Transconductance.....	3800 μ mhos
Plate Resistance (approx.).....	40,000 Ohms

NOTES:

1. This tube is intended for use in automobile radios operated from a nominal 12-volt battery. Design of the tube is such that the heater will operate satisfactorily over the range 10.0 volts to 15.9 volts, and that the maximum ratings provide a safety factor for the wide voltage variation encountered with this type of supply.
2. Average contact potential bias developed across the specified grid resistor.

APPLICATION

The Sylvania Type 12CN5 is a miniature sharp-cutoff pentode intended for use as an I F amplifier in automobile radio receivers. It is designed primarily to operate where the heater, plate, and screen voltages are obtained directly from a 12-volt automotive storage battery.

Plate Resistance (approx.).....	8200	150,000 Ohms
Ec1 for Ib = 100 μ a (approx.).....	-6.5	-8 Volts

NOTES:

1. Heater warm-up time is defined as the time required for the voltage across the heater to reach 80% of its rated value after applying four (4) times rated heater voltage to a circuit consisting of the tube heater in series with a resistance equal to three (3) times rated heater voltage divided by rated heater current.
2. Design-maximum ratings are limiting values of operating and environmental conditions applicable to bogey electron device of a specified type as defined by its published data, and should not be exceeded under the worst probable conditions.
The device manufacturer chooses these values to provide acceptable serviceability of the device, taking responsibility for the effects of changes in operating conditions due to variations in device characteristics.
The equipment manufacturer should design so that initially and throughout life no design-maximum value for the intended service is exceeded with a bogey device under the worst probable operating conditions with respect to supply-voltage variation, equipment component variation, equipment control adjustment, load variation, signal variation, and environmental conditions.

12CT8 (Cont'd)

APPLICATION

Type 12CT8 has a medium mu triode and pentode amplifier contained in a miniature envelope. The pentode section is intended for use as a video amplifier. Type 12CT8 has controlled heater warm-up time for series string operation.

Grid No. 1 Voltage for Ib = 10 μ a (approx.)	-4.5 Volts

NOTES:

1. This tube is intended for use in automobile radios operated from a nominal 12-volt battery. Design of the tube is such that the heater will operate satisfactorily over the range from 10.0 to 15.9 volts, and that the maximum ratings provide a safety factor for the wide voltage variations encountered with this type of supply.
2. Design-Maximum ratings are the limiting values expressed with respect to bogen tubes at which satisfactory tube life can be expected to occur. To obtain satisfactory circuit performance, therefore, the equipment designer must establish the circuit design so that no design-maximum value is exceeded with a bogen tube under the worst probable operating conditions with respect to supply voltage variation, equipment component variation equipment control adjustment, load variation, and environmental conditions.
3. Average contact potential developed across specified grid resistor.
4. Signal applied in series with 1.0 μ f grid-leak capacitor.

APPLICATION NOTES

The Sylvania Type 12CX 6 is a miniature, sharp-cutoff pentode intended for use as an rf amplifier. It is designed for operation where the heater, plate and screen voltages are supplied directly from a 12-volt automotive storage battery.

NOTES:

1. This tube is intended for use in automobile radios operated from a nominal 12 volt battery. Design of the tube is such that the heater will operate satisfactorily over the range 10.0 volts to 15.9 volts, and that the maximum ratings provide a safety factor for the wide voltage variation encountered with this type of supply.
2. External Shield No. 316 connected to cathode or Pin No. 2.
3. Grid No. 3 Voltage is obtained through a resistor (R-9) connected to Grid No. 1 which obtains its voltage from an AVC circuit. The value of the resistor connecting Grid No. 1 to Grid No. 3 is influenced by circuit and AVC voltage variations.
4. Bias voltage for Grid No. 1 is normally obtained from an AVC circuit, therefore, the value of the resistor (R-10) connected to Grid No. 1 is influenced by circuit and AVC voltage variations. Bias voltage for Grid No. 1 can also be developed across a 2.2 megohm resistor by means of contact potential.
5. From Grid No. 3 to Plate.

SYLVANIA TYPE 12EG6 (Cont'd)

TYPICAL DUAL CONTROL R-F AMPLIFIER CIRCUIT

APPLICATION

The Sylvania Type 12EG6 is a dual control heptode contained in a T-6 $\frac{1}{2}$ envelope. It is intended for use as an RF amplifier where the application of AVC control voltage to two control grids is a definite advantage in reducing back biasing of the AVC line (a condition encountered when receiving strong RF signals.) It is designed for operation where the heater plate, and grids No. 2 and No. 4 voltages are supplied directly from a 12-volt automotive storage battery.

NOTES:

1. This tube is intended for use in automobile radios operated from a nominal 12 volt battery. Design of the tube is such that the heater will operate satisfactorily over the range 10.0 volts to 15.9 volts, and that the maximum ratings provide a safety factor for the wide voltage variation encountered with this type of supply.
2. Contact potential bias developed across a 2.2 megohm resistor.
3. Bias voltage is developed across a 15 megohm resistor by means of Grid No. 1 rectification (obtained when applying the specified signal voltage) and contact potential.
4. With no signal applied to Grid No. 1 and bias developed solely by contact potential, the plate current is 6.0 ma.

APPLICATION

The Sylvania Type 12EM6 is a miniature diode-tetrode designed for use in automobile receivers. The diode section is intended for use as a detector while the tetrode section is designed to be used as a power amplifier driver. It is designed for operation where the heater, plate and screen voltages are supplied directly from a 12 volt automotive storage battery.

4. With no signal applied to Grid No. 2 and bias developed solely by contact potential, the plate current is 40 Ma.

APPLICATION

Sylvania Type 12K5 is a space-charge tetrode. It is designed for use where plate, space-charge grid and heater potentials are obtained directly from a 12 volt automotive battery.

Transconductance	7000 μ mhos
Plate Resistance	13,000 Ohms
Grid No. 1 Voltage for $I_b = 0.5$ Ma (approx.)	-22 Volts

INSTANTANEOUS PLATE KNEE VALUES

$E_b = 45$ V, $E_{c2} = 110$ V, and $E_{c1} = 0$
 $I_b = 120$ Ma and $I_{c2} = 17$ Ma.

NOTES:

1. Heater warm-up time is defined as the time required for the voltage across the heater to reach 80% of the rated heater voltage after applying four (4) times rated heater voltage to a circuit consisting of the tube heater in series with a resistance equal to three (3) times the rated heater voltage divided by the rated heater current.
2. For operation in a 525-line, 30-frame system as described in "Standards of Good Engineering Practice for Television Broadcast Stations; Federal Communications Commission," the duty cycle of the voltage pulse must not exceed 15% of one scanning cycle.
3. In stages operating with grid leak bias, an adequate cathode bias resistor or other suitable means is required to protect the tube in the absence of excitation.

APPLICATION

The Sylvania Types 12R5 and 17R5 are miniature, beam power pentodes designed for use as vertical deflection amplifiers. Types 12R5 and 17R5 have controlled heater warm-up time for series string operation.

NOTES:

1. This tube is intended for use in automobile radios operated from a nominal 12 volt battery. Design of the tube is such that the heater will operate satisfactorily over the range 10.0 volts to 15.9 volts, and that the maximum ratings provide a safety factor for the wide voltage variation encountered with this type of supply.
2. Section 1 connects to pins 6, 7 and 8. Section 2 connects to pins 1, 2 and 3.
3. External shield No. 315 connected to cathode of section under test.

APPLICATION

The Sylvania Type 12U7 is a general purpose, medium μ , dual triode, having separate cathodes for each section. It is designed for operation where the heater and plate voltages are supplied directly from a 12-volt automotive storage battery.

NOTES:

1. Heater warm-up time is defined as the time required for the voltage across the heater to reach 80% of its rated value after applying four (4) times rated heater voltage to a circuit consisting of the tube heater in series with a resistance equal to three (3) times rated heater voltage divided by rated heater current.
2. Design-Maximum Ratings are limiting values of operating and environmental conditions applicable to a bogey electron device of a specified type as defined by its published data, and should not be exceeded under the worst probable conditions.
The device manufacturer chooses these values to provide acceptable serviceability of the device, taking responsibility for the effects of changes in operating conditions due to variations in device characteristics.
The equipment manufacturer should design so that initially and throughout life no design-maximum value for the intended service is exceeded with a bogey device under the worst probable operating conditions with respect to supply-voltage variation, equipment component variation, equipment control adjustment, load variation, signal variation, and environmental conditions.
3. For operation in a 525-line, 30-frame system as described in "Standards of Good Engineering Practice for Television Broadcasting Stations; Federal Communications Commission." The duty cycle of the voltage pulse must not exceed 15% of one scanning cycle.

APPLICATION

The Type 17H3 is a half-wave diode designed for use as a damping diode in horizontal deflection circuits of series string TV receivers.

NOTE:

1. Fixed bias operation at maximum ratings is not recommended.

APPLICATION

The Sylvania Type 35L6GT is a pentode audio power amplifier designed for series string operation, capable of delivering relatively high power output with low supply voltages. It is similar, except for filament operation, to the Types 25L6GT and 50L6GT.

NOTES:

1. Grid 2 connected to plate.
2. CCS—Continuous Commercial Service.
3. ICAS—Intermittent Commercial and Amateur Service.
4. Averaged over any audio frequency cycle of sine-wave form.
5. The d c grid 1 circuit resistance should be limited to 100,000 ohms with fixed bias or 500,000 ohms with cathode bias.
6. The driver stage should be capable of supplying the No. 1 grids of the class AB₁ stage with the specified driving voltage at low distortion.
7. May be obtained from a separate well regulated source or from the plate supply voltage if a voltage divider is used.
8. The effective grid circuit resistance should not exceed 500 ohms per grid, or the impedance 700 ohms.
9. Distortion in practical circuits should not exceed 5%, 5% and 3% respectively, under CCS conditions.
10. Bias may be provided by use of 12,800 ohm grid leak, 410 ohm cathode resistor, fixed separate source or a combination of these. The grid circuit resistance should not exceed 30,000 ohms.

SYLVANIA TUBE TESTER SETTINGS

	A	B	C	D	E	F	G	Test or K

TYPES 950, 951

(See Condensed Data Section)

SYLVANIA TYPE 5642 HALF-WAVE RECTIFIER

5642

MECHANICAL DATA

Bulb.....	T-3
Base.....	Flexible Leads
Basing.....	5462
Lead Diameter.....	0.017" +0.002
	-0.001
Cathode.....	Filamentary
Mounting Position.....	Any

ELECTRICAL DATA

HEATER CHARACTERISTICS

Filament Voltage.....	1.25 Volts
Filament Current (Per Tube).....	200 Ma

DIRECT INTERELECTRODE CAPACITANCES (Unshielded)

Filament to Plate.....	0.6 μ f
------------------------	-------------

MAXIMUM RATINGS (Design Center Values)

Half Wave Rectifier Service

Peak Inverse Voltage.....	10000 Volts
Steady State D C Output Current.....	0.25 Ma
Steady State Peak Plate Current ¹	5 Ma
Minimum Frequency of Supply Voltage.....	5 Kc

CHARACTERISTICS

Tube Voltage Drop ²	30 Volts
--------------------------------------	----------

TYPICAL OPERATION

Pulse Type Rectifier Doubler in Television Scanning Circuit²

Peak Plate Pulse Voltage.....	8000 Volts
D C Output Current.....	150 μ a
Output Voltage (Two Tubes).....	12000 Volts

NOTES:

1. The duration of the voltage pulse should not exceed 15% of one horizontal scanning cycle. In a 525 line interlaced two to one 30 frame per second system, 15% of one horizontal scanning cycle is 10 microseconds.
2. Measured with applied d c voltage at 4.0 ma.

APPLICATION

The Sylvania Type 5642 is a subminiature half-wave rectifier designed for service in high efficiency, compact high voltage power supplies. The long flexible leads allow it to be wired in, thus reducing insulation and leakage problems.

TYPES 9002, 9003, 9006, XXB, XXD, XXFM, XXL
