

## SERVICE MANUAL FOR PHILIPS RECEIVER TYPE 141U

Front view of Receiver

### VALVE COMBINATION

- V1 UCH42 Frequency changer.
- V2 UF41 I.F. Amplifier.
- V3 UBC41 Detector, A.F. Amplifier, A.G.C.
- V4 UL41 Power amplifier.
- V5 UY41 Mains rectifier.

### MAINS CONSUMPTION

With 245 V. 50 c/s applied to the 220/250 V. tapping, the consumption (measured with a moving iron instrument) is approximately 230 mA.

### PILOT LAMP

Type 8097D-00 (19 V., 0.09 A.).

### VOLTAGE RANGE

200/250 V. D.C./A.C., 50/100 c/s.

### WAVEBAND RANGES

- M.W. 1622-517 Kc/s. (185-580 m.).
- L.W. 261-150 Kc/s. (1150-2000 m.).

### DIMENSIONS OF CABINET (overall)

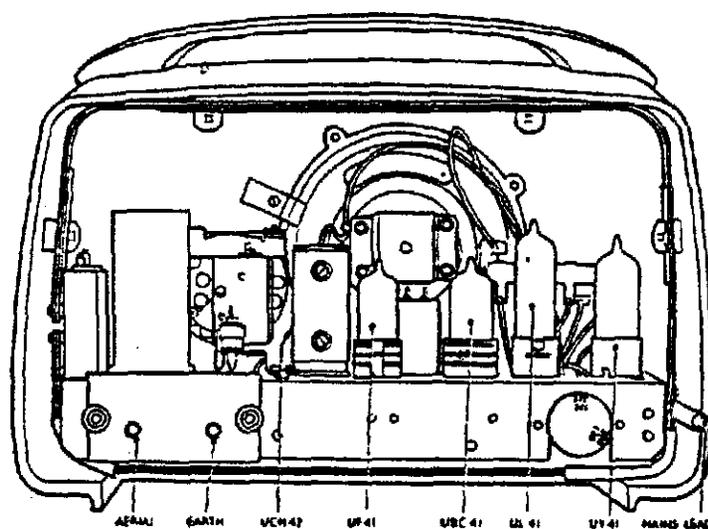

Height 8½". Width 12¼". Depth 6½".

### TRIMMING FREQUENCIES

- I.F. 470 Kc/s.
- M.W. 550 Kc/s., 1630 Kc/s.
- L.W. 152 Kc/s.

### REMOVING THE BACK AND BASEPLATES

The back and baseplates are combined, and are held by two 4mm. bolts through the baseplate, and four captured screws through the backplate.

Back view of Receiver

### REMOVING THE KNOBS

The two plastic knobs are held by grub screws threaded into the control spindles. The plastic wave change switch control slides off the spindle once the tuning knob has been removed. It is located in a keyway and, when replacing, care should be taken to ensure that it is in its correct position.

### REPLACING THE PILOT LAMP

Remove backplate/baseplate assembly.

The pilot lamp holder is held to the chassis by one 3mm. bolt.

### REMOVING THE SCALE

The scale is held to the cabinet by four ornamental bolts.

### REMOVING THE CHASSIS

Remove the backplate/baseplate assembly.

Remove the knobs.

Remove the scale.

Turn the gang to maximum capacitance.

Remove the two chassis fixing bolts which bolt into the rear of the cabinet front and, guiding the pointer through the slot in the cabinet, withdraw the chassis.

Replace in the reverse order.

### REPLACING THE CORD DRIVE

(See Fig. 1)

Make up the cord to the length indicated.

Turn the gang to maximum capacitance.

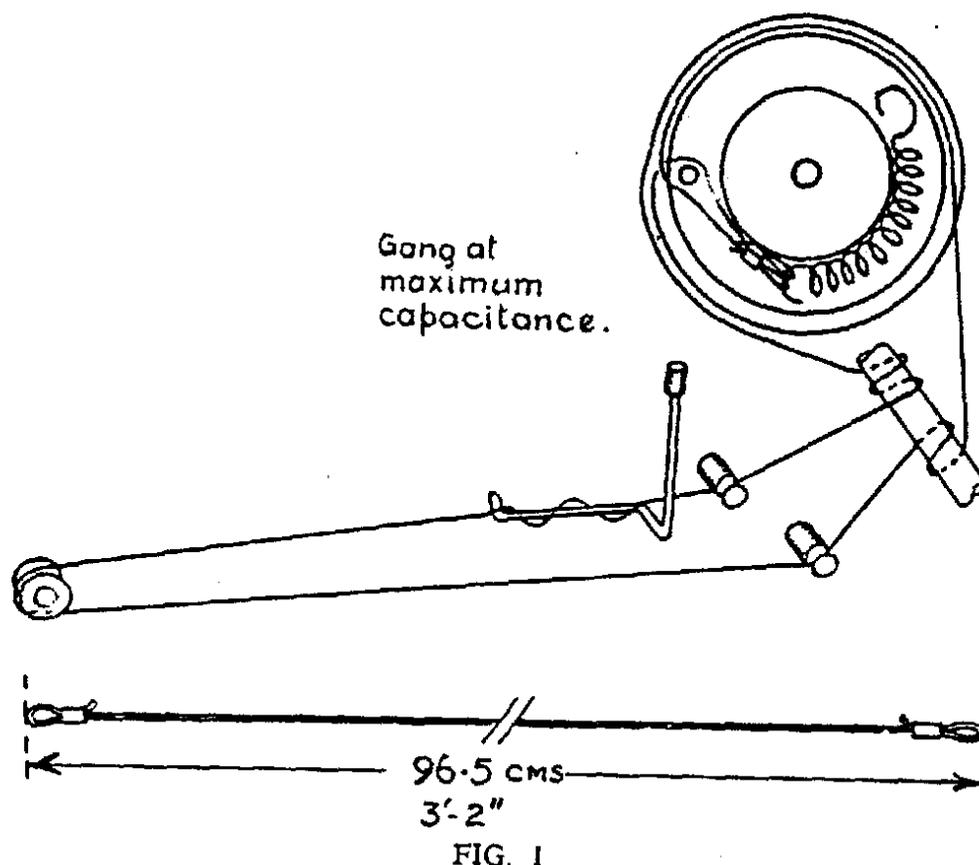

Fit the spring to its anchor point on the drum.

Hook one end of the cord to the spring, and pass the cord under the stud on the drum, through the hole in, and clockwise round the drum. Loop the cord round the drive spindle in the direction indicated on the figure.

(This operation can be easily carried out if the receiver chassis is allowed to overhang the work bench, when advantage can be taken of the "V" cut out in the chassis flange to loop the cord over the spindle.) Pass the cord under the stud, round the end pulley, back and under the other stud and round the spindle as indicated. It is important to get the two sets of turns round the spindle in the correct directions, and in their correct relative positions as indicated in the diagram. Pass the cord clockwise round the drum as far as the top. At this point, pull the cord taut, and at the same time stretch (with pliers) the spring. Hold the cord to the drum with one finger, pass the cord on clockwise round the drum, through the hole in the drum, over the stud, and hook the end on to the spring. Gently release the cord to allow the spring to take up its normal tension.

The fixing of the pointer to the cord is evident from the diagram. There are two turns of cord round the pointer base. To avoid bending the pointer base, push the first turn of cord (which is easily fitted) up towards the pointer end of the base. Then the second turn can be easily fitted.

With the gang at minimum, the pointer should be adjusted so that its centre lines up with the "d" in "Third."

### TRIMMING INSTRUCTIONS

#### (a) I.F. Circuits

Set gang capacitor to its mid position.

Switch to M.W.

Set volume control to maximum.

Unscrew the cores of the I.F. transformers a few turns.

Apply a signal of 470 Kc/s to g1V1 via a coupling capacitor of 47 KpF. Trim cores for maximum output in the following order, S18, S17, S16 (top core), S15 (bottom core).

#### (b) Pointer Setting

With the gang at minimum, the centre line of the pointer should line up with the "d" in "Third."

#### (c) Aerial and Oscillator Circuits.

The oscillator frequency = tuning frequency + I.F.

Set volume control to maximum.

Apply the signal between the aerial socket and chassis with the loop aerial connected and in position.

#### (i) Medium Waves

Adjust the gang so that the pointer lines up with the right-hand end of the R. Eireann (i.e. 550 Kc/s. position) station block. Apply a modulated signal of 550 Kc/s. and trim S12 and S4 for maximum output.

With gang at minimum capacitance, apply 1630 Kc/s. and trim C17 and C5 for maximum output.

Repeat the above.

#### (ii) Long Waves

Tune the receiver to a signal of 152 Kc/s. and trim S6 for maximum output.

## SPARE PARTS LIST—TYPE 141U

**IMPORTANT.** When ordering spare parts, the type number of the receiver and the code number of the part, as given in this manual, **MUST** be quoted to enable the order to be correctly executed. When claiming free replacement under guarantee, the defective part should be returned and the type and serial number of the receiver, also the date of sale, should be quoted.
