Velocidades de giro	: 16-33-45-78 rev./min.
Presión de aguja 00S-04S	: 5,5 gramos (no ajustable)
Presión de aguja 00L-04L	: 2-5 gramos (ajustable)
Altura de apilado	: 6 discos

GB

REPAIR HINTS (see Fig. 1)

a. Disconnecting the switching unit

Remove screws 5 and 11.

Lift the unit so high that the knobs are clear of the mounting plate.

Disconnect the mains switch bracket.

Remove the unit so that the trip lever bracket is pulled out of the change unit.

b. Disconnecting the change unit

Remove the switching unit (see point a).

Remove screws 8 and retaining rings 21.

Remove spring 151 from locking bracket 150.

Remove the change unit from the mounting plate.

c. Disconnecting the pick-up arm

Slightly loosen screw 29.

Disconnect the pick-up arm flex.

Lift the pick-up arm by its bearing.

Adjusting the dropping diameter

To adjust the dropping diameter, insert a screwdriver through hole G in the groove of the eccentric block 165.

By turning the screwdriver clockwise, the arm can move further inwards. By turning counter clockwise, the arm will lower further outwards.

F

INSTRUCTIONS POUR LA REPARATION (voir fig. 1)

a. Retrait du bloc de commutation

Enlever les vis 5 et 11.

Soulever le bloc jusqu'à ce que les boutons se dégagent de la plaque de montage. Détacher l'étrier du commutateur secteur. On pourra ainsi détacher le bloc entier, l'étrier du ressort du palpeur se détachant ainsi du bloc d'échange.

b. Comment détacher le bloc d'échange

Enlever le bloc de commutation (voir point a).

Dévisser les vis 8 et les colliers de serrage 21.

Détacher le ressort 151 de l'étrier de verrouillage 150. Le bloc d'échange peut ainsi être enlevé de la plaque de montage.

c. Comment détacher le bras de lecture

Desserrez légèrement la vis 29.

Détacher le cordon du bras. Soulever le bras de lecture à l'endroit du palier.

Réglage du diamètre de pose du bras

Enfoncer un tournevis au travers du trou G et le placer dans l'entaille du bloc excentrique 165. En tournant vers la droite, le bras se prossera plus près du centre, vers la gauche on l'éloignera du centre du disque.

I

ISTRUZIONI PER LA RIPARAZIONE (vedere fig. 1)

a. Ritiro del blocco di commutazione

Togliere le viti 5 e 11.

Sollevare il blocco fino a liberare i tasti dalla piastra di montaggio. Togliere la squadra del cambiotensione. Si potrà ora togliere il blocco completo, staccando dal blocco di scambio la squadra della molla del palpeur.

b. Ritiro del blocco di scambio

Togliere il blocco di commutazione (vedere il punto a).

Svitare la vite 8 e le ranelle di chiusura 21.

Togliere la molla 151 della squadra di fermo 150.

Il blocco di scambio può ora essere tolto dalla piastra di montaggio.

c. Come togliere il braccio di lettura

Svitare leggermente la vite 29. Staccare il cavo del braccio. Sollevare il braccio dal suo supporto.

Regolazione del diametro di posa del braccio

Infilare un cacciavite attraverso il foro G e porlo nella sede del blocco eccentrico 165. Girando verso destra, il braccio si

NL

REPARATIEWENKEN (zie fig. 1)

a. Losnemen van de schakeleenheid

Schroeven 5 en 11 verwijderen.

Eenheid lichten tot de knoppen uit de montageplaat komen. De netschakelaarbeugel losmaken. De eenheid kan nu verwijderd worden, waardoor de tasterveerbeugel uit de wisselenheid getrokken wordt.

b. Losnemen van de wisselenheid

Schakeleenheid verwijderen (zie punt a).

Schroeven 8 en klemringen 21 verwijderen.

Veer 151 van vergrendelbeugel 150 losnemen. De wisselenheid kan nu van de montageplaat losgenomen worden.

c. Losnemen van de P.U. arm

Schroef 29 iets losdraaien.

P.U. armsnoer losmaken. De P.U. arm bij het lager nemen, en omhoog trekken.

Instelling van opzetdiameter

Met een schroevendraaier door gat G in de gieuf van excentrisch blok 165. Bij rechtsom draaien van de schroevendraaier, kan de arm verder naar binnen komen.

Bij linksom draaien zal de arm verder naar buiten opzetten.

D

REPARATURHINWEISE (siehe Abb. 1)

a. Lösen der Schalteinheit

Entferne Schrauben 5 und 11.

Hebe die Einheit so weit an, bis sich die Knöpfe aus der Montageplatte heben.

Löse den Netzschaalterbügel.

Entferne die Einheit und ziehe dabei die Betätigungs Feder aus der Wechselseinheit.

b. Lösen der Wechselseinheit

Entferne die Schalteinheit (siehe Punkt a).

Entferne die Schrauben 8 und die Klemmringe 21.

Löse die Feder 151 des Rastbügels 150.

Nimm die Wechselseinheit von der Montageplatte.

c. Lösen des Tonarms

Löse Schraube 29 etwas.

Löse die Tonarmschraube.

Fasse den Tonarm bei seinem Lager und ziehe ihn nach oben.

Einstellen des Aufsetzdurchmessers

Einstellen des Aufsetzdurchmessers geschieht, indem man einen Schraubenzieher durch Öffnung G in die Rille des Exzenterblocks 165 steckt. Bei Rechtsdrehung der Schraubenzieher setzt der Tonarm mehr nach innen und bei Linksdrehung setzt der Tonarm weiter nach aussen auf.

E

CONSEJOS DE REPARACION (fig. 1)

a. Demontaje de la unidad comutadora

Quite a los tornillos 5 y 11. Levante a la unidad hasta que los botones salen de la placa de montaje. Suelte a la brida del commutador de red. Ahora puede ser quitada la unidad, por lo que también es quitada la brida del resorte palpadore de la unidad de cambio.

b. Demontaje de la unidad de cambio

Quite a la unidad comutadora (vea el punto a).

Retire a los tornillos 8 y a las arandelas de presión 21.

Suelte el resorte 151 de la brida de bloqueo 150.

La unidad de cambio puede ser quitado ahora de la placa de montaje.

c. Demontaje del brazo fonocaptor

Suelte algo al tornillo 29.

Suelte a los cables de fonocaptor. Tome el brazo fonocaptor por el cojinete y trelle hacia arriba.

Ajuste del diámetro de colocación del brazo

Se efectua introduciendo un destornillador a través del orificio

AUTO-CHANGE MECHANISM WITH RECORD SPINDLE (Fig. 1)

Depress the start knob. The trip lever spring of bracket 67 is pushed against trip lever 128 so that this lever is pushed against the turntable spindle. Besides, mains switch 153 is switched on by means of rod 152; bracket 147 stops bracket 150. The motor starts running and the idler wheel is pulled against the motor pulley by rod 74 and bracket 73. Consequently, the turntable starts turning.

The projection on the turntable is pressed against the trip lever, thus trip lever is pushing back in its longitudinal direction. The trip lever pushes bracket 127 from behind projection x of the control disc, so that gearwheel 103 is pulled against the turntable spindle by spring 101.

The turntable drives gearwheel 103, and this wheel, in its turn, drives control disc 132. This disc starts turning clockwise; bracket 110 is lifted out of its rest position D and closes the P.U. switch. (Fig. 3). Pin P of bracket 175 moves from its rest position d in groove B to e (Fig. 2).

At point e, projection m is pressed against wire spring 129 of trip lever 128; consequently the trip lever moves away from the turntable spindle.

The roller of bracket 134 runs along track III and the arm is raised.

Besides, clutch 172 is pressed against disc 168 on plate 163. Pin P at point f. The roller on bracket 117 runs along track I. Bracket 117 is pressed against bracket 123, which, by means of pin 116, operates the record spindle; and tag 137 on bracket 113 is moved out of reach of the control-disc.

Pin P moves from point f to h.

Bracket 175 drives clutch 172 and rotates it; bracket 117 locks gearwheel 103. As soon as pin P reaches point h, bracket 143 (whose roller runs along track II) operates bush 114 and, consequently, the record spindle.

When pin P has reached point j, the roller of bracket 143 has moved as far as possible and the record spindle releases a record.

When pin P has reached point k, the tip of bracket 149 leaves the inner wall of groove A, along which it has moved so far. Thus step bracket 161 is released as far as the stop of rod 80 extending of the diameter adjustment.

When pin P has reached point l, the roller of bracket 143 returned to its point of departure. At point x, pin P follows groove B so that the pick-up arm moves inwards until plate 164 with part 167 is pressed against step bracket 161.

Pin P moves to point m. The arm is lowered. As soon as the tip of bracket 149 strikes again the inner wall of groove A, step bracket 161 is removed from part 167 of plate 164.

At point n the arm is in its lowest position, the stylus has been placed on the record, and clutch 172 has come clear of disc 164. Pin P moves to point d. The roller of bracket 112 moves into the opening of stop D. Projection x strikes the lip of bracket 127 and gearwheel 103 is then moved out of reach of the turntable. The control disc is stopped and the pick-up switch is opened.

End of the record

Carrier 166 on plate 164 pushes trip lever 128 against the turntable spindle.

The projection on the turntable pushes trip lever 128 back in its longitudinal direction, and the auto-change mechanism is operated again in the way described above. The pick-up arm is raised and moved outwards by clutch 172.

After the playing of the last record has been concluded, the set is stopped automatically. This happens as follows:

If the record spindle is no longer loaded with records, the raising movement of pin 116 is automatically limited.

As a consequence, lip 137 on bracket 113 does not move out of reach of the control disc. The lip of steering plate 106 which passes through the control disc, strikes lip 137, and shifts the steering plate so that the run-in opening of groove B is shut. Consequently, pin P keeps following groove A also after point z has been passed by.

At point r pin P is pushed against steering plate 106 so that this plate shifts again.

At point s the arm is lowered until it reaches support 125, and pin P moves on switch spring 131. So the lip of the switch spring is pushed through the control disc at point u. This lip now abuts on bracket 147, which releases bracket 150. Thus the mains switch is switched off.

The turntable slows down, and, consequently, the control disc is turned forwards.

Pin P moves through groove C towards point d, and the control disc stops in the rest position.

Stopping when a stack of records is played

When the stop button is depressed, the trip lever spring of rod 67 is pushed against trip lever 128 which operates the change mechanism again.

Besides, bracket 89 is shifted towards steering plate 106. As soon as pin P reaches point l, bracket 89 is pressed against the uppermost lip of steering plate 106.

This plate is shifted and shuts groove B. Bracket 89 is set by the same lip of steering plate 106 to the position of departure. Pin P pushes, at point r, against steering plate 106, which is shifted again. So groove B is opened again. Then pin P moves through groove C to point d, and the record player is switched off.

Automatic working if one record is played only (short pin)

The record changer is operated in nearly the same way as in the case of a stack of records being played. The difference is that, because there is no record spindle, bracket 143 is not operated through bush 114. Owing to this, switching spring 141 remains within the reach of the control disc; consequently steering plate 106 can shift and shut this groove after the running-in of pin P, after point z in groove B. This implies that after the record has been played, pin P remains in groove A and the set is stopped automatically.

Stopping when playing one record

The operation is nearly the same as with stopping in the case of change-operation. The only difference is that steering-plate 106 already shuts groove B as described above and need not first be shifted by bracket 89.

Manual

Button "Manual" in start position.

Rod 92 pulls bracket 89 within the reach of steering plate 106. Bracket 93 operates lifter bracket 140, thus raising the pick-up arm. Besides, the mains switch is switched on by rods 64 and 152; bracket 147 is locked, and the idler wheel is pulled against the motor pulley. The motor starts running and drives the turntable. Now the stylus can be placed above the record. The button is set to "Manual". Bracket 93 releases lifter bracket 140, which is slowly lowered by spring 136, and positions the pick-up arm on the record by means of bracket 134. At the end of the record, the set is stopped automatically because, by bracket 89, steering plate 106 has shut groove B. Stopping with "Manual" is done in the same way as with auto-change operation.

RECORD SPINDLE (Fig. 4)

The record spindle is locked in the set by means of locking pin 7.

Position I The record spindle is in the starting position.

Position II Records have been placed on the supports 4).

Pin L has risen 3 mm. Cone 1 has risen 3 mm and pushes brake spring 3 so far outwards that it is stopped by a record.

Besides, cone 1 is pressed against trip lever spring 2 so that the lug on this spring fits in the opening between records a and b.

Position III Cone 1 rises another 3 mm.

Stop cam 5 is slid behind brake spring 3; consequently, brake spring 3 is pressed into the record spindle.

By trip lever spring 2 the stack of records is lifted so that only plate a remains resting on supports 4.

Position IV Socket K rises 5 mm and also pushes socket 6, 5 mm upwards. As a result, support 4 moves inwards, causing record a to slide over the record spindle and to drop onto the turntable.

Then socket K is lowered again, so that support 4 swings outwards.

Immediately after, socket K starts to dropping, pin L also moves downwards.

Consequently, trip lever spring 2 is lowered, thus dropping the records on brake spring 3, which is pushed inwards. So the records are placed on supports 4.

Position V There are not any records left on the record spindle.

Pin L rises 3 mm. Brake spring 3 is pushed outwards. Stop cam 5 touches brake spring 3, thus preventing cone 1 from rising.

Socket K is also pressed upwards 5 mm, so that the supports are swinging inwards and does not function any more.

Because pin L cannot be pressed upwards more than 3 mm, the gramophone is shut off.

F

BROCHE D'ECHANGE (fig. 4)

La broche d'échange est verrouillée à l'appareil par la broche de verrouillage 7.

Position I La broche d'échange est en position de départ.

Position II Il y a des disques sur les supports 4.

La broche L s'est soulevée de 3 mm. Le cône 1 s'est aussi soulevé de 3 mm et pousse le ressort de freinage 3 vers l'extérieur jusqu'à ce qu'il soit retenu par le disque.

En même temps, le cône 1 appuie contre le ressort de palpeur 2, à la suite de quoi la patte de ce ressort vient se loger entre l'espace des disques a et b.

Position III Le cône se soulève encore de 3 mm. La came d'arrêt 5 glisse derrière le ressort de freinage 3, ce qui enforce à son tour le ressort dans la broche d'échange.

Le ressort de palpeur 2 fait en sorte que la pile de disques s'allège, seul le disque a reste alors sur les supports 4.

Position IV La douille K se soulève de 5 mm et entraîne aussi le manchon 6 de 5 mm vers le haut. Le support 4 entre dans la broche, le disque a glisse le long de la broche d'échange et de ce fait le disque tombe sur le plateau.

La douille K s'abaisse, le support 4 se rabat vers l'extérieur. Peu après que la douille K ait entamé le mouvement vers le bas, la broche L s'abaisse également.

Le ressort de palpeur 2 descend et, fait en sorte que les disques tombent sur le ressort de freinage 3, qui à son tour est poussé vers l'intérieur faisant en sorte que les disques se placent sur les supports 4.

Position V Il n'y a plus de disques sur la broche d'échange. La broche L s'est soulevée de 3 mm.

Le ressort de freinage 3 est poussé vers l'extérieur. La came d'arrêt 5 est poussée contre le ressort de freinage 3 empêchant le cône 1 de se soulever.

La douille K est aussi soulevée de 5 mm, le support se repliant alors dans la broche, celle-ci n'ayant plus de fonction particulière. Du fait que la broche L ne peut pas être soulevée de plus de 3 mm, l'appareil s'arrête.

NL

WISSELLEN (fig. 4)

De wisselen wordt d.m.v. vergrendelen 7 in het apparaat vergrendeld.

Positie I De wisselen is in uitgangspositie.

Positie II Er bevinden zich grammofoonplaten op de dragers 4. Pen L 3 mm gestegen. Konus 1 is 3 mm gestegen en drukt remveer 3 naar buiten, tot hij wordt tegengehouden door een grammofoonplaat. Tevens drukt konus 1 tegen tasterveer 2, waardoor de lip, aan die veer, in de opening tussen grammofoonplaat a en b komt.

Positie III Konus 1 nog 3 mm verder omhoog.

Blokkeernok 5 schuift achter remveer 3, waardoor de remveer 3 weer binnen de wisselen wordt gedrukt. Door tastveer 2 wordt de stapel grammofoonplaten gelicht, zodat alleen plaat a op de dragers 4 blijft liggen.

Positie IV Bus K 5 mm omhoog, drukt bus 6 eveneens 5 mm omhoog. Daardoor komt drager 4 naar buitenen, waardoor grammofoonplaat a over de wisselen schuift, en op de draaistafel valt.

Daarna gaat bus K weer naar beneden, waardoor drager 4 naar buiten klappt. Ondmiddellijk nadat bus K begint te zakken, gaat ook pen L naar beneden.

Daardoor gaat tastveer 2 naar beneden en laat de grammofoonplaten op remveer 3 zakken, die naar binnen gedrukt wordt, en de grammofoonplaten komen op de dragers 4 te liggen.

Positie V Er bevinden zich geen grammofoonplaten meer op de wisselen.

Pen L 3 mm omhoog. Remveer 3 wordt naar buiten gedrukt. Blokkeernok 5 komt tegen remveer 3, waardoor konus 1 niet hoger kan komen.

Bus K wordt ook 5 mm omhoog gedrukt, waardoor de dragers naar binnen klappen, die in dit geval geen dienst doen.

Doordat pen L niet meer dan 3 mm omhoog gedrukt kan worden, slaat het apparaat af.

D

WECHSELACHSE (Abb. 4)

Die Wechselachse wird mit Raststift 7 im Gerät verriegelt.

Position I Die Wechselachse befindet sich in Ausgangsstellung

Position II Es liegen Schallplatten auf Träger 4.

Stift L ist 3 mm angehoben. Konus 1 ist 3 mm angehoben und drückt Bremsfeder 3 nach aussen, bis diese gegen eine Schallplatte stößt.

Außerdem drückt Konus 1 gegen Betätigungs-feder 2, wodurch der Nocken der Feder in die Öffnung zwischen Schallplatte a und b drückt.

Position III Konus 1 wird um weitere 3 mm gehoben. Sperrnocken 5 schiebt hinter Bremsfeder 3, wodurch Bremsfeder 3 wieder in die Wechselachse gedrückt wird.

Betätigungs-feder 2 hebt den Stapel Schallplatten, so dass nur noch Platte a auf Träger 4 liegt.

Position IV Buchse K hebt sich 5 mm und drückt Buchse 6 ebenfalls 5 mm nach oben. Hierdurch schwenkt Träger 4 nach innen, die Schallplatte a schließt über den Wechselstift und fällt auf den Plattenteller.

Buchse K senkt sich wieder und Träger 4 klappt nach aussen. Beim Sinken der Buchse K bewegt sich Stift L ebenfalls abwärts. Betätigungs-feder 2 sinkt hierdurch und lässt die Schallplatten auf Bremsfeder 3 fallen. Die Feder wird nach innen gedrückt und die Schallplatten gelangen auf Träger 4.

Position V Es liegen keine Schallplatten mehr auf der Wechselachse. Stift L hebt sich 3 mm. Bremsfeder 3 wird nach aussen gedrückt. Sperrnocken 5 drückt gegen Bremsfeder 3, wodurch Konus 1 sich höher kommen kann.

Buchse K wird ebenfalls 5 mm nach oben gedrückt, wodurch die Träger nach innen klappen und keine Funktion mehr ausüben.

Da Stift L nicht höher als 3 mm gedrückt werden kann, schaltet das Gerät ab.

I

ASTA DI SCAMBIO (fig. 4)

L'asta di scambio è fissata all'apparecchio attraverso la boccola di fermo 7.

Posizione I L'asta di scambio è in posizione di partenza.
Posizione II Vi sono dei dischi sui supporti 4.

L'asta L è ora sollevata di 3 mm. Il cono 1 è così sollevato di 3 mm e spinge la molla di frenaggio 3 verso l'esterno fino ad essere bloccato dal disco. Nello stesso tempo, il cono 1 appoggia contro la molla del palpeur 2, per cui l'estremità di questa molla viene ad inserirsi tra lo spazio dei dischi a e b.

Posizione III Il cono si solleva ancora di 3 mm. La camma di arresto 5 scivola dietro la molla di blocco 3 premendo a sua volta la molla nell'asta di scambio. La molla del palpeur 2 permette l'alleggerimento della pila dei dischi, allora solo il disco a resta sui supporti 4.

Posizione IV La boccola K si solleva di 5 mm e trascina anche il manicotto 6 di 5 mm verso l'alto. Il supporto 4 entra nell'asta. Il disco a scivola lungo l'asta di scambio e per questo il disco cade sul piatto. La boccola K si abbassa, il supporto 4 si porta verso l'esterno. Poco dopo che la boccola K ha impresso il movimento verso il braccio. L'asta L s'abbassa ugualmente.

La molla del palpeur 2 discende e, finendo che i dischi cadano sulla molla di blocco 3, che al suo giro è premuta verso l'interno permettendo che i dischi si posino sui supporti 4.

Posizione V Non vi sono più dischi sull'asta di scambio l'asta L si è sollevata di 3 mm. La molla di blocco è premuta verso l'esterno. La camma d'arresto 5 è spinta contro la molla di blocco 3 impedendo al cono 1 di sollevarsi.

La boccola K è così sollevata di 5 mm, il supporto portandosi nell'asta questa non avrà più funzioni particolari per il fatto che l'asta L non può più essere alzata più di 3 mm, l'apparecchio si ferma.

E

PERNO DE CAMBIO (fig. 4)

El perno de cambio es encerrado en el aparato mediante el perno de bloqueo 7.

Posición I El perno de cambio se encuentra en la posición de salida.

Sobre los portadores 4 se hallan discos.
Posición II El perno L sube 3 mm. El cono 1 sube también 3 mm y empuja el resorte de freno 3 hacia afuera hasta que es parado por un disco.
 El cono 1 empuja además contra el resorte palpeador 2 por lo que el labio sobre este resorte. El llevado en la abertura entre los discos a y b.

Posición III El cono 1 sube 3 mm más hacia arriba.
 La leva de bloqueo 5 corre detrás del resorte de freno 3 por lo que este es empujado devuelto en el perno de cambio.

La pila de discos es levantada por el resorte palpeador 2, de modo que solo queda el disco a sobre los portadores 4.

Posición IV El tubo K sube 5 mm y empuja también el tubo 6 sobre esta distancia hacia arriba. Esto hace que los portadores 4 sean contraídos, originando a su vez que el disco a caí al largo del perno de cambio sobre la mesa giratoria. Luego baja nuevamente el tubo K haciendo salir así a los portadores 4.

Un poco después de que el tubo K empieza a bajar baja también el perno L.
 Debido a esto el resorte palpeador va hacia abajo, deja caer los discos sobre el resorte de freno 3, cual es empujado hacia adentro, y los discos se encuentran sobre los portadores 4.

Posición V Sobre el perno de cambio no se encuentran más discos.

El perno L sube 3 mm. El resorte de freno 3 es empujado hacia afuera. La leva de bloqueo 5 toca el resorte de freno 3 evitando así subida del cono 1. El tubo K es empujado 5 mm hacia arriba por lo que el portador es contraído. En este caso no tiene este función alguna.

Ahora, como que el perno L no puede ser subido más que 3 mm, se desconecta el aparato.
