## CIRCUIT ALIGNMENT

**I.F. Stages.**—Switch receiver to M.W., turn gang to minimum capacitance and volume control to maximum. Connect signal generator (via an 0.1 μF capacitor in the "live" lead) to control grid (pin 6) of V1 and chassis. Feed in a 470 kc/s (688.3 m) signal, and adjust the cores of L14 (location reference B2), L13 (F4), L12 (A2) and L11 (G4) for maximum output. Repeat these adjustments until no further improvement results.

**R.F. and Oscillator Stages.**—With the gang set to minimum capacitance, the cursor should coincide with the vertical line labelled "MIN" at the top left-hand corner of the tuning scale. Transfer "live" signal generator lead to A socket, via a suitable dummy aerial.

**M.W.**—Switch receiver to M.W., tune to vertical line labelled "M.W." (or "M" in some receivers) at the top of tuning scale, feed in a 1,550 kc/s (193.6 m) signal and adjust C29 (G3) and C26 (G3) for maximum output. Repeat these adjustments.

**L.W.**—Switch receiver to L.W. and tune to line labelled "L" at top of tuning scale. Feed in a 160 kc/s (1,875 m) signal and adjust C31 (F3) for maximum output.

**S.W.**—Switch receiver to S.W., tune to vertical line labelled "S" at top left-hand side of tuning scale, feed in an 18 Mc/s (16.67 m) signal and adjust C30 (G3) for maximum output, choosing the peak involving the lower trimmer capacitance. Also trim C25 at this frequency for maximum output. Tune receiver to vertical line labelled "S" at the top right-hand side of tuning scale, feed in a 6 Mc/s (50 m) signal and adjust the core of L6 (A1) for maximum output. Tune receiver to "S" mark at the top left-hand side of tuning scale, feed in an 18 Mc/s (16.67 m) signal and readjust C30 and C25 for maximum output. Repeat these adjustments until no further improvement results.

Sketch of the tuning drive system, drawn as seen from the rear of the chassis with the gang set at maximum capacitance.
