### CIRCUIT ALIGNMENT

**IF Stages.**—Only the first IF transformer will need adjustment, the second being fixed-tuned at the works. Connect signal generator, via a  $0.1 \mu\text{F}$  condenser, to control grid (top cap) of **V1** and chassis. Connect a 100,000  $\Omega$  resistor between control grid and chassis. Switch set to LW, and turn gang to maximum. Feed in a 465 KC/S signal, and adjust cores of **L18, L17** for maximum output. Remove the condenser and resistor.

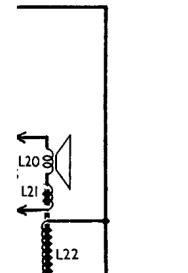

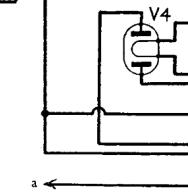

**RF and Oscillator Stages.**—With gang at maximum, pointer should cover the right-hand ends of the clear sections of the scales. Connect signal generator, via a suitable dummy aerial, to **A** and **E** sockets.

**MW.**—Switch set to MW, tune to 200 m on scale, feed in a 200 m (1,500 KC/S) signal, and adjust **C31**, then **C29**, for maximum output. Check at 550 m.

**LW.**—Switch set to LW, tune to 1,200 m on scale, feed in a 1,200 m (250 KC/S) signal, and adjust **C32** for maximum output. Check at 2,000 m.

**SW2.**—There are no adjustments on this band.

**SW1.**—Switch set to SW1, feed in a 14 m (21.4 MC/S) signal, and tune it in accurately. Adjust **C33**, then **C28**, for maximum output. Check at 50 m.

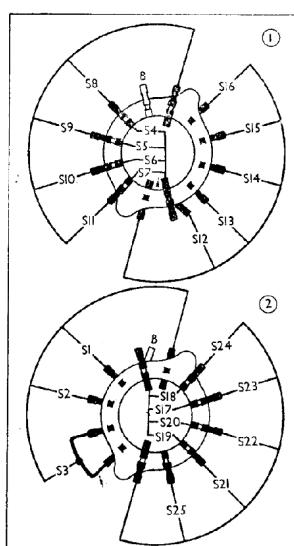

### VALVE ANALYSIS

Valve voltages and currents given in the table below are those measured in our receiver when it was operating on mains of 233 V, using the 216-235 V tapping on the mains transformer. The receiver was tuned to the lowest wavelength on the medium wave band, and the volume control was at maximum, but there was no signal input.

Voltages were measured on the 400 V scale of a model 7 Universal Avometer, chassis being negative.

Valve	Anode Voltage (V)	Anode Current (mA)	Screen Voltage (V)	Screen Current (mA)
V1 ECH3	{ 274 Oscil. 135	2.5 5.6	84	2.8
V2 EFO	274	4.5	84	1.4
V3 EBL1	262	37.0	274	4.8
V4 AZ1	380†	—	—	—

† Each anode, AC.

Diagrams of the two switch units, as seen from the rear of the underside of the chassis.
