

The resistor between L22 and L23 is R27.

RESISTANCES		Values (ohms)
R 1	LW aerial shunt	10,000
R 2	MW aerial shunt	10,000
R 3	Part aerial coupling	10,000
R 4	V1 hexode anode decoupling	1,000
R 5	V1 osc. CG resistance	50,000
R 6	V1 osc. anode HT feed	30,000
R 7	V1 osc. SW HT feed	100,000
R 8	V2 CG decoupling	1,100,000
R 9	V1, V2 SG's HT feed	20,000
R 10	V3 signal diode load resistances	110,000
R 11	280,000	
R 12	Part of tone compensator	50,000
R 13*	Manual volume control	1,000,000
R 14	V3 triode GB; AVC delay	1,000
R 15	Negative feed-back coupling	25
R 16	V3 triode anode decoupling	15,000
R 17	V3 triode anode load	30,000
R 18	AVC line decoupling	1,100,000
R 19	V3 AVC diode load resistances	510,000
R 20	V4 CG resistance	510,000
R 21	V4 grid stopper	25,000
R 22	Part of tone control	3,000
R 23	Part neg. feed-back feed	200
R 24	V1, V2 fixed GB, and V4 GB resistances	25
R 25		50
R 26	V1 osc. anode shunt	80,000

\* Tapped at 250,000 Ω from chassis end.

+ Each anode, A.C.

Valve	Anode Voltage (V)	Anode Current (mA)	Screen Voltage (V)	Screen Current (mA)
V1 ECH3	235	4.5	114	8.7
V2 EF9	25	3.1	114	2.8
V3 EBC3	241	11	—	—
V4 EL6	117	2.5	—	—
V5 AZ2	222	6.7	241	8.0

Valve voltages and currents given in the table below were those measured in our receiver when it was operating on mains of 233 V using the 216-235 V tapping on the mains transformer. The receiver was tuned to the lowest wave-length on the MW band, and the volume control was at maximum, there was no signal input.

Voltages were measured on the 400 V scale of a model 7 Universal Avometer, chassis being negative.

Two diagrams of the press-button switch unit. Above, as seen from above the chassis, and below, as seen from beneath the chassis.

### COIL TABLE

Button	Wavelength range	Frequency range
1	Gram	—
2	1,150-2,000 m	—
3	1,150-2,000 m	—
4	260-560 m	—
5	195-395 m	—
6	LW manual	—
7	MW manual	—
8	48.0-50.0 m	6.25-6.0 MC/S
9	30.6-31.9 m	9.8-9.4 MC/S
10	24.8-25.8 m	12.1-11.6 MC/S
11	19.3-20.1 m	15.5-14.9 MC/S
12	16.5-17.1 m	18.2-17.5 MC/S
13	13.7-14.2 m	21.9-21.2 MC/S

### CIRCUIT ALIGNMENT

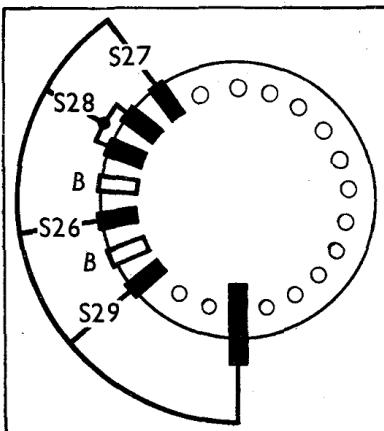

**IF Stages.**—Press the LW manual button. Connect signal generator via a  $0.01\mu F$  condenser between control grid (top cap) of **V1**, leaving existing connection in place, and chassis. Connect a  $500,000\Omega$  resistance directly across the generator output. Feed in a 462 KC/S signal, and adjust the cores of **L33**, **L34** and **L35**, **L36**.

Disconnect resistance and condenser, and transfer signal generator to **A** and **E** sockets via a suitable dummy aerial. Feed in a 462 KC/S signal, and adjust **C67** for minimum output.

**RF and Oscillator Stages.**—With the gang at maximum, the line on the pointer should coincide with the marks at the tops of the two end scales. See that the scale panel fits squarely on its clamps. Connect signal generator via a suitable dummy aerial to **A** and **E** sockets, turn volume control to maximum, and tone control fully anti-clockwise.

**MW.**—Press MW button, tune to 200 m. on scale, feed in a 200 m. (150 KC/S) signal, and adjust **C64**, then **C37**, for maximum output. Feed in a 520 m. (576 KC/S) signal, tune it in, and adjust **C62** for maximum output, while rocking the gang for optimum results.

**LW.**—Press LW button, tune to 1,000 m. on scale, feed in a 1,000 m. (300 KC/S) signal, and adjust **C65**, then **C38**, for maximum output. Feed in a 1,800 m. (167 KC/S) signal, tune it in, and adjust **C63** for maximum output, while rocking the gang for optimum results.

The tone-control switch unit, seen from the rear of the underside of the chassis.

**Bandspread Circuits.**—Press the appropriate SW button, tune in the strongest transmission near the middle of the band covered, then move pointer to where that station is marked on the scale, noting whether this requires an increase or a decrease of tuning capacity: if an *increase* is required, turn the appropriate oscillator coil core adjustment screw *in* (clockwise); if a *decrease* is required, screw the core *out* (anti-clockwise). If a large movement of the core is necessary, select the peak with the screw farthest in (highest frequency).

If a new aerial coil unit has been fitted, the following procedure should be followed in conjunction with the table below:

### TRIMMING TABLE

Band (metr's)	Osc. coil	Trimmers			Test frequency MC/S
		Aerial	Grid	Image	
13	L18	C59	C60	—	21.56
16	L20	C56	C58	C57	17.8
19	L21	C53	C55	C54	15.2
25	L22	C50	C52	C51	11.8
31	L23	C47	C49	C48	9.6
49	L24	C44	C46	C45	6.07

S30	—

Set aerial trimmer  $\frac{1}{2}$  turn from maximum; set grid circuit trimmer  $\frac{1}{2}$  turn from maximum; set image trimmer to minimum. Then adjust as follows, in the same order:

Tune to test frequency on scale, feed in that frequency to **A** and **E** sockets, and adjust aerial and grid trimmers for maximum output, while rocking the gang for optimum results.

Increase generator frequency by 924 KC/S, and increase output as necessary, adjusting frequency to peak with set.

Adjust image trimmer for *minimum* output, while rocking the gang for optimum results. If this operation requires more than a small movement of the trimmer screw, repeat the whole process until this adjustment requires a negligible movement.

### STATION SETTING

To adjust the pre-set station circuits, press the appropriate button and adjust the corresponding oscillator coil core (**L29-L32**), then the aerial trimmer (**C39-C42**) for maximum output, using the signal from the required station or from the signal generator. If the generator is used, final adjustment should always be made on the actual transmission.

Subsequent adjustment of **C37** or **C38** may necessitate readjustment of trimmers **C39-C42**.
