Power Output (approx.)	25	30	40	50 Watts

NOTES:

1. Base dielectric loss factor is 0.1 maximum. Reference: ASTM Designation D-150-47T.
2. Extreme values which may be expected in production.
3. With plate modulation.
4. Continuous commercial service.
5. Intermittent commercial and amateur service.
6. May be obtained from a separate, well-regulated source or from the plate supply voltage if a voltage divider is used.
7. The effective grid circuit resistance should not exceed 500 ohms per grid, or the impedance 700 ohms.
8. Distortion in practical circuits should not exceed 5%, 5% and 3%, respectively, under CCS conditions.
9. The total effective grid circuit resistance should not exceed 25,000 ohms. May be obtained by either fixed bias or bypassed cathode resistor.
10. Generally obtained from the modulated plate supply through the specified resistor but a separate source properly modulated may be used.
11. Bias may be provided by any method. When grid leak bias is used the grid circuit resistance should not exceed the specified value.
12. May be obtained from the plate voltage supply through the specified dropping resistor or a separate supply may be provided.
13. Bias may be provided by use of 12,800 ohm grid leak, 410 ohm cathode resistor, fixed separate source, or combination of these. The grid circuit resistance should not exceed 25,000 ohms.

CIRCUIT APPLICATION

This type was primarily designed to make available the good characteristics of the Type 807 in a mechanical structure that could stand up under rough service. If it is desired to use this type for replacement in existing equipment, the effect of the different base diameter and bulb size (shown on the outline drawing) will require consideration.
