

# ROBERTS - P5A

## CIRCUIT ALIGNMENT

**I.F. Stages.**—Connect signal generator, via a 0.1  $\mu$ F capacitor in each lead, to control grid (top cap) of V2 and chassis, leaving existing connector in position. Turn volume control to maximum, feed in a 467 Kc/s (642.4 m) signal, and adjust the cores of L12 and L13 for maximum output.

Transfer signal generator leads to control grid (top cap) of V1 and chassis, again leaving existing connector in position, and adjust the cores of L10 and L11 for maximum output. Repeat these adjustments and rescal the core adjustment screws.

**R.F. and Oscillator Stages.**—With the gang at maximum the pointer should cover the horizontal lines at the high wavelength ends of the three scales. The signal generator leads should be secured to the bench, close to the assembly.

**M.W.**—Switch set to M.W., tune to 250 m on scale, feed in a 250 m (1,200 Kc/s) signal, and adjust C30, then C25, for maximum output. Feed in a 500 m (600 Kc/s) signal, tune it in, and adjust C32, while rocking the gang, for maximum output.

**L.W.**—Switch set to L.W., tune to 1,200 m on scale, feed in a 1,200 m (250 Kc/s) signal, and adjust C31, then C26, for maximum output. Feed in a 1,800 m (166.7 Kc/s) signal, tune it in, and adjust C33, while rocking the gang, for maximum output.

**S.W.**—Switch set to S.W., and connect signal generator leads to A and E sockets via a suitable dummy aerial. Tune to 16 m on scale, feed in a 16 m (18.75 Mc/s) signal, and adjust C29 for correct calibration, choosing the peak involving the lesser trimmer capacitance. Check calibration at 50 m (6.0 Mc/s).
