INTEGRATED STEREO AMPLIFIER

SPECIFICATIONS

GENERAL

Power Requirements: 120 V ac, 60 Hz (US, Canadian model)
110 – 120 V and 220 – 240 V ac, adjustable 50/60 Hz (AEP, UK, E model)

Power Consumption: 190 W (US model)
490 VA (Canadian model)
450 W (AEP, E model)
550 W (UK model)

Dimensions: Approx. 430 (w) x 170 (h) x 390 (d) mm
16⅞ (w) x 6¾ (h) x 15⅜ (d) inches
including projecting parts and controls

Weight: Approx. 12.5 kg, 27 lb 9 oz (net)
Approx. 14.2 kg, 31 lb 5 oz (in shipping carton)

SAFETY-RELATED COMPONENT WARNING!!

COMPONENTS IDENTIFIED BY SHADING AND ⚠ MARK ON THE SCHEMATIC DIAGRAMS, EXPLODED VIEWS AND IN THE PARTS LIST ARE CRITICAL TO SAFE OPERATION. REPLACE THESE COMPONENTS WITH SONY PARTS WHOSE PART NUMBERS APPEAR AS SHOWN IN THIS MANUAL OR IN SUPPLEMENTS PUBLISHED BY SONY.

ATTENTION AU COMPOSANT AYANT RAPPORT À LA SÉCURITÉ !

LES COMPOSANTS IDENTIFIÉS PAR UN TRAMÉ ET UNE MARQUE ⚠ SUR LES DIAGRAMMES SCHÉMATIQUES, LES VUES EXPLOSÉES ET LA LISTE DES PIÈCES SONT CRITIQUES POUR LA SÉCURITÉ DE FONCTIONNEMENT. NE REMPLACER CES COMPOSANTS QUE PAR DES PIÈCES SONY DONT LES NUMÉROS SONT DONNÉS DANS CE MANUEL OU DES SUPPLÉMENTS PUBLIÉS PAR SONY.

POWER AMPLIFIER SECTION

Power Output and Total Harmonic Distortion: With 8 Ω loads, both channels driven, from 20–20,000 Hz; rated 100 W per channel minimum RMS power, with no more than 0.03 % total harmonic distortion from 250 mW to rated output.
(US, Canadian model)

Continuous RMS Power Output: (Less than 0,03 % THD, both channels driven simultaneously)
At 20 Hz–20 kHz
100 W + 100 W (8 Ω)
According to DIN 45500
100 W + 100 W (8 Ω)
(AEP, UK, E model)

Power Bandwidth (IHF): 5 Hz – 35 kHz (50 W output, 0.03 % THD, 8 Ω)
(AEP, UK, E model)

Harmonic Distortion: Less than 0.03 % at rated output
Less than 0.015 % at 1 W/10 W output

Intermodulation (IM) Distortion: (60 Hz : 7 kHz = 4 : 1)
Less than 0.03 % at rated output
Less than 0.008 % at 1 W/10 W output

Frequency Response: DC – 100 kHz $^{+0}_{-1}$ dB

– Continued on page 2 –

SONY®
SERVICE MANUAL

S/N Ratio: Greater than 115 dB, short-circuited input

Residual Noise: Less than 50 μV (8 Ω, network A)

Damping Factor: 50 (8 Ω, 1 kHz)

Inputs: POWER INPUT
Sensitivity 1.3 V (4.5 dB), for rated output
Impedance 50 kΩ

Outputs: SPEAKER terminals A, B
Accept speakers of 4 – 16 Ω
(US, Canadian model)
Accept speakers of 8 – 16 Ω
(AEP, UK, E model)

HEADPHONES jack
Accepts low and high-impedance stereo headphones

PREAMPLIFIER SECTION

Harmonic Distortion: Less than 0.003 %
(TUNER → PRE OUTPUT, 10 V output, 1 kHz)

Intermodulation (IM) Distortion: Less than 0.003 %
(60 Hz : 7 kHz = 4 : 1) (TUNER → PRE OUTPUT, 10 V output)

Frequency Response: PHONO 1, 2 RIAA equalization ±0.2 dB
TUNER, AUX 1, 2, TAPE 1, 2: 2 Hz – 150 kHz $^{+0}_{-1}$ dB

Tone Controls: BASS
±10 dB at 60 Hz
TREBLE
±10 dB at 25 kHz

Filters: LOW
6 dB/octave attenuation below 15 Hz
HIGH
6 dB/octave attenuation above 9 kHz

Residual Noise: –∞ (infinity)

Inputs:

	Sensitivity	Impedance	Phono overload (1 kHz)	S/N (weighting network, input level)
PHONO 1	2.5 mV (–50 dB)	50 kΩ	250 mV	85 dB (A, 2.5 mV)
PHONO 2 (HEAD AMP)	0.08 mV (–80 dB)	100 Ω	8 mV	70 dB (A, 0.08 mV)
TUNER AUX 1, 2 TAPE 1, 2	150 mV (–14.5 dB)	50 kΩ	———	105 dB (A, 150 mV)

Outputs:

	Voltage	Impedance
REC OUT 1, 2	150 mV (–14.5 dB) (13.5 V at max.)	10 kΩ
PRE OUTPUT	1.3 V (4.5 dB) (10 V at max.)	2.5 kΩ (max.)

0 dB = 0.775 V

SERVICING NOTES

1. REPLACEMENT OF THE TRANSFORMERS IN THE PULSE-LOCKED POWER-SUPPLY CIRCUIT

The lead wire arrangement for each of T601–603 in the inverter circuit are shown in Figs. 1 and 2.

As the repair parts, T603 is formed by an iron core and a coil winding, but T601 and T602 are only iron core. Thus, if the coils are defective, arrange a new transformers as shown in Fig. 1. Note that the lead lengths must be exact. Also wind the coil carefully.

The lead wires (5) to (8) are as follows:

- *lead wire diameter:* *(7) and (8) are of equal diameter*
  (5) and (6) are of equal diameter
- *lead wire length:* *(5) longer than (6)*
  (7) longer than (8)

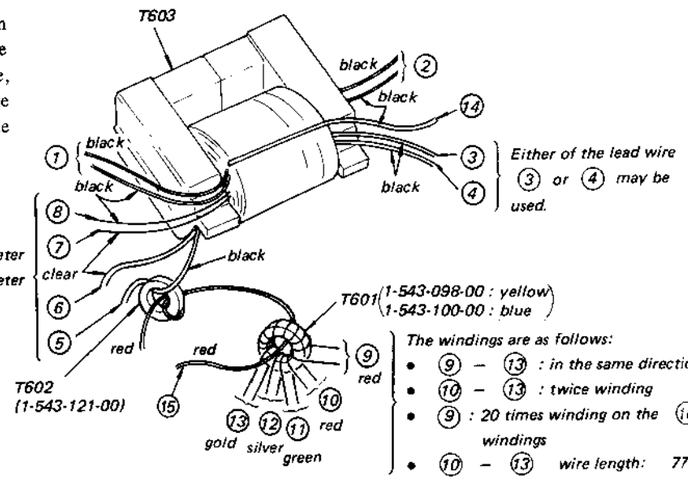

Fig. 1

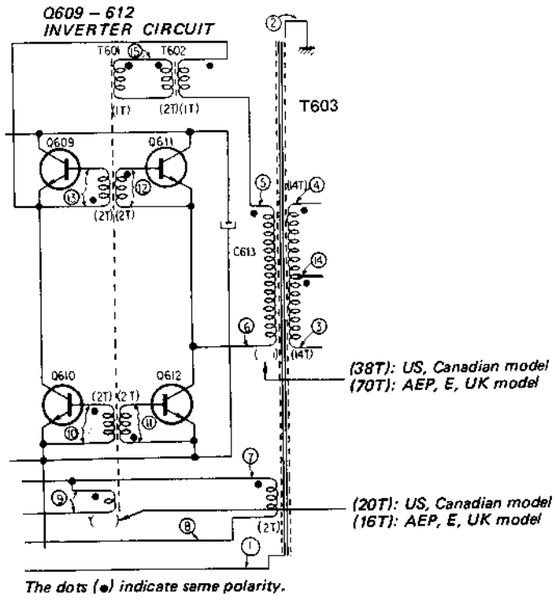

Fig. 2

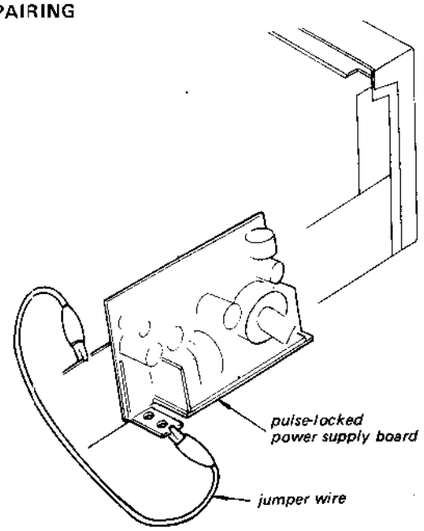
2. PULSE-LOCKED POWER SUPPLY BOARD REPAIRING

This set has a pulse-locked power-supply circuit which is quite different from a conventional power-supply circuit. The pulse-locked power-supply directly rectifies and smooths the ac input power to produce the higher dc voltages required in the power supply circuit. When servicing this set, note the following.

1) To prevent unwanted radiation due to pulse signals in the pulse-locked power-supply circuit, the pulse-locked power-supply board is shielded by the aluminum diecast box.
2) The negative circuit of the secondary rectifier in the pulse-locked power-supply circuit is grounded by screws in the aluminum diecast box. When checking the pulse-locked power-supply board out of the box, use a jumper wire as shown.

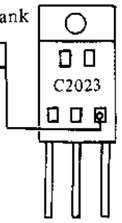


3. INVERTER CIRCUIT TRANSISTOR REPLACEMENT (Q609–612)

1) Be sure that there are no bits of solder and wire ends on the places marked *2 in Fig. 3.
2) Proceed the following items surely when replacing the transistors (Q609–612).
   * Apply thermal compound coat to the positions marked *1 and *2 in Fig. 3 before mounting the transistors.
   * Lay the F-shaped plate flat to ensure uniform contact with all 4 transistors (see Fig. 4).

AEP, UK, E model

		hFE rank
Q609–612	8-729-302-31	2SC2023-R
	8-729-302-32	2SC2023-O



Note: When replacing Q609–Q612 in the pulse-locked power-supply circuit, use those which have the same hFE ranks.

US, Canadian model

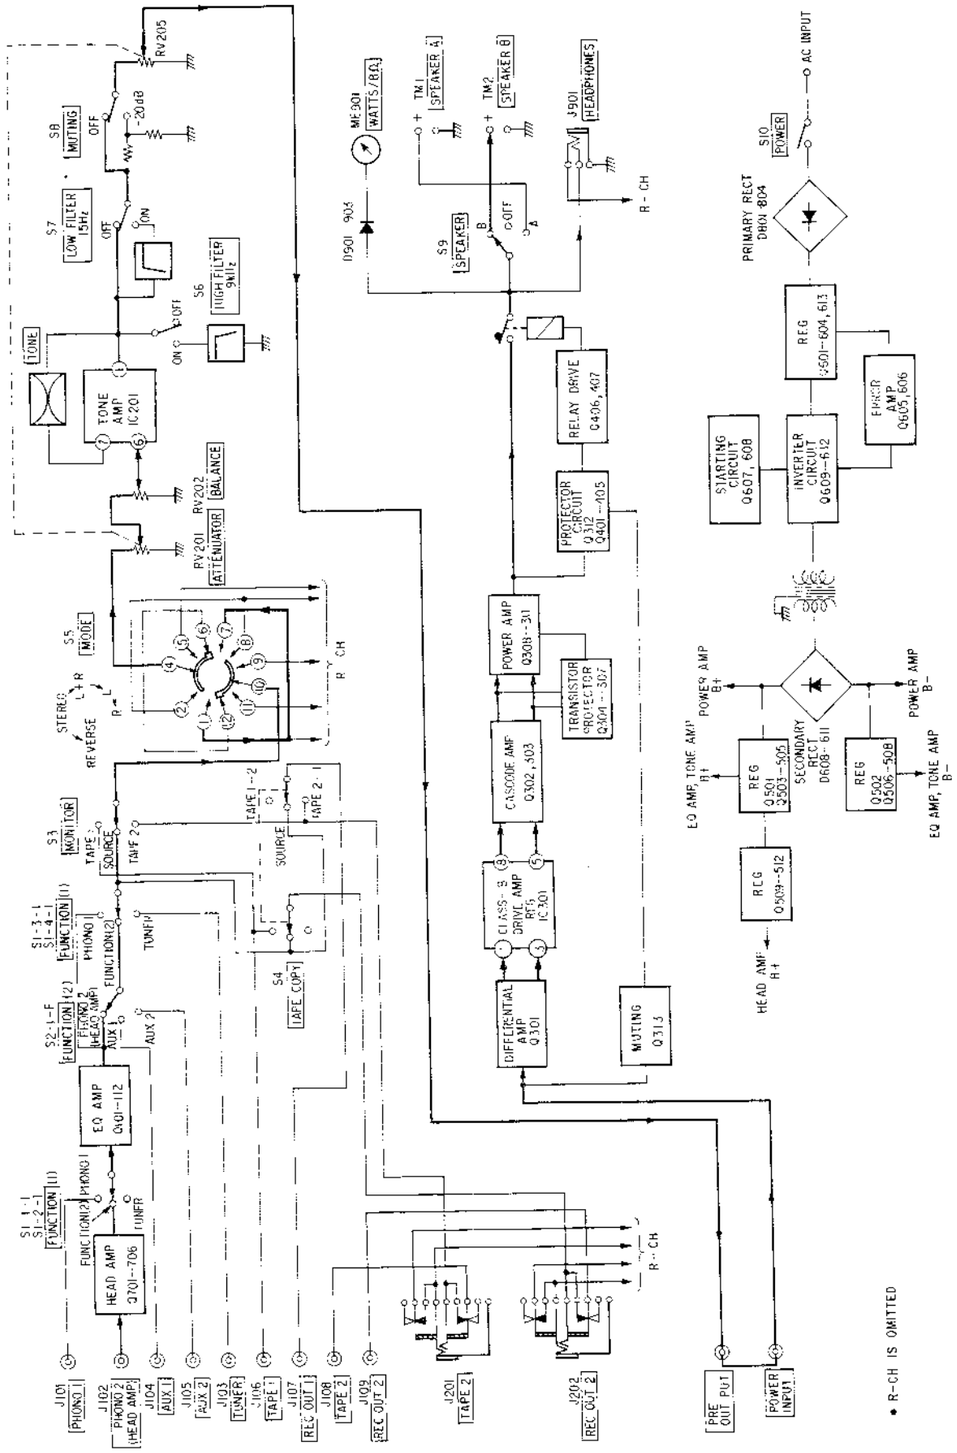
BLOCK DIAGRAM

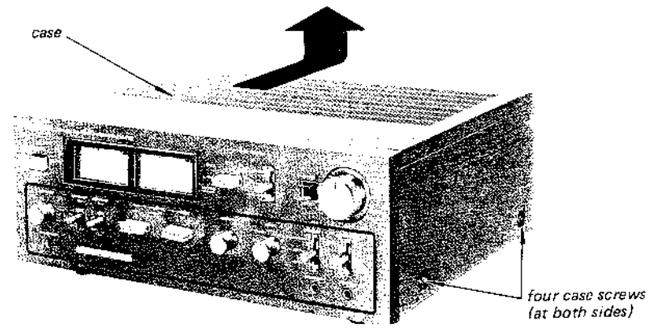


• R-CH IS OMITTED

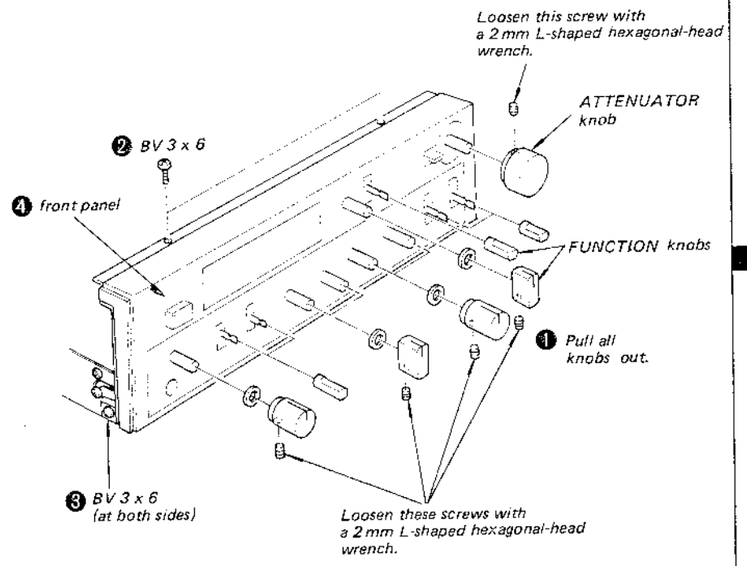
SECTION 2
DISASSEMBLY

- Follow the disassembly procedure in the numerical order given.

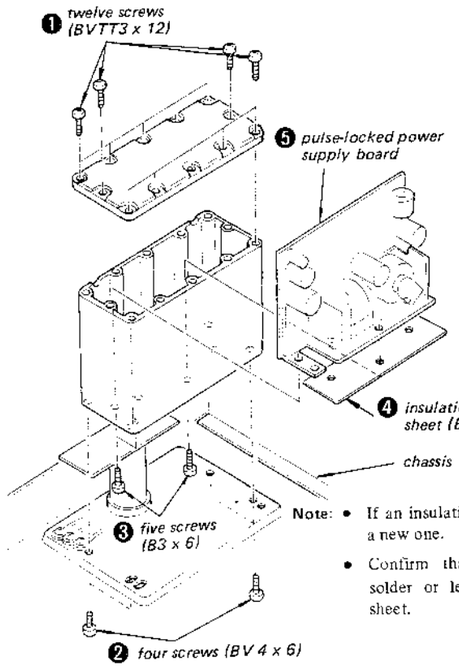
CASE REMOVAL



FRONT PANEL REMOVAL



PULSE-LOCKED POWER SUPPLY BOARD REMOVAL

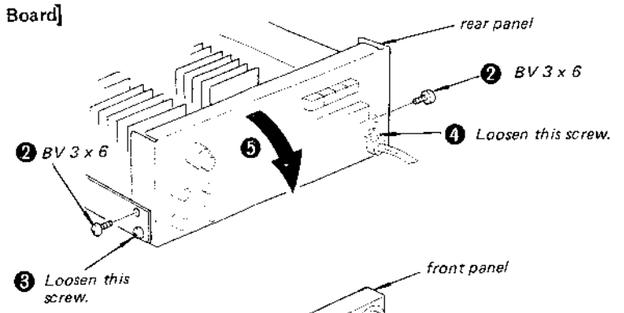


Note:
- If an insulation sheet is defective, change a new one.
- Confirm that there are no scraps of solder or lead wire on any insulation sheet.

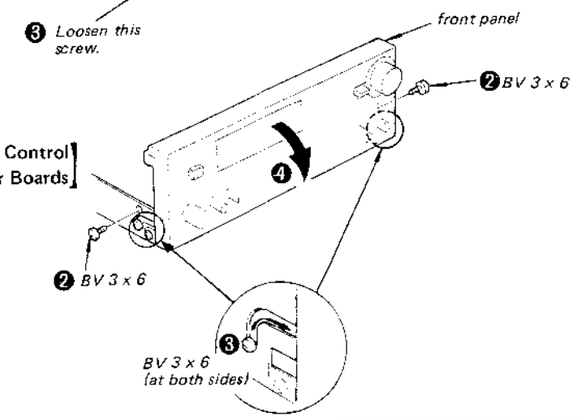
CIRCUIT BOARDS CHECKING AND REPAIRING

❶ *Remove the case (See page 6).*

[Head Amp Board]

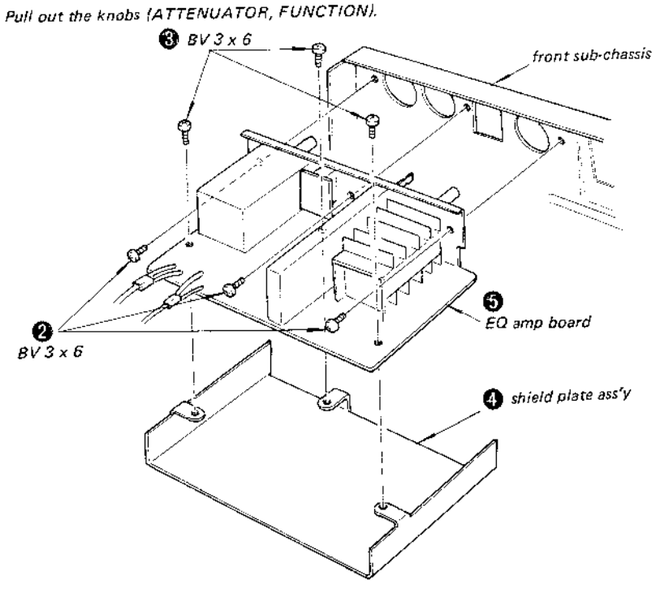


[EQ Amp, Control and Meter Boards]



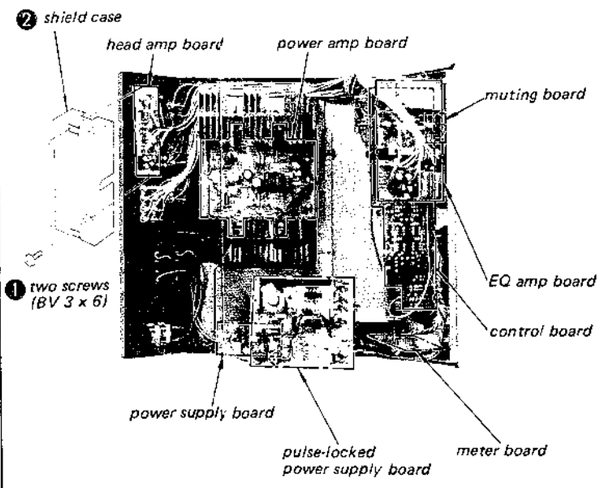
EQ AMP BOARD REMOVAL

❶ *Pull out the knobs (ATTENUATOR, FUNCTION).*

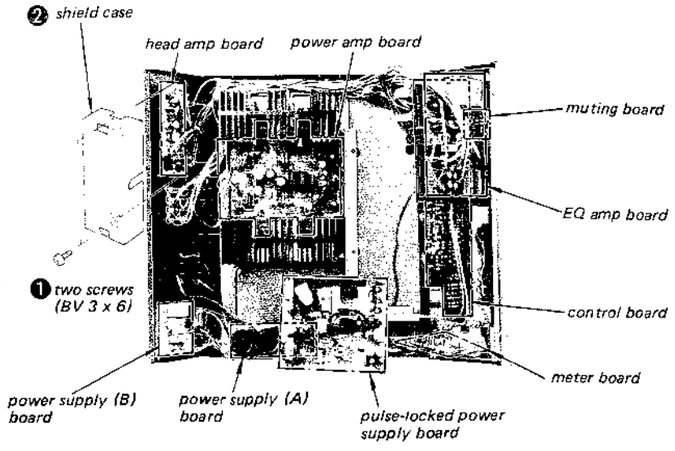


Each circuit board is located as shown below.

(US, Canadian model)



(AEP, UK, E model)

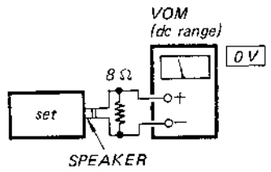


SECTION 3
ADJUSTMENTS

Note: 1. DC BIAS and DC BALANCE adjustments should be performed about several minutes later after the POWER switch (S10) is turned on.
2. Repeat DC BIAS and DC BALANCE adjustments two or three times.
3. After replacing the power transistors, DC BIAS and DC BALANCE adjustments should be performed.

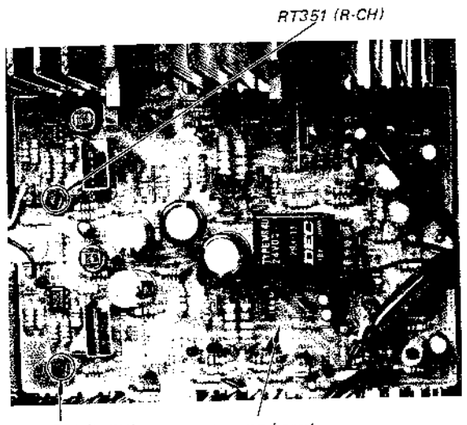
DC Balance Adjustment

Procedure:



Adjust RT301 (L-CH) and RT351 (R-CH) for 0 V reading on the VOM.

Adjustment Location:

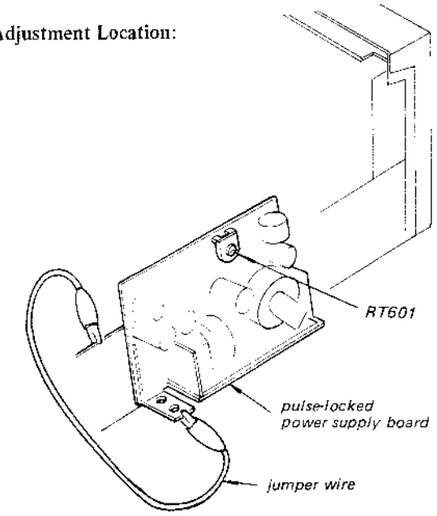


DC Voltage Adjustment

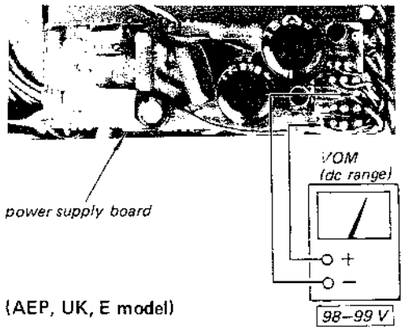
Procedure:

1. Connect a jumper wire.
2. Adjust RT601 for 98–99 V reading on the VOM.

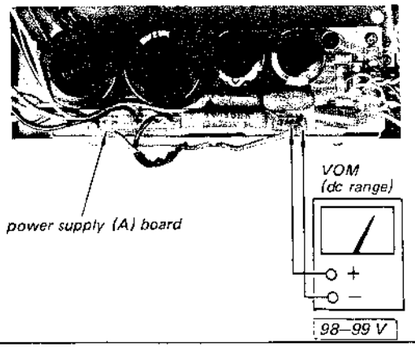
Adjustment Location:



(US, Canadian model)



(AEP, UK, E model)

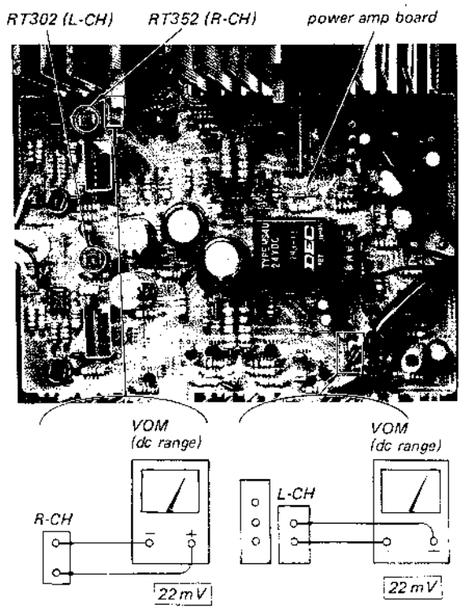


DC Bias Adjustment

Procedure:

Adjust RT302 (L-CH) and RT352 (R-CH) for 22 mV reading with no signal input.

Adjustment Location:

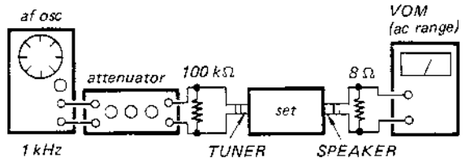


Meter Level Adjustment

Setting:

FUNCTION switch: TUNER

Procedure:



1. Turn the VOLUME control fully clockwise.
2. Adjust the TUNER input level for 2.83 V (1 W) reading on the VOM.
3. Adjust RT901 (L-CH) and RT951 (R-CH) so that the power meters indicate 1 W.

Adjustment Location:

RESISTORS

All resistors are in ohms. Common ¼ W carbon resistors are omitted. Refer to the list on page 49 for their part numbers.
All variable and adjustable resistors have characteristic curve B, unless otherwise noted.
kΩ : 1000 Ω

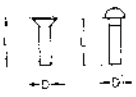
HARDWARE NOMENCLATURE

Screw: P 3 × 10

- *L: Length in mm*
- *D: Diameter in mm*
- *Type of head*
- *Indicated slotted-head only*
- *Unless otherwise indicated, it means cross-recessed head (Phillips type).*



Nut, Washer, Retaining ring: N 3

- *Diameter of usable screw or shaft*
- *Reference designation*

Reference Designation	Shape	Description	Remarks
		SCREWS	
P		pan-head screw	binding-head (B) screw for replacement
PWH		pan-head screw with washer face	binding-head (B) screw and flat washer for replacement
PS PSP		pan-head screw with spring washer	binding-head (B) screw and spring washer for replacement
PSW PSPW		pan-head screw with spring and flat washers	binding-head (B) screw and spring and flat washers for replacement
R		round-head screw	binding-head (B) screw for replacement
K		flat-countersunk-head screw	
RK		oval-countersunk-head screw	
B		binding-head screw	
T		truss-head screw	binding-head (B) screw for replacement
F		flat-fillister-head screw	
RF		fillister-head screw	
BV		brazier-head screw	

Reference Designation	Shape	Description	Remarks
		SELF-TAPPING SCREWS	
TA		self-tapping screw	ex. TA, P 3 × 10
PTP		pan-head self-tapping screw	binding-head self-tapping (TA, B) screw for replacement
PTPWH		pan-head self-tapping screw with washer face	binding-head self tapping (TA, B) screw and flat washer for replacement
PTTWH		pan-head thread-rolling screw with washer face	bind-ng-head (B) screw and flat washer for replacement
		SET SCREWS	
SC		set screw	
SC		hexagon-socket set screw	ex: SC 2.6 × 4, hexagon socket
		NUT	
N		nut	
		WASHERS	
W		flat washer	
SW		spring washer	
LW		internal-tooth lock washer	ex: LW3, internal
LW		external-tooth lock washer	ex: LW3, external
		RETAINING RINGS	
E		retaining ring	
G		grip-type retaining ring

CIRCUIT DESCRIPTION

SONY
SERVICE MANUAL

This audio amplifier is equipped with a pulse-locked power supply which has the following desirable features:

1) Better regulation (less than 1%) due to impedance as low as 1/15 of conventional power supply impedance.
2) Square waves as high in frequency as 20 kHz are used, so hum does not occur.
3) Small in size and lightweight. Approximately 1/2 the volume and 1/4 to 1/8 the weight of a conventional power supply.
4) Operable even with a dc power source.

The circuit of this pulse-locked power supply is outlined below (See Fig. 1).

1. Surge-Current Control Circuit (See Fig. 2 or Fig. 3)

This circuit suppresses the large surge-current which occurs when the power switch S10 is first turned on, thereby preventing the burning of the switch contact and unnecessary blowing of the fuse.

In the pulse-locked power supply circuit, ac line current is directly rectified and smoothed. Since a very-large charge-current (surge-current) flows into the smoothing capacitor C801 (and C805 in AEP, UK, E models). the surge-current control circuit is required.

- When the power switch is turned on, the current flows through R801 and R802 to suppress the surge-current. After the secondary-rectified current starts to flow, the relay RY801 is turned on to shunt R801 and R802 out of the circuit.

2. Line Filter (See Fig. 2 or Fig. 3)

This filter prevents high-frequency noise (generated in the chopper-type voltage regulator and inverter circuits) from entering the ac power line.

- The filter consists of coil L601 with bifilar windings on a ferrite-ring core and three capacitors C601–C603. Noise which appears between the ac line and the ground (common-mode noise, See Fig. 4.) is suppressed, thereby reducing the amount of unwanted radiation (noticeable when this amplifier is connected to preamplifier, tuner, turntable, etc.) to insignificant levels.
- Furthermore, noise radiated directly from the voltage regulator and inverter circuits is suppressed by an aluminum diecast shield, while any leakage of noise to the dc output terminals is stopped by the LC filter of the secondary rectifier.

3. Chopper-Type Voltage Regulator (See Fig. 5)

This voltage regulator circuit, formed by the high-speed switching circuit (Q601–603, Q613) and demodulation filter (low-pass filter L604, C613), maintains a constant voltage output (applied to the inverter) despite fluctuations in input voltage and load.

- Control signals from the error amplifier activate the high-speed switching circuit, turning the output on and off. This output is smoothed out by L604 and C613 to obtain a constant voltage.
- D601 (flywheel diode) is used to release the stored magnetic energy (accumulated when Q601 and Q613 are on) from the choke coil L604 when Q601 and Q613 are turned off. This diode also improves the switching characteristics.

  When D601 is on, the energy in the choke coil is supplied through this diode to the output circuit.
- Without this diode, the energy accumulated in the choke coil (when Q601 and Q613 are on) would result in very high voltage levels when Q601 and Q613 are turned off, and would probably damage these two transistors.
- The circuit diagram in Fig. 5 is simplified to the circuit diagram in Fig. 6.

The switching transistor Q1 is turned on and off by PWM (pulse-width modulation) waves applied to its base. Output voltage stability is achieved by varying the period that the switching transistor Q1 is on (T_{on}) or off (T_{off}). The relevant waveforms are shown in Figs. 7 and 8.

1) If, for example, the output voltage tends to drop because of a load fluctuation, the degree of fluctuation is detected by the error amplifier, resulting in a change in T_{on}/T_{off} ratio. That is, the switching transistor remains on for a longer time, thereby compensating for the output voltage drop.
2) If the output voltage then tends to increase (due to further load fluctuation) the error amplifier will again detect the degree of fluctuation, and consequently shorten the period that Q1 is on. Output voltage is stabilized by utilizing the operations described in 1) and 2) above.

The relation between E_0 and E_1 is given by the following expression:

$$E_0 = E_1 \cdot \frac{T_{on}}{T_{on} + T_{off}}$$

4. PWM (Pulse-Width Modulation) Circuit (See Fig. 9)

This circuit is used to control the chopper-type voltage regulator to maintain constant inverter output voltage. Square-wave pulses from the inverter are converted into sawtooth waves, and are then compared with a reference voltage level.

- The circuit diagram in Fig. 9 is simplified to the circuit diagram in Fig. 10.

1) The fluctuating output voltage is divided by the detector resistors R609, R610 and RT601, and the divided voltage V_0 applied to Q606. In addition, the pulses from the inverter are converted into sawtooth waves, by the integrating circuit R612, C607, and added to V_0 through C606.
2) Variations in regulation are corrected by R611, R613, R622 and C608, while the reference voltage V_{ref} (stabilized by the zener diode D602) is applied to the base of Q605.
3) When the combined sawtooth wave and reference voltage V_{ref} are compared and amplified by the error amplifier Q605 and Q606, the output will be pulse-width modulated as shown in Fig. 11.

5. Inverter Trigger Circuit (See Fig. 12)

When the power switch is turned on, this circuit supplies a trigger pulse to the winding N1 of T601 to start the inverter oscillating.

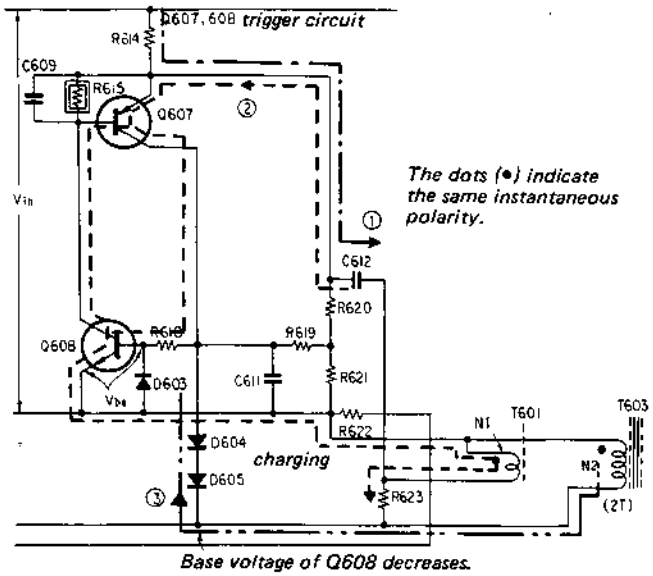

Fig. 12

1) When the power switch is turned on, C612 is charged through R614 (route ①).
2) Once the voltage difference V_{be} between base and emitter of Q608 satisfies the following relation:

$$\frac{R621}{R614 + R620 + R621} \cdot V_{in} > 0.6\ V$$

Q607 and Q608 will turn on.

3) When these two transistors are on, the charge on C612 is applied as a pulse signal to N1 through Q607 and Q608 to start the inverter oscillating. (route ②).
4) Once the inverter starts to oscillate, the voltage generated in winding N2 of T603 is rectified by D604 and D605 (thereby obtaining a minus voltage), resulting in a decrease of the Q608 base voltage. Then transistors Q607 and Q608 turn off (route ③).
5) Q607 and Q608 turn off so that winding N1 of T601 is not loaded with C612, Q607 and Q608, thereby permitting normal inverter-starting operation.

6. Inverter Circuit (See Fig. 13)

This bridge-type inverter circuit, consisting of four power transistors Q609–Q612, generates square-wave signals by using a constant dc voltage supplied from the chopper-type voltage regulator. High-frequency transformer T603 isolates the secondary circuit from the primary circuit and also changes the voltage.

The circuit diagram in Fig. 13 is simplified to the circuit diagram in Fig. 14.

- The secondary voltage waveform of the high-frequency transformer shown in Fig. 15 is obtained by switching S1 and S4 alternately, and S2 and S3 alternately. The dc voltage is consequently converted into square waves.
- The inverter circuit (Fig. 13) operates in the following manner.

1) A trigger pulse signal is applied to N1 from the inverter trigger circuit.
2) For example, an initial pulse produces voltages which cause the transistors connected to N4 and N5 to turn on and the transistors connected to N3 and N6 to turn off.
3) Q610 and Q611 turn on and the current flows from the ⊕ terminal to the ⊖ terminal through Q611, N7, N8, and Q610.
4) The current flowing through N10 will be proportional to the current flowing to T603 through T602.

   This current flowing through N10 produces voltages in N4 and N5. Such voltages turn on Q610 and Q611.
5) The transformer T602 is used to adjust the amount of current feedback.
6) Furthermore, since N2 is wound on T603, N2 generates a voltage which will be applied to N1 through R623.
7) Since N1 is wound on T601, voltages will be generated in N4 and N5, and will also turn Q610 and Q611 on again (voltage feedback).
8) Q610 and Q611 are sufficiently saturated by these two types of feedback (current and voltage) and supply the power to T603. T603 is then saturated and will no longer generate enough voltage to turn Q610 and Q611 on.

9) Q610 and Q611 turn off, and a voltage of opposite polarity is generated in N2.

10) This voltage of opposite polarity consequently produces a magnetic field in the opposite direction, generating voltages in N3 and N6. Such voltages turn Q609 and Q612 on.

11) Once these two transistors Q609 and Q612 are turned on, voltage and current feedbacks will keep Q609 and Q612 on until T601 is saturated in the same way as in the previous half cycle. Then Q610 and Q611 turn on again to continue inverter oscillation.

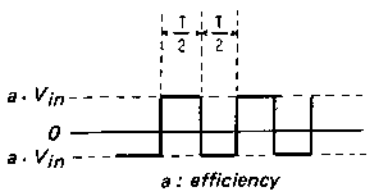

Fig. 15

7. Secondary Rectifier

- This is a rectifier/smoothing circuit which converts the square-wave (changed to the desired voltage by the high-frequency transformer) back into a direct current.
- The high-speed switching diode ensures low loss in the rectification of the square-waves.
- The smoothing circuit uses an LC filter. Due to the square-wave power input, even small value LC components ensure high smoothing efficiency.
