Tape Transport Mechanism	TCM-110V13

FEATURES

Dolby NR C-type noise reduction system

In addition to the conventional B-type Dolby NR system, the TC-FX77 employs the newly-developed C-type Dolby NR system which reduces tape noise twice as effectively as the B-type system. The C-type system also incorporates an anti-saturation network to improve the high-frequency dynamic range by 4 dB at 10 kHz.

Newly-developed LA (Laser Amorphous) head

The record/playback head is made of a special amorphous magnetic alloy developed by Sony, and its cores are solidly welded by laser. This new highly-durable head provides a wider dynamic range and a more extended frequency response, especially in the high-frequency range. The head is designed to take full advantage of the potential of the metal tapes.

Digital linear counter

This counter indicates the recording or playback time elapsed on the tape so that the tape can be precisely indexed. While conventional displays can only indicate the elapsed recording time, this display can indicate with a minus sign how much recording time remains.

Tape programming functions

The AMS (Automatic Music Sensor), Memory, Repeat and Ending Control functions allow you to program the tape deck operation as you desire.

AMS: for locating the beginning of a selection on the tape.

Memory: for easily locating any point on the tape.

Repeat: for repeating any selection any number of times.

Ending control: for stopping the tape after playing a paticular number of selections.

Full-logic "feather-touch" operation

At the slightest touch, the "feather-touch" function buttons which control a microprocessor enable you to switch directly from one mode to another without going through the stop mode.

Bright 16 segment peak program meters and wide-scale REC LEVEL (recording level) controls

The peak program meters follow the transient peaks of the music and maintain the peak readings for about 4 seconds. This double indication and the wide-scale REC LEVEL controls make it easy to set critical recording levels precisely.

Timer-activated recording and playback

A timer switch is provided to turn the deck on and off any number of times at preset times determined by an optional timer.

Remote control operation

Using the optional RM-50 or RM-80 remote control unit, various operations—recording, playback, record muting operation, etc.– can be remotely controlled.

When the RM-65 synchro remote control unit is used to connect this cassette deck with a turntable equipped with a synchro remote control jack or a TC-PB5 stereo cassette player, the operation of the cassette deck and the turntable or TC-PB5 will be synchronized.

SAFETY CHECK-OUT (US Model)

After correcting the original service problem, perform the following safety check before releasing the set to the customer:
Check the antenna terminals, metal trim, "metallized" knobs, screws, and all other exposed metal parts for AC leakage. Check leakage as described below.

LEAKAGE TEST

The AC leakage from any exposed metal part to earth ground and from all exposed metal parts to any exposed metal part having a return to chassis, must not exceed 0.5 mA (500 microampers). Leakage current can be measured by any one of three methods.

1. A commercial leakage tester, such as the Simpson 229 or RCA WT-540A. Follow the manufacturers' instructions to use these instruments.
2. A battery-operated AC milliammeter. The Data Precision 245 digital multimeter is suitable for this job.
3. Measuring the voltage drop across a resistor by means of a VOM or battery-operated AC voltmeter. The "limit" indication is 0.75 V, so analog meters must have an accurate low-voltage scale. The Simpson 250 and Sanwa SH-63Trd are examples of a passive VOM that is suitable. Nearly all battery operated digital multimeters that have a 2V AC range are suitable. (See Fig. A)

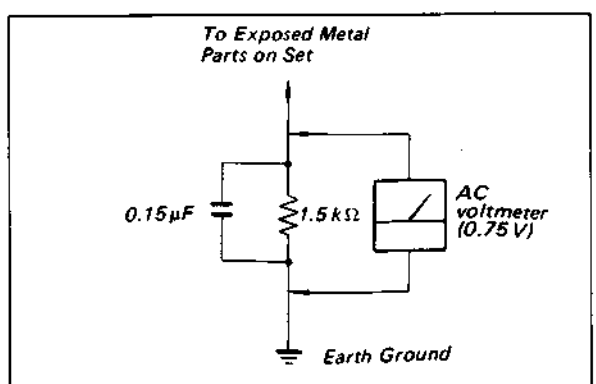

Fig. A. Using an AC voltmeter to check AC leakage.

CAUTION ON REPAIRING AND SHUT-OFF DETECTION

This set performs the shut-off detection optically. There are five grooves on each reel table, the lamp light being transmitted with light guide on the back of the ornamental plate is to the phototransistor intermittently by the rotation of reel table.

Phototransistors Q802, 803 produce pulse waves by intermittent lights, which is input to mechanism controller of IC501 and the AMS counter of IC502 after shaped at IC507. Therefore, when it is necessary to repair by removing the ornamental plate, set the oscillator temporarily to the each input terminal of IC507 (input pattern on MD board or terminal 5, 6 of CNP510 on the system control board) not to operate the auto shut-off.

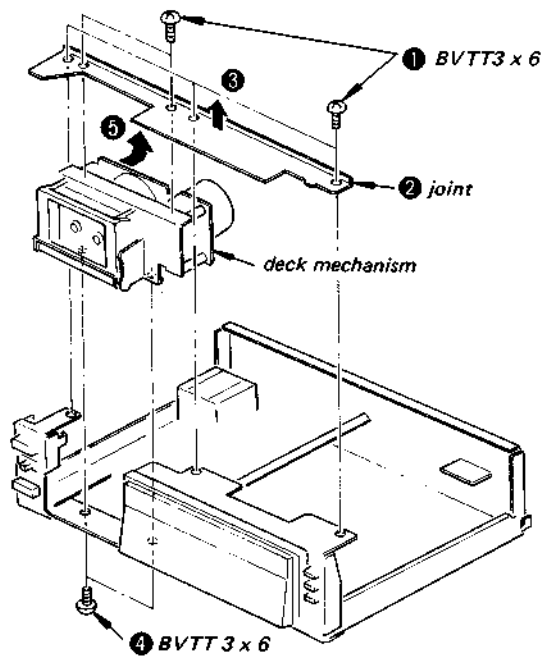
DECK MECHANISM



CASSETTE-ORNAMENT PLATE

Note: This set uses a newly-developed cassette-ornament plate. This plate does not need screws to be installed. So no care is exersised about the screws in this plate-mounting system.

1 Press the ejection button and open the cassette lid.

2 Remove the cassette lid. Remove the tape cassette from the cassette holder if any.

3 Release the two claws from the cassette-ornament plate at both top corners.

4 Depress the two slide-switch levers at the inside of the set and remove the cassette-ornament plate.
(Alternatively, push the two slide-switch levers up from inside of the cassette compartment, and remove the cassette-ornament plate.)

5 When reinstalling the cassette-ornament plate, perform the steps in a reverse manner.

SECTION 3
ADJUSTMENTS

3-1. MECHANICAL ADJUSTMENTS

PRECAUTION

1. Clean the following parts with a denatured-alcohol-moistened swab:

record/playback head	pinch roller
erase head	rubber belts
capstan	idlers

2. Demagnetize the record/playback head with a head demagnetizer.
3. Do not use a magnetized screwdriver for the adjustments.
4. After the adjustments, apply suitable locking compound to the parts adjusted.
5. The adjustments should be performed with the rated power supply voltage unless otherwise noted.

Torque Measurement and Back Tension Torque Adjustment

1.

Torque	Torque meter	Meter reading
Forward	CQ-102C	30–60 g · cm (0.41–0.83 oz · inch)
Back tension	CQ-102C	2.5–4.5 g · cm (0.04–0.06 oz · inch)
