RADIOGRAM MODIFICATIONS

In the radiogram model 97 and the radiogram model 98 the 102 chassis, modified to permit V2 to operate as a pick-up amplifier, is employed. This involves the addition of six capacitors and 3 resistors and four switches.

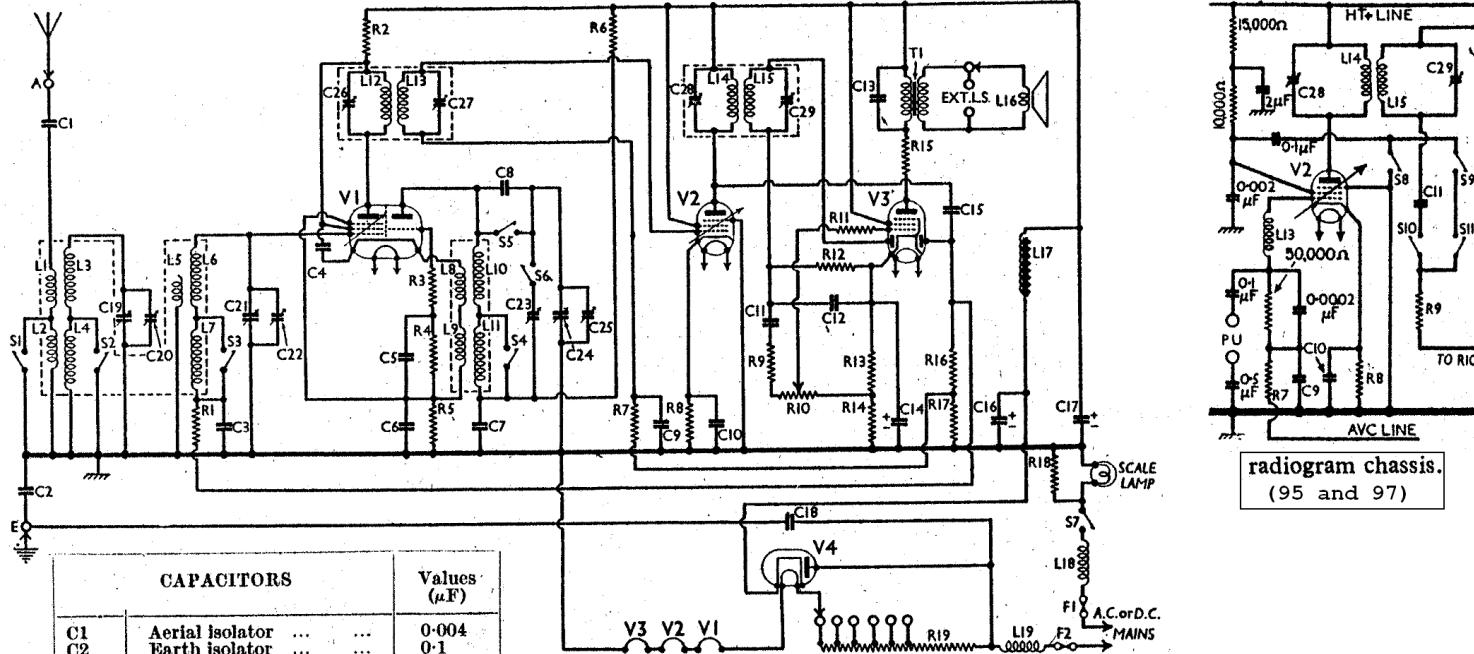

A section of the circuit diagram is redrawn and inset beside the main circuit diagram overleaf, showing the modified arrangement. The pick-up is fed in to V2 control grid circuit, and the AF output is taken from the screen, which acts as a triode anode. It then passes via S9 and S10 to R9 and R10. Component values are marked in the diagram.

The four switches S8-S11 are added at the rear end of the switch unit, just beyond S4, where they occupy only two spaces.

CIRCUIT ALIGNMENT

IF Stages.—Connect signal generator to control grid (top cap) of V1 and E socket, feed in a 456 kc/s (657.9 m) signal, and adjust C29, C28, C27 and C26 for maximum output.

MW.—Switch set to MW, tune to 200 m on scale, feed in a 200 m (1,500 kc/s) signal, and adjust C25, then C22 and C20, for maximum output. If a whistle appears just above 340 m, readjust C20 and C25 until it disappears.

LW.—Switch set to LW, tune to 1,500 m on scale, feed in a 1,500 m (200 kc/s) signal, and adjust C23 for maximum output.
