HIGH-VACUUM RECTIFIER

The Eimac 2-450A is a high-vacuum diode rectifier intended for use in rectifier units, voltage multipliers, or in special applications where high peak-inverse voltages, extreme temperatures, high operating frequency, or the production of high-frequency transients would prevent the use of mercury-vapor or gas-filled rectifier tubes.

COOLING

The temperature of the plate seal and envelope must not be allowed to exceed 225°C and 250°C respectively. When several tubes are being operated in the same compartment and at or near maximum rated plate dissipation, forced-air cooling is required. In any event, it should be remembered that the listed temperatures are maximums and that lower operating temperatures will result in longer life and improved reliability. The use of a temperature-sensitive paint, sparingly applied in the referenced areas, is recommended to determine the effectiveness of the cooling employed in any given installation.

*Choke-input filter with L equal to or greater than twice "critical"; zero circuit loss assumed; tube drop considered.

CHOKE-INPUT FILTER

The maximum d-c current rating of the 2-450A is 1.0 amperes when the load incorporates a choke-input filter with the "critical" value (or larger) of input inductance. This value may be calculated from the appropriate formula below:

$$L_o = \frac{R_{eff}}{18.8f} \begin{cases} \text{for full-wave} \\ \text{single wave} \\ \text{power supplies} \end{cases} \quad L_o = \frac{R_{eff}}{75f} \begin{cases} \text{for half-wave} \\ \text{three-phase} \\ \text{power supplies} \end{cases} \quad L_o = \frac{R_{eff}}{660f} \begin{cases} \text{for full-wave} \\ \text{three-phase} \\ \text{power supplies} \end{cases}$$

where: L_o = "critical" value of input inductance (henries) f = supply-line frequency (cycles per second)

$$R_{eff} = \frac{\text{Load voltage (volts)}}{\text{Load current (amps)}}$$
