and connect a 1 megohm resistor from this grid to the chassis. Connect the ground side of the oscillator (the shielding) to the receiver chassis.
2. Set the test oscillator to 485 K.C. Refer to Curve B on the Calibration chart to obtain the proper setting of the test oscillator.
3. Set the tone control to the left. Align the output intermediate frequency transformer by turning the top screw at the rear of the output I.F. transformer until maximum response is obtained on the output meter. Adjust the other trimmer screws in the same manner.
4. Adjust the input intermediate frequency transformer in the same manner.

ALIGNMENT OF TUNING CIRCUITS

5. Connect the output of the test oscillator to the antenna lead of the receiver through a .00025 M.F.D. condenser and connect the ground side (shielding) to the chassis.
6. Set the wave change switch to the long-wave position (Red). Set the dial and test oscillator to 900 meters. Adjust the long-wave oscillator trimmer until the signal is brought in. If no signal is heard, then adjust the long-wave padder. See diagram of chassis for location of trimmer and padder condensers.
7. Then adjust the long-wave antenna and R.F. trimmers for maximum response. Set the dial and test oscillator to 1800 meters and adjust the long-wave padder for maximum response while rocking the gang condenser. By rocking the gang is meant tuning to a point just above and just below the test oscillator frequency while making some other adjustment. Return to 900 meters and repeat the entire procedure.
8. Set the wave change switch to the broadest position (Yellow). Set the dial and test oscillator to 214 meters (1400 K.C.) and adjust the E.C. oscillator, R.F. and antenna trimmers till maximum response is obtained. Set the dial and test oscillator to 600 K.C. and adjust the E.C. padder condenser while rocking the gang till maximum response is obtained.
9. Set the wave change switch to the high frequency band (Short-wave Green). Substitute a 400 ohm resistor for the .00025 M.F.D. condenser in the antenna circuit. Set the dial and test oscillator to 30 meters (10 megacycles). Start the receiver on end and adjust the 50 meter oscillator coil (located to the right of switch when viewed from bottom) till the signal is brought in. Stop at the first peak. Screwing the trimmer down still more will give another peak which is the image and must not be used. To make certain the set is not tuned to the image, set the test oscillator to 11 megacycles and if another signal is received, then the set is correctly tuned. Reset the test oscillator to 30 meters and adjust the R.F. and antenna trimmers for maximum response, while rocking the gang. Set the dial and test oscillator to 75 meters and check for sensitivity.

MODEL 306
Circuit Data,
Socket Trimmers
Chassis

GENERAL DESCRIPTION

This model is a ten tube, four band superheterodyne receiver designed for world wide reception including the U.S. Weather Band and employs the new all-metal tubes.

The circuit employs a high frequency amplifier using the new type 6K7 tube. This is followed by the first detector circuit employing a 6AG tube and a separate oscillator (type 6G5). These tubes with their associated circuits (coils, variable condensers, trim condensers for R.F. and detector stages, and trim and lag condensers for the oscillators) comprise a complete assembly in compact form separately cushioned from the main chassis. This assembly is known as the "Precision Tuner". In addition the set includes a new and novel development of intermediate frequency circuits which allows the adjustment of the band width of the amplifier to be varied over a wide range. At one end of the range is the most selective condition which allows single channel reception even under the influence of powerful nearby stations. At the other end the transmission characteristic of the amplifier is so changed as to allow transmission without attenuation of frequencies up to 7000 cycles on either side of the carrier. As a matter of fact, the amplifier is overcoupled to such a degree that frequencies in the neighborhood of five thousand cycles on either side of the carrier are transmitted at greater efficiency than frequencies close to the carrier. This design is necessary since radio frequency circuits give rise to some side band attenuation, which must be compensated for in the I.F. amplifier. The net result is a smooth transmission curve over the entire band.

From the oscillator the energy passes thru a variable selector I.F. transformer and to a 6K7 amplifier tube. Then thru another variable selector I.F. transformer and to an additional 6K7 amplifier tube. From here further selection takes place in the 3rd I.F. transformer where the energy is passed on to the 2nd detector and A.V.C. diode (type 6H6). After detection there follows a first audio amplifier (type 6G5) and by means of an audio transformer the energy is sent to the power output stage comprising two 6V6 pentodes in push-pull. A 6X5 rectifier supplies the necessary direct current for the tubes.

REMOVING INDIVIDUAL COIL AND SWITCH SECTIONS OF "PRECISION TUNER"

If a component part located underneath the switch and coil assemblies of the "Precision Tuner" has to be replaced or a section of the unit has to be removed for inspection, each section can easily be removed separately. To do this proceed with care as follows:

1. Remove the three coil shields.
2. Remove the two self-tapping screws which fasten the mounting plate of the wave-change switch shaft to the chassis frame. Pull switch shaft straight out.
3. Unsolder the stator and rotor leads from the gang condenser.
4. The fastening screws for the switch-sections are located on top of the "Precision Tuner" and are indicated by 7, 11, and 13 in Figure #8. Remove the corresponding screw.
5. Each individual section can then be pulled out straight.

Note: On the R.F. section, the plate lead from the 6K7 socket will have to be unsoldered from the switch terminal before the section can be removed.

On the oscillator section, the plate lead will have to be unsoldered from the 6G5 socket.

6. After repairs have been made resolder the plate leads mentioned above and replace the section being careful to observe that the slotted holes in the switch bracket line up with the round guide pins on the base plate of the "Precision Tuner". This is IMPORTANT as the switch shaft cannot be inserted if the switch brackets do not line up.
7. Replace the section fastening screw.
8. Resolder the stator and rotor leads on gang condenser.
9. Replace the switch shaft and the mounting fastening screws. When inserting the switch shaft, be careful that all the switch discs are in the same position. Otherwise the switch shaft will not slide in. NEVER force the shaft into the switch discs. If shaft does not slide in freely, examine the position of the slot in each switch disc.
10. Before replacing the coil shields, it might be advisable to bend the shields slightly to assure that positive contact is made. To do this hold the shield with your two hands using the thumbs and first two fingers as shown in Figure #1. Pull out the ends of the shield slightly and at the same time apply a little pressure on the sides of the shield as indicated by the arrows in the drawing. Then replace the shields and observe that they fit tightly. In addition to assuring positive contacts, this will also prevent the contacts from rattling.

UNITED AMERICAN BOSCH CORP.

ADJUSTMENT OF BROADCAST BAND

1. Leave test signal on grid of 6B7 tube and set the test oscillator to 1400 K.C.
2. Turn the gang condenser to the maximum position. Adjust dial indicator until horizontal lines on the dial scale. Then set dial indicator to 1400 K.C.
3. Adjust trimmer #8 to maximum output.
4. Apply test signal to antenna of set and adjust trimmer #8 to maximum output.

ADJUSTMENT OF POLICE BAND

When adjustments are outlined under the broadcast band are completed, the police band requires no adjustment unless the coil had been changed. In this event, set test oscillator and station indicator to police band frequency and adjust trimmer #10. The police band winding is indicated by "A" in Fig. #2. Adjust the position of this winding by sliding it back and forth on the core until maximum output is obtained. The unit maximum output readings should then be secured in place by applying a thin coat of coil cement.

ADJUSTMENT OF I.P. (485 K.C.)

1. Set volume control on full, turn tone control knob to the right hand position. Set wave-change switch on the broadcast position and the dial indicator at approximately 600 K.C.
2. Connect output meter across voice coil of speaker.
3. Adjust oscillator to 485 K.C. and adjust its output to produce a measurable reading on output meter when test signal is applied to the grid of the 6B6 tube thru a .5 mfd. blocking condenser.
4. Adjust #28 (see Fig. #2) to maximum output reducing output of test oscillator as required.
5. Apply test signal to grid of 6B7 tube and adjust trimmer #10 to maximum output.
6. With test signal still on the grid of 6B7 tube, repeat the above adjustments for greatest sensitivity.

GENERAL DESCRIPTION

This model is a five-tube, A.C., two-band superheterodyne receiver whose circuit comprises a combined first detector-oscillator-an intermediate frequency amplifier-first audio amplifier-a detector power pentode output stage and a rectifier with its associated filter circuit and power transformer.

This model is designed to work over two bands, the broadcast band extending from 540 to 1800 K.C. and a police band which extends from 1400 to 3600 K.C.

LINE-UP CAPACITOR ADJUSTMENTS

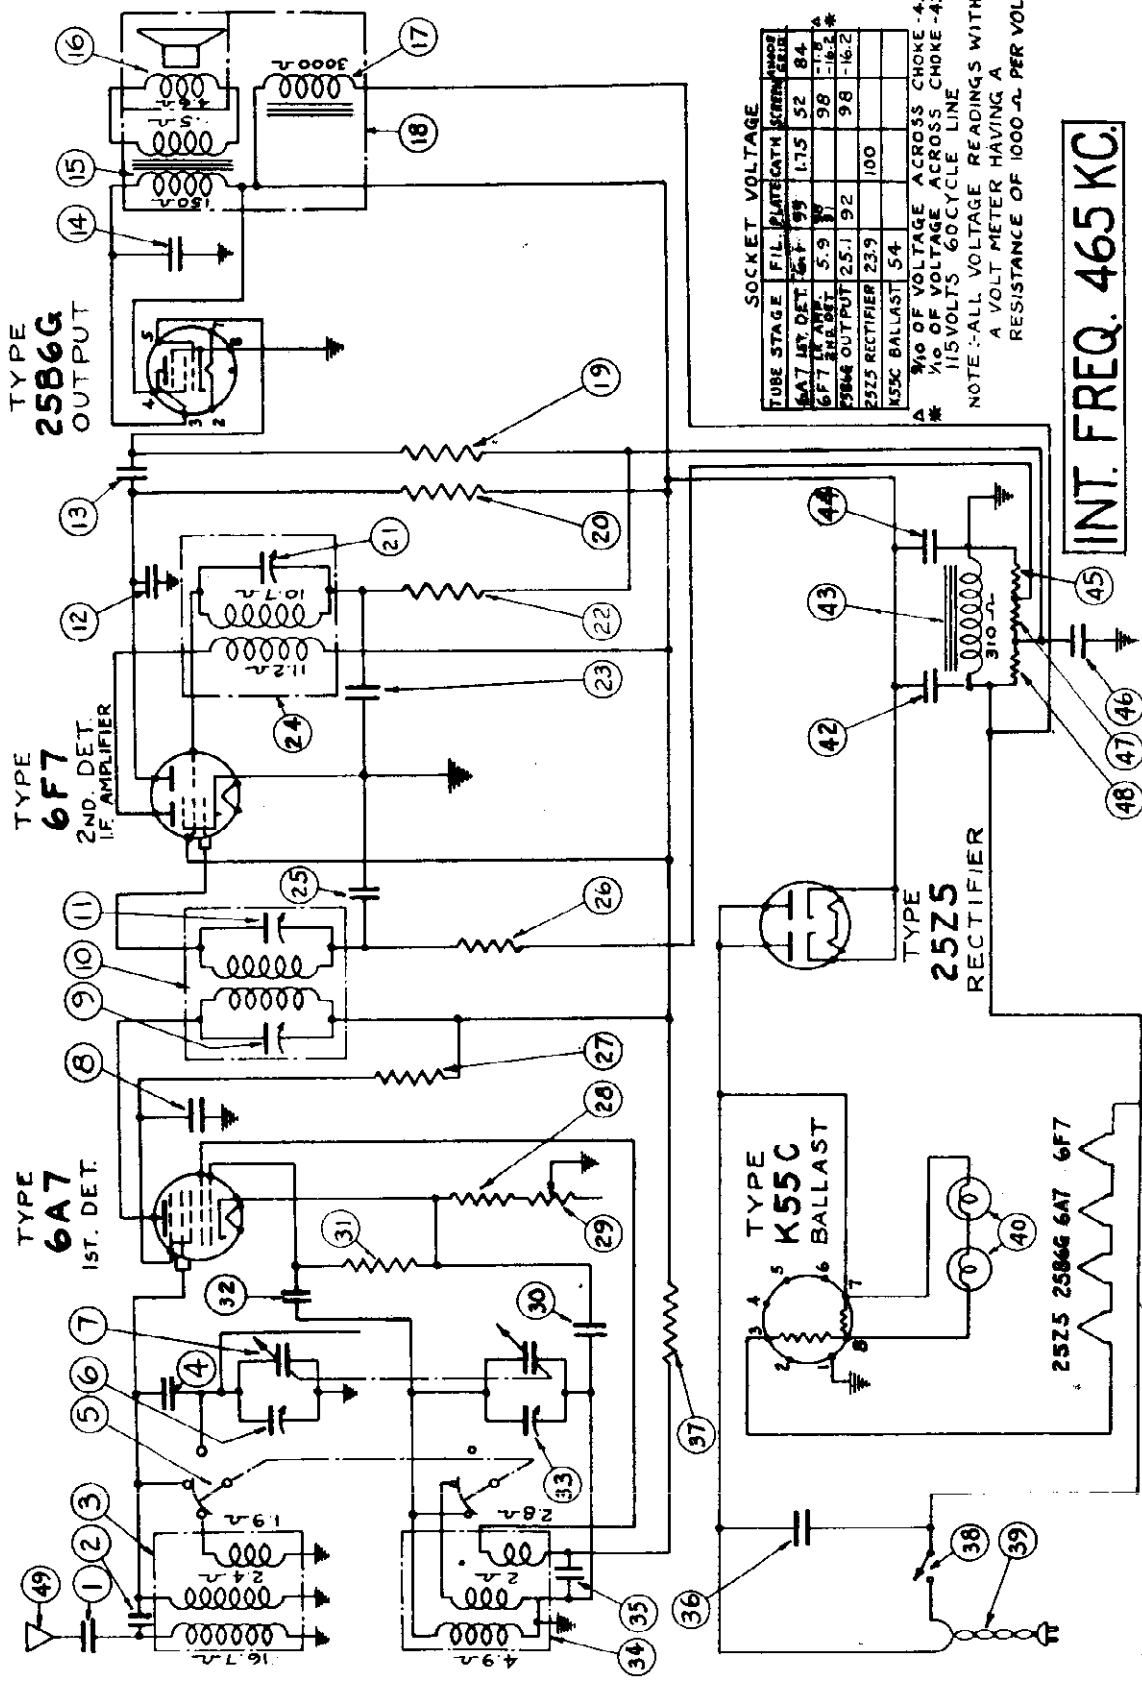

To align the elements of this receiver it is essential to use a high grade modulated test oscillator, the output of which can be continuously varied with absence from overload when the individual trimmers of the receiver are brought into alignment.

A conventional output meter can be connected across the terminals of the speaker voice coil to indicate the sensitivity of the output meter. The output meter must be sufficient to give satisfactory readings with a low input signal.

Before attempting to align the receiver,

ELECTRICAL SPECIFICATIONS

Power Supply Characterization 105 to 125 volts, 50 to 60 cycle A.C. or D.C.
 Power Consumption 1.5 to 2.5 Watts
 Tuning Range 530 to 1555 KC., 1500 to 3000 KC.
 Maximum Output 1.5 Watts
 Maximum Condenser Output

GENERAL DESCRIPTION

This model is a five-tube, A.C.-D.C. superheterodyne receiver whose circuits consist of a combined first detector-oscillator stage, a second detector, a power output stage and a rectifier.

LINE-UP CAPACITOR ADJUSTMENTS

To align this model, it is essential to use a high grade modulated oscillator and sensitive output meter. The R.F. signal it will produce in the very weak or making correct alignment impossible. The sensitivity of the output meter must be sufficient to give satisfactory reading with a low signal.

Before attempting to align a receiver, the service man should familiarize himself with the general layout of the chassis, alignment condensers, top and bottom views of the chassis are shown in Figures #1 and #2, and should be carefully studied before the actual work is started.

I.F. ADJUSTMENT (465 KC.)

NOTE: The signal generator or alignment oscillator should be connected to the antenna terminal, either to the power line and the low potential output

1. Connect the output meter across the voice coil of speaker.
2. Set volume control at maximum.
3. Set the test oscillator to 465 KC., and connect the antenna lead to the grid of the 6F7 tube through a .05 mfd. condenser.
4. Adjust second I.F. alignment condenser #21 to maximum output.
5. Apply the test signal to the grid of the 6A7 first detector-oscillator tube.
6. Adjust alignment condensers #9 and #11 to maximum output.

OSCILLATOR AND R.F. ADJUSTMENT

1. Set the test oscillator and 441 inductor to 1500 KC., and apply the test signal to the antenna of the receiver through an .05 mfd. condenser.
2. Adjust the oscillator and antenna alignment condensers #33 and #6 to maximum output.
3. Check sensitivity over scale.
4. Check sensitivity on short-wave band.

CIRCUIT ALIGNMENT

1. Aligning the I-F Stages at 262 K.C.
 - (a) Feed a test oscillator signal of 262 K.C. into the control grid of the 6B7 tube (leave grid clip in place) through a .25 mfd. condenser and adjust the I-F trimmers on the 2nd I-F coil (illus. #7 on Fig. 3). Care should be taken to keep the test oscillator leads well away from the grid leads of other tubes in the receiver to avoid inaccurate adjustments.
 - (b) Remove the test oscillator lead from the grid of the 6B7 tube and connect it to the grid of the 6A7 tube (leaving grid clip in place) and adjust the trimmers on the 1st I-F coil (illus. #5 Fig. 3) carefully for maximum output.
 - (c) The preceding adjustments should be repeated as given for test results. Do not align the two stages together by feeding a signal into the grid of the 6A7 tube.
2. Aligning the B-F Stages
 - (a) Change the test oscillator setting to 1560 K.C. and feed this signal into the antenna connection on the chassis through a .0002 mfd. condenser. Turn the condenser rotor plates until they are completely out of mesh and rest against the high frequency stop. Adjust the parallel trimmer for the oscillator section (middle) of the gang condenser.
 - (b) Change test oscillator setting to 1400 K.C. and turn condenser rotor plates until this signal is tuned in. Then adjust the trimmers for the other two sections of the condenser gang.
 - (c) Change test oscillator setting to 600 K.C. and turn condenser rotor plates until this signal is tuned in. Adjust the antenna compensating condenser (illus. #6, Fig. 4), while rocking the condenser gang plates back and forth through the signal until maximum output is obtained. It will be necessary to readjust this trimmer to the car antenna upon installation.

(d) Recheck alignment of the antenna section of the gang condenser (illus. #10, Fig. 3) for maximum output at 1400 K.C.

NOTE: Each of the trimmers on the gang condenser should be carefully sealed with Duco Household Cement to prevent any change in adjustment. In using this cement care should be taken to see that it is placed only between the top blade of the trimmer condenser and its adjusting screw.

UNITED MOTORS SERVICE

CIRCUIT ALIGNMENT

If alignment is found necessary--make all adjustments for maximum output with chassis in its case and use a calibrated test oscillator and output meter.

1. Aligning I-F Stages at 262 K.C.

Feed a test oscillator signal of 262 K.C. into the control grid of the 6A7 tube (leave grid clip in place) through a .25 mfd. condenser and adjust the trimmers on the I-F coils (illus. 7 & 8, Fig. 4) for maximum output. (Case should be taken to keep the test oscillator leads well away from the grid leads of other tubes to avoid inaccurate adjustments.)

2. Aligning R-F Stages

(a) Change the test oscillator setting to 1560 K.C. and feed this signal into the antenna connection on the chassis through a .0002 mfd. (mica) condenser. Turn the condenser rotor plates until they are completely out of mesh and rest against the high frequency stop. Adjust the parallel trimmer for the oscillator section (middle) of the gang condenser. (illus. #9 Fig. 4)

(b) Change test oscillator setting to 1400 K.C. and turn condenser rotor plates until this signal is tuned in. Then adjust the trimmers for the other two sections of the condenser gang.

(c) Change test oscillator setting to 600 K.C. and turn condenser rotor plates until this signal is tuned in. Adjust the antenna compensating condenser, (illus. #10 Fig. 3) while rocking the condenser plates back and forth through the signal until maximum output is obtained. It will be necessary to readjust this trimmer to the car antenna upon installation.

(d) Recheck Alignment of the antenna section of the gang condenser (illus. 9, Fig. 3) for maximum output at 1400 K.C.

NOTE: Each of the trimmers on the gang condenser should be carefully sealed with Deco Household Cement to prevent any change in adjustment. In using this cement care should be taken to see that it is placed only between the top blade of the trimmer condenser and its adjusting screw.

MODEL 632

Socket, Trimmers
Alignment

UNITED MOTORS SERVICE

GENERAL: The Delco Model 632 is a six tube, single unit auto radio with tone and sensitivity controls, dust-proof speaker and a primary type vibrator. This receiver is supplied with a wide variety of tuning controls and adapter packages making it possible to obtain "custom built" installation in most any make car.

CIRCUIT ALIGNMENT

If alignment is found necessary--make all adjustments for maximum output with chassis in its case and use a calibrated test oscillator and output meter.

1. Aligning the I-F Stages at 262 K.C.
Feed a test oscillator signal of 262 K.C. into the control grid of the 6A7 tube (leave grid clip in place) through a .25 mfd. condenser and adjust the trimmers on the I-F coils (illus. 7 & 8, Fig. 4) for maximum output. (Care should be taken to keep the test oscillator leads well away from the grid leads of other tubes to avoid inaccurate adjustments)
2. Aligning the R-F Stages
(a) Change the test oscillator setting to 1560 K.C. and feed this signal into the antenna connection on the chassis through a .002 mfd. condenser. Turn the condenser rotor plates until they are completely out of mesh and rest against the high frequency stop. Adjust the parallel trimmer for the oscillator section (middle) of the gang condenser.
(b) Change test oscillator setting to 1400 K.C. and turn condenser rotor plates until this signal is tuned in. Then adjust the trimmers for the other two sections of the condenser gang.

- (c) Change test oscillator setting to 600 K.C. and turn condenser rotor plates until this signal is tuned in. Adjust the antenna compensating condenser, while rocking the condenser plates back and forth through the signal until maximum output was obtained. It will be necessary to readjust this trimmer to the car antenna upon installation.
(d) Recheck alignment of the antenna section of the gang condenser (illus. 10, Fig. 5) for maximum output at 1400 K.C.

NOTE: Each of the trimmers on the gang condenser should be carefully sealed with Ducc Household Cement to prevent any change in adjustment. In using this cement care should be taken to see that it is placed only between the top blade of the trimmer condenser and its adjusting screw.

MODEL 633

Socket, Trimmers Alignment

UNITED MOTORS SERVICE

GENERAL: The Delco Model 633 is a six tube, header speaker auto radio, with tone and sensitivity controls, dust-proof speaker and a primary type vibrator. This receiver is supplied with a wide variety of tuning controls and adapter packages making it possible to obtain "custom built" installation in most any make car.

CIRCUIT ALIGNMENT

1. Aligning the I-F Stages at 262 K.C.

(a) Feed a test oscillator signal of 262 K.C. into the control grid of the 6A7 tube (have grid clip in place) through a .25 mfd. condenser and adjust the trimmers on the I-F coils (illus. 7 & 8, Fig. 4) for maximum output. Care should be taken to keep the test oscillator leads well away from the grid leads of other tubes to avoid inaccurate adjustments.

(b) Repeat above adjustments until no further increase in output can be obtained.

2. Aligning the R-F Stages

(a) Change the test oscillator setting to 1560 K.C. and feed this signal into the antenna connection on the chassis through a .0002 mfd. condenser. Turn the condenser rotor plates until they are completely out of mesh and rest against the high frequency stop. Adjust the parallel trimmer for the oscillator section (middle) of the gang condenser.

(b) Change test oscillator setting to 1400 K.C. and turn condenser rotor plates until this signal is tuned in. Then adjust the trimmers for the other two sections of the condenser gang.

(c) Change test oscillator setting to 600 K.C. and turn condenser rotor plates until this signal is tuned in. Adjust the antenna compensating condenser, (illus. #11, Fig. 4) while rocking the condenser plates back and forth through the signal until maximum output is obtained. It will be necessary to readjust this trimmer to the car antenna upon installation.

(d) Recheck alignment of the antenna section of the gang condenser (illus. #9, Fig. 3).

NOTE: Each of the trimmers on the gang condenser should be carefully sealed with Ducc Household Cement to prevent any change in adjustment. In using this cement care should be taken to see that it is placed only between the top blade of the trimmer condenser and its adjusting screw.

MODEL 634
Socket, Trimmers
Alignment

UNITED MOTORS SERVICE

1. Aligning the I-F Stages at 262 K.C.

(a) Feed a test oscillator signal of 262 K.C. into the control grid of the 6A7 tube (leave grid clip in place) through a .25 mfd. condenser and adjust the trimmers on the I-F coils (Illus. 7 & 8, Fig. 2) for maximum output. Care should be taken to keep the test oscillator leads well away from the grid leads of other tubes to avoid inaccurate adjustments.

(b) Repeat above adjustments until no further increase in output can be obtained.

2. Aligning the R-F Stages

(a) Change the test oscillator setting to 1560 K.C. and feed this signal into the antenna connection on the chassis through a .0002 mfd. condenser. Turn the condenser rotor plates until they are completely out of mesh and rest against the high frequency stop. Adjust the parallel trimmer for the oscillator section (middle) of the gang condenser.

(b) Change test oscillator setting to 1400 K.C. and turn condenser rotor plates until this signal is tuned in. Then adjust the trimmers for the other two sections of the condenser gang.

(c) Change test oscillator setting to 600 K.C. and turn condenser rotor plates until this signal is tuned in. Adjust the antenna compensating condenser, (Illus. #10, Fig. 3) while rocking the condenser plates back and forth through the signal until maximum output is obtained. It will be necessary to readjust this trimmer to the car antenna upon installation.

(d) Recheck alignment of the antenna section of the gang condenser (Illus. #12, Fig. 2) for maximum output at 1400 K.C.

1st I-F COIL PART NUMBER

In certain production series of the Model 634 receiver, the part number applying to the 1st I-F coil assembly was incorrectly stamped on its shield case as #1210699. The correct number is 1210969 as listed in the parts list of this Bulletin and any orders for this part should be placed under this number.

FIG. 2--PARTS LAYOUT--Top View

FIG. 3--PARTS LAYOUT--Bottom View

MODEL 635
Socket, Trimmers
Alignment

UNITED MOTORS SERVICE

GENERAL: The Delco Model 635 is a six tube, combination "dash" and "header" speaker auto radio, with sensitivity control, bass compensation control, speaker selector switch, synchronous vibrator and metal type (6F6) power tubes. This receiver is supplied with a wide variety of tuning controls and header speaker adapters, making it possible to obtain "custom built" installation in most any car.

CIRCUIT ALIGNMENT

If re-alignment of the receiver circuits is found necessary--make all adjustments for maximum output with the receiver chassis in its case and use a calibrated test oscillator and output meter.

1. Aligning the I-F Stages at 262 K.C.

(a) Feed a test oscillator signal of 262 K.C. into the control grid of the 6A7 tube (leave grid clip in place) through a .25 mfd. condenser and adjust the trimmers on the I-F coils (illus. #7 and 8, Fig. 2) for maximum output. Care should be taken to keep the test oscillator leads well away from the grid leads of other tubes to avoid inaccurate adjustments.

(b) Repeat above adjustments until no further increase in output can be obtained.

2. Aligning the R-F Stages

(a) Change the test oscillator setting to 1650 K.C. and feed this signal into the antenna connection on the chassis through a .0002 mfd. condenser. Turn the condenser rotor plates until they are completely out of mesh and rest against the high frequency stop. Adjust the parallel trimmer for the oscillator section (middle) of the gang condenser.

(b) Change test oscillator setting to 1400 K.C. and turn condenser rotor plates until this signal is tuned in. Then adjust the trimmers for the other two sections of the condenser gang.

(c) Change test oscillator setting to 600 K.C. and turn condenser rotor plates until this signal is tuned in. Adjust the antenna compensating condenser, (illus. #10, Fig. 3) while rocking the condenser plates back and forth through the signal until maximum output is obtained. It will be necessary to readjust this trimmer to the car antenna upon installation.

(d) Recheck alignment of the antenna section of the gang condenser (illus. 12, Fig. 2) for maximum output at 1400 K.C.

NOTE: Each of the trimmers on the gang condenser should be carefully sealed with Duco Household Cement to prevent any change in adjustment. In using this cement care should be taken to see that it is placed only between the top blade of the trimmer condenser and its adjusting screw.

MODEL S 544246 Buick-Pontiac

393885 Olds

UNITED MOTORS SERVICE

1291344 Buick

Socket, Trimmers, Changes
Alignment

CIRCUIT CHANGES

A number of the early receivers have a 1 mfd. tubular condenser mounted above the candohm resistor, illustration #42 on Figure 2 and connected in parallel with the 85 tube cathode by-pass section and connected in parallel with the 85 tube cathode by-pass section 20D of the #1209144 electrolytic condenser block. The use of the tubular condenser was necessary in production to reduce the R.F. resistance of the 85 cathode by-pass. A change has been made in the design of the condenser block, making the use of the tubular condenser unnecessary. All of the service parts replacement stock of #1209144 electrolytics are of the new design and it is immaterial whether or not the tubular condenser is left in the receiver when replacing the electrolytic condenser block.

It may be noted on some of the earlier receivers that there is a small condenser in a metal case mounted below the candohm resistor, illus. #42, Fig. 2, with two terminals that are not connected. This condenser was originally placed in the set to filter vibrator interference, but it was found after production started that two small condensers mounted in the vibrator unit were more effective and the external condenser was simply disconnected.

Peaking I.F. Stages at 268 K.C.

- (a) Connect the ground lead of the test oscillator to the chassis frame. Connect a 1 mfd. condenser in series with the other lead and connect this lead to the grid cap of the 6A7 tube leaving the grid clip in place. The 1 mfd. condenser is necessary to prevent the oscillator circuit of the receiver from affecting the I.F. adjustments.
- (b) Set the test oscillator on 268 kilocycles.
- (c) Turn the volume control of the receiver on full.
- (d) Peak the I.F. trimmer P-3 located on the 2nd I.F. coil shown on Figure 2.
- (e) Then peak trimmers P-2 and P-1 located on the first I.F. coil also shown on Figure 2.
- (f) In order to insure accurate settings of the I.F. trimmers the above adjustments should be repeated using the lowest oscillator output that will give a reasonable deflection of the output meter pointer. Make all adjustments for maximum output.

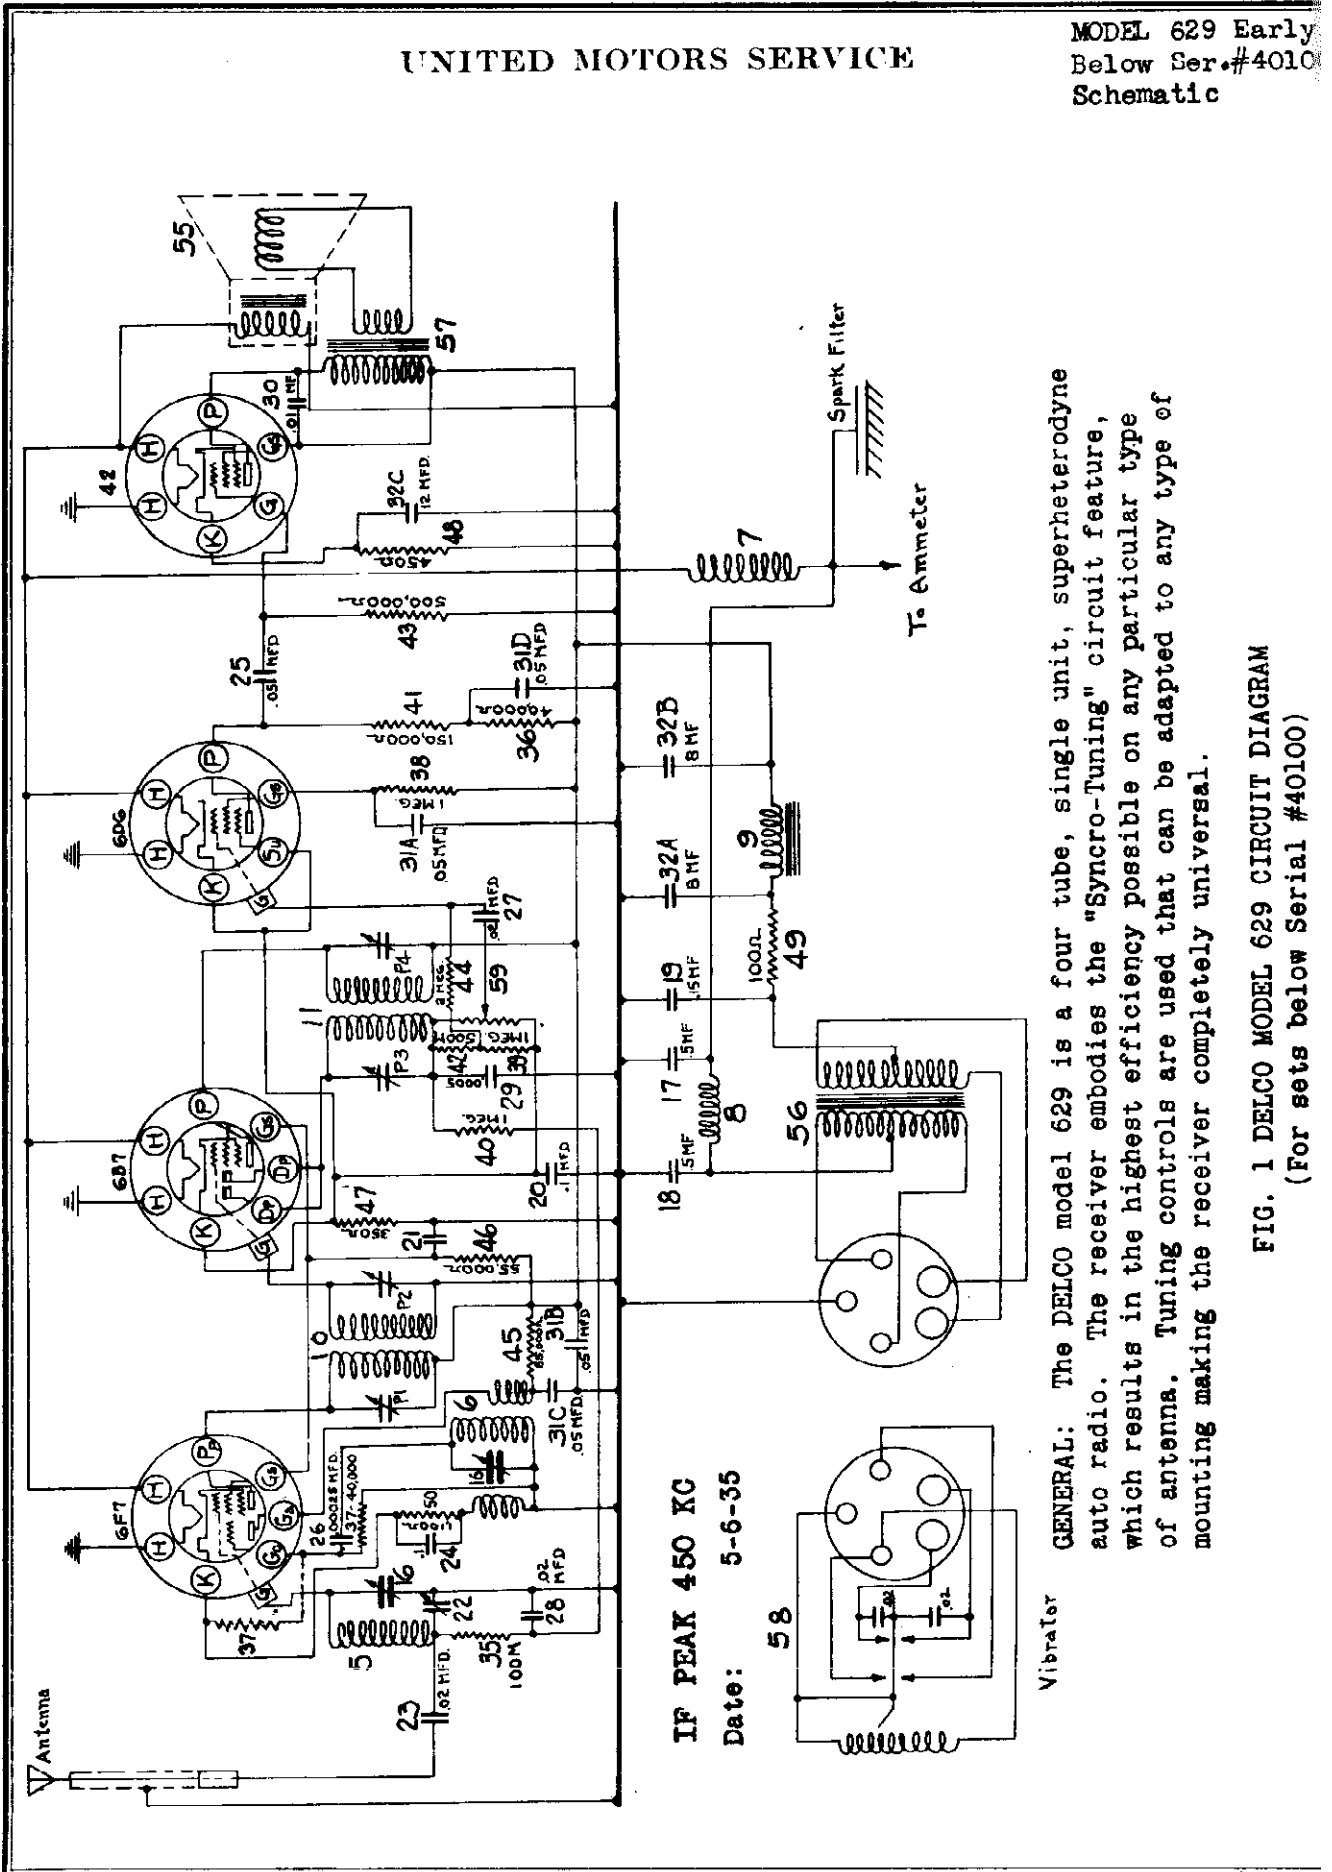

Peaking Gang Condenser at 1530 and 1400 K.C.

- (a) Connect the output of the test oscillator to the antenna connection of the receiver and to the chassis ground. Do not use the 1 mfd. condenser that was required in aligning the I.F. stages.
- (b) Turn the rotor plates of the gang condenser until they are COMPLETELY OUT OF MESH.
- (c) Set the test oscillator on 1530 kilocycles.
- (d) Adjust the trimmer condenser for the oscillator section (middle section) of the gang condenser CAREFULLY for maximum output. Then adjust the trimmers for the "R.F." and "ANT" sections of the gang condenser.
- (e) Set the test oscillator on 1400 kilocycles.
- (f) Turn the condenser rotor plates until the 1400 K.C. signal from the test oscillator is turned in with maximum output. (No calibration blocks should be used as the oscillator circuit is adjusted at 1530 K.C. on this set.)
- (g) Readjust the parallel trimmers for the "R.F." and "ANT" sections of the gang condenser for maximum output. DO NOT disturb the oscillator trimmer (middle section) as this is adjusted at 1530 K.C. only and any further adjustments at this point will affect both the tuning range of the receiver and the tracking of its circuits.

CAUTION: Always use the lowest possible test oscillator output that will give a reasonable deflection of the output meter pointer, in order to prevent the A.V.C. from leveling out the output as the adjustments are made.

 MODELS 629, Early & Late

Peaking I.F. Stages at 262 K.C.

(a) Connect the ground lead of the test oscillator to the chassis frame. Connect a .5 mfd. condenser in series with the other lead and connect this lead to the grid cap of the 6F7 tube, leaving the tube's grid clip in place. (The .5 mfd. condenser Peaking I.F. Stages

is necessary to prevent the oscillator circuit of the receiver from affecting the I.F. adjustments.)

(b) Set the test oscillator

(c) Turn the volume control of the receiver on full.

(d) Peak each of the I.F. trimmers on the 2nd I.F. coil.

(e) Then peak each of the trimmers on the 1st I.F. coil,

(f) In order to insure accurate settings of the I.F. trimmers the above adjustments should be repeated using the lowest oscillator output that will give a reasonable output meter scale deflection. Make all adjustments for maximum output.

2. Peaking Oscillator Section of Gang Condenser at 1540 K.C.

(a) Connect the output of the test oscillator to the antenna connection of the receiver and to the chassis ground. (Do not use the .5 mfd. condenser that was required in aligning the I.F. stages.)

(b) Turn the rotor plates of the gang condenser until they are COMPLETELY OUT OF MESH.

(c) Set the test oscillator on exactly 1540 kilocycles.

(d) Adjust the parallel trimmer for the "OSC." section (middle section) CAREFULLY for maximum output. Then adjust the trimmers for the other two sections of the gang condenser also for maximum output.

3. Tracking "Syncro-Tuning" Circuit

(a) Set the test oscillator on 1400 kilocycles. (Leave test oscillator connected to ant. and Gnd. of receiver.)

(b) Turn the condenser rotor plates until the 1400 K.C. signal from the test oscillator is tuned in with maximum output.

Tracking "Syncro-Tuning" Circuit--Cont'd.

(c) Readjust the parallel trimmers for the "ANT." and "R.F." sections of the gang condenser (shown on Fig. 2) for maximum output. DO NOT DISTURB the setting of the oscillator trimmer as this is adjusted at the 1540 K.C. only and adjustment at this point will affect both the tuning range of the receiver and the tracking of its circuits.

NOTE: In order to accurately set the "ANT." trimmer of the condenser gang at 1400 K.C. it will be necessary to make a preliminary adjustment of the "antenna compensating condenser" before installing the receiver on a car.

(d) Then set the test oscillator on 600 kilocycles.

(e) Turn the condenser rotor plates until the 600 K.C. signal from the test oscillator is tuned in with maximum output.

(f) Peak the antenna compensating condenser for maximum output. Re-tune the gang condenser for maximum output. Repeat these operations alternately until no further improvement in output can be obtained.

(g) Reset the test oscillator on 1400 kilocycles.

(h) Turn the condenser rotor plates until the 1400 K.C. signal is tuned in with maximum output.

(i) Adjust the trimmer for the "ANT." section of the gang condenser CAREFULLY for maximum output.

4. Adjusting Compensating Condenser to Car Antenna

After the "ANT." trimmer of the gang condenser has been correctly set according to the preceding information, it will require no further adjustment. It will be necessary, however, to reset the "antenna capacity compensating condenser" to the car antenna when installing the receiver in a car in order to compensate for the wide range of antenna capacities being used. This is done in the following manner:

(a) Tune the receiver to a weak broadcast station between 570 to 540 K.C.

(b) Peak the compensating condenser for maximum output, rocking the receiver dial and adjusting the compensating condenser alternately until no further improvement in output can be obtained.

CAUTION: Do not touch the adjustment of the parallel trimmer for the "ANT." section of the gang condenser after the receiver is installed on a car.

FIG. 2 PARTS LAYOUT (Bottom View)

CIRCUIT CHANGES

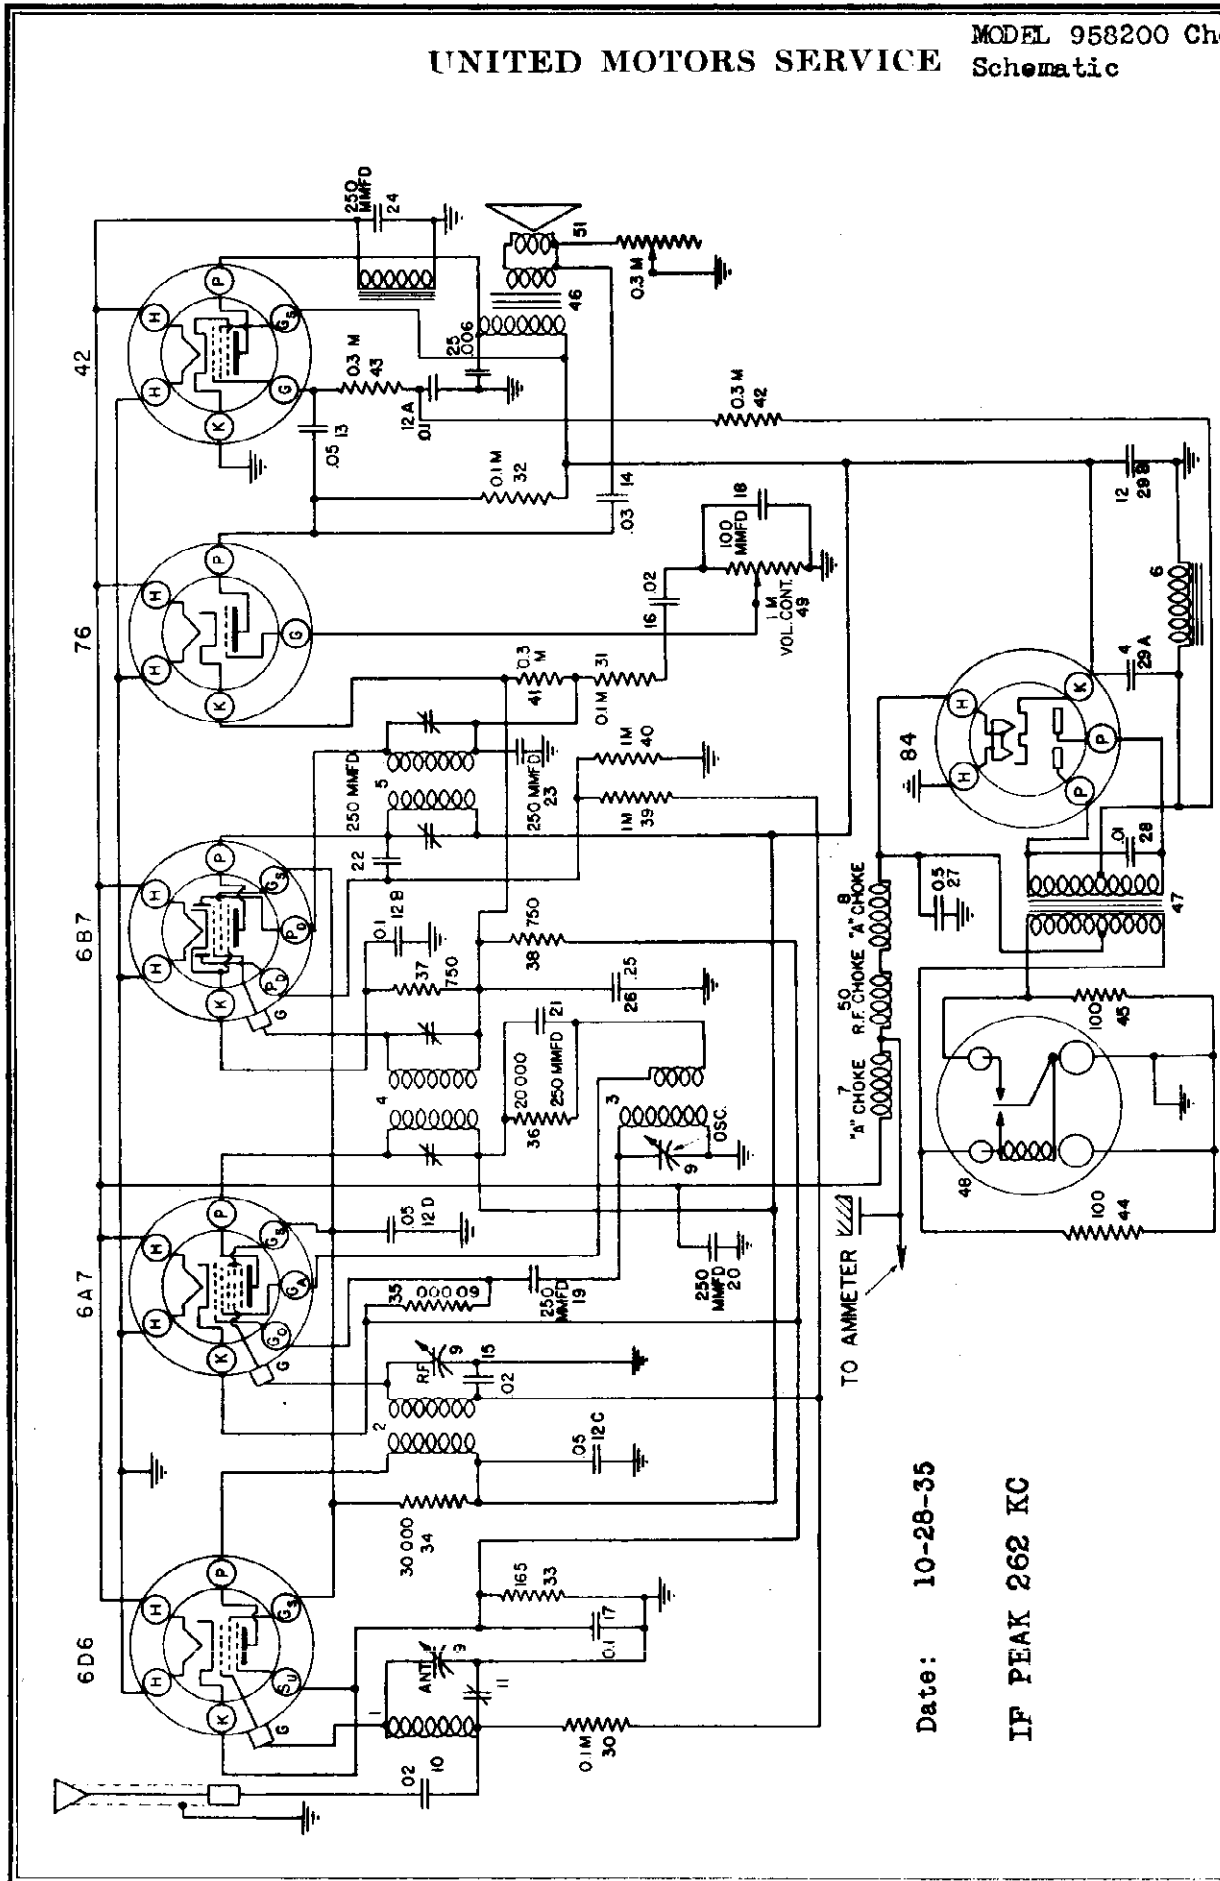

A number of the early receivers have $\frac{1}{4}$ mfd. tubular condenser mounted above the candohm resistor, illustration #42 on Figure 2 and connected in parallel with the 85 tube cathode by-pass section 20D of the #1209144 electrolytic condenser block. The use of the tubular condenser was necessary in production to reduce the R.F. resistance of the 85 cathode by-pass. A change has been made in the design of the condenser block, making the use of the tubular condenser unnecessary. All of the service parts replacement stock of #1209144 electrolytics are of the new design and it is immaterial whether or not the tubular condenser is left in the receiver when replacing the electrolytic condenser block.

It may be noted on some of the earlier receivers that there is a small condenser in a metal case mounted below the candohm resistor, Illus. #42, Fig. 2, with two terminals that are not connected. This condenser was originally placed in the set to filter vibrator interference, but it was found after production started that two small condensers mounted in the vibrator unit were more effective and the external condenser was simply disconnected.

CONVENTIONAL ALIGNMENT-SEE SPECIAL SECTION

Generator frequency at 262 KC, connected thru 1 MFD condenser to the grid of the 6A7 tube. Grid clip is not disturbed. Peak trimmers P3, then P2 and P1.

Generator connected direct to the antenna lead of receiver. Frequency set at 1530 KC. Rotor plates of gang condenser completely out of mesh. Adjust the OSC section parallel trimmer (middle section) to peak. Then adjust the parallel trimmers of the front and rear sections, to maximum peak. Generator then set to 1400 KC. The rotor of variable condenser adjusted until heard. Peak front and rear sections at this frequency. No oscillator padding required.

1210066	Screw	Chassis to case (P.K. #5x3/4")	
1209558	Socket	Speaker	

GENERAL: The Chevrolet Model 958200 is a six tube receiver with a "Dome" type speaker, instrument panel tuning control and tone control. This receiver was designed specifically for 1936 Model Chevrolets and for use on the under-car antenna system required.

Antenna System: The antenna system used with this receiver consists of an assembly of two rubberized metal strips for mounting below each running board with special brackets.

TUBE COMPLEMENTS

The tubes used in this receiver are: 6D6 R-F Amplifier, 6A7 Oscillator-Modulator, 6B7 I-F Amplifier-Diode Detector-A.V.C., 76 1st A-F Amplifier, 42 Power Output and a type 84 Rectifier.

CIRCUIT ALIGNMENT

If Alignment is found necessary -- make all adjustments with chassis in its case and use a calibrated test oscillator and output meter. To align the I-F stages -- feed a test oscillator signal of 262 K.C. into the grid of the 6A7 tube (leave grid clip in place) through a .25 mfd. condenser and adjust the four trimmers located on top of the I-F coils. To align R-F stages -- change the test oscillator setting to 1560 K.C. and feed this signal into the antenna connection on the receiver through a .0002 mfd. condenser. Turn the condenser plates until they are completely out of mesh and adjust the oscillator parallel trimmer on the middle section of the condenser gang. Change test oscillator setting to 1400 K.C. and turn condenser plates until the signal is tuned in. Then adjust the trimmers for the other two sections of the condenser gang. Change the test oscillator setting to 800 K.C. and adjust the antenna compensating condenser, (located through a small hole in the tuning control side of the chassis case) while rocking the tuning condenser plates back and forth slightly. Recheck alignment of the antenna parallel trimmer on condenser gang at 1400 K.C.

TUBE SOCKET VOLTAGES

Tube	H	F	Ga	Gc	I
6D6	6	240	100	-	3.5
6A7	6	140	100	160	3.5
6B7	6	130	100	-	3.5
76	6	130	-	-	8.0
42	6	220	240	-	0
84	5.6	-	-	-	240

NOTE

Ken-Rad 6D6 tubes were used in the R-F Stages of some of these receivers -- in using National Union tubes for replacement the alignment of the "Ant" section of the condenser gang should be checked because of a possible difference in internal capacities of the two makes of tubes.

MODEL 982006 Olds
Alignment, Change

UNITED MOTORS SERVICE

4. Aligning at 1400 Kilocycles

Remove the signal lead of the test oscillator from the grid of the 6D6 Trans-lator tube and connect to the antenna terminal of the receiver THROUGH A .002 MICA CONDENSER connected in place of the .1 mfd. condenser previously used. (It is very important that a .002 mfd. mica condenser be used in aligning the antenna stage of these receivers in order that this circuit can be made to track properly. Some test oscillators have this condenser included and if the capacity is correct, it will not be necessary to use an external series condenser.) Set the test oscillator to 1400 K.C. Turn the condenser rotor plates until the frequency is tuned in with maximum output. Adjust the R-F parallel trimmer on the condenser gang (illus. #9B, Fig. 3) and the antenna compensating condenser (illus. #21, Fig. 4) located on the side of the receiver case for maximum output.

5. Aligning at 600 Kilocycles

The oscillator padding condenser was previously adjusted at 540 K.C., how-ever, it is necessary in most cases to repeak the oscillator tracking con-denser at 600 K.C. in order to make the receiver track properly and to secure full sensitivity.

Set the test oscillator on 600 K.C. Turn the condenser rotor plates until the signal from the test oscillator is tuned in with maximum output. Main-tain a low output signal from the test oscillator and readjust the oscil-lator tracking condenser (illus. #4, Fig. 4) while rocking the variable condenser gang tuning shaft back and forth through the signal. This op-eration should be continued until no further increase in output can be obtained.

SUBJECT--CHANGE IN "CIRCUIT ALIGNMENT" PROCEDURE
 OLDS RADIO #982006 Date: 6-25-36

Oldsmobile radios #982006 were shipped from the factory with their oscil-lator circuits high frequency adjustment made at either 1560 or 1540 K.C.

ADJUSTING OSCILLATOR CIRCUIT

Sets adjusted at 1540 K.C. by the factory will not tune to 1560 K.C. un-less the oscillator trimmer is screwed out too far. If re-alignment of any of these radios is found necessary, make the high frequency adjustment of the oscillator section of the condenser gang at 1540 instead of 1560 K.C. as indicated in the "CIRCUIT ALIGNMENT" procedure. All other ad-justments of the receiver circuits should be made as indicated under "CIRCUIT ALIGNMENT".

CHECKING ALIGNMENT

If it is found in checking the receiver alignment with a test oscillator that the receiver will tune to 1560 K.C., it will not be necessary to re-set the oscillator section of the condenser gang to 1540 K.C. That is, unless the oscillator coil has been replaced, in which case the adjustment should be made at 1540 K.C.

1. Peaking I-F Stages at 262 Kilocycles

IMPORTANT: The "Local-Distance" switch on the tuning control used with this receiver is used to control the alignment of the first I-F coil wind-ings. The capacity existing between the leads and the shielding of the cable connecting to the switch in the tuning control is part of the I-F tuned circuit and must be taken into consideration when aligning the I-F stages.

In order to duplicate this capacity and provide facilities for switching from "Local to Distance" a "TEST AND ALIGNMENT CABLE" (Part #1210201) has been made available. This cable eliminates the necessity of removing the tuning control from the car.

(a) Connect the signal lead of the test oscillator to the grid cap of the 6D6 Translator Tube through a .1 mfd. condenser, leaving the tube's grid clip in place. Connect the ground lead of the test oscillator to the chassis frame.

(b) Insert the four prong plug of the "TEST AND ALIGNMENT CABLE" of the tuning control cable into the socket provided on the receiver chassis. Turn switch on test cable or tuning control to "DISTANCE" position. (If the receiver is aligned with the switch in the "local" position, the "Local-Distance" switch will operate backwards.)

(c) Set the test oscillator to exactly 262 K.C.

(d) Adjust the trimmers on the I-F coils (illus. 5 and 6, Fig. 4) for maximum output. These adjustments should be repeated several times and during alignment the test oscillator output should be kept to as low a value as is consistent with obtaining a readable indication on the output meter.

2. Aligning at 1560 Kilocycles

Leave the test oscillator leads connected the same as for aligning the I-F circuits. Turn the rotor plates of the gang condenser all the way out and against the high frequency stop. Set the test oscillator to 1560 kilo-cycles. Adjust the parallel trimmer for the oscillator section of the condenser gang (illus. 9, Fig. 3) for maximum output. (It is very impor-tant that this frequency be set accurately as a slight missetting will cause the receiver to be out of track over the entire high frequency end of the dial.

3. Aligning at 540 Kilocycles

Leave test oscillator leads connected the same as before. Turn the rotor plates of the gang condenser all the way into mesh so that they rest against the low frequency stop. Set the test oscillator to 540 K.C. Adjust the oscillator padding condenser (illus. #4, Fig. 4) located on the under-side of the receiver sub-panel to maximum output. (This adjustment sets the low frequency tuning range of the receiver to 540 K.C.)

UNITED MOTORS SERVICE

Overall Oscillation:— On some of the first production of these receivers, overall oscillation was noticed in tuning to resonance on a station. On sets having this trouble--examine the receiver chassis to see if a .00025 mfd. condenser is connected between the 42 tube control grid and ground. (This condenser is shown as Illus. #40 on Fig. 4.) If this condenser is not used--connect a part #1209055 condenser from the 42 tube control grid to ground. This condenser was used in the later production of these receivers and should eliminate all trouble from this source.

UNITED MOTORS SERVICE

Alignment, Change

4. Aligning at 1400 Kilocycles

Remove the signal lead of the test oscillator from the grid of the 6D6 Translater tube and connect to the antenna terminal of the receiver THROUGH A .0002 MICA CONDENSER connected in place of the .1 mfd. condenser previously used. It is very important that a .0002 mfd. mica condenser be used in aligning the antenna stage of these receivers in order that this circuit can be made to track properly. Some test Oscillators have this condenser included and if the capacity is correct, it will not be necessary to use an external series condenser. Set the test oscillator to 1400 K.C. Turn the condenser rotor plates until the frequency is tuned in with maximum output. Adjust the B-F parallel trimmer on the condenser gang (illus. #10B, Fig. 2) and the antenna compensating condenser (illus. #24, Fig. 3) located on the side of the receiver case for maximum output.

5. Aligning at 600 Kilocycles

The oscillator padding condenser was previously adjusted at 540 K.C., however, it is necessary in most cases to repeak the oscillator tracking condenser at 600 K.C. in order to make the receiver track properly and to secure full sensitivity.

Set the test oscillator on 600 K.C. Turn the condenser rotor plates until the signal from the test oscillator is tuned in with maximum output. Maintain a low output signal from the test oscillator and readjust the oscillator tracking condenser (illus. #5, Fig. 3) while rocking the variable condenser gang tuning shaft back and forth through the signal. This operation should be continued until no further increase in output can be obtained.

SUBJECT--CHANGE IN "CIRCUIT ALIGNMENT" PROCEDURE

OLDS RADIOS 982007 & 982008 were shipped from the factory with their oscillator circuits high frequency adjustment made at either 1560 or 1540 K.C.

ADJUSTING OSCILLATOR CIRCUIT

Sets adjusted at 1540 K.C. by the factory will not tune to 1560 K.C. unless the oscillator trimmer is screwed out too far. If re-alignment of any of these radios is found necessary, make the high frequency adjustment of the oscillator section of the condenser gang at 1540 instead of 1560 K.C. as indicated in the "CIRCUIT ALIGNMENT" procedure. All other adjustments of the receiver circuits should be made as indicated under "CIRCUIT ALIGNMENT".

CHECKING ALIGNMENT

If it is found in checking the receiver alignment with a test oscillator that the receiver will tune to 1560 K.C., it will not be necessary to re-set the oscillator section of the condenser gang to 1540 K.C. That is, unless the oscillator coil has been replaced, in which case the adjustment should be made at 1540 K.C.

Be sure to check your test oscillator for correct calibration against known station frequencies before making any receiver adjustments.

CIRCUIT ALIGNMENT

1. Peaking I-F Stages at 262 Kilocycles

IMPORTANT: The "Local-Distance" switch on the tuning control used with these receivers is used to control the alignment of the first I-F coil windings. The capacity existing between the leads and the shielding of the cable connecting to the switch in the tuning control is part of the I-F tuned circuit and must be taken into consideration when aligning the I-F stages.

In order to duplicate this capacity and provide facilities for switching from "Local to Distance" a "TEST AND ALIGNMENT CABLE" (Part #1210201) has been made available. This cable eliminates the necessity of removing the tuning control from the car.

(a) Connect the signal lead of the test oscillator to the grid cap of the 6D6 Translater Tube through a .1 mfd. condenser, leaving the tubes grid clip in place. Connect the ground lead of the test oscillator to the chassis frame.

(b) Insert the four prong plug of the "TEST AND ALIGNMENT CABLE" of the tuning control cable into the socket provided on the receiver chassis. Turn switch on test cable or tuning control to "DISTANCE" position. (If the receiver is aligned with the switch in the "Local" position, the "Local-Distance" switch will operate backwards.)

(c) Set the test oscillator to exactly 262 K.C.

(d) Adjust the trimmers on the I-F coils (illus. 6 and 7, Fig. 3) for maximum output. These adjustments should be repeated several times and during alignment the test oscillator output should be kept to as low a value as is consistent with obtaining readable indication on the output.

2. Aligning at 1560 Kilocycles

Leave the test oscillator leads connected the same as for aligning the I-F circuits. Turn the rotor plates of the gang condenser all the way out and against the high frequency stop. Set the test oscillator to 1560 kilocycles. Adjust the parallel trimmer for the oscillator section of the condenser gang (illus. 10C, Fig. 2) for maximum output. (It is very important that this frequency be set accurately as a slight missetting will cause the receiver to be out of track over the entire high frequency end of the dial.)

3. Aligning at 540 Kilocycles

Leave test oscillator leads connected the same as before. Turn the rotor plates of the gang condenser all the way into mesh so that they rest against the low frequency stop. Set the test oscillator to 540 K.C. Adjust the oscillator padding condenser (illus. #5, Fig. 3) located on the under-side of the receiver sub-panel to maximum output. (This adjustment sets the low frequency tuning range of the receiver to 540 K.C.)

UNITED MOTORS SERVICE

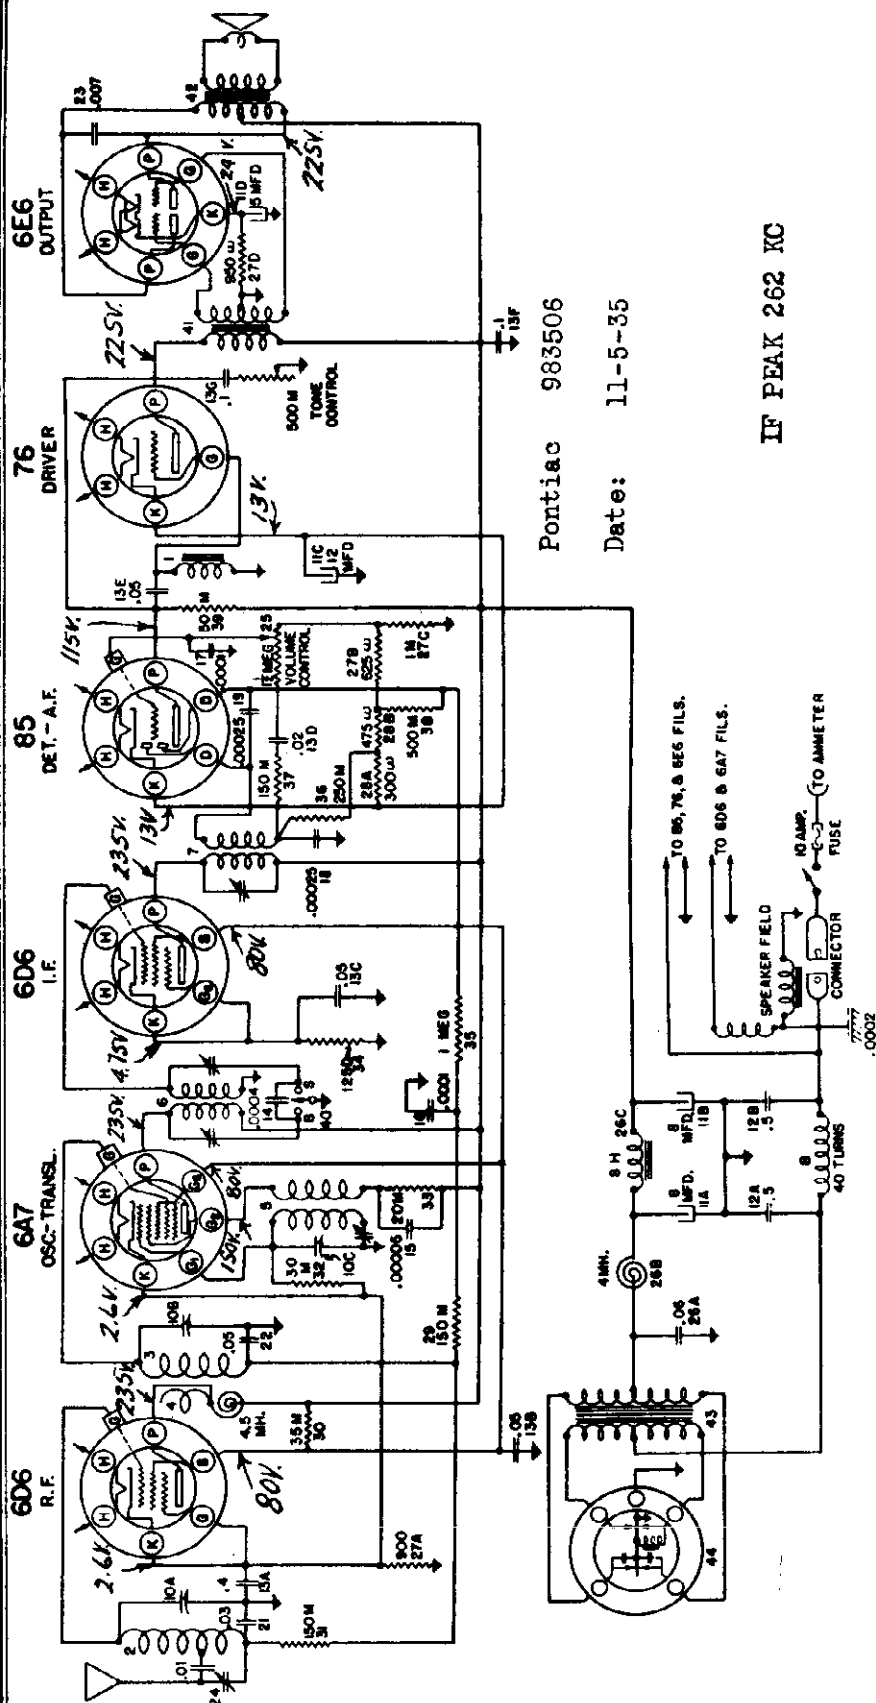

FIG. 2 PARTS LAYOUT--Top View

MODEL 983506 Pontiac
Schematic, Voltage
Alignment

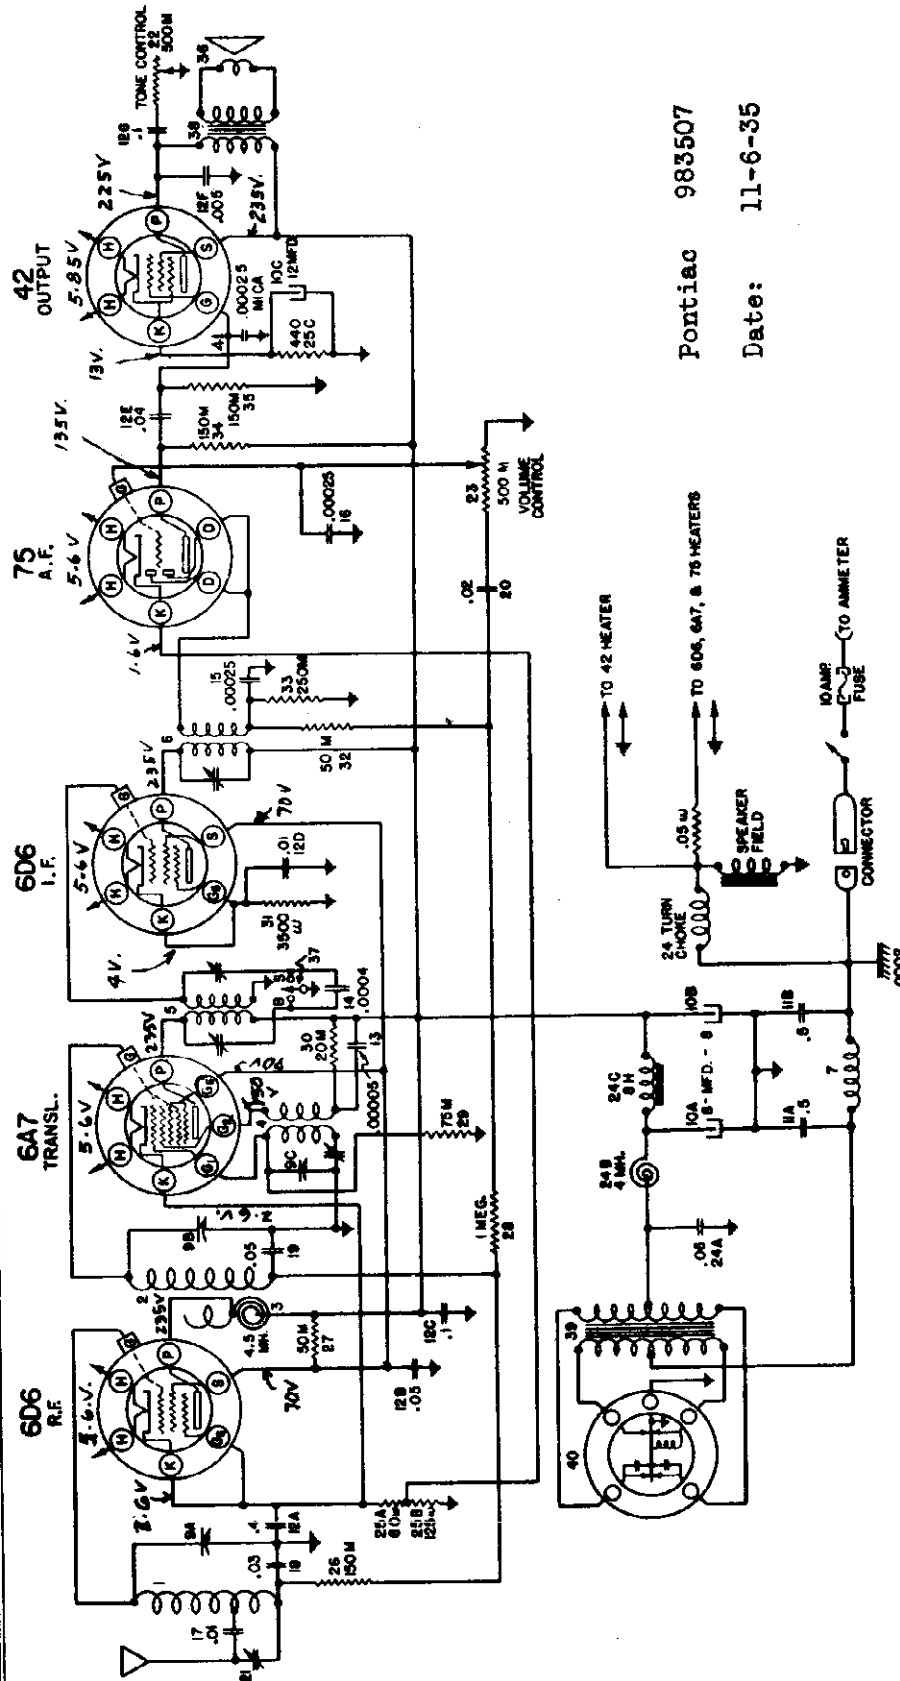

UNITED MOTORS SERVICE

Feed 262-kc. signal to control grid of 6A7. Use 0.25-mf condenser as dummy antenna. Adjust the three trimmers on top of the i-f coils. (Be sure "Local-Distance" switch is in "Distance" position) Feed signal of 1560 kc to antenna post through a 0.002-mf condenser dummy. Turn condenser plates completely out of mesh. Adjust Osc. trimmer-- middle section of condenser gang. Set signal generator and dial to 600 kc. Adjust Osc. tracking condenser (on bottom of chassis) while rocking the gang condenser plates. Set signal generator and dial to 1400 kc. Adjust the r-f trimmer on the condenser gang. Recheck Osc. trimmer of condenser gang at 1560 kc.

UNITED MOTORS SERVICE

MODEL 983507 Pontiac
Schematic, Voltage
Alignment

ALIGNMENT - To align the I-F stages -- feed a test oscillator signal of 262 K.C. into the control grid of the 6A7 tube through a .25 mfd. condenser and adjust the three trimmers located on top of the I-F coils (Make sure that the "Local-Distance" switch is in the "Distance" position). To align the R-F circuits - change the test oscillator frequency to 1560 K.C. into antenna connection on receiver through a .0002 mfd. condenser. Turn the condenser plates until they are completely out of mesh and against the high frequency stop. Adjust the oscillator trimmer on the middle section of the condenser gang. Change test oscillator frequency to 540 Kilocycles and turn condenser plates until this signal is tuned in (approximately 600 K.C. position of plates) and adjust the oscillator tracking condenser located on the bottom of the chassis while rocking the condenser gang plates back and forth slightly, until maximum output is obtained. Change test oscillator setting to 1400 K.C. and turn condenser plates until this signal is tuned in. Adjust the R-F trimmer on the condenser gang. Re-check the setting of the osc.

985301, 985400

Chevrolet

UNITED MOTORS SERVICE

Alignments

CHEVROLET MODEL 985100 - ALIGNMENT1. Aligning I-F Stages at 262 Kilocycles

- Connect the signal lead of the test oscillator to the grid cap of the 6A7 tube, through a .1 mfd. condenser, leaving the tube's grid clip in place.
- Connect the ground lead of the test oscillator to the chassis frame.
- Set the test oscillator to exactly 262 K.C.
- Adjust the trimmers on the I-F coils (illus. 5 and 6) carefully for maximum output. These adjustments should be repeated several times and during alignment the test oscillator output should be kept to as low a value as is consistent with obtaining readable indication on the output meter.

2. Aligning at 1560 Kilocycles

- Leave the test oscillator leads connected the same as for aligning the I-F circuits.
- Turn the rotor plates of the gang condenser all the way out and against the high frequency stop.
- Set the test oscillator to 1560 kilocycles.
- Adjust the parallel trimmer for the oscillator section of the condenser gang (illus. 9C, Fig. 2) for maximum output. It is very important that this frequency be set accurately as a slight missetting will cause the receiver to be out of track over the entire high frequency end of the dial.

3. Aligning at 540 Kilocycles

- Leave test oscillator leads connected the same as before.
- Turn the rotor plates of the gang condenser all the way into mesh so that they rest against the low frequency stop.
- Set the test oscillator to 540 K.C.
- Adjust the oscillator tracking condenser (illus. #4, Fig. 3) located on the under-side of the receiver sub-panel to maximum output. (This adjustment sets the low frequency tuning range of the receiver to 540 K.C.)

4. Aligning at 1400 Kilocycles

- Remove the signal lead of the test oscillator from the grid of the 6A7 tube and connect to the antenna terminal of the receiver through a .0002 mica condenser connected in place of the .1 mfd. condenser previously used.
- Set the test oscillator to 1400 K.C.
- Turn the condenser rotor plates until this frequency is tuned in with maximum output.
- Adjust the R-F parallel trimmer on the condenser gang (illus. #9B, Fig. 2) and the antenna compensating condenser (illus. #16, Fig. 4) located on the side of the receiver case for maximum output.

5. Aligning at 600 Kilocycles

The oscillator padding condenser was previously adjusted at 540 K.C., however, it is necessary in most cases to repeak the oscillator tracking condenser at 600 K.C. in order to make the receiver track properly and to secure full sensitivity.

- Set the test oscillator on 600 K.C.
- Turn the condenser rotor plates until the signal from the test oscillator is tuned in with maximum output.
- Maintain a low output signal from the test oscillator and readjust the oscillator tracking condenser (illus. #4, Fig. 3) while rocking the variable condenser gang tuning shaft back and forth through the signal. This operation should be continued until no further increase in output can be obtained.

NOTE: If the entire alignment procedure has been accomplished correctly, the receiver should be very nearly uniformly sensitive over the entire frequency range.

CHEVROLET MODEL 985300 - ALIGNMENTCIRCUIT ALIGNMENT

If alignment is found necessary -- make all adjustments with chassis in its case and use a calibrated test oscillator and output meter. To align the I-F stages -- feed a test oscillator signal of 262 K.C. into the grid of the 6A7 tube (leave grid clip in place) through a .25 mfd. condenser and adjust the four I-F trimmers located on top of the I-F coils. This operation should be repeated until no further increase in output can be obtained. To align the R-F circuits -- change the test oscillator setting to 1560 K.C. and feed this signal into the antenna connection of the receiver through a .0002 mfd. condenser. Turn the condenser gang plates until they are completely out of mesh. Then adjust the oscillator parallel trimmer on the

middle section of the condenser gang. (The parallel trimmers for the condenser gang are accessible through the side of the chassis case by removing the "spring buttons"). Change test oscillator setting to 1400 K.C. and turn condenser plates until this signal is tuned in, then adjust the trimmers of the other two sections of the condenser gang. Change test oscillator setting to 600 K.C. and turn condenser plates until signal is tuned in having the greatest output (800 K.C. position of plates). Adjust the oscillator tracking condenser (accessible through a small hole in the chassis sub-panel between the condenser gang and the 6A7 tube) while rocking the condenser gang plates back and forth slightly until no further increase in output can be obtained. Recheck the alignment of the parallel trimmer for the middle section of the condenser gang at 1560 K.C.

CHEVROLET MODEL 985301 - ALIGNMENT1. Aligning the I-F Stages at 260 K.C.

The I-F Coil assemblies used in this receiver are "iron core" types and adjustment is made by varying the inductance as the capacity tuning the coil windings is fixed. The inductance is varied by changing the relative positions of the iron cores with the adjusting screws provided on the top and bottom of each I-F coil assembly.

- Feed a test oscillator signal of 260 K.C. into the control grid of the 6A7 tube (leave grid clip in place) through a .25 mfd. condenser. Keep the test oscillator leads away from the grid leads of other tubes.
- Adjust the set screw provided on the top and bottom of each I-F coil assembly. (See illustration 55 and 56, Figures 2 and 3.) Repeat these adjustments until maximum output is obtained.

2. Aligning the R-F Stages

The antenna coil used in this receiver is also an "iron core" type similar to the I-F's. Extreme care should be exercised in carrying out the following procedure to insure proper alignment of the antenna circuit.

- Change the test oscillator setting to 1560 K.C. and feed this signal into the control grid (cap) of the 6D6 R-F tube through a .25 mfd. condenser. Turn the condenser rotor plates until they are completely out of mesh and rest against the high frequency stop. Adjust the parallel trimmer for the oscillator section (center) of the gang condenser.
- Change the test oscillator setting to 600 K.C. and tune condenser gang to pick up this signal (at approximately 600 K.C.) and adjust the oscillator series condenser, (illustration #2, Figure 3) simultaneously rocking the gang condenser back and forth through the signal until maximum output results.
- Re-check setting of parallel trimmer for oscillator section (center) of the gang condenser as covered in paragraph (a).
- Feed a test oscillator signal of 600 K.C. through a .0002 mfd. (mica) condenser into the antenna connection on the receiver. Tune gang condenser to pick up this signal and adjust the screw of the antenna coil (illustration #31 on Fig. 3) simultaneously rocking the condenser gang plates back and forth until maximum output is obtained.
- Change test oscillator setting to 1400 K.C. and turn condenser gang plates until this signal is heard (at 1400 K.C.). Then adjust the parallel trimmers on the top and bottom sections of the gang condenser.
- Repeat paragraph (d) to see if further improvement can be made. If improvement results, repeat paragraph (a).

Bass Compensation--Tone Control: Bass Compensation is obtained at low audio outputs by by-passing some of the higher frequencies to ground, with a series condenser and resistor connected to a tap on the volume control. Tone control action is obtained by by-passing some of the higher frequencies present in the plate circuit of the 76 driver tube to ground, through a series condenser and rheostat. The audio signal voltage present in the 76 tube plate circuit is coupled to one of the voice coil leads in the speaker cable with a small condenser. The higher frequencies are by-passed to ground at the speaker with the tone control.

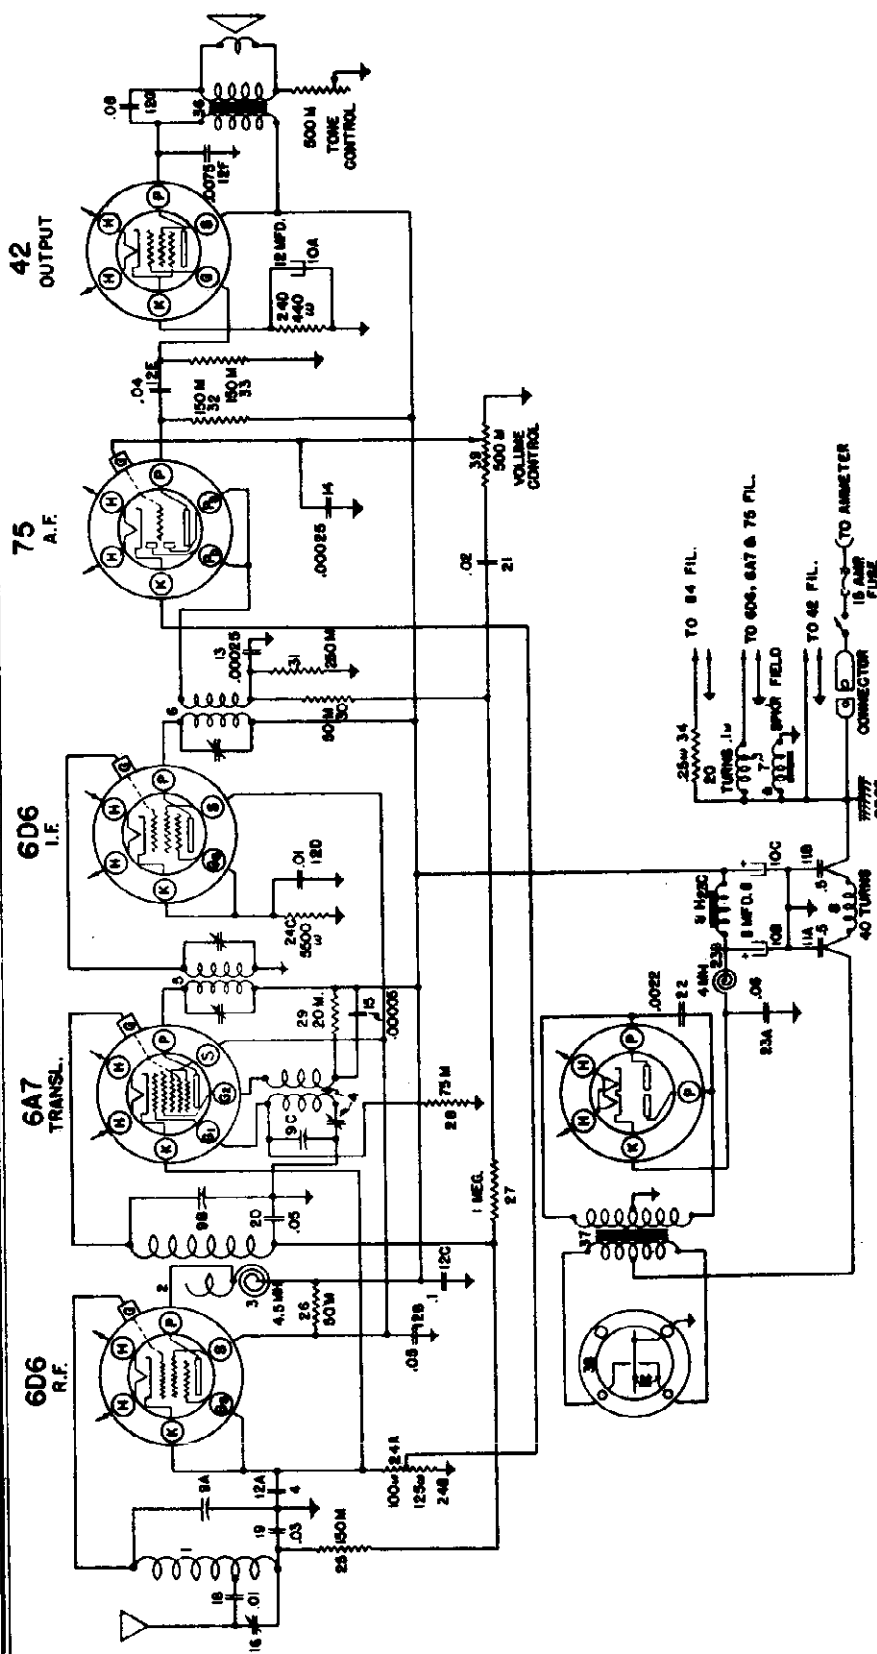

CHEVROLET MODEL 985400 - ALIGNMENTCIRCUIT ALIGNMENT

If alignment is found necessary--make all the adjustments with chassis in its case and use a calibrated test oscillator and output meter. To align the I-F Stages--feed a test oscillator signal of 262 K.C. into the control grid of the 6A7 tube (leave grid clip in place) through a .25 mfd. condenser and adjust the trimmers on the I-F coils for maximum output. Care should be taken to keep the test oscillator leads away from the grid leads of the other tubes in order to avoid inaccurate adjustments.

To align the R-F Stages--change the test oscillator setting to 1560 K.C. and feed this signal into the antenna connection on the chassis through a .0002 mfd. condenser. Turn the condenser rotor plates until they are completely out of mesh and adjust the parallel trimmer for the oscillator section (middle) of the condenser gang. Change the test oscillator setting to 1400 K.C. and turn condenser rotor plates until this signal is tuned in. Then adjust the trimmers for the other two sections of the condenser gang. Change test oscillator setting to 600 K.C. and adjust the antenna compensating condenser (located near the control shaft bushing) while rocking the tuning control plates back and forth slightly. Recheck alignment of the antenna section (see PARTS LAYOUT) of condenser gang for maximum output at 1400 K.C. It will also be necessary to readjust the antenna compensating condenser to the car antenna upon installation.

FIG. 2--PARTS LAYOUT--Top View

FIG. 3--PARTS LAYOUT--Bottom View

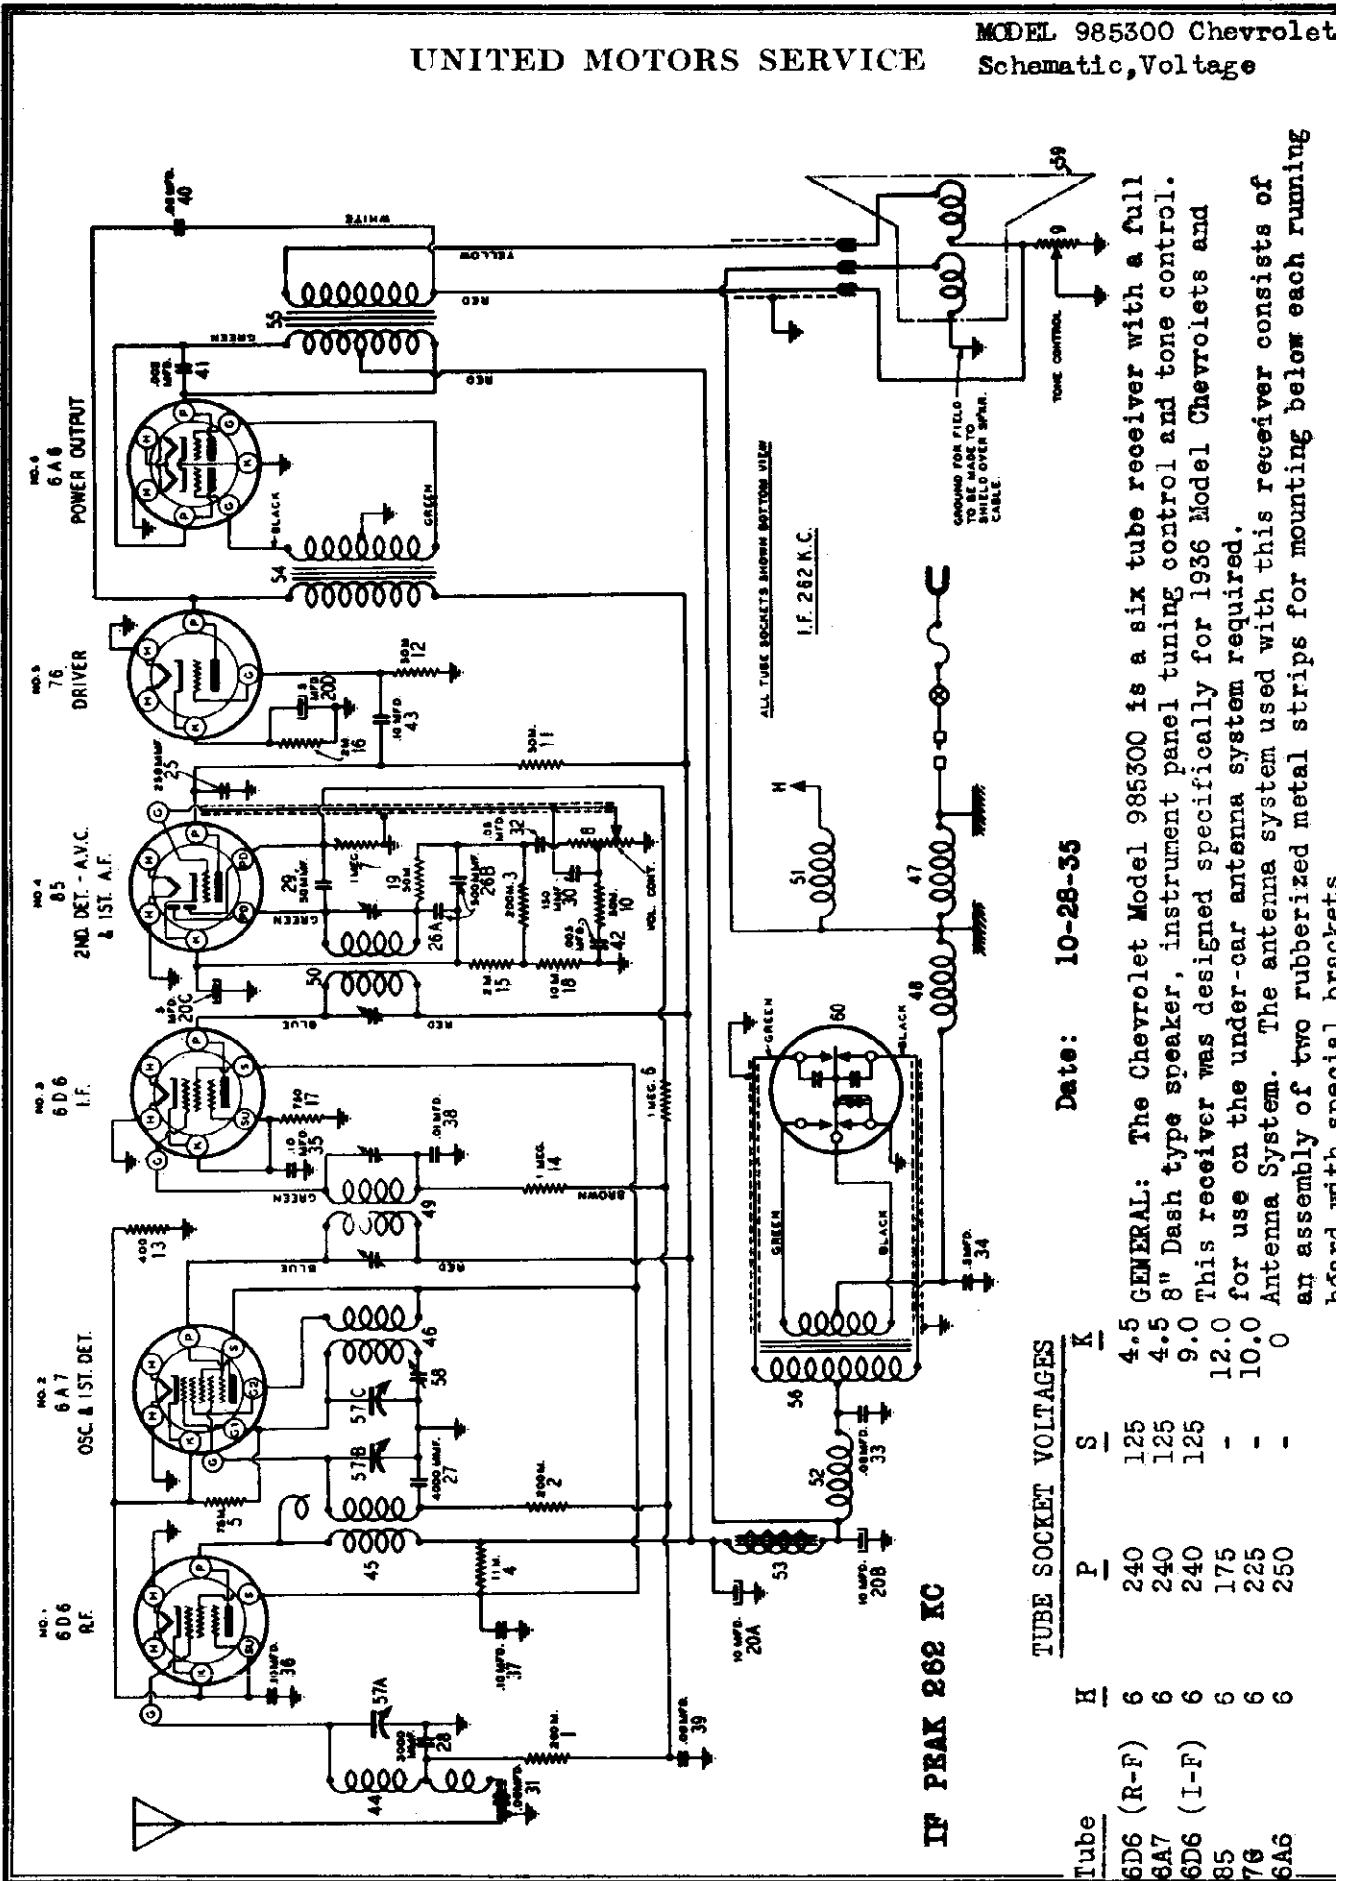

GENERAL: The Chevrolet Model 985100 is a six tube two unit receiver with an instrument panel tuning control, tone control and a "dome" type speaker. This receiver was designed specifically for 1936 Model Chevrolets.

ANTENNA SYSTEM: The antenna system used with this receiver consists of an assembly of three rubberized metal strips mounted beneath each running board with special brackets. The strip assemblies are well insulated having no exposed metal connections thereby reducing the possibility of unsatisfactory reception due to leakage caused by mud, water, etc.

PART #1210760 FILTER ASSEMBLY

The part #1210760 Filter Assembly (Illus. #23) consists of an iron core choke, R-F choke and an .06 mfd. condenser sealed in a separate container. The component parts of this assembly are not serviceable and if any are found to be defective, it will be necessary to replace the complete unit.

WEBSTER CO.

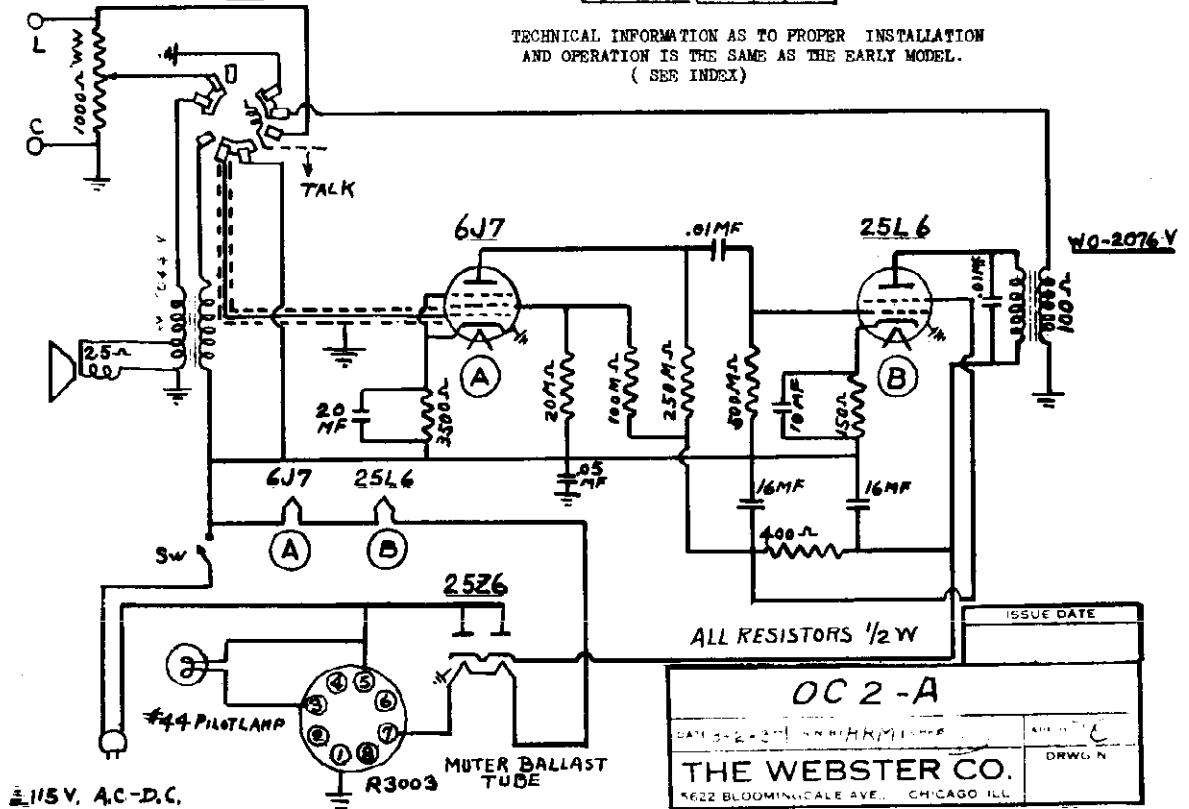

MODEL B, Commun. Sys.
MODEL OC-2 Amplifier
MODEL OC-2A Amplifier
Schematics, Notes

MODEL OC-2 AMPLIFIER
INTEROFFICE COMMUNICATION SYSTEM
DATE 12-30-34 DESIGNED BY G.S. CHECKED ROP APP'D P.J.
THE WEBSTER CO. DRWG NO.
3028 W LAKE ST. CHICAGO ILL.

This system is built for operation on 115 Volt D.C., and 115 Volt A.C., 25, 40, 50 and 60 cycles. IF THE SYSTEM FAILS TO OPERATE WHEN CONNECTED TO D.C. LINE REVERSE THE POWER CORD PLUG.
INSTALLATION Each cabinet contains its own amplifier, and its power cord should be inserted into the nearest light receptacle. The two wires of a two conductor unshielded cord should be connected to lugs at the rear of chassis. The right hand terminal is grounded. The other terminal (ungrounded) is indicated by a red dot. Webster two conductor cable is recommended but whatever cable is used should be color coded so that the same wire is connected to ground on both of the amplifiers. A volume control is mounted on the rear side of the chassis controlling the volume of the station. This control is set for the desired volume. OPERATION - After "ON-OFF" switch is turned on, in 15 seconds station is operative. The "OFF-OFF" switch controls the operation of each unit. The only other control is the operation switch, which, in its normal position, is for listening. Operator turns switch to right hand position to talk, must be held in position while talking, when released it returns to listening position.

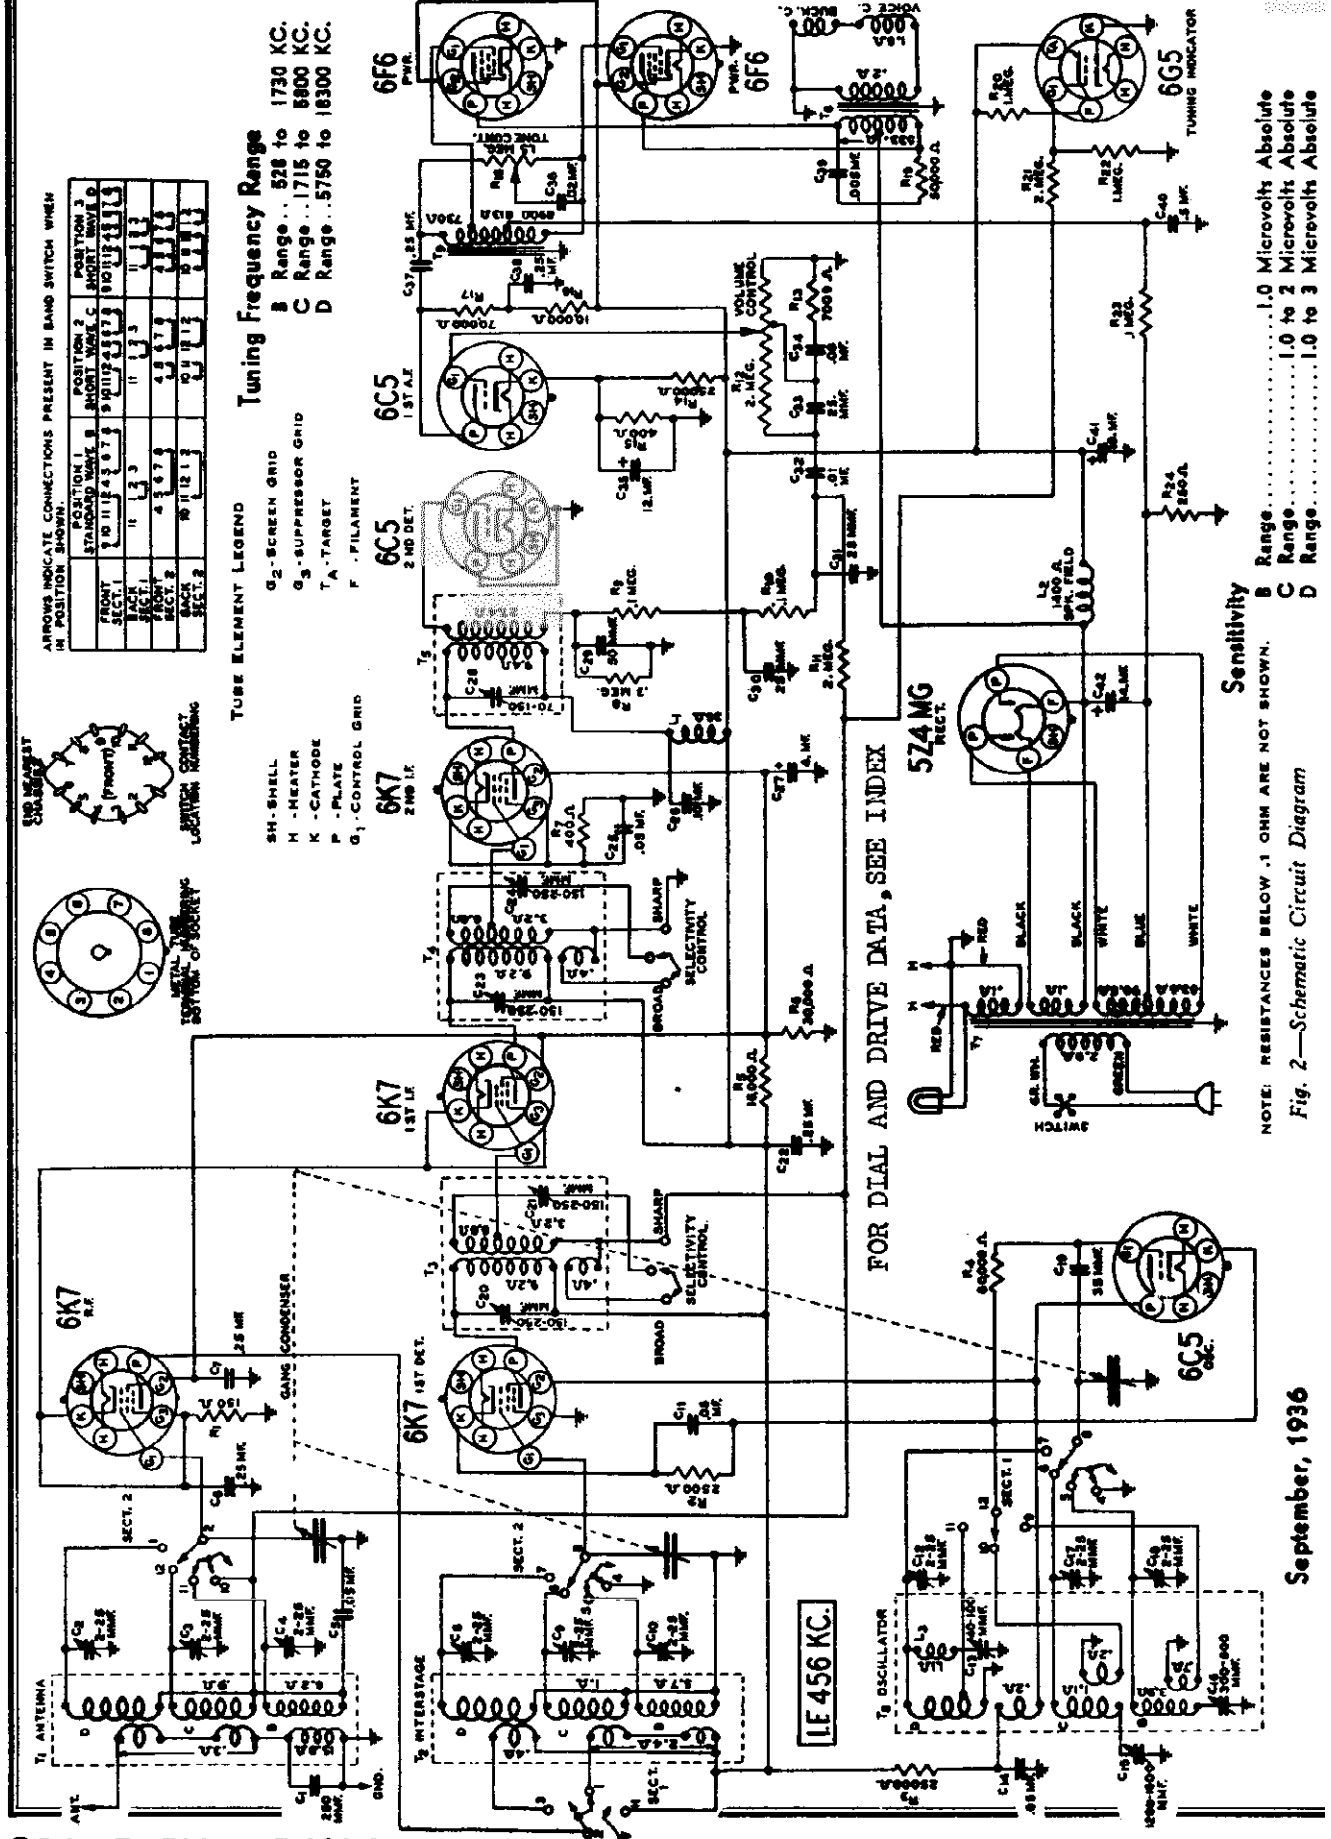

TECHNICAL INFORMATION AS TO PROPER INSTALLATION AND OPERATION IS THE SAME AS THE EARLY MODEL.
(SEE INDEX)

WELLS-GARDNER & CO.

MODEL OEL
Alignment, Phono, Data
Notes

I. F. Adjustment

Set the signal generator for a signal of 456 KC. Connect the output of the signal generator through a .1 mf. condenser to the grid of the 1st detector. Connect the ground lead of the receiver to the ground post of the signal generator. Turn the band switch to the Range B position (standard wave band). Turn the selectivity control to the sharp position and keep it in this position for all adjustments. Turn the volume control to the maximum position. Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC. Then adjust the five I F trimmers until maximum output is obtained. The adjusting screws for these condensers are reached from the top of the chassis and the location is shown in Fig. 3.

Range B Alignment

After the procedure for the alignment of each range, as explained below, is completed, it is advisable to repeat the procedure as a final check.

1730 KC Adjustment

Set the signal generator for 1730 KC. Turn the rotor of the tuning condenser to the full open position. Keep the band switch in the standard wave position.

Connect the antenna lead of the receiver through a 200 ohm condenser to the output of the signal generator.

For this and all subsequent adjustments keep the volume control at the maximum position and attenuate the signal from the signal generator to prevent AVC action. Adjust the oscillator Range B trimmer (C18) until maximum output is obtained. The location of this trimmer is shown in Fig. 3.

1500 KC Adjustment

Set the signal generator for 1500 KC. Turn the rotor of the tuning condenser carefully until maximum output is obtained.

In sets using pointers, loosen the screw of the large pointer and set the pointer at the 1500 KC mark on the standard wave band scale. Retighten the screw.

In sets using the moving beam of light, there is a moving light assembly held to the front of the drive drum by means of a screw. Loosen this screw and move the light assembly until it is at the 1500 KC mark on the dial. Retighten the screw.

Adjust the interstage Range B trimmer (C10) and antenna Range B trimmer (C4) to maximum.

Do not change the setting of the oscillator Range B trimmer.

600 KC Adjustment

Set the signal generator for 600 KC. Turn the tuning condenser rotor until maximum output is obtained.

Turn the rotor slowly back and forth at the same time adjusting the 600 KC trimmer until the peak of greatest intensity is obtained. See Fig. 3 for location of this trimmer.

Range C Alignment

CAUTION—When aligning the short wave bands be sure NOT to adjust at the image frequency. This can be checked as follows: Let us say the signal generator is set for 5000 KC. The signal will then be heard at 5000 KC on the dial of the radio. The image signal, which is 4088 KC, will be heard at 5000 less 912 KC, or 4088 KC. It may be necessary to increase the input signal to hear the image.

5800 KC Adjustment

Set the signal generator for 5800 KC. Connect the antenna lead of the receiver through a 400 ohm resistor to the output of the signal generator. Turn the rotor of the tuning condenser to the full open position.

Turn the band switch to the Range C position (first short wave band).

Adjust the oscillator Range C trimmer (C17) until maximum output is obtained. See Fig. 3 for location of this trimmer.

5000 KC Adjustment

Set the signal generator for 5000 KC. Turn the rotor of the tuning condenser carefully until maximum output is obtained.

Adjust the interstage Range C trimmer (C9) and antenna Range C trimmer (C5) to maximum. Do not change the setting of the oscillator Range C trimmer.

1800 KC Adjustment

Set the signal generator for 1800 KC. Turn the tuning condenser rotor until maximum output is obtained.

Turn the rotor slowly back and forth at the same time adjusting the 1800 KC trimmer until the peak of greatest intensity is obtained. See Fig. 3 for location of this trimmer.

Range D Alignment

18,300 KC Adjustment

Set the signal generator for 18,300 KC. Keep the antenna lead of the receiver connected through the 400 ohm resistor to the output of the signal generator.

Turn the rotor of the tuning condenser to the full open position. Adjust the oscillator Range D trimmer (C12) until maximum output is obtained. See Fig. 3 for location of this trimmer.

15,000 KC Adjustment

Set the signal generator for 15,000 KC. Turn the rotor of the tuning condenser carefully until maximum output is obtained.

Adjust the interstage Range D trimmer (C8) and antenna Range D trimmer (C2) to maximum.

When adjusting the interstage and antenna Range D trimmers, it will be necessary at the same time to turn the tuning condenser rotor slowly back and forth until the peak of greatest intensity is obtained.

Do not change the setting of the oscillator Range D trimmer.

6000 KC Adjustment

Set the signal generator for 6000 KC. Turn the tuning condenser rotor until maximum output is obtained.

Turn the rotor slowly back and forth at the same time adjusting the 6000 KC trimmer until the peak of greatest intensity is obtained. See Fig. 3 for location of this trimmer.

Trimmer Replacement

If one trimmer of the gang trimmer strip should become defective, it is not necessary to replace the entire strip. A single trimmer P.17A36, as shown in the replacement parts list, may be used. Disconnect the lead from the coil side (side not grounded) of the defective trimmer in the strip. This connection is then made to the single trimmer. Connect it to the side of the trimmer not in contact with the adjusting screw. The other side of the single trimmer is then connected to a good ground using a piece of heavy wire in order to support the trimmer adequately. In replacing a trimmer, be sure to keep both leads as short as possible and keep the ungrounded lead as far from ground as possible.

Planetary Drive Assembly

The planetary assembly is the unit that is integral with the tuning shaft.

If the nut on the back end of this assembly is too tight, the drive will be jerky and will turn hard in high speed. If this condition exists, back off this nut one or two turns and note the effect.

If this nut is too loose, the drive will slip in slow speed. This remedy in this case, of course, is to tighten the nut.

Should the condenser drive cord slip when the planetary pulley is turning, inspect the tuning condenser, drive drum and gears to see if they are turning properly or if they are being obstructed in some way.

If the drive turns unevenly (rough in spots), this may mean that the planetary assembly is defective or damaged internally and a new unit will be required.

Phonograph Connections

Phonograph connections can be made as shown in Fig. 7. The parts required are shown in the parts list. Knockouts are provided in the back panel of the chassis for mounting the phono jack and phono switch.—See Fig. 8.

The phono switch must be mounted with one set of terminals nearest the bottom of the chassis base. The connections are made by opening the diode return circuit at the volume control. This is done by removing the white wire connected to the insulated lug of the terminal strip on which one end of con-

denser C32 is also connected. The terminal strip is located at the back of the volume control. This wire is then connected to the phono switch, as shown in Fig. 7. A wire is then connected from the lug on the above mentioned terminal strip to the phono switch, as shown in Fig. 7. Both of the above wires are connected to the switch terminals nearest the chassis base and should be twisted together as far

Fig. 7—Phonograph Connections

as possible and run as close to the back of the chassis base as possible.

The lead to condenser C32, after turning away from the back of the chassis base, should be run close to the 6C7 tube sockets.

Complete the other connections as illustrated in Fig. 7, using the lugs in the chassis base, located near the phono switch and jack, for grounding purposes.

The control grid lead of the 6E6 power tube near the back of the chassis should be removed and a longer lead substituted. This lead is run from the tone control to the back of the chassis, along the lower edge and is then brought to the grid terminal by being routed between the speaker socket and the tubular condenser next to it.

If a hum is heard when the phono pickup is touched, reverse the two pickup leads.

Switch Contact Location Numbering

A standard arrangement for switch contact location numbering has been adopted. This numbering is illustrated in Fig. 2. In contact locations not used, the number applying to that particular location is not employed.

Voltage Chart

The voltage readings are taken with a voltmeter, having a resistance of 1000 ohms per volt.

The standard metal tube socket terminal numbering system (bottom of diagram) is shown in Fig. 5. On the schematic circuit diagram, Fig. 2, is a listing of the complete names of the tube elements and the corresponding symbols as used on the sockets on the schematic.

Fig. 5—Metal Tube Terminal numbering (bottom of socket)

MODEL OEL
Notes, Parts

WELLS-GARDNER & CO.

Referring to the 1st and 2nd I.F. transformers T3 and T4 in Fig. 2, it will be noted that there are coupling windings shown below the primaries in the illustration.

When the selectivity control is in the sharp position, the coupling windings are open circuited and the loose coupling which exists between the primary and secondary of these transformers results in high selectivity.

When the selectivity control is in the broad position, the coupling winding which is wound under the primary is connected in series with the secondary. This provides overcoupling which results in a greatly widened resonance curve. Passage of a wide range of audio frequencies is thus obtained.

Across the volume control resistor R12 is a filter composed of condensers C33 and C34 and resistor R13. A tap connection near the low potential end of the volume control is connected between the two condensers. At high volume settings, the filter is not effective. At the low volume settings, as the movable arm approaches the tap, the higher frequencies are by-passed through condenser C34. Very high frequencies are transmitted through condenser C33 to compensate for the reduction of these frequencies. At low volume settings the low frequency amplitudes are increased as a result.

Transformer coupling is used between the first audio stage and the output stage which employs two type 6F6 output pentode tubes in a stage of push-pull amplification. A type 5Z4MG (metal glass tube) full wave rectifier is used in the power unit.

The 6G5 tuning indicator tube is wired as shown in the schematic. This tube contains a triode and cathode ray section in one envelope.

The cathode ray is produced by the attraction of electrons from the upper end of the cathode to the coated target or anode, which is operated at a high positive potential. When this electron stream strikes the target the coating glows. The electron stream is controlled by an additional element, or control electrode, in the tube.

As a signal is tuned in, the control grid of the triode section of the 6G5 cathode ray tube becomes increasingly negative, the negative bias voltage being taken from the AVC line. The AVC voltage is reduced to a suitable value by the potentiometer arrangement of the 1 and 2 megohm resistors. The increased bias voltage reduces the triode plate current. This reduces the voltage drop across the 1 megohm plate resistor and raises the triode plate voltage. The triode plate is connected to the control electrode of the cathode ray section of the tube.

The shape and size of the area on the target struck by the cathode ray is governed by the voltage of the control electrode. When the signal is tuned to resonance, practically no plate current flows and the voltage of the control electrode is the same as that of the target. There is no opposition to the flow of electrons to the target. Tuning off resonance decreases the control electrode voltage and causes the darkened sector of the target to widen, because of the opposition to the flow of electrons in the direction of the control electrode.

NOTICE—There is a large letter on the chassis which identifies the set as to major part changes. When ordering parts, please be sure to mention the series number and this large letter.

Trimmer Replacement

If one trimmer of the gang trimmer strip should become defective, it is not necessary to replace the entire strip. A single trimmer P-17A36, as shown in the replacement parts list, may be used. Disconnect the lead from the coil side (side not grounded) of the defective trimmer in the strip. This connection is then made to the single trimmer. Connect it to

the side of the trimmer not in contact with the adjusting screw. The other side of the single trimmer is then connected to a good ground, using a piece of heavy wire in order to support the trimmer adequately. In replacing a trimmer, be sure to keep both leads as short as possible and keep the ungrounded lead as far from ground as possible.

MISCELLANEOUS

Table listing miscellaneous parts including resistors, capacitors, and trimmers.

MISCELLANEOUS

If the drive turns unevenly (rough in spots) this may mean that the planetary assembly is defective or damaged internally and a new unit will be required. Referring to the 1st and 2nd I. F. transformers T3 and T4 in Fig. 2, it will be noted that there are coupling windings shown below the primaries in the illustration.

TRANSFORMERS AND COILS

Table listing transformer and coil parts including Part No., Description, and Price.

REPLACEMENT PARTS

At low volume settings the low frequency amplitudes are increased as a result. Models with the filament rheostat are connected as shown in Fig. 2. This rheostat permits the use of a 3 volt "A" battery. As shown in Fig. 2, there are two separate variable resistors one of which controls the filament voltage and the other the dial lamp voltage.

CONDENSERS

Should the condenser drive cord slip when the planetary pulley is turning, inspect the tuning cone driver, drive drum and gears to see if they are turning properly or if they are being obstructed in some way.

1. F. Adjustment

Set the signal generator for a signal of 450 KC. Connect the output of the signal generator through a 1 mfd. condenser in the grid of the 1st detector. Connect the ground lead of the receiver to the ground post of the signal generator.

Range B Alignment

After the procedure for the alignment of each range, as explained below, is completed, it is advisable to repeat the procedure as a final check. 1730 KC Adjustment

Range C Alignment

When aligning the short wave bands be sure NOT to adjust at the image frequency. This can be checked as follows: Let us say the signal generator is set for 1000 KC. The signal will then be heard at 1000 KC on the dial of the radio. The image frequency, which will be heard at 2000 KC, will be heard at 1000 KC. To check for image frequency, tune to increase the input signal to hear the image.

6000 KC Adjustment

Set the signal generator for 6000 KC. Turn the tuning condenser rotor until maximum output is obtained. Turn the rotor slowly back and forth, at the same time adjusting the 600 KC trimmer, until the peak of greatest intensity is obtained. See Fig. 6 for location of this trimmer.

Range D Alignment

Turn the band switch to the Range D position (second short wave band). Adjust the oscillator Range D trimmer (C13) until maximum output is obtained. See Fig. 6 for location of this trimmer.

MODEL 5H Alignment, Notes Parts

Parts list table with columns for Part No., Description, and Quantity. Includes sections for TUBULAR, ELECTROLYTIC, MISC. WORD, SOCKET, RESISTORS, TRANSFORMERS AND COILS, CONDENSERS, and WIRE WOUND.

If the receiver does not operate after being turned on, turn the switch on immediately, examine the lead connections and the fuse and see if all tubes are properly inserted.

Replacement Parts

The primary of transformer T7 serves as an audio choke in the filament circuit. The secondary of this transformer is in the control grid circuit of the 1F4.

MISCELLANEOUS

There is a large letter on the sheet which identifies the parts to be replaced. When ordering parts, please refer to the number in the column and this large letter.

TRANSFORMERS AND COILS

When the rotor is in the range D position, the primary of the power transformer is connected to the 110 volt AC line.

CONDENSERS

Do not turn the receiver on unless ALL the tubes are in the sockets. Removal of any of them will result in abnormal voltages on the remaining tubes.

Under the ground connections from the top legs on the inside of the chassis base (right side from front).

Range D Alignment

When aligning the short wave band, be sure NOT to adjust the image frequency. This can be checked as follows: Let us say the signal generator is set for 15,000 KC. The signal will then be heard at 15,000 on the dial of the radio.

16,000 KC Adjustment

Set the signal generator for 16,000 KC. Connect the antenna lead of the receiver through a 400 ohm resistor to the output of the signal generator.

15,000 KC Adjustment

Set the signal generator for 15,000 KC. Turn the rotor of the tuning condenser carefully until maximum output is obtained.

6000 KC Adjustment

Set the signal generator for 6000 KC. Turn the tuning condenser rotor until maximum output is obtained.

1500 KC Adjustment

Set the signal generator for 1500 KC. Turn the rotor of the tuning condenser carefully until maximum output is obtained.

Range B Alignment

After the procedure for the alignment of each range has been followed below is completed, it is advisable to repeat the procedure as a final check.

Now unsolder the mounting lug holding the terminal strip to the transformer cover. Remove the four nuts from the bolts holding the transformer assembly to the chassis.

Trimmer Replacement

If one trimmer of the gang trimmer strip should become defective, it is not necessary to replace the entire strip. A single trimmer 17A16, as shown in the replacement parts list, may be used.

Caution

Do not turn the receiver on unless ALL the tubes are in the sockets. Removal of any of them will result in abnormal voltages on the remaining tubes.

Service Power Unit

The power unit is that portion of the chassis assembly contained within the large rectangular shield can and the circuit for which is shown within the shield lines at the lower center of the schematic diagram, Fig. 4.

600 KC Adjustment

Set the signal generator for 600 KC. Turn the rotor of the tuning condenser until maximum output is obtained.

1500 KC Adjustment

Set the signal generator for 1500 KC. Turn the rotor of the tuning condenser carefully until maximum output is obtained.

600 KC Adjustment

Set the signal generator for 600 KC. Turn the tuning condenser rotor until maximum output is obtained.

Turn the volume control to the maximum position. Adjust the signal from the signal generator to prevent the leveling-off action of the AVC.

1730 KC Adjustment

Set the signal generator for 1730 KC. Turn the rotor of the tuning condenser to the full open position.

1500 KC Adjustment

Set the signal generator for 1500 KC. Turn the rotor of the tuning condenser until maximum output is obtained.

1500 KC Adjustment

Set the signal generator for 1500 KC. Turn the rotor of the tuning condenser carefully until maximum output is obtained.

600 KC Adjustment

Set the signal generator for 600 KC. Turn the tuning condenser rotor until maximum output is obtained.

1500 KC Adjustment

Set the signal generator for 1500 KC. Turn the rotor of the tuning condenser carefully until maximum output is obtained.

600 KC Adjustment

Set the signal generator for 600 KC. Turn the tuning condenser rotor until maximum output is obtained.

MODELS 5K, 5KL Alignment, Parts

WELLS-GARDNER & CO.

Table with columns: Part No., Description, Price. Lists various components like Volume Indicator Card, Lamp Sockets, Lamp, etc.

TRANSFORMERS AND COILS

Table with columns: Part No., Description, Price. Lists transformers and coils like Antenna Transformer, I.F. Transformer, etc.

CONDENSERS

Table with columns: Code, Description, Price. Lists various capacitor codes and values.

MISCELLANEOUS

Table with columns: Part No., Description, Price. Lists miscellaneous parts like sockets, speakers, knobs, etc.

TRIMMERS

Table with columns: Code, Description, Price. Lists various trimmer codes and types.

MISCELLANEOUS

Table with columns: Code, Description, Price. Lists miscellaneous parts like resistors, carbon, wire wound, etc.

RESISTORS

Table with columns: Code, Description, Price. Lists various resistor codes and values.

WIRE WOUND

Table with columns: Code, Description, Price. Lists wire wound resistor codes and values.

Loosen the screw of the large pointer and set the pointer at the 1700 KC mark on the standard wave band scale. Retighten the screw.

Adjust the antenna Range B trimmer (C5) to maximum.

Do not change the setting of the oscillator Range B trimmer.

600 KC Adjustment Set the signal generator for 600 KC.

Turn the tuning condenser rotor until maximum output is obtained.

Turn the rotor slowly back and forth at the same time adjusting the 600 KC trimmer (C11) until the peak of greatest intensity is obtained.

location of this trimmer.

Replacement Parts

NOTICE—There is a large letter on the chart which identifies the set as to major part changes.

be sure to mention the series number and this large letter.

MISCELLANEOUS

Table with columns: Part No., Description, Price. Lists miscellaneous parts like sockets, speakers, knobs, etc.

TRIMMERS

Table with columns: Code, Description, Price. Lists various trimmer codes and types.

MISCELLANEOUS

Table with columns: Code, Description, Price. Lists miscellaneous parts like resistors, carbon, wire wound, etc.

WIRE WOUND

Table with columns: Code, Description, Price. Lists wire wound resistor codes and values.

Turn the rotor of the tuning condenser carefully until maximum output is obtained.

Adjust the antenna Range D trimmer (C3) to maximum.

When adjusting the antenna Range D trimmer, it will be necessary at the same time to turn the tuning condenser rotor slowly back and forth until the peak of greatest intensity is obtained.

Do not change the setting of the oscillator Range D trimmer.

Range C Alignment

Turn the tuning condenser rotor until maximum output is obtained.

Turn the rotor slowly back and forth at the same time adjusting the 5800 KC trimmer (C11) until the peak of greatest intensity is obtained.

location of this trimmer.

Turn the band switch to the Range C position (1st short wave band).

Adjust the oscillator Range C trimmer (C9) until maximum output is obtained.

5000 KC Adjustment

Set the signal generator for 5000 KC.

Turn the rotor of the tuning condenser carefully until maximum output is obtained.

Adjust the antenna Range C trimmer (C4) to maximum.

Do not change the setting of the oscillator Range C trimmer.

Range B Alignment

Turn the rotor of the tuning condenser carefully until maximum output is obtained.

1730 KC Adjustment

Set the signal generator for 1730 KC.

Turn the rotor of the tuning condenser to the full open position.

Turn the band switch to the standard wave position.

Connect the antenna lead of the receiver through a 200 mmf. condenser to the output of the signal generator.

Adjust the oscillator Range B trimmer (C10) until maximum output is obtained.

The location of this trimmer is shown in Fig. 3.

1500 KC Adjustment

1. F. Adjustment Set the signal generator for a signal of 416 KC.

Connect the output of the signal generator through a .1 mf. condenser to the grid of the 1st detector.

Connect the ground lead of the receiver to the ground post of the signal generator.

Turn the band switch to the Range B position (standard wave band).

Turn the volume control to the maximum position.

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

Then adjust the four I.F. trimmers until maximum output is obtained.

The adjusting screws for these condensers are reached from the top of the chassis, and the location is shown in Fig. 3.

Connect the antenna lead of the receiver through a 200 mmf. condenser to the output of the signal generator, and adjust the I.F. wave trap trimmer (C1) for minimum output.

The location of this trimmer is shown in Fig. 3.

Range D Alignment

After the procedure for the alignment of each range, as explained below, is completed, it is advisable to repeat the procedure as a final check.

CAUTION—When aligning the short wave bands be sure NOT to adjust at the image frequency.

This can be checked as follows: Let us say the signal generator is set for 5000 KC.

The signal will then be heard at 5000 KC on the dial of the radio.

The image signal, which is much weaker, will be heard at 5000 less 912 KC, or 4088 KC.

It may be necessary to increase the input signal to hear the image.

18,300 KC Adjustment

Set the signal generator for 18,300 KC.

Connect the antenna lead of the receiver through a 400 ohm resistor to the output of the signal generator.

Turn the rotor of the tuning condenser to the full open position.

Turn the band switch to the Range D position (2nd short wave band).

For this and all subsequent adjustments keep the volume control at the maximum position and attenuate the signal from the signal generator to prevent AVC action.

Adjust the oscillator Range D trimmer (C8) until maximum output is obtained.

See Fig. 3 for location of this trimmer.

15,000 KC Adjustment

Set the signal generator for 15,000 KC.

Turn the rotor of the tuning condenser carefully until maximum output is obtained.

See Fig. 3 for location of this trimmer.

Table with columns for part numbers and descriptions under the heading 'CONTROL HEAD AND PLATE ASSEMBLY'.

Table with columns for part numbers and descriptions under the heading 'ROOF SPEAKER MOUNTING KITS'.

8 inch speaker). This radio is designed that roof speaker installations in these cars can readily be made.

Table with columns for part numbers and descriptions under the heading 'MISCELLANEOUS SOCIETIES'.

Table with columns for part numbers and descriptions under the heading 'TRANSFORMERS AND COILS'.

Table with columns for part numbers and descriptions under the heading 'RESISTORS'.

Table with columns for part numbers and descriptions under the heading 'CONDENSERS'.

If the total capacity of the antenna and shielded lead is approximately 70 mmf, such as may be the case if a "fish pole" antenna is used, insert the antenna plug with the mark on the LC side.

Control Head Mounting This auto radio is supplied with a Universal control head. This head, in conjunction with suitable screwdown plates and mounting brackets, can be mounted in the instrument panel of practically all widely sold 1936 and 1937 automobiles.

Panel Kits 1937 Radio—See Fig. 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82, 83, 84, 85, 86, 87, 88, 89, 90, 91, 92, 93, 94, 95, 96, 97, 98, 99, 100.

Pointers, Screws and Spacer Washers A few of the first shipments of 1937 panel kits did not contain the pointer screw and spacer washer. It may, therefore, be necessary to order these items in some instances.

Roof Speaker and Dual Speakers The Ford and General Motors 1936 automobiles have provision for mounting a speaker in the car roof (Ford 5 1/2 inch speaker, General Motors 5 1/4 or 1936 Cars).

I. F. Adjustment Set the signal generator for a signal of 173 KC. Connect the output of the signal generator through a .05 mf. condenser to the rotor of the R.F. linkage section of the tuning condenser. (See Fig. 2 for location of this section.)

600 KC Adjustment Turn the rotor of the tuning condenser to the full open position. Insert the antenna plug with the mark on the antenna lead from the chassis through a 150 mf. condenser to the antenna post of the signal generator.

1400 KC Adjustment Turn the rotor of the tuning condenser carefully until maximum output is obtained. Adjust the R.F. interstage and antenna 1400 KC trimmer for maximum output.

Adjusting Antenna 600 KC Trimmer After the radio is installed and the car antenna is connected, it will be necessary to readjust the antenna trimmer. Tune in a weak signal at approximately 600 KC with the volume control about three-quarters open. Turn the adjusting screw of the antenna trimmer up or down until maximum output is obtained. See Fig. 3 for location of this trimmer.

Inserting Antenna Plug IMPORTANT—The antenna plug can be inserted in two ways depending on whether the antenna is of high or low capacity. If the total capacity of the antenna and shielded lead is approximately 200 mmf., which would be the case in a running board or ordinary roof antenna (not metal roof), insert the antenna plug with the mark on the HC side—See Fig. 3.

MODEL 6S

Alignment, Voltage
Socket, Trimmers
Resistance, Notes

WELLS-GARDNER & CO.

Remove chassis from case.
Establish ground connection between chassis and power supply.

Reconnect A and B wires from power supply to chassis.
Set the signal generator for a signal of 175 KC.

Connect the antenna lead of the signal generator thru a .05 mf. condenser to the stator of the 1st detector (middle) section of the tuning condenser. This can be done by pushing a wire or conductor between the stator plates or by extending an insulated wire thru the hole in the shield over the stator and pushing the wire thru the hole in the lug which extends up from the insulated stator assembly.

Connect the ground lead of the signal generator to the chassis ground.

Short out the oscillator section of the tuning condenser.
Set the volume control at the maximum position.

Attenuate the signal from the signal generator to prevent the levelling off action of the A.V.C.

Then adjust the three I.F. trimmers until maximum output is obtained. The location of these trimmers are shown in Fig. 2.

1650 KC. Adjustment

Set the signal generator for 1650 KC.
Turn the rotor of the tuning condenser to the full open position.

Connect the shielded antenna lead from the chassis through a 250 nmf. condenser to the antenna post of the signal generator.

For this and all subsequent adjustments keep the volume control at the maximum position and attenuate the signal from the signal generator to prevent A. V. C. action.

Adjust the trimmer of the oscillator section of the three gang condenser until maximum output is obtained—see Fig. 2 for location of this trimmer.

1400 K C. Adjustment

Set the signal generator for 1400 KC.
Turn the rotor of the tuning condenser carefully until maximum output is obtained.

Adjust the 1st detector and antenna trimmers for maximum output.

Do not change the setting of the oscillator trimmer.

Adjusting Antenna Trimmer

After the receiver is installed and the car antenna is connected it will be necessary to adjust the antenna trimmer. Tune in a weak signal between 1200 and 1400 KC. with the volume control about three-fourths on. Remove the cover of the chassis case. The antenna trimmer is the trimmer condenser closest to the terminal strip—see Fig. 2. Turn the adjusting screw of this condenser up or down until maximum output is obtained. CAUTION—Do not turn any of the other trimmer adjusting screws for this adjustment.

Calibrating the Receiver

After installing the receiver in the car, it will be necessary to calibrate the control unit. Tune in a station of known frequency at about the center of the dial. At the back of the control unit is a calibration screw—See Fig. 4 in the installation manual enclosed with each receiver. Remove the pilot light assembly.

The calibration screw will be seen at the bottom of the receptacle from which the pilot light assembly is withdrawn. Insert a screwdriver and turn this screw until the pointer on the dial scale is at the frequency of the station being received. The knob must be held during this adjustment.

Voltages At Sockets

On the voltage chart are given the voltages at the sockets with all tubes in and the set in operating condition. The antenna should be disconnected.

The voltages can be read with the chassis in the case, by means of an analyzer plug.

If the chassis unit is taken out of the case all of the socket terminals can easily be reached under the chassis with test prods.

If the chassis is taken out, a jumper wire must be connected from the chassis base to the metal wall of the "B" power unit, in order to complete the ground circuit.

D. C. Resistance of Windings

Following are the D. C. resistances of the various windings in the chassis.

New Part No.	ITEM	Code	D. C. Resistance in Ohms

MODEL 7E
Alignment, Coils
Drive Cord Data

REPLACING DRIVE CORD

Remove the chassis from the cabinet. Take off the stem pointer by removing the screw at the center of the dial. Loosen the two set screws in the collar on the band selector switch shaft. Loosen the dial assembly by taking out the two screws which secure the bottom of this assembly to the chassis and one screw at the top which secures this assembly to the bracket. Pull the dial assembly forward until the collar is free of the band selector shaft; and lay the assembly face downward in front of the chassis.

Turn the dial drum until the opening in this drum is approximately vertical and with the hole at the top. Remove the tension spring and the old drive cord. When replacing this drive cord a 50 pound test cord as regularly supplied by the factory should be used.

See that the eyelet is in the hole in the drive drum. Insert one end of the new drive cord from the outside through the hole in the eyelet in the drive drum. Tie the end of the cord, which has been inserted through the hole, to one end of the tension spring. Now wrap the cord in a counter clock-wise direction (facing the front of the chassis) around the drive drum for approximately one and one half turns, progressing towards the front. Then tilt the chassis up on its back panel and bring the cord mentioned in the previous paragraph down to the drive shaft. Wrap it two and one-half times around this shaft, progressing toward the back of the chassis. Wrap the cord on directly in line with the drive drum above. Then bring this cord up to the drive drum until it is up to the eye-let in the drive drum.

Now insert the free end of the cord through the hole in the eyelet and tie it to the end of the tension spring. The end of the spring when hanging free and with the slack taken out of the drive cord should be three eights or less from the flange of the drum. Cut off the surplus length of the cord after it has been knotted.

Now secure the other end of the tension spring over the spur on the drive drum. Turn the drive shaft back and forth several times.

Replace the dial assembly and pointer.

Replace the chassis in the cabinet.

Fig. 5—Color Coding of Coil Wires and D. C. Resistance of Windings. (Also see complete D. C. Resistance List Below)

(940) until maximum output is obtained. See Fig. 3 for location of this trimmer.

15,000 KC Adjustment
Set the signal generator for 15,000 KC.

Turn the rotor of the tuning condenser carefully until maximum output is obtained.

Adjust the interstage Range D trimmer (C8) and antenna Range D trimmer (C4) to maximum.

When adjusting the interstage Range D trimmer, it will be necessary at the same time to turn the tuning condenser rotor slowly back and forth until the peak of the greatest intensity is obtained.

Then go back and repeat the procedure as given for the 16,000 KC adjustment. If it is found necessary to make any appreciable change in the settings of the oscillator Range D trimmer, the 15,000 KC adjustment must be repeated.

Do not make any further change in the setting of the oscillator Range D trimmer.

8000 KC Adjustment
Set the signal generator for 8000 KC.

Turn the tuning condenser rotor until maximum output is obtained.

Turn the rotor slowly back and forth at the same time adjusting the 8000 KC trimmer until the peak of greatest intensity is obtained. See Fig. 5 for location of this trimmer.

Adjust the interstage Range B trimmer (C6) and antenna Range B trimmer (C2) to maximum.

Do not change the setting of the oscillator Range B trimmer.

800 KC Adjustment
Set the signal generator for 800 KC.

Turn the tuning condenser rotor until maximum output is obtained.

Turn the rotor slowly back and forth at the same time adjusting the 800 KC trimmer until the peak of the greatest intensity is obtained. See Fig. 5 for location of this trimmer.

Be sure to use a non-metallic screwdriver for this adjustment.

RANGE C ALIGNMENT

4900 KC Adjustment
Set the signal generator for 4900 KC.

Connect the antenna lead of the receiver through a 400-ohm resistor to the output of the signal generator.

Turn the rotor of the tuning condenser to the full open position.

Turn the band selector to the Range C position (let short wave band — green dial color).

As mentioned above, keep the volume control at the maximum position and attenuate the signal from the signal generator to prevent A.V.C. action.

Adjust the oscillator Range C trimmer (C41) until maximum output is obtained. See Fig. 5 for location of this trimmer.

4400 KC Adjustment
Set the signal generator for 4400 KC.

Turn the rotor of the tuning condenser carefully until maximum output is obtained.

Adjust the interstage Range C trimmer (C7) and antenna Range C trimmer (C5) to maximum.

Do not change the setting of the oscillator Range C trimmer.

RANGE D ALIGNMENT

16,000 KC Adjustment
Set the signal generator for 16,000 KC.

Keep the antenna lead of the receiver connected through the 400-ohm resistor to the output of the signal generator.

Turn the rotor of the tuning condenser to the full open position.

Turn the band selector to the Range D position (End short wave band—red dial color).

As mentioned above, keep the volume control at the maximum position and attenuate the signal from the signal generator to prevent A.V.C. action.

Adjust the oscillator Range D trimmer

A signal generator that will provide an accurately calibrated signal at 456, 1750, 1500, 800, 4800, 4800, 15,000, 16,000 and 8000 KC and an output indicating meter are required. It will be practically impossible to align the receiver if unsatisfactory apparatus is used.

Use a non-metallic screwdriver for the adjustments. The complete procedure is as follows:

I.F. Adjustment
Set the signal generator for a signal of 456 KC.

Connect the output of the signal generator through a 0.1 mf. condenser to the switch end of condenser C9—see Fig. 2. There is a lead which goes to the lug on the top of the center stator section of the tuning condenser—see Fig. 4. The connection can be made at this lug.

Connect the ground lead of the receiver to the ground post of the signal generator. Turn the band selector to the Range B position (standard wave band—purple dial color).

Turn the volume control to the maximum position.

Attenuate the signal from the signal generator to prevent the levelling-off action of the A.V.C.

Then adjust the five I.F. trimmers until maximum output is obtained. The adjusting screws for these condensers are reached from the top of the chassis, and the location is shown in Fig. 4.

RANGE B ALIGNMENT

1750 KC Adjustment
Set the signal generator for 1750 KC.

Turn the rotor of the tuning condenser to the full open position.

Keep the band selector in the standard wave position.

Connect the antenna lead of the receiver through a 200 mf. condenser to the output of the signal generator.

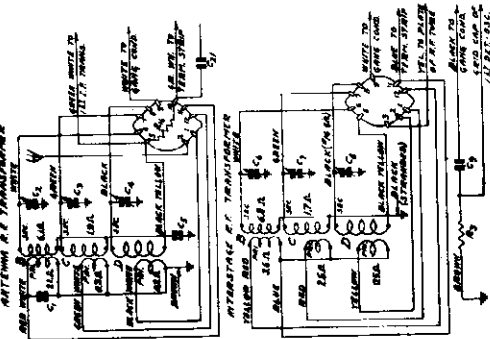

For this and all subsequent adjustments keep the volume control at the maximum position and attenuate the signal from the signal generator to prevent A.V.C. action.

Adjust the oscillator Range B trimmer (C45) until maximum output is obtained. The location of this trimmer is shown in Fig. 5.

1500 KC Adjustment
Set the signal generator for 1500 KC.

Turn the rotor of the tuning condenser carefully until maximum output is obtained.

Loosen the pointer set screw and set the large pointer at the 1500 KC mark on the standard wave band scale. Retighten the set screw.

MODEL S 7F, 7FL Alignment, Part Phono. Data

Table with columns for part numbers and descriptions, including 'ELECTROLYTIC' and 'MISCELLANEOUS' sections.

Shielding of the cable. The switch terminal shown connected to the tone control R19 in Fig. 7, should be connected to the switch terminal which connects to the 01 condenser C27.

Trimmer Replacement. If one trimmer of the gang trimmer strip should become defective, it is not necessary to replace the entire strip. A single trimmer P.17A15, as shown in the replacement parts list, may be used.

Across the volume control resistor R13 is a filter capacitor C20. A R.F.A. connection was the low potential end of the volume control is connected between the two condenser. At high volume settings, the filter is not effective.

Replacement Parts. NOTICE—There is a large letter on the chassis which identifies the set as to major part changes. When ordering parts, please be sure to mention the series number and the large letter.

MISCELLANEOUS SOCIETY. Includes a list of various electronic components and their specifications.

PHONO ATTACHMENT PARTS WITH SWITCH MOUNTED ON CHASSIS. Lists various phono attachment parts and their part numbers.

TRANSFORMERS AND COILS. Lists various transformers and coils used in the radio set.

CONDENSERS. Lists various types of condensers and their specifications.

Twenty-five Cycle Receivers. The twenty-five cycle receiver differs from the sixty cycle receiver only in the fact that a different power transformer is used. The correct power transformer for the twenty-five cycle receiver can be operated either factory from a sixty cycle power supply.

Phonograph Connections Switch on Back Panel of Chassis. Phonograph connections can be made as shown in Fig. 7. The parts required are shown in the parts list.

Range D Adjustment. CAUTION—When aligning this short wave band be sure NOT to adjust at the image frequency. This can be checked as follows: Lay on any the signal generator at 15,000 KC. The signal will be heard at 15,000 KC. The image signal, which is 11,000 less 912 KC, or 14,088 KC. It may be necessary to increase the input signal to hear the image.

Range B Adjustment. Set the signal generator for 15,000 KC. Turn the tuning condenser rotor until maximum output is obtained. Slowly back and forth at the same rate adjusting the 600 KC trimmer until the greatest intensity is obtained. See Fig. 3 for location of this trimmer.

Range A Alignment. After the procedure for the alignment of each range, as explained below, is completed, it is advisable to repeat the procedure as a final check.

380 KC Adjustment. Set the signal generator for 380 KC. Turn the rotor of the tuning condenser to the full open position.

350 KC Adjustment. Set the signal generator for 350 KC. Turn the rotor of the tuning condenser carefully until maximum output is obtained.

165 KC Adjustment. Set the signal generator for 165 KC. Turn the tuning condenser rotor until maximum output is obtained.

1730 KC Adjustment. Set the signal generator for 1730 KC. Turn the rotor of the tuning condenser to the full open position.

600 KC Adjustment. Set the signal generator for 600 KC. Turn the tuning condenser rotor until maximum output is obtained. Slowly back and forth at the same rate adjusting the 600 KC trimmer until the greatest intensity is obtained. See Fig. 3 for location of this trimmer.

15,000 KC Adjustment. Set the signal generator for 15,000 KC. Turn the rotor of the tuning condenser carefully until maximum output is obtained.

18,300 KC Adjustment. Set the signal generator for 18,300 KC. Connect the antenna lead of the radio through a 400 ohm resistor to the output of the signal generator.

6000 KC Adjustment. Set the signal generator for 6000 KC. Turn the tuning condenser rotor until maximum output is obtained.

1900 KC Adjustment. Set the signal generator for 1900 KC. Turn the rotor of the tuning condenser to the full open position.

1900 KC Adjustment. Set the signal generator for 1900 KC. Turn the rotor of the tuning condenser carefully through the 500 ohm resistor to the output of the signal generator.

1900 KC Adjustment. Set the signal generator for 1900 KC. Turn the rotor of the tuning condenser to the full open position.

1900 KC Adjustment. Set the signal generator for 1900 KC. Turn the rotor of the tuning condenser carefully through the 500 ohm resistor to the output of the signal generator.

TRANSFORMERS AND COILS

PHONO ATTACHMENT PARTS

Phonograph Connections

Phonograph connections can be made as shown in Fig. 7. The parts required are shown in the parts list. Knockouts are provided in the back panel of the chassis for mounting the phono jack and phono switch—see Fig. 8.

For mounting the 12 mfd. 25 volt dry electrolytic condenser, two No. 27 drill holes should be drilled in the side of the chassis base directly below the wet electrolytic condensers. These holes are 1 1/4" from

Fig. 7—Phonograph Connections

Fig. 8—Location of Phono Knockouts

the bottom, 3/8" and 3 3/4" from the front of the chassis.

The ground lug which extends out from the side of the chassis should be bent back into the chassis wall. The connections are made by opening the diode return circuit at the volume control. Unsolder the shielded lead which runs from the I. F. transformer to the volume control at the lug on the volume control. Cut this lead to length and connect it to the switch as shown in Fig. 7. The extra length of shielded lead which is provided, is connected from the volume control R9 to the phono switch as illustrated.

Remove the ground from the cathode terminal of the 6B7 2nd detector tube by bending the chassis

ground lug away from this terminal. Be sure to solder back to this ground lug any leads that were connected to it (not including cathode connection of socket).

Connect one side of the 12 mfd. 25 volt electrolytic condenser to ground and the other side of the condenser to the cathode terminal of the 6B7 2nd detector and the phono switch as shown in Fig. 7. To this same terminal on the phono switch connect the 900 ohm .2 watt resistor. The other side of this resistor goes to ground. Complete the other connections as illustrated.

A high impedance pick-up should be used. If a low impedance pick-up is used a step-up transformer will be required for sufficient volume. The volume control and tone control of the set will regulate the phono volume and tone.

Servicing R. F. Coil Assemblies

The R. F. coil assemblies in this receiver are sold complete with can. This is due to the fact that the trimmers are soldered to the can, and cannot be easily disassembled.

The lead colors and resistances of the various windings in each assembly are shown in Fig. 3.

If it is ever necessary to remove one of coil assemblies from the can, proceed as follows: First remove the nuts from the screws at the top of the can. The outside lug on the trimmer condenser is inserted in a slot in the coil can, and this lug is soldered into position.

Apply a soldering iron to the can at the point of the soldered connection. Then with a screw driver lift up on the outside edge of the trimmer (edge soldered to can) until the trimmer is clear of the can. After the trimmers are all unsoldered, the coil can be taken out.

Twenty-five Cycle Receivers

The twenty-five cycle receiver differs from the sixty cycle receiver only in the fact that a different power transformer is used. The correct power transformer is shown in the parts list.

The twenty-five cycle chassis can be operated satisfactorily from a sixty cycle power supply. However, the reverse is not true; the sixty cycle receiver cannot be operated from a twenty-five cycle power supply.

A 115-230 Volt, 40 to 60 cycle as well as other power transformers with special power ratings are also available for this model.

Alignment, Socket Trimmers, Voltage Resistance, Coils Changes

WELLS-GARDNER & CO.

D. C. Resistance of Windings

Following are the D. C. resistances of the various windings in the chassis. The values given below will vary slightly in different sets. Refer to Fig. 3.

Part No.	Item	Code	D. C. Resistance in Ohms
9A38	Antenna Transformer Winding	T1	27
	Range B Primary Winding	T1	0.3
	Range B Secondary Winding	T1	Small
9A39	N. F. Interstage Transformer	T2	2.6
	Range B Primary Winding	T2	2.6
	Range B Secondary Winding	T2	2.6
9A38	Oscillator Transformer	T3	11
	Range B Grid Coil	T3	Small
	Red White to White	T3	Small
	Black White to Black	T3	Small
9A39	Oscillator Plate Coil	T4	11.9
	Primary Winding	T4	11.9
9A39	2nd Primary Winding	T5	12.9
	Secondary Winding	T5	4.5
	Range B Plate Coil	T5	19
	Primary Winding	T5	19
	Secondary Winding	T5	19
	Speaker Field	L3	105
	Speaker Voice Coil	L3	33
	Speaker Printing Coil	L3	32.0

Changes in Early Models

In the early models the antenna transformer had two B primary windings as shown in Fig. 3. In later models only one winding was used as shown in Fig. 3.

Fig. 6—Location of Tubes

Loosen the pointer set screw and set the pointer at the 1500 KC mark on the standard wave band scale. Retighten the set screw.

Adjust the interstage standard wave trimmer (C7) and antenna standard wave trimmer (C7) until maximum output is obtained. Do not change the setting of the oscillator standard wave trimmer.

600 KC Adjustment
Set the signal generator for 600 KC. Turn the tuning condenser rotor until maximum output is obtained.

Turn the rotor slowly back and forth at the same time adjusting the 600 KC trimmer until the peak of greatest intensity is obtained. See Fig. 4 for location of this trimmer.

Be sure to use a non-metallic screw driver for this adjustment.

18,300 KC Adjustment
Set the signal generator for 18,300 KC. Turn the rotor of the tuning condenser to the full open position.

Turn the band switch to the short wave position. As mentioned above, keep the volume control at the maximum position and attenuate the signal from the signal generator to prevent A.V.C. action. Adjust the oscillator short wave trimmer (C20) until maximum output is obtained. See Fig. 4 for location of this trimmer.

If a maximum output peak cannot be reached, it may be due to the fact that the antenna and interstage short wave trimmers are screwed down too far. Back off these two trimmer screws two or three turns and then adjust the oscillator short wave trimmer for maximum output.

15,000 KC Adjustment
Set the signal generator for 15,000 KC. Turn the rotor of the tuning condenser carefully until maximum output is obtained.

Adjust the interstage short wave trimmer (C8) and antenna short wave trimmer (C5) until maximum output is obtained.

When adjusting the interstage short wave trimmer, it will be necessary at the same time to turn the tuning condenser rotor slowly back and forth until the peak of greatest intensity is obtained.

Then go back and repeat the procedure as given for the 18,300 KC adjustment. If it is found necessary to make any appreciable change in the setting of the oscillator short wave trimmer, the 15,000 KC adjustment must be repeated.

Do not make any further change in the setting of the oscillator short wave trimmer.

6000 KC Adjustment
Set the signal generator for 6000 KC. Turn the tuning condenser rotor until maximum output is obtained.

Turn the rotor slowly back and forth at the same time adjusting the 6000 KC trimmer until the peak of greatest intensity is obtained. See Fig. 4 for location of this trimmer.

Use a non-metallic screw driver for this adjustment.

Correct alignment is extremely important in connection with all wave receivers. The receiver is all properly aligned at the factory with precision instruments and re-alignment should not be attempted unless all other possible causes of the faulty operation have first been investigated and unless the service technician has the proper equipment.

A signal generator that will provide an accurately calibrated signal at 456, 1730, 1500, 600, 18,300, 15,000 and 6000 KC and an output indicating meter are required. It will be practically impossible to align the receiver if unsatisfactory apparatus is used.

Use a non-metallic screw driver for the adjustments. The complete procedure is as follows:

I. F. Adjustment

Set the signal generator for a signal of 456 KC. Connect the antenna lead of the signal generator thru a 1 MF condenser to the grid of the 1st detector. Connect the ground lead of the signal generator to the chassis ground.

Turn the band switch to the standard wave position. Turn the volume control to the maximum position. Attenuate the signal from the signal generator to prevent the leveling-off action of the A.V.C.

Then adjust the four I. F. trimmers until maximum output is obtained. The adjusting screws for these condensers are reached from the top of the chassis, and the location is shown in Fig. 6.

1730 KC Adjustment

Set the signal generator for 1730 KC. Turn the rotor of the tuning condenser to the full open position.

Keep the band switch in the standard wave position. Connect the antenna lead of the receiver through a 270 muf. condenser to the output of the signal generator.

For this and all subsequent adjustments keep the volume control at the maximum position and attenuate the signal from the signal generator to prevent A.V.C. action.

Adjust the oscillator standard wave trimmer (C19) until maximum output is obtained. The location of this trimmer is shown in Fig. 4.

1500 KC Adjustment

Set the signal generator for 1500 KC. Turn the rotor of the tuning condenser carefully until maximum output is obtained.

Series 7L - OEL - 2DL

October, 1936 DIAL AND DRIVE PARTS LIST SUPPLEMENT

Four distinct types of dials are used in the above series of radios. Each type is supplied in two sizes. When ordering dial parts, specify the items shown to the right to insure getting the correct part.

When ordering parts specify

- 1—Type of dial.
- 2—Size of dial.
- 3—Name on dial or escutcheon.
- 4—Model or series of radio.

TYPE OF DIAL

Pointer Dials

No. 2 Dial

External pointers — each dial scale a different color for each band — circular micrometer scale numbered to 10.

No. 4 Dial

External pointers—all dial scales gold etched — ten sided micrometer scale numbered to 100.

Phantom Light Dials

No. 3 Dial

Moving beam of light indicators — celluloid translucent background.

No. 7 Dial

Moving beam of light indicators — mirror background.

Back View of Pointer Dial

Back View of Phantom Light Dial

SIZE OF DIAL

In each of the above types of dial there are two sizes known as the "7 inch" and "9 inch" size. The size of the dial is determined not by the length of

the glass but by the horizontal distance across the opening of the escutcheon.

The "7 inch" dials have the upper corners cut off as shown in the illustration at left, and are approximately 8 inches in length.

The "9 inch" dials are rectangular in shape as shown in the illustration at left, and are approximately 10 inches in length.

Dial & Drive Parts

DIAL ASSEMBLY

Dial Assembly Complete with Dial Glass; Dial Cardboard; Dial Assembly Mounting Plate; Reflectors; Small Pointers; Cords, Collars, Springs and Pulleys for Small Pointers; and Band Indicator Assembly Less Large Station Pointer and Micrometer Pointer.....

Dial Glass Only.....

Dial Cardboard (For Radios with Tuning Eye mounted in Dial).....

Dial Cardboard (For Radios without Tuning Eye mounted in Dial).....

Dial Assembly Mounting Plate Only (Includes Small Pointer Shafts and Pulleys, and Band Indicator Assembly).....

Dial Assembly Support Brackets (Attached to Gang Condenser) .. ea.

Large Station Pointer.....

Micrometer Pointer (No. 2 Dial).....

Micrometer Pointer (No. 4 Dial).....

Small Volume or Tone Control Pointer (No. 2 Dial)..... ea.

Small Volume or Tone Control Pointer (No. 4 Dial)..... ea.

Fibre Strip (At bottom of Dial Glass).....

Dial Lamp Reflectors (At each side of Dial Assembly Mounting Plate)..... ea.

Dial Lamp Sockets and Clips..... ea.

Dial Lamps—No. 51 Bayonet Type..... ea.

10" Black Cord for Small Pointers..... doz.

Brass Collar with Set Screws for Securing Small Pointer Cords to Shafts..... ea.

Tension Springs for Small Pointer Cords..... ea.

Small Pointer Shafts and Pulleys..... ea.

Glass Crystal (Mounted in Escutcheon Plate).....

Retaining Ring (For above Crystal).....

DRIVE ASSEMBLY

Planetary Assembly Complete with Hex Nut and Lock Washer (This is the unit mounted at the front of the Chassis Base. It is integral with the Tuning Shaft).....

Black Tuning Drive Cord Only.....

Tension Spring for Tuning Drive Cord.....

Drive Drum Assembly Complete with Gears and Shafts.....

Spreader Spring for Stationary Gear.....

Spreader Spring for Rotary Gear.....

Rubber Cushion (Front) for Gang Condenser.....

Rubber Cushion (Rear) for Gang Condenser.....

Rubber Cushion (Rear—under Chassis Base) for Gang Condenser.....

Rear Mounting Foot for Gang Condenser.....

No. 3 and No. 7 PHANTOM LIGHT DIALS

DIAL ASSEMBLY

Dial Assembly Complete with Dial Glass, Dial Assembly Mounting Plate, Reflectors, Micrometer Indicator, Cardboard Reflector, Tone and Volume Indicators, Tension Spring for Tone and Volume Indicators, Indicator Cords, Brass Collars for Indicators, Fibre Dial Strip and Dial Assembly Support Brackets. (This Assembly also includes Celluloid Background for No. 3 Dials only)..... (No. 3 Dial)

Dial Assembly Complete as above..... (No. 7 Dial)

Dial Glass Only.....

Celluloid Background for Dial (Used on No. 3 Dial Only).....

Dial Assembly Mounting Plate Complete with Tone and Volume Indicators and Indicator Pulleys..... (No. 3 Dial)

Dial Assembly Mounting Plate as above..... (No. 7 Dial)

Dial Assembly Support Brackets (Attached to Gang Condenser) .. ea.

Tension Spring for Tone and Volume Indicators..... doz.

10" Black Cord for Tone and Volume Indicators..... doz.

Brass Collars with Set Screw for Securing Indicator Cords to Shafts..... ea.

Dial Lamp Reflector (Left from front of Radio).....

Dial Lamp Reflector (Right from front of Radio).....

Dial Lamp Sockets and Clips (For edge lighting of dial and for Tone and Volume Indicators)..... ea.

Dial Lamps—No. 51 Bayonet Type (For edge lighting and Phantom Light Assembly)..... ea.

Phantom Light Assembly Complete with Lamps.....

Springs for Lamps of Phantom Light Assembly..... ea.

Brass Collars for Lamps of Phantom Light Assembly..... ea.

Micrometer Indicator (Celluloid and metal disc)..... (No. 3 Dial)

Micrometer Indicator (Metal disc)..... (No. 7 Dial)

Cardboard Reflector for Micrometer Indicator..... (No. 3 Dial)

Cardboard Reflector for Micrometer Indicator..... (No. 7 Dial)

Fibre Strip (At bottom of Dial Glass).....

Switch for Phantom Light Assembly (This switch is not included in any of the above Assemblies).....

DRIVE ASSEMBLY

Planetary Assembly Complete with Hex Nut and Lockwasher (This is the unit mounted at the front of the Chassis Base. It is integral with the Tuning Shaft).....

Black Tuning Drive Cord Only.....

Tension Spring for Tuning Drive Cord.....

Drive Drum Assembly Complete with Gears and Gear Spreader Springs.....

Spreader Spring for Stationary Gear.....

Spreader Spring for Rotary Gear.....

Rubber Cushion (Front) for Gang Condenser.....

Rubber Cushion (Rear) for Gang Condenser.....

Rubber Cushion (Rear—under Chassis Base) for Gang Condenser.....

Rear Mounting Foot for Gang Condenser.....

- (2) If I.F. readings are made with a cord and plug, ground the control grid through a condenser to prevent oscillation.
- (3) Read Across R12 and R14.

Condenser Alignment

Misalignment or mistracking of condensers generally manifests itself in broad tuning and lack of volume at portions or all of the broadcast band. The receivers are all properly aligned at the factory with precision instruments and realignment should not be attempted unless all other possible causes of the faulty operation have first been investigated and unless the service technician has the proper equipment. A signal generator that will provide an accurately calibrated signal of 175 K.C. and accurately calibrated signals over the broadcast band, and an output indicating meter are necessary. The procedure is as follows:

Set the signal generator for 175 K.C. Connect the signal lead from the signal generator to the grid of the 1st detector tube through a .05 mfd condenser. Turn the tuning condenser rotor until the plates are completely out. The ground lead from the signal generator goes to the ground lead of the receiver. Then adjust the four intermediate frequency condensers for maximum output. The adjusting

screws for these condensers are reached from the bottom of the chassis.

Next set the signal generator for a signal of exactly 1400 K.C. The antenna lead from the signal generator, in this instance, connected to the antenna lead of the receiver. Set the dial pointer on the 1400 K.C. mark on the dial scale and adjust the three trimmer condensers on the gang tuning condenser for maximum output, adjusting the oscillator trimmer first.

Next set the signal generator for a signal of 600 K.C. and adjust the oscillator 600 K.C. trimmer. The adjusting screw for this condenser is reached from the top of the chassis and is between the I.F. and oscillator coil cans.

A non-metallic screwdriver is necessary for this adjustment. Turn the tuning condenser rotor until maximum output is obtained. Then turn the rotor slowly back and forth over this setting, at the same time adjusting the 600 K.C. trimmer screw until the highest output is obtained.

Then set the signal generator again for a signal of 1400 K.C. and check the adjustment of the tuning condenser trimmers at this frequency for maximum output.

MODEL S-724

Circuit Data
Alignment, Voltage
Resistance

WESTERN AUTO SUPPLY CO.

Circuit

This receiver is designed to operate from a battery power supply the values of which are shown in Fig. 1. All of the tubes used are of the 2 volt type. The receiver is designed to operate at a very low current drain from the batteries and still have a very satisfactory quality of output.

The circuit has a preselector stage incorporating 2 tuned circuits for image rejection. This couples into the type 32 first detector-oscillator tube through a combination of inductive coupling in T1 and capacitive coupling through C3. In Fig. 1 the two coils to the right of the 32 1st detector tube are the primary and secondary of the 1st I. F. transformer while below this tube are the oscillator coils. The oscillating circuit is tuned by the oscillator section of the gang condenser and is always resonant at a frequency of 175 K. C. above the frequency to which the R. F. circuit is tuned.

One stage of I. F. amplification is employed using a 34 tube. Fixed condensers tune the primary and secondary of the first I. F. transformer. A second I. F. unit of the impedance coupled type is provided in which the inductance L4 is tuned by a trimmer condenser C9. The volume control is of the variable antenna input and I. F. bias type. Referring to Fig 1 it will be noted that one end of the volume control strip is connected to the antenna and the other end is connected to resistor R9. Also note that the volume control strip is tapped. Bias voltage for the 34 I. F. tube is obtained from a potentiometer consisting of resistors R9, R10 and the 60,000 ohm section of the volume control R8 which resistors are connected across the 22½ volt "C" battery.

As the slider of the volume control is moved away from the antenna end, the signal input to the antenna stage is increased. The bias voltage of the I. F. tube is not affected until the tap is reached. As the slider moves from this point to the end of the strip the I. F. bias is decreased, thus increasing the sensitivity. When this happens the plate current goes up and more battery current is used.

A 34 tube is used as the 2nd detector or demodulator. Demodulation takes place in the grid circuit of this tube.

Resistance coupling is used between the 2nd detector and the 1st audio stage which uses a 30 tube. The 1st audio stage is transformer coupled to the output stage. Class "B" amplification is employed in the output stage which uses a type 19 tube. This consists of two output tubes in one envelope. A magnetic reproducer is used.

A 3 pole switch controls all three sources of battery supply.

Condenser Alignment

Misalignment or mistracking of condensers generally manifests itself as broad tuning and lack of volume at portions or all of the broadcast band. The receivers are all properly aligned at the factory with precision instruments and realignment should not be attempted unless all other possible causes of the faulty operation have first been investigated and unless the service technician has the proper equipment. A signal generator that will provide accurately calibrated signals over the broadcast band and at the intermediate frequency, and an output meter are required for indicating the effect of adjustments.

First set the signal generator to a frequency of 175 K. C. Connect the antenna lead of the signal generator to the grid of the 1st detector thru a .05 mfd. condenser. The ground lead from the signal generator goes to the ground lead of the receiver. Adjust trimmer condenser C9 on the back panel of the chassis until maximum output is obtained. A non-metallic screw driver should be used in making this adjustment as the I. F. trimmer is at B+ potential.

Next set the signal generator for 1730 K. C. Turn the rotor to the full open position. The antenna lead from the signal generator is in this instance connected to the antenna lead of the receiver. Adjust the trimmer of the oscillator section of the 3 gang condenser until maximum output is obtained. The oscillator section is the one with the cut plate rotor.

Then set the signal generator for 1400 K. C. and turn the rotor until maximum output is obtained. Adjust the other two trimmers on the gang condenser for maximum output.

To obtain dial scale calibration tune in an 800 K. C. signal and set the dial pointer at that mark on the dial scale. When calibrated in this manner, the setting will be approximately correct at both ends of the scale.

Fig. 4—Using Voltage Regulator with 3 Volt "A" Battery
The use of the cut plate type of condenser eliminates the necessity of a 600 K. C. padder and no adjustment, at this frequency, therefore, is required.

						Total

(1) With 250,000 ohm meter.
(2) Subject to variation due to oscillatory current.
(3) With 25,000 ohm meter.
(4) As read at "C" battery.

Voltages

Check the voltages at the sockets to see if correct values are being delivered to the tubes. The antenna and ground should be disconnected and the antenna and ground leads from the set connected together. The volume control should be turned to the right or maximum position.

The voltage chart gives the voltages with all tubes in, the speaker connected and the set in operating condition. These voltages are typical of the sets but will vary slightly with variations in individual receivers, tubes, test equipment used and battery voltages.

MODEL S-727

Voltage, Alignment
Resistance, Socket
Trimmers, Change

WESTERN AUTO SUPPLY CO.

Condenser Alignment

Correct alignment is extremely important in connection with all wave receivers. The receivers are all properly aligned at the factory with precision instruments and the alignment should not be attempted unless all other possible causes of trouble have been investigated. Turn the antenna lead to the full open position. An oscillator should be used as the proper equipment. A signal generator that will provide a accurately calibrated signal of 456 K. C. and accurately calibrated over the broadcast and short wave bands, 530-1740 K. C. and 5.3-18.3 M. C., is required. An output indicating meter is also necessary. It will be practically impossible to align the receiver if unsatisfactory apparatus is used.

Use a non-metallic screw driver for the adjustments. The complete procedure is as follows:

Intermediate Frequency Adjustment

Set the signal generator for 456 K. C. Connect the antenna lead of the signal generator to the grid of the 1st detector through a .05 mfd. condenser. Turn the tuning condenser rotor until the plates are completely out. The condenser rotor of the receiver is now at the maximum position. Reduce the signal so that A. V. C. action is not obtained.

Then adjust the five I. F. trimmer condensers until maximum output is obtained. The adjusting screws for the 1st, 2nd, 3rd, 4th and 5th trimmer condensers are reached from the top of the chassis. The trimmer condensers are held in position by small cover plates which are held in position by screws. Loosen these screws until the cover plates can be swung away. **CAUTION - Use an insulated screwdriver for adjusting trimmers to prevent short-circuiting to ground.** In the 3rd I. F. coil, only the primary has a variable trimmer condenser. This condenser is mounted on the back panel of the chassis as shown in Fig. 2 and the adjustment screw is reached through a hole in the back panel.

Broadcast Band Adjustment

The broadcast short wave switch should be in the broadcast position. Set the signal generator for 1740 K. C. Turn the rotor to the full open position. The antenna lead from the signal generator to the primary connected to the antenna lead of the receiver. Adjust the oscillator broadcast trimmer until maximum output is obtained. This trimmer is on the tuning condenser and its location is shown in Fig. 2. Then set the signal generator for 1500 K. C. Turn the rotor until maximum output is obtained. Loosen the 1st trimmer condenser rotor for the primary at the 1500 K. C. mark on the broadcast band control. Then set the rotor for V. C. action is not obtained. Adjust the oscillator broadcast trimmer until maximum output is obtained. This trimmer is on the tuning condenser and its location is shown in Fig. 2. Then set the signal generator for 600 K. C. and adjust the 600 K. C. trimmer. The adjusting screw is reached through a hole in the front panel of the chassis as shown in Fig. 2. Then turn the rotor slowly back and forth over this setting at the same time adjusting the 600 K. C. trimmer screw until the highest output is obtained.

Short Wave Band Adjustment

CAUTION - After the broadcast band alignment as described above has been made, do not change the adjustment of any of the broadcast band trimmers.

In aligning the short wave band of the receiver, it will be noted that the signal will be heard with the signal generator set at two 15,000 K. C. apart. That is, if the receiver is aligned at 15,000 K. C. and again at 16,500 K. C. and the signal generator is set at 15,912 K. C. This is due to image reception on the fact that a 456 K. C. beat is obtained when the signal is 456 K. C. lower than the receiver oscillator and also when the signal is 456 K. C. higher than the receiver oscillator. Care should

Replacing Drive Cord

Remove chassis from cabinet.
Take off the pilot light assembly by lifting of the two sockets and spring clips.
Detach the large pointer by removing the screw at the center of the dial.
Loosen the dial assembly by taking out the two screws which secure the bottom of this assembly to the chassis.
Then lay the complete dial assembly face downward in front of the chassis. It is not necessary to remove the volume control and tone control collars which hold the indicator cords of these two controls in position.
Turn the drive drum until the opening in this drum is approximately vertical and with the hole at the top as shown in Fig. 4.

Remove the tension spring and the old drive cord. See that the eyelet is in the hole in the arc drum as shown in Fig. 4. Insert one end of the drive cord from the outside through the hole at the center in the drive drum. Tie the end of the cord which has been inserted in the hole to one end of the tension spring.
Wrap the cord in a clockwise direction (facing front of chassis) round the drive drum approximately one-half turn. Then tilt the chassis up on its back panel and bring the cord across the top of the chassis and wrap around the drive shaft. Wrap it two or one-half times around the drive shaft as shown in Fig. 4.
Then bring this cord up from the drive shaft and wrap it around the drive drum approximately one and one fifth

Fig. 4—Drive Cord Replacement

turns in a clockwise direction until it is up to the hole in this drum as illustrated.
Insert the free end of the cord through the hole in the eyelet and tie it to the end of the tension spring. The end step-up transformer will be approximately 1/2" from the front of the chassis as shown in Fig. 4. Cut off volume.
Then secure the other end of the tension spring over the spur on the drive drum.
Replace the dial assembly and pointer.
Replace the pilot light assembly after which the chassis ground was connected to the B+ side of the 1st I. F. coil primary.

Change in Early Models

In the early models of this receiver the side of the trimmer condenser C27 which is shown in Fig. 1 as connected to chassis ground was connected to the B+ side of the 1st I. F. coil primary.

Phono Connections

Phonograph connections can be made as shown in Fig. 5. A single pole double throw switch and double pin jack are a square inch in size and are mounted on the back panel of the chassis close to the 2nd detector. The connections are made by opening the diode circuit at this point through switch and pin jacks as indicated. A high impedance pick-up should be used. If a low impedance pick-up is used a step-up transformer will be required for sufficient volume. The volume control of the set will regulate the phono volume.

be taken to see that the receiver is tracked with the signal generator adjusted to the lower of the two frequencies at which a signal is heard, in order that the oscillator in the receiver will be 456 K. C. higher in frequency than the signal. Turn the broadcast short wave switch to the short wave position. Turn the rotor to the full open position. An oscillator should be used as the proper equipment. A signal generator that will provide a accurately calibrated signal of 456 K. C. and accurately calibrated over the broadcast and short wave bands, 530-1740 K. C. and 5.3-18.3 M. C., is required. An output indicating meter is also necessary. It will be practically impossible to align the receiver if unsatisfactory apparatus is used.

Use a non-metallic screw driver for the adjustments. The complete procedure is as follows:

Then set the signal generator for 600 K. C. and adjust the 600 K. C. trimmer. The adjusting screw is reached through a hole in the front panel of the chassis as shown in Fig. 2. Then turn the rotor slowly back and forth over this setting at the same time adjusting the 600 K. C. trimmer screw until the highest output is obtained.

Fig. 2—Arrangement of Controls

D. C. Resistance of Windings

Following are the D.C. resistances of the various windings in the chassis.

Part No.	Description	Winding	D.C. Resistance (ohms)

ELECTRICAL SPECIFICATIONS

Type and Number of Tubes 1 #6A7, 1 #6D6, 1 #75, 1 #45, 1 #25Z5, 1 #48C - Total 6
 Power Supply 105 to 125 volt, D.C., or 105 to 125 volt, 50 to 60 cycle A.C.
 Power Consumption 47 Watts
 Tuning Ranges 540 to 1850 and 1500 to 3500 KC.
 Maximum Output75 watt
 Maximum Undistorted Output75 watt
 Line-Up Frequencies I.F. 465 KC., 1400 KC.

LINE-UP CAPACITOR ADJUSTMENTS
 ADJUSTMENT OF I.F. (465 KC.)

- Set volume control on full, the wave-change switch on the Broadcast (treble position) and the dial indicator at approximately 600 KC.
- Connect output meter across voice coil of speaker.
- Set test oscillator to 465 KC., and adjust its output to produce a measurable reading on output meter when test signal is applied to the grid of the 6D6 I.P. tube through a .5 mfd. blocking condenser.
- Adjust #24 (see Fig. #2) to maximum output, reducing output of test oscillator as required.
- Apply test signal to grid of 6A7 first detector-oscillator tube and adjust #15 and #15 (Fig. #1) to maximum output.
- With test signal still on the grid of 6A7 tube, repeat the above adjustments for greatest sensitivity.
- Apply strong 465 KC. signal to the antenna and adjust trap coil trimmer #5 to a minimum output.

ADJUSTMENT OF BROADCAST BAND

- Apply test signal on grid of 6A7 tube and set the test oscillator to 1400 KC.
- Turn the gang condenser to its maximum position. Adjust dial indicator until either end is directly over the long horizontal lines on the dial scale. Then set dial indicator to 1400 KC.
- Adjust trimmer #7 to maximum output.
- Apply test signal to antenna of set through a .0002 mfd. condenser and adjust trimmer #8 to maximum output.

ADJUSTMENT OF POLICE BAND

When adjustments as outlined under the Broadcast Band are completed, the Police Band requires no adjustment unless the coil has been changed. In this event, see 1700 KC. trimmer test signal and readjusted. The Police Band test signal is indicated by #15 in Fig. #2. Adjust the position of this winding by sliding it back and forth on the coil until maximum output is indicated on the output meter. This winding should then be secured in place by applying a thin coat of coil cement.

Power Tube 25B6G
 Power Consumption 48 Watts
 Maximum Output 1.5 Watts
 Maximum Undistorted Output 1 Watt

ADJUSTMENT OF POLICE BAND

- Set volume control on full, the wave-change switch on the Broadcast (treble position) and the dial indicator at approximately 600 KC.
- Connect output meter across voice coil of speaker.
- Set test oscillator to 465 KC., and adjust its output to produce a measurable reading on output meter when test signal is applied to the grid of the 6D6 I.P. tube through a .5 mfd. blocking condenser.
- Adjust #24 (see Fig. #2) to maximum output, reducing output of test oscillator as required.
- Apply test signal to grid of 6A7 first detector-oscillator tube and adjust #15 and #15 (Fig. #1) to maximum output.
- With test signal still on the grid of 6A7 tube, repeat the above adjustments for greatest sensitivity.
- Apply strong 465 KC. signal to the antenna and adjust trap coil trimmer #5 to a minimum output.

ADJUSTMENT OF BROADCAST BAND

- Apply test signal on grid of 6A7 tube and set the test oscillator to 1400 KC.
- Turn the gang condenser to its maximum position. Adjust dial indicator until either end is directly over the long horizontal lines on the dial scale. Then set dial indicator to 1400 KC.
- Adjust trimmer #7 to maximum output.
- Apply test signal to antenna of set through a .0002 mfd. condenser and adjust trimmer #8 to maximum output.

ADJUSTMENT OF POLICE BAND

When adjustments as outlined under the Broadcast Band are completed, the Police Band requires no adjustment unless the coil has been changed. In this event, see 1700 KC. trimmer test signal and readjusted. The Police Band test signal is indicated by #15 in Fig. #2. Adjust the position of this winding by sliding it back and forth on the coil until maximum output is indicated on the output meter. This winding should then be secured in place by applying a thin coat of coil cement.

ADJUSTMENT OF POLICE BAND

- Set volume control on full, the wave-change switch on the Broadcast (treble position) and the dial indicator at approximately 600 KC.
- Connect output meter across voice coil of speaker.
- Set test oscillator to 465 KC., and adjust its output to produce a measurable reading on output meter when test signal is applied to the grid of the 6D6 I.P. tube through a .5 mfd. blocking condenser.
- Adjust #24 (see Fig. #2) to maximum output, reducing output of test oscillator as required.
- Apply test signal to grid of 6A7 first detector-oscillator tube and adjust #15 and #15 (Fig. #1) to maximum output.
- With test signal still on the grid of 6A7 tube, repeat the above adjustments for greatest sensitivity.
- Apply strong 465 KC. signal to the antenna and adjust trap coil trimmer #5 to a minimum output.

ADJUSTMENT OF BROADCAST BAND

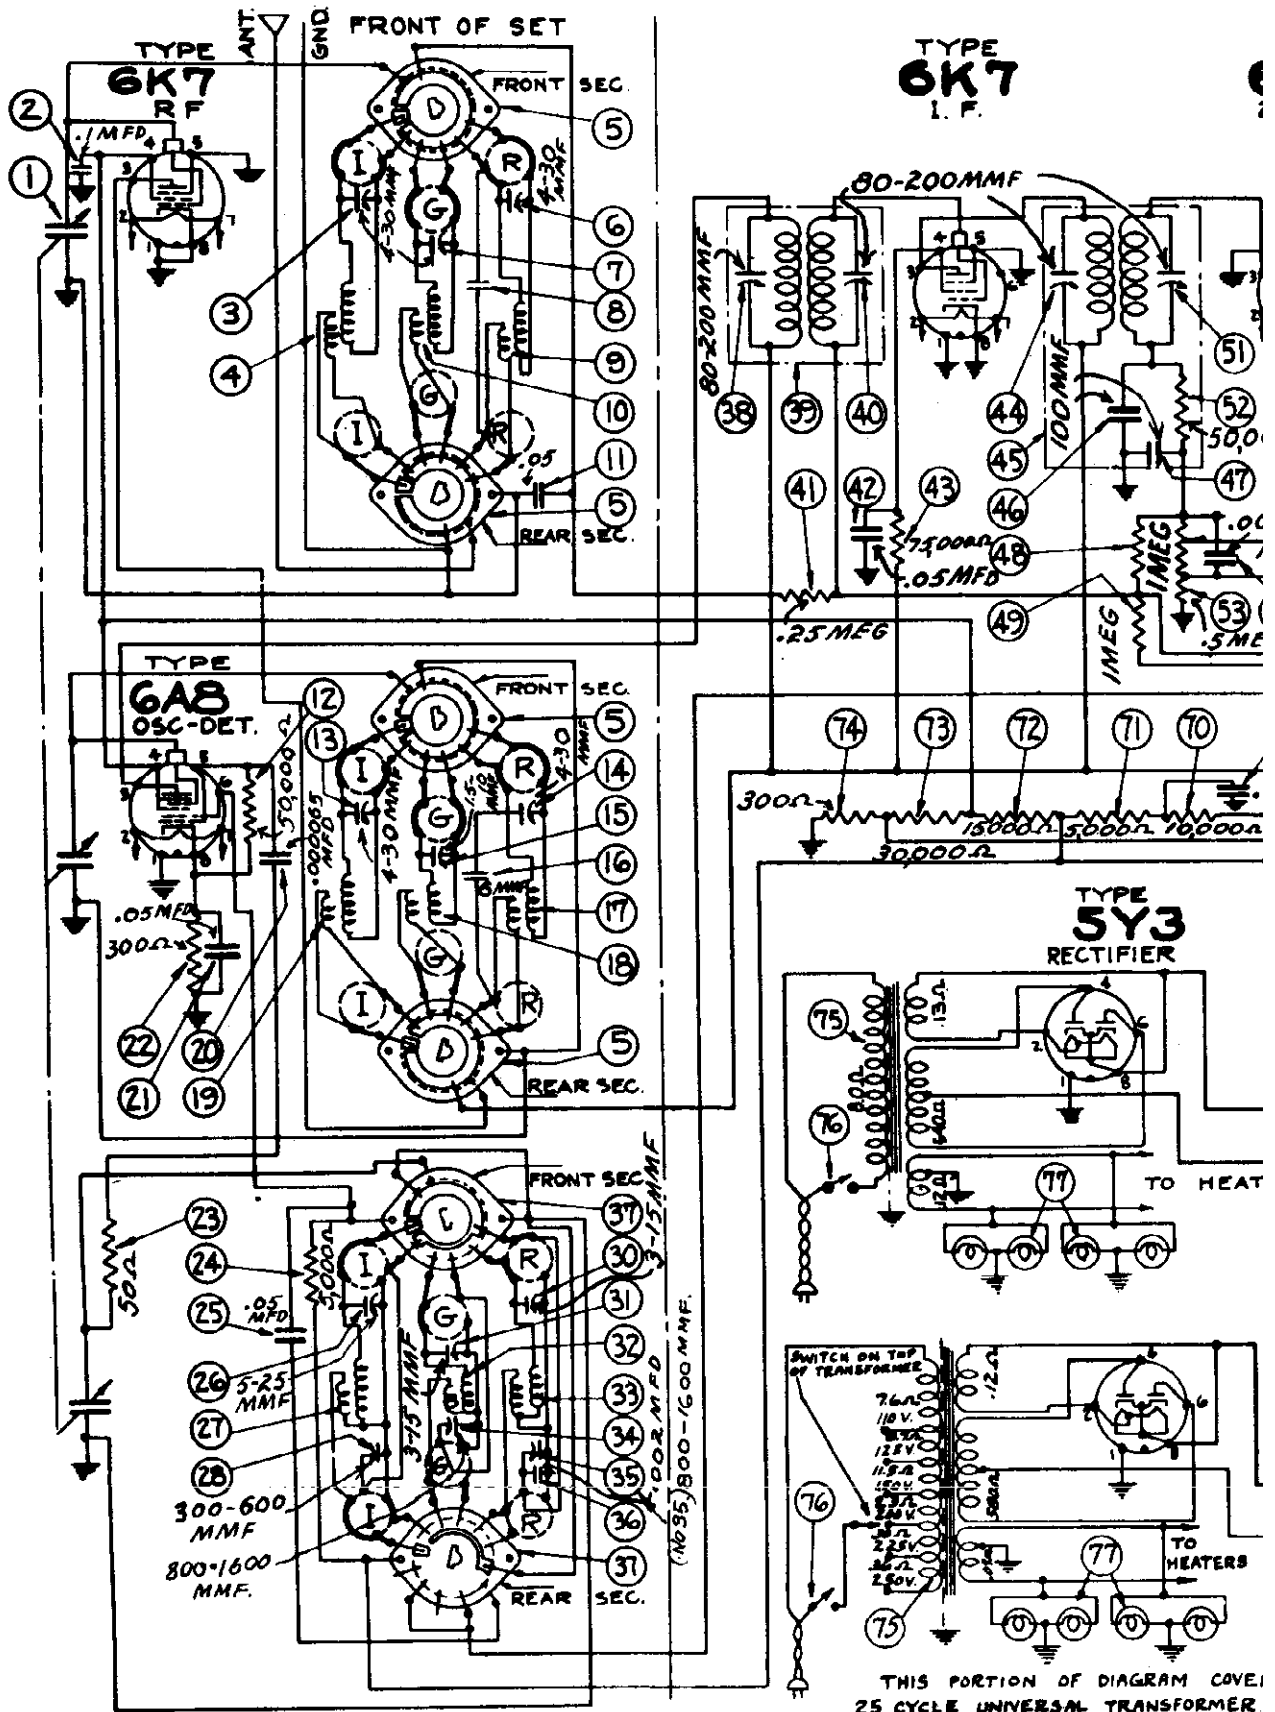

- Apply test signal on grid of 6A7 tube and set the test oscillator to 1400 KC.
- Turn the gang condenser to its maximum position. Adjust dial indicator until either end is directly over the long horizontal lines on the dial scale. Then set dial indicator to 1400 KC.
- Adjust trimmer #7 to maximum output.
- Apply test signal to antenna of set through a .0002 mfd. condenser and adjust trimmer #8 to maximum output.

ADJUSTMENT OF POLICE BAND

When adjustments as outlined under the Broadcast Band are completed, the Police Band requires no adjustment unless the coil has been changed. In this event, see 1700 KC. trimmer test signal and readjusted. The Police Band test signal is indicated by #15 in Fig. #2. Adjust the position of this winding by sliding it back and forth on the coil until maximum output is indicated on the output meter. This winding should then be secured in place by applying a thin coat of coil cement.

ELECTRICAL SPECIFICATIONS

Type and Number of Tubes ... 2 6SK7, 1 6AB, 1 6BE, 1 6G5, 1 6G6, 1 6G5, 1 6Y3 - Total B Power Supply
 Power Consumption 105 to 125 volts, 50 to 60 cycles A.C. 80 Watts
 Maximum Output 3.5 Watts
 Maximum Undistorted Output 2.6 Watts
 Tuning Ranges (White Band - 525 to 1800 KC. Green Band - 1750 to 6000 KC. Red Band - 5800 to 18500 KC. Line-Up Frequencies .. I.P. 465 KC., 1600 KC., 570 KC., 5600 KC., 1900 KC., 17000 KC., 46000 KC.)

LINE-UP CAPACITOR ADJUSTMENTS

ADJUSTMENT OF I.P. (465 KC.)
 1. Set volume control on fully turn tone control to the bass position, the wave change switch on broadcast and the dial indicator at approximately 600 KC.
 2. Connect output meter across voice coil of speaker.
 3. Set test oscillator to 465 KC. and adjust its output to produce a measurable reading on output meter when test signal is applied to the grid of the 6E7 I.P. tube through a .5 mfd. blocking condenser.
 4. Adjust trimmers #44 and #51 to maximum output, reducing output of test oscillator as required.
 5. Apply coil to grid of 6AB detector coil and adjust #38 and #40 to maximum output.

ADJUSTMENT OF BROADCAST BAND

1. Set wave change switch to the White or Broadcast Band position.
 2. Set test oscillator and dial indicator to 1600 KC.
 3. Apply test signal to antenna terminal of chassis through a .0002 mfd. series condenser and adjust #26, #15 and #5 to maximum output.
 4. Set test oscillator and dial indicator to 570 KC. and adjust #28 to maximum output, at the same time rocking the variable tuning condenser.
 5. Return to 1600 KC. setting with both test oscillator and dial indicator and readjust #28, #15 and #5 for accuracy.

ADJUSTMENT OF GREEN BAND

NOTE: In adjusting the two short-wave bands (Green and Red) a .0002 mfd. condenser

ser and a 400 ohm resistor connected in series should be inserted in the high side of the test oscillator leads. This condenser-resistor combination is the approximate equivalent of a short-wave antenna.
 1. Set wave change switch to the Green Band position.
 2. Set test oscillator and dial indicator to 5500 KC. and adjust #31, #15 and #7 to maximum output.
 3. Set test oscillator and dial indicator to 1900 KC. and adjust #34 to maximum output, at the same time rocking the variable tuning condenser.
 4. Return to 5500 KC. setting and make re-adjustment of #31, #15 and #7.

ADJUSTMENT OF RED BAND

1. Set wave change switch to the Red Band position.
 2. Set test oscillator and dial indicator to 17000 KC. and adjust #30, #14 and #6 to maximum output.
 3. Set test oscillator and dial indicator to 6000 KC. and adjust #35 to maximum output, at the same time rocking the variable tuning condenser.
 4. Return to 17000 KC. setting and make re-adjustment of #30, #14 and #6.

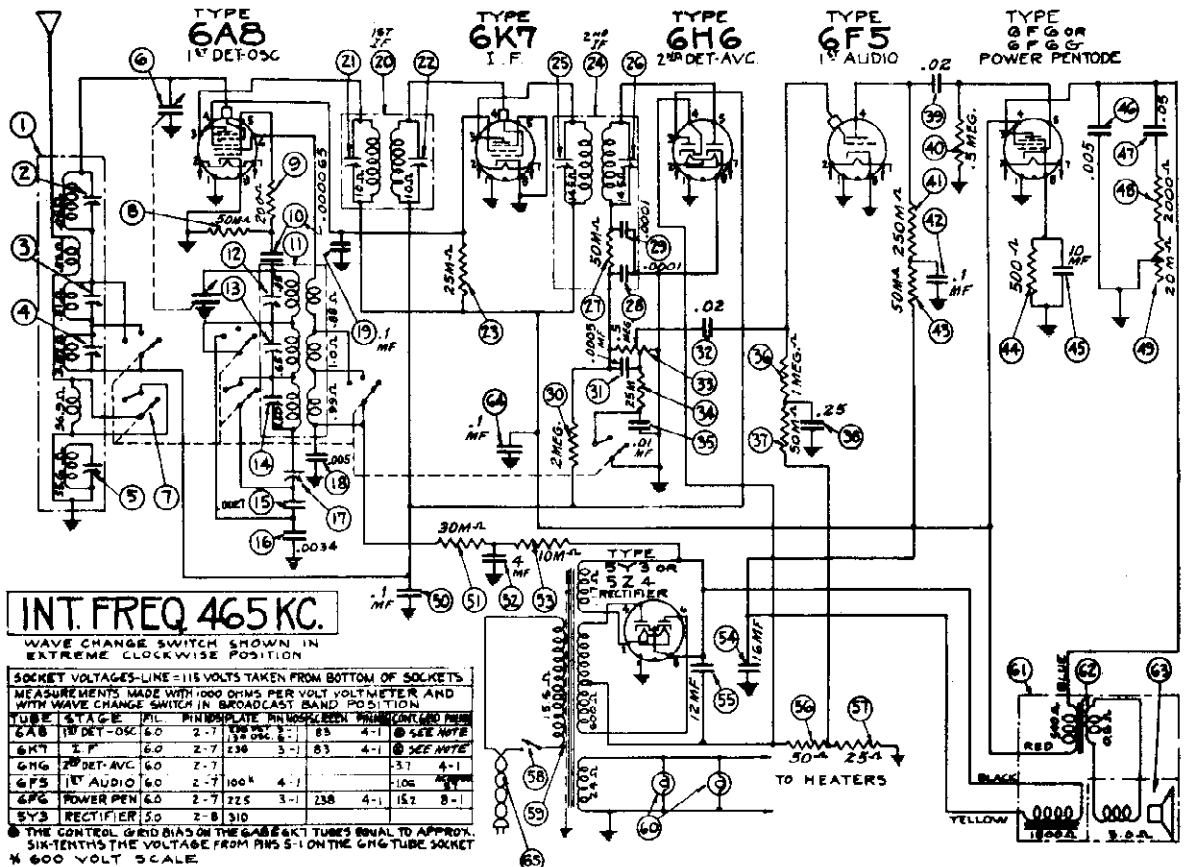

IMPORTANT: While testing or making repairs on this receiver, the chassis should not be turned upside down or on its side for any long period of time while the set is turned on as the chemicals in the electrolytic filter condenser will come out through the air vents making the condenser appear to be defective. If left in this position too long the condenser may be injured.

GENERAL DESCRIPTION

This model is a twelve-tube three-band, superheterodyne receiver and incorporates a Type 6AB oscillator-modulator. This tube converts the 465 KC. I.F. to a second I.F. frequency of 100 KC. The automatic frequency control works by automatically changing the frequency of this second oscillator.

From the output of the oscillator-modulator the signal is fed through a conventional I.F. to the A.V.C. detector and audio system.

The signal is also fed from the output of the I.F. to the type 6K7 limiter tube which is so connected as to give fairly even output, regardless of input. This will then give the same amount of control, regardless of the strength of the station being received. The signal is then fed to the discriminator type 6H6 tube which is connected to the grid of the type 6V7 control tube. In the discriminator circuit voltages are developed either positive or negative, depending on which side of resonance the set is tuned. This change of bias on the control tube (6V7) will cause this tube to change the frequency of the oscillator to bring the set into tune.

Before attempting to align the receiver, the service man should familiarize himself with the general layout of the chassis, the location of the tubes and various signal condensers. Top and bottom views of the chassis are shown in Figures #1 and #2 and should be carefully studied before the actual work is started.

ADJUSTMENT OF I.F. CONTROL OSCILLATOR AND DISCRIMINATOR

1. Set the volume control on full and turn the bass control to the bass position (position immediately after set is turned).
2. Connect the output meter across the voice coil of the speaker.
3. Set the test oscillator to 100 KC., and adjust the output to give a readable deflection on the output meter when the signal is applied to the grid of the 6K7 I.F. amplifier tube through a 0.5 mfd. blocking condenser.
4. Connect a 10,000 ohm resistor across the primary winding of the third I.F. coil #62. This should be connected to terminals marked "A" and "B" in Figure #2.
5. Adjust trimmer #64 to maximum output, reducing the output of the test oscillator as required.
6. Remove the 10,000 ohm resistor from the primary side of I.F. coil #62 and connect terminals marked "C" and "D".
7. Adjust trimmer #63 to maximum output, reducing the output of the test oscillator as required. Remove 10,000 ohm resistor.
8. Turn switch #98 to the left-hand position (cleared from rear of chassis).
9. Set the output of the test oscillator to a high level.
10. Connect a 0 to 5 microammeter across resistor #149 and adjust trimmer condenser #111 to maximum swing of the microammeter, keeping the output of the signal generator or test point which will give a deflection of 0.5 microampere when connected across terminals marked "E" and "F".

LINE-UP CAPACITOR ADJUSTMENTS

To properly align the circuits of the receiver it is essential to use a high grade modulated test oscillator, the output of which can be continuously varied when the individual circuits are brought into alignment. A conventional output meter can be connected across the terminals of the speaker voice coil to indicate when the circuits are aligned. The sensitivity of the output meter must be sufficient to give satisfactory reading with a low input signal. It is also necessary to use an 0-5 microammeter in order to align the discriminator circuits.

11. Adjust trimmer #110 until the microammeter reading is reduced exactly to zero.
12. Turn switch #98 to the right-hand position and proceed with the alignment of the I.F.
13. Apply the test signal to the grid of the 6AB oscillator-modulator tube.
14. Connect the 10,000 ohm resistor across the primary of I.F. coil #50 by connecting it to the terminals marked "G" and "H" in Figure #3.
15. Adjust trimmer #52 to maximum output, reducing the output of the test oscillator as required.
16. Remove the 10,000 ohm resistor and connect across the secondary of I.F. transformer #51. Connect to terminals marked "G" and "H".
17. Adjust trimmer #51 to maximum output, reducing the output of the test oscillator as required.
18. Remove the 10,000 ohm resistor.
19. Set the test oscillator to 465 KC., and adjust the control oscillator trimmer #92 to maximum output.
20. Apply the test signal to the grid of the type 6AB oscillator-detector tube.
21. Connect the 10,000 ohm resistor across the primary of I.F. transformer #28 by connecting it to the points marked "J" and "K" in Figure #3.
22. Adjust trimmer #28 to maximum output, reducing the output of the test oscillator as required.
23. Remove the 10,000 ohm resistor and connect across the secondary of the I.F. transformer #26 by connecting it to the points marked "L" and "M" in Figure #1.
24. Adjust trimmer #27 to maximum output, reducing the output of the test oscillator as required. Remove the 10,000 ohm resistor.

ADJUSTMENT OF BROADCAST BAND

1. Set the wave-change switch to the White or Broadcast Band position.
2. Set the test oscillator and dial indicator to 1500 KC.
3. Apply the test signal to the antenna terminal of the chassis through a .0002 mfd. series condenser and adjust the oscillator trimmer condenser #80 until the signal is received at a maximum.
4. Adjust trimmers #17 and #5 to maximum output.
5. Set the test oscillator and dial indicator to 570 KC., and adjust the oscillator series condenser #31 to maximum output, at the same time rocking the condenser gang.

6. Return both the test oscillator and dial indicator to 1500 KC., and check the adjustment of trimmers #30, #41 and #6 for accuracy.

ADJUSTMENT OF GREEN BAND

1. Set the wave-change switch to the Green Band position.
2. Set the test oscillator and dial indicator to 5500 KC., and adjust the oscillator trimmer condenser #39 until the signal is received at a maximum.
3. Adjust trimmer condensers #22 and #10 to maximum output.
4. Set the test oscillator and dial indicator to 1500 KC., and adjust the oscillator series condenser #40 to maximum output, at the same time rocking the condenser gang.
5. Return both the test oscillator and dial indicator to 5500 KC., and check the adjustment of trimmers #39, #22 and #10 for accuracy.

ADJUSTMENT OF RED BAND

1. Set the wave-change switch to the Red Band position.
2. Set the test oscillator and dial indicator to 17000 KC., and adjust the oscillator trimmer condenser #36 until the signal is received.

NOTE: When adjusting the oscillator trimmer condenser #36 it will be possible to tune several peaks. The peak secured with the trimmer screw turned in that direction should be used. When aligned on the correct peak a strong signal will be heard at 17000 KC., and a weaker signal at approximately 16000 KC. No signal should be heard at 18000 KC.

3. Adjust trimmer condensers #20 and #7 to maximum output.
 4. Set the test oscillator and dial indicator to 6000 KC., and adjust the oscillator series condenser #56 to maximum output, at the same time rocking the condenser gang.
 5. Return both the test oscillator and dial indicator to 17000 KC., and check adjustment of trimmers #36, #20 and #7 for accuracy.
- IMPORTANT: While testing or making repairs on this receiver the chassis should not be turned upside down or on its side for any long period of time while the set is turned on as the chemicals in the electrolytic filter condensers will come out through the air vents, making the condenser appear to be defective. If left in this position too long the condenser may be injured.

BROADCAST BAND ADJUSTMENT

1. Set the test oscillator and dial indicator to 1400 KC.
2. Apply the test signal to the antenna of the receiver through a .0002 mfd. condenser.
3. Adjust oscillator trimmer condenser #37 (#13 position on Figure 2 of Form #2563) until the signal is received.
4. Adjust the prescaler trimmer condenser #5 (#4 position on Figure 1 of Form #2563) to maximum output.
5. Set test oscillator and dial indicator to 800 KC., and adjust the oscillator series condenser #6 (#16 position on Figure 1 of Form #2563) until the signal is received. Tune the receiver to a slightly lower frequency and readjust trimmer #6 to maximum output. If this sensitivity increases, continue this procedure in the same direction until maximum sensitivity is obtained. If the sensitivity decreases try this procedure at slightly higher frequencies.
6. Return maximum sensitivity to maximum output.
7. Return test oscillator and dial indicator to 1400 KC., and check adjustment of the oscillator and prescaler trimmer condensers.

RED BAND ADJUSTMENT

1. Set the wave-change switch to the Red Band position.
2. Set the test oscillator and dial indicator to 57000 KC., and adjust the oscillator trimmer condenser #38 (#12 position on Figure 2 of Form #2563) until the signal is received. Two positions may be found at which the signal may be tuned in. Use the position with the lower capacity trimmer setting or with the alignment screw turned farther out.
3. Adjust the prescaler trimmer #5 to maximum output.
4. Check the receiver over scale for calibration and sensitivity.

LINE-UP CAPACITOR ADJUSTMENTS
MODELS WR-116X and WR-316X

1. Set the volume control to maximum position, the tone control to treble position, the wave-change switch on Broadcast and the dial indicator at approximately 500 KC.
2. Connect the output meter to the terminals of the voice coil.
3. Set the test oscillator to 465 KC., and apply the test signal to the grid of the 6X7 tube through a .45 mfd. block trimmer condenser #48 (#36 position on Figure 2 of Form #2563) and #50 (#37 position on Figure 2 of Form #2563) to maximum output.
5. Apply the test signal to the grid of the type 6A8 first detector-oscillator tube and adjust trimmer condensers #30 (#22 position on Figure 2 of Form #2563) and #32 (#23 position on Figure 2 of Form #2563) to maximum output.
6. Connect the test oscillator to the antenna of the receiver and with a strong input signal adjust wave trap trimmer condenser #6 to maximum output.

LONG-WAVE BAND ADJUSTMENT

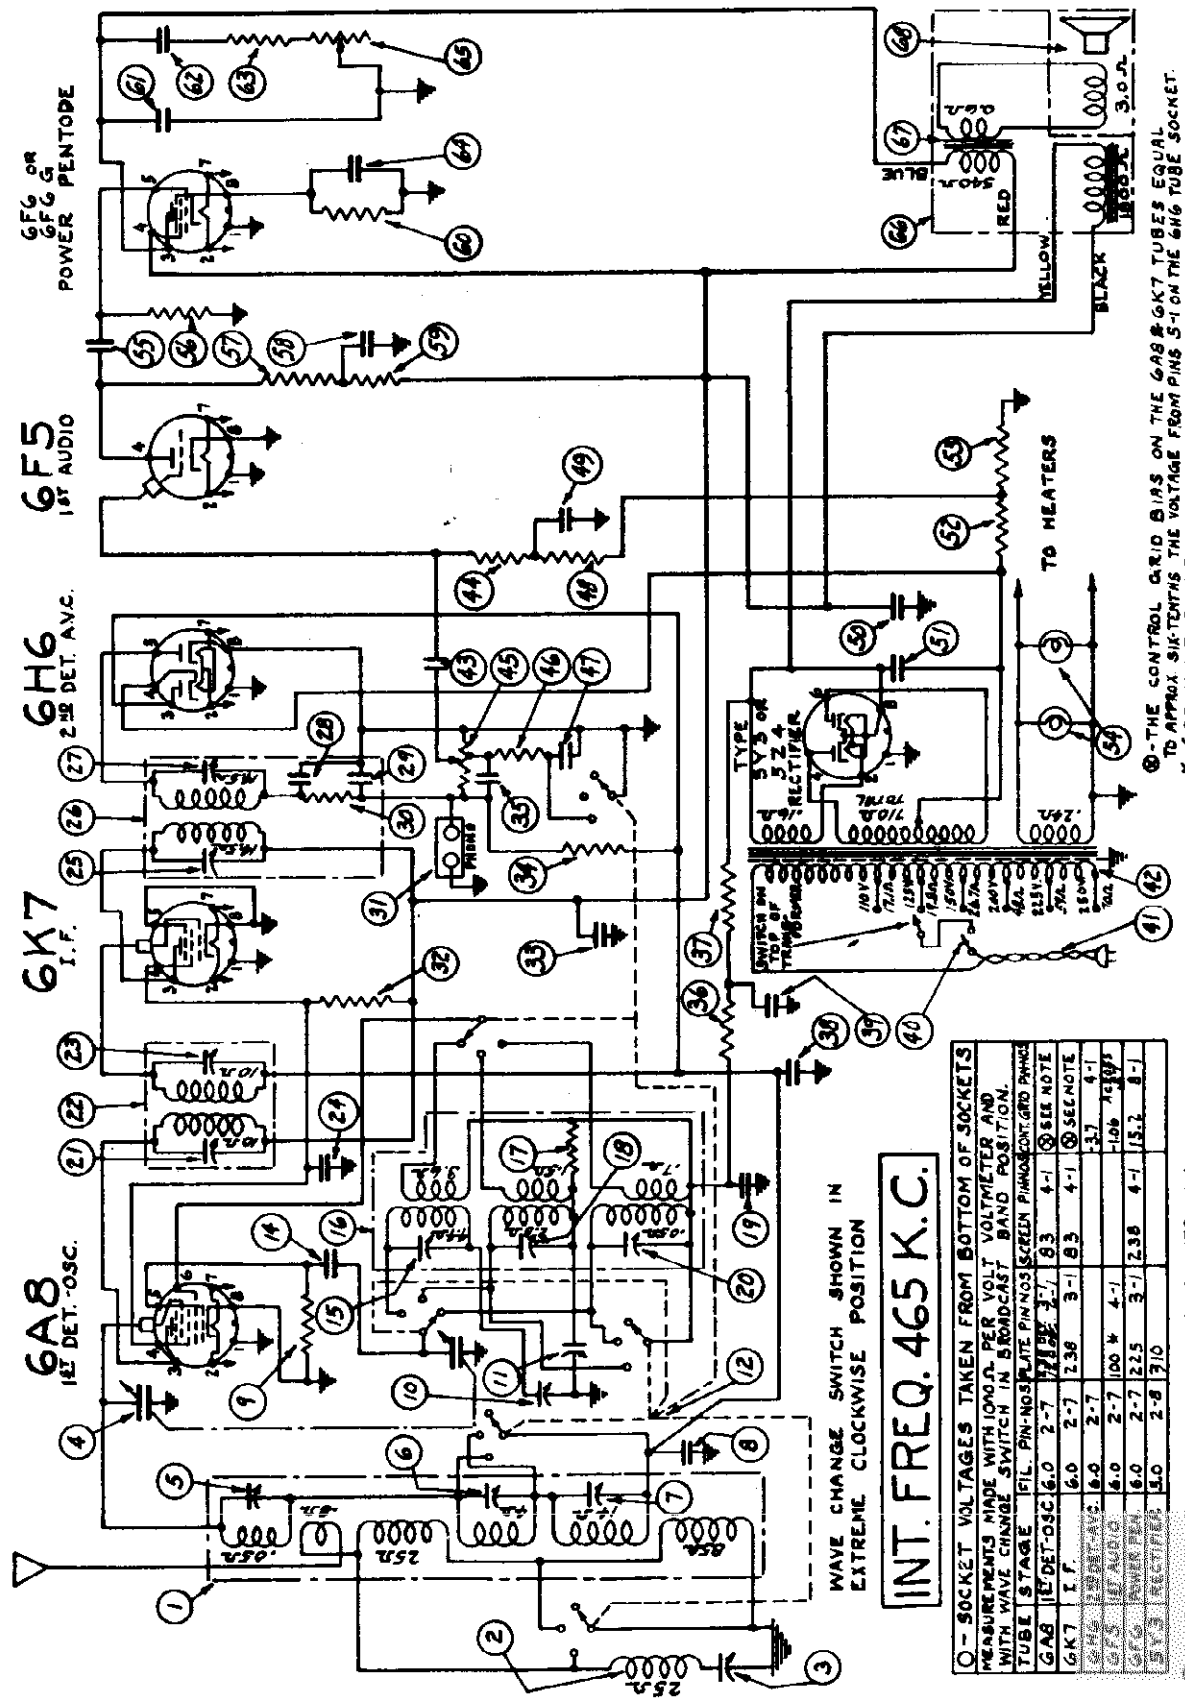

1. Set the wave-change switch to the long-wave band (White).
2. Set the test oscillator and dial indicator to 350 KC.
3. Apply the test signal to the antenna of the receiver through a .0002 mfd. condenser.
4. Adjust the oscillator trimmer condenser #29 (#14 position on Figure 2 of Form #2563) until the signal is received.
5. Adjust the antenna trimmer condenser #7 (#5 position on Figure 1 of Form #2563) to maximum output.
6. Set the test oscillator and dial indicator to 165 KC., and adjust the oscillator series condenser #3 (located under chassis in front right-hand corner, viewing the set from the rear) to maximum output at the same time rocking the variable tuning condenser.
7. Return both the test oscillator and dial indicator to 1400 KC., and check the adjustment of trimmers #29 and #7.

indicator to 550 KC., and check adjustment of trimmers #18 and #6.
 ADJUSTMENT OF BROADCAST BAND (540-1500 KC.)
 1. Set wave-change switch to standard Broadcast Band position, and dial indicator to 1400 KC.
 2. Set test signal to the antenna of speaker and adjust the oscillator trimmer condenser #15 (#15 position on Figure 2 of Form #2567) until the signal is received.
 3. Adjust the preslector trimmer #7 (#7 position on Figure 1 of Form #2567) to maximum output.
 4. Set the test oscillator and dial indicator to 600 KC., and adjust the coil-lator series condenser #24 (#17 position on Figure 1 of Form #2567) until the signal is received. Tune the variable condenser to a slightly lower frequency and readjust trimmer #24 to maximum output. If the sensitivity increases, continue this trial and error method in the same direction until no further improvement in sensitivity can be made. If the sensitivity decreases, try this adjustment at slightly higher frequencies.

ADJUSTMENT OF RED BAND (5,500-16,500 KC.)
 1. Set the wave-change switch to the Red Band position, and dial indicator to 15,000 KC.
 2. Set test signal to the antenna of speaker and adjust the oscillator trimmer condenser #15 (#15 position on Figure 2 of Form #2567) until the signal is received. Tune the variable condenser to a slightly lower frequency and readjust trimmer #15 to maximum output. If the sensitivity increases, continue this trial and error method in the same direction until no further improvement in sensitivity can be made. If the sensitivity decreases, try this adjustment at slightly higher frequencies.

ADJUSTMENT OF LONG-WAVE BAND (150-370 KC.)
 1. Set the wave-change switch to the long-wave band position and apply the test signal to the antenna of the receiver through a .0002 mfd. condenser.
 2. Set the dial indicator and test oscillator to 350 KC., and adjust trimmer #2567 until the signal is received at a maximum.
 3. Adjust trimmer condenser #5 (#4 on Figure 1 of Form #2567) to maximum output.
 4. Set the test oscillator and dial indicator to 150 KC., and adjust trimmer condenser #19 (#19 position on Figure 1 of Form #2567) to maximum output at the rear of the chassis viewed from rear of the set, rocking the variable tuning condenser.
 5. Return both the test oscillator and dial

indicator to 550 KC., and check adjustment of trimmers #18 and #6.
 ADJUSTMENT OF BROADCAST BAND (540-1500 KC.)
 1. Set wave-change switch to standard Broadcast Band position, and dial indicator to 1400 KC.
 2. Set test signal to the antenna of speaker and adjust the oscillator trimmer condenser #15 (#15 position on Figure 2 of Form #2567) until the signal is received.
 3. Adjust the preslector trimmer #7 (#7 position on Figure 1 of Form #2567) to maximum output.
 4. Set the test oscillator and dial indicator to 600 KC., and adjust the coil-lator series condenser #24 (#17 position on Figure 1 of Form #2567) until the signal is received. Tune the variable condenser to a slightly lower frequency and readjust trimmer #24 to maximum output. If the sensitivity increases, continue this trial and error method in the same direction until no further improvement in sensitivity can be made. If the sensitivity decreases, try this adjustment at slightly higher frequencies.

ADJUSTMENT OF RED BAND (5,500-16,500 KC.)
 1. Set the wave-change switch to the Red Band position, and dial indicator to 15,000 KC.
 2. Set test signal to the antenna of speaker and adjust the oscillator trimmer condenser #15 (#15 position on Figure 2 of Form #2567) until the signal is received. Tune the variable condenser to a slightly lower frequency and readjust trimmer #15 to maximum output. If the sensitivity increases, continue this trial and error method in the same direction until no further improvement in sensitivity can be made. If the sensitivity decreases, try this adjustment at slightly higher frequencies.

ADJUSTMENT OF LONG-WAVE BAND (150-370 KC.)
 1. Set the wave-change switch to the long-wave band position and apply the test signal to the antenna of the receiver through a .0002 mfd. condenser.
 2. Set the dial indicator and test oscillator to 350 KC., and adjust trimmer #2567 until the signal is received at a maximum.
 3. Adjust trimmer condenser #5 (#4 on Figure 1 of Form #2567) to maximum output.
 4. Set the test oscillator and dial indicator to 150 KC., and adjust trimmer condenser #19 (#19 position on Figure 1 of Form #2567) to maximum output at the rear of the chassis viewed from rear of the set, rocking the variable tuning condenser.
 5. Return both the test oscillator and dial

indicator to 550 KC., and check adjustment of trimmers #18 and #6.
 ADJUSTMENT OF BROADCAST BAND (540-1500 KC.)
 1. Set wave-change switch to standard Broadcast Band position, and dial indicator to 1400 KC.
 2. Set test signal to the antenna of speaker and adjust the oscillator trimmer condenser #15 (#15 position on Figure 2 of Form #2567) until the signal is received.
 3. Adjust the preslector trimmer #7 (#7 position on Figure 1 of Form #2567) to maximum output.
 4. Set the test oscillator and dial indicator to 600 KC., and adjust the coil-lator series condenser #24 (#17 position on Figure 1 of Form #2567) until the signal is received. Tune the variable condenser to a slightly lower frequency and readjust trimmer #24 to maximum output. If the sensitivity increases, continue this trial and error method in the same direction until no further improvement in sensitivity can be made. If the sensitivity decreases, try this adjustment at slightly higher frequencies.

ADJUSTMENT OF RED BAND (5,500-16,500 KC.)
 1. Set the wave-change switch to the Red Band position, and dial indicator to 15,000 KC.
 2. Set test signal to the antenna of speaker and adjust the oscillator trimmer condenser #15 (#15 position on Figure 2 of Form #2567) until the signal is received. Tune the variable condenser to a slightly lower frequency and readjust trimmer #15 to maximum output. If the sensitivity increases, continue this trial and error method in the same direction until no further improvement in sensitivity can be made. If the sensitivity decreases, try this adjustment at slightly higher frequencies.

MODELS WR-209(Final), WR-209X

Schematic, Voltage Alignment

WESTINGHOUSE ELEC. INTERNATIONAL CO.

TUNING RANGES

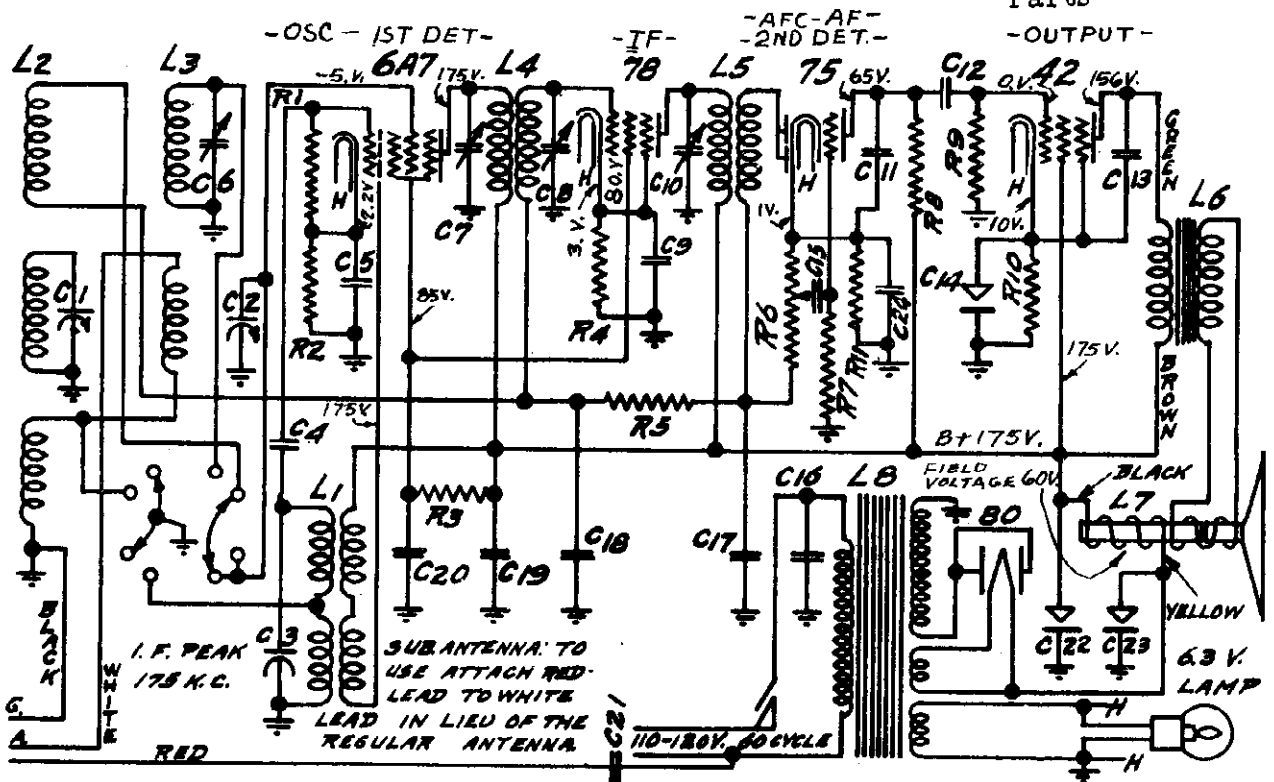

Model WR-209	540 - 1500 kc
Model WR-209X	540 - 1500 kc
	150 - 370 kc

POWER SUPPLY CHARACTERISTICS
 WR-209: 130 Volts- 50-60 cyc.
 WR-209X: 220 Volts- 50-60 cyc.
 110-250 Volts 25-60 cyc.

Align i-f transformers at 465 kc.
LONG-WAVE BAND ALIGNMENT: Wave switch to Long-wave. Signal Generator and dial to 350 kc. Use .0002 mf dummy. Adjust Osc. trimmer #16 (front cond. on Osc. coil until signal is received. Adjust Ant. trimmer (rear cond. on Ant. coil at chassis rear) for max. output. Signal generator to 165 kc and adjust Osc. padder #15 (right hand cond. from chassis rear) to maximum while rocking. Reset dial and signal generator to 350 kc and check.
BROADCAST-BAND ALIGNMENT: Wave switch to Broadcast. Signal generator to 465 kc. Adjust wave-trap trimmer #3 (under trap coil under base) to MINIMUM output. Set dial and signal generator to 1400 kc and adjust the Osc. trimmer (rear cond. on Osc. coil) until signal is received. Adjust trimmer #14 (to left of #15 viewed from rear) to maximum output while rocking. Return signal generator and dial to 1400 kc and check alignment.

MODEL 6B8

FREQUENCY RANGE -

- 1500 to 550 KC
- 4 to 1.5 MC
- 15.5 to 5.5 MC

ALIGNMENT

BROADCAST - Generator is connected to ANT lead thru a standard dummy antenna, set at 1400 KC, trim the Oscillator trimmer, then the Pre-selector trimmers to maximum peak. Pad the Oscillator circuit at 600 KC while rocking the rotor of gang condenser.

FOREIGN - Generator is connected in same manner, set at 15 MC, locate signal on dial, trim Pre-selector trimmers to peak. Check at 6 MC

POLICE - Generator to 3.5 MC, locate signal on dial, then trim Pre-select- or trimmers to peak. Repeat adjustments.

CONVENTIONAL ALIGNMENT

MODEL 6D6

FREQUENCY RANGE -

1500 to 550 KC

5.5 to 15.5 MC

BROADCAST BAND ALIGNMENT :

Wave change switch in counter clockwise position, generator to antenna lead thru standard dummy antenna. Adjust OSC trimmer (rear of gang) to 1400 KC peak. Then adjust the ANT and Pre-selector trimmers to peak. Pad the OSC circuit at 600 KC.

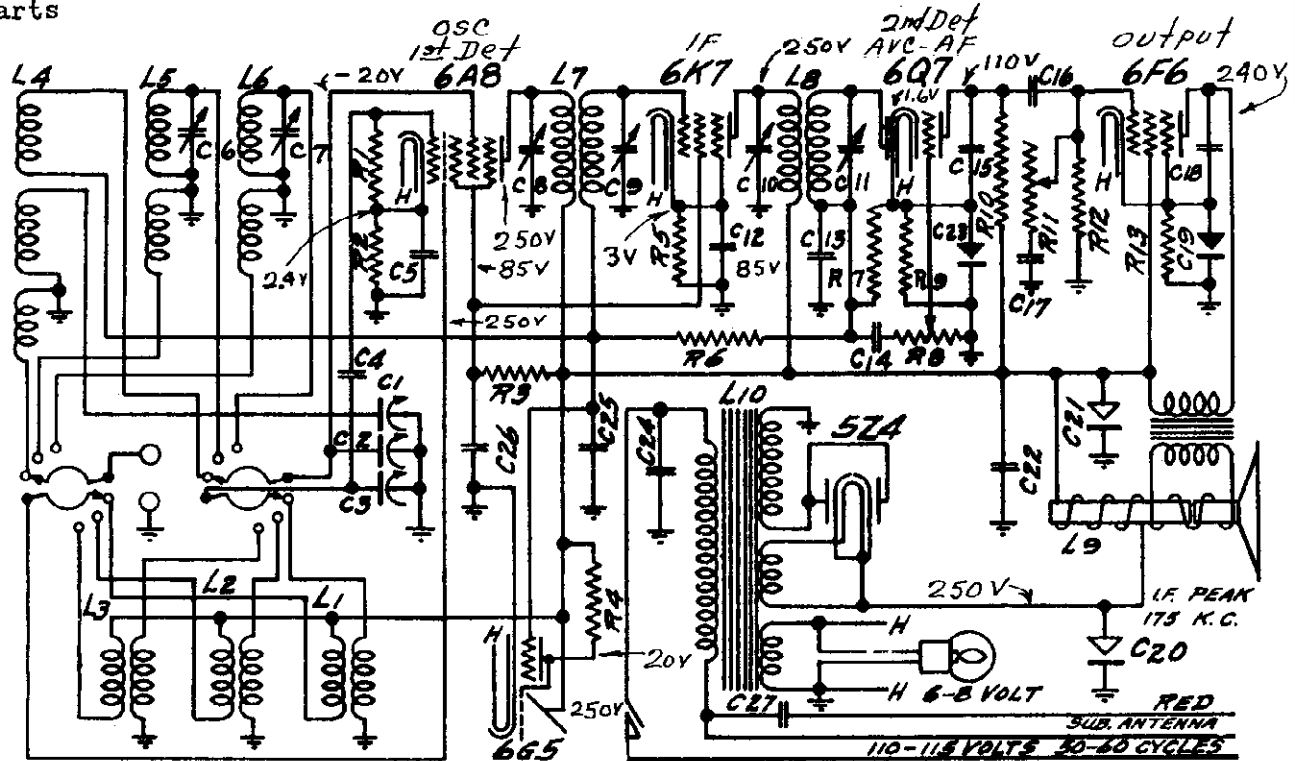

SHORT WAVE BAND - Wave change switch in clockwise position. Generator to 15 MC, locate signal on dial, then peak ANT and Pre-selector trimmers. No padding of oscillator circuit required on band.

CONVENTIONAL ALIGNMENT -

MODEL 6F6, 6FB6

FREQUENCY RANGE -

- 1500 to 550 KC
- 4 to 1.5 MC
- 15.5 to 5.5 MC

BROADCAST - Gen. to ANT lead thru standard dummy antenna, set at 1400 KC, trim OSC trimmer, then Pre-selector trimmers to maximum peak. Pad OSC circuit at 600 KC while rocking gang.

FOREIGN- Generator to 15 MC, locate signal on dial, peak Pre-selector trimmers to maximum. Check at 6 MC.

POLICE - Generator to 3.5 MC, locate the signal on dial, adjust Pre-selector trimmers to peak. Repeat adjustments for maximum response.

CONVENTION ALIGNMENT PROCEDURE

VOLTAGES AND CURRENTS OF MODEL # 671 AMPLIFIER. ALL MEASUREMENTS MADE WITH LINE VOLTAGE 115-VOLTS.

ALL VOLTAGES MEASURED WITH 1000 OHMS PER VOL. VOLTMETER.

AVERAGE PLATE VOLTAGE MEASURED FROM PLATE TO CHASSIS -

OUTPUT -45 355-VOLTS D.C.

DRIVER -45 327-VOLTS D.C.

-30 175-VOLTS D.C.

-30 80-VOLTS D.C.

AVERAGE VOLTAGES ACROSS SPEAKER FIELDS AND ELECTROLYTIC CONDENSERS.

3200-OHM AUXILIARY SPEAKER FIELD VOLTAGE MEASURED FROM #1-CONTACT TO #1-CONTACT ON SPEAKER SOCKET 205-VOLTS D.C.

2500-OHM SPEAKER FIELD VOLTAGE MEASURED FROM #1-CONTACT TO #3-CONTACT ON SPEAKER SOCKET 155-VOLTS D.C.

C-18 ELECTROLYTIC 305-VOLTS D.C.

C-17 ELECTROLYTIC 360-VOLTS D.C.

C-16 ELECTROLYTIC 355-VOLTS D.C.

AVERAGE GRID VOLTAGE MEASURED FROM GRID TO FILAMENT.

RECTIFIER 523 50-VOLTS A.C.

OUTPUT -45 87-VOLTS D.C.

DRIVER -45 40-VOLTS D.C.

-30 2.1-VOLTS A.C.

-30 2.1-VOLTS D.C.

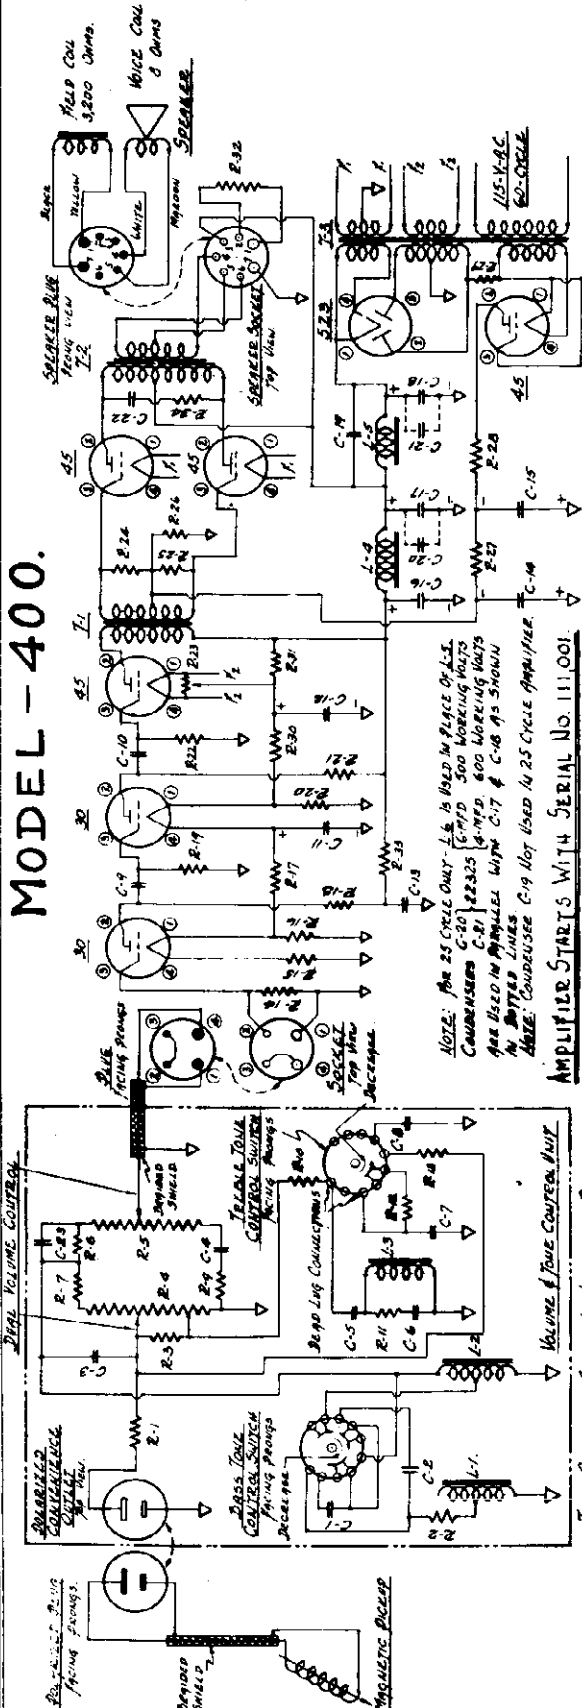

MODEL 400

VOLTAGES AND CURRENTS OF MODEL 672-AMPLIFIER. ALL MEASUREMENTS MADE WITH LINE VOLTAGE 115-VOLTS.	
ALL VOLTAGES MEASURED WITH 1,000-OHMS PER VOLT VOLTMETER.	
AVERAGE PLATE VOLTAGE MEASURED FROM PLATE + TO CHASSIS -	AVERAGE GRID VOLTAGE MEASURED
OUTPUT - 45 355-VOLTS D.C.	FROM GRID TO FILAMENT.
DRIVER - 45 38.0-M.A.D.C.	OUTPUT - 45 87-VOLTS D.C.
-30 175-VOLTS D.C.	DRIVER - 45 40-VOLTS D.C.
-30 80-VOLTS D.C.	-30 1.5-M.A.D.C.
AVERAGE VOLTAGES ACROSS SPEAKER FIELDS AND ELECTROLYTIC CONDENSERS.	
3,200-OHM SPEAKER FIELD VOLTAGE MEASURED FROM #1-CONTACT TO #7-CONTACT ON SPEAKER SOCKET	205-VOLTS D.C.
2,500-OHM AUXILIARY SPEAKER FIELD VOLTAGE MEASURED FROM #1-CONTACT TO #3-CONTACT ON SPEAKER SOCKET	155-VOLTS D.C.
C-18 ELECTROLYTIC	385-VOLTS D.C.
C-16 ELECTROLYTIC	355-VOLTS D.C.
FROM RECTIFIER - 45-PLATE - TO CHASSIS + 150-VOLTS D.C.

SOCKET VOLTAGES

Tube	Position	1	2	3	4	5	6	7	8	9
1C7	1st Det. Osc.	0	2	125	45	-2	112	0	0	0
1D5	I.F.	0	2	126	48	-	-	0	0	0
1F7	2nd Det. A.V.C.	0	2	27	0	0	9	0	0	0
1F5	Power	0	2	123	136	0	-	0	0	-

All voltages measured with a 1000 ohm per volt D.C. meter and using the Zenith 6 V Economy Pack—Antenna and ground disconnected.

Battery Voltage—6.3 V.

Battery Drain—.98 amp. **ALIGNMENT**

Connect the output leads of the signal generator to the grid of the first detector and receiver ground lead. Also connect an output meter across the speaker leads.

Set the signal generator at 456 K.C. and carefully adjust the four I.F. trimmers to the point giving the greatest output reading. These I.F. transformers are of a very high gain, selective type, and the adjustments should be repeated several times for greatest accuracy.

Change the signal generator leads to the antenna and ground terminals of the receiver.

Set the signal generator at 1400 K.C. Set the pointer on the receiver dial at the same frequency. First adjust the oscillator and then the detector trimmers on the gang condenser to the point giving the maximum reading on the output meter, using as small a signal from the generator as possible so as to prevent the A.V.C. action from affecting the output readings.

Reset the signal generator to 600 K.C.

Slowly rock the pointer past 600 K.C. on dial meanwhile adjusting the osc. padder (located in rear of gang condenser) to the combination giving the greatest output reading.

Repeat operation No. 4.

All voltages measured with a 1000 ohm per volt D.C. meter and using the Zenith 6 V Economy Pack—Antenna and ground disconnected.
 Battery Voltage—6.3 V.
 Battery Drain—1.1 ampere

ALIGNMENT PROCEDURE

- Connect the output leads of the signal generator to grid of the first detector and receiver chassis. Also connect an output meter across the speaker transformer leads.
- Set the signal generator at 456 K.C. and carefully adjust the four I.F. trimmers to the point giving the highest reading on the output meter. The I. F. transformers are of a very high gain, selective type, and these adjustments should be repeated several times in order to secure maximum accuracy.
- All adjustments should be made using as weak an output from the signal generator as possible in order to prevent the A.V.C. action from affecting the output readings.
- Change the signal generator leads to the antenna and ground terminals of the receiver.
- Set signal generator at 5 M.C. Switch receiver to band B and adjust osc. trimmer on gang for correct dial reading.
- Set signal generator at 1400 K.C. Switch receiver to band A and adjust broadcast trimmer (located at front of chassis—see diagram below) for correct dial reading. Also adjust antenna trimmer on gang to resonance.
- Set signal generator at 18 M.C.—Switch receiver to band C and adjust the short wave trimmer while rocking the pointer past 18 M.C. on the dial to the combination giving the greatest output.
- Set signal generator at 600 K.C.—Switch receiver to band A and rock pointer past 600 on dial while adjusting the broadcast padder (located adjacent to gang condenser) to combination giving the greatest output reading.
- Readjust broadcast and ant trimmers at 1400 K.C. (Same as No. 5).

Alignment Notes

IMPORTANT ANTENNA INFORMATION
(All Models)

Some cars are factory equipped with an antenna. If this is the case, the lead should be checked to make certain that it is not grounded, and after being shielded by a large diameter foam, ground this lead to the instrument panel, and attach the Delco-Remy male connector to the end of the antenna wire. This should be done carefully so as to insure a good solder joint, and prevent any grounding at this point to the braided shieldings. Insert the antenna lead-in connector into the female Delco-Remy receptacle directly below the tuning cable shoulder on the receiver case.

Where a car is not equipped with an antenna, such as convertible models, or those with all steel turret top, any one of the following Zenith antennas may be used:

Undercar antenna—part No. S-4800 and S-4801.

Over the Top Antenna (Sedan) S-4802.

Over the Top Antenna (Coupe) S-4803.

Zenith Fleet Wing Antenna S-4821.

Zenith Bumper Pole Antenna S-4822.

Complete instructions covering the installation of each of the above antennas is furnished with the various kits.

IMPORTANT: BALANCING SET TO ANTENNA. There is such an extremely wide variation in antenna capacities that it is difficult to match this condition without some means of variable antenna alignment. To accomplish this, an antenna compensating adjustment is provided through the small hole directly above the antenna cable connector on the receiver case. In addition to this, a tapped antenna transformer is also incorporated (see Figure No. 2). The proper method of alignment is as follows: After completely connecting receiver, tune in a signal between 1400 and 1450 K.C. and adjust the antenna compensator shown in Figure 3, for either the root antenna, or single or double under-car antenna. The receiver is shipped from the factory with the antenna tap shown in Figure 2 set to the No. 2 position, and, therefore, need not be changed for either of the two types of antennas mentioned.

For Zenith Fleet Wing, and Over the Top Antennas, unsolder the antenna lead from the No. 2 lug, and resolder it to the No. 3 lug. After this is done, tune in a station between 1450 and 1400 K.C., and adjust the antenna compensator shown in Figure 3 to resonance.

For high capacity antennas such as the 1936 Dodge solid steel roof, or the Lincoln Zephyr luggage compartment, drawer antenna, etc., remove the antenna lead from the No. 2 lug, as it comes from the factory, and resolder it to the No. 1 connector. After this is done, the same procedure of tuning in a signal from 1450 to 1400 K.C., and balancing to resonance with the antenna compensator, as described above, should be followed.

This system of tapped transformer, and variable compensating adjustment gives an extremely flexible means of resonating the receiver to any type of antenna, and it should be noted that the tap need only be changed in two cases. Of course, it is necessary to remove the bottom cover in order to shift the antenna tap where necessary.

IGNITION INTERFERENCE

Remove the center high tension lead of the distributor and insert the suppressor into the distributor at that point. The wire is then placed in the open end of the suppressor. The generator condenser is fastened under the cut-out housing and the wire connected to the generator connection on the coil cut-out. The coil condenser is attached to the battery connection of the coil and the other end to the coil case. Make absolutely certain that this condenser is not accidentally connected to the distributor side of the coil since this will increase motor noise terrifically and make operation of the receiver highly unsatisfactory when the motor is running. Where two distributors or two coils are employed a corresponding number of condensers and suppressors must be applied. In some instances it might be of benefit to attach a by-pass condenser from one side of the antenna to a grounded part of the instrument panel. If the dome light is feeding interference to the antenna the lead should be cut where it comes from the post and a switch inserted on the instrument panel at that point, to turn it off and on. In some cases, a by-pass condenser connected to the dome-light lead and grounded at the post is as effective as a separate switch. Try this first.

If additional attention is necessary to reduce motor interference, the motor block must be securely bonded, both at the rear and front supports with 1/2 inch copper braid. Also bond or ground all metal control cables or pipes feeding from the motor side into the car. These bonds should be made to the control wire or pipe and soldered to the fire wall immediately adjacent on the motor side. As a further precaution the rotor should be lengthened to reduce the gap between it and the distributor housing contacts by either peening the end or applying a small quantity of solder at this point.

ALIGNMENT

5-M-1

"A" Connect the service oscillator output leads to the control grid of the 6A8 tube, and to the chassis. If the oscillator output is a single shielded lead the shield should connect to the chassis.

Connect an output meter across the primary of the speaker transformer.

Set the service oscillator at 456 K.C. and adjust the trimmers on the I.F. transformers to the point giving the greatest reading on the output meter. These, as well as the following adjustments should be made using as small an output from the signal generator as possible so that the A.V.C. action will be least effective.

"B" Change the service oscillator lead from the grid of the 6A8 to the antenna connection. A male Delco Remy connector may be used in making a connection to the antenna lead.

Set the service oscillator at 1600 K.C. and rotate the gang condenser until the plates are entirely out of mesh. Adjust the oscillator section trimmer until the 1600 K.C. signal is tuned in.

"C" Set the service oscillator to 800 K.C. and rock the gang condenser slowly to and fro past the point where this signal is received, meanwhile adjusting the peadder condenser for a setting which gives the greatest output reading.

"D" Repeat operation "B". See antenna instruction page 379 for correct alignment of antenna stage.

5-M-192 — 5-M-193 — 5-M-194 — 5-M-195

"A" Connect the service oscillator to the control grid of the 6A8 tube and the chassis.

Connect the output meter across the primary of the speaker transformer.

Set the service oscillator to 252.5 K.C. and adjust the trimmers on the I.F. transformers for the greatest output reading. These adjustments should be repeated several times using as weak an input signal as possible so as to obtain greater accuracy.

"B" Change the service oscillator lead from the grid of the 6A8 to the antenna connection. A male Delco Remy connector may be used in making a connection to the antenna lead.

Set the service oscillator at 1600 K.C. and rotate the gang condenser until the plates are entirely out of mesh. Adjust the oscillator section trimmer until the 1600 K.C. signal is tuned in.

Change the service oscillator to 1400 K.C. Rotate the gang condenser until this signal is tuned in, and then adjust the R.F. trimmer on the gang condenser to the point giving the greatest output reading.

"C" Set the service oscillator to 500 K.C. and rock the gang condenser slowly to and fro past the point where this signal is received, meanwhile adjusting the peadder condenser for a setting which gives the greatest output reading.

"D" Repeat operation "B".

The sensitivity control should be in the extreme clockwise position when making all adjustments.

NOTE — Due to the high gain type of I.F. transformers used in these receivers it is essential that a non-metallic screw driver be used in making all adjustments. See antenna instructions for correct alignment of antenna stage.

SERVICE NOTE

The 02A rectifier tube used in the 5 and 6 tube models may be replaced with a 6X5 rectifier, providing the 6X5 tube is installed in a grounded tube shield.

The Coat shield with a ground clip which connects to the shield contact pin of the tube is the most convenient type to use.

Line voltage 115 V. Antenna and ground disconnected. All voltages measured from point indicated to ground, using a 1000 ohm per volt meter.

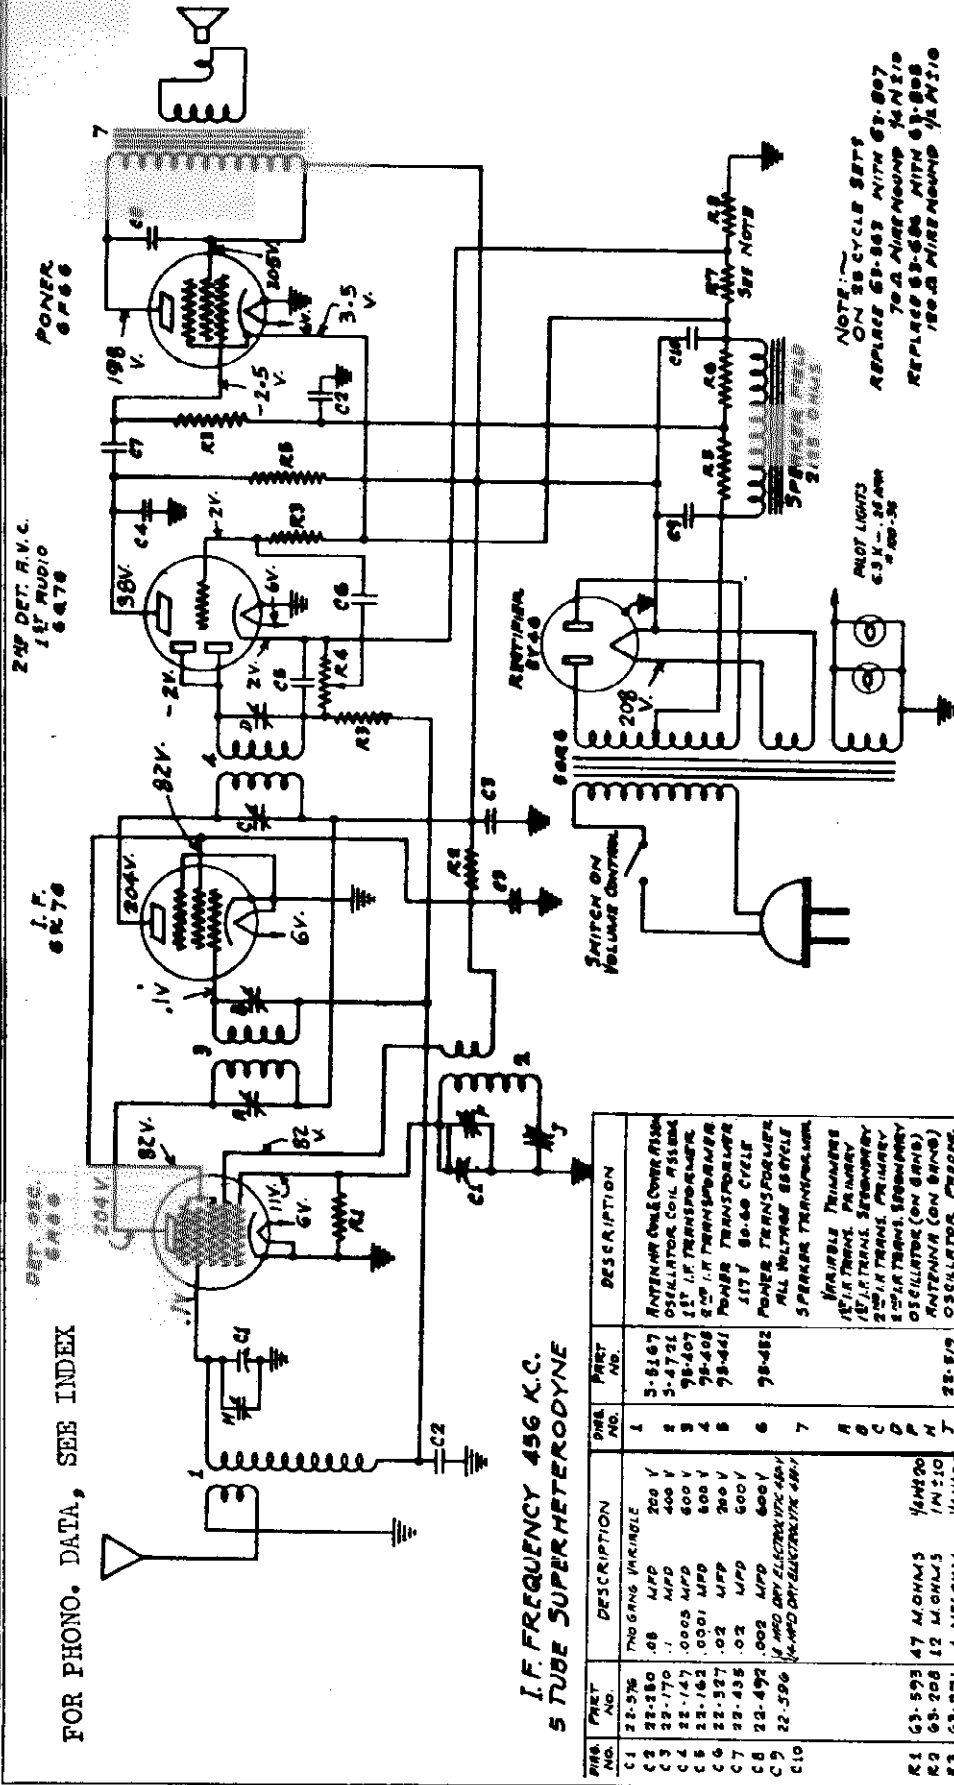

ALIGNMENT PROCEDURE

Connect the output leads of the signal generator to the grid of the first detector and receive ground lead. Also connect an output meter across the speaker leads.
 Set the signal generator at 456 K.C. and carefully adjust the four I.F. trimmers to the point giving the greatest output reading. These I.F. transformers are of a very high gain, selectivity type and the adjustments should be repeated several times for greatest accuracy.
 Change the signal generator leads to the antenna and ground leads of the receiver.
 Set the signal generator at 1400 K.C. Set the pointer on the receiver dial at the same frequency. First adjust the oscillator and then the detector trimmers on the gang condenser to the point giving the maximum reading on the output meter, using as small a signal from the generator as possible so as to prevent the A.V.C. action from affecting the output readings.
 Reset the signal generator to 600 K.C.
 Slowly rock the pointer past 600 K.C. on dial meanwhile adjusting the osc. padder (located beneath dial on front of chassis) to the combination giving the greatest output reading.
 Repeat operation No. 4.

Connect ordinary single wire antenna to A with jumper wire placed between Z and C (shipped from factory in this manner).

When using a ZENITH DOUBLET ANTENNA, remove jumper wire between Z and C and attach doublet lead-in to A and Z.

Although it is not usually necessary to ground the receiver, there may be occasional instances where a ground connection removes noise or may aid reception of signals. It should be tried and left connected if any improvement is noted. Where it does not help, or if it introduces hum, try reversing the wall plug or leave the ground lead off entirely.

CHASSIS No. 1203

ALIGNMENT PROCEDURE

- (1) Connect the output leads of the signal generator to the control grid of the first detector and receiver ground. Also connect an output meter across the speaker transformer leads.
- (2) Set the signal generator at 456 K.C. and carefully adjust the four I.F. trimmers to the point giving the highest reading on the output meter. The output transformers are of a very high gain, selective type, and these adjustments should be repeated several times in order to secure maximum accuracy. All adjustments should be made using as weak an output from the signal generator as possible in order to prevent the A.V.C. action from affecting the output readings.
- (3) Change the signal generator leads to the antenna and ground terminals of the receiver.
- (4) Set signal generator at 1400 K.C.—Switch receiver to Band A and adjust broadcast oscillator trimmer "A," (located on front of chassis) for correct dial reading. Also adjust the R.F. and det. trimmers on gang condenser for greatest output.
- (5) Set signal generator at 600 K.C., and rock pointer past 600 K.C. on dial scale, meanwhile adjusting the broadcast paddler until combination is reached which gives the greatest output reading.
- (6) Realign broadcast trimmers as outlined in operation No. 4.
- (7) Set signal generator at 5.5 M.C.—Switch receiver to Band B, and adjust trimmer "B," (located on front of chassis) while rocking pointer past 5.5 on dial scale for combination giving the highest output reading.
- (8) Set signal generator at 18 M.C.—Switch receiver to Band D and adjust the short wave trimmer "D," (located on front of chassis) while rocking the pointer past 18 M.C. on dial scale to combination giving the highest output reading.
- (9) There are no adjustments on the I.C. ultra short wave band. Caution! The length and position of the leads on both coil trimmers and band switch greatly affect the tuning on the short wave bands. These leads should not be altered in any way.

SERVICE NOTES ON 1203 CHASSIS

OFF SCALE—Unable to line up and gain drops off—check 20 ohm resistor in screen of 1st detector for open R-15 63-41, check 50 mfd condenser in oscillator circuit C4-22-289.

NOISY—Tubes, antenna and ground. Poor contact on band switch; volume control; coil wires short to band switch; poor contact on sensitivity switch. Noisy air trimmers, 16 mfd. screen condenser noisy, C-21—22-506.

NOISY ON "D" BAND—Clear gang bonds away from chassis, center in chassis holes, wire of "D" band tuned circuit shorting, loose solder lugs or terminals.

LACK SENSITIVITY ON "D" BAND—Open coil winding, defective 6H6, 6L7 tubes, poor contact of tube prongs, poor contact on band switch, check antenna, check I.F. peak at 18 M.C. Shorted 25 mfd condenser in detector circuit, if it shorts in "D" band circuit.

NOISY AND OFF SCALE ON "D" BAND—Replace 50 mfd. in oscillator circuit, will vary scale reading considerably, if defective.

STATIONS RIDE IN—Check balance, check .0012 in oscillator plate circuit.

LACK SENSITIVITY ON ULTRA SHORT WAVE—Note: Do not expect extreme pick-up on this band. However, the following will affect operation of the band—open oscillator coil, open or shorted .0012 condenser, shorted 50 mfd across HF coil, grounded trimmer on detector section of gang. Do not alter or change length of wires or position of coils, etc., as this will affect short wave band operation—leave or replace all units in position shipped from factory. Open resistor in short wave reception, also aerial installation.

DISTORTION—Tubes, open 16 mfd condenser, output tubes mismatched, 10 mfd. dry electrolytic in cathode circuit; open cathode circuits, defective by-pass condenser; grounded or shorted tone circuit; defective speaker. Distortion only on normal, tone switch lugs are shorted. Also shorted .005 on one of the output tubes, open P.P. transformer.

CARRIER HUM—Open electrostatic shield in power transformer, by-pass A.C. line with approx. 600 micromold. Reverse A.C. plug. Open cathodum ground—shorted .005 plate of output tube, grounded tap on volume control, tubes 6C5, 6H6 and output.

LACK MICHAS—Poor contact on tone switch, .0025 open; if tap on volume control is open, tone dial will have no R.F. signals. S meter coil broken loose from gang terminal. Shorted air trimmer, gang trimmer shorted, open resistor in plate 1st audio. Tubes, filters shorted or by-pass condenser. Open coils.

B. C. OFF SCALE—Check pointer—line up across dial scale parallel to line with gang closed. Note: Air trimmer for "B" band as shown in earlier receivers and listed in technical book not used on later models. B.C. and D trimmers in same position as shown—follow usual line up procedure.

CHASSIS Nos. 5635-5801-1004

ALIGNMENT PROCEDURE

- (1) Connect the output leads of the signal generator to the grid of the first detector and receiver chassis. Also connect an output meter across the speaker transformer leads.
- (2) Set the signal generator at 456 K.C. and carefully adjust the four I.F. trimmers to the point giving the highest reading on the output meter. The output transformers are of a very high gain, selective type and these adjustments should be repeated several times in order to secure maximum accuracy. All adjustments should be made using as weak an output from the signal generator as possible in order to prevent the A.V.C. action from affecting the output readings.
- (3) Change the signal generator leads to the antenna and ground terminals of the receiver.
- (4) Set signal generator at 6 M.C.—Switch receiver to band B, and adjust osc. trimmer on gang for correct dial reading.
- (5) Set signal generator at 1400 K.C.—Switch receiver to band A and adjust broadcast trimmer (located in front of oscillator tube—see diagram below) for correct dial reading. Also adjust ant. and det. trimmer on gang to resonance, adjust only the det. trimmer on two gang sets.
- (6) Set signal generator at 18 M.C.—Switch receiver to band C and adjust the short wave trimmer while rocking the pointer past 18 M.C. or the dial to the combination giving the greatest output.
- (7) Set signal generator at 600 K.C.—Switch receiver to band A, and rock pointer past 600 on dial while adjusting the broadcast paddler (located adjacent to gang condenser) to combination giving the greatest output reading.
- (8) Re-align broadcast trimmers at 1400 K.C. as outlined in operation 5.

SERVICE NOTES 1004 CHASSIS

OFF SCALE AT LOW FREQUENCY END OF DIAL, UNABLE TO ADJUST BY REGULAR ALIGNMENT—Check 600 paddler, broken lug, wire, etc. Also check .0012 condenser in oscillator plate circuit C-6 22-485.

LACK OF SENSITIVITY ON ALL BANDS—Check tubes, antenna and ground—all coils. Poor contact on sensitivity switch—rebalance.

LACK OF SENSITIVITY ON BROADCAST BAND—Open radio frequency plate choke.

NOISY—Tubes, check condenser bond wires to clear chassis; dirty gang condenser or wipers; loose lugs on cathodum resistor; shorted bus bar wires in coil circuits; aerial and ground. Also loose connecting wire between C and Z on aerial strip.

NOISY ON "C" BAND ONLY IN SPOTS—Check dial pulley—move pulley away from dial pan; condenser bonds do not clear chassis hold. Poor contacts on any of the band, tone or sensitivity switches; defective volume control; defective 16 mfd. condenser—22-506.

HUM—Tubes, oscillator tube shorted or output tubes not matched; open filter, electrostatic shield open in power transformer. This will give carrier hum and can be corrected by by-passing the A.C. line with .001 mica-condenser. Reverse A.C. plug.

STATIONS RIDE IN—Check balance; check .0012 condenser in oscillator plate circuit.

WEAK OR LACK VOLUME—Open 2nd detector cathode resistor or cathodum; will also affect tone quality if open; .00025 condenser grounded in tone circuit; noticeable on high fidelity position of switch, with distortion. Repeat I.F.'s to 456 K.C. Defective tubes, in particular 1st and 2nd detector. Switch on normal and with lack volume—check tone switch for short circuit to foreign lug.

FLUTTERING AT LOW FREQUENCY—Tubes, particularly oscillator tube, rebalance I.F.'s to 456.

INTERMITTENT RECEPTION—Tubes, I.F. trimmers short; dirty variable condenser, poor ground at cathodum; loose link wire across Z and G on aerial strip. Poor contact on band switch; defective aerial; defective by-pass condenser.

POOR ACTION OF TARGET TUNER—Note: Do not expect target to center exactly in the center of bull's eye, except on very strong input signal. Check 6C5 tube or replace target unit.

 MODEL 650
 Schematics, Alignment

HETRO ELECTRICAL INDUSTRIES
 WATTERSON RADIO MFG. CO.

Set service oscillator to 456 KC and connect "HOT" lead to grid of 6A7. Ground the stator of rear (oscillator) section of variable condenser. Turn Volume Control for maximum output, and peak IF trimmers for maximum gain. Turn Volume Control for maximum gain. Remove variable condenser short and turn wave band switch knob towards right. Adjust service oscillator and receiver to 1500 KC, and peak variable condenser trimmers for maximum gain.

This is a dual wave superheterodyne with automatic volume control and a frequency range 1650-545 and 3700-1600 Kilocycles.

ANTENNA: No outside antenna is necessary unless used in a steel or shielded building, but it is necessary to unwind the reel of wire that is attached to the receiver chassis. For addition power the brown wire may be connected to an outside antenna.

TUBES: 6D6, 6A7, 6Q7G, 25B5, 25Z5, M49B

IMPORTANT: DO NOT GROUND THIS RECEIVER OR TOUCH GROUND WIRE TO CHASSIS IN ANY WAY.

FREQUENCY RANGES -
20 to 9.5 MC, 10 to 3.3 MC, 3.75 to 1.5 MC, 1500 to 550 KC

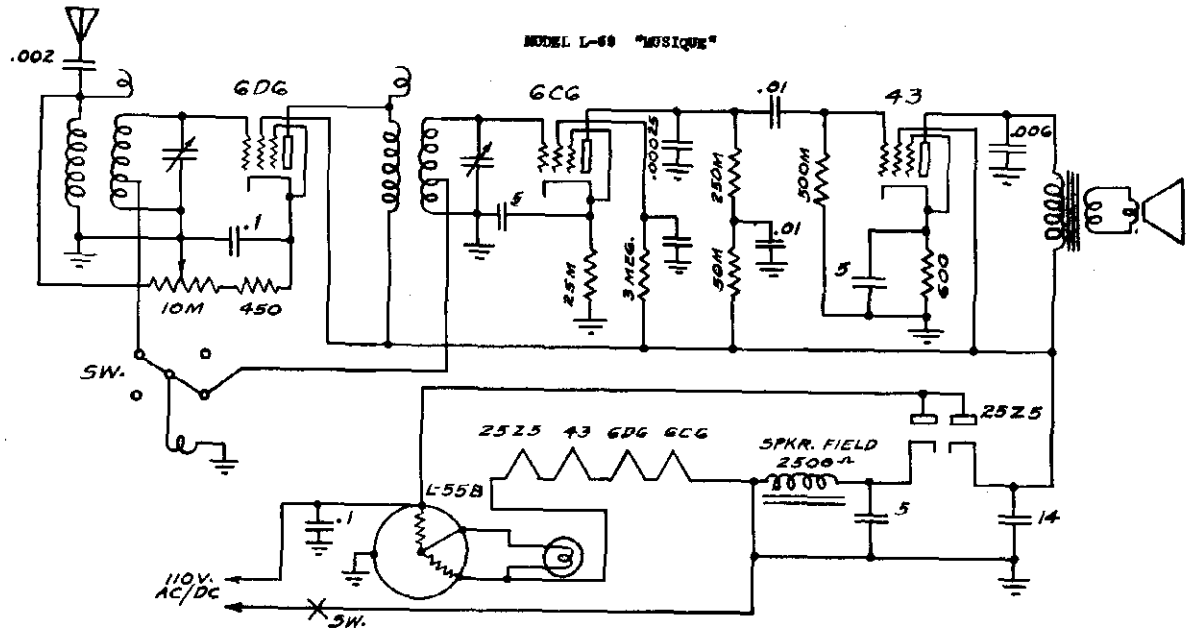

CONVENTIONAL ALIGNMENT - SEE SPECIAL SECTION

Align the I-F transformer trimmers at 175 KC. The generator and dial of the receiver are now set to 1500 KC. The Oscillator trimmer and then the R-F and Antenna trimmers are adjusted to maximum peak. Generator and dial next set to 600 KC, pad the oscillator circuit for maximum peak. Padding condenser is reached thru hole in rear center of chassis. Rock the variable condenser during the padding adjustment. The front section of the variable condenser is used for shortwave reception, and requires no adjustment other than above.

Model "MS"

Model ICS-124-1

Emerson L117, L122, L133, L135, L141

The schematic on page 7-27 of *Rider's Volume VII* applies only to sets bearing serial numbers under 895,962. Since the publication of Volume VII we have been advised by the manufacturer that changes have been made in this chassis, Model L, and in order that you may have the latest data, we are showing herewith the schematic of the chassis that is used in those sets with serial numbers above 895,962. Also please note that a sixth model number has been added to the above list: L150.

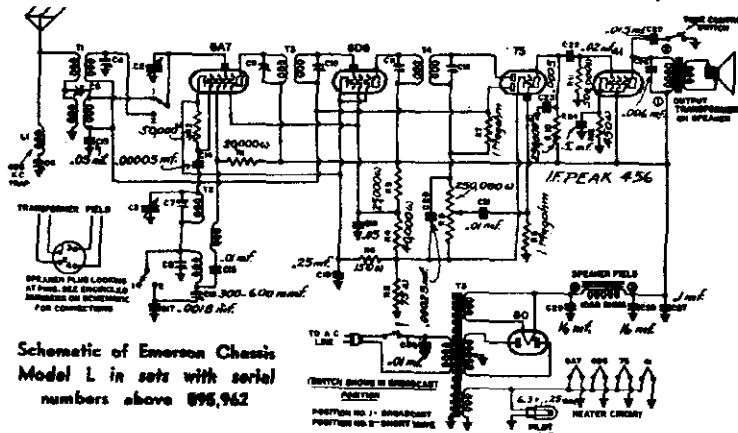

In this late chassis a 75 second detector has been substituted for the 85 tube. The voltage table, given with the rest of the servicing data on page 7-28 of *Rider's Volume VII*, is the same as that of the new chassis, except

for the readings of the 75 tube, which are:

Plate	120
Screen	—
Cathode	1.8
Filament	6.3

Note that in Model L150 the electrolytic condensers, C28 and C29, have values of 12 mf. and 8 mf. respectively, and have a voltage rating of 450. Also note that in sets having serial numbers below 961,900 the two primaries of the antenna coil, T1, were in parallel from antenna to ground, and a 0.00005-mf. mica condenser was in series with the antenna lead and the short-wave primary. Also, C17 was an 0.00135-mf. mica condenser.

The General Notes and Adjustments on Emerson page 7-28 apply to this new chassis, as well as the early.

Emerson Chassis C and CLW

The 6C5 and the 6F6 tubes of these chassis have been replaced by a 6J7 and 6L6 respectively. There have also been other changes in the audio

Changes in Emerson Chassis C and CLW

amplifier, which can be seen by comparing the partial schematic shown herewith and the original which will be found on page 7-36 of *Rider's Volume VII*. The values of parts on the accompanying schematic are the new values. These changes apply to sets carrying serial numbers above 880,050 of Chassis C and above 848,410 for Chassis CLW.

Also please make a note that Chassis CLW is the same as Chassis C, except that a long-wave coil has been substituted for that one covering the police range.

The voltage data that appears on page 7-35 applies to sets having the above changes incorporated with the exception of the readings for the 6J7 tube; these are: Plate—115; Screen—45, and Cathode—1.2. This means that the readings for the 6L6 are the same as those for the 6F6.

Emerson 35

The voltage readings for Chassis T6, used with the model 35, will be found below. The schematic of this receiver will be found on page 4-3 of *Rider's Volume IV*.

Tube	Plate	Screen	Cathode	Suppressor
78 1st R.F.	98	98	1-3.5	0
78 Det-Osc.	98	98	13	13
78 I.F.	98	98	1-3.5	0
75 2nd Det. AVC	50	..	1.0	..
43 O.P.	90	98	0	..

The bias for the 43 tube is measured across the filter choke and should be between 15 and 18 volts. The voltage across the speaker field should be approximately 115.

Emerson H-5

The schematic of this chassis appears on page 3-6 of *Rider's Volume III* and page 884 of the *Rider-Combination Manual*. The voltage data and socket layout appears on page 4-5 of *Rider's Volume IV*. Also on this latter page is the schematic diagram for the chassis No. H-5-L, which receiver has the same voltage and socket layout with the following exceptions:

A 6A7 tube is used as a 1st detector-oscillator and the "screen" voltage reading in the table should be 50 instead of 98. This tube in the socket layout is the top one on the right-hand side nearest the gang condenser and should be so marked on the above-mentioned page, bearing in mind, of course, that this layout also applies to the H-5 chassis, which uses a 78 tube as a 1st detector-oscillator.

Also please note that the model numbers of this chassis, H-5, are 30, 250, and 300.

Emerson 117

We are advised by the manufacturer that receivers having serial numbers above 761,440 of this model (Chassis C-5) have the following changes incorporated in the circuit:

The compensator on the oscillator coil trimmer strip, which formerly went from the grid condenser to ground, now goes directly across the broadcast oscillator secondary. This change facilitates alignment.

The compensator on the antenna coil trimmer strip, which formerly went from the grid end of the broadcast antenna secondary to ground, now goes from the grid end of the broadcast antenna secondary directly to the antenna lead. This change introduces capacity coupling and increases the sensitivity at the high-frequency end of the broadcast band.

The schematic of this receiver will be found on page 7-21 of *Rider's Volume VII*.

Philco 59

The schematic, furnished by the manufacturer and shown on page 5-30 of *Rider's Volume V*, has an error in the field coil circuit, Part No. 25. Compare

Partial schematic of Philco 59, showing correct wiring of the field coil, Part No. 25.

the partial schematic shown here with the one mentioned above and you will see the difference in the connections to the field coil.

Philco 37-33

Starting with Run No. 3, the filament wiring of the 1D5G i-f. tube was reversed, thus improving operation of the set. In Fig. 1 on page 7-16 of *Rider's Volume VII*, the left-hand filament terminal of this tube is marked "2 volts." This terminal is now grounded to the chassis.

Referring to Fig. 3 on the same page, resistor No. 8 has been removed from the r-f. terminal panel and connected directly from the oscillator grid contact on the 1D7G socket to ground. This change improved the sensitivity in the center of the broadcast band.

Philco 630

The schematic of this receiver shown on page 6-31 of *Rider's Volume VI* indicates a 1d-coil resistance of 1140 ohms. This is incorrect and should be 640 ohms. Please make this change in your Volume VI.

Philco 65

The schematic of this receiver was published on the following pages of *Rider's Volume I*: page 1-16 of the revised edition and page #459 of the early edition; and on page 1638 of the *Rider-Combination Manual*. At the time of publication the values of the parts were unobtainable and these are now given in the list below. The first column is the identifying number used on the schematic; the second column is the part number; and the third column is the value.

Schematic Number	Part Number	Value
1	3524	10,000 ohms
5	3292A	.1 mf. — 250 ohms
6	3584A	.05 mf. — 250 ohms
13	3583	.5 mf.
14	3525	32,000 ohms
21	3422	200 "
22	3526	5,000 "
23	3518	4,000 "
24	3512	2700 ohms (700,2000)
25	3528	2,000 ohms
26	3628	6 "
27	3292B	.05 mf. 00 250 ohms
29	2850	3200 "

Philco 645

The schematic of this set will be found on page 7-109 of *Rider's Volume VII*. Several changes have been made, as follows:

Starting with Run No. 3, the 51,000-ohm resistor, No. 16, has been removed. A 32,000-ohm resistor, ½ watt, Part No. 33-332334, has been connected from the oscillator grid of the 6A7 to the suppressor grid of the 78 r-f. tube. The 0.05-mf. condenser, No. 61, has been removed. The 25,000-ohm resistor, No. 60, has been replaced with one having a value of 240,000 ohms, ¼ watt, Part No. 33-424143.

A 0.06-mf. condenser, Part No. 30-4114, has been connected from the —C end of the B.C. resistor, No. 64, to the junction of the 1-megohm and 490,000-ohm resistors, Nos. 66 and 67.

The filament voltage of the 80 rectifier is shown as 6.3 volts in Fig. 3 on page 7-108 of *Rider's Volume VII*. This should be 5.0 volts.

Beginning with Run No. 4, the green and yellow leads of the a-f input transformer, No. 52, were reversed to reduce hum.

Philco 651

The leads of the i-f. transformer should be separated as widely as possible from each other, in order to reduce the possibilities of i-f. oscillation.

This means, too, that the leads from one of these transformers should be as far as possible from the leads of the other.

The -B lead from the suppressor plate terminal of the 78 r-f. tube to the wiring panel mounted on the 0.05-mf. condenser, No. 72, should be run close to the baseboard and away from the wave trap coil. This should eliminate motor-boating at 540 kc.

For schematic, see page 7-111, *Rider's Volume VII*.

Philco 655

In the paragraph titled "Police" of the alignment instructions on page 7-116 of *Rider's Volume VII*, it reads that the detector trimmer No. 11 should be adjusted for maximum output. This should be trimmer No. 12 to conform with the layout of Fig. 4 at the top of the page.

In Fig. 1, the designations of the r-f. transformers on page 7-114 should be changed as follows: 15-A, oscillator, to 16; 9, antenna, to 3; and 14, detector, to 10. To correct the lead designations of the oscillator transformer, No. 16 on the schematic, change No. 3 to 7; 7 to 5; 5 to 4; and 4 to 3.

Another error in the manufacturer's data was in the tube layout shown on the top of page 7-115 of *Rider's Volume VII*. The second detector is a 75, not an 85. The designation on the schematic on this same page is correct. Please make these changes in your Volume VII.

Beginning with Run No. 4, the 51,000-ohm resistor, No. 14, was removed and a 32,000-ohm resistor, Part No. 33-332334, ½ watt, was connected from the oscillator grid of the 6A7 to the suppressor of the 78 r-f. tube.

Philco I-F. Peaks

In certain localities it has been found advisable to align certain two- and three-gang Philco sets at some other i-f. peak than the one for which they were designed, i.e., 470 kc. This change has been found necessary because of some interference that is peculiar to these localities: Portland, Maine; Miami, Fla.; New Haven, Conn.; San Diego, Cal.; about one third of northern Long Island; Newark and southern New Jersey.

Therefore, if you are operating in any of these places and are bothered by code interference, align either of the two type sets mentioned above at 456 kc., 465 kc., or 480 kc. The i-f. peaks just mentioned are to be used depending on the location and type of interference.

Philco 37-600

To prevent reduction in sensitivity at the low-frequency end of the band, the 200-ohm resistor, No. 7, has been changed to 300 ohms, starting with Run No. 3. This change has been noted in the Parts List on page 7-37 of *Rider's Volume VII*, but it still shows as 200 ohms on the schematic, which will be found on the same page.

The lead connecting the suppressor grid to the cathode of the 6J7G i-f tube has been changed. It now runs from the suppressor grid to the junction of the sensitivity control, No. 23, and the secondary of the i-f transformer, No. 19.

Philco 37-116

Up to Run No. 4, a condenser was connected between the heater contact and ground of the 6K7G r-f tube. This condenser was removed starting with Run No. 4 to prevent hum modulation on Range 5. It is not shown on the schematic appearing on page 7-31, 7-32 of *Rider's Volume VII*.

Electrolytic condensers, Nos. 126 and 127, 8 mf., have been changed to 4 mf. Part No. 30-2174, starting with Run No. 5.

Starting with Run No. 6, the two 25,000-ohm resistors, Nos. 110 and 111, have been removed from the audio unit and relocated in the power unit near the 6B4G sockets.

To obtain the proper selectivity curve in the expanded position of the i-f expanding unit and to avoid regeneration, dress the plate lead (white) of the 6L7G tube as follows: The plate lead should lay across the 6L7G socket, then pass into the oscillator section close to the base; from here the wire must pass through the second aperture from the front of the r-f unit into the i-f unit.

To prevent clicks when tuning the bass compensation control on a very strong carrier, a 2-megohm resistor, Part No. 33-520339, was connected from the lug on which the 70,000-ohm resistor, No. 103, and the .008-mf. condenser, No. 104, are connected in the audio unit, to ground.

It will be noticed in the schematic on page 7-31, 7-32 of *Rider's Volume VII*, that two parts carry the same number: No. 135. One is the pilot light and this is the correct number for this part; the second is a switch, located on the schematic just below and to the left of the 6J5G AVC tube. The number of this switch should be 137. This number does not appear in

the list of parts on page 7-36, but the switch is used on the automatic dial mechanism and appears in the parts list under "Code 122" as "Plunger Stop and Switch Assembly, Part No. 45-2330."

Another switch located between Nos. 100 and 103 on the schematic with the wording "used in code 122 only," is used to short the audio system when using the automatic dial. This switch is located on the vernier drive assembly. The part numbers of the removable sections which contain the riveted contacts, are 45-2350 and 28-4110.

The magnetic tuning transformer has been changed. Its old part number was 32-2217 and its new number is 32-2361.

Philco 37-38

Starting with Run No. 4, the filament wiring of the 1D5G i-f tube was reversed to improve the operation of the set. In Fig. 1 on page 7-18 of *Rider's Volume VII*, the "F+" of the 1D5G socket becomes "F—" and is grounded to the lug near the socket.

The 32,000-ohm resistor, No. 8 (see schematic on page 7-17 of *Rider's Volume VII*) has been replaced with one having a value of 51,000 ohms, Part No. 33-351339. The resistor is removed from the range switch assembly and is connected directly to the oscillator grid of the 1C7G tube and ground. This change was made to improve the sensitivity in the center of the broadcast band.

Philco 37-60

Run No. 2. The 1000-mf. condenser, No. 11, was changed to 250 mmf., Part No. 30-1032, and resistor No. 12 was changed from Part No. 33-351339 to No. 33-332339. This change was made to prevent relaxation oscillation.

Run No. 5. Refer to the Base View of the chassis on page 7-22 of *Rider's Volume VII*. The condenser No. 46 has been moved from the location shown—near the front—to the rear of the power unit. The tubular condenser No. 40 has been replaced with Part No. 8318-SU Bakelite condenser and mounted in the location from which No. 46 was removed.

Run No. 6. The suppressor grid of the 6K7G, i-f tube, is removed from ground and connected to the -2.5 negative tap of the bias resistor, No. 43. See schematic on page 7-19 of *Rider's Volume VII*.

Beginning with Run No. 9, the i-f transformers were changed. The first i-f transformer No. 15 now is Part No. 32-2274 and the second, No. 27, is Part No. 32-2276. The first i-f transformer has a stabilizing winding which is placed in series with the suppressor grid of the 6K7G i-f tube. The short or yellow lead is connected to the ground lug and the long lead to the suppressor grid.

Philco 37-61

The changes applying to Philco Model 37-60 also apply to Model 37-61 with the exception of the first paragraph. The schematic diagram appears on page 7-23 in *Rider's Volume VII*.

Philco 90, 90A

Please make a note on page 84 of *Aligning Philco Receivers* that the i-f. peak of both chassis used in these models (with two 45s and one 47) is 175 kc. Note 1 on this page should read "175 kc. for both chassis." The correct i-f. peak is indicated on the schematics in *Rider's Manuals*.

Wells-Gardner 6K Series

If noise (not motor or vibrator) is encountered in this model, it may be due to the fact that the antenna transformer shield can is not grounding satisfactorily. The noise brought about by this condition is a popping or scratching, and will be heard only when the chassis is bumped or shaken.

By inserting a spring as shown above in the Wells-Gardner 6K series chassis, a good ground is assured for the antenna transformer shield.

This condition can easily be remedied without removing the chassis from the case by inserting a phosphor-bronze spring between the antenna coil can and the chassis bracket. This spring is inserted with a pair of long-nose pliers and the position after insertion is shown in the illustration.

For other data, see pages 7-20 and 7-21 in *Rider's Volume VII*.

RCA Automatic Record Changer

Data and notes on the automatic record changer will be found incorporated in the service data of model RE-73. These notes will be found on the following pages in *Rider's Volume II: revised edition, pages 2-79 to 2-83 inclusive; early edition, pages 504-Q to 504-U inclusive; and in the Rider Combination Manual, pages 1897 to 1901 inclusive.*

Please make a note in your Index where these data may be found.

RCA 690

We have been advised by the manufacturer that no service data on this model were issued, but that it contained a Radiola Model 82 chassis and a Capehart Model 1012-C automatic record changer.

The schematic diagram of the 82 chassis will be found on page 1-45 of the revised *Volume I*; page *502 of the early edition; and on page 1929 of the *Rider-Combination Manual*. Other data will be found on the following pages: 2-92, 2-93, and 2-94 of the revised *Volume II*; 502-C, 502-D, and front of the early edition; and on pages 1930, 1931, and 1932 of the *Rider-Combination Manual*.

RCA T11-8

A 5Z4 metal rectifier has been substituted for the 5Z3 in this chassis, the schematic for which will be found on page 7-144 of *Rider's Volume VII*.

RCA T6-1 and C6-2

A metal rectifier tube, 5Z4, has been substituted in the chassis used in these models in place of the type 80 shown in the schematic on page 6-83 of *Rider's Volume VI*. The partial schematic and wiring diagrams, show how the 5Z4 is connected.

These diagrams show the connections for the 5Z4 rectifier in the RCA models T6-1 and C6-2.

The resistor, R3, in the cathode circuit of the 6A8 tube has been changed from 56,000 ohms to 100,000, the new Part No. 3118. The resistor, R4, in the screen grid circuit of the same tube, has been changed from 12,000 ohms to 33,000, the new Part No. 8072. New power transformers have also been substituted, depending on the voltage and frequency of the line; they are: 105-125 volts, 50-60 cycles, Part No. 11848; same voltage for 25-50 cycles, Part No. 11849; for 100 up to 250 volts, 40-60 cycles, Part No. 11850. The following parts are not used in the revised chassis: the .1-mf. condenser, C23; and the resistors, R8, 1200 ohms, and R9, 220,000 ohms.

RCA D11-2

Several changes have been incorporated in this model, the schematic of which may be found on page 7-137 of *Rider's Volume VII*.

A 5Z4 metal rectifier tube has been substituted for the 5Z3 formerly used. The phonograph motor has been changed and is now of the capacitor type. The motor is wired in this instrument as follows: One power supply lead connects to one terminal of switch S14, the main toggle switch. The other terminal of S14 connects to one terminal of the brake switch S15. The other terminal of S15 connects to the yellow motor lead. The green motor lead connects to one lead of the motor capacitor, Part No. 12051. The red motor lead connects to the other capacitor lead and also to the remaining power-supply lead. A new suspension spring is also used, Part No. 12050.

The 0.01-mf. condenser, C24, is no longer used. The following parts are added to the revised model D11-2: the motor, 105-125 volts, for 60 and 50 cycles, Part Nos. 9650 and 9651 respectively for the motor formerly employed; filter pack for phonograph that is used in some models, Part No. 12037; and a new reproducer, complete, Part No. 6952.

RCA R-14

For servicing information on this model, please refer to the data covering Radiola Model 42, which will be found on page 3-19 of *Rider's Volume III* and on page 1866 in the *Rider-Combination Manual*.

RCA 342

This combination radio-phonograph set is similar to the Model 341 with the exception of the pick-up coupling transformer. Instead of this unit, the

Change in the pick-up circuit of the RCA 342. Compare with Model 341.

apparatus shown in the schematic herewith, has been substituted in the 342. The schematic for Model 341 will be found on page 5-157 in *Rider's Volume V*.

RCA AR-4229

Certain changes were made in this police auto radio receiver, necessitating new components. Below will be found corrections for the parts list, which was run on page 5-206 in *Rider's Volume V*.

New Stock No.	Old Stock No.	Description
4049	3745	C-12, 1310 mmf.*
7701	7601	3-gang variable condenser
7702	6540	R-f coil assembly
7703	6731	Antenna coil
7704	6471	Oscillator coil
6570	6784	Dial scale
7698	G-7850	Control box cover
7705	G-7851	Control box complete
6161	G-5021	Station selector knob

*Was 745 mmf.

RCA 6K10, 6T10, 8T10, 9K10

These receivers are similar to models 6K2, 6T2, 8T, and 9K2 respectively, except for cabinet design. The servicing data, as published on the following pages in *Rider's Volume VII*, applies to these new model numbers: 6T10 and 6K10, page 7-41; 8T10, page 7-56; and 9K10, page 7-99.

RCA 10K11, 10T11

The chassis and speakers of these two models are identical to models 10K and 10T, which will be found in *Rider's Volume VII* on page 7-132. The service data starting on that page applies to these new model numbers with the exception of some minor replacement parts for the new cabinets in which these chassis are housed.

Silvertone Wave-Trap

A wave-trap has been designed for use with the following receivers when they are used near ship transmitters, airports, or air beacon stations, which cause code interference: 1989, 4408, 4420, 4520, 4409, 4413, 4442, 4443, 4522, 4523, 4542, 4543. The part number of this wave-trap is 101311-4256.

Installation:

The trap should be mounted, by means of two wood screws, at any convenient place on the chassis shelf or cabinet, where it will be near the an-

Installation of wave-trap in various Silvertone chassis

tenna terminal of the set. Connect the yellow lead of the wave-trap to the antenna downlead and splice the green wire of the wave-trap to the green antenna lead of the receiver. Cut off any excess wire from the trap and from the chassis antenna lead, so that the green lead from the wave-trap to the chassis is as short as possible. The yellow lead from the wave-trap should be run so that it is as far as possible from the green lead. Splice one of the black leads from the wave-trap to the black ground lead of the receiver. Connect the other black lead to the ground that is used for the installation. See accompanying illustration.

Adjustment:

The trap is pre-tuned to the intermediate frequency of the set, so that normally no further adjustment should be needed. However, if interference still be experienced, tune the receiver to approximately between 550 and 600

kc. Then adjust the wave-trap until the interference is eliminated, by means of the trimmer screw at the bottom of the container. The addition of the trap will reduce the sensitivity of the receiver around 600 kc. by about 50%. It would be wise to advise the set owner of this fact before installing this trap.

Silvertone 2- and 3-Volt Chassis

The model numbers in which these chassis are used are as follows: 4404, 4405, 4424, 4444, 4524, and 4544 for the 3-volt models; 4410, 4411, 4425, and 4445 for the 2-volt models. The schematic for both chassis will be found on page 7-55 of *Rider's Volume VII*.

In some localities where a 930-kc. station is operating, it may be desirable to shift the i-f. peak — 465 kc. — of these chassis to eliminate a whistle due to a beat between the second harmonic of the i-f. peak and the signal of 930 kc.

First determine at what point between 900 and 960 kc. the whistle will be least objectionable. Dividing this frequency in half will give the new i-f. peak at which the receiver should be aligned. For example: assume that the whistle at 915 kc. would be unobjectionable, then the new i-f. peak would be $915 \div 2$, or 457.5 kc. Align the i-f. transformers at this new frequency and then realign the rest of the receiver, as described on page 7-56 of *Rider's Volume VII*.

Silvertone 1802A, 1803A, 1807

Refer to the schematic page 5-31 of *Rider's Volume V*. The 0.001-mf. condenser in the plate circuit of the 2A6, second detector, is no longer grounded. One side is still connected to the plate, as it was in the schematic mentioned above, but the other side now is connected to the cathode of the 2A6.

Silvertone 1825, 1828

A change has been made in the antenna circuit of this chassis, the schematic of which appears on page 5-39 of *Rider's Volume V*. The switch, connected across the 100,000-ohm resistor in the antenna primary circuit, has been eliminated.

Silvertone 1945

The original production of this model was supplied with 1.5-ampere fuses. Sometimes trouble was experienced with these fuses blowing out, due to the initial charging current of the electrolytic condensers. This occurred only when the receiver had not been used for a considerable time, so that the electrolytic condensers momentarily drew large forming current when the set was first turned on.

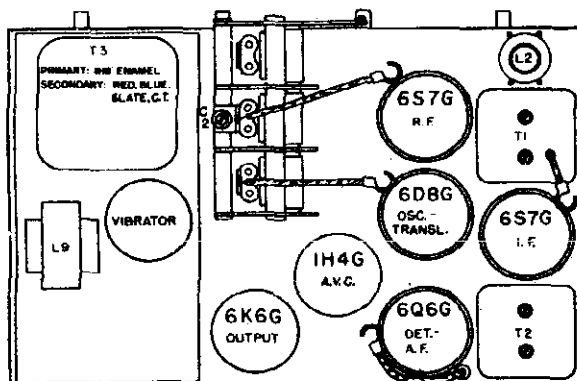

Later production of this model was supplied with a 2-ampere fuse and if you come across any of these models with the smaller fuse, substitute the 2-ampere type.

Silvertone 4428A, 4448A, 4528A, 4548A

We have been advised by the manufacturer that the tube layout and the two chassis views that were supplied with the servicing instructions of the chassis used in the above models, were incorrect. We are reproducing here the three correct layouts that should appear on pages 7-61 and 7-62 of *Rider's Volume VII*. Please make proper notation on these pages in your Manual.

The locations of the parts under the power supply unit of the Silvertone 4428A and other models

The correct chassis views of the Silvertone models 4428A, 4448A, 4528A, and 4548A.

Bosch 601

Several omissions of parts values were in the preliminary schematic diagram of this set which was published on page 7-20 of *Rider's Volume VII* and these missing values will be found below opposite the diagram number by which the various components are designated. The connections are the

Top view of Bosch 601 chassis

same in the final schematic as they are shown on the above-mentioned page with the one exception: A 0.5-mf. condenser has been inserted between the high side of the filament supply and ground. Draw this in on your schematic just to the left of the dial lamp (No. 53) where the lead to the filament of the 1A4 tube is connected. The part number of this new condenser is CW 2-50 and its diagram number is 57.

Diagram No.	Part No.	Description
10, 28, 37	CW 4-02	0.02 mf., 400 v.
19, 23	CW 2-05	0.05 mf., 200 v.
29	VR 9538	0.5 megohm, vol. con.
38	CW 4-005	0.005 mf., 400 v.
42	CW 6-005	0.005 mf., 600 v.
44	CW 4-01	0.01 mf., 400 v.

Also check the values of diagram numbers 55 and 56; they should be 0.94 and 0.42 ohm respectively.

Bottom view of Bosch 601 chassis

Below will be found the alignment data for this receiver together with the layouts of the apparatus on both the top and bottom of the chassis. The numbers of the parts correspond with the diagram numbers on the schematic already published in *Rider's Volume VII*.

Wave Switch	Dial Position	Dummy Antenna	Quesney	Sig. Gen. 465 kc.	Sig. Gen. 1A4 grid 21, 22	Connec- tion	Trim- mers	Out- put Signal
.....	000 kc.	.5 mf.	1A4 grid 16, 18	Max.
.....	1000 kc.	.0002 mf.	1600 kc.	Antenna	Min.
.....
.....	000 kc.	800 kc.	11 1/2
.....	1000 kc.	1600 kc.	8, 3
Sh. Wave	0000 kc.	0000 kc.	7
.....	3

1 Volume control to maximum and tone control to treble
2 While rocking condenser.

39. The new value is .005 mf., Part No. CW4-005.

Below will be found the resistance of the windings of the power transformer:

Winding	Primary	Sec. Total	6.3 Fil.	Rect. Fil.
TR 9555	15.5 ohms	600 ohms	.24 ohm	.17 ohm
TR 9564	16.5 ohms	570 ohms	.23 ohm	.14 ohm
TR 9565	61 ohms	580 ohms	.23 ohm	.15 ohm

Please add these data to the schematic.

Bosch 650

The final schematic of this model is the same as the preliminary, which will be found on page 7-33 of *Rider's Volume VII*, with the following exceptions:

Diagram No.	Old Value	New Value	Part No.
10	.0001 mf.	.000065 mf.	CM9511
18	.005 mf.	.005 mf.	CW4005
23	40,000 ohms	40,000 ohms	SA99957
38	.05 mf.	.25 mf.	CW2-25
51	30,000 ohms	50,000 ohms	RE95116
59	65 ohms	50 ohms	RE9537

Note that the part numbers only of items 18 and 23 are changed; the values remain the same.

Please make a correction on the schematic. The lower plate of condenser No. 10 should be connected to the junction of the tuning condenser and condenser No. 12. This was omitted from the drawing.

Bosch 605, 605C

The final schematic is the same as the preliminary, which will be found on page 7-25 of *Rider's Volume VII*, with the following change in the value of the .01-mf. condenser, Diagram No.

Bosch 640

The final schematic is the same as the preliminary, which will be found on page 7-31 of *Rider's Volume VII*, with the following exceptions:

Diagram No.	Old Value	New Value	Part No.
10	.0001 mf.	.000065 mf.	CS9511
23	40,000 ohms	25,000 ohms	SA99777
38	.05 mf.	.25 mf.	CW2-25
39	.05 mf.	.1 mf.	CW2-10
46	65 ohms	50 ohms	RE9537

Please make these changes in the list of parts on Bosch page 7-32 in *Rider's Volume VII*.

Silvertone Wave-trap Change

Wave-trap, Part No. 1013114477, used for eliminating code interference in models 1986, 1987, 4403, 4463, 4464, 4484, 4563, and 4584 (see page 7-45 of *Rider's Volume VII*), is described as having three leads.

In later production of this trap only two leads were used, having the colors black and green. The green lead is to be connected to the green lead of the set's antenna lead or connected to the antenna terminal, if the receiver has a terminal board. The black lead of the trap is to be connected to ground.

This trap acts as a series resonant circuit connected across the antenna and ground terminals of the set.

CORRECTION OF SPEAKER CABLE CONNECTIONS TO THE SPEAKER PLUG OF MODEL 601.
