## I. INTRODUCTION

The Philips digital multimeter PM 2422 A is an accurate 3+1 digit instrument with a maximum reading of 1999 to measure:

- DC and AC voltages of 100  $\mu$ V ... 1000 V (600 V AC,) 5 ranges
- DC and AC currents of 100 nA ... 2 A, 5 ranges
- Resistances of 0.1  $\Omega$  ... 20 M $\Omega$ , 6 ranges
- DC high voltages up to 30 kV with the EHT probe PM 9246
- UHF voltages with UHF probe PM 9200 up to 800 MHz.

For frequencies above 30 MHz it is advisable to use T-connector PM 9250 in conjunction with this probe.

- DC and AC currents up to 31.6 A with shunt PM 9244
- AC currents up to 100 A with current transformer PM 9245

Operation of the instrument is easy.

Selection of the measuring ranges is effected by a rotary switch, and AC and DC selection by push-buttons.

The decimal point is set automatically by switching the ranges.

The polarity of direct voltages and currents is indicated automatically.

Only the -sign is displayed.

The instrument is protected against overloads on all ranges up to at least 250 V.

This efficiently designed instrument can be employed for all applications in modern electronics.

## II. TECHNICAL DATA

Properties expressed in numerical values with tolerances are guaranteed by the manufacturer. Numerical values without tolerances are given for general information and represent the properties of an average instrument.

The data below are applicable at 23°C  $\pm$  1°C unless otherwise stated.

### A. MEASURING RANGES

#### 1. Direct voltages

Measuring range

0.1 mV ... 1000 V

5 ranges up to 200 mV, 2 V, 20 V, 200 V and 1 kV

Resolution	100 $\mu$ V						
Accuracy	$\pm 0.1\%$ of range and $\pm 0.1\%$ of reading						
Temperature coefficient	$\pm 1$ digit / $5^{\circ}\text{C}$						
Input resistance	10 M $\Omega$ $\pm 0.2\%$						
Input capacity	< 100 pF						
Series mode rejection	> 66 dB at 50 Hz and 60 Hz						
Common mode rejection	> 120 dB at DC, 50 Hz and 60 Hz						
<b>2. <u>Alternating voltages</u></b>							
Measuring range	0.1 mV ... 600 V 5 ranges up to 200 mV, 2 V, 20 V, 200 V and 600 V						
Maximum resolution	100 $\mu$ V						
Input impedance	10 M $\Omega$ $\pm 0.2\%$ // max. 100 pF						
Accuracy	<table> <tbody> <tr> <td><math>\pm 0.2\%</math> of range and <math>\pm 0.2\%</math> of reading</td> <td rowspan="2">} at a frequency of 1 kHz</td> </tr> <tr> <td><math>\pm 0.3\%</math> of range and <math>\pm 0.3\%</math> of reading</td> </tr> <tr> <td><math>\pm 0.5\%</math> of range and <math>\pm 0.5\%</math> of reading</td> <td rowspan="2">} at a frequency of 20 kHz ... 25 kHz</td> </tr> <tr> <td></td> </tr> </tbody> </table>	$\pm 0.2\%$ of range and $\pm 0.2\%$ of reading	} at a frequency of 1 kHz	$\pm 0.3\%$ of range and $\pm 0.3\%$ of reading	$\pm 0.5\%$ of range and $\pm 0.5\%$ of reading	} at a frequency of 20 kHz ... 25 kHz	
$\pm 0.2\%$ of range and $\pm 0.2\%$ of reading	} at a frequency of 1 kHz						
$\pm 0.3\%$ of range and $\pm 0.3\%$ of reading							
$\pm 0.5\%$ of range and $\pm 0.5\%$ of reading	} at a frequency of 20 kHz ... 25 kHz						
Temperature coefficient	$\pm 1$ digit / $5^{\circ}\text{C}$						
Frequency range	30 Hz ... 25 kHz						
Max. input voltage	600 V						
Max. frequency on 600 V range	1 kHz						
<b>3. <u>Direct currents</u></b>							
Measuring range	100 nA ... 2 A 5 ranges up to 200 $\mu$ A, 2 mA, 20 mA, 200 mA and 2 A						
Maximum resolution	100 nA						
Accuracy	$\pm 0.3\%$ of range and $\pm 0.3\%$ of reading						
Temperature coefficient	$\pm 1$ digit / $4^{\circ}\text{C}$						
Voltage loss	< 250 mV for currents $\leq 200$ mA < 600 mV for 2 A						

4. Alternating currents

Measuring range	100 nA ... 2 A 5 ranges up to 200 $\mu$ A, 2 mA, 20 mA, 200 mA and 2 A
Maximum resolution	100 nA
Accuracy	$\pm 0.4\%$ of range and $\pm 0.4\%$ of reading
Frequency range	30 Hz ... 1 kHz
Temperature coefficient	$\pm 1$ digit / $4^{\circ}\text{C}$
Voltage loss	< 250 mV for current $\leq 200$ mA < 600 mV for 2 A

5. Resistances

Measuring range	0.1 $\Omega$ ... 20 M $\Omega$ 6 ranges up to 200 $\Omega$ , 2 k $\Omega$ , 200 k $\Omega$ , 2 M $\Omega$ and 20 M $\Omega$
Maximum resolution	0.1 $\Omega$
Accuracy	$\pm 0.2\%$ of range and $\pm 0.2\%$ of reading } for ranges < 200 k $\Omega$ $\pm 0.2\%$ of range and $\pm 0.5\%$ of reading } for the 2 M $\Omega$ and 20 M $\Omega$ ranges
Temperature coefficient	$\pm 1$ digit / $3^{\circ}\text{C}$ for ranges $\leq 200$ k $\Omega$ $\pm 1$ digit / $2^{\circ}\text{C}$ for the 2 M $\Omega$ and 20 M $\Omega$ ranges
Measuring current	1 mA for the 200 $\Omega$ and 2 k $\Omega$ ranges 10 $\mu$ A for the 20 k $\Omega$ and 200 k $\Omega$ ranges 100 nA for the 2 M $\Omega$ and 20 M $\Omega$ ranges
Max. voltage with open input	< 2.7 V for the 200 $\Omega$ , 20 k $\Omega$ , and 2 M $\Omega$ ranges < 12 V for the 2 k $\Omega$ , 200 k $\Omega$ and 20 M $\Omega$ ranges
Semi-conductors	Can be tested forwards on the 2 k $\Omega$ range and reverse on the 2 M $\Omega$ and 20 M $\Omega$ ranges

## B. GENERAL DATA

1. Display

Number of digits	3 + 1
Max. display	1999
Polarity	Automatic display of "-" sign No indication for + DC, AC and Ohm
Overrange	The digit of the hundreds displays 0, the others are blanked.
Decimal point	Set automatically by range selector

## 2. Analog to digital conversion

Conversion system	Delta pulse modulation system <sup>⌘</sup>
Sampling rate	2 times per second, memory keeps the reading displayed during the measuring time
Display control	Serial, Scan frequency 512 Hz

## 3. Input

Measuring input	Floating
Range selection	Manual
Max. common mode signal	500 V d.c. 350 V a.c., 50 Hz
Capacity "0" - $\perp$	1.8 nF
Maximum voltage between V-R and $\perp$	1000 V d.c. or 1000 V r.m.s.

## 4. Temperature range

Ambient temperature	0 ... 45°C
Zero point drift	± 1 digit / 4°C

## 5. Protection

Max. permissible voltages	Range	Value
	Ranges $\leq 2$ V DC } and AC	350 V d.c.; 300 V a.c. (50 Hz)
	Ranges $> 2$ V AC	500 V d.c.; 600 V a.c.
	Ranges $> 2$ V DC	1.2 kV d.c.; 600 V a.c.
	The voltage ranges are protected for overloads up to 3 kV supplied by high ohmic sources	
Current ranges	6 A fuse and power diodes for protection of the shunts. Max. permissible voltage 250 V d.c. or a.c.	

⌘ Philips patent

Resistance ranges

Protected against 250 V d.c. or a.c. (50 Hz)  
For ranges  $\leq 2 \text{ k}\Omega$  above 30 V a fuse (125 mA)  
will blow

#### 6. Power supply

Mains voltage

110 V or 220 V  $\pm$  15%  
Additional adaption by 18 V is possible

Frequency

40 - 60 Hz

Power consumption

30 VA

#### C. MECHANICAL DATA

Dimensions

Height: 145 mm  
Width : 236 mm  
Depth : 298 mm

Weight

about 3.5 kg

### III. ACCESSORIES

#### A. SUPPLIED AS PART OF THE EQUIPMENT

Set of measuring leads with test pins PM 9260  
Interconnection strip between terminals "0" and 

#### B. OPTIONALLY AVAILABLE

EHT probe PM 9246 (fig. 1, page 12)

The HT probe PM 9246 is suitable for measuring direct voltages up to 30 kV.

The PM 9246 may be used for measuring instruments with an input impedance of 100 M $\Omega$ , 10 M $\Omega$  or 1.2 M $\Omega$  (selectable).

#### TECHNICAL DATA

Maximum voltage	30 kV
Attenuation	1000 x
Input impedance	600 M $\Omega$ $\pm$ 5%
Accuracy	$\pm$ 3% for instruments input impedance of 10 M $\Omega$ and 100 M $\Omega$ $\pm$ 5% for instruments input impedance of 1.2 M $\Omega$

#### Note:

Pay attention to safe earth connections

UHF probe 9200 (fig. 2, page 42)

The UHF probe PM 9200 is suitable for measuring alternating voltages between 10 mV and 16 V.

Frequency range	100 kHz ... 800 MHz
Frequency response	100 kHz ... 1 MHz $\pm$ 10% 1 MHz .. 300 MHz $\pm$ 5% 300 MHz .. 800 MHz $\pm$ 10%
Input impedance	1 MHz .. 110 k $\Omega$ 10 MHz .. 80 k $\Omega$ 50 MHz .. 25 k $\Omega$
Input capacitance	2 pF
Max. permissible voltage on the probe	450 V d.c.

At frequencies above 30 MHz these tolerances apply only if T-connector PM 9250 is used.

UHF T-connector PM 9250 (fig. 3, page 42)

Impedance	50 $\Omega$
Frequency response	0.1 ... 1000 MHz
Standing wave ratio	0.1 ... 800 MHz : 1.1 800 ... 1000 MHz : 1.2

Current transformer PM 9245 (fig. 4, page 42)

With this transformer it is possible to measure alternating currents over 10 A up to 100 A.

Transfer factor	1000 × (100 A = 100 mA)
Transfer error	± 3%
Frequency range	45 Hz ... 1 kHz
Secondary voltage loss	< 200 mV
Max. voltage with respect to earth	400 V a.c.
Max. air-gap	0.05 mm

Before measuring connect the current transformer to the instrument.

Prevent pollution of the core-parts.

Shunt PM 9244 (fig. 5, page 42)

With this shunt it is possible to measure d.c. and a.c. (max. 1 kHz) currents up to 31.6 A.

Current range	10 A and 31.6 A
Output voltage	100 mV and 31.6 mV
Accuracy	100 mV: ± 1% 31.6 mV : ± 2%
Dissipation	max. 3.16 W
Dimensions	Height : 55 mm Width : 140 mm Depth : 65 mm

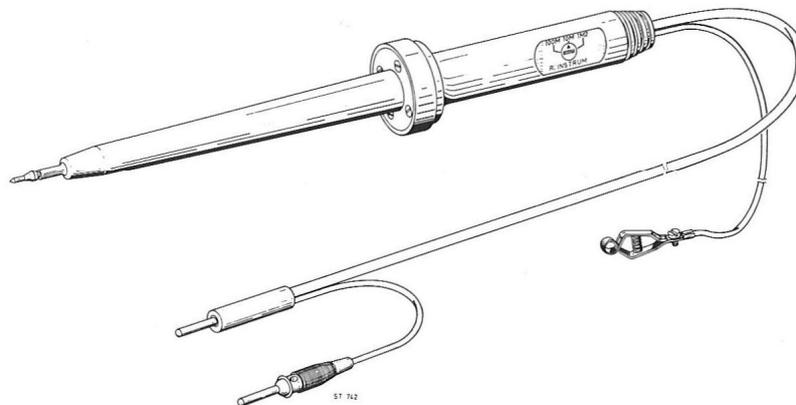

Fig. 1.

## IV. PRINCIPLE OF OPERATION (Fig. 8)

### A. INPUT CIRCUIT

The purpose of the input circuit is to supply a direct voltage of 2 V to the ADC input, at end of range values.

The analog sections translates all input signals viz. d.c. and a.c. voltages, d.c. and a.c. currents and resistances to this signal of 2 V.

For the d.c. and a.c. voltages the same divider is used.

The attenuated signal is supplied to an 1 x or 10 x amplifier with an output of 2 V d.c. or 2 V<sub>r.m.s.</sub>

In the case of a.c. measurements the output signal of the amplifier is supplied to an AC/DC converter, which is out of circuit in the case of d.c. measurements.

Currents supplied to input I are converted into voltages by shunts.

These voltages are also supplied to the 1 x or 10 x amplifier and then directly, or in the case of a.c. currents via the AD/DC converter, supplied to the ADC.

For resistance measurements, a constant current is passed through the unknown resistance.

The following currents are used in the different ranges:

Ranges	Current	Measuring voltage (at end of range)
200 $\Omega$	1 mA	200 mV
2 k $\Omega$	1 mA	2 V
20 k $\Omega$	10 $\mu$ A	200 mV
200 k $\Omega$	10 $\mu$ A	2 V
2 M $\Omega$	100 nA	200 mV
20 M $\Omega$	100 nA	2 V

The measuring voltage across the unknown resistance is supplied to the ADC via the 1 x or 10 x amplifier.

### B. DIGITAL SECTION

The analog to digital converter of the PM 2422 A is based on the delta-pulse modulation principle. This integrating system ensure good linearity and series mode rejection. Furthermore the circuit contains a minimum of critical elements, only the accuracy of the reference voltage is important for the accuracy of the ADC.

The basic circuit of the ADC is shown in Fig. 7. The operation is as follows:

With a comparator the input voltage  $V_x$  is compared with voltage  $V_c$

The output of the comparator controls switch S via flip-flop in such a way that the positive reference voltage ( $+V_{REF}$ ) is connected to R1 if  $V_c < V_x$  or the negative reference ( $-V_{REF}$ ) if  $V_c > V_x$ .

Suppose  $V_x$  is positive with respect to  $V_c$  and switch  $S$  to position  $+V_{REF}$ .

This results in charging the capacitor so that  $V$  increases until it becomes larger than  $V_x$ .

At the first clock pulse after  $V_c$  has become larger than  $V_x$ , flip-flop is set; switch  $S$  is set to position  $-V_{REF}$ . Capacitor  $C1$  will be discharged until  $V_c$  becomes smaller than  $V_x$ . Then switch  $S$  is set again to the starting position ( $S$  in position  $+V_{REF}$ ) at the next clock pulse.

Due to this compensation method the average value of  $V_c$  will be equal to  $V_x$ . If  $V_x$  has a constant value (a.d.c. level) the average charge of capacitor  $C1$  must be also constant. This means, that the charge supplied ( $Q_c$ ) is equal to the charge drained off ( $Q_d$ ) when integrated over a longer period (measuring time  $t_m$ ).

$$\text{Charge supplied: } Q_c = \frac{+V_{REF} - V_c}{R} \cdot t_c$$

$$\text{Charge drained: } Q_d = \frac{V_c - (-V_{REF})}{R} \cdot t_d$$

$$\text{thus: } V_c = V_x = \frac{t_c - t_d}{t_c + t_d} \cdot V_{REF} \text{ or } V_x = \left( \frac{t_c}{t_c + t_d} - \frac{t_d}{t_c + t_d} \right) V_{REF}.$$

in which  $t_c$  = sum of the charging times,  $t_d$  = sum of the draining times during time  $t_m$  ( $+V_{REF}$  and  $-V_{REF}$  have the same absolute value).

By counting the number of clock pulses during the charging time ( $t_c$ ) and subtracting the clock pulses during the draining time ( $t_d$ ) this results in a number of clock pulses which corresponds to the input voltage.

Assume:  $N$  = total number of clock pulses during  $t_m$

$T$  = period time of clock pulse

then  $t_m$  = measuring time =  $NT = t_c + t_d$

If during  $t_c$ ,  $n$  clock pulses are used, then during  $t_d$   $N-n$  pulses are used, so that  $V_x$  becomes

$$V_x = \frac{nT - (NT - nT)}{NT} V_{REF} = \frac{2n - N}{N} V_{REF}.$$

If  $2n - N = n'$  = the number of pulses to be counted, then:

$$n' = V_x \frac{N}{V_{REF}}$$

$N$  is a fixed number of pulses determined by a timer and amounts to 2046. When using a reference voltage of 2.046 V the formula becomes

$$n' = 1000 V_x \quad (V_x \text{ in volts})$$

(In PM 2422 A capacitor C1 is connected between the inputs of the comparator to obtain a better series mode rejection).

The counting of pulses is realised in an up-down counter which is included in a MOS integrated circuit. This circuit contains, moreover:

- An input flip-flop (FF, described before)
- Two analog switches (S) to switch the positive and negative reference voltage
- A polarity detector
- A timer to control the measuring time
- A clock oscillator
- A pulse output circuit which controls the 4-decade counter.

The latter circuit counts the pulses supplied by the ADC.

The number of counted pulses will be transferred to a memory after which the counter will be reset to zero by a reset pulse from the ADC.

A new measuring cycle can start now.

A multiplexer connects alternately each decade of the memory to the decoder-driver, simultaneously a pulse arises to drive the anode switch of the corresponding indicator tube.

Via the decoder-driver the decoded number will be transferred to one of the 4 indicator tubes, the cathodes of which are switched in parallel.

Only that indicator, the anode switch of which is closed, will light up.

As the switching speed is 512 times per second it seems that all indicators light at the same time.

# DIRECTIONS FOR USE

## V. INSTALLATION

### A. MAINS SUPPLY

Before the instrument is connected to the mains, check that the instrument is set to the local voltage.

If necessary, connect the transformer windings as shown in Fig. 9.

The instrument is set to 220 V in the factory.

### B. FUSE

Make sure that only fuses with the required current rating and of the specified type are used. The use of repaired fuses and the short-circuiting of fuse holders is prohibited.

The rating of the mains fuse mounted inside on the rear plate (fig. 32, page 101) should be:

- for 110 V : 250 mA, delayed action
- for 220 V : 140 mA, delayed action

### C. EARTHING

The instrument should be connected to a protective earth in accordance with the local safety regulation. This can be effected via the 3-core means lead. The mains plug should only be inserted in a socket outlet provided with a protective earth contact, the protective action of which is not cancelled by the use of an extension card or device without protective conductor.

## VI. OPERATION

### A. SWITCHING ON (fig. 10)

The instrument is ready for use after connection to the mains and earthing. It is switched on by means of mains switch POWER ON (SK3)

Then the display tubes light up.

A warming-up time of approximately 30 min. should be observed to obtain full accuracy.

## B. ELECTRICAL ZERO SETTING

- Switch on the instrument and allow to warm up for approximately 30 min.
- Interconnect terminals "0" (BU2) and "V-R" (BU3)
- Press push-button DC (SK2/1)
- Set range selector (SK1) to position 200 mV
- Adjust the reading to 00.0 by means of potentiometer "ZERO" (screwdriver adjustment at the rear of the instrument).
- If the indicator "-" blinks it is an indication that the zero setting has been effected correctly.

## C. CALIBRATION

Calibration of this instrument may only be carried out if a DC standard with an accuracy of at least  $\pm 0.04\%$  (preferably  $\pm 0.02\%$ ) is available.

For calibration reference is made to chapter XI sub-point D.1.

## D. MEASURING

### 1. Direct and alternating voltages

- Select measuring mode DC-R or AC
- Select the correct measuring range with range selector SK1
- Connect the test voltage to terminals "0" (BU2) and V-R (BU3)

#### Notes:

- For floating measurements, remove interconnection strip between "0" (BU2) and  $\perp$  (BU1).
- The capacitance between terminals "0" and  $\perp$  is approximately 1.8 nF.
- For d.c. voltages the polarity indicator indicates the polarity on terminal V-R with respect to terminal "0". Only the "-" sign will be displayed.
- Maximum permissible voltage between terminal "0" and chassis  $\perp$  is 500 V d.c. or 350 V a.c. 50 Hz
- Maximum permissible voltage between terminal V-R and chassis  $\perp$  is 1000 V d.c. or 1000 V r.m.s.
- Maximum permissible voltage:

Range	Measuring mode DC	Measuring mode AC
200 mV } 2 V }	350 V d.c.; 300 V a.c. (50 Hz)	350 V d.c.; 300 V a.c. (50 Hz)
20 V } 200 V } 1000 V }	1.2 kV d.c.; 600 V a.c. (50 Hz)	500 V d.c.; 600 V a.c. (50 Hz)

## 2. EHT voltages up to 30 kV with probe PM 9246

- Select measuring mode DC-R
- Connect the probe terminals "0" and V-R (terminals "0" and  $\perp$  should be interconnected by the interconnection strip)
- Connect the earthing clip of the probe to a proper earth
- Select the 10 M $\Omega$  range on the probe
- With the range selector the following ranges are possible.

Range selector to position	HT range
20 V	2 kV max.
200 V	20 kV max.
1000 V	30 kV max. (see note)

### Notes:

- Maximum permissible d.c. voltage 30 kV (range end is 100 kV)
- The position of the decimal point should be observed.

## 3. UHF voltages (with probe PM 9200 and T-connector PM 9250)

- Select measuring mode DC-R
- Connect the probe to terminals "0" and V-R, with the earthing pin to "0" (terminals "0" and  $\perp$  should be interconnected)
- Set measuring range selector to the desired position.

### Notes:

- The maximum permissible voltage on the probe is 16 V<sub>r.m.s.</sub>
- The correction factor on the calibration curve of the probe should be taken into account.

## 4. Direct and alternating currents

- Select measuring mode DC-R or AC
- Select the correct measuring range with selector SK1
- Connect the current source to be measured to terminals "0" and I (BU4)

### Notes:

- The polarity indicator shows the polarity at terminal I with respect to terminal "0". Only the "-" sign will be displayed.
- Maximum permissible voltage on the current terminals in all ranges 250 V a.c. or d.c.
- The shunts are protected with a 6 A fuse (see chapter VIII sub-point B).

### 5. DC and AC (max. 1 kHz) currents up to 31.6 A with DC shunt PM 9244

- Select measuring mode DC-R or AC
- Connect the output sockets + and - of shunt PM 9244 to terminals V-R and "0" (BU3 and BU2)
- Set the range selector to position 200 mV
- Connect the current source to terminals - and 10 A or 31.6 A dependent on the current to be measured.
- By means of switch SK1 (Fig. 5) the output voltage of shunt PM 9244 can be switched-over from 100 mV to 31.6 mV.

### 6. AC currents up to 100 A with current transformer PM 9245

- Select measuring mode AC
- Connect the terminals of transformer PM 9245 to terminals "0" and I
- Set the range selector to position 200 mA
- Pass the current-carrying conductor through the opening of the transformer.
- Maximum permissible alternating current 100 A.
- Frequency range 45 Hz - 1 kHz.

### 7. Resistors

- Select measuring mode DC-R
- Connect the unknown resistor to terminals "0" and V-R
- Select the correct measuring range.

#### Notes:

- The measuring current is :    1 mA for the 200  $\Omega$  and 2 k $\Omega$  ranges,  
     10  $\mu$ A for the 20 k $\Omega$  and 200 k $\Omega$  ranges and  
     100 nA for the 2 M $\Omega$  and 20 M $\Omega$  ranges.
- For measuring resistors measuring clip PM 9261 can be used.
- Semi-conductors can be measured in forward direction of range 2 k $\Omega$ . The display shows the diode voltage in forward direction of 1 mA. Terminal "V-R" (BU3) is positive with respect to terminal "0" (BU2).

## VII. CIRCUIT DESCRIPTION

## SERVICE DATA

## A. ANALOG SECTION

The analog section of the instrument serves to convert all modes to be measured into a voltage level of + or -2 V in order to obtain a maximum display.

This voltage is supplied to the digital section, which has a constant input-sensitivity of 2 V for maximum display.

## 1. DC voltage circuit

The input circuit for direct voltage measurements is shown in Fig. 12. The attenuation for the various ranges is given in the table below.

Range	Attenuation	Input amplifier (at end-of-range)
200 mV	1x	0.2 V
2 V	1x	2 V
20 V	100x	0.2 V
200 V	100x	2 V
1000 V	1000x	1 V

The attenuated input voltage is supplied to an amplifier, the gain of which is switchable between 1x and 10x by means of wafer SK1/II f. The output voltage of the amplifier is always 2 V at end-of-range. Spark-gap VL102, which conducts at voltages over 1700 V, serves to protect switch SK1.

## 2. AC voltage circuit

The circuit for alternating voltage measurements is shown in Fig. 12 and is in principle equal to the circuit for direct voltage measurements.

However, for the a.c. behaviour the attenuator resistors are shunted by capacitors C101 up to C105. After being amplified 1 or 10 times the alternating voltage (always 2 V a.c. at end-of-range) is supplied to an a.c.-to-d.c. converter.

The output direct voltage is supplied to the analog-to-digital converter.

## 3. Direct and alternating current circuit

The circuit for current measurements is shown in Fig. 13.

The current to be measured is converted into a voltage by means of shunts (R116 ... R120).

The voltage across the shunt is 0.2 V at end-of-range, thus the 1x/10x amplifier is set to position 10x for all current ranges.

For alternating currents the a.c.-to-d.c. converter is switched in after the amplifier.

The current ranges are protected by a 6A-fuse (VL103)

If the voltage across the shunt, caused by too high a current or by supplying an excessive voltage to the current input, is larger than about 1.4 V diodes GR101/GR103 or GR102/GR104, depending on the polarity, become conductive. The current through the diodes is restricted by R112 up to R115.

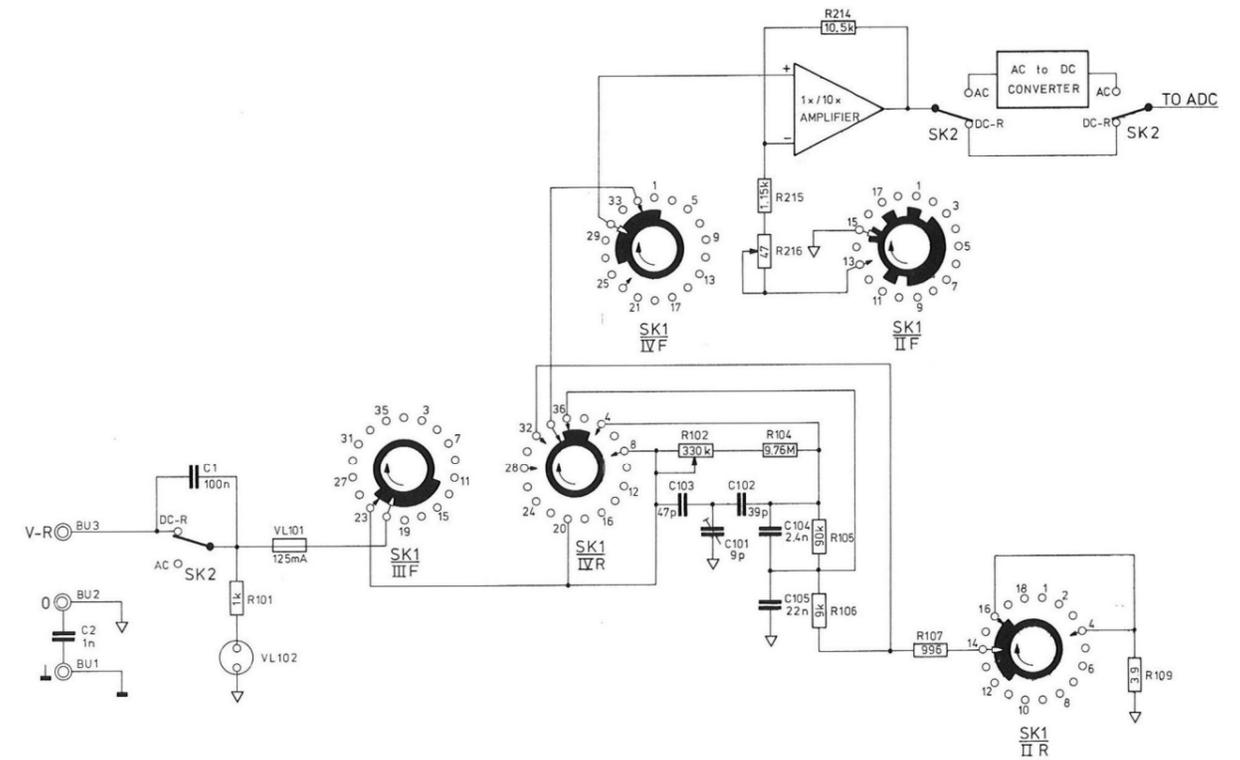

Fig. 12. Direct and alternating voltage measuring circuit

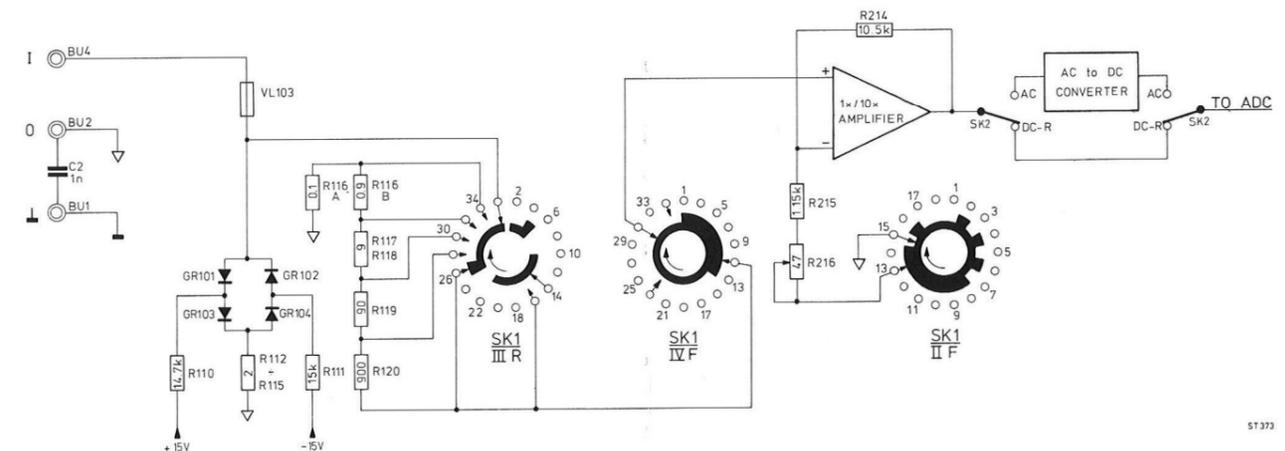

Fig. 13. Direct and alternating current measuring circuit

#### 4. Resistance measuring circuit

The principle for resistance measurements is shown in Fig. 14.

A constant current passes through the unknown resistance  $R_x$ .

The voltage obtained across  $R_x$  is a measure for the value of  $R_x$ .

The voltage across  $R_x$ ,  $V_x$ , is supplied to the + input of IC2 (1x/10x amplifier). Depending on the position of switch S,  $V_x$  will be amplified 1 or 10 times.

As the difference between both inputs is zero (for an ideal operation amplifier) voltage  $V_x$  is also available at the - input of IC2, which is interconnected with the + input of IC1. At the - input of IC1 a constant current source (1 mA) is connected.

As no current flows from the - input of IC1 the current of 1 mA causes a voltage of 1 V across the 1 k $\Omega$ -resistor. At the output of IC1 is present :  $V_x$  (from the + input) + 1 V (across 1 k $\Omega$ -resistor).

Thus a voltage of  $V_x + 1 \text{ V} - V_x = 1 \text{ V}$  is available across  $R_s$ ; this voltage is independent of  $V_x$  and thus of  $R_x$ . Resistor  $R_s$  determines the current through  $R_x$ .

Fig. 15 represents the situation how this principle is used in the PM 2422A.

The next table gives a survey of the various measuring currents and voltages for the selected ranges.

Range	Value of $R_s$	Composition of $R_s$	Measuring current	Measuring voltage at end-of-range	1x/10x amplifier	ADC input
20 M $\Omega$	10 M $\Omega$	R107+R106+R105+	100 nA	2 V	1x	2 V
2 M $\Omega$	10 M $\Omega$		100 nA	200 mV	10x	2 V
200 k $\Omega$	100 k $\Omega$	R107+R106+R105	10 $\mu$ A	2 V	1x	2 V
20 k $\Omega$	100 k $\Omega$		10 $\mu$ A	200 mV	10x	2 V
2 k $\Omega$	1 k $\Omega$	R107 + resistance value of VL101 (approx. 4 $\Omega$ )	1 mA	2 V	1x	2 V
200 $\Omega$	1 k $\Omega$		1 mA	200 mV	10x	2 V

All resistance ranges can withstand 250 V a.c. at the input.

In the case of incorrect operation in the ranges 200  $\Omega$  and 2 k $\Omega$  the applied voltage appears across resistor R107 and is also supplied to the output of IC401 via R107. The voltage across R107, however, is limited by zener diodes GR105/GR106 at a value of about 12 V. Resistor R108 limits the zener-current. If the current exceeds 125 mA, fuse VL101 will blow.

All other resistor ranges are protected because the current will be low due to the very high value of resistor  $R_s$  (100 k $\Omega$  and 10 M $\Omega$ ). Fuse VL101 then will not blow.

The current source consists of TS401 and GR402.

Zener diode GR402 is chosen so that the variations of  $V_{BE}$  of TS401 at temperature variations are compensated for by the temperature coefficient of the zener diode.

#### 5. 1x/10x Amplifier (Fig. 16)

The amplifier consists of operational amplifier IC201 preceded by source-follower TS203.

This source-follower has a very high input-impedance at a low offset current. The offset voltage of the amplifier is compensated for by R212 and potentiometer "ZERO" (R208) at the rear panel. With the latter potentiometer also the drift of TS203 can be compensated for.

The gain of the amplifier is determined by ratio

$$\frac{R214 + R215 + R216}{R215 + R216} = \frac{R214}{R215 + R216} + 1.$$

If switch S (corresponds to SK1/II f) is open the gain is 1 time, if it is closed the gain is 10 times.

With potentiometer R216 the gain can be adjusted to 10 times exactly.

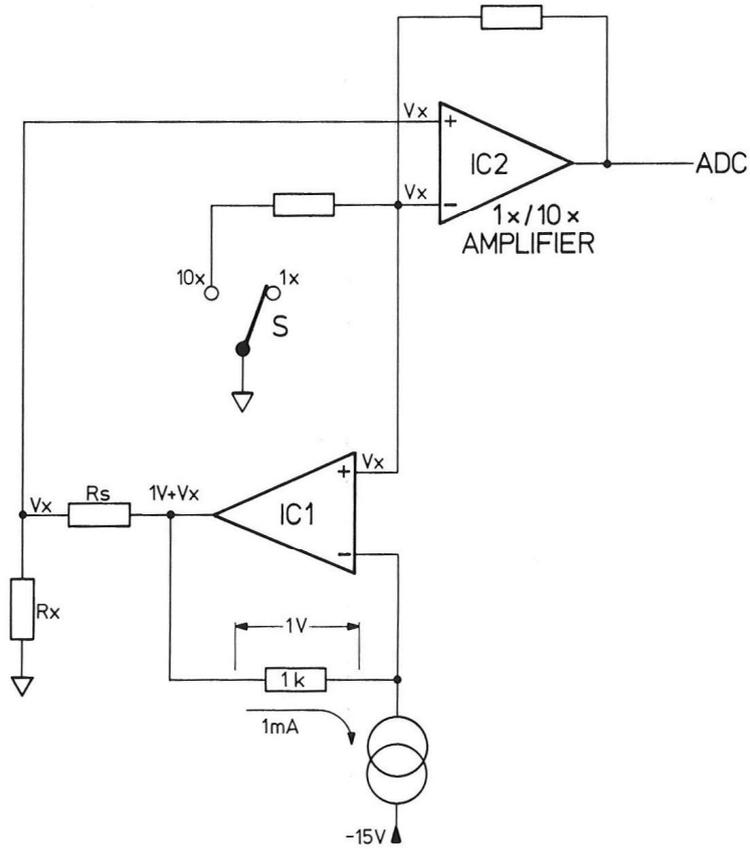

Fig. 14. Principle of resistance measurements

ST 367

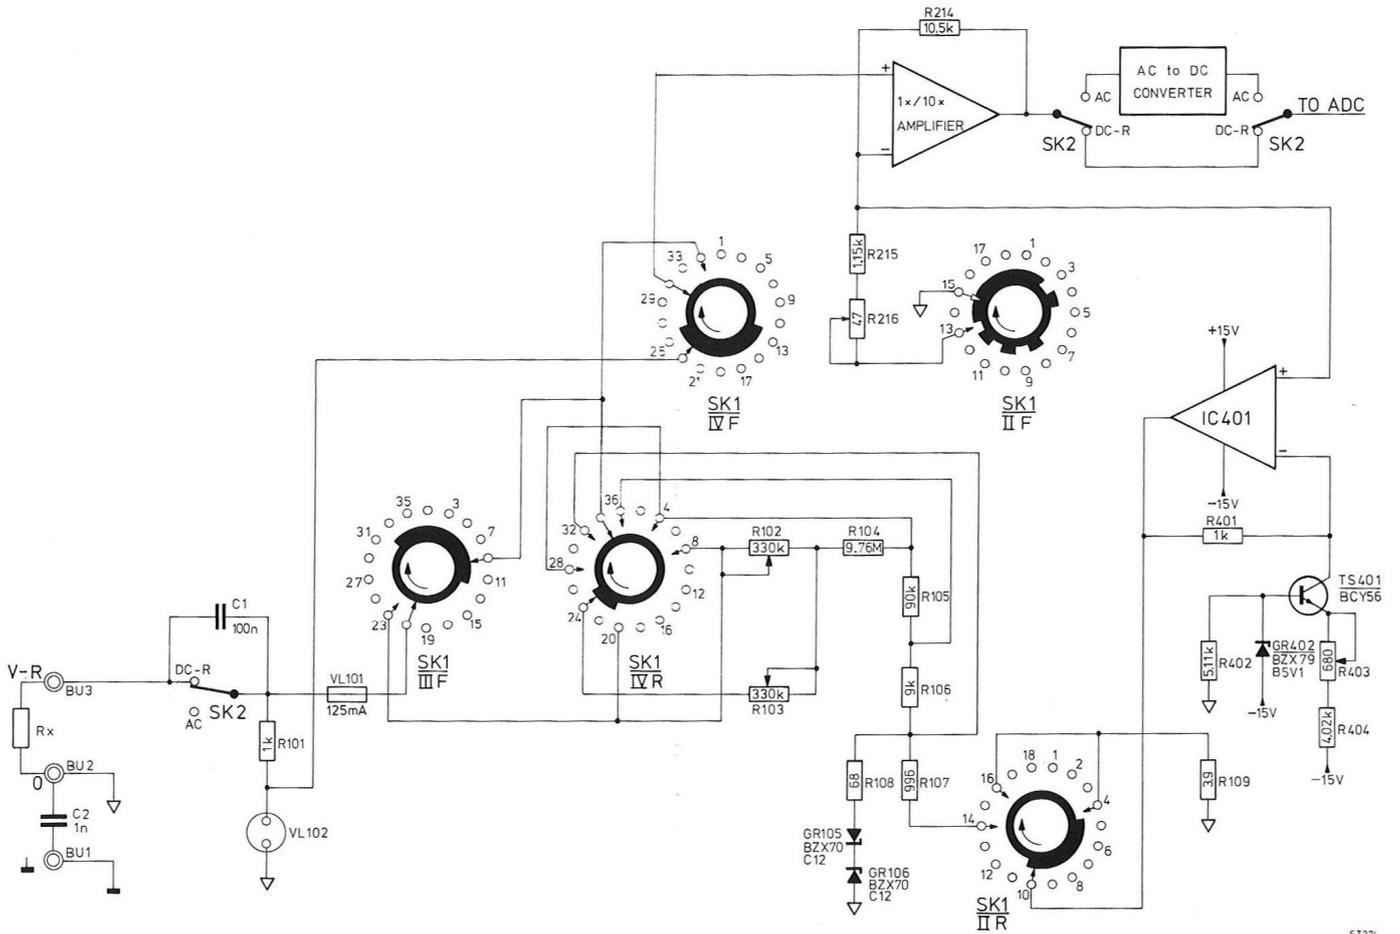

Fig. 15. Resistance measuring circuit

5137c

For d. c. measurements capacitor C203 is connected to circuit zero via FET switch TS204, thus forming together with R201 and R202 an RC-filter by which a. c. voltages are suppressed.

For a. c. measurements an improvement of the frequency response is achieved by  $C201 + C202 // R202$ .

The gate-leakage current of TS203 is kept low by making the source-drain voltage low by means of zener diode GR201.

### Protection

The protection of the amplifier is made by transistors TS201 and TS202. By connecting bases and collectors two zener diodes are obtained the zener voltage of which is approximately 8 V with a low leakage current. If the voltage at point TP202 exceeds 8 V the transistors become conductive and limit the gate-voltage of TS203.

The input current is limited by R201 and R202.

## 6. AC-to-DC converter (Fig. 17)

The supplied voltage which is always  $2 V_{r.m.s.}$  at range-end-values in all ranges is converted to 2 V d. c. To eliminate the non-linearity of the diode characteristic an operational amplifier with a high open-loop gain is used (IC301).

The gain for positive periods is determined by the ratio  $\frac{R309}{R301 + R302}$ , for negative periods by the ratio  $\frac{R308}{R301 + R302}$  and should be 2.22 (twice the form factor).

As IC301 is controlled at the inverting input the input impedance of the converter is low (about 4.5 k $\Omega$ ). However, the converter is preceded by the 1x/10x amplifier which serves as a buffer.

A separate d. c. feedback branch (R303-R306) is used to decrease the drift of IC301. However, it is decoupled for a. c. by C307.

Offset compensation is made by potentiometer R304 and indirectly used to adjust the linearity at small input voltages.

Potentiometer R302 is used to make end-of-range calibration.

## B. DIGITAL SECTION

The digital section of the instrument serves to convert the supplied d. c. voltage from the analog section into a decimal information corresponding to the input signal.

The digital section contains the following circuits:

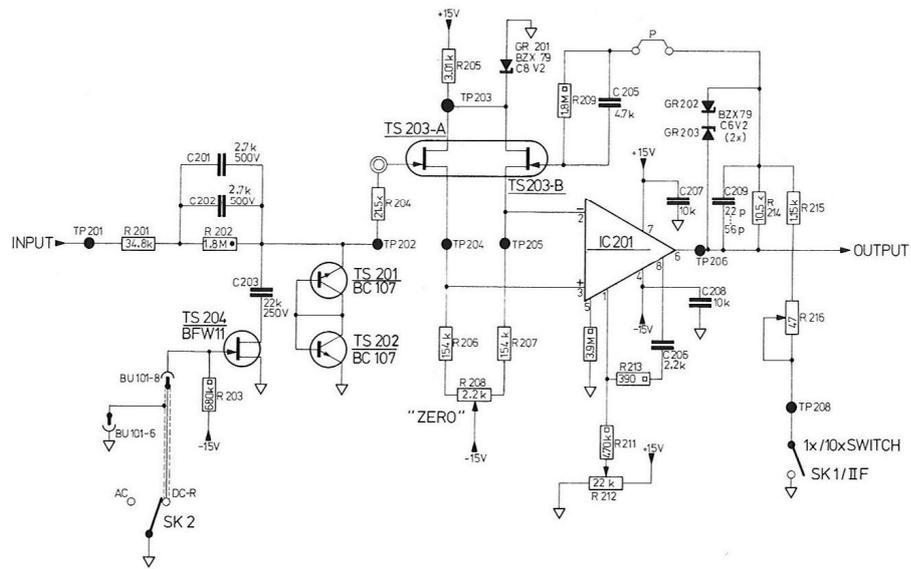

- $+V_{REF}$  and  $-V_{REF}$ .
- Analog-to-digital converter (ADC)
- Display

### 1. $+V_{REF}$ and $-V_{REF}$ (Fig. 18)

These voltages are required as reference voltage for the ADC.

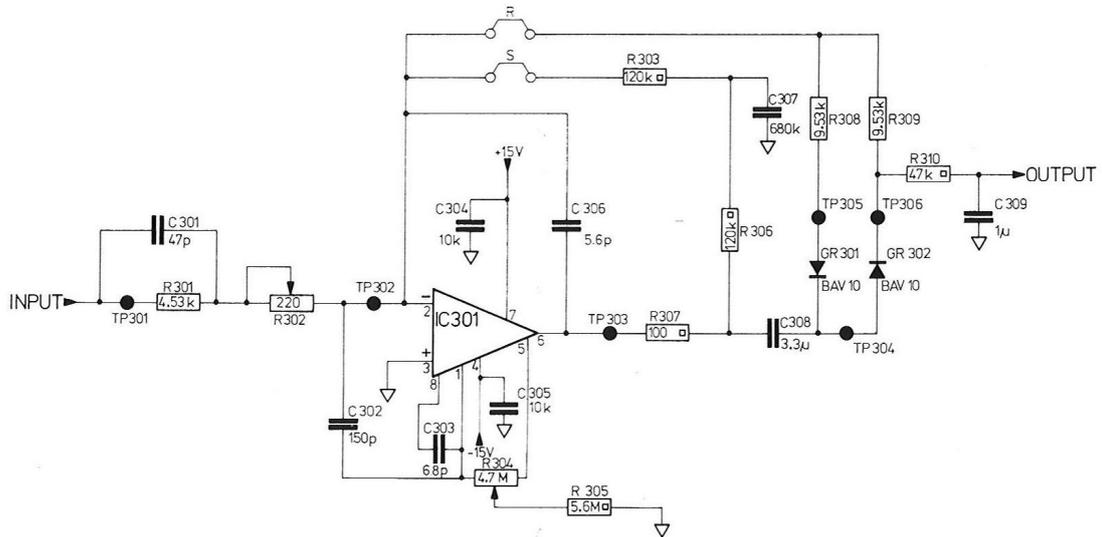

The positive reference voltage is achieved via zener diode GR602 (50 ppm/ $^{\circ}$ C) controlled from a current source. With voltage divider  $R603 + R604 + R605/R608$  an output voltage of 2.046 V is obtained which can be adjusted by potentiometers R603 and R604 (available at the rear).

The negative reference voltage is achieved by inverting  $+V_{REF}$  via an amplifier with a gain of -1. Potentiometer R612 can be used to correct differences in "on" resistances and switching times of the switches in the ADC.

Fig. 18. +V<sub>REF</sub> and -V<sub>REF</sub> circuit

## 2. Analog-to-digital converter (ADC)

The used system is derived from the delta pulse modulation principle.

For the function of the ADC, refer to chapter IV, sub-point B.

### Practical execution

In PM 2422A this system is obtained as shown in Fig. 19.

The comparator consists of TS501 with a constant current source (TS502) followed by an amplifier (IC501) fed back for a.c.

The subtracting of pulses as described before is effected by an up-down counter which is included in IC502.

This (P-channel-MOS) integrated circuit comprises also the next circuits:

- Input flip-flop, connection point 3.

This flip-flop sets the analog switches, which select the reference voltage.

- Analog switch: input at point 16 ( $+V_{REF.}$ ) and point 14 ( $-V_{REF.}$ ), output at point 15.

- Synchronisation circuit:

input : point 13

outputs : the reset pulse (11)

the transfer pulse (4)

the scan pulse (2)

If the input becomes logical 0 the measuring cycle is started at the first positive edge supplied by the input flip-flop, so that jitter and stalling of the digital part of the ADC are prevented.

- Polarity output circuit, output 12.

This circuit detects the polarity of the input voltage. If the output is logical 1 the polarity is negative; if, however, it is logical 0 the polarity is positive.

- Pulse output circuit, output 5.

During the measuring time, the ADC pulses are supplied to the display via output 5.

### Remark

The scanning output supplies a signal with a frequency of 512 Hz and a duty cycle of about 1:15 at a clock frequency of 8.2 kHz.

This 512 Hz pulse feeds the scanning system of the display.

## 3. Clock oscillator (Fig. 20)

The clock pulse is derived from the programmable U. J. T. TS503.

The oscillator frequency is adjustable with R515. This frequency should be 8.2 kHz. By this the frequency of the scanning output of IC502 will be 512 Hz.

## 4. Display

The display is divided in the following blocks

- 4-decade counter/register (multiplexed output)
- decoder driver
- anode switches
- overrange detector

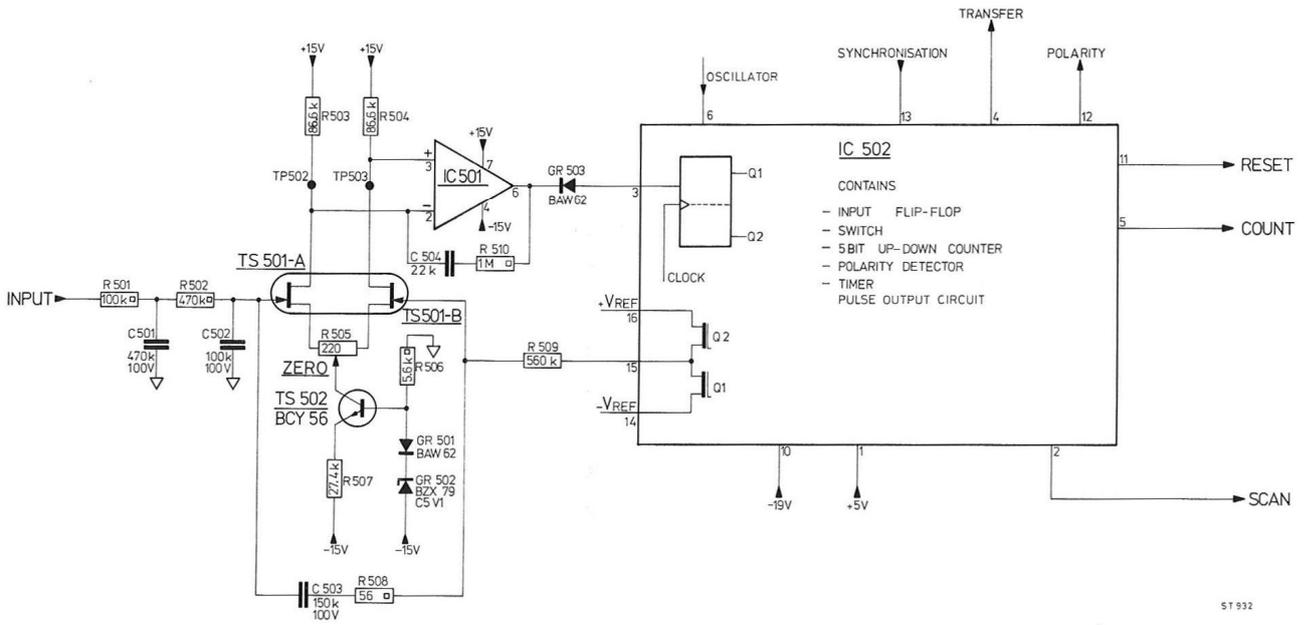

Fig. 19. Analog-to digital converter

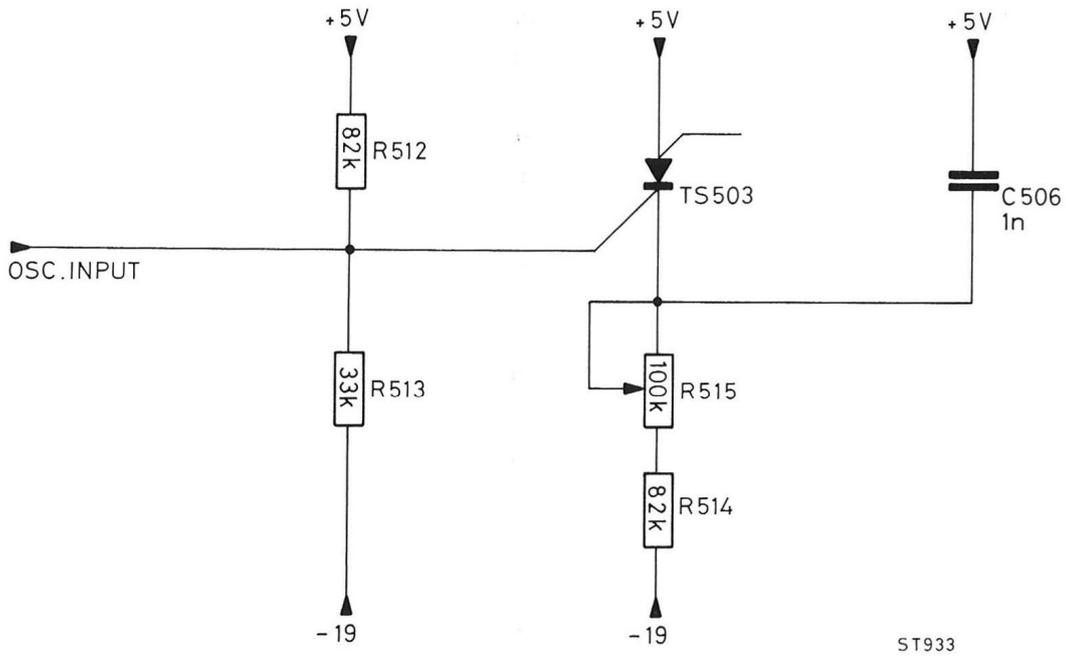

Fig. 20. Monostable multivibrator

a. 4-decade counter/register (Fig. 21)

This counter is a monolithic (P-channel-MOS) integrated circuit and contains

- four decade counters connected in series in such a way that the supplied pulses are converted into a BCD-code per decade.
- four buffer-registers which store the digital information from the decade counters.
- a multiplexer which converts the BCD parallel information into a serial form and transfers the digital information to the input of a decoder-driver synchronously with the relevant anode switch.
- a scaler-of-four which converts the scan frequency with a decoder, by means of a 1 out 4 code to drive the anode switches.

b. Decoder driver

The decoder driver converts the supplied BCD information into a decimal figure and controls the indicators  $10^0$ ,  $10^1$ ,  $10^2$  and  $10^3$  from which the cathodes are parallel-connected.

c. Anode switches (Fig. 22)

The indicators are controlled via 4 anode switches (TS707...TS710), which in turn are driven by signals "Scan  $10^3$ ", "Scan  $10^2$ ", "Scan  $10^1$ " and "Scan  $10^0$ " supplied by IC701 (see 4.a.).

Via a differentiating network (e.g. C702-R716) pulse "Scan  $10^3$ " (a negative pulse) is applied to the base of TS707. The negative-going edge turns on TS707; thus the corresponding indicator anode ( $10^3$ ) is connected to the +185 V supply.

At the positive-going edge TS707 is blocked.

GR710/GR712/GR714/716 limit  $V_{BE}$  of the anode switches at the positive edge; while GR713/GR715/GR718 limit the  $V_{CE}$ .

To block the transistors TS707...TS710 the emitter is biased with respect to the base by means of stabistor GR717.

Sequence diagram Fig. 23 gives a short survey of the working.

d. Overrange detector (Fig. 24)

If the read-out exceeds 1999 the overrange detector detects both the logical levels of signals DATA OUT "B" (logical 1) and SCAN  $10^3$  (logical 0). The output voltage of the detector becomes logical 1 (5 V) thus blocking the pulses SCAN  $10^0$  and SCAN  $10^1$ . The corresponding indicators extinguish. Only indicator B703 ( $10^2$ ) lights and shows a 0 because the maximum display is 2046. Furthermore the "2" indication for the thousands is not built in.

C. SUPPLY (Fig. 35, blz. 67)

1. +185 V source

This source serves to supply the indicators (B702...B705) and is stabilized via a series-stabilisation circuit.

The reference voltage, derived from zener diodes GR806 and GR807, serves also to clamp maximum  $V_{CE}$  of the transistor switches TS707...TS710.

Zener diode GR805 and resistor R815 serve to limit the load current, as the current supplied to the decoder-driver amounts to 7 mA max. (at  $V_{QL} = 0$  V).

The voltage across C807 (+230 V) is used to supply LA701 ("-" indicator).

2. +15 V and +5 V source

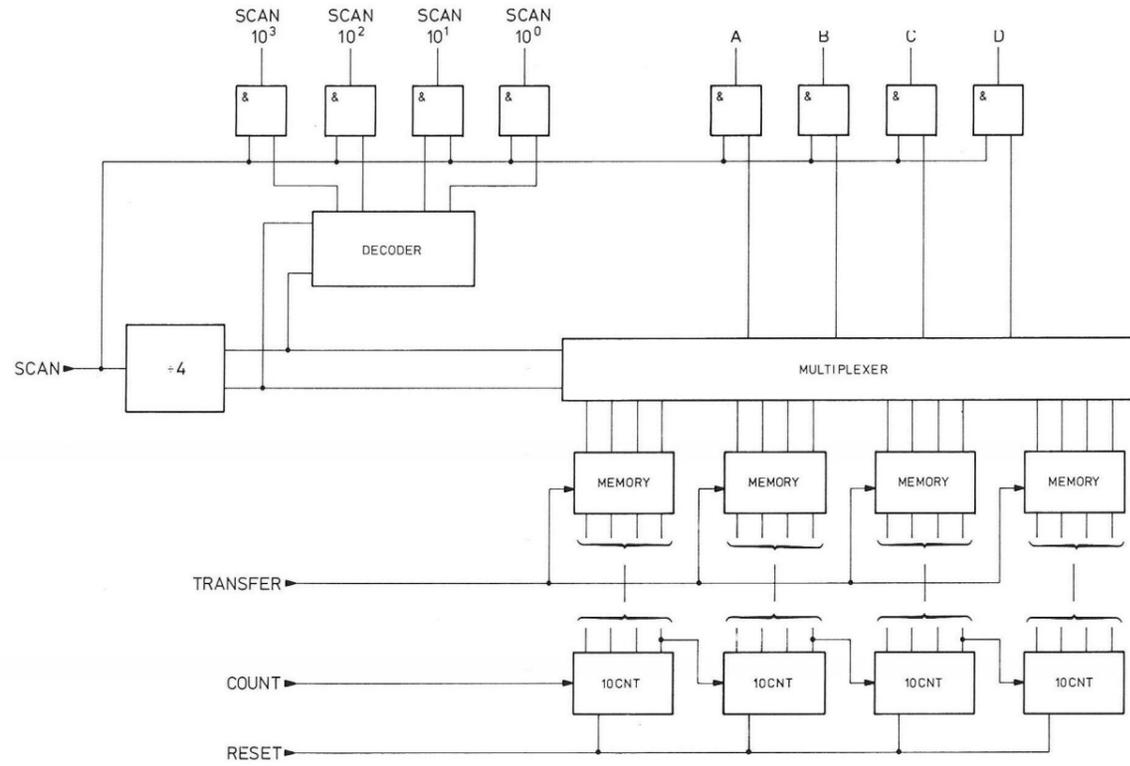

This source is stabilized via voltage regulator IC801 which comprises a reference amplifier, a control amplifier and a current limiting circuit.

The +5 V source is derived from the +15 V source with zener diode GR801 and transistor TS801. R801 serves for current limitation for transistor TS801.

3. -19 V and -15 V source

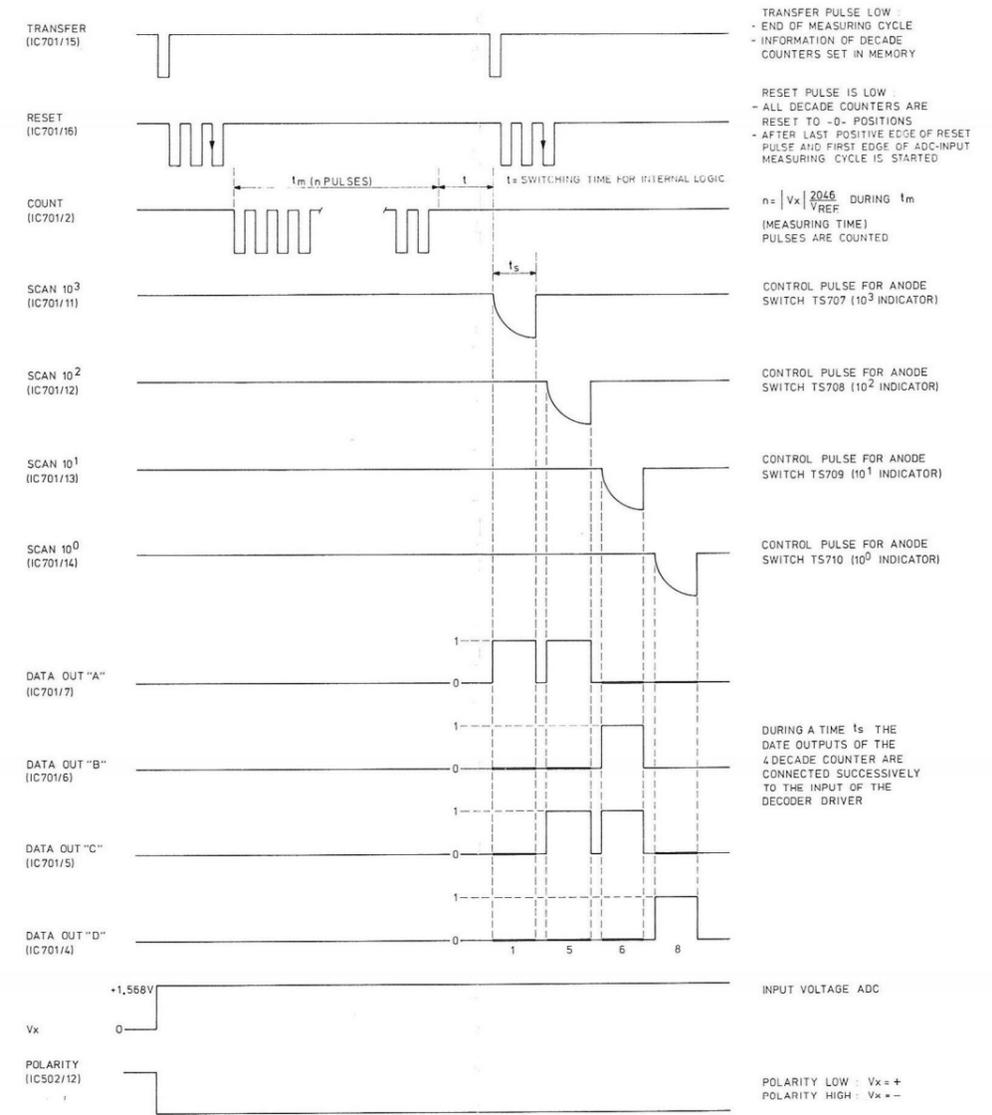

This source is stabilized via voltage regulator IC802. The output current is limited by zener diode GR804 and series resistor R811.

The -15 V source is derived from the -19 V source with stabistor GR809.

## VIII. ACCESS

The opening of parts, or removal of covers, is likely to expose live conductors. The instrument should therefore be disconnected from all voltage sources before any opening of parts or removal of covers is started.

During and after dismantling, bear in mind that capacitors in the instrument may still be charged even if it has been separated from all voltage sources.

USE A WELL-FITTING CROSSHEAD SCREW-DRIVER TO DISMANTLE THE INSTRUMENT TO PREVENT THE CROSS-SLOTTED SCREWS FOR DAMAGE.

## A. DISMANTLING

1. Top cover

- Remove both screws "A" (Fig. 31).
- Lift the cover at the rear and slide it backwards from the unit.

2. Bottom cover

- Remove both screws "B" (Fig. 31).
- Lift the cover at the rear and slide it backwards from the unit.

## B. FUSES

1. Fuse VL1

The mains supply is protected by fuse VL1 mounted inside on the rear plate (fig. 32, page 101).

2. Fuse VL101

In the resistance circuit fuse VL101 will protect the zener current. If the current exceeds 125 mA, the fuse will blow.

3. Fuse VL103

In the current circuit (via terminals I, BU4) a 6.3 A glass fuse has been incorporated to protect the shunt resistors R116-120.

## C. ELECTRICAL COMPONENTS

If an electrical component (resistor, capacitor, transistor or integrated circuit) has been replaced by a new one, the relevant part of the circuit must be checked in accordance with chapter XI.

The next survey indicates roughly which sub-point(s) of chapter XI must be performed.

Part number	Adjust or check in accordance with
R102...R107 (Attenuator)	XI.D.4. , XI.F.1. and XI.F.2.
R116...R120 (Shunts)	XI.G.
C101-C105 (a.c. attenuator)	XI.E.4. and XI.E.5.
Components starting with sequence number 2..	XI.D.1. , XI.D.2. and XI.D.3.

Part number	Adjust or check in accordance with
Components starting with sequence number 3..	XI.E.1., XI.E.2. and XI.E.3.
Components starting with sequence number 4..	XI.F.1.
Components starting with sequence number 5..	XI.C.1., XI.C.2. and XI.C.3.
Components starting with sequence number 6..	XI.C.1., XI.C.2. and XI.C.3.

## IX. MAINTENANCE AND SERVICE

Digital multimeter PM 2422A requires no maintenance because the instrument contains no components which are subject to wear.

However, to ensure reliable and faultless operation, the instrument should not be exposed to moisture, heat, corrosive vapours and excessive dust.

### Service hints

If service work must be performed, the following points should be taken into account to avoid damage of the instrument.

- In case of measurements on a switched-on instrument proceed carefully to avoid short-circuits by means of measuring clips or measuring hooks
- For soldering use absolutely acid-free soldering tin
- For all soldering work on the printed circuit boards, use a miniature soldering iron (35 W max.) with a thin-cleaner or a vacuum soldering iron.

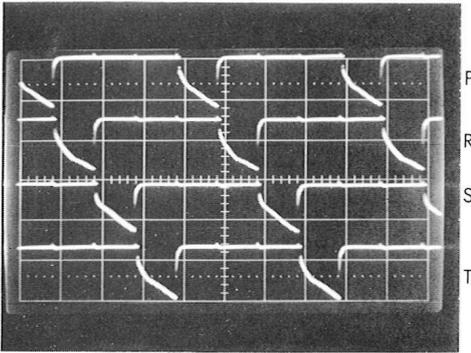

### Trouble shooting

On the printed wiring board test points are introduced at the component side as well as at the conductor side. The test points at the component side (Fig. 25) are especially made for service work, those at the conductor side for testing purposes in the factory. The latter can, of course, also be used for servicing (Fig. 26).

Furthermore, jumpers are introduced on the printed wiring board (Fig. 27); they can be used to interrupt circuits in order to test the functioning of the corresponding circuit.

### General conditions:

- nominal mains voltage (220 V, 50 Hz)
- calibrated
- voltages with respect to circuit zero (terminal "0"), unless otherwise stated
- the data given represent the properties of an average instrument and may serve as a guide only
- voltages are measured with digital multimeter PM 2421
- oscillograms are recorded with oscilloscopes PM 3370 and PM 3250
- measure voltages and oscillograms with 10 M $\Omega$  input impedance.

## B. ELECTRICAL

This parts list does not contain multi-purpose and standard parts. These components are indicated in the circuit diagram by means of identification marks. The specification can be derived from the survey below.

Diese Ersatzteilliste enthält keine Universal- und Standard-Teile. Diese sind im jeweiligen Prinzipschaltbild mit Kennzeichnungen versehen. Die Spezifikation kann aus nachstehender Übersicht abgeleitet werden.

In deze stuklijst zijn geen universele en standaardonderdelen opgenomen. Deze componenten zijn in het prinsipschema met een merkteken aangegeven. De specificatie van deze merktekens is hieronder vermeld.

La présente liste ne contient pas des pièces universelles et standard. Celles-ci ont été repérées dans le schéma de principe. Leurs spécifications sont indiquées ci-dessous.

Esta lista de componentes no comprende componentes universales ni standard. Estos componentes están provistos en el esquema de principio de una marca. El significado de estas marcas se indica a continuación.

	Carbon resistor E24 series Kohleschichtwiderstand, Reihe E24 Koolweerstand E24 reeks Résistance au carbone, série E24 Resistencia de carbón, serie E24	} 0,125 W      5%		Carbon resistor E12 series Kohleschichtwiderstand, Reihe E12 Koolweerstand E12 reeks Résistance au carbone, série E12 Resistencia de carbón, serie E12	} 1 W ≤ 2,2 MΩ, 5% > 2,2 MΩ, 10%
	Carbon resistor E12 series Kohleschichtwiderstand, Reihe E12 Koolweerstand E12 reeks Résistance au carbone, série E12 Resistencia de carbón, serie E12		} 0,25 W ≤ 1 MΩ, 5% > 1 MΩ, 10%		
	Carbon resistor E24 series Kohleschichtwiderstand, Reihe E24 Koolweerstand E24 reeks Résistance au carbone, série E24 Resistencia de carbón, serie E24	} 0,5 W ≤ 5 MΩ, 1% > 5 MΩ ≤ 10 MΩ, 2% > 10 MΩ, 5%			Wire-wound resistor Drahtwiderstand Draadgewonden weerstand Résistance bobinée Resistencia bobinada
	Carbon resistor E12 series Kohleschichtwiderstand, Reihe E12 Koolweerstand E12 reeks Résistance au carbone, série E12 Resistencia de carbón, serie E12		} 0,5 W ≤ 1,5 MΩ, 5% > 1,5 MΩ, 10%		Wire-wound resistor Drahtwiderstand Draadgewonden weerstand Résistance bobinée Resistencia bobinada
	Wire-wound resistor Drahtwiderstand Draadgewonden weerstand Résistance bobinée Resistencia bobinada	} 10 W      5%			
	Tubular ceramic capacitor Rohrkondensator Keramische kondensator, buistype Condensateur céramique tubulaire Condensador cerámico tubular		} 500 V		Polyester capacitor Polyesterkondensator Polyesterkondensator Condensateur au polyester Condensador polyester
	Tubular ceramic capacitor Rohrkondensator Keramische kondensator, buistype Condensateur céramique tubulaire Condensador cerámico tubular	} 700 V			Flat-foil polyester capacitor Miniatur-Polyesterkondensator (flach) Platte miniatuur polyesterkondensator Condensateur au polyester, type plat Condensador polyester, tipo de placas planas
	Ceramic capacitor, "pin-up" Keramikkondensator "Pin-up" (Perltyp) Keramische kondensator "Pin-up" type Condensateur céramique, type perle Condensador cerámico, versión "colgable"		} 500 V		Paper capacitor Papierkondensator Papierkondensator Condensateur au papier Condensador de papel
	"Microplate" ceramic capacitor Miniatur-Scheibenkondensator "Microplate" keramische kondensator Condensateur céramique "microplate" Condensador cerámico "microplaca"	} 30 V			Wire-wound trimmer Drahttrimmer Draadgewonden trimmer Trimmer à fil Trimmer bobinado
	Mica capacitor Glimmerkondensator Micakondensator Condensateur au mica Condensador de mica		} 500 V		Tubular ceramic trimmer Rohrtrimmer Buisvormige keramische trimmer Trimmer céramique tubulaire Trimmer cerámico tubular

For multi-purpose and standard parts, please see PHILIPS' Service Catalogue.

Für die Universal- und Standard-Teile siehe den PHILIPS Service-Katalog.

Voor universele en standaardonderdelen raadplege men de PHILIPS Service Catalogus.

Pour les pièces universelles et standard veuillez consulter le Catalogue Service PHILIPS.

Para piezas universales y standard consulte el Catálogo de Servicio PHILIPS.

Resistors

No.	Ordering number	Value	%	Series	Description
R102	5322 101 14045	330 kΩ	20	0.5 W	Potentiometer

By means of the jumpers of Fig. 27 circuits may be interrupted for separate testing purposes. Interruption is done by removing the solder from the spot by means of a vacuum soldering iron.

A short survey of the jumpers follows:

Jumper		Function
A	Supply +230 V	Measuring of unloaded supply voltages
B	Supply +112 V	
C	Supply +185 V	
D	Supply + 15 V	
E	Supply + 5 V	
F	Supply - 19 V	
		It is recommended to interrupt always jumper A in order to prevent damaging of the circuits.
J	Overrange out	No detection of over-range indication. Maximum reading of 2046.
K	Comparator out	No special function
L	Chopped output of ADC	
N	Input from current source	Separation of the current source for $\Omega$ measurements and d.c. amplifier
P	Feed-back of 1x/10x amplifier	Measuring open loop gain of IC 201
R	A.C. feed-back IC 301	AC behaviour of the a.c. - to d.c. converter
S	D.C. feed-back IC 301	DC behaviour of the a.c. - to d.c. converter
T	Output current source	Functioning of the current source
U	Input ADC	Separation of analogue part and digital part

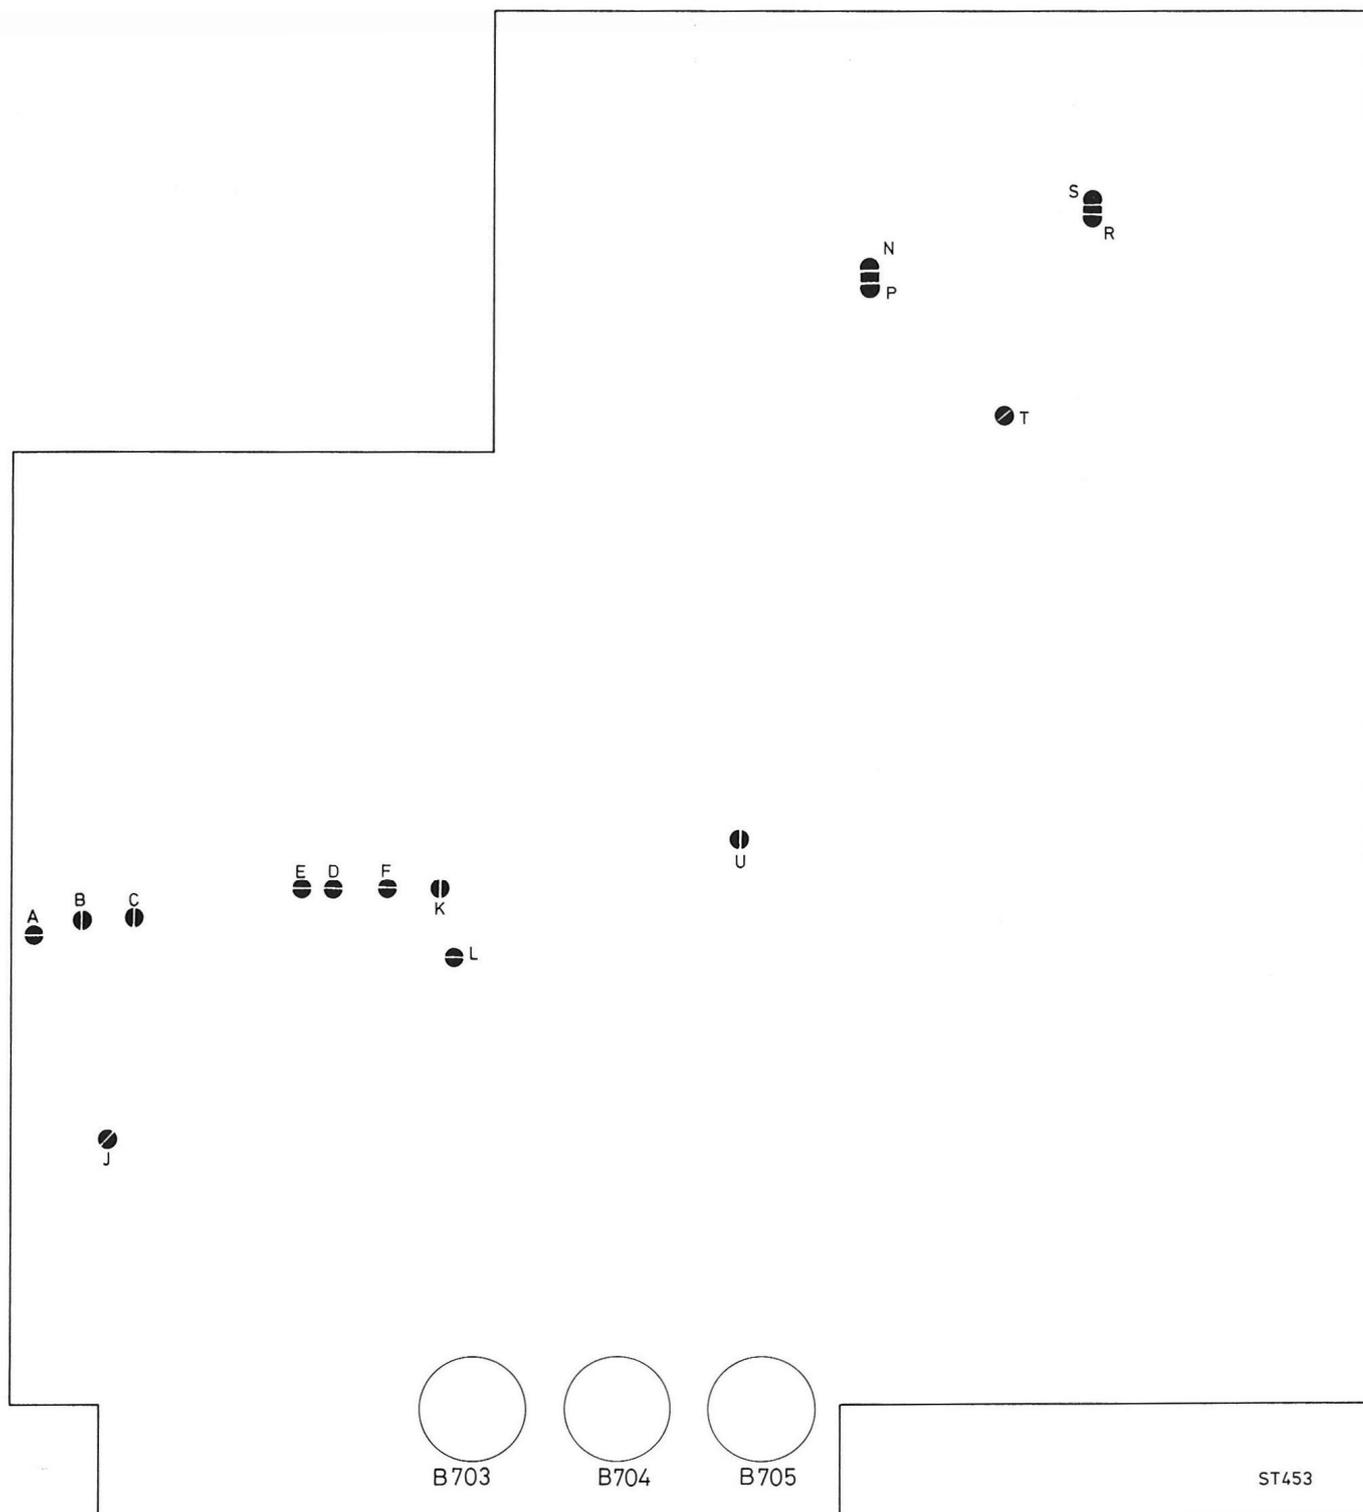

Fig. 27. Location of jumpers on the printed wiring board

## X. CHECKING AND ADJUSTING SURVEY

The next table gives a survey of the adjustments and checking procedure of multimeter PM 2422A. For a complete adjustment adhere to the sequence of chapter XI.

Control element	Fig. 29	Checking or adjusting point	According to chapter XI sub-point
	-	<u>Supply voltages</u> +230 V, +185 V, +112 V, +15 V +5 V, -15 V and -19 V	A. 2.
R515		<u>Clock oscillator frequency</u>	B
		<u>ADC</u>

Required test equipment

To calibrate this measuring instrument only reference voltages and measuring equipment with the required accuracy should be applied. The test equipment and standards required for checking, adjusting or calibration are listed in the next table.

Test	Required performance	Recommended equipment
DC Calibration	Accuracy : at least $\pm 0.04\%$ Range : 10 mV ... 1000 V	DC standard e.g. PM 2480
AC Calibration	Accuracy : at least $\pm 0.08\%$ Voltage : 10 mV - 110 V Frequency: 30 Hz ... 25 kHz	AC standard e.g. HP745A
	<u>Resistance accuracy</u>	
Resistance calibration	50 $\Omega$	A series of standard resistors (e.g. metal film) or Guildline type 9330
	190 $\Omega$	
	200 $\Omega$	
	600 $\Omega$	
	1 k $\Omega$	
	1.4 k $\Omega$	
	1.9 k $\Omega$	
	19 k $\Omega$	
	190 k $\Omega$	
	1.9 M $\Omega$	
19 M $\Omega$	at least 0.1 %	
Supply voltages		Multimeter e.g. PM 2421
Pulse form		Oscilloscope e.g. PM 3231
Clock frequency		Counter e.g. PM 6630

## XI. CHECKING AND ADJUSTING

The tolerances stated in this chapter correspond to the factory data, which only apply to a newly re-adjusted instrument. Such data may differ from these given in chapter II, TECHNICAL DATA. Values without tolerances represent the properties of an average instrument and serve merely for reference.

A survey of the adjustments and adjusting elements is given in chapter X.

Perform calibration after a warming-up time of approximately 30 minutes.

Any adjustment, maintenance, and repair of an instrument which is opened whilst connected to the mains should be avoided as far as possible and, if inevitable, shall be only carried out by skilled personnel familiar with the risk of shock involved.

### A. SUPPLY

#### 1. Current consumption

The current consumption amounts to

- for 110 V mains : 250 mA max.
- for 220 V mains : 125 mA max.

#### 2. Supply voltages

Check the supply voltage in accordance with the next table at nominal mains voltage

Supply	Value	Measuring point
+230 V	+230 V $\pm$ 15 V	TP801 (+) and terminal 0
+185 V	+185 V $\pm$ 10 V	TP803 (+) and terminal 0
+112 V	+112 V $\pm$ 8 V	TP802 (+) and terminal 0
+ 15 V	+ 15 V $\pm$ 0.9 V	TP804 (+) and terminal 0
+ 5 V	+ 5 V $\pm$ 0.3 V	TP805 (+) and terminal 0
- 15 V	- 15 V $\pm$ 1.4 V	TP808 (-) and terminal 0
- 19 V	- 19 V $\pm$ 1.2 V	TP806 (-) and terminal 0

### B. CLOCK OSCILLATOR

- Connect an oscilloscope to test point L (SCAN)
- Check the pulse form (Fig. 28).

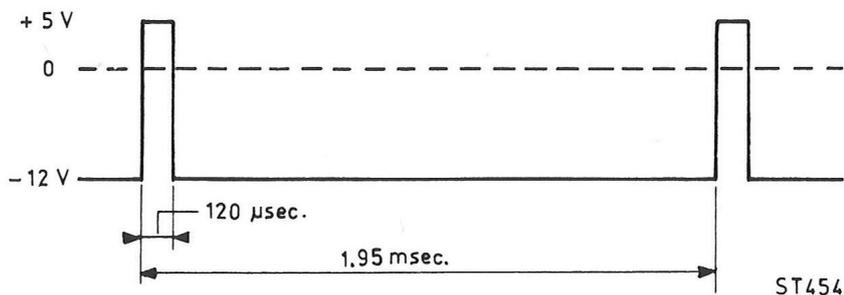

Fig. 28. Clock pulse

- Connect a counter (e.g. PM 6630) to test point L
- Adjust the frequency to 512 Hz  $\pm 1$  % with potentiometer R515 (the clock frequency will then be approximately 8.2 kHz).

## C. ADC

### 1. Zero setting comparator

- Pull-out connector BU101 (by this the digital section is separated from the analog section)
- Connect pin U (input ADC) and jumper L (= TP505) with the zero level (e.g. terminal "0")
- Connect an oscilloscope to TP504 (output comparator).

Oscilloscope settings: time base 0.5 msec/div.

amplitude 5 V/div.

Adjust potentiometer R505 as well as possible for zero level on the oscilloscope (within 1 div.)

- Remove the made connections

### 2. End-of-range calibration ADC

- Supply +1990 mV to test point U
- Adjust the reading to 1990 with potentiometer R604 (potentiometer CAL available at the rear)
- Supply -1990 mV to test point U.
- Adjust the reading to -1990 with potentiometer R611

### 3. Zero setting ADC

- Supply alternately + and -10 mV from a DC standard to test point U
  - Adjust the reading to +010 and -010 with potentiometer R612.
- Repeat C2 and C3, after which BU101 should be connected.

## D. CALIBRATING AND CHECKING THE DIRECT VOLTAGE RANGES

### 1. Calibration

- Interconnect terminals V-R (BU3) and 0 (BU2)
  - Set range selector SK1 to 200 mV
  - Depress button DC-R (SK2/1)
  - Set potentiometer R208 (potentiometer ZERO available at the rear) to its mid-position
  - Adjust the reading to  $00.0 \pm 3$  digits with potentiometer R212.
- With potentiometer R208 (ZERO) the reading can be adjusted to 000.
- Set range selector SK1 to 2 V
  - The reading should be .000. If not, the adjustment of the ADC is incorrect. Repeat sub-point C.
  - Supply +1990 mV
  - Adjust the reading to  $1990 \pm 0$  digits with potentiometer R604 (potentiometer CAL available at the rear)
  - Supply -1990 mV
  - The reading should be  $-1990 \pm 1$  digit (if necessary, readjust with potentiometer R611).

## 2. Adjustment 1x/10x amplifier

- Set range selector SK1 to 200 mV
- Perform zero setting with potentiometer ZERO (R208)
- Supply +199.0 mV to inputs V-R (BU3) and 0 (BU2)
- Adjust the reading to  $199.0 \pm 0$  digits with potentiometer R216
- Supply -199.0 mV
- The reading should be  $-199.0 \pm 1$  digit.

## 3. Checking the linearity

- Set range selector SK1 to position 200 mV
- Check the linearity of the instrument in accordance with the next table for positive as well as for negative voltages.

Supply to BU2-BU3	Reading
5 mV	$05.0 \pm 2$ digits
10 mV	$10.0 \pm 2$ digits
20 mV	$20.0 \pm 2$ digits
40 mV	$40.0 \pm 2$ digits
60 mV	$60.0 \pm 2$ digits
80 mV	$80.0 \pm 2$ digits
100 mV	$100.0 \pm 2$ digits
120 mV	$120.0 \pm 2$ digits
140 mV	$140.0 \pm 2$ digits
160 mV	$160.0 \pm 2$ digits
180 mV	$180.0 \pm 2$ digits
199 mV	$199.0 \pm 2$ digits

## 4. DC attenuator

Adjust or check the attenuator in accordance with the next table

Range selector to position	Supply to BU2-BU3	Reading	Adjust with
20 V	+ 19.9 V	$19.90 \pm 0$ digits	R102
200 V	+199 V	$199.0 \pm 1$ digit	-
1000 V	+990 V	$990 \pm 1$ digit	-

## E. CALIBRATING AND CHECKING THE ALTERNATING VOLTAGE RANGES

### 1. AC-to-DC converter

- Depress button AC (SK2/2).
- Adjust the converter in accordance with the next table

Range selector to position	Supply to BU2-BU3	Reading	Adjust with
200 mV	short-circuited	00.0 $\pm$ 5 digits	-
2 V	19 mV, 1 kHz	.019	R304
2 V	1900 mV, 1 kHz	1.900 $\pm$ 1 digit	R302
2 V	short-circuited	.000 $\pm$ 1 digit	
2 V	19 mV, 1 kHz	.019	R304
2 V	1900 mV, 1 kHz	1.900 $\pm$ 1 digit	R302

## 2. Frequency response AC-to-DC converter

- Adjust the converter in accordance with the next table

Range selector to position	Supply to BU2-BU3	Reading
200 mV	190 mV, 20 kHz	190.0 $\pm$ 5 digits
2 V	1.9 V, 20 kHz	1.900 $\pm$ 5 digits

If the reading in range 200 mV is too high and in range 2 V correct or too low, the value of capacitor C209 should be made higher.

If the reading in range 2 V is too high and in range 200 mV correct or too low, the value of capacitor C209 should be made smaller.

## 3. Checking the linearity

- Set range selector SK1 to position 200 mV

- Check the linearity of the instrument at a frequency of 1 kHz in accordance with the next table

Supply to BU2-BU3	Reading	Tolerance
5 mV	05.0	} $\pm$ 2 digits
20 mV	20.0	
40 mV	40.0	
60 mV	60.0	
80 mV	80.0	
100 mV	100.0	
120 mV	120.0	
140 mV	140.0	
160 mV	160.0	
180 mV	180.0	
190 mV	190.0	

## 4. Frequency independent attenuator

Adjust and check the attenuator in accordance with the next table

Range selector to position	Supply to BU2-BU3	Reading	Adjust with
200 mV	190 mV, 15 kHz	"X" (note this value)	-
20 V	19 V, 15 kHz	noted value "X"	C101
20 V	19 V, 150 Hz	19.00 $\pm$ 4 digits	-
20 V	19 V, 1.5 kHz	19.00 $\pm$ 4 digits	

5. Checking the frequency response

Check the frequency response in accordance with the next table

Range selector to position	Supply to BU2-BU3	Frequency	Reading	Tolerance
20 V	19 V	30 Hz	19.00	$\pm 6$ digits
		100 Hz	19.00	$\pm 4$ digits
		300 Hz	19.00	$\pm 4$ digits
		1 kHz	19.00	$\pm 4$ digits
		3 kHz	19.00	$\pm 4$ digits
		10 kHz	19.00	$\pm 4$ digits
		20 kHz	19.00	$\pm 6$ digits
		25 kHz	19.00	$\pm 8$ digits
200 V	109 V	30 Hz	109.0	$\pm 6$ digits
		100 Hz	109.0	$\pm 4$ digits
		300 Hz	109.0	$\pm 4$ digits
		1 kHz	109.0	$\pm 4$ digits
		3 kHz	109.0	$\pm 4$ digits
		10 kHz	109.0	$\pm 4$ digits
		20 kHz	109.0	$\pm 4$ digits
		25 kHz	109.0	$\pm 8$ digits
600 V AC	600 V	1 kHz	600	$\pm 4$ digits

If the deviation (downwards) is too large, add C106 parallel to C104 (ceramic capacitor 39 pF).

## F. RESISTANCE RANGES

1. Adjustment

- Depress button DC/R (SK2/1)
- Set range selector SK1 to 200 k $\Omega$
- The reading should be 0 (overload)
- Interconnect terminals V-R (BU3) and 0 (BU2)
- The reading should be 00.0  $\pm 1$  digit
- Connect a resistor of 190 k $\Omega$  to terminals V-R (BU3) and 0 (BU2)
- Adjust the reading to 190.0  $\pm 1$  digit with potentiometer R403
- Set range selector SK1 to position 2 M $\Omega$
- Interconnect terminals V-R (BU3) and 0 (BU2)
- The reading should be .000  $\pm 1$  digit (to be corrected with potentiometer ZERO at the rear)
- Connect a resistor of 1.9 M $\Omega$  to terminals V-R and 0
- Adjust the reading to 1.900  $\pm 1$  digit with potentiometer R103
- Check the other ranges in accordance with the next table

Range selector to position	Connect to BU2-BU3	Reading	Tolerance
200 $\Omega$	190 $\Omega$	190.0	$\pm 4$ digits
20 k $\Omega$	19 k $\Omega$	19.00	$\pm 4$ digits
20 M $\Omega$	19 M $\Omega$	19.00	$\pm 4$ digits

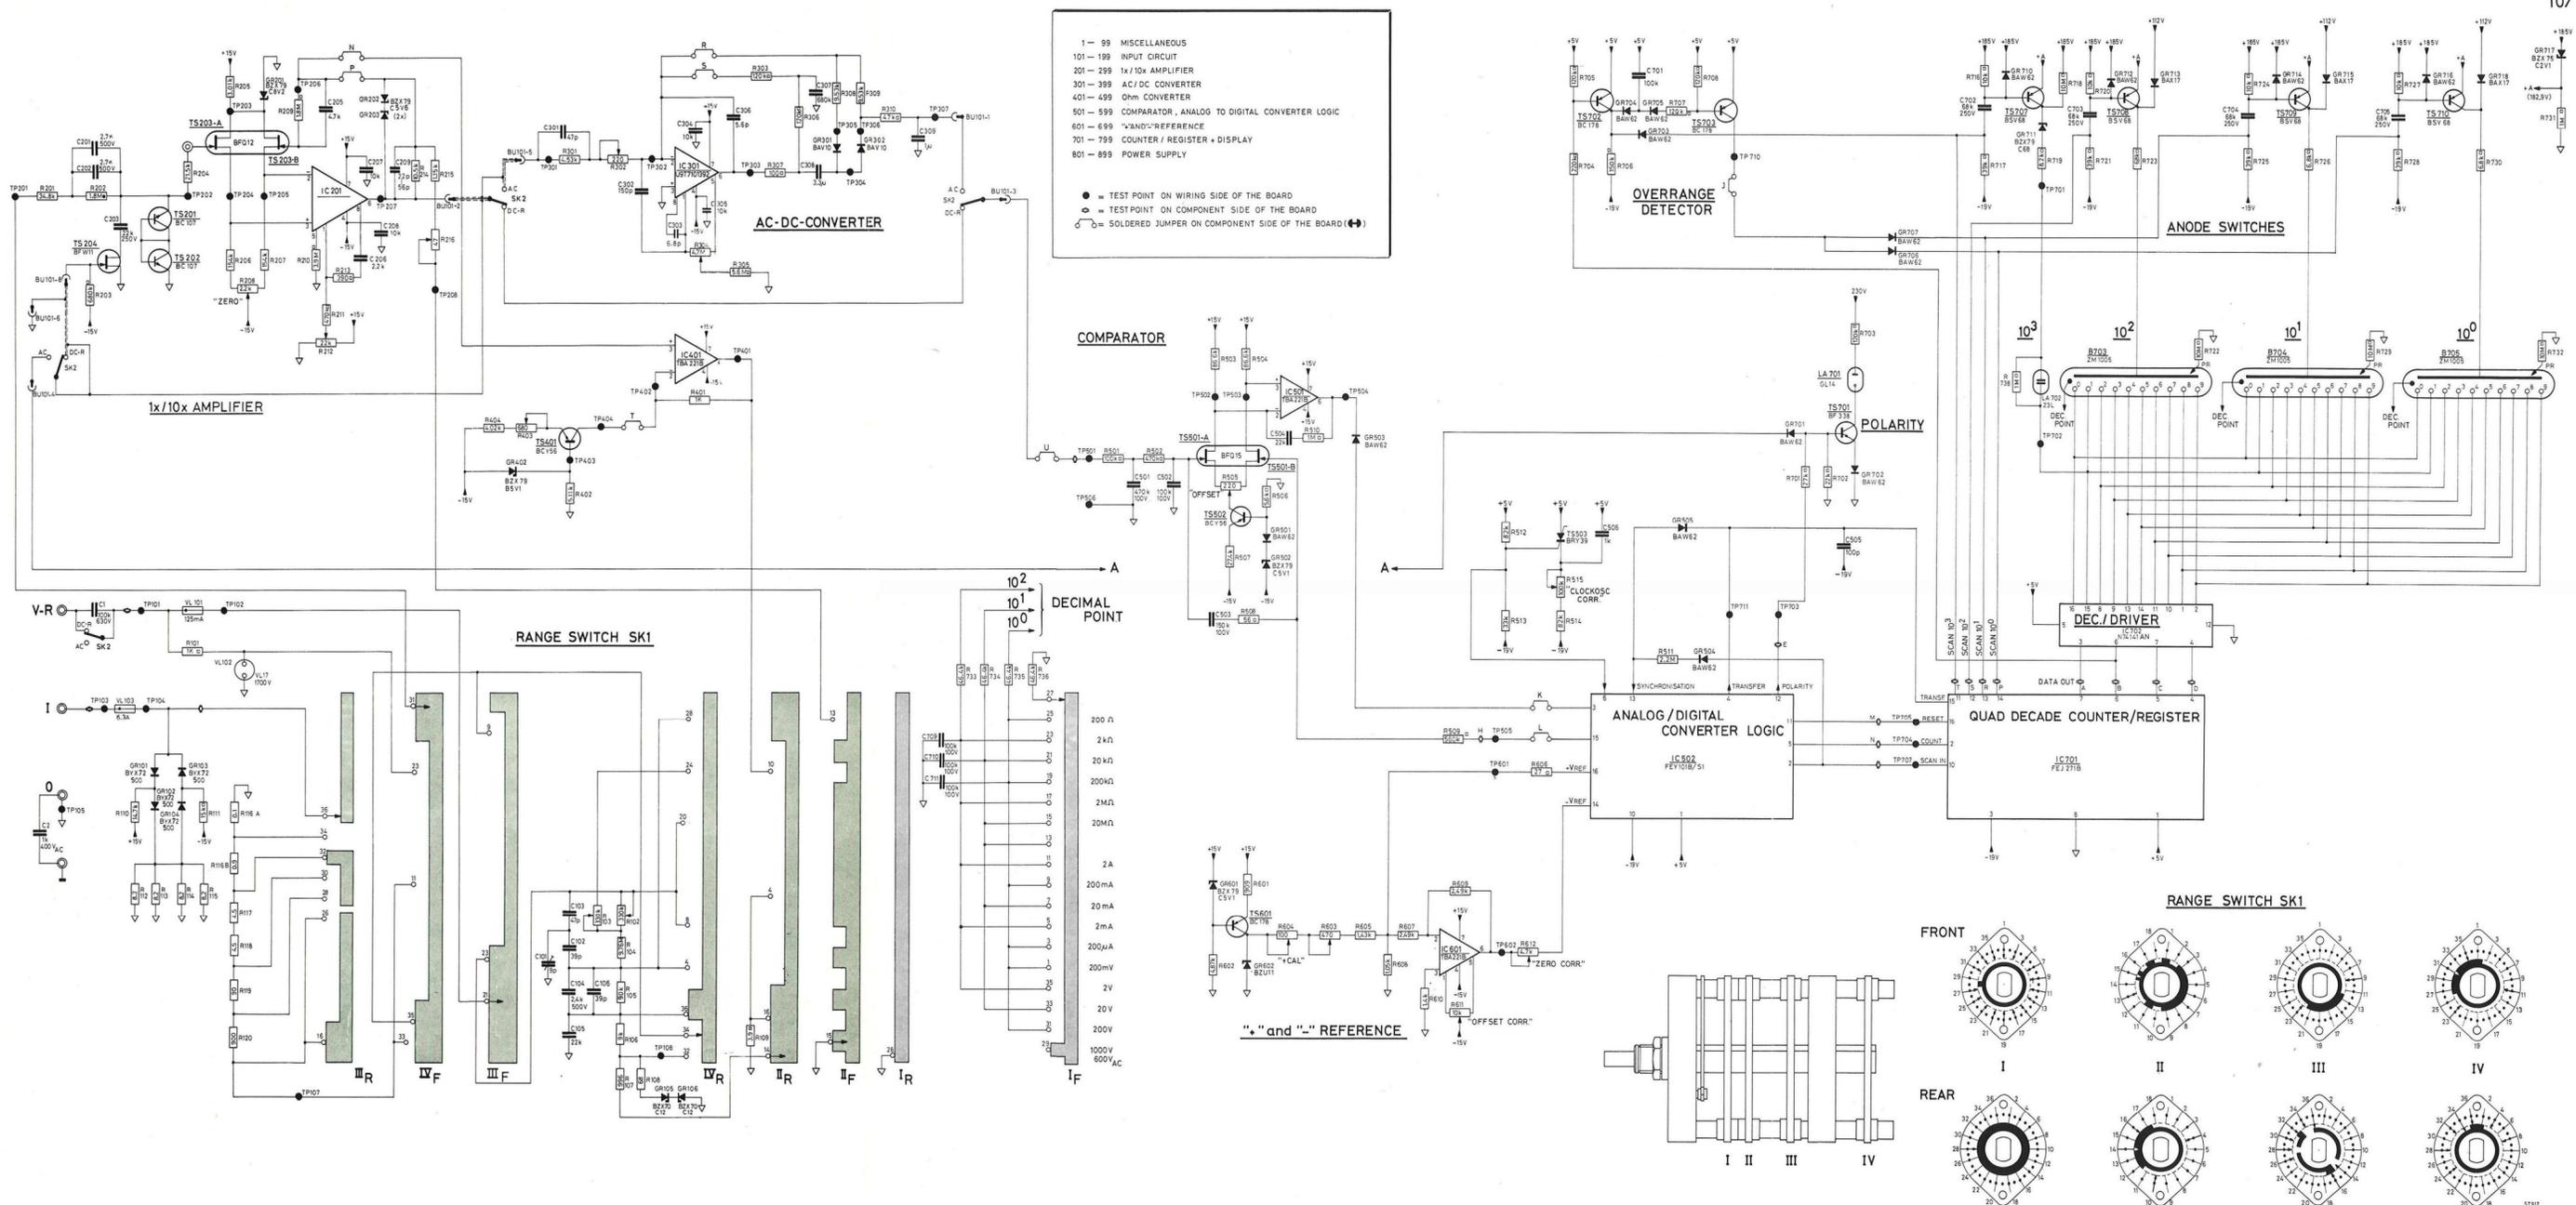

Fig. 36. Circuit diagram analog and digital section PM 2422 A

2. Linearity

- Set range selector SK1 to position 2 kΩ
- Check the linearity in accordance with the table below

Connect to	Reading	Tolerance
BU2-BU3		
50 Ω	.050	± 2 digits
200 Ω	.200	± 3 digits
600 Ω	.600	± 3 digits
1000 Ω	1.000	± 3 digits
1400 Ω	1.400	± 3 digits
1900 Ω	1.600	± 4 digits

G. CHECKING THE DIRECT CURRENT RANGES

- Depress button DC/R (SK2/1).
- Check the direct current ranges in accordance with the next table

Range selector to position	Supply to BU4 a current of	Reading	Tolerance
200 μA	190 μA	190.0	± 6 digits
2 mA	1.9 mA	1.900	
20 mA	19 mA	19.00	
200 mA	190 mA	190.0	
2 A	1.9 A	1900	

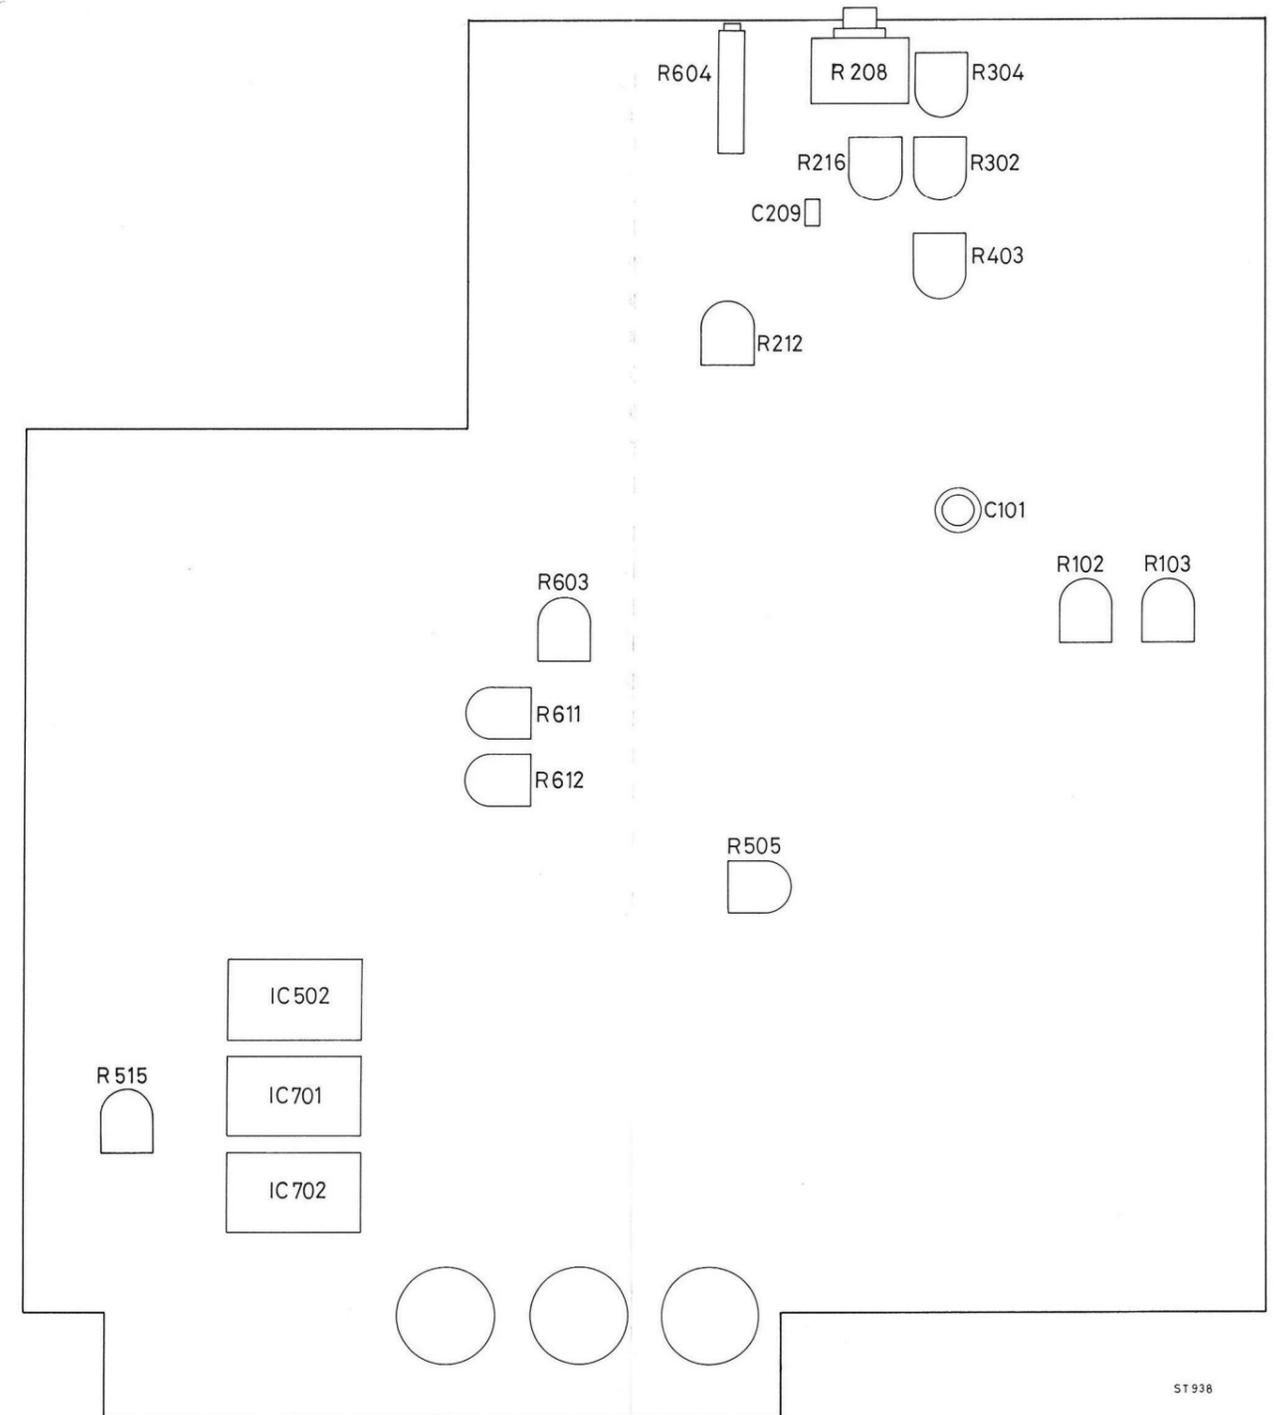

Fig. 29. Location of adjusting elements
