

# EKCO - AD38

| RESISTORS |                                              | Values<br>(ohms) |
|-----------|----------------------------------------------|------------------|
| R1        | Aerial-earth shunt                           | 50,000           |
| R2        | Parts V1 variable gain control potentiometer | 30,000           |
| R3        | V1 variable gain control                     | 140              |
| R4        | V1 anode and SG HT feed                      | 10,000           |
| R5        | V1 grid leak                                 | 10,000           |
| R6        | V2 SG HT feed                                | 2,000,000        |
| R7        | V2 SG HT feed                                | 250,000          |
| R8        | V2 anode decoupling                          | 25,000           |
| R9        | V2 anode load                                | 100,000          |
| R10       | RF stopper                                   | 10,000           |
| R11       | V3 CG resistor                               | 500,000          |
| R12       | V3 GB resistor                               | 165              |
| R13       | Part of TC filter                            | 10,000           |
| R14       | V4 surge limiter                             | 100              |
| R15       | Scale lamp by-pass                           | 50               |
| R16       | Heater circuit ballast                       | 775*             |

| Switch | LW | MW |

## CIRCUIT ALIGNMENT

With the gang at maximum, pointer should cover the 500 m. mark on the scale. If it does not, loosen the two small screws in the front of the pointer mounting plate, and turn the pointer through the desired angle, subsequently tightening up the screws again. Connect a signal generator to A and E sockets via a  $0.0002 \mu\text{F}$  condenser.

**MW.**—Switch set to MW, and tune to 250 m on scale. Set volume (gain) control to maximum, and sensitivity (reaction) control to a point at which receiver is just short of oscillation. Feed in a 250 m (1,200 kc/s) signal, adjusting C21 and C18 for maximum output.

**LW.**—Switch to LW, tune to 1,000 m on scale, and readjust C23 (reaction) until receiver is just short of oscillation. Feed in a 1,000 m (2<sup>7</sup> kc/s) signal, and adjust C22 and C19 for maximum output.

If during these operations receiver breaks in oscillation, reduce the reaction setting slightly to avoid this.
