# PLL frequency synthesizer for tuners BU2614 / BU2614FS

The BU2614 PLL frequency synthesizers work up through the FM band. Featuring low radiation noise, low power dissipation, and highly sensitive built-in RF amps, they support an IF count function.

### Applications

Tuners (Mini components, radio cassette players, radio equipment, etc.)

#### Features

- 1) Built-in high-speed prescaler can divide 130MHzVCO.
- Reference oscillation of 75kHz keeps unnecessary radiation noise to a low level.
- Low current dissipation (during operation: 4mA, PLL OFF 100μA).
- In addition to the standard FM and AM, also offers the following 7 frequencies: 25kHz, 12.5kHz, 6.25kHz, 3.125kHz, 5kHz, 3kHz, and 1kHz.
- 5) Counter for measurement of intermediate frequencies.
- 6) Unlock detection.
- Three output ports (open drain). The BU2615, with seven output ports, is also available.
- 8) Serial data input (CE, CK, DA).

\* FMIN = pulldown, AMIN = pulldown, PD = high impedance

- (5) S: switch between FMIN and AMIN 0: FMIN 1: AMIN
- (6) PS: If this bit is set to ON while AMIN is selected, swallow counter division is possible.
- (7) GT: Frequency measurement time and unlock detection ON/OFF

| СТ | GT | Frequency measurement | Unlock detection      | Data output |  |  |
|----|----|-----------------------|-----------------------|-------------|--|--|
| 0  | 0  | OFF                   | OFF                   | NG          |  |  |
| 0  | 1  | OFF                   | ON                    |             |  |  |
| 1  | 0  | ON gate time 16 ms    | ON gate time 16 ms ON |             |  |  |
| 1  | 1  | ON gate time 32 ms    | ON                    |             |  |  |

(8) TS: Test data (0) is input.

#### Frequency counter

(1) Structure

CE CK Shift register CD

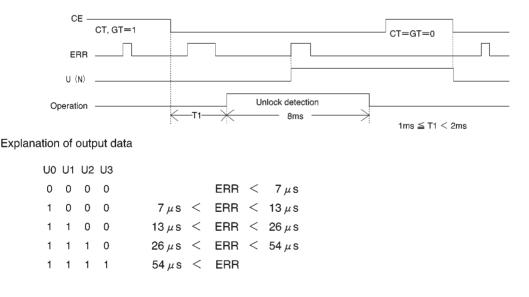

(2) How the frequency counter operates When control data CT equals 1, the 20-bit counter and the amp go into operation. When CT equals 0, input pulldown and the counter are reset. Measuring time (gate pulse) is selected (16ms/32ms) on the basis of control data GT. When control data CT equals 0, the counter is reset.

How the unlock detection circuit operates

When control data GT equals 1, or CT equals 1, the unlock detection circuit goes into operation for 8ms. When CT equals 1, the unlock detection circuits stops operating before the frequency counter gate pulse is emitted. (3) Explanation of output data

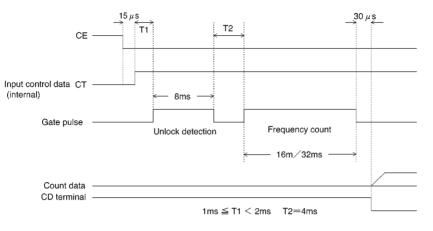

Do: LSB D19: MSB

When CT equals 0, or GT equals 0, the unlock detection circuit is reset.

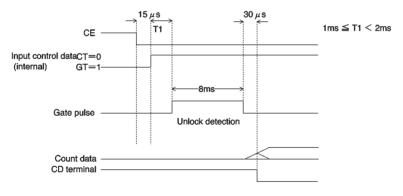

How the frequency counter and unlock detection circuit operate

(1) When CT = 1: Frequency count and unlock detection are carried out.

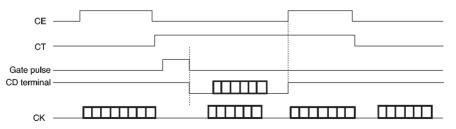

(2) When CT = 0 and GT = 1: Only unlock detection is carried out.

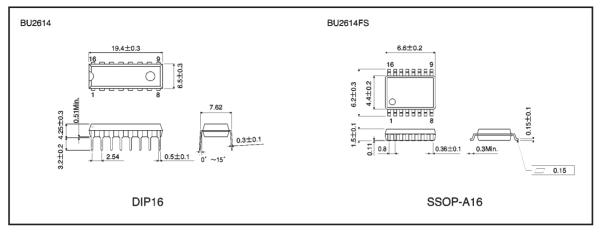

## Explanation of CD terminal

When frequency measurement or unlock detection is finished, the CD terminal goes to LO to indicate that the count and unlock detection have finished. It also synchronizes with CK to output counter data. When the next data is input, it goes to HI.

## External dimensions (Units: mm)
