VALVE ANALYSIS

Valve voltages and currents given in the table below are those measured in our receiver when it was operating on mains of 223 V, using the 230 V tapping on the mains transformer. The receiver was tuned to the lowest wavelength on the medium band and the volume control was at maximum, but there was no signal input.

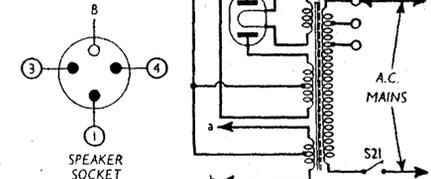

Voltages were measured on the 400 V scale of a model 7 Universal Avometer, chassis being negative.

Valve	Anode Voltage (V)	Anode Current (mA)	Screen Voltage (V)	Screen Current (mA)
V1 41STH	230 (Oscillator)	1.6	70	3.4
V2 MVS/Pen/B	230	3.2	70	1.2
V3 1DD4	82	2.4	—	—
V4 PenA4	238	29.0	258	4.3
V5 DW4/350	327†	—	—	—

GENERAL NOTES

Switches.—S1-S17 are the wavelength, and S18-S20 the scale lamp, switches, ganged in three rotary units inside the coil boxes. Their positions are indicated in our under-chassis view, and shown in detail in the diagrams.

The table below gives the switch positions for the three control settings, starting from fully anti-clockwise. A dash indicates open, and C closed.

Diagrams of the switch units as seen looking from the rear of the underside of the chassis. The radiogram model has an extra unit, as explained under "General Notes."

S21 is the O.M.B. mains switch, ganged with the volume control, R10.

Coils.—The signal frequency and oscillator coils are in a partitioned screened unit, with the wavechange switches, and several other components.

CIRCUIT ALIGNMENT
I.F. stages: Connect the primary winding to the secondary of the transformer and a 0.1 μF condenser in series between the grid and the secondary to earth, and when adjusting a secondary connect them from the anode end of the primary to earth set to M.W. and tune to about 300 m. Connect signal generator to control grid (top cap) of V2 and chassis. Feed in a 495 KC/S signal and adjust C84 and C93 for maximum output. Transfer generator to top cap of V1, max. chassis, and adjust C92 for maximum output. Re-check all adjustments.

R.F. and Oscillator Stages.—S.W.
Connect generator to A and E sockets, switch set to S.W., tune to 18 m., on scale, and feed in an 18 m. (1,607 KC/S) signal. Adjust C28 for maximum output, trimmer capacity. Adjust C21 for maximum output. Check calibration at 50 m. M.W.—Switch set to M.W., tune to 200 m. on scale, feed in a 200 m. (1,500 KC/S) signal, and adjust C29 for maximum output on the peak scale. Tune to 200 m. on scale, feed in a 200 m. (1,500 KC/S) signal, and adjust C21 for maximum output. Check calibration at 50 m. L.W.—Switch set to L.W., tune to 1,300 m. on scale, feed in a 1,300 m. (230.7 KC/S) signal, and adjust C30 for maximum output. Tune to 1,500 m. on scale, feed in a 1,500 m. (200 KC/S) signal, and adjust C28 for maximum output. Tune to 1,607 m. (1,607 KC/S) signal, tune it in, and adjust C27 for optimum results. Re-check at 1,300 m.
