

- Voltage readings taken between tube socket terminals and B minus (metal shell of electrolytic condenser).
- Dial set to low frequency, no signal, and volume control minimum.
- Measurements made from 117 volts AC line. If measured from DC line, voltages may be slightly lower.
- Voltage readings taken with a vacuum tube voltmeter. Socket terminals marked with an asterisk \* indicate much lower voltage or zero voltage if measured with a 1000 ohm-per-volt meter.
- If measurements are made on battery operation, tube filament and B plus voltages will vary with the condition of the batteries. These voltages will equal the terminal voltage of the A or B battery less the voltage drop through components.

## TUBE AND TRIMMER LOCATION

## REPLACEMENT OF BATTERIES

Use replacement A and B batteries of the following types:  
**A** Battery: Ensign A47 or equivalent.  
**B** Battery: Ensign B67, Burgess XX45, Eveready 467 or equivalent.

\* If taken with a 1000 ohm-per-volt meter, readings will be lower or zero.

\* C7, C8, R5, R6, R7 are contained in a multiple-unit component called a couplelate (part number 63A4-3). Although a defective section of the couplelate can sometimes be replaced by individual components, we recommend replacing the entire couplelate.

Note that numerals 1, 2, 3, 4, 5, and 6 shown at schematic connections, correspond to couplelate lead numbers printed on body of couplelate directly above the leads.
