*Average over an audio-frequency cycle of sine-waveform under maximum-signal conditions.

**Average over an audio-frequency cycle of sine-waveform under approximately 70% of maximum drive conditions.

***Based upon peak power demand from driver.

****Low distortion operating condition recommended for plate modulating the final stage of 1 KW Broadcast Transmitters. This operating condition makes possible exceptionally low distortion because of the relatively high value of the minimum input resistance to the grids of the tubes, coupled with a low driving power requirement and a practically straight line plate transfer characteristic.

The Amperex 849-H is identical in all but its interelectrode capacitances with the 849-A. The only other point of difference is the grid connection which terminates in an arm extending from the side of the glass envelope. It is designed for more efficient operation at high frequencies and may be operated at full ratings up to 30 megacycles in many classes of service.
