The purpose of this manual is to provide a technical supplement to the Instruction Manual supplied with the FT-102 from the factory. Detailed information regarding installation, operation and alignment, as well as the circuit description, has been provided in the Instruction Manual, and is not reprinted here. Therefore, this Technical Supplement is not intended to serve as an independent reference, but to be used in conjunction with the information provided in the Instruction Manual.

Every effort has been made to include all of the modifications and updates that have been developed during production of the FT-102. However, certain custom modifications that are not of general interest have not been included, and Yaesu reserves the right to carry out additional modifications without notifying owners.

So far, the FT-102 has proven to be extremely reliable in the field, with only a few common problems having required modifications. These have all been incorporated into the later production lots, but details of the modifications are included here for those who may need to update earlier models.

We trust that technically-minded owners and service technicians of the FT-102 will find this manual useful as a supplement to the FT-102 Instruction Manual. Although Yaesu can not assume liability for any damages that may occur because of possible errors in this Supplement or the Instruction Manual, we do invite readers to call our attention to errors or inconsistencies that we might have overlooked.

Pages 17-25 have been deleted from the Supplement, as they describe procedures for band conversions that are not authorized in certain countries. This material is available from Yaesu representatives in those countries where such operation and modification of the FT-102 is legal. Contact your nearest authorized Yaesu dealer for details.

ERRATA FOR THE FT-102 INSTRUCTION MANUAL

These errata apply to early printings of the Instruction Manual, up to the present. Only those of possible technical significance are listed here, although there were a few other minor typographical errors. The following pages 3 and 4 are completely updated replacements for pages 15 and 44, respectively, in all early editions of the FT-102 Instruction Manual.

Page 30, line 4:

Q2011 should be noted as a type 2SC1815Y transistor.

Page 30, fifth paragraph:

Only D6004 should be mentioned as a noise detector. Also, the DC squelch control signal from the SQL control is passed to the squelch control section of Q6008, and not to Q6010 and Q6011. D6004, Q6010 and Q6011 have been deleted from the AM/FM Unit.

Page 35, FT-102 FREQUENCY RELATIONSHIPS

The frequency of the carrier signal input to the Balanced Modulator (at the upper right corner of the diagram) should show LSB as 456.6 kHz and USB as 453.4 kHz. This was reversed in the first printing of the manual.

Also in the same diagram, the small table at the upper left should show the IF as 8.2134 MHz for LSB, and 8.2166 MHz for USB. LSB was not mentioned in the original printing.

Page 36, line 2:

Q4026 is a fixed crystal oscillator, and not a VCXO.

Page 38, TOP VIEW:

Later printings of the manual include an indication of the location of PO ADJ potentiometer VR5 in the labelling of this photo. The location of this potentiometer is also indicated in the rear panel photograph on page 10, as the upper lefthand control in the dashed box numbered 12.

Page 40, Upper left photo:

The title of this photo, RECT. A UNIT, was inadvertently omitted from earlier printings of the manual.

Also on this page, in step 2 of the PO Meter Adjustment, VR7 appeared as the adjustment potentiometer number. This should read VR5, indicating the PO ADJ potentiometer.

Page 41, Carrier Balance Procedure:

Step 3 should read, "Press the MOX switch." (only).

Pages 42 and 43, SSB Carrier Point Procedure:

This procedure has been revised from that appearing in early editions of the Instruction Manual, and should read as follows:

SSB Carrier Point

1. Set the MODE selector to USB, and connect the frequency counter to TP₄₀₀₇.
2. Key the transmitter and adjust potentiometer VR₄₀₀₃ for 10.5466 MHz on the counter.
3. Now connect the frequency counter to TP₄₀₀₆, key the transmitter, and adjust potentiometer VR₄₀₀₂ for 19.2166 MHz on the counter.
4. Set the MODE selector to LSB and check TP₄₀₀₇ for 10.5434 MHz and TP₄₀₀₆ for 19.2134 MHz with the counter during transmission.
5. Connect the audio signal generator to pin 8 of the MIC jack (pin 7 is ground), and connect the oscilloscope to the TP₃₀₀₅ on AF Unit. Set the AG for 1 kHz @ 2 mV, MIC gain to 9 o'clock, and HEATER off. Key the transmitter and note the amplitude of the scope display. Now change the AG frequency to 300 Hz (2 mV) and adjust VR₃₀₀₂ for the same amplitude on the scope.

6. Retune the AG to 1 kHz, and switch the HEATER on, 14 MHz band. Tune up the transmitter for 100 watts output, adjusting the signal generator output level to obtain this power output with the MIC GAIN control at the 12 o'clock position.
7. Now adjust the audio generator frequency to 300 Hz while maintaining a constant generator output level. If the ALC indication on METER II does not change during this audio frequency change, check the output power level, which should now be 25 watts. If necessary, adjust VR₄₀₀₅ for 25 watts output. If the ALC indication changes, repeat step 5 with the MIC GAIN control set lower and the signal generator level correspondingly higher.
8. Return to receive, switch the MODE selector to USB and repeat step 6, adjusting VR₄₀₀₆, if necessary, to obtain 25 watts output.

Page 47, AM/FM UNIT (photo):

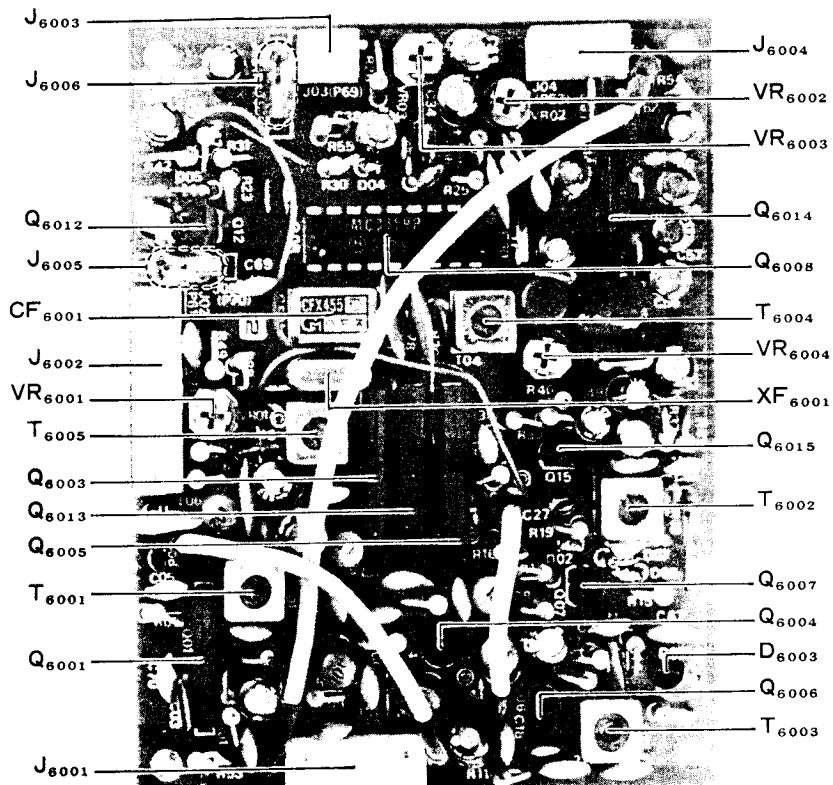

This photo was replaced from the second printing of the manual with the photo of the updated Unit, shown below. Also, the Varactor Pinout diagram was denoted as D6003 in later printings.

Page 52, AM/FM Unit Installation:

Step 3 of the procedure was corrected as follows:

3. Remove the plastic covers from the two connectors and connect the six connectors to the AM/FM Unit as shown in Figure 2.

RF UNIT ALIGNMENT (PB-2342)

Bandpass Filters

1. Connect the sweep generator output to J_{1001} (TX IN), and connect the oscilloscope to RF OUT jack J_5 on the rear panel. Turn the HEATER switch OFF.
2. Key the transmitter and adjust the appropriate transformer for each band according to the following chart to obtain the correct 3 dB bandwidth with minimum ripple, as displayed on the scope. Ripple should not exceed 3 dB.

Band	Adjust	Passband (-3 dB)
1.8	T_{1011}, T_{1022}	1.8– 2.0 MHz
3.5	T_{1013}, T_{1014}	3.5– 4.0 MHz
7.0	T_{1015}, T_{1016}	7.0– 7.3 MHz
10.0	T_{1017}, T_{1018}	10.0– 10.5 MHz
14.0	T_{1019}, T_{1020}	14.0– 14.5 MHz
18.0	T_{1021}, T_{1022}	18.0– 18.5 MHz
21.0	T_{1023}, T_{1024}	21.0– 21.5 MHz
24.5	T_{1025}, T_{1026}	24.5– 25.5 MHz
28/29	T_{1027}, T_{1028}	28.0– 29.9 MHz

Preselector

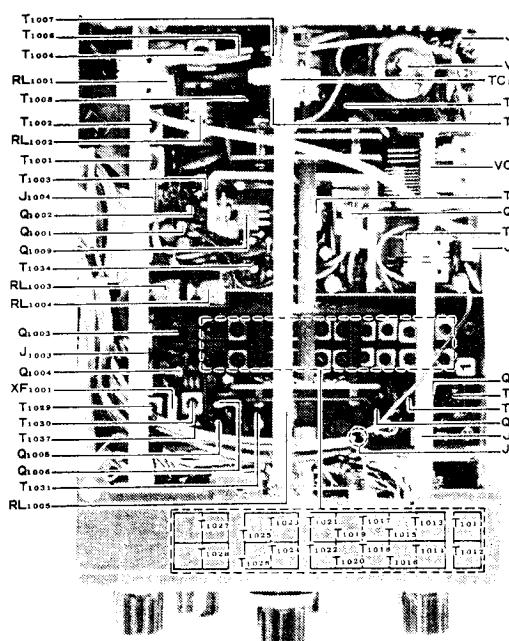

1. Connect the SSG to the ANT terminal, or alternatively, switch the MARK signal ON (rear panel switch).
2. Set the FT-102 to the band and frequency shown in the following chart, and set the

PRESELECT control to the position indicated. Switch the RF AMP ON.

3. Adjust the transformer indicated in the chart for maximum S-meter reading.

Band	Frequency	Preselect	Transformer	S-meter Reading
3.5	4.000 MHz	8	T_{1004}	
7.0	7.000 MHz	5	T_{1005}	
10.0	10.000 MHz	6	T_{1006}	
14.0	14.500 MHz	8	T_{1007}	
21.0	21.500 MHz	8	T_{1008}	Maximum

4. Remove the SSG and connect the dummy load to the ANT terminal. Set to 29.5 MHz band, 30.000 MHz, PRESELECT to 8, key the transmitter and adjust T_{1009} for maximum power output.
5. Reconnect the SSG to the ANT terminal and adjust TC_{1001} for maximum RX S-meter indication.
6. Remove the SSG and connect the dummy load to the ANT terminal. Set to 28.5 MHz band, 28.500 MHz, and key the transmitter. Adjust the PRESELECT control for maximum power output, and leave at this setting for the next step.
7. Repeat step 5, adjusting TC_{1002} .

SOLDERING AND DESOLDERING TECHNIQUE ON PRINTED CIRCUIT BOARDS

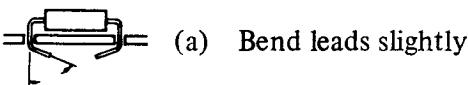

The FT-102 circuit boards are tough, but mishandling during soldering can cause circuit traces to "lift." While this does not cause permanent damage to the board, much servicing trouble can result, because of the tendency for this lifted trace to break. A few simple precautions will keep your circuit boards in A-1 condition.

1. Use only a 12 to 30-watt chisel-tip soldering iron, with the tip arounded or isolated from AC and DC potential. Voltage at the tip can easily destroy CMOS components.
2. Use only the minimum amount of heat necessary to remove a component, or to cause the solder to "flow" when installing a new component.
3. USE ONLY 60/40 ROSIN CORE SOLDER.
4. Use solder removing braid and flux to absorb excess solder before installing a new component. A solder sucker can also be used, but most be handled with care to avoid lifting traces.
5. Do not attempt to remove DIP ICs without first cutting all of the pins on the component side of the board, unless you have the correct desoldering equipment (spring-loaded clamp and all-pin desoldering tip).

If you do lift a trace, don't worry! Read on to find out how to repair traces like a pro.

INSERTION OF PARTS ON CIRCUIT BOARDS

All of the below are acceptable ways of inserting components into circuit board mounting holes.

(a) Bend leads slightly

(b) Straight-in mounting

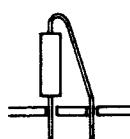

NOTES ON USE OF CMOS COMPONENTS:

As CMOS devices are extremely sensitive to damage from static electricity, special precautions must be observed.

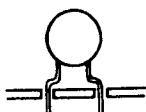

In storage, use only conductive sponge specially designed for CMOS components.

When installing a CMOS part in a socket, or on a circuit board, be certain that the power is off. In addition, the technician should rest his hand on the chassis as the component is inserted, so as to place his hand at the same potential as the chassis (better to discharge small amounts of static electricity through your fingers than through a \$5 IC!).

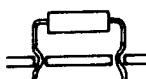

When soldering a CMOS part onto a circuit board, use a low-wattage iron, and be sure to ground the tip with a clip lead, if the tip is not grounded through a three-wire power cord.

(c) Vertical mounting

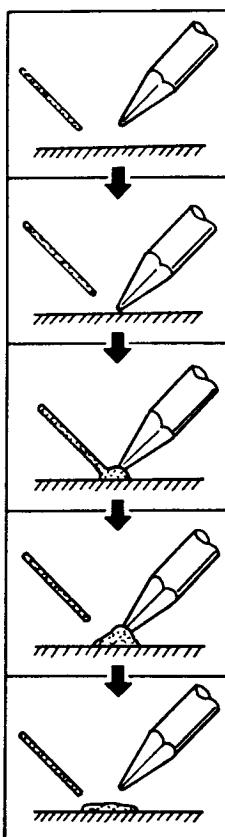

(d) Preformed disc ceramic capacitor

(e) Preformed resistor, diode, etc.

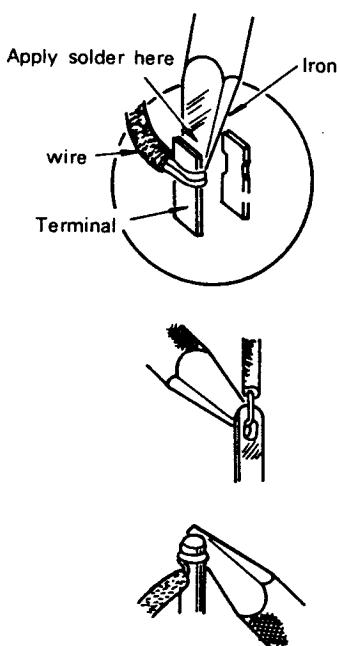

BASIC SOLDERING PRACTICE

- (1) Prepare soldering iron and solder. The tip of the iron should be thoroughly tinned and wiped clean of excess solder.
- (2) Apply soldering iron to surface to be soldered. Do not press the iron into the surface.
- (3) Apply solder to junction of iron and heated surface.
- (4) When enough solder is applied, remove solder. Continue to apply heat just until solder flows cleanly.
- (5) Remove iron from work. Do not apply more heat than necessary for good solder flow.

Soldering to terminal posts:

(Be certain to apply heat to both post and wire.)

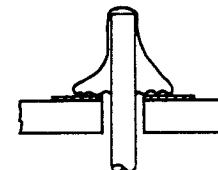

EXAMPLES OF POOR SOLDERING PRACTICE

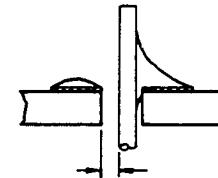

Unwanted solder bridge connecting two tracks (caused by use of too much solder)

"Cold joint" (caused by insufficient heat to part of work, resulting in poor solder flow)

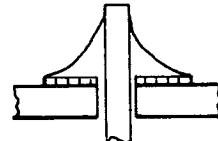

Unstable joint (caused by insufficient heat or solder)

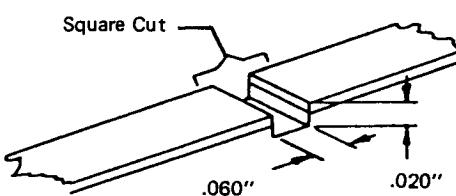

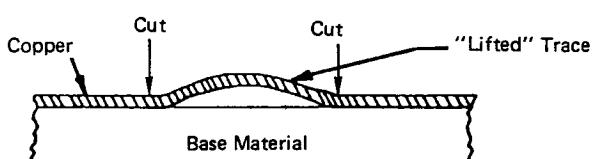

Proper soldering:

A smooth fillet of solder surrounds the lead and just covers the foil pad.

For Service Manuals Contact

If you have previously lifted a trace, make an etch cut on each side of the lifted trace as shown in the drawing, and install a wire bridge.

Coat Cut Area With Eastman 910
After Soldering Wire Bridge

TYPICAL PART FAILURES, CAUSES AND SYMPTOMS

PARTS	CAUSE OF TROUBLE	SYMPTOMS
Semiconductors (IC, FET, TR)	High supply voltage Open circuit Excessive drive High temperature	Short or open circuit Output decreases to 1/2 at 80°C Internal noise Instability
MOS FET MOS IC	Static electricity	Total failure Short or open circuit
Crystal Crystal filter	Shock High temperature Aging	No oscillation Off frequency Frequency drift Filter bandpass change
Resistor	Excessive power High temperature	Component burned Value changed Open circuit
Potentiometer	Excessive power Shock Dust or oil Wear	Component burned Open circuit Noise Unsmooth rotation
Capacitor	Excess voltage High temperature Aging	Shorted Leakage Open/decreased capacitance
Variable capacitor Trimmer capacitor	Ratings exceeded Dust between plates Shock, forced rotation	Shorted Leakage Unsmooth rotation
Coils	Ratings exceeded Misadjusted Core or bobbin broken	Open or short circuit Leakage or shorted turns Detuned
Switch	Ratings exceeded Aging Dust or oil	Poor contact Unsmooth operation Open circuit
Relay	Ratings exceeded Humidity Dust or oil on contacts	Coil open Poor or intermittent contact Noise

MODIFICATION PROCEDURES

This section includes modifications that were developed for the FT-102 for special operating requirements, as well as for improved transceiver performance. Also included are modifications that must be made in accessory equipment for use with the FT-102.

Modifications to improve transceiver performance have been incorporated into the production line at some point in time, so that those transceivers produced after that time do not require the modification. Each procedure indicates the range of serial numbers that were not modified when they left the factory. Serial numbers are composed of a letter and a number, indicating the date of manufacture, followed by six digits. The first two digits (closest to the date code) are the Production Lot number. So, for example, serial number 0C123456 is from Production Lot 12, set number 3456. Before making any modification, make sure that the procedure to be followed applies to the Lot number of the particular transceiver being modified.

In some cases, the need for a modification did not exist originally, but became necessary later due to other changes in the transceiver circuitry made during the course of production. In such situations, the modification procedures which follow indicate a certain production lot prior to which the modification should not be performed. If any of the modifications are carried out on sets from production lots other than those specified, performance may be degraded.

Also, before making any modification, check to see if the intended modification has already been carried out by a Yaesu agent, dealer or previous owner.

Most of the following modifications require removal of the transceiver covers, and some require access to the RF Unit. These procedures are detailed here:

Cover Removal

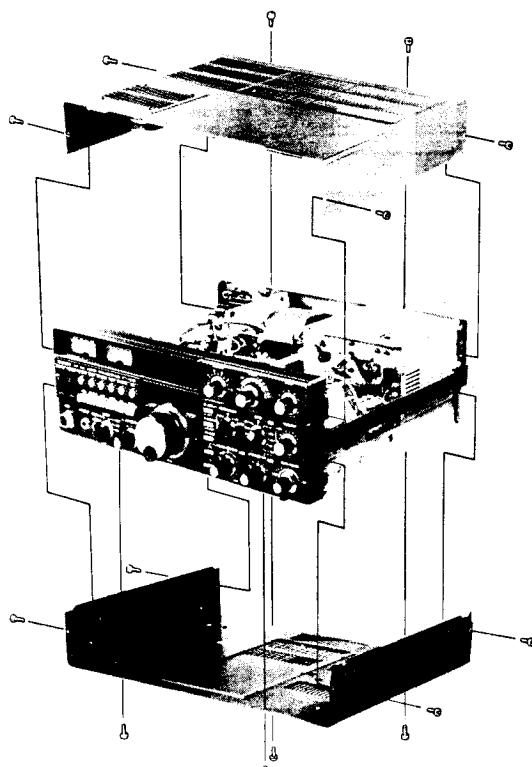

Disconnect the transceiver from the power source. Remove the two screws affixing the carrying handle, and then the fourteen screws affixing the top and bottom covers, as shown on this page. Remove the handle and covers, and stand the transceiver on its left side.

RF Unit Access (Solder side)

Disconnect and remove the optional AM/FM Unit, if installed. Referring to page 38 of the Instruction Manual for Unit locations, remove the four screws from the AF Unit (PB-2344), and gently fold it over the VFO. Then remove the two machine screws affixing the shield panel that was behind the AF Unit, and remove the panel from the main chassis, using care to avoid bending the 7-lug terminal strip that also mounts under one of the panel screws. The solder side of the RF Unit is now accessible.

WARNING

HIGH VOLTAGE IS PRESENT INSIDE THE TRANSCEIVER, AND IS RETAINED IN THE HIGH VOLTAGE CAPACITORS EVEN WHEN THE POWER IS OFF AND THE POWER SOURCE DISCONNECTED. BEFORE REMOVING THE COVERS TO WORK ON THE TRANSCEIVER, ALWAYS DISCONNECT THE POWER CORD AND ALLOW A FEW MINUTES FOR THE CAPACITORS TO DISCHARGE. DURING ALIGNMENT, USE EXTREME CAUTION TO AVOID TOUCHING ANY METAL PARTS INSIDE THE CHASSIS WITH FINGERS OR METAL TOOLS.

Kecklick

This modification is provided to remedy possible keyclick trouble with FT-102s having serial numbers between XX030001 and XX069999. Kecklicks were not a problem in the first two production lots, but appeared after certain other modifications were carried out in production. This modification has already been incorporated in later production lots (after Lot 6).

1. On the component side of the RF Unit, install a $1\ \mu F$, 50WV electrolytic capacitor, as shown in Figures 1 and 2. The positive lead of the capacitor is soldered to the lead of R1045, and the negative lead to the TEST PIN (G1).
2. Referring to Figures 3 and 4, cut the white wire connected to J4017 on the Local Unit, and wrap the end of the white wire with insulating tape to prevent it from shorting to other parts.

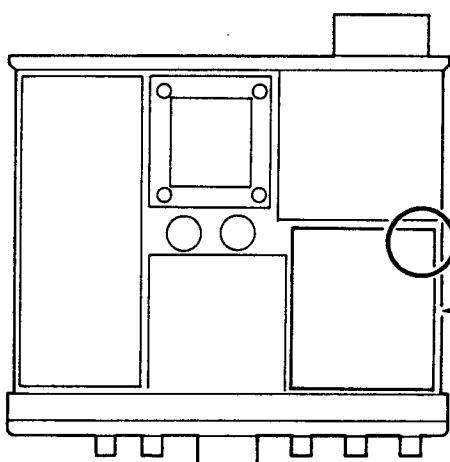

Figure 1

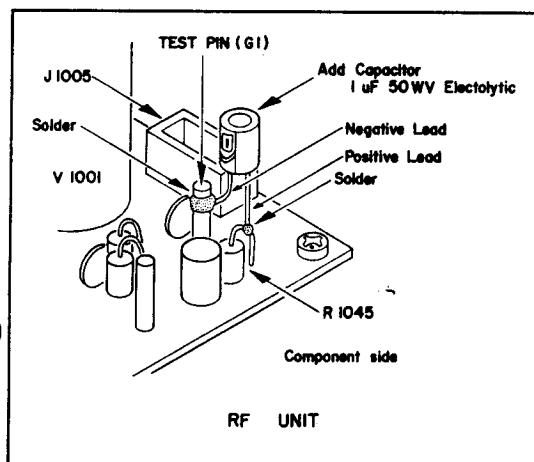

Figure 2

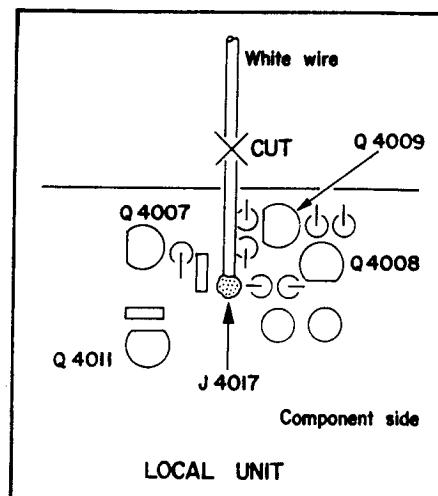

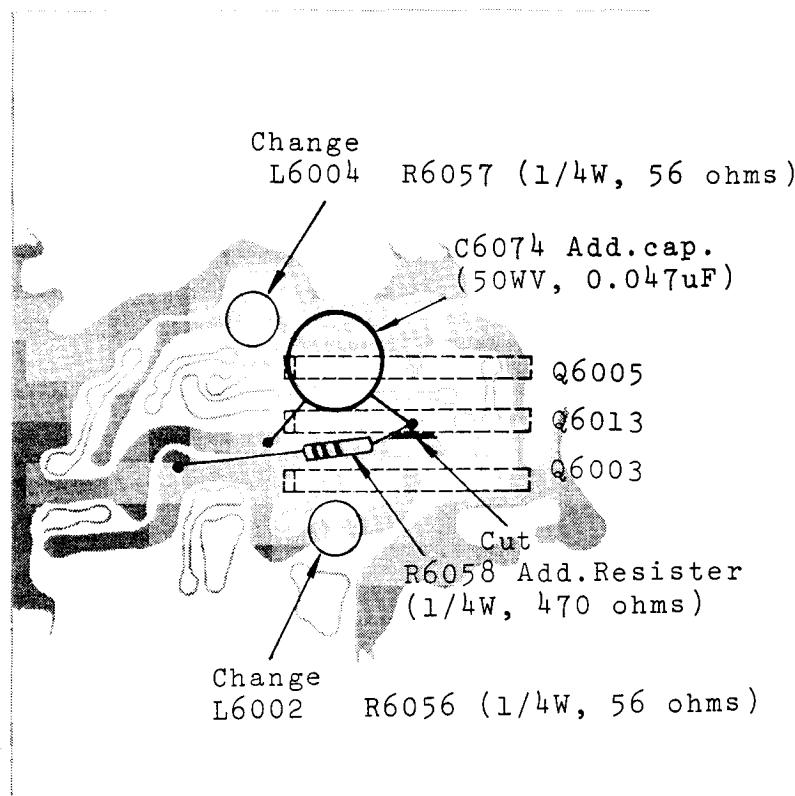

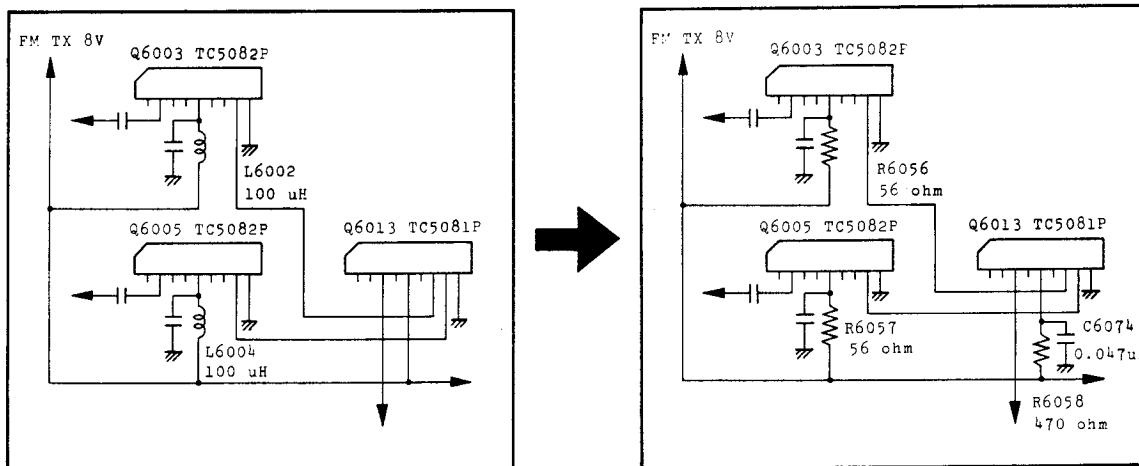

Figure 4

FM Unit Protection

This modification can be adopted in the early models of the FM Unit in the FT-102, in order to prevent damage to the TC5081AP used in the Unit.

1. Remove the FM Unit from the transceiver, and L6002 and L6004 from the Unit.
2. Install 56-ohm resistors in the same locations where L6002 and L6004 were installed.
3. On the solder side of the Unit, cut the copper pattern connected to pin 5 of Q6013, and solder a 470-ohm resistor across the cut.
4. Solder a $0.047\mu\text{F}$ disc ceramic capacitor between pin 5 of Q6013 and ground.
5. Replace the FM Unit in the transceiver and reconnect all plugs.

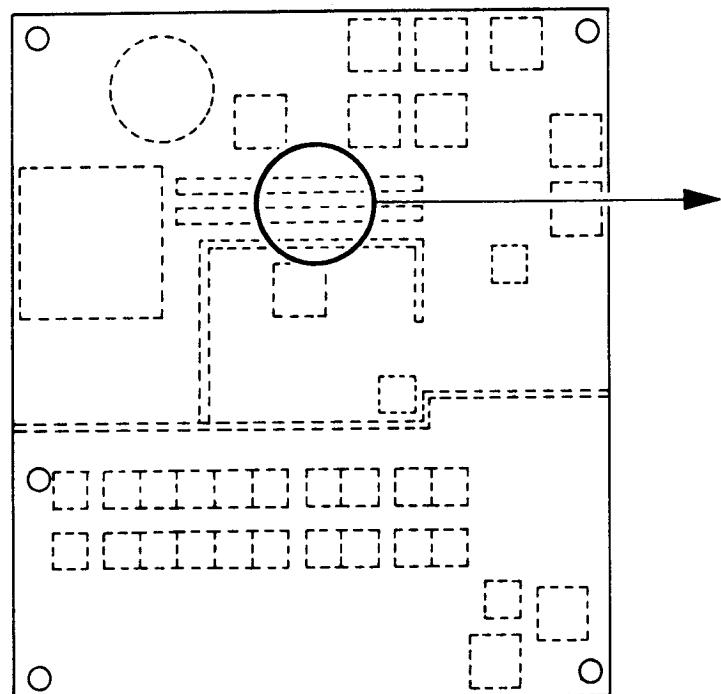

VIEWED FROM SOLDER SIDE

24.5 MHz ALC Reduction

This modification increases the drive level during transmission on the 24.5 MHz band in those transceivers having serial numbers under XX-080001. Later sets have this modification already incorporated.

1. Referring to the diagrams below, locate the places on the solder side of the RF Unit where the terminals from the stationary contacts of bandswitch wafers S11b-3 and S11b-4 are soldered to the RF Unit. Carefully cut the foil pattern to isolate the 24.5 MHz pad of wafer S11b-3 as shown. Make sure it is the right place before cutting.
2. Install a small jumper between the 24.5 MHz pad isolated in the previous step and the 21 MHz pad on the opposite side from the cut.

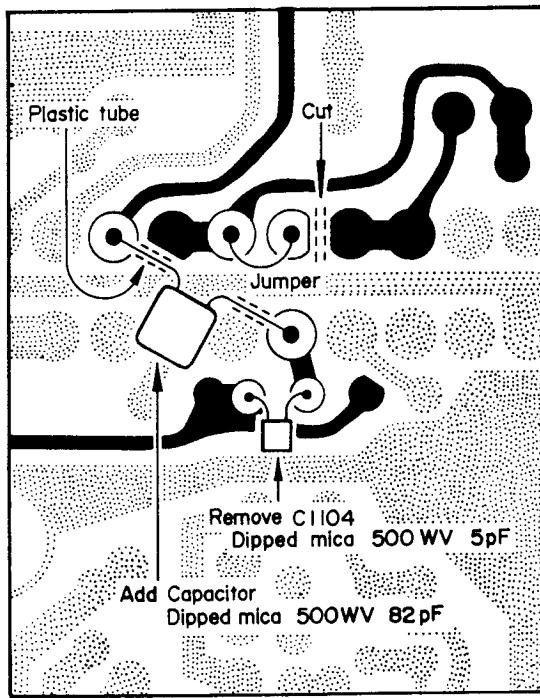

RF UNIT

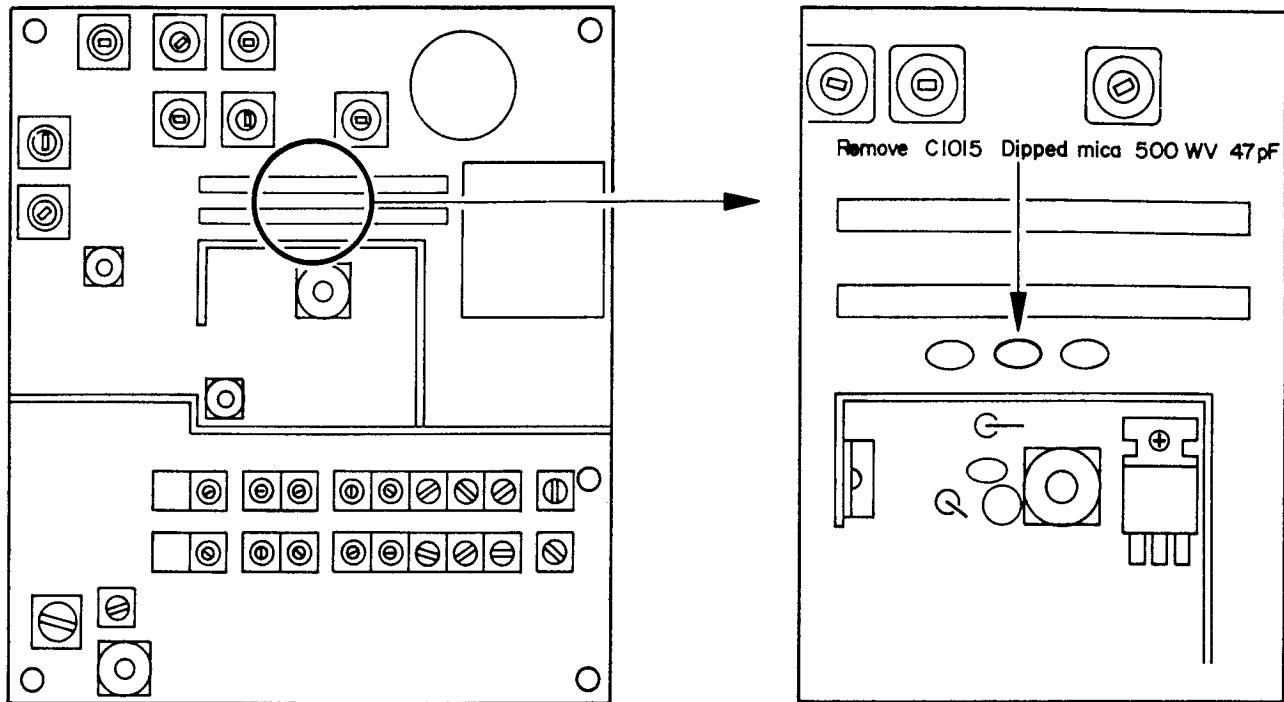

3. Now locate C1015 on the component side of the board, and C1104 on the solder side (connected in parallel to the same pads). Remove both of these capacitors to isolate the 24.5 MHz pad of wafer S11b-4.
4. Install plastic insulating sleeves over both leads of an 82 pF, 500 WV dipped mica capacitor, and connect from the 14 MHz pad of S11b-3 to the 24.5 MHz pad of S11b-4 on the solder side of the RF Unit, as shown in the diagram. This new capacitor is designated C1108.

This completes the modification.

Solder side

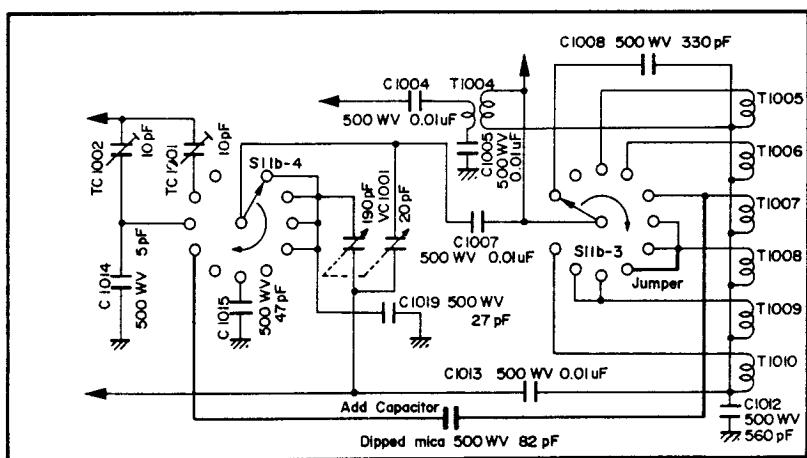

Component side

RF UNIT

Original

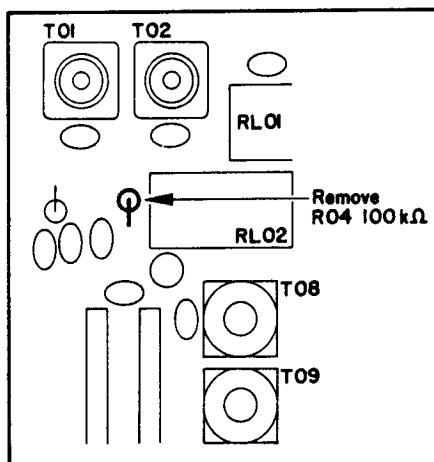

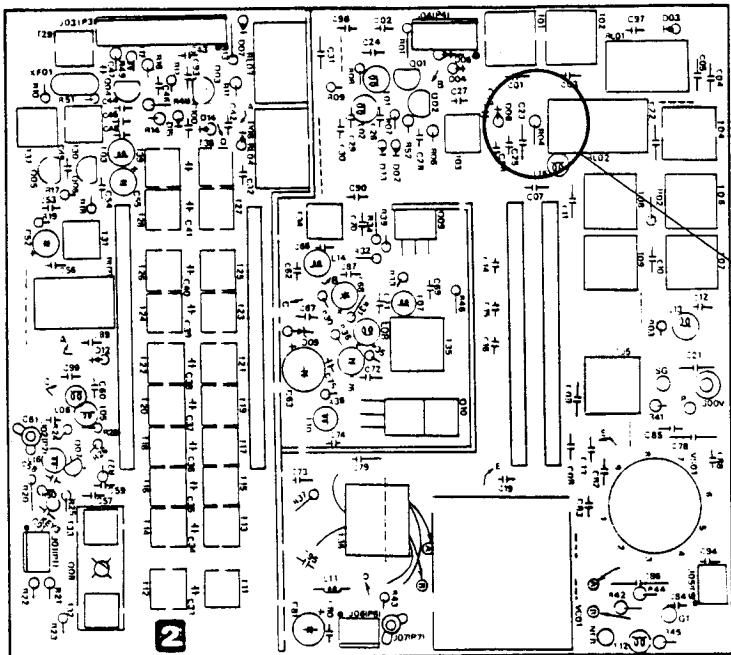

Receiver RF Amplifier Protection

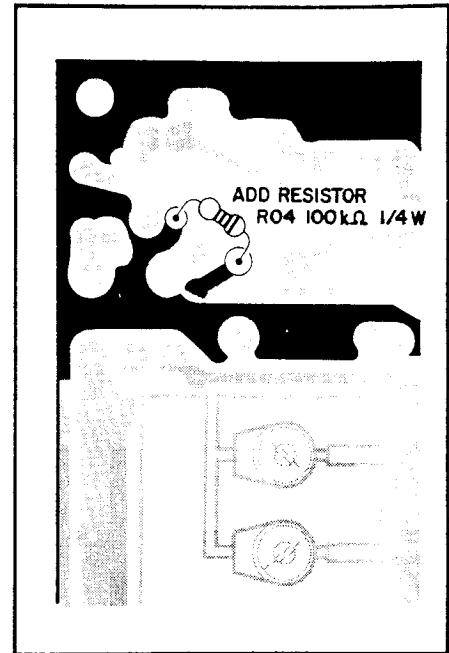

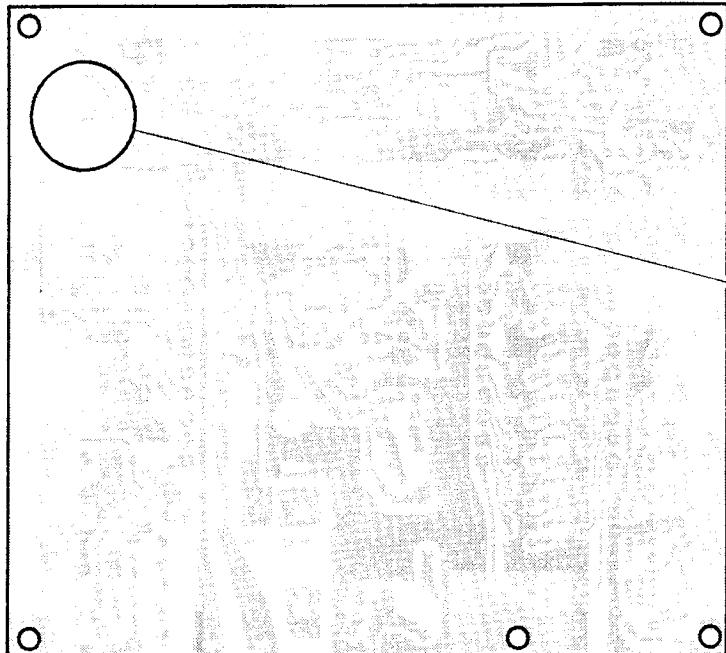

This modification provides better protection for the RF amplifier FETs from spikes that may appear at the input for those FT-102s having serial numbers below XX040000. It has been incorporated in all transceivers from Lot 4.

1. Remove the covers and expose the solder side of the RF Unit as described on page 8.
2. Referring to the drawings below, locate resistor R04, and carefully remove the indicated end of this resistor. Reconnect it as shown.
3. Replace the shield cover and AF Unit, the AM/FM Unit, and the covers and associated screws.

RF UNIT

Solder side

RF UNIT

Receiver Spurious Reduction

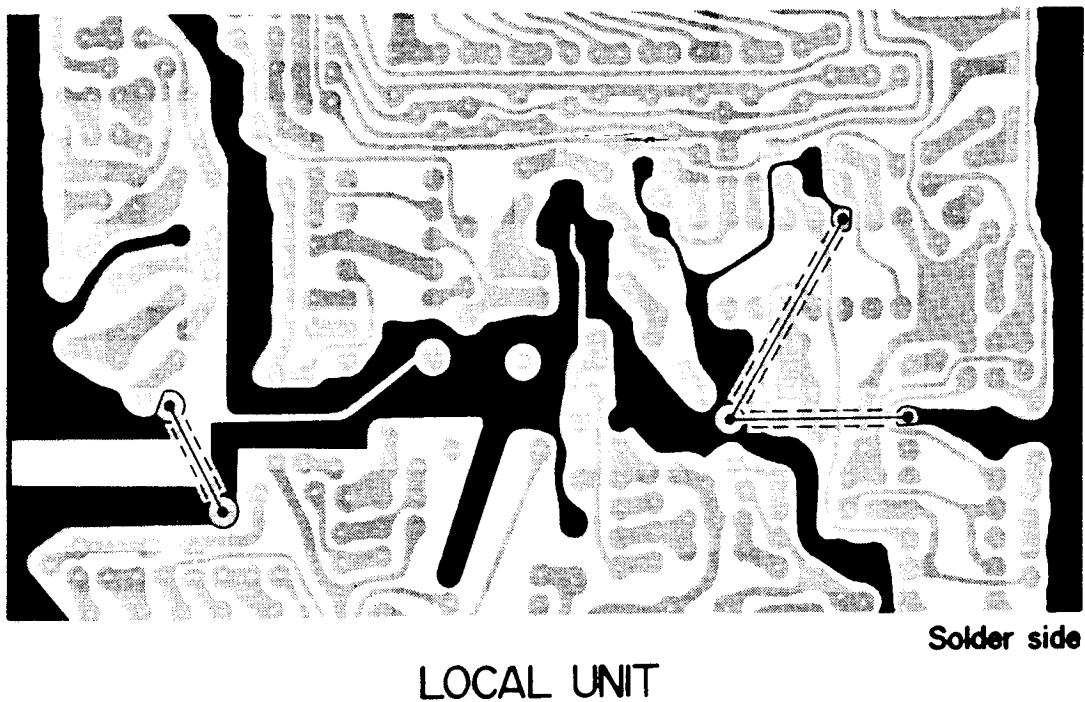

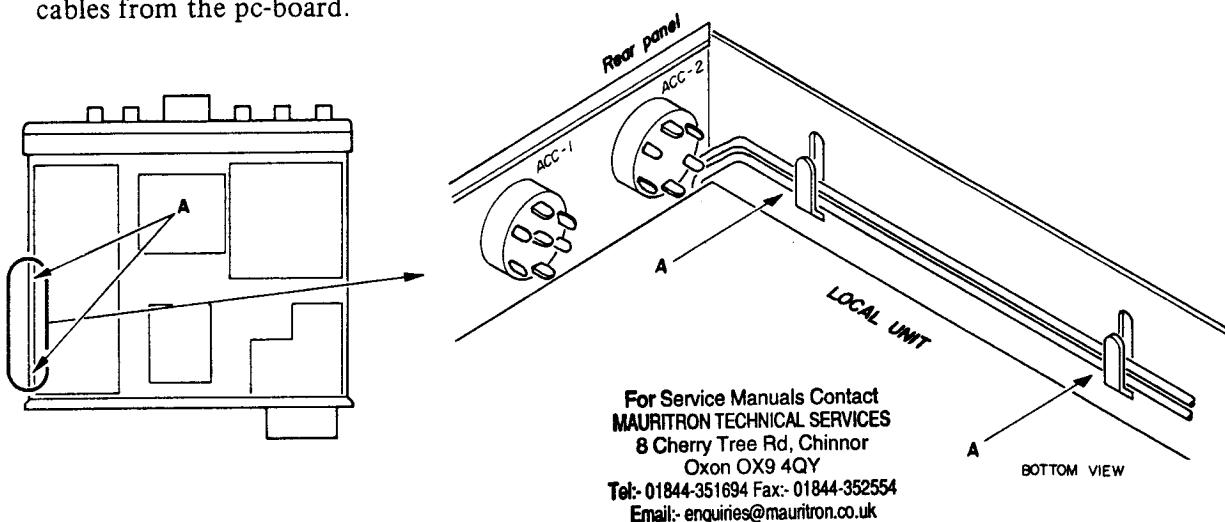

This modification serves to reduce the spurious signals of the receiver in the amateur bands in those FT-102s having serial numbers below XX040000.

1. Lay the transceiver upside down on the work surface, and remove the bottom cover.
2. Referring to the diagrams below, carefully bend the two chassis clips (marked A) slightly inwards about 5 mm, so that the two gray shielded cables can be removed from the clips. It is not necessary to disconnect these cables from the pc-board.

3. Remove the seven screws affixing the Local Unit (PB-2345), and carefully lift the outer edge of the board, folding it towards the middle of the transceiver so that the solder side is exposed.

4. Referring to the local unit diagram below, install heavy wire or copper straps insulated with plastic sleeving in the three locations shown, connecting the ground patterns on the Local Unit.

5. Replace the Local Unit and its screws, reinstall the gray cables in the chassis clips and bend them back into place, and replace the cover.

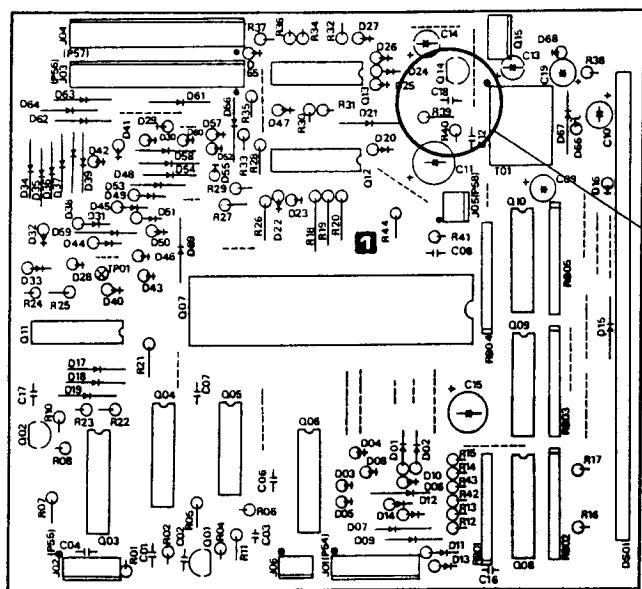

Counter Noise Reduction

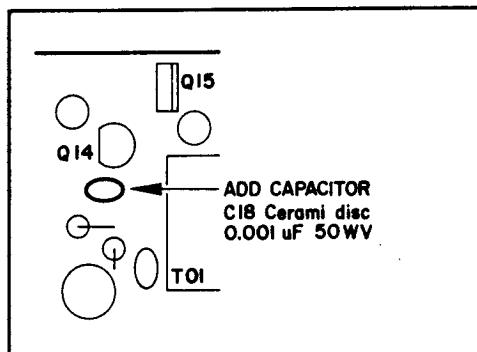

This modification will reduce drifting counter noise that may appear on the lower frequency bands in those FT-102s having serial numbers below XX040000. It has been incorporated into production from Lot 4.

1. Remove the top cover, and without pulling on the wires, remove P57, the 13-pin connector plug nearest the edge of the Counter Unit (PB-2346A). Then remove the four screws affixing the Unit, and slide the pc-board back so that it can be tipped up to expose the solder side.
2. Referring to the drawing below, install a $0.001 \mu\text{F}$, 50 WV ceramic capacitor between the collector of Q14 and ground.
3. Gently replace the pc-board in its original position. Replace the display-backing bracket with the two front mounting screws, and then replace the two rear screws. Reconnect P57 to J04, and replace the top cover.

COUNTER UNIT

Component side

B. 10-meter Band Modification

The procedure for this modification is the same for all models. DO NOT perform this modification if Modification A has been performed.

It requires the sacrifice of all but one existing 10-meter 500 kHz segment. The new segment will be selected when the BAND selector and switch are set to the same position as used for the 10-meter segment being replaced.

1. Perform steps 1, 2 and 3 of the previous modification procedure.
2. Install 1SS53 diodes (white band) on the solder side of the Local Unit at the locations shown in Figure 5, making sure that the banded ends of the diodes are aligned as indicated. Install D_D for 28.0–28.5 MHz, or D_E for 28.5–29.0 MHz (DO NOT INSTALL BOTH). Then perform step 5 of the previous modification procedure.

MODIFICATION OF THE FTV-901R TRANSVERTER FOR USE WITH THE FT-102 TRANSCEIVER

This modification enables the FTV-901R to be used with those FT-102s having serial numbers above 030000 for VHF and/or UHF operation. Earlier FT-102s should first be modified by an authorized Yaesu agent.

Parts required:

One ALC AMP Unit, Part No. C022940
One Connection Cable E, Part No. T9101282,
shown in Fig.
One 24-centimeter length of hookup wire

1. Remove the twelve screws affixing the top and bottom covers of the FTV-901R, and remove the covers (Figure 1).

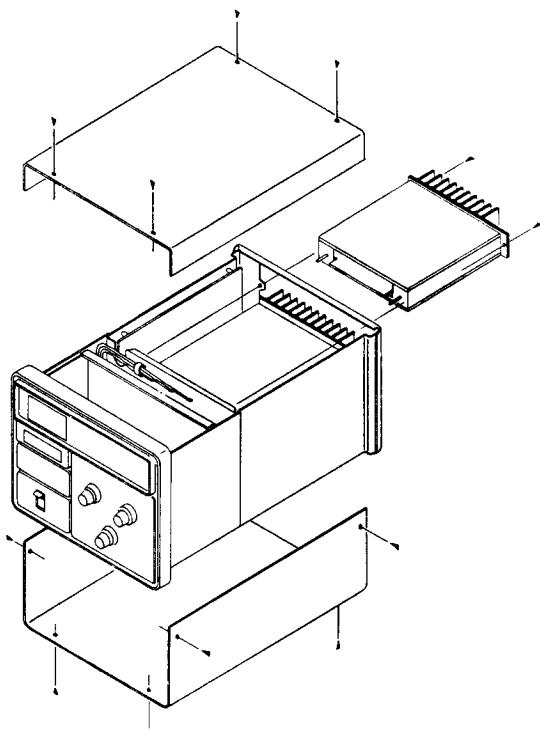

Figure 1

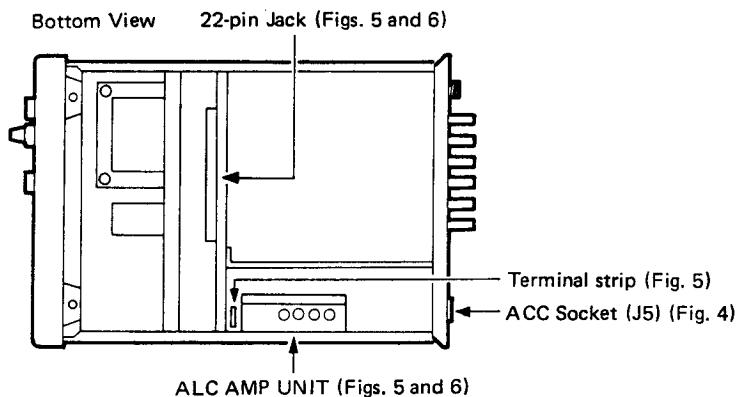

Figure 2

2. On POWER switch S2a, disconnect the blue wire from the OFF terminal, and reconnect this wire to the ON terminal, as shown in Figure 3.

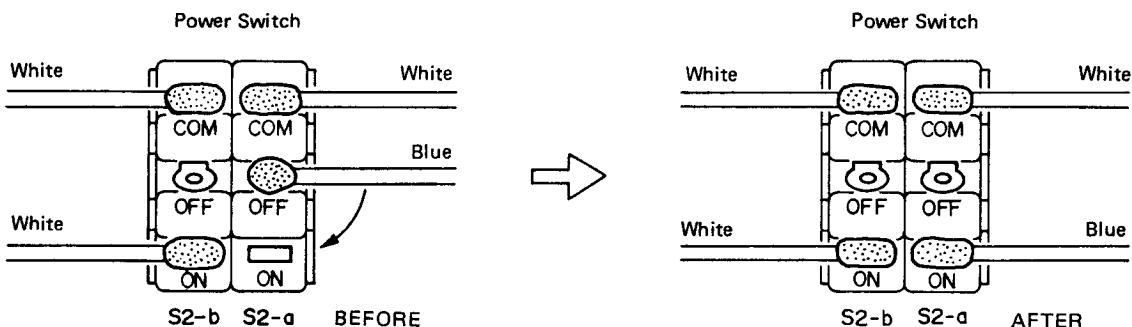

Figure 3

3. On the ACC socket (J5), disconnect the large white wire from pins 2 and 5, and reconnect this wire to the ground terminal at the socket, as shown in Figure 4. Also, if a diode is connected to pins 1 and 4 of the ACC socket (early models), remove this diode from the transverter.

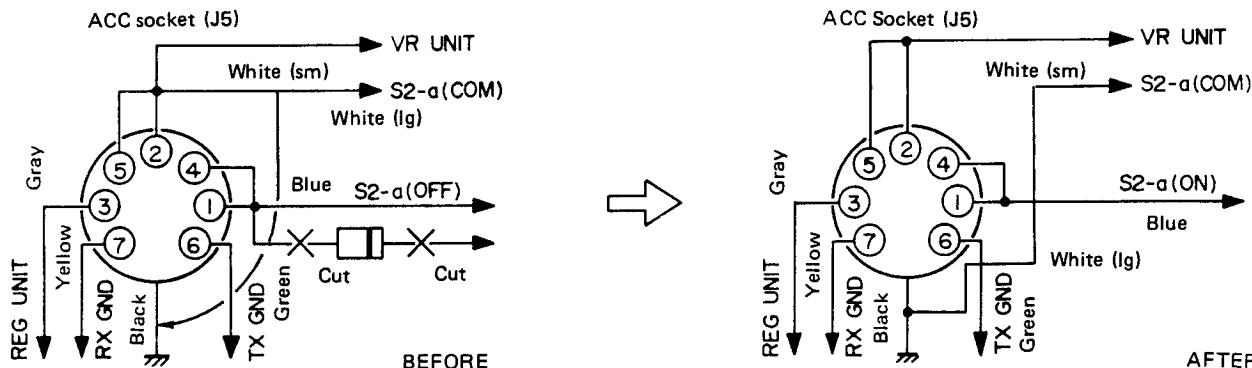

Figure 4

4. If the serial number of the FTV-901R is below 030000, perform the following procedure and skip part 5. Otherwise, skip this part and proceed directly to part 5.

- Note on tags the connection point of each red wire connecting to the ALC AMP Unit and tape a tag to each of these wires. Then disconnect all wires (two shielded, three red, and one each orange, white/green and white/red).
- Remove the four screws in the side of the chassis affixing the ALC AMP Unit, and replace the original Unit with the new ALC AMP Unit (Part No. C022940).
- Reconnect the wires to the new Unit as shown in Figure 5 and described below:
 - Connect the input shielded wire to the input terminal, and the output shielded wire to the output terminal of the ALC AMP Unit.
 - Disconnect the brown wire from the terminal strip, and connect this wire to pin 4 of the ALC AMP Unit. Now remove the terminal strip, together with its components and red wire, from the transverter.
 - Splice the red wire removed from pin 2 of the old ALC AMP Unit directly to the white/green wire, and carefully insulate the splice with plastic tape.

- Disconnect the white/blue wire from pin 18 of the blue 22-pin connector jack, and connect this wire to pin 1 of the ALC AMP Unit.
- Connect the 24-centimeter length of hookup wire from pin 18 of the blue 22-pin connector jack to pin 2 of the ALC AMP Unit.
- Connect the orange wire, removed from pin 1 of the old ALC AMP Unit, to pin 3 of the new Unit. Then connect the red wire removed from pin 3 of the old Unit to pin 5 of the new Unit. Finally, connect the white/red wire, removed from pin 4 of the old Unit, to pin 6 of the new ALC AMP Unit. Skip the next part and proceed to part 6.

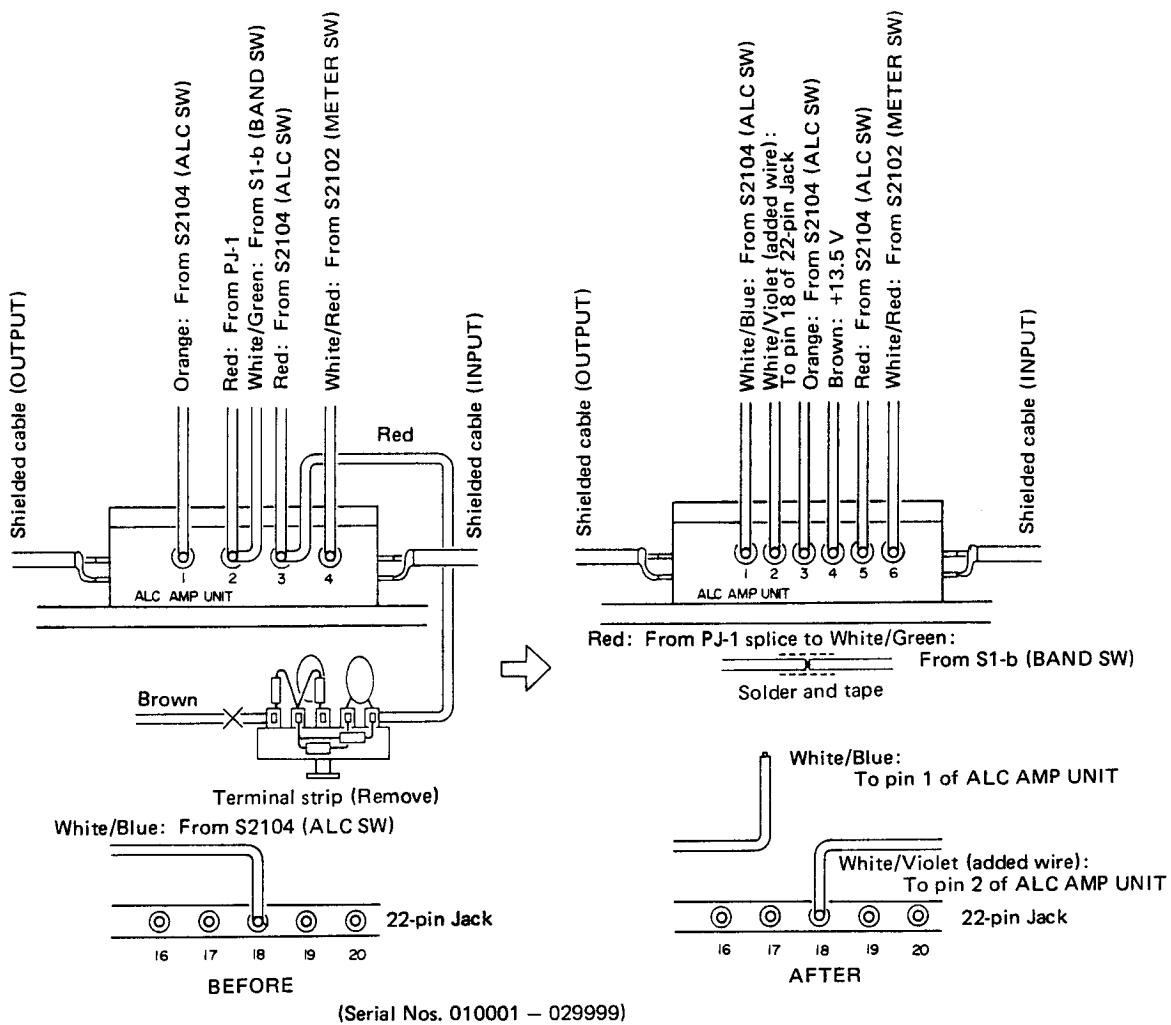

Figure 5

5. For those FTV-901Rs with serial number above 030000, perform the following procedure.
 - a. Disconnect all wires from the ALC AMP Unit (two shielded, and one each orange, brown, red, white/blue and white/red).
 - b. Remove the four screws in the side of the chassis affixing the ALC AMP Unit, and replace the original Unit with the new ALC AMP Unit (Part No. C022940).
 - c. Reconnect the wires to the new Unit as shown in Figure 6 and described below:
 1. Connect the input shielded wire to the input terminal, and the output shielded wire to the output terminal of the ALC AMP Unit.
 2. Connect the wires removed from the old ALC AMP Unit to the new Unit: white/blue to pin 1, orange to pin 3, brown to pin 4, red to pin 5, and white/red to pin 6.
3. Disconnect the white/blue wire from pin 18 of the blue 22-pin connector jack, and carefully insulate the end of this wire with plastic tape.
4. Connect the 24-centimeter piece of hookup wire from pin 18 of the 22-pin jack to pin 2 of the new ALC AMP Unit.
6. Modification is now complete. Replace the top and bottom covers of the FTV-901R and their twelve screws, and connect the transverter to the FT-102 as shown in Figure 7.

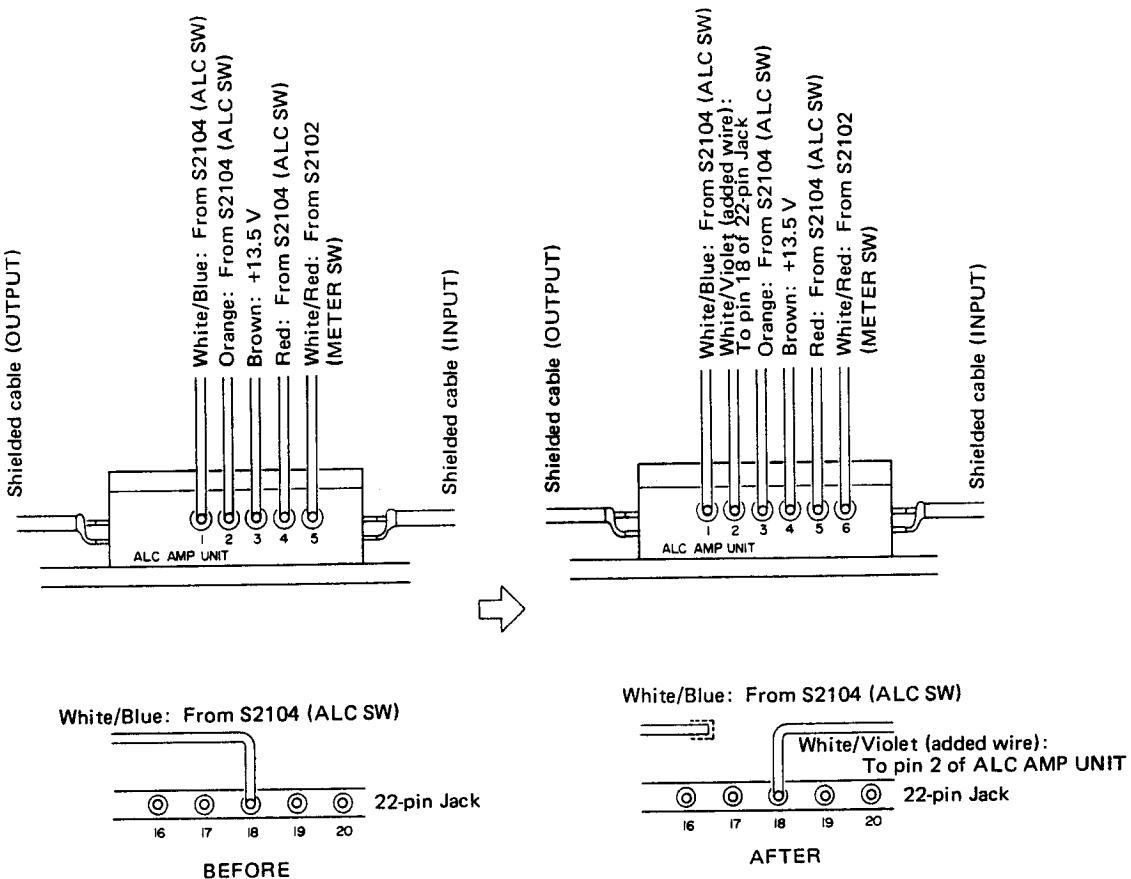

Figure 6

CAUTION

ONCE THE FTV-901R HAS BEEN MODIFIED IT MUST NOT BE USED WITH ANY MODEL TRANSCEIVER OTHER THAN THE FT-102, OR SEVERE DAMAGE TO THE EQUIPMENT MAY RESULT.

WHENEVER USING THE FTV-901R WITH THE FT-102 BE ABSOLUTELY CERTAIN THAT THE HEATER SWITCH ON THE FT-102 IS OFF, AND THAT THE TUBES HAVE HAD AT LEAST 30 SECONDS TO COOL.

WHEN USING THE FTV-901R WITH THE FT-102, THE IF MONITOR OF THE FT-102 WILL NOT FUNCTION NORMALLY. ALTHOUGH IT MAY SOUND DISTORTED, THIS IS NOT AN INDICATION OF DISTORTION OF THE OUTPUT OF THE FTV-901R.

ALSO, WHEN TRANSMITTING WITH THE FT-102 AND FTV-901R, THE IC, PO AND ALC METER FUNCTIONS IN THE FT-102 ARE DISABLED, AS WELL AS THE PLATE AND LOAD CONTROLS.

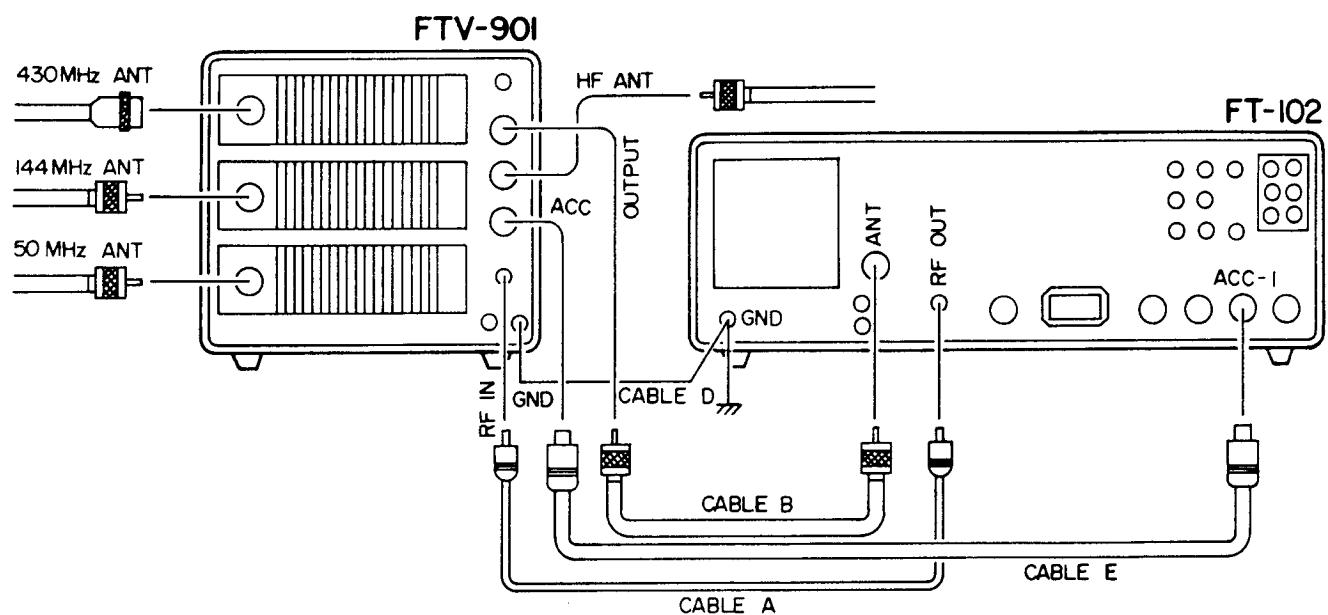

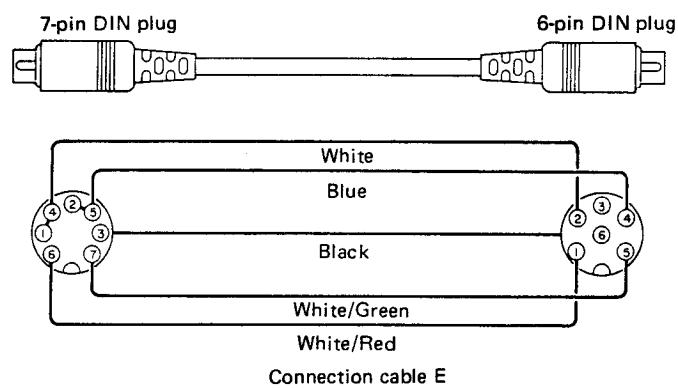

Figure 7

Connection cable E

Figure 8

MODIFICATION OF THE FTV-107 TRANSVERTER FOR USE WITH THE FT-102 TRANSCEIVER

This modification enables the FTV-107 to be used with those FT-102s having serial numbers above 030000 for VHF and/or UHF operation. Earlier FT-102s should first be modified by an authorized Yaesu agent.

Parts required:

One Connection Cable E, Part No. T9101283, shown in Fig. 4
One 47-ohm, 2-watt wire-wound resistor, part No. J31336470
One piece of hookup wire, approximately 20 centimeters long
One piece of vinyl insulation sleeve

1. Remove the fourteen screws affixing the top and bottom covers of the FTV-107, and remove the covers. (Figure 1.)
2. Rewire POWER switch S02 as described below and shown in Figure 2.
 - a. Disconnect the yellow wire from the COM terminal of switch section S02-b and insulate the end of this wire with plastic tape.
 - b. Connect the 20 cm piece of hookup wire from this COM terminal to the ground terminal of the meter.
 - c. Disconnect the yellow wire from the ON terminal of the switch, and also insulate the end of this wire with plastic tape.
 - d. Disconnect the red wire from the ON terminal of the S02-a section of the switch, and connect this wire to the ON terminal of the S02-b section, as shown in the Figure.
 - e. Cut the insulation sleeve in half, and install over each lead of the 47-ohm resistor. Then connect the resistor from the ON terminal of S02-a to the meter lamp.
3. Replace the top and bottom covers and their screws, and connect the FT-102 to the FTV-107 as shown in Figure 3. This completes the modification.

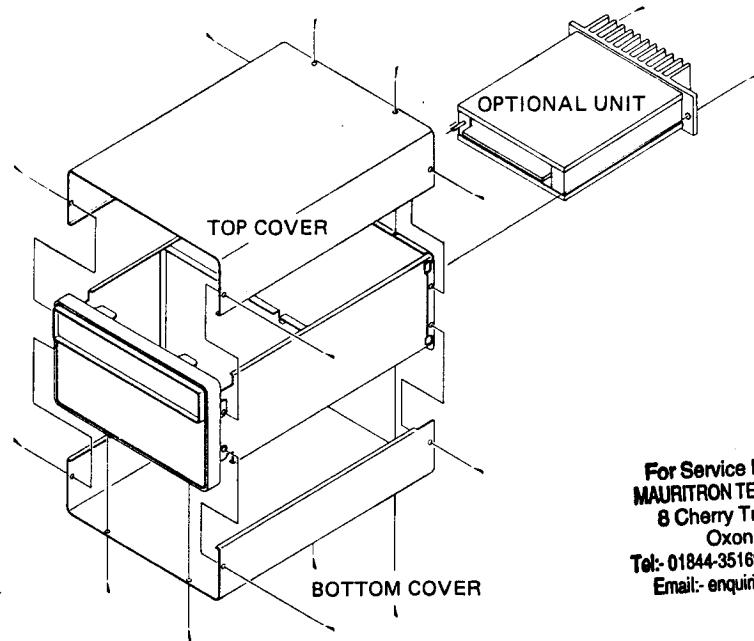

CAUTION

ONCE THE FTV-107 HAS BEEN MODIFIED IT MUST NOT BE USED WITH THE FT-107, FT-ONE, OR ANY TRANSCEIVER OTHER THAN THE FT-102, OR SEVERE DAMAGE TO THE EQUIPMENT MAY RESULT.

WHENEVER USING THE FTV-107 WITH THE FT-102 BE ABSOLUTELY CERTAIN THAT THE HEATER SWITCH ON THE FT-102 IS OFF, AND THAT THE TUBES HAVE HAD AT LEAST 30 SECONDS TO COOL.

WHEN USING THE FTV-107 WITH THE FT-102, THE IF MONITOR OF THE FT-102 WILL NOT FUNCTION NORMALLY. ALTHOUGH IT MAY SOUND DISTORTED, THIS IS NOT AN INDICATION OF DISTORTION OF THE OUTPUT OF THE FTV-107. ALSO, WHEN TRANSMITTING WITH THE FT-102 AND FTV-107, THE IC, PO AND ALC METER FUNCTIONS IN THE FT-102 ARE DISABLED, AS WELL AS THE PLATE AND LOAD CONTROLS.

Figure 1

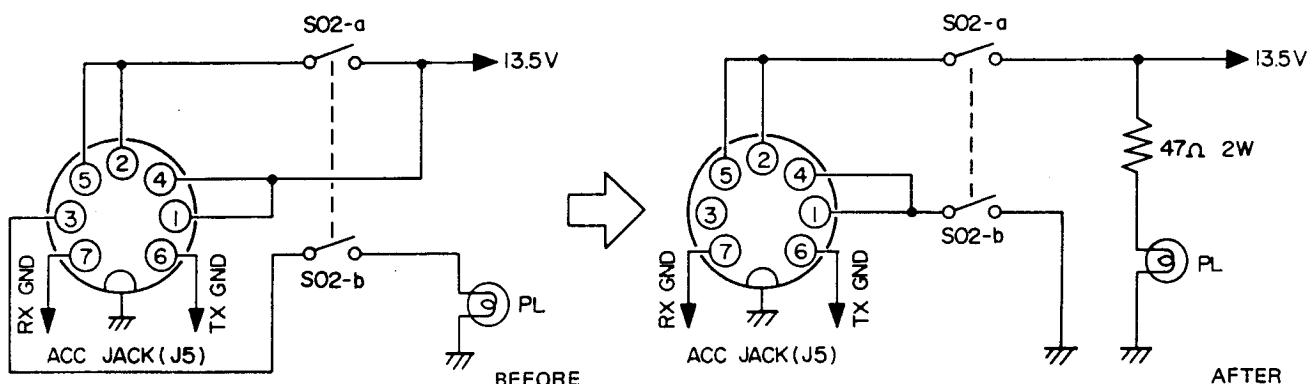

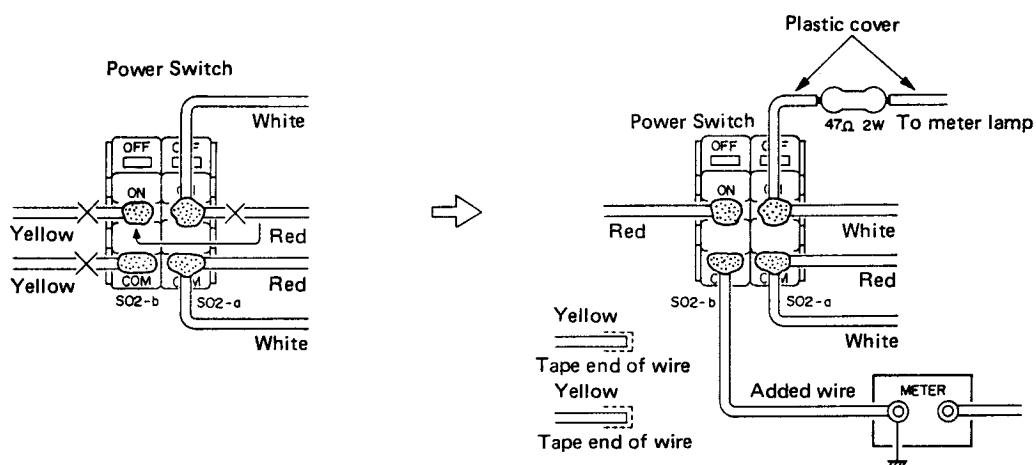

Figure 2

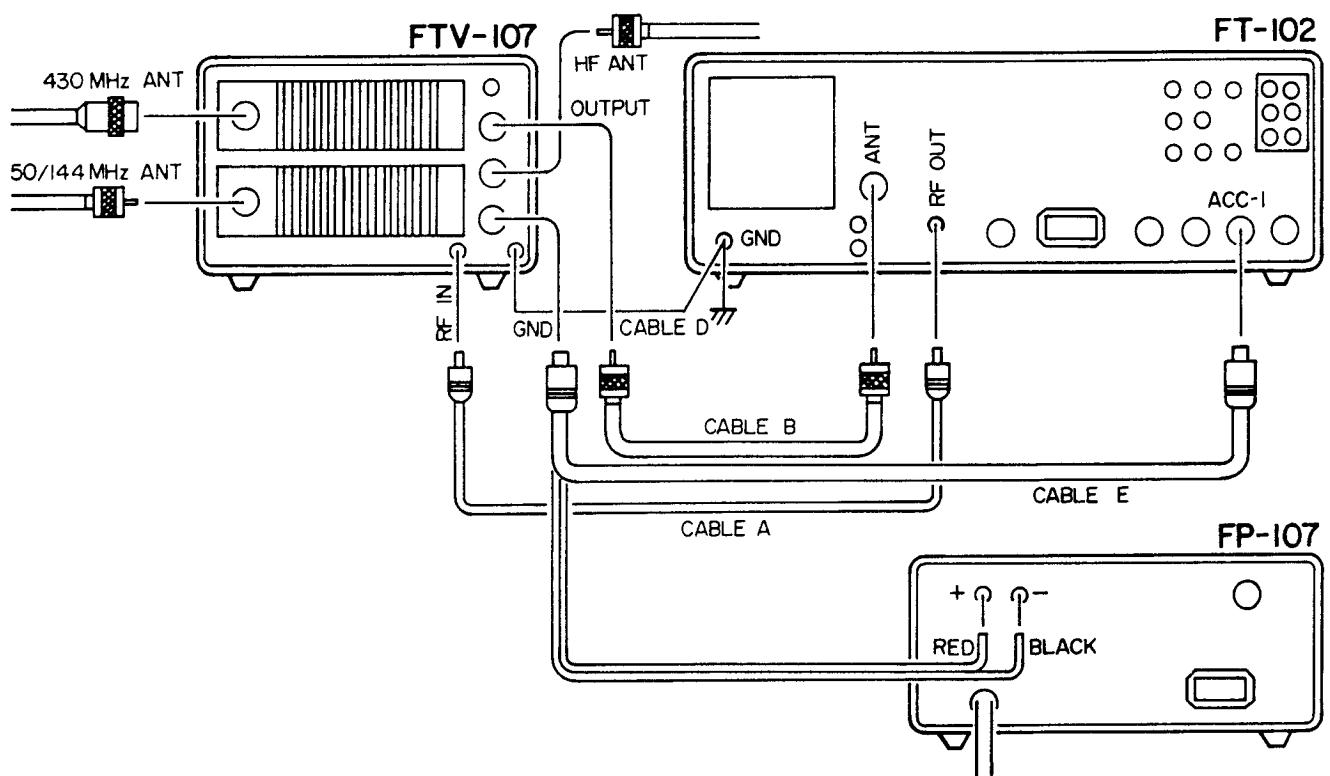

Figure 3

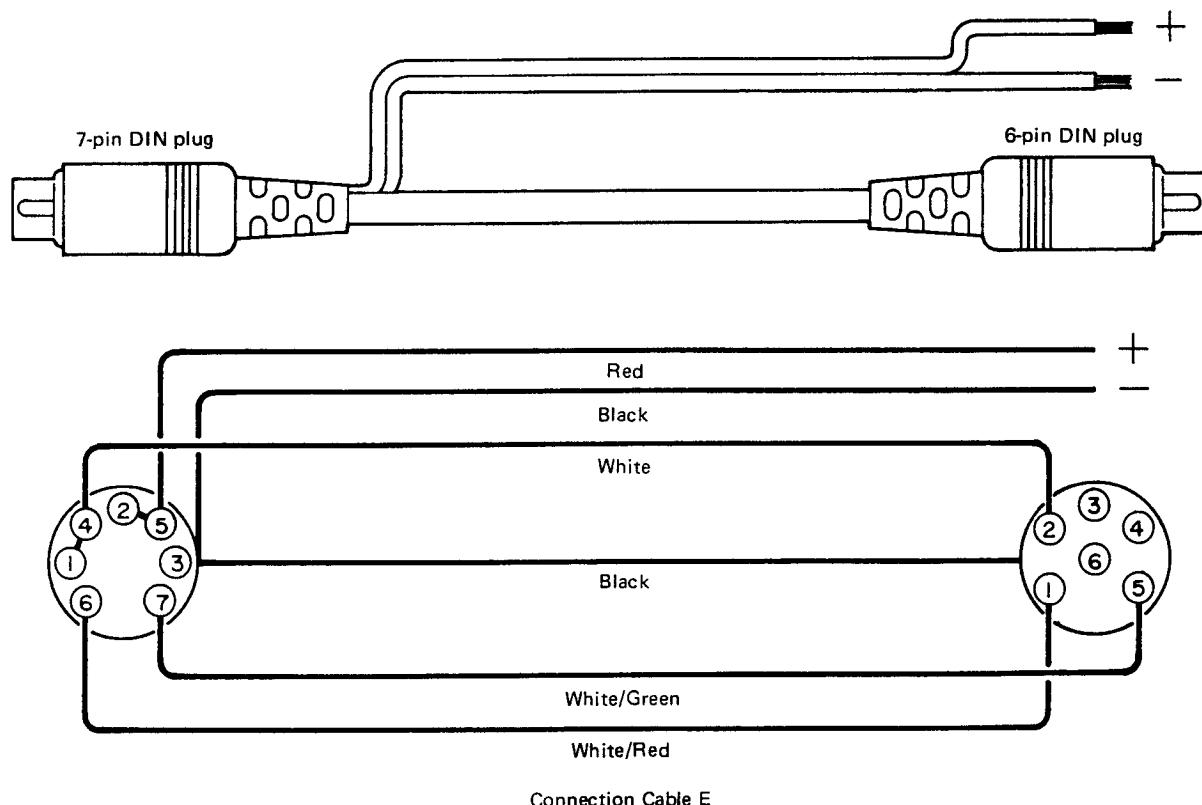

Figure 4

MODIFICATION OF THE FTV-707 TRANSVERTER FOR USE WITH THE FT-102 TRANSCEIVER

This modification enables the FTV-707 to be used with those FT-102s having serial numbers above 030000 for VHF or UHF operation. Earlier FT-102s should first be modified by an authorized Yaesu dealer.

Parts required:

One 6-pin DIN plug, Part No. P0090032

One Power Cord (1 meter), (Figure 7, not needed if FP-707 is used)

1. Remove the eight screws affixing the top cover of the FTV-707, and remove the cover (Figure 1).

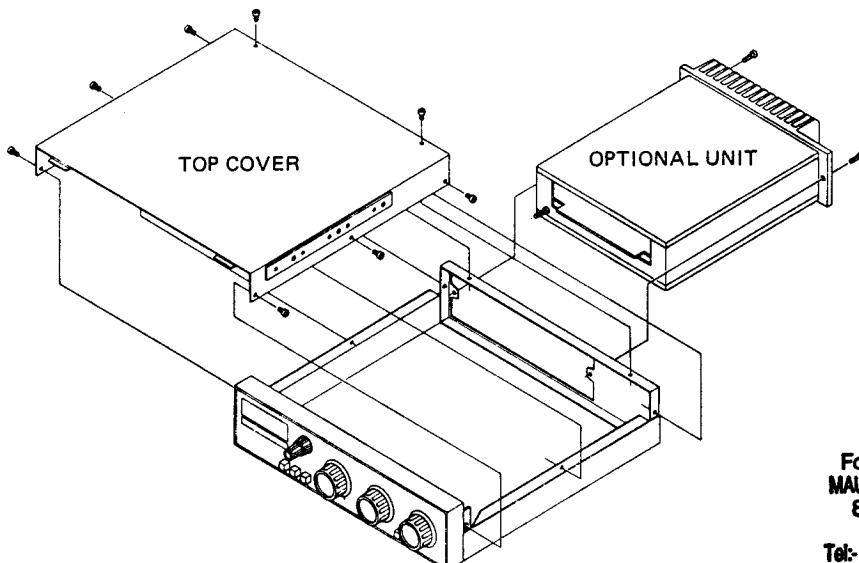

Figure 1

Tel:- 01844-351694 Fax:- 01844-352554
Email: enquiries@mauritron.co.uk

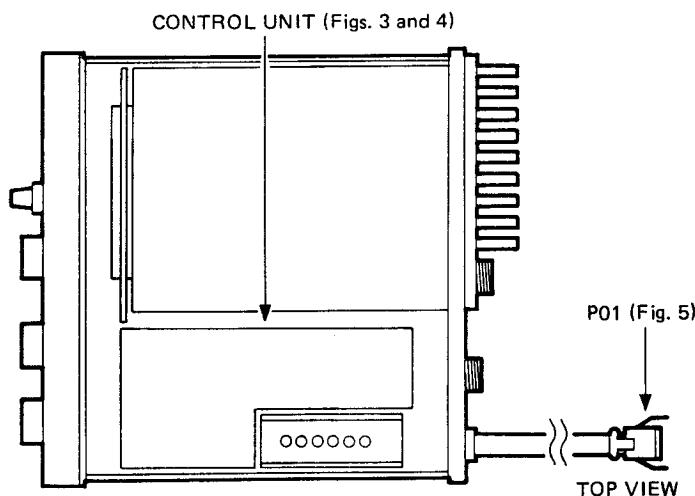

Figure 2

2. Referring to Figures 2 and 3, disconnect all wires and connectors from the Control Unit as described in the following steps:
- Disconnect 8-pin connector P02 from J01, and 9-pin connector P03 from J02.
 - Disconnect the following wires by carefully sliding their connectors off of the contact pins on the Control Unit:
 - the orange wire at the DC 13.5 V OUT terminal
 - the small red wire at the S3 terminal
 - the large red wire at pin 3
 - the white/brown wire at the PO SW terminal
 - the brown wire at the Sla terminal
 - the white/orange wire at the RX HF terminal
 - Disconnect the next set of wires by unsoldering their connections at the Control Unit:
 - the white/brown wire at the TX 13.5 V IN terminal
 - the yellow wire at the TX 13.5 V OUT terminal
 - the center conductor of the coax at the RX OUT terminal
 - the bare solid wire at the 10 m OUT terminal
 - the bare solid wire at the HF ANT terminal

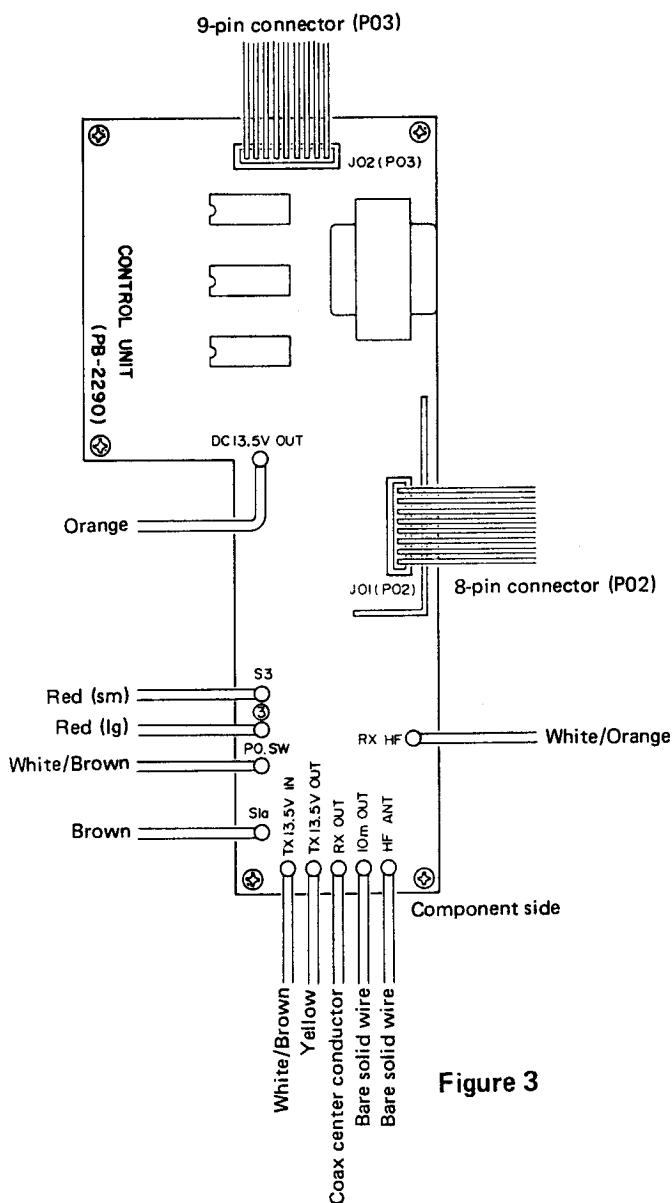

Figure 3

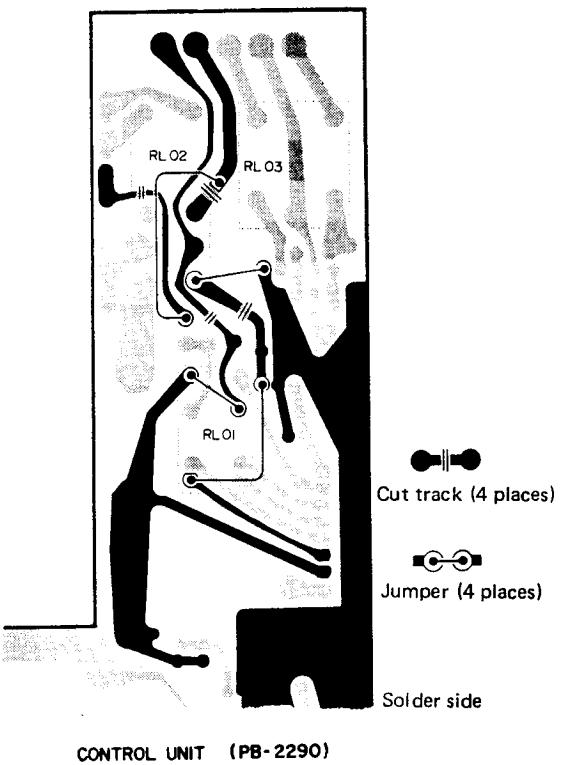

Figure 4

3. Now remove the five screws from the Control Unit, and remove the Unit from the transverter.
4. Referring to Figure 4, carefully cut the four tracks on the solder side of the Control Unit, and install four jumpers as illustrated.
5. Replace the Control Unit and its five screws, and reconnect each connector and wire in the same order that they were removed in part 2, above; i.e. connect P02 to J01 first, and solder the bare wire to the HF ANT terminal last.
6. Replace the top cover of the transverter, and replace the eight screws.
7. Replace the 4-pin connector (P01) at the end of the connection cable on the FTV-707 with the 6-pin DIN plug as shown in Figure 5 and described below:
 - a. Remove the four screws on the 4-pin connector, and slide the black metal cover back to expose the wire connections to the pins. Unsolder the wires and remove the 4-pin connector parts.
 - b. Slide the shell of the DIN connector over the cable, and connect the white/brown wire to pin 2 of the DIN plug. Connect the black wire to the case (ground) of the DIN plug, and the yellow wire to pin 1 of the DIN plug.
 - c. Carefully insulate the end of the red wire with plastic tape, and then slide the shell of the DIN plug over the connections. Schematic diagrams are shown in Figure 8.

Connect the FTV-707 to the FT-102 as shown in Figure 6. If the FP-707 supply is not being used, connect 12 V DC to the FTV-707 using the Power Cord mentioned under "Parts required", after connecting the 4-pin connector left from part 7, as shown in Figure 7.

CAUTION

ONCE THE FTV-707 HAS BEEN MODIFIED IT MUST NOT BE USED WITH ANY MODEL TRANSCEIVER OTHER THAN THE FT-102, OR SEVERE DAMAGE TO THE EQUIPMENT MAY RESULT.

WHENEVER USING THE FTV-707 WITH THE FT-102, BE ABSOLUTELY CERTAIN THAT THE HEATER SWITCH ON THE FT-102 IS OFF, AND THAT THE TUBES HAVE HAD AT LEAST 30 SECONDS TO COOL.

WHEN USING THE FTV-707 WITH THE FT-102, THE IF MONITOR OF THE FT-102 WILL NOT FUNCTION NORMALLY. ALTHOUGH IT MAY SOUND DISTORTED, THIS IS NOT AN INDICATION OF DISTORTION OF THE OUTPUT OF THE FTV-707.

ALSO, WHEN TRANSMITTING WITH THE FT-102 AND FTV-707, THE IC, PO AND ALC METER FUNCTIONS IN THE FT-102 ARE DISABLED, AS WELL AS THE PLATE AND LOAD CONTROLS.
