SECTION 1
OUTLINE

1-1. CIRCUIT DESCRIPTION (See Fig. 1)

Program Sensor

The FM or LW band can be changed automatically through the optical detection by the following procedures;

1 Set the FUNCTION switch (S1) to band selector position (center position).
2 Then, Set the band selector switch (S3) to PROGRAM SENSOR position.
3 Match the dial pointer to the desired station marker. (See Fig. 2)
4 The FM or LW band changes automatically.

1) When the pointer matches only with the FM station marker:

a) The light of IC301 (Photo Interrupter) is intercepted by the marker, bias voltage is applied to the base of Q303 through R305, and Q303 is turned on.
b) The collecter voltage of Q303 reduces and D203 is turned on.
c) D203 is conducted, B+ voltage through R217 is decreased.
d) D201 is opened, B+ voltage is not supplied to the terminal (23) of IC201.
e) FM circuit operates (The terminal (23) of IC201 serves as a switch).

Note: When B+ voltage is applied to the terminal (23) of IC201 through R217, R216 and D201, the receiver is in LW mode.

f) At the same time, PL905 (FM indicator lamp) lights because of Q304 operating.

2) When the pointer matches only with the LW station marker:

a) As the light of IC301 is not intercepted, Q303 and D203 are turned off. As a result, B+ voltage is applied to the terminal (23) of IC201 through R217 and R216. On the other hand, the light of IC302 is intercepted by the LW station marker.
b) Q306 and Q305 are turned on.
c) B+ voltage is applied to L208 (LW oscillator coil).
d) LW circuit operates. When Q305 is on, PL906 (LW indicator lamp) simultaneously lights.

3) When the pointer matches simultaneously with both the FM and LW station markers:

a) Q303 and Q304 are turned on by intercepting the light of IC301. On the other hand, the light of IC302 is also intercepted and the bias voltage is applied to the base of Q306, but because the collector voltage of Q304 is high, D304 is turned off. The emitter voltage of Q306 rises and B+ voltage is not applied to L208 (LW oscillator coil) and PL906. Consequently, only the FM station signal is received.

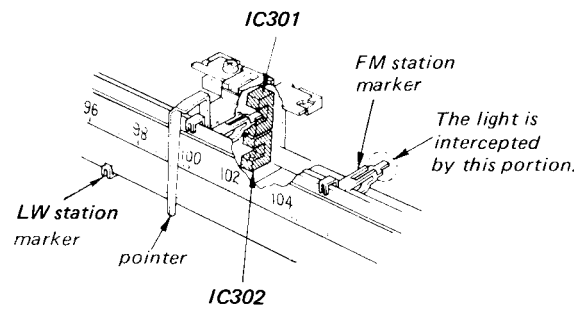

Fig. 2

Q302 and 301

Q302 operates to improve the rise time of PL905 (FM indicator lamp) or PL906 (LW indicator lamp) when tuning the receiver, and at the same time Q302 switches Q301. Q301 serves as a high-speed-muting switch which is turned on or off as soon as the station signal is tuned or detuned.

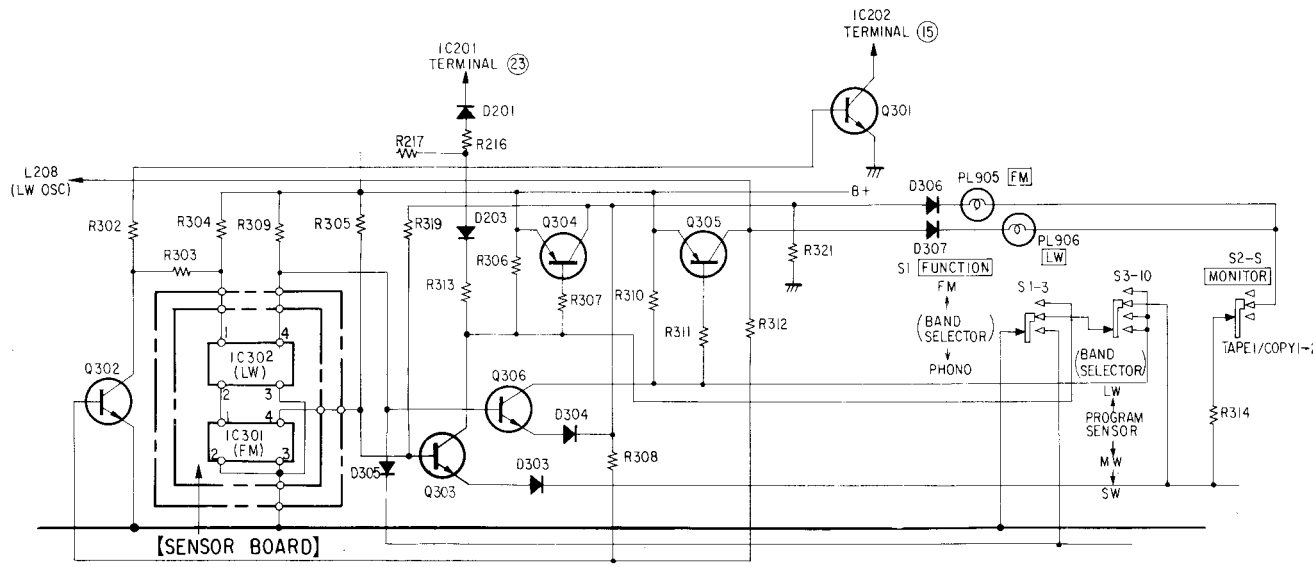

Fig. 1

IC201 (CX168), IC202 (CX178)

These two ICs form a system. Both of them are bipolar-linear-ICs. CX168 integrates 343 elements and CX178 integrates 260 elements. They include many functions and are improved upon the degree of integration now available as a linear-ICs for tuner use. They have high performance in FM reception and form a muting system having an FM muting attenuation of 90dB. In addition, because a muting circuit is newly employed in the AM circuit not only is there high performance in FM reception but AM station signal can be received with fine tone quality and sensitivity as with FM broadcasting station. As an additional function, they operate for FM/AM continuous station selection, FM/AM signal-strength meter output, FM/AM muting output switching and enforced AGC at FM reception.

Photo Interrupter (IC301, 302)

The terminals (1) and (2) of the photo interrupter operate as the light emitting diode. On the other hand, the terminals (3) and (4) operate as the photo detector. When the photo detector receives the light as shown in Fig. 3, the terminal between terminals (3) and (4) is a low-impedance. When light is intercepted by the marker, as shown in Fig. 4, it becomes high-impedance.
