* Within this range a higher First Anode Voltage will provide an improved focus performance.

PICTURE CENTRING

Maximum magnet flux density at centre of neck should not be less than	17 Gs
Maximum distance of centre of magnetic field from reference line	53 mm

NOTE

If this tube is operated at voltages in excess of 16kV, x-ray radiation shielding may be necessary to avoid possible danger of personal injury from prolonged exposure at close range. The normal glass protective viewing window may provide such a safeguard. If the radiation measured in contact with this window does not exceed 0.5 milliröntgens per hour, the window will normally provide adequate protection.

DEFLECTION ANGLES

Height	82°
Width	99°
Diagonal	110°

WEIGHT

Approximate Single Tube Weight : Net	7.2 kg (16 lb)
Packed	9.1 kg (20 lb)

All dimensions in mm.

Not to be scaled.

Notes :

* During the face sealing operation the glass in this area (total 22mm) may be disturbed. As the shape of the contour within this area may be either convex or concave the bulb should not be gripped within this region unless special precautions are taken (such as the use of resilient packing material).

† Determined by Reference Gauge No. 16 (JEDEC No. 126).

**The socket for the B8H button base should not be rigidly mounted, it should have flexible leads and be allowed to move freely. The design of the socket should be such that the wiring cannot impress lateral strains through the socket contacts on the base. Bottom circumference of base wafer will fall within a circle concentric with the bulb axis and having a diameter of 44mm.

The maximum dimensions at the face seal may be 3.5 mm larger than the maximum face dimensions but at any point around the seal the bulge will not protrude more than 2 mm.

There is an annular region of anti-corona coating with diameters of 30 mm and 100 mm surrounding the CT8 cap, the tube should not be handled in this region.
